| Insert Column | **Method:** insertColumn([before],[cell])<br/> <br/> var rteObj = \$("#rte  
").data("ejRTE "); <br/> <br/>rteObj.insertColumn(true, "<td></td>") | **Property:** TableColumns  
<br/> <br/> viewBag.table = new [] { "TableColumns" } <br/>  
<br/>@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>

```
e.Items((object)ViewBag.items)).QuickToolbarSettings(e =>
e.Table((object)ViewBag.table)).Render() |
```

```
| Insert Row | Method: insertRow([before],[cell])

 var rteObj = $("#rte").data("ejRTE");

 rteObj.insertRow(true, "<tr></tr>") | Property:

 TableRows ViewBag.table =
new [] { "TableRows" }

 @Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).QuickToolbarSettings(e =>
e.Table((object)ViewBag.table)).Render() |
```

```
| Remove Table | Method: removeTable([table])

 var rteObj = $("#rte").data("ejRTE");

 rteObj.removeTable("table") | Property: TableRemove

 ViewBag.table =
new [] { "TableRemove" }

 @Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e
=> e.Items((object)ViewBag.items)).QuickToolbarSettings(e =>
e.Table((object)ViewBag.table)).Render() |
```

### Counts

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Character Count | **Property:**

```
ShowCharCount

@{Html.EJ().RichTextEditor("rteSample").ShowCharCount(true).Rende
r();} | Property: ShowCharCount

```

```

@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ShowCharCount(true).Render() |
```

| Word Count | **Property:** ShowWordCount<br/>

```

@{Html.EJ().RichTextEditor("rteSample").ShowWordCount(true).Render();} | Not Applicable
|
```

| Maximum Length | **Property:** MaxLength <br/>

```

@{Html.EJ().RichTextEditor("rteSample").MaxLength(1000).Render();} | Property:
MaxLength

@Html.EJS().RichTextEditor("defaultRTE").MaxLength(1000).Render() |
```

### IFrame

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Enable Iframe | By Default, enabled | **Property:** IframeSettings<br/>

```

@Html.EJS().RichTextEditor("iframe").Value((string)ViewBag.value).IframeSettings(iframeS
ettings => iframeSettings.Enable(true)).Render() |
```

| Attributes | **Property:** IframeAttributes<br/>

```

@{Html.EJ().RichTextEditor("rteSample").Width("800px").IframeAttributes(new
Dictionary<string, object> { { "style", "background-color:#e0ffff color:#6495ed;" } }).Render();} |
```

**Property:** Attributes <br/>

```

@Html.EJS().RichTextEditor("iframe").Value((string)ViewBag.value).Height("500").IframeS
ettings(iframeSettings => iframeSettings.Enable(true)).Render()

<script>var
iframeRTE; function created() {

 iframeRTE = this;

this.setProperties({

```

```

</>iframeSettings: { enable: true, attributes: { readonly: "readonly" } }, false);
}</></></script> |
| Resource | Property: external-CSS</>
</>@{Html.EJ().RichTextEditor("rteSample").ExternalCSS("/Content/Css/iframe-
custom.css").Render();} | Property: Attributes</>
</>@Html.EJS().RichTextEditor("iframe").Value((string)ViewBag.value).Height("500").IframeS
ettings(iframeSettings => iframeSettings.Enable(true)).Render()</> </></script></> </>
var iframeRTE;</> </>function created() {</> </>iframeRTE = this;</>
</>this.setProperties({ iframeSettings: { enable: true, resources: { styles: ["myStyle.css"]} },
false);}</> </></script> |

```

### Editor Mode

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Editor Mode | Not Applicable | **Property:** EditorMode </> </>1.HTML</> </>2.Markdown  
</>

```

</>@Html.EJS().RichTextEditor("types").Value((string)ViewBag.value).EditorMode(EditorMod
e.Html).Render() |

```

### Undo

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Undo Stack Limit | **Property:** UndoStackLimit </>

```

</>@{Html.EJ().RichTextEditor("rteSample").UndoStackLimit(50).Render();} | Property:
UndoRedoSteps </>

```

```

</>@Html.EJS().RichTextEditor("types").Value((string)ViewBag.value).UndoRedoSteps(30).Re
nder() |

```

| Undo Redo Timer | Not Applicable | **Property:** UndoRedoTimer</>

```

</>@Html.EJS().RichTextEditor("types").Value((string)ViewBag.value).UndoRedoTimer(300).R
ender() |

```

### Common

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Allow Editing | **Property:** AllowEditing </>

```

</>@{Html.EJ().RichTextEditor("rteSample").AllowEditing(true).Render();} | Property:
Readonly</> </>@Html.EJS().RichTextEditor("default").Readonly(true).Render() |

```

| Auto Focus | **Property:** AutoFocus </>

```

</>@{Html.EJ().RichTextEditor("rteSample").AutoFocus(true).Render();} | Not Applicable |

```

| Auto Height | **Property:** AutoHeight </>

```

</>@{Html.EJ().RichTextEditor("rteSample").AutoHeight(true).Render();} | Not Applicable |

```

| Paste Clean Up | **Property:** paste-cleanup-settings  
 <br/><br/>@Html.EJ().RichTextEditor("rteSample").PasteCleanupSettings(c=>c.CleanCSS(true).CleanElements(true).ListConversion(true).RemoveStyles(true)).Render();} | Not Applicable |

| Css Class | **Property:** CssClass <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").CssClass("customstyles").Render();} | **Property:** CssClass <br/> <br/>@Html.EJS().RichTextEditor("default").CssClass("customStyle").Render() |

| Enabled | **Property:** Enabled <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").Enabled(true).Render();} | **Property:** Enabled<br/>  
 <br/>@Html.EJS().RichTextEditor("default").Enabled(true).Render() |

| Html Encode | **Property:** EnableHtmlEncode <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").EnableHtmlEncode(true).Render();} | **Property:** EnableHtmlEncode<br/>  
 <br/>@Html.EJS().RichTextEditor("default").EnableHtmlEncode(true).Render() |

| Persistence | **Property:** EnablePersistence <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").EnablePersistence(true).Render();} | **Property:** EnablePersistence<br/>  
 <br/>@Html.EJS().RichTextEditor("default").EnablePersistence(true).Render() |

| Resize | **Property:** EnableResize <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").EnableResize(true).Render();} | Not Applicable |

| XHTML | **Property:** EnableXHTML <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").EnableXHTML(true).Render();} | Not Applicable |

| Height | **Property:** Height <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").Height("350px").Render();} | **Property:** Height<br/> <br/>@Html.EJS().RichTextEditor("default").Height("300px").Render() |

| Width | **Property:** Width <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").Width("500px").Render();} | **Property:** Width  
 <br/> <br/>@Html.EJS().RichTextEditor("default").Width("500px").Render() |

| Html Attributes | **Property:** HtmlAttributes <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").Width("800px").HtmlAttributes(htmlattr).Render();} | **Property:** HtmlAttributes<br/>  
 <br/>@Html.EJS().RichTextEditor("default").HtmlAttributes((object)ViewBag.attr).Render() |

| Is Responsive | **Property:** IsResponsive <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").IsResponsive(true).Render();} | No separate Property for responsive, provided default. |

| Maximum Height | **Property:** MaxHeight <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").MaxHeight("500px").Render();} | Not Applicable |

| Maximum Width | **Property:** MaxWidth <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").MaxWidth("500px").Render();} | Not Applicable |

| Minimum Height | **Property:** MinHeight <br/>  
 <br/>@Html.EJ().RichTextEditor("rteSample").MinHeight("300px").Render();} | Not Applicable |

| Minimum Width | **Property:** MinWidth <br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").MinWidth("300px").Render();} | Not Applicable |

| name | **Property:** name <br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").name("commentBlog").Render();} | Not Applicable |

| Clear All | **Property:** ShowClearAll <br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowClearAll(true).Render();} | Not Applicable |

| Clear Format | **Property:** ShowClearFormat <br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowClearFormat(true).Render();} | No separate Property for clear Format. Its Provided in toolbar command.<br/> <br/> ViewBag.item = new[]  
 {"ClearFormat"} <br/> <br/>@Html.EJS().RichTextEditor("default").ToolBarSettings(e =>  
 e.Items((object)ViewBag.item)).Render() |

| Place holder | Not Applicable | **Property:** Placeholder<br/>  
 <br/>@Html.EJS().RichTextEditor("default").Placeholder("Enter the text").Render() |

| Context Menu | **Property:** ShowContextMenu<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowContextMenu(true).Render();} | Not Applicable |

| Dimensions | **Property:** ShowDimensions<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowDimensions(true).Render();} | Not Applicable |

| Show Footer | **Property:** ShowFooter<br/>  
 <br/><@{Html.EJ().RichTextEditor("rteSample").ShowFooter(true).Render();} | Not Applicable |

| Html Source | **Property:** ShowHtmlSource<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowHtmlSource(true).Render();} | **Method:**  
 showSourceCode() <br/> <br/> var rteObj =  
 document.getElementById("richtexteditor").ej2\_Instances[0];<br/>  
 <br/>rteObj.showSourceCode(); |

| Html Tag Info | **Property:** ShowHtmlTagInfo<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowHtmlTagInfo(true).Render();} | Not Applicable |

| Rounded Corner | **Property:** ShowRoundedCorner<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").ShowRoundedCorner(true).Render();} | Not Applicable |

| Tooltip | **Property:** TooltipSettings<br/>  
 <br/>@{Html.EJ().RichTextEditor("rteSample").TooltipSettings(tooltip=>tooltip.ShowShadow(false)).Render();} | Not Applicable |

| value | **Property:** Value<br/> <br/>@{Html.EJ().RichTextEditor("rteSample").Value("The Rich Text Editor (RichTextEditor) control is an easy to render in client side.").Render();} | **Property:** Value<br/>

<br/>@Html.EJS().RichTextEditor("types").Value((string)ViewBag.value).Height("720px").ToolBarSettings(e => { e.Enable(true); }).Render() |

| Validation Rules | **Property:** ValidationRules<br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ValidationRules(new Dictionary<string, object> { { "required", "true" }, { "minWordCount", 15 } }).Render();} | Achieved in sample level. <br/>

<br/><https://ej2.syncfusion.com/aspnetmvc/documentation/rich-text-editor/validation.html#validation-rules> |

| Validation Message | **Property:** ValidationMessage<br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ValidationMessage(new Dictionary<string, object> { { "minWordCount", "A minimum of {10} words is required here" }, { "Required", "Please enter the content" } }).Render();} | Achieved in sample level.<br/>

<br/><https://ej2.syncfusion.com/aspnetmvc/documentation/rich-text-editor/validation.html#validation-message> |

| Zoom Step | **Property:** ZoomStep<br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ZoomStep("0.5").Render();} | Not Applicable |

| Disable | **Method:** disable() <br/> <br/> var rteObj = \$("#rte ").data("ejRTE "); <br/>

<br/>rteObj.disable() | **Property:** Enabled<br/>

<br/>@Html.EJS().RichTextEditor("default").Enabled(false).Render() |

| Enable | **Method:** enable()<br/> <br/> var rteObj = \$("#rte ").data("ejRTE ");<br/> <br/>

rteObj.enable() | **Property:** Enabled<br/>

<br/>@Html.EJS().RichTextEditor("default").Enabled(true).Render() |

| Focus | **Method:** focus() <br/> <br/> var rteObj = \$("#rte ").data("ejRTE ");<br/> <br/> rteObj.

focus() | **Method:** focusIn() <br/> <br/> var rteObj = document.getElementById("richtexteditor").ej2\_Instances[0]; <br/> <br/>rteObj. focusIn(); |

| Focus Out | Not Applicable | **Method:** focusOut() <br/> <br/>var rteObj = document.getElementById("richtexteditor").ej2\_Instances[0]; <br/> <br/>rteObj. focusOut(); |

| Command Status | **Method:** getCommandStatus() <br/> <br/>var rteObj = \$("#rte ").data("ejRTE ");<br/> <br/>rteObj.getCommandStatus() | Not Applicable |

| Get Document | **Method:** getDocument()<br/> <br/> var rteObj = \$("#rte ").data("ejRTE ");<br/> <br/> rteObj.getDocument() | Not Applicable |

| Get Html | **Method:** getHtml() <br/> <br/> var rteObj = \$("#rte ").data("ejRTE ");<br/> <br/> rteObj.getHtml() | **Method:** getHtml() <br/> <br/> var rteObj = document.getElementById("richtexteditor").ej2\_Instances[0]; <br/> <br/>rteObj. getHtml(); |

| Execute Command | Method: executeCommand(cmdName, args, [textnodeType])

var
rteObj = $("#rte ").data("ejRTE ");

 rteObj.executeCommand("bold", true) | Method:
executeCommand(cmdName, value)

var rteObj =
document.getElementById("richtexteditor").ej2_Instances[0];

rteObj.
executeCommand("Bold"); |

| Execute events | Event: Execute

@{Html.EJ().RichTextEditor("rteSample").ClientSideEvents(evt =>
evt.Execute("onExecute")).Render();} | Event: ActionComplete

@Html.EJS().RichTextEditor("defaultRTE").ActionComplete("onActionComplete").Render()
|

| Before Execute | Not Applicable | Event: ActionBegin

@Html.EJS().RichTextEditor("defaultRTE").ActionBegin("onActionBegin").Render() |
```

## Schedule

### Getting Started with ASP.NET MVC Scheduler Control

This section briefly explains about how to include [ASP.NET MVC Scheduler](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Add ASP.NET MVC Scheduler control

Now, add the Syncfusion ASP.NET MVC Scheduler control in ~/Views/Home/Index.cshtml page.

**CSHTML**

```
@Html.EJS().Schedule("schedule").Render()
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Scheduler control will be rendered in the default web browser.

|          | May 01 - 07, 2022 ▾ |          |          |          |          |          |          | Today | Day | Week | Work Week | Month | Agenda |
|----------|---------------------|----------|----------|----------|----------|----------|----------|-------|-----|------|-----------|-------|--------|
|          | Sun<br>1            | Mon<br>2 | Tue<br>3 | Wed<br>4 | Thu<br>5 | Fri<br>6 | Sat<br>7 |       |     |      |           |       |        |
| 12:00 AM |                     |          |          |          |          |          |          |       |     |      |           |       |        |
| 1:00 AM  |                     |          |          |          |          |          |          |       |     |      |           |       |        |
| 2:00 AM  |                     |          |          |          |          |          |          |       |     |      |           |       |        |
| 3:00 AM  |                     |          |          |          |          |          |          |       |     |      |           |       |        |
| 4:00 AM  |                     |          |          |          |          |          |          |       |     |      |           |       |        |

## Populating appointments

To populate an empty Scheduler with appointments, bind the event data to it by assigning the [DataSource](#) property under [EventSettings](#) property.

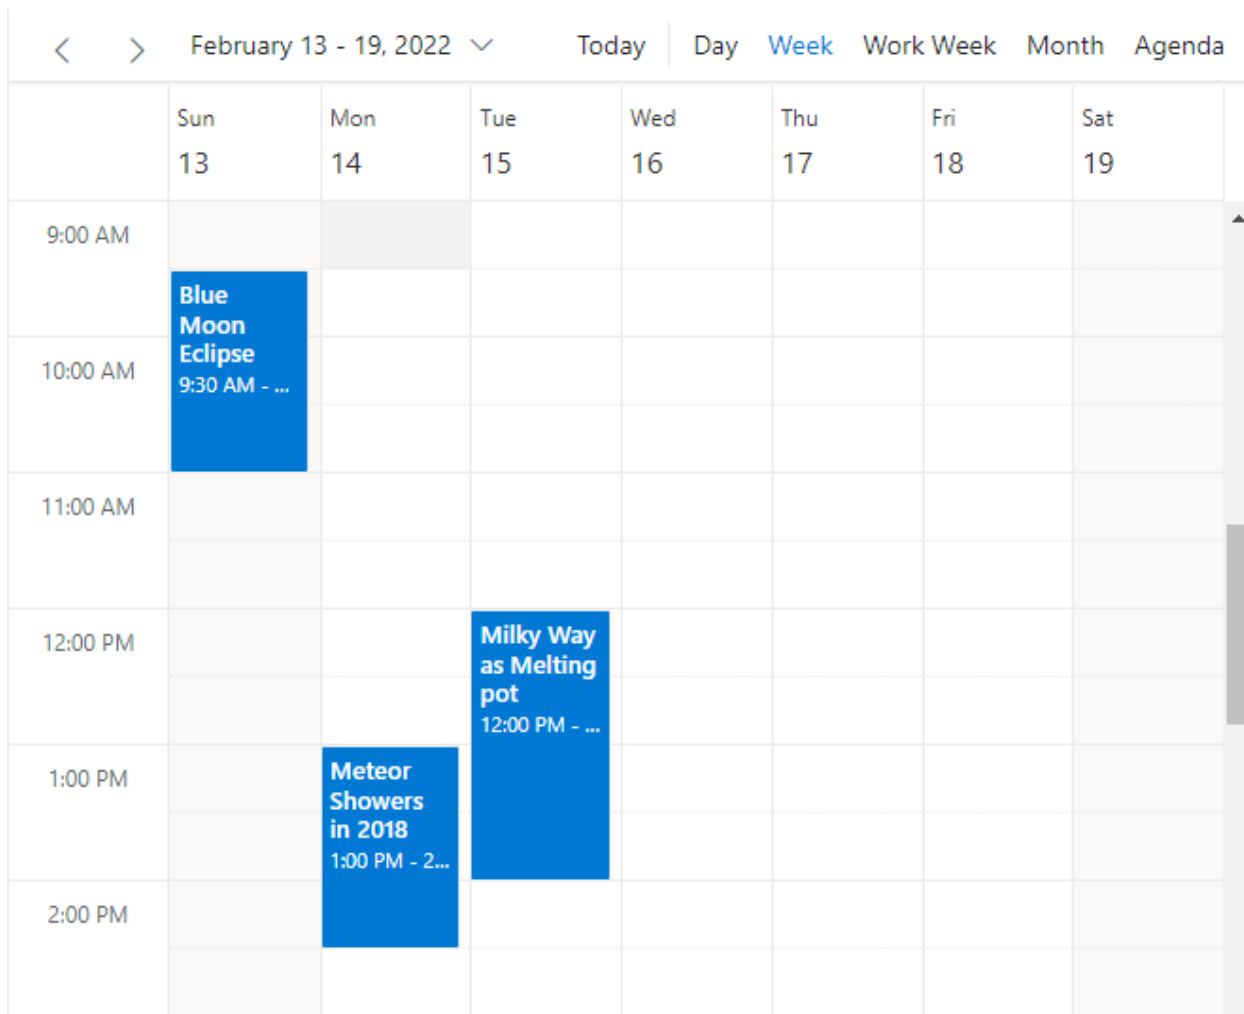

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@model List<ScheduleSample.Controllers.AppointmentData>
```

```
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource = Model })
 .SelectedDate(new DateTime(2022, 2, 15))
 .Render()
)
```

### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(GetScheduleData());
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2022, 2, 11, 9, 30, 0), EndTime = new DateTime(2022, 2, 11, 11, 0,
 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", StartTime = new DateTime(2022,
 2, 12, 12, 0, 0), EndTime = new DateTime(2022, 2, 12, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2022, 2,
 13, 9, 30, 0), EndTime = new DateTime(2022, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2018", StartTime = new DateTime(2022,
 2, 14, 13, 0, 0), EndTime = new DateTime(2022, 2, 14, 14, 30, 0) });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", StartTime = new
 DateTime(2022, 2, 15, 12, 0, 0), EndTime = new DateTime(2022, 2, 15, 14, 0,
 0) });
 return appData;
 }
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Setting date

Scheduler usually displays the system date as its current date. To change the current date of scheduler with specific date, define the [SelectedDate](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@model List<ScheduleSample.Controllers.AppointmentData>
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource = Model })
 .SelectedDate(new DateTime(2022, 2, 15))
 .Render()
)
```

### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(GetScheduleData());
 }
}
```

```

}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2022, 2, 11, 9, 30, 0), EndTime = new DateTime(2022, 2, 11, 11, 0,
 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", StartTime = new DateTime(2022,
 2, 12, 12, 0, 0), EndTime = new DateTime(2022, 2, 12, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2022, 2,
 13, 9, 30, 0), EndTime = new DateTime(2022, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2018", StartTime = new DateTime(2022,
 2, 14, 13, 0, 0), EndTime = new DateTime(2022, 2, 14, 14, 30, 0) });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", StartTime = new
 DateTime(2022, 2, 15, 12, 0, 0), EndTime = new DateTime(2022, 2, 15, 14, 0,
 0) });
 return appData;
}
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Setting view

Scheduler displays **week** view by default. To change the current view, define the applicable view name to the [CurrentView](#) property. The applicable view names are,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@model List<ScheduleView>

```

```
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(Model)
 .Height("550px")
 .SelectedDate(new DateTime(2022, 2, 15))
 .Render()
)
```

### HOMECONTROLLER.CS

```
public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineDay }
 };
 return View(viewOption);
}
```

|          | February 13 - 19, 2022 ▾ |           |           |           |           |           |           | Today | Week | Timeline Day |

| 11:00 AM |                          |           |           |           |           |           |           |       |      |              |

#### Individual view customization

Each individual scheduler views can be customized with its own options such as setting different start and end hour on Week and Work Week views, whereas hiding the weekend days on Month view alone. This can be achieved by defining views property to accept the array of object type, where each object depicts the individual view customization.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@model List<ScheduleView>
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(Model)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

**HOMECONTROLLER.CS**

```
public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week, DateFormat = "dd-MMM-yyyy" },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month, ShowWeekend = false, Readonly = true }
 };
 return View(viewOption);
}
```

**Note:** [View Sample in GitHub.](#)

**Note:** You can also explore our [ASP.NET MVC Scheduler example](#) that shows how to use the toolbar buttons to play with Scheduler functionalities.

## ASP.NET MVC Scaffolding

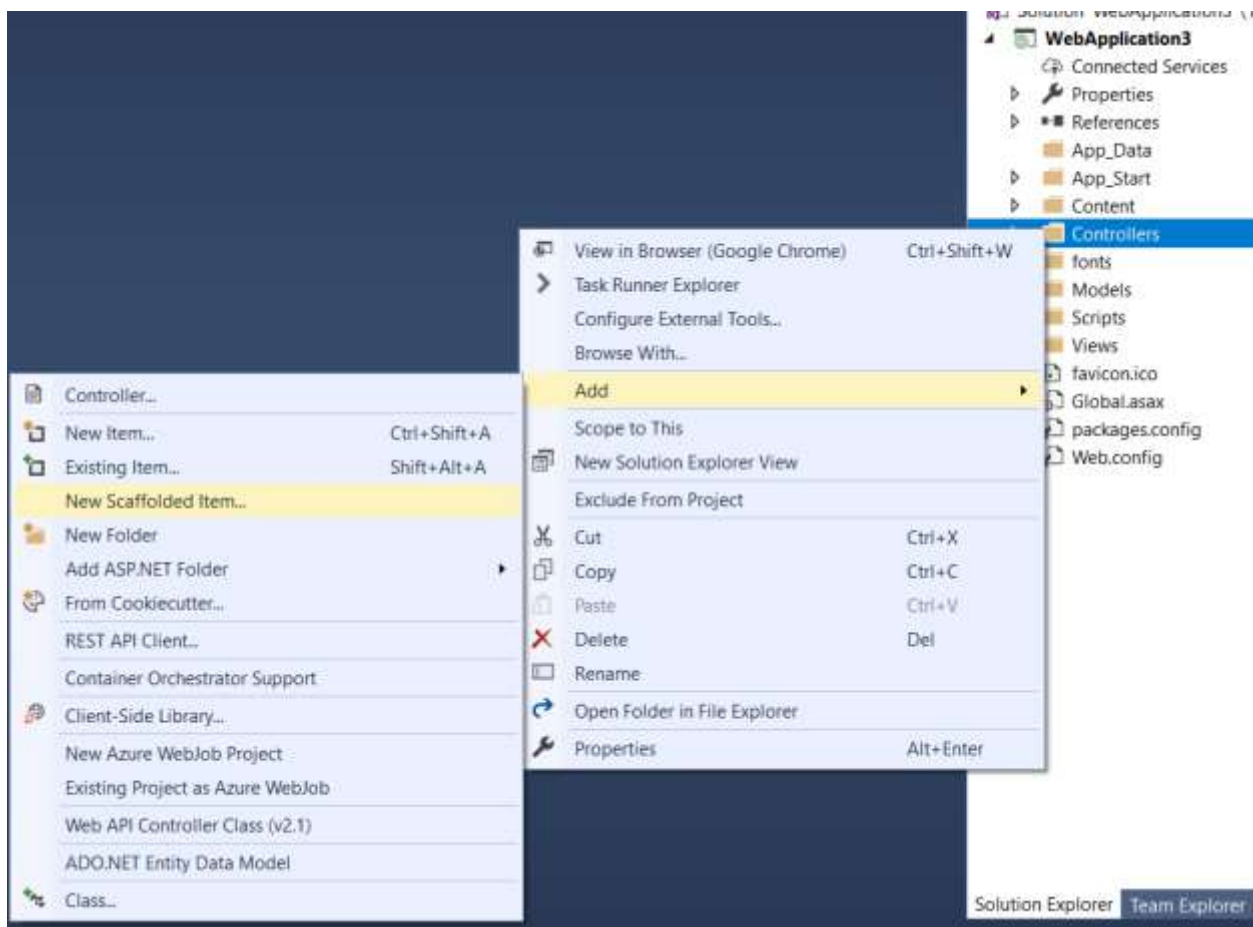

Syncfusion includes an extension for **Visual Studio** with UI Scaffolding options for the ASP.NET MVC Scheduler to quickly add its code and interact with data models. This allows you to easily create the appropriate **Views** and **Controller** action methods with respective ASP.NET MVC Scheduler code.

**Note:** The Syncfusion ASP.NET MVC UI Scaffolder is available from the version **v16.4.0.40**.

### Getting Started

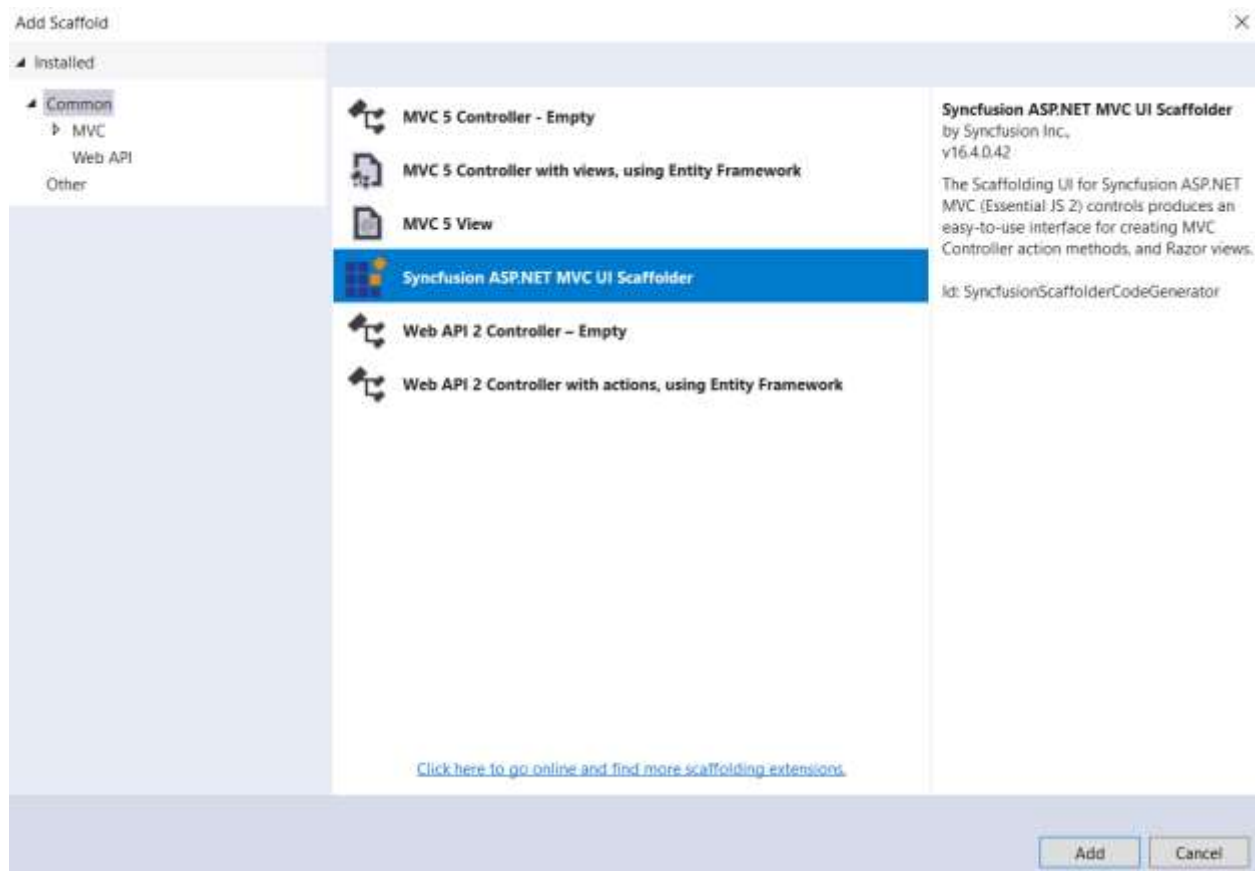

Let's start with the steps on how to scaffold the ASP.NET MVC Scheduler into your web application.

- Create an ASP.NET MVC application and add an Entity Framework data model referring from the [documentation](#) with Scheduler related fields such as Id, Subject, Location, Start Date, End Date and All-day. Once the model file is added, ensure the required DbContext and all its related properties are added.
- Refer the [Getting Started documentation](#) to know about how to configure the Syncfusion Essential JS2 for ASP.NET MVC in your web application.
- Right-click on the **Controllers** folder in the Solution Explorer and select **Add → New Scaffolded Item** from the menu options.

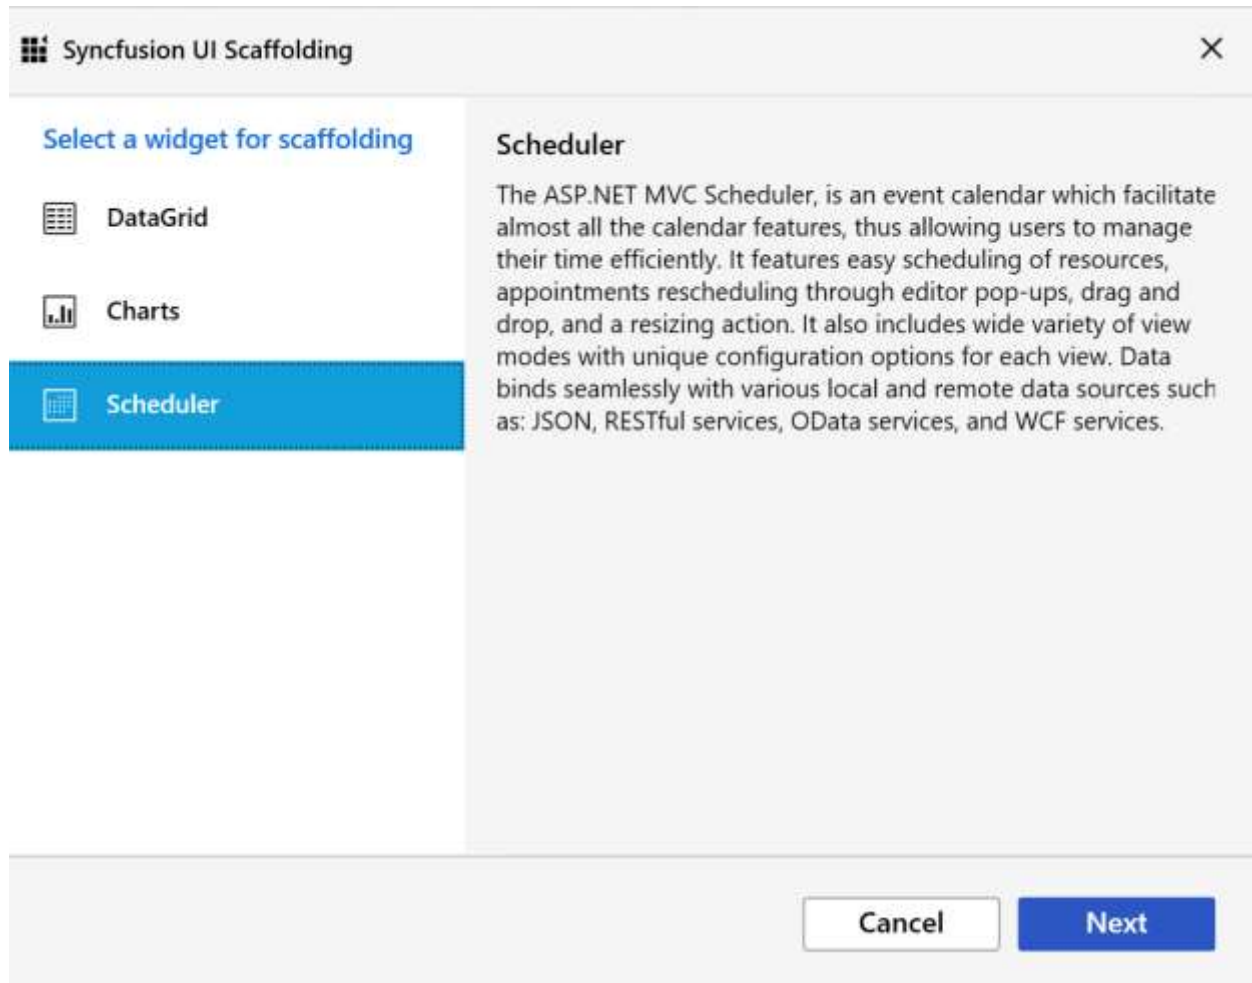

- You will see the **Add Scaffold** dialog. Select the **Syncfusion ASP.NET MVC UI Scaffolder** and click **Add** button, which will display the Syncfusion UI Scaffolding dialog.

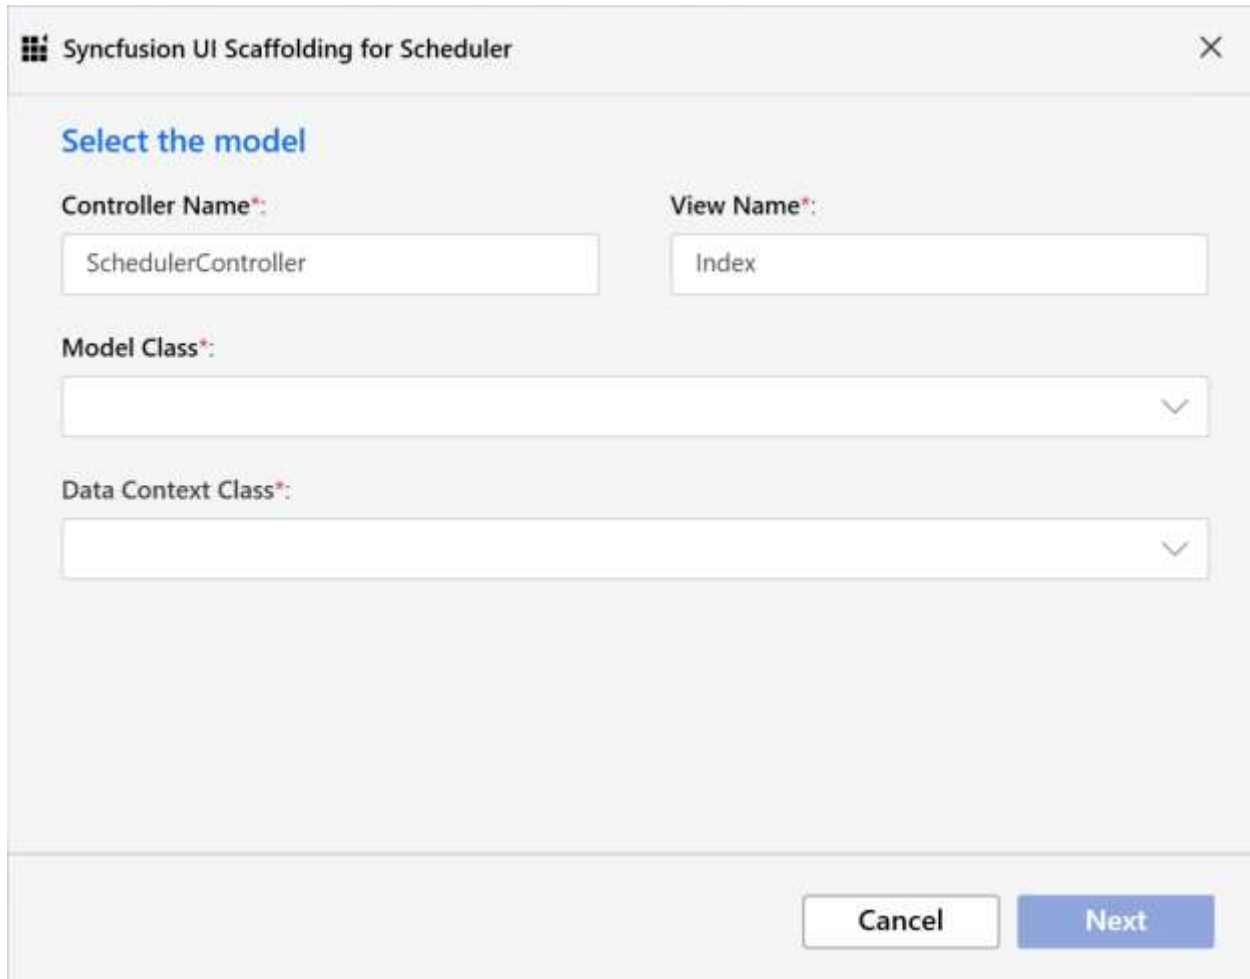

- Choose the Scheduler control to perform Scaffolding with it and click **Next**.

- Syncfusion UI Scaffolding for Scheduler dialog will be opened, from which you are opted to choose the Model and Data Context options. Enter the **Controller** and **View** names as per the application requirement. Once the required **Model Class** and its relevant **Data Context Class** are chosen, now click the **Next** button, which offers the Scheduler functionalities to be configured before scaffolding.

**Syncfusion UI Scaffolding for Scheduler**

**Select the model**

**Controller Name\*:** SchedulerController

**View Name\*:** Index

**Model Class\*:**

**Data Context Class\*:**

Cancel Next

**Note:** All the model types present in the current application will be listed in the **Model Class** DropDownList. Also, from the available **Data Context Class**, choose the appropriate Entity Framework Data Model.

- Now, select the required Scheduler options (select the corresponding **Scheduler Views** and **Properties** from the options) and Click the **Add** button. Use the **Back Arrow**, if you need to modify the already chosen Controller or View name, or to change the **selected Model Class** and **Data Context Class**.

**Syncfusion UI Scaffolding for Scheduler**

**Select the feature(s)**

DataSource Type:

Local Data

☐ TimeScale ☐ ReadOnly

**Scheduler Views\*:**

☐ Day ☐ Week ☐ WorkWeek

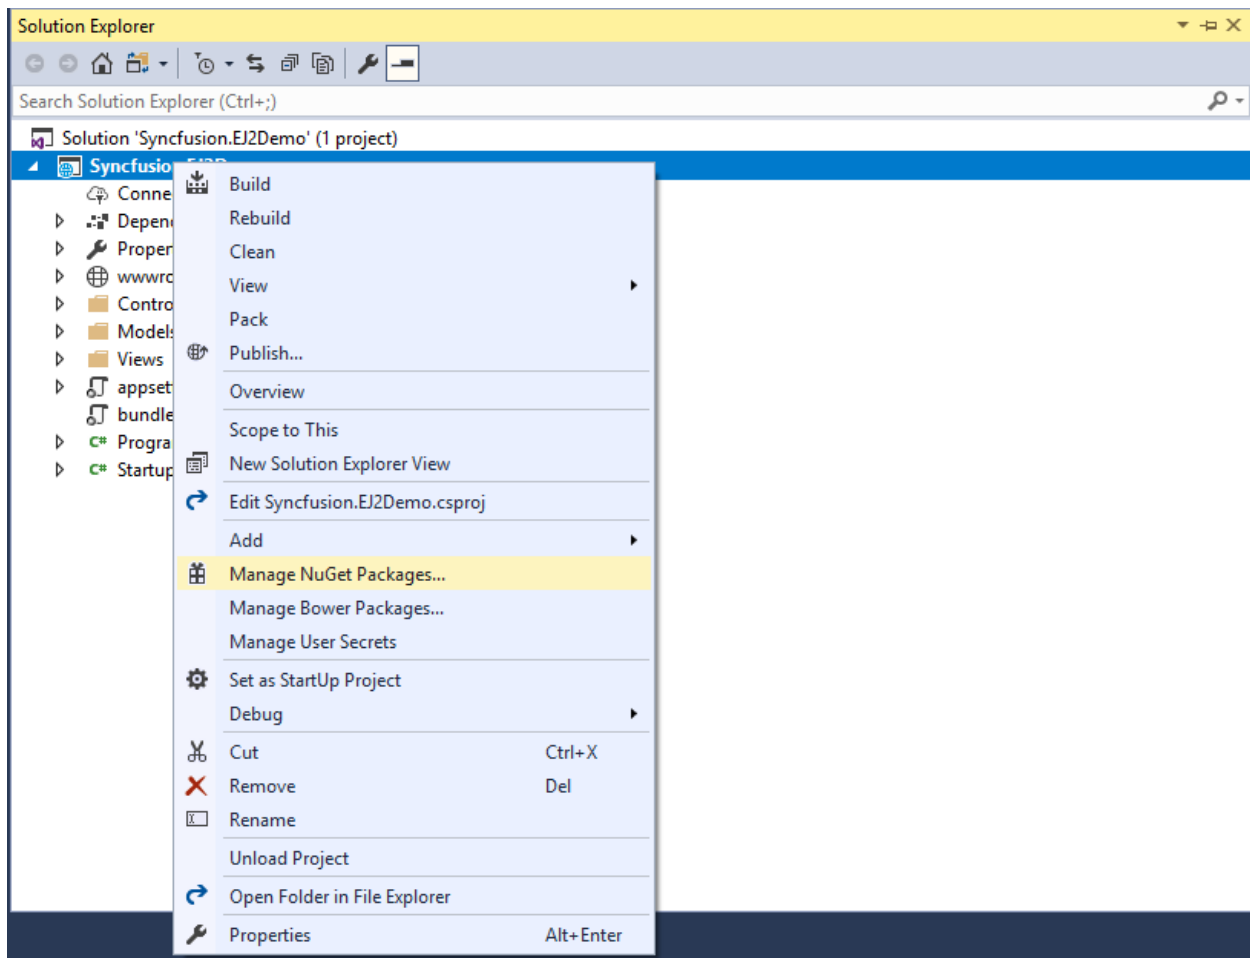

☐ Month ☐ Agenda ☐ MonthAgenda

☐ TimelineDay ☐ TimelineWeek ☐ TimelineWorkWeek

☐ TimelineMonth

← Cancel Add

- Once the required Scheduler options are configured through the **Scheduler UI Scaffolding**, the respective Scheduler **Controller** and the corresponding **View** files are now generated with the appropriate Scheduler code snippet.

**Note:** Ensure that at least one Entity Framework model exists in your active project and also the application gets compiled once. If you make any changes in the Model properties later, compile the application once before performing scaffold.

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Scheduler interactions

The following table describes the Scheduler actions and also illustrates how those actions are carried out through mouse and touch interactions on Scheduler.

| Actions                      | Mouse interaction                                                                               | Touch interaction                                                                                                      |
|------------------------------|-------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|
| ----- -----  -----           |                                                                                                 |                                                                                                                        |
| Single click or tap on cells | Single click on a cell to select a cell.                                                        | Single tapping on cells, will display a + icon on the cell. Tapping on it again will open the new event editor window. |
| Multiple cell selection      | Single click on a cell and drag the selection to other cells to enable multiple cell selection. | No multiple cell selection is allowed using touch gestures.                                                            |

| Event selection | Single click on an event to select it. | Tap holding on events, select an event and opens a small popup at the top holding the options to edit or delete. The popup also displays the selected event's subject. |

| Multiple event selection and deletion | Pressing **Ctrl** key and altogether single clicking on multiple events one after the other will enable multiple event selection. Pressing **Delete** key after event selection will delete all the selected events. | Tap hold an event to select it, which opens a small popup at the top holding the options to edit or delete. As a continuation of this action, keep on single tapping on other events, to enable multiple event selection. Also, the popup displayed at the top remains in opened state, showing the count of the number of selected events. Pressing **Delete** option from the popup will delete all the selected events. |

| Date navigation | Clicking on the previous or next date navigation icons in the header bar allows you to navigate between dates. | Swiping the scheduler view port to the left or right will allow you to navigate between the dates on touch devices. You can prevent the swiping action by disabling [allowSwiping](#) property. NOTE: Swiping does not work when horizontal scroller present in the Scheduler. You can also make use of the previous and next navigation icons at the header bar to navigate. |

| View navigation | Click on an event and try moving it over the Scheduler to enable drag and drop action. | The view options are available within the popup options at the top right extreme end of the header bar and you can choose the view from it. |

| Drag and drop | Click on an event and try moving it over the Scheduler to enable drag and drop action. | Tap hold the event and try moving it over the Scheduler to enable drag and drop action. |

| Event resizing | Hover the mouse across the extremities or edges of the Scheduler events and when the mouse pointer changes into resize handler, now click and start resizing an event to the desired time range. | Touch the event extremities and start resizing the events directly. |

| Tooltip | Hover the mouse pointer over the events or resource header and the tooltip will be displayed. | Tap holding the events will open the tooltip on events. |

| Open editor window | Double click on cells or events to open the editor window. | Double click on cells or events to open the editor window. Single tap on cells, which displays a **+** icon on the cell. Now, tap on it again to open the new event editor window. To open the editor on events, single tap on it and then click on the edit icon to open the editor window in **Edit** mode. |

| Open quick info popup | Single clicking on a cell will open a quick popup prompting for new event creation. Single clicking on an event will open a popup displaying event information along with the option to edit and delete it. | No quick info popup is available while single tapping on cells. Single tapping on events, opens the popup showing event information. |

### Appointments in ASP.NET MVC Schedule Component

Appointments can be anything that are scheduled for a specific time period. It can be created on varied time range and each appointments are categorized based on this range. The Scheduler events can be categorized as,

- Normal events
- Spanned events
- All-day events
- Recurring events

### Normal events

Represents an appointment that is created for any specific time interval within a day.

#### Creating a normal event

The following example depicts how to define a normal event on the Scheduler, with event data being loaded from simple JSON data.

#### CHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Subject = "Paris",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Spanned events

Represents an appointment that is created for more than 24 hours, and usually displayed on the all-day row. Also, represents another type of appointment that is created for more than one day but less than 24 hours, and usually displayed appropriately on both the days.

**Note:** For example, if an appointment is created for two days say from November 25, 2018 – 11.00 PM to November 26, 2018 2.00 AM but less than 24 hours time interval, then the appointment is split into two partitions and will be displayed on both the days.

### All-day events

Represents an appointment that is created for an entire day such as holiday events. It is usually displayed separately in an all-day row, a separate row for all-day appointments below the date header section. In Timeline views, the all-day appointments displays in the working space area, and no separate all-day row is present in that view.

**Note:** To change normal appointment into all-day event, set `IsAllDay` field to true.

### Hide all-day row events

You can make use of the CSS customization to prevent the display of all-day row appointments on the Scheduler UI.

```
`css
.e-schedule .e-date-header-wrap .e-schedule-table thead {
display: none;
}
`
```

**Note:** You can also enable scroller for all-day row, [refer](#) here to know more.

### Customize the rendering of the spanned events

By default, Scheduler will renders the spanned events (appointment with more than 24 hours duration) in the all-day row by setting `AllDayRow` will the default type renders to the `SpannedEventPlacement` option within the `EventSettings` property. Now we can customize rendering of the that events inside the work cells itself by modifying the `SpannedEventPlacement` option as `TimeSlot`. In this following example, shows how to render the spanned appointments inside the work cells as follows.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource, SpannedEventPlacement = SpannedEventPlacement.TimeSlot
}))
 .SelectedDate(new DateTime(2018, 1, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
```

```

 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 17, 12, 30, 0),
 IsAllDay = false
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "London",
 StartTime = new DateTime(2018, 1, 16, 12, 0, 0),
 EndTime = new DateTime(2018, 1, 18, 13, 0, 0),
 IsAllDay = false
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Recurring events

Represents an appointment that is created for a certain time interval and occurring repeatedly on a daily, weekly, monthly or yearly basis at the same time interval based on the provided recurrence rule. Usually, the recurring events are indicated by a repeat marker added at the bottom-right position.

### Creating a recurring event

The following example depicts how to create a recurring event on Scheduler with the specific recurrence rule. In the following example, an event is made to repeat on daily mode and ends after 5 occurrences.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 RecurrenceRule = "FREQ=DAILY; INTERVAL=1; COUNT=5"
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RecurrenceRule { get; set; }
}

```

### Adding exceptions

A few instance of the recurrence series can be excluded on specific dates, by adding those exceptional dates to the **RecurrenceException** field. These date values should be given in the ISO date time format with no hyphens(-) separating the date elements.

For example, 22nd February 2018 can be represented as 20180222. Also, the time part being represented in UTC format needs to add "Z" after the time portion with no space. "07:30:00 UTC" is therefore represented as "073000Z".

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),

```

```

 EndTime = new DateTime(2018, 1, 28, 12, 30, 0),
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=8",
 RecurrenceException =
"20180129T043000Z,20180131T043000Z,20180202T043000Z"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RecurrenceRule { get; set; }
 public string RecurrenceException { get; set; }
}

```

#### *Editing an occurrence from a series*

To dynamically edit a particular occurrence from an event series and display it on the initial load of Scheduler, the edited occurrence needs to be added as a new event to the dataSource collection, with an additional **RecurrenceID** field defined to it. The **RecurrenceID** field of edited occurrence usually maps the ID value of the parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 is edited with different timings. Therefore, this particular date is excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by adding the **RecurrenceException** field with the excluded date value on the parent event. Also, the edited occurrence event which is created as a new event should carry the **RecurrenceID** field pointing to the parent event's **Id** value.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Scrum Meeting",

```

```

 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0),
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=8",
 RecurrenceException = "20180130T043000Z"
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Scrum Meeting",
 StartTime = new DateTime(2018, 1, 30, 09, 0, 0),
 EndTime = new DateTime(2018, 1, 30, 10, 30, 0),
 RecurrenceID = 1
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RecurrenceRule { get; set; }
 public string RecurrenceException { get; set; }
 public Nullable<int> RecurrenceID { get; set; }
}

```

#### *Edit only the current and following events*

To edit only the current and following events enable the property `editFollowingEvents` within `eventSettings` property. The edited occurrence needs to be added as a new event to the `dataSource` collection, with an additional `followingID` field defined to it. The `followingID` field of edited occurrence usually maps the ID value of the immediate parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 and its following dates are edited with different subject. Therefore, this particular date and its following dates are excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by updating the `recurrenceRule` field with the until date value on the parent event. Also, the edited events which is created as a new event should carry the `followingID` field pointing to the immediate parent event's `Id` value.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments, EditFollowingEvents = true })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{

```

```

 ViewBag.appointments = GetScheduleData();
 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Scrum Meeting",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0),
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;UNTIL=20180129T043000Z;"
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Scrum Meeting - Following Edited",
 StartTime = new DateTime(2018, 1, 30, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 30, 10, 30, 0),
 RecurrenceRule =
"FREQ=DAILY;INTERVAL=1;UNTIL=20180204T043000Z;",
 FollowingID = 1
 });
 return appData;
 }
 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RecurrenceRule { get; set; }
 public string RecurrenceException { get; set; }
 public int FollowingID { get; set; }
 }

```

#### *Recurrence options and rules*

Events can be repeated on a daily, weekly, monthly or yearly basis based on the recurrence rule which accepts the string value. The following details should be assigned to the **RecurrenceRule** property to generate the recurring instances.

- Repeat type - daily/weekly/monthly/yearly.
- How many times it needs to be repeated?
- The interval duration.
- The time period to render the appointment, etc.

There are four repeat types available namely,

- **Daily** - Creates the recurring instances on daily basis.
- **Weekly** - Creates the recurring instances on weekly basis for the selected days.
- **Monthly** - Creates the recurring instances on monthly basis for the selected months and other provided recurrence criteria.

- **Yearly** - Creates the recurring instances on yearly basis.

#### *Recurrence properties*

The properties based on which the recurrence appointments are created with its respective time period are depicted in the following table. Also, the valid rule string can be referred from [iCalendar](#) specifications.

**Note:** Refer [iCalendar](#) specifications for valid recurrence rule string.

| Property   | Purpose                                                                                                                                                                                                                                                                                                                                                                                                | Example                                                 |
|------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| FREQ       | Maintains the repeat type (Daily, Weekly, Monthly, Yearly) value of the appointment.                                                                                                                                                                                                                                                                                                                   | FREQ=DAILY;INTERVAL=1                                   |
| INTERVAL   | Maintains the interval value of the appointments. When you create the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday (Creates an appointment on all days by leaving the interval of one day gap).                                                                                                                                       | FREQ=DAILY;INTERVAL=2                                   |
| COUNT      | It holds the appointment's count value. When the COUNT value is 10, then 10 instances of appointments are created in the recurrence series.                                                                                                                                                                                                                                                            | FREQ=DAILY;INTERVAL=1;COUNT=10                          |
| UNTIL      | This property holds the end date value (in ISO format) denoting when the recurrence actually ends.                                                                                                                                                                                                                                                                                                     | FREQ=DAILY;INTERVAL=1;UNTIL=20180530T041343Z            |
| BYDAY      | It holds the day value(s), representing on which the appointments actually renders. Create the weekly appointment, and select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is saved in the BYDAY property. When multiple days are selected, the values are separated by commas. | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10             |
| BYMONTHDAY | This property is used to store the date value of the Month, while creating the Month recurrence appointment. When you create a Monthly recurrence appointment for every 3rd day of the month, then BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month.                                                                                                                 | FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10           |
| BYMONTH    | This property is used to store the index value of the selected Month while creating the yearly appointments. When you create the yearly appointment on June month, the index value of June month 6 will get stored in the BYMONTH field. The appointment is created on every 6th month of a year.                                                                                                      | FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10 |
| BYSETPOS   | This property is used to store the index value of the week. When you create the monthly appointment in second week of a month, the index value of the second week (2) is stored in BYSETPOS.                                                                                                                                                                                                           | FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;COUNT=10               |

**Note:** The default recurrence related validation has been included for recurrence appointments similar to the one available in Outlook. The validation usually occurs during the recurrence appointment creation, editing, drag and drop or resizing of the recurrence appointments and also if any single occurrence changes.

#### *Daily Frequency*

| Description | Example |
|-------------|---------|
|             |         |

| Daily recurring event that never ends | FREQ=DAILY; INTERVAL=1 |

| Daily recurring event that ends after 5 occurrences | FREQ=DAILY; INTERVAL=1; COUNT=5 |

| Daily recurring event that ends exactly on 12/12/2018 | FREQ=DAILY; INTERVAL=1; UNTIL=12/12/2018 |

| Daily event that recurs on alternative days and repeats for 10 occurrences | FREQ=DAILY; INTERVAL=2; COUNT=10 |

#### *Weekly Frequency*

| Description | Example |

|-----|-----|

| Weekly recurring event that repeats on every Monday, Wednesday and Friday and never ends | FREQ=WEEKLY; INTERVAL=1; BYDAY=MO,WE,FR |

| Repeats every week Thursday and ends after 10 occurrences | FREQ=WEEKLY; INTERVAL=1; BYDAY=TH; COUNT=10 |

| Repeats every week Monday and ends on 12/12/2018 | FREQ=WEEKLY; INTERVAL=1; BYDAY=MO; UNTIL=12/12/2018 |

| Repeats on Monday, Wednesday and Friday of alternative weeks and ends after 10 occurrences | FREQ=WEEKLY; INTERVAL=2; BYDAY=MO, WE, FR; COUNT=10 |

#### *Monthly Frequency*

| Description | Example |

|-----|-----|

| Monthly recurring event that repeats on every 15th day of a month and never ends | FREQ=MONTHLY; BYMONTHDAY=15; INTERVAL=1 |

| Monthly recurring event that repeats on every 16th day of a month and ends after 10 occurrences | FREQ=MONTHLY; BYMONTHDAY=16; INTERVAL=1; COUNT=10 |

| Repeats every 17th day of a month and ends on 12/12/2018 | FREQ=MONTHLY; BYMONTHDAY=17; INTERVAL=1; UNTIL=12/12/2018 |

| Repeats every 2nd Friday of a month and never ends | FREQ=MONTHLY; BYDAY=FR; BYSETPOS=2; INTERVAL=1 |

| Repeats every 4th Wednesday of a month and ends after 10 occurrences | FREQ=MONTHLY; BYDAY=WE; BYSETPOS=4; INTERVAL=1; COUNT=10 |

| Repeats every 4th Friday of a month and ends on 12/12/2018 | FREQ=MONTHLY; BYDAY=FR; BYSETPOS=4; INTERVAL=1; UNTIL=12/12/2018; |

#### *Yearly Frequency*

| Description | Example |

|-----|-----|

| Yearly event that repeats on every 15th day of December month and never ends | FREQ=YEARLY; BYMONTHDAY=15; BYMONTH=12; INTERVAL=1 |

| Event that repeats on every 10th day of December month and ends after 10 occurrences |  
FREQ=YEARLY; BYMONTHDAY=10; BYMONTH=12; INTERVAL=1; COUNT=10 |

| Repeats on every 12th day of December month and ends on 12/12/2025 | FREQ=YEARLY;  
BYMONTHDAY=12; BYMONTH=12; INTERVAL=1; UNTIL=12/12/2025 |

| Repeats on every 3rd Friday of December month and never ends | FREQ=YEARLY; BYDAY=FR;  
BYMONTH=12; BYSETPOS=3; INTERVAL=1 |

| Repeats on every 3rd Tuesday of December month and ends after 10 occurrences | FREQ=YEARLY;  
BYDAY=TU; BYMONTH=12; BYSETPOS=3; INTERVAL=1; COUNT=10 |

| Repeats on every 4th Wednesday of December month and ends on 12/12/2028 | FREQ=YEARLY;  
BYDAY=WE; BYMONTH=12; BYSETPOS=4; INTERVAL=1; UNTIL=12/12/2028 |

### Recurrence Validation

The built-in validation support has been added by default for recurring appointments during its creation, edit, drag and drop or resize action. The following are the possible validation alerts that displays on Scheduler while creating or editing the recurring events.

| Validation messages | Description |

|-----|-----|

| The recurrence pattern is not valid. | This alert will raise, when the selected recurrence rule value is not a valid one. For example, when you try to select the end date value (using **Until** option) for a recurring event, which occurs before the start date, an alert will popup out saying that the chosen pattern is invalid. |

| The changes made to specific instances of this series will be cancelled and those events will match the series again. | This alert will raise, when you try to edit the whole series, whose occurrence might have been already edited. For example, If there are five occurrences and one of the occurrence is already edited. Now, when you try to edit the entire series, you will get this validation alert. |

| The duration of the event must be shorter than how frequently it occurs. Shorten the duration, or change the recurrence pattern in the recurrence event editor. | This validation will occur, if the event duration is longer than the selected frequency. For example, if you create a recurring appointment with two days duration in **Daily** frequency with no intervals set to it, you may get this alert. |

| Some months have fewer than the selected date. For these months, the occurrence will fall on the last date of the month. | When you try to create a recurring appointment on 31st of every month, where few months won't have 31 days and in this scenario, you will get this alert. |

| Two occurrences of the same event cannot occur on the same day. | This validation will occur, when you try to edit or move any single occurrence to some other date, where another occurrence of the same event is already present. |

### Event fields

The Scheduler dataSource usually holds the event instances, where each of the instance includes a collection of appropriate [fields](#). It is mandatory to map these fields with the equivalent fields of database, when remote data is bound to it. When the local JSON data is bound, then the field names defined within the instances needs to be mapped with the scheduler event fields correctly.

**Note:** To create an event on Scheduler, it is enough to define the **startTime** and **endTime**. Also **id** field becomes mandatory to process CRUD actions on appropriate events.

*Built-in fields*

The built-in fields available on Scheduler event object are as follows.

| Field name          | Description                                                                                                                                                                                                                                                                                                                                                             |
|---------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Id                  | The Id field needs to be defined as mandatory and this field usually assigns a unique ID value to each of the events.                                                                                                                                                                                                                                                   |
| Subject             | The Subject field is optional, and usually assigns the summary text to each of the events.                                                                                                                                                                                                                                                                              |
| StartTime           | The StartTime field defines the start time of an event and it is mandatory to provide it for any of the valid event objects.                                                                                                                                                                                                                                            |
| EndTime             | The EndTime field defines the end time of an event and it is mandatory to provide the end time for any of the valid event objects.                                                                                                                                                                                                                                      |
| StartTImezone       | It maps the StartTImezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the StartTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler. |
| EndTImezone         | It maps the EndTImezone field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the EndTime field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler.     |
| Location            | It maps the Location field from the dataSource and the location text value will be displayed over the events.                                                                                                                                                                                                                                                           |
| Description         | It maps the Description field from the dataSource and denotes the event description which is optional.                                                                                                                                                                                                                                                                  |
| IsAllDay            | The IsAllDay field is mapped from the dataSource and is used to denote whether an event is created for an entire day or for specific time alone. Usually, an event with IsAllDay field set to true will be considered as an all-day event.                                                                                                                              |
| RecurrenceID        | It maps the RecurrenceID field from dataSource and usually holds the ID value of the parent recurrence event. This field is applicable only for the edited occurrence events.                                                                                                                                                                                           |
| RecurrenceRule      | It maps the RecurrenceRule field from dataSource and holds the recurrence rule value in a string format. Also, it uniquely identifies whether the event belongs to a recurring type or normal ones.                                                                                                                                                                     |
| RecurrenceException | It maps the RecurrenceException field from dataSource and is used to hold the collection of exception dates, on which the recurring occurrences needs to be excluded. The RecurrenceException should be specified in UTC format.                                                                                                                                        |
| IsReadOnly          | It maps the IsReadOnly field from dataSource. It is mainly used to make specific appointments as readonly when set to true.                                                                                                                                                                                                                                             |
| IsBlock             | It maps the IsBlock field from dataSource. It is used to block the particular time ranges in the Scheduler and prevents the event creation on those time slots.                                                                                                                                                                                                         |

*Binding different field names*

When the fields of event instances has the default mapping name, it is not mandatory to map them manually. If a Scheduler's dataSource holds the events collection with different field names, then it is necessary to map them with its equivalent field name within the `EventSettings` property.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule").Height("550px")
 .EventSettings(es =>
 es.Fields(f =>
 f.Subject(sub => sub.Name("TravelSummary"))
 .Id("TravelId")
 .IsAllDay(allday => allday.Name("FullDay"))
 .Location(loc => loc.Name("Source"))
 .Description(des => des.Name("Comments"))
 .StartTime(st => st.Name("DepartureTime"))
 .EndTime(et => et.Name("ArrivalTime"))
 .StartTImezone(stz => stz.Name("Origin"))
 .EndTImezone(etz => etz.Name("Destination"))
)
).DataSource(ViewBag.appointments)
)
.SelectedDate(new DateTime(2018, 2, 15))
.Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 TravelId = 1,
 TravelSummary = "Paris",
 DepartureTime = new DateTime(2018, 2, 15, 10, 0, 0),
 ArrivalTime = new DateTime(2018, 2, 15, 12, 30, 0),
 FullDay = false,
 Source = "London",
 Comments = "Summer vacation planned for outstation.",
 Origin = "Asia/Yekaterinburg",
 Destination = "Asia/Yekaterinburg"
 });
 return appData;
}
public class AppointmentData
{
 public int TravelId { get; set; }
 public string TravelSummary { get; set; }
 public DateTime DepartureTime { get; set; }
```

```

public DateTime ArrivalTime { get; set; }
public bool FullDay { get; set; }
public string Source { get; set; }
public string Comments { get; set; }
public string Origin { get; set; }
public string Destination { get; set; }
}

```

**Note:** The mapper field **Id** is of string type and has no additional validation options, whereas all other fields are of **Object** type and has additional options.

#### Event field settings

Each field of the Scheduler events are provided with additional settings such as options to set default value, to map with appropriate data source fields, to validate every event fields and to provide label values for those fields in the event window.

| Options    | Description                                                                                                                                  |
|------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| Default    | Accepts the default value to the applicable fields (Subject, Location and Description), when no values are provided to them from dataSource. |
| Name       | Accepts the field name to be mapped from the dataSource fields.                                                                              |
| Title      | Accepts the label values to be displayed for the fields of event editor.                                                                     |
| Validation | Defines the validation rules to be applied on the event fields within the event editor.                                                      |

In following example, the Subject field in event editor will display its appropriate label as **Summary**. When no subject value is provided while saving an event, then the appointment will be saved with the default subject value as **Add Summary**.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(e => e.Fields(f => f.Id("Id")
 .Subject(sub =>
 sub.Name("Subject").Title("Summary").Default("Add Summary")
 .Location(loc => loc.Name("Location"))
 .Description(des => des.Name("Description"))
 .StartTime(st => st.Name("StartTime"))
 .EndTime(et => et.Name("EndTime"))
)
 .DataSource(ViewBag.appointments)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
}

```

```

 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Subject = "Paris",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
 }
 public class AppointmentData
 {
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

### Adding Custom fields

Apart from the default Scheduler fields, the user can include 'n' number of custom fields for appointments. The following code example shows how to include two custom fields namely **Status** and **Priority** within event collection. It is not necessary to bind the custom fields within the **EventSettings**. However, those additional fields can be accessed easily, for internal processing as well as from application end.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(e => e.Fields(f => f.Subject(sub => sub.Name("Subject"))
 .Id("Id")
 .IsAllDay(allday => allday.Name("IsAllDay"))
 .StartTime(st => st.Name("StartTime"))
 .EndTime(et => et.Name("EndTime"))
)
 .DataSource(ViewBag.appointments)
)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Subject = "Paris",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
}

```

```

 {
 Id = 2,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false,
 Status = "Completed",
 Priority = "High"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public string Status { get; set; }
 public string Priority { get; set; }
}

```

### Customize the order of the overlapping events

By default, the scheduler will render the overlapping events based on the start and end time. Now we can customize the order of the overlapping events based on the custom fields by using the **SortComparer** property grouped under the **EventSettings** property. The following code example shows how to sort the appointments based on the custom field as follows.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@{
 Object sortComparer = "sortComparer";
}
<div class="col-lg-9 control-section">
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource, SortComparer = sortComparer })
 .SelectedDate(new DateTime(2017, 9, 29))
 .Render()
)
</div>
<script type="text/javascript">
 function sortComparer (args) {
 return args.sort(function (event1, event2) {
 return event1.RankId.localeCompare(event2.RankId, undefined, {
 numeric: true });
 });
 };
</script>

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
 Subject = "Rank 3",
 StartTime = new DateTime(2023, 9, 29, 10, 30, 0),
 EndTime = new DateTime(2023, 9, 29, 12, 30, 0),
 RankId = "3"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Rank 1",
 StartTime = new DateTime(2023, 9, 29, 10, 0, 0),
 EndTime = new DateTime(2023, 9, 29, 11, 30),
 RankId = "1"
 });
 eventsData.Add(new EventsData
 {
 Id = 3,
 Subject = "Rank 6",
 StartTime = new DateTime(2023, 9, 29, 7, 0, 0),
 EndTime = new DateTime(2023, 9, 29, 14, 30, 0),
 RankId = "6"
 });
 eventsData.Add(new EventsData
 {
 Id = 4,
 Subject = "Rank 9",
 StartTime = new DateTime(2023, 9, 29, 11, 0, 0),
 EndTime = new DateTime(2023, 9, 29, 15, 30, 0),
 RankId = "9"
 });
 return eventsData;
}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RankId { get; set; }
}

```

### Drag and drop appointments

Appointments can be rescheduled to any time by dragging and dropping them onto the desired location. To work with drag and drop functionality make sure that `AllowDragAndDrop` is set to **true** on

Scheduler. In mobile mode, you can drag and drop the events by tap holding an event and dropping them on to the desired location.

**Note:** By default, drag and drop action is applicable on all Scheduler views, except Agenda, Month-Agenda and Year view.

#### *Drag and drop multiple appointments*

We can drag and drop multiple appointments by enabling the `allowMultiDrag` property. We can select multiple appointments by holding the CTRL key. Once the events are selected, we can leave the CTRL key and start dragging the event.

We can also drag multiple events from one resource to another resource. In this case, if all the selected events are in the different resources, then all the events should be moved to the single resource that is related to the target event.

**Note:** Multiple events drag and drop is not supported on mobile devices.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .AllowMultiDrag(true)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

*Disable the drag action*

By default, you can drag and drop the events within any of the applicable scheduler views, and to disable it, set **false** to the **AllowDragAndDrop** property.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .AllowDragAndDrop(false)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

*Preventing drag and drop on specific targets*

It is possible to prevent the drag action on particular target, by passing the target to be excluded in the **excludeSelectors** option within **DragStart** event arguments. In this example, we have prevented the drag action on all-day row.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStart("onStart")
```

```

 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
 <script type="text/javascript">
 function onStart(args) {
 args.excludeSelectors = 'e-header-cells,e-header-day,e-header-
date,e-all-day-cells';
 }
 </script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Disable scrolling on drag action

By default, while dragging an appointment to the edges, either top/bottom in the vertical Scheduler or left/right in the timeline Scheduler, scrolling action takes place automatically. To prevent this scrolling, set `false` to the `scroll` value within `DragStart` event arguments.

## CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

```
<script type="text/javascript">
 function onStart(args) {
 args.scroll = { enable: false };
 }
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Controlling scroll speed while dragging an event

The speed of the scrolling action while dragging an appointment to the Scheduler edges, can be controlled within **DragStart** event arguments by setting the desired value to the **scrollBy** and **timeDelay** option whereas its default value is 30 minutes and 100 ms.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.scroll = { enable: true, scrollBy: 5, timeDelay: 200 };
 }
</script>
```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

*Auto navigation of date ranges on dragging an event*

When an event is dragged either to the left or right extreme edges of the Scheduler and kept hold for few seconds without dropping, the auto navigation of date ranges will be enabled allowing the Scheduler to navigate from current date range to back and forth respectively. This action is set to **false** by default and to enable it, you need to set **navigation** to true within **DragStart** event.

By default, the navigation delay is set to 2000 ms. The navigation delay decides how long the user needs to drag and hold the appointments at the extremities. You can also set your own delay value for letting the users to navigate based on it, using the **timeDelay** within **DragStart** event.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.navigation = { enable: true, timeDelay: 4000 };
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

#### Setting drag time interval

By default, while dragging an appointment, it moves at an interval of 30 minutes. To change the dragging time interval, pass the appropriate values to the `interval` option within `DragStart` event.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.interval = 10; // drag interval time is changed to 10 minutes
 }
</script>

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

#### *Drag and drop items from external source*

It is possible to drag and drop the unplanned items from any of the external source into the scheduler, by manually saving those dropped item as a new appointment data through `addEvent` method of Scheduler.

In this example, we have used the tree view control as an external source and the child nodes from the tree view component are dragged and dropped onto the Scheduler. Therefore, it is necessary to make use of the `nodeDragStop` event of the TreeView component, where we can form an event object and save it using the `addEvent` method.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("500px")
 .Views(view => { view.Option(View.Month).Add(); })
 .SelectedDate(new DateTime(2018, 1, 28))
 .ActionBegin("onActionBegin")
 .Drag("onItemDrag")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .Render()
)
@(Html.EJS().TreeView("tree")
 .Fields(fields =>
fields.DataSource(ViewBag.treeDataSource).Id("Id").Text("Subject")
 .AllowDragAndDrop(true)
 .NodeDragStop("onTreeDragStop")
 .NodeDragging("onItemDrag")
 .Render())
<script type="text/javascript">
 var isTreeItemDropped = false;
 var draggedItemId = '';
 function onItemDrag(event) {
 var scheduleObj = document.querySelector(".e-
schedule").ej2_instances[0];

```

```

 if (scheduleObj.isAdaptive) {
 var classElement = scheduleObj.element.querySelector('.e-device-
hover');
 if (classElement) {
 classElement.classList.remove('e-device-hover');
 }
 if (event.target.classList.contains('e-work-cells')) {
 ej.base.addClass([event.target], 'e-device-hover');
 }
 }
 if (document.body.style.cursor === 'not-allowed') {
 document.body.style.cursor = '';
 }
 if (event.name === 'nodeDragging') {
 var dragElementIcon = document.querySelectorAll('.e-drag-item
.e-icon-expandable');
 for (var i = 0; i < dragElementIcon.length; i++) {
 dragElementIcon[i].style.display = 'none';
 }
 }
 function onActionBegin(event) {
 if (event.requestType === 'eventCreate' && isTreeItemDropped) {
 var treeObj = document.querySelector(".e-
treeview").ej2_instances[0];
 var treeViewdata = treeObj.fields.dataSource;
 var filteredPeople = treeViewdata.filter(function (item) {
return item.Id !== parseInt(draggedItemId, 10); });
 treeObj.fields.dataSource = filteredPeople;
 var elements = document.querySelectorAll('.e-drag-item.treeview-
external-drag');
 for (var i = 0; i < elements.length; i++) {
 remove(elements[i]);
 }
 }
 }
 function onTreeDragStop(event) {
 var treeElement = ej.base.closest(event.target, '.e-treeview');
 var scheduleObj = document.querySelector(".e-
schedule").ej2_instances[0];
 var classElement = scheduleObj.element.querySelector('.e-device-
hover');
 if (classElement) {
 classElement.classList.remove('e-device-hover');
 }
 if (!treeElement) {
 event.cancel = true;
 var scheduleElement = ej.base.closest(event.target, '.e-content-
wrap');
 if (scheduleElement) {
 var treeviewData = this.fields.dataSource;
 if (event.target.classList.contains('e-work-cells')) {
 var filteredData =
 treeviewData.filter(function (item) { return item.Id
=== parseInt(event.draggedNodeData.id, 10); });
 var cellData = scheduleObj.getCellDetails(event.target);

```

```

 var resourceDetails =
scheduleObj.getResourcesByIndex(cellData.groupIndex);
 var eventData = {
 Subject: filteredData[0].Subject,
 StartTime: cellData.startTime,
 EndTime: cellData.endTime
 };
 scheduleObj.addEvent(eventData);
 isTreeItemDropped = true;
 draggedItemId = event.draggedNodeData.id;
 }
}
}
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 ViewBag.treeDataSource = GetTreeData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public List<AppointmentData> GetTreeData()
{
 List<AppointmentData> treeData = new List<AppointmentData>();
 treeData.Add(new AppointmentData
 {
 Id = 11,
 Subject = "Sky Gazers",
 StartTime = new DateTime(2018, 1, 27, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 27, 12, 30, 0)
 });
 treeData.Add(new AppointmentData
 {
 Id = 12,
 Subject = "The Cycle of Seasons",

 EndTime = new DateTime(2018, 1, 28, 15, 0, 0)
 });
 treeData.Add(new AppointmentData
 {
 Id = 13,

```

```

 Subject = "Aliens vs Humans",
 StartTime = new DateTime(2018, 1, 29, 13, 0, 0),
 EndTime = new DateTime(2018, 1, 29, 14, 0, 0)
 });
 return treeData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

#### Opening the editor window on drag stop

There are scenarios where you want to open the editor filled with data on newly dropped location and may need to proceed to save it, only when **Save** button is clicked on the editor and on clicking the cancel button should revert these changes. This can be achieved using the **DragStop** event of Scheduler.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .DragStop("onStop")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStop(args) {
 args.cancel = true; //cancels the drop action
 var scheduleObj = document.querySelector(".e-
schedule").ej2_instances[0];
 scheduleObj.openEditor(args.data, "Save"); //open the event window
 with updated start and end time
 }
</script>

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),

```

```

 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Inline Appointment

In Scheduler, another easier way for adding or editing the appointment's subject alone can be achieved by using the inline Add/Edit support. It allows the user to add and edit the appointments inline. To get familiar with the inline Add mode, single click on any of the Scheduler cells or press enter key on the selected cells.

When the inline adding mode is ON, a text box will get created within the clicked Scheduler cells with a blinking cursor in it, requiring the user to enter the subject of an appointment. Once the subject is entered, the appointment will be saved on pressing the enter key.

To enable the inline edit mode, single click on any of the existing appointment's subject, so that the user can edit the subject of that appointment. The edited subject of that appointment will be updated on pressing the enter key.

The inline option can be enabled/disabled on the Scheduler by using the allowInline API, whereas its default value is set to false.

While using the allowInline the showQuickInfo will be turned off. The quickPopup will not show on clicking the work cell or clicking the appointment when the allowInline property is set to true.

In work cells, select multiple cells using keyboard, and then press enter key. The appointment wrapper will be created, and focus will be on the subject field. Also, consider the overlapping scenarios when creating an inline event.

### Normal Event

While editing appointments, single-click the appointment subject, the editable option will be enabled in UI and the cursor will focus at the end of the text. Inline editing will be considered for all possible views.

### Recurrence Event

While editing the occurrence from the recurrence series, it is only possible to edit a single occurrence, not an entire series.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .AllowInline(true)
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Appointment Resizing**

Another way of rescheduling an appointment can be done by resizing it through either of its handlers.

To work with resizing functionality make sure that **AllowResizing** property is set to **true**.

*Disable the resize action*

By default, resizing of events is allowed on all Scheduler views except Agenda and Month-Agenda view.

To disable this event resizing action, set false to the **AllowResizing** property.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .AllowResizing(false)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
}

```

```

 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
 }
 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

#### Disable scrolling on resize action

By default, while resizing an appointment, when its handler reaches the extreme edges of the Scheduler, scrolling action will take place along with event resizing. To prevent this scrolling action, set **false** to **scroll** value within the **ResizeStart** event.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .ResizeStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.scroll = { enable: false };
 }
</script>

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData

```

```

 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### *Controlling scroll speed while resizing an event*

The speed of the scrolling action while resizing an appointment to the Scheduler edges, can be controlled within the `ResizeStart` event by setting the desired value to the `scrollBy` option.

### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .ResizeStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.scroll = { enable: true, scrollBy: 5, timeDelay: 200 };
 }
</script>

```

### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}

```

```

}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Setting resize time interval

By default, while resizing an appointment, it extends or shrinks at an interval of 30 minutes. To change this default resize interval, set appropriate values to **interval** option within the **ResizeStart**.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .ResizeStart("onStart")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onStart(args) {
 args.interval = 10; // drag interval time is changed to 10 minutes
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

```
}

```

### Appointment customization

The look and feel of the Scheduler events can be customized using any one of the following ways.

- [Using event template](#)
- [Using EventRendered event](#)
- [Using custom CSS class](#)

#### Using template

Any kind of text, images and links can be added to customize the look of the events. The user can format and change the default appearance of the events by making use of the **Template** option available within the **EventSettings** property. The following code example customizes the appointment's default color and time format.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource, Template = ViewBag.template })
 .Readonly(true)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

<style>
 .e-schedule .e-vertical-view .e-content-wrap .e-appointment {
 border-radius: 8px;
 }
 .e-schedule .e-vertical-view .e-content-wrap .e-appointment .e-
appointment-details {
 padding: 0;
 height: 100%;
 }
 .e-schedule .template-wrap {
 height: 100%;
 white-space: normal;
 }
 .e-schedule .template-wrap .subject {
 font-weight: 600;
 font-size: 15px;
 padding: 4px 4px 4px;
 text-overflow: ellipsis;
 white-space: nowrap;
 overflow: hidden;
 }
 .e-schedule .template-wrap .time {
 height: 50px;
 font-size: 12px;
 padding: 4px 6px 4px;
 overflow: hidden;
 }

```

```

 }
</style>
<script type="text/javascript">
 var instance = new ej.base.Internationalization();
 function getTimeString(value) {
 return instance.formatDate(value, { skeleton: 'hm' });
 }
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetWebinarData();
 ViewBag.template = "<div class='template-wrap'
style='background:${SecondaryColor}'><div class='subject'
style='background:${PrimaryColor}'>${Subject}</div><div class='time'
style='background:${PrimaryColor}'>Time: ${getTimeString(data.StartTime)} -
${getTimeString(data.EndTime)}</div><div class='image'><img src =
'../../Content/schedule/images/${ImageName}.svg'
alt='${ImageName}'/></div><div class='description'>${Description}</div><div
class='footer' style='background:${PrimaryColor}'></div></div>";
 return View();
}

public List<WebinarData> GetWebinarData()
{
 List<WebinarData> webinarData = new List<WebinarData>();
 webinarData.Add(new WebinarData
 {
 Id = 1,
 Subject = "Environment Day",
 Tags = "Eco day, Forest conserving, Earth & its resources",
 Description = "A day that creates awareness to promote the healthy
planet and reduce the air pollution crisis on nature earth.",
 StartTime = new DateTime(2023, 2, 12, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 12, 14, 0, 0),
 ImageName = "environment-day",
 PrimaryColor = "#1aaa55",
 SecondaryColor = "#47bb76"
 });
 webinarData.Add(new WebinarData
 {
 Id = 2,
 Subject = "Health Day",
 Tags = "Reduce mental stress, Follow good food habits",
 Description = "A day that raises awareness on different health
issues. It marks the anniversary of the foundation of WHO.",
 StartTime = new DateTime(2023, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 13, 14, 0, 0),
 ImageName = "health-day",
 PrimaryColor = "#357cd2",
 SecondaryColor = "#5d96db"
 });
 webinarData.Add(new WebinarData
 {
 Id = 3,

```

```

 Subject = "Cancer Day",
 Tags = "Life threatening cancer effects, Palliative care",
 Description = "A day that raises awareness on cancer and its
preventive measures. Early detection saves life.",
 StartTime = new DateTime(2023, 2, 14, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 14, 0, 0),
 ImageName = "cancer-day",
 PrimaryColor = "#7fa900",
 SecondaryColor = "#a4c932"
 });
 webinarData.Add(new WebinarData
 {
 Id = 4,
 Subject = "Happiness Day",
 Tags = "Stress-free, Smile, Resolve frustration and bring
happiness",
 Description = "A general idea is to promote happiness and smile
around the world.",
 StartTime = new DateTime(2023, 2, 15, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 14, 0, 0),
 ImageName = "happiness-day",
 PrimaryColor = "#ea7a57",
 SecondaryColor = "#ee9478"
 });
 webinarData.Add(new WebinarData
 {
 Id = 5,
 Subject = "Tourism Day",
 Tags = "Diverse cultural heritage, strengthen peace",
 Description = "A day that raises awareness on the role of tourism
and its effect on social and economic values.",
 StartTime = new DateTime(2023, 2, 16, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 14, 0, 0),
 ImageName = "tourism-day",
 PrimaryColor = "#00bdae",
 SecondaryColor = "#32cabe"
 });
 return webinarData;
}

public class WebinarData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public string Tags { get; set; }
 public string Description { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string ImageName { get; set; }
 public string PrimaryColor { get; set; }
 public string SecondaryColor { get; set; }
}

```

**Note:** All the built-in fields that are mapped to the appropriate field properties within the `EventSettings`, as well as custom mapped fields from the Scheduler dataSource can be accessed within the template code.

*Using eventRendered event*

The **EventRendered** event triggers before the appointment renders on the Scheduler. Therefore, this client-side event can be utilized to customize the look of events based on any specific criteria, before rendering them on the scheduler.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventRendered("onEventRendered")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onEventRendered(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 var categoryColor = args.data.CategoryColor;
 if (!args.element || !categoryColor) {
 return;
 }
 if (scheduleObj.currentView === 'Agenda') {
 (args.element.firstChild).style.borderColor = categoryColor;
 } else {
 args.element.style.backgroundColor = categoryColor;
 }
 }
</script>
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2023, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2023, 1, 28, 12, 30, 0),
 CategoryColor = "#357cd2"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
```

```

public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public string CategoryColor { get; set; }
}

```

### Using cssClass

The customization of events can also be achieved using `CssClass` property of the Scheduler. In the following example, the background of appointments has been changed using the `cssClass`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .CssClass("custom-class")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource})
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<style>
 .custom-class.e-schedule .e-vertical-view .e-all-day-appointment-wrapper
.e-appointment,
 .custom-class.e-schedule .e-vertical-view .e-day-wrapper .e-appointment,
 .custom-class.e-schedule .e-month-view .e-appointment{
 background: green;
 }
</style>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetWebinarData();
 return View();
}
public List<WebinarData> GetWebinarData()
{
 List<WebinarData> webinarData = new List<WebinarData>();
 webinarData.Add(new WebinarData
 {
 Id = 1,
 Subject = "Environment Day",
 Tags = "Eco day, Forest conserving, Earth & its resources",
 Description = "A day that creates awareness to promote the healthy planet and reduce the air pollution crisis on nature earth.",
 StartTime = new DateTime(2023, 2, 12, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 12, 14, 0, 0),
 ImageName = "environment-day",
 PrimaryColor = "#1aaa55",
 SecondaryColor = "#47bb76"
 });
 webinarData.Add(new WebinarData

```

```

{
 Id = 2,
 Subject = "Health Day",
 Tags = "Reduce mental stress, Follow good food habits",
 Description = "A day that raises awareness on different health
issues. It marks the anniversary of the foundation of WHO.",
 StartTime = new DateTime(2023, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 13, 14, 0, 0),
 ImageName = "health-day",
 PrimaryColor = "#357cd2",
 SecondaryColor = "#5d96db"
});
webinarData.Add(new WebinarData
{
 Id = 3,
 Subject = "Cancer Day",
 Tags = "Life threatening cancer effects, Palliative care",
 Description = "A day that raises awareness on cancer and its
preventive measures. Early detection saves life.",
 StartTime = new DateTime(2023, 2, 14, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 14, 0, 0),
 ImageName = "cancer-day",
 PrimaryColor = "#7fa900",
 SecondaryColor = "#a4c932"
});
webinarData.Add(new WebinarData
{
 Id = 4,
 Subject = "Happiness Day",
 Tags = "Stress-free, Smile, Resolve frustration and bring
happiness",
 Description = "A general idea is to promote happiness and smile
around the world.",
 StartTime = new DateTime(2023, 2, 15, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 14, 0, 0),
 ImageName = "happiness-day",
 PrimaryColor = "#ea7a57",
 SecondaryColor = "#ee9478"
});
webinarData.Add(new WebinarData
{
 Id = 5,
 Subject = "Tourism Day",
 Tags = "Diverse cultural heritage, strengthen peace",
 Description = "A day that raises awareness on the role of tourism
and its effect on social and economic values.",
 StartTime = new DateTime(2023, 2, 16, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 14, 0, 0),
 ImageName = "tourism-day",
 PrimaryColor = "#00bdae",
 SecondaryColor = "#32cabe"
});
return webinarData;
}
public class WebinarData
{
 public int Id { get; set; }

```

```

public string Subject { get; set; }
public string Tags { get; set; }
public string Description { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public string ImageName { get; set; }
public string PrimaryColor { get; set; }
public string SecondaryColor { get; set; }
}

```

### Setting minimum height

It is possible to set minimal height for appointments on Scheduler using `EventRendered` event, when its start and end time duration is less than the default duration of a single slot.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventRendered("onEventRendered")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onEventRendered(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 let cellHeight = (scheduleObj.element.querySelector('.e-work-
cells')).offsetHeight;
 let appHeight = (args.data.EndTime.getTime() -
args.data.StartTime.getTime()) / (60 * 1000) * (36 *
scheduleObj.timeScale.slotCount) / scheduleObj.timeScale.interval;
 args.element.style.height = appHeight + 'px';
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2023, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2023, 1, 28, 12, 30, 0),
 });
}

```

```

 CategoryColor = "#357cd2"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string CategoryColor { get; set; }
}

```

### Block Dates and Times

It is possible to block a set of dates or a particular time ranges on the Scheduler. To do so, define an appointment object within **EventSettings** along with the required time range to block and set the **IsBlock** field to **true**. Usually, the event objects defined with **IsBlock** field set to true will block the entire time cells lying within the appropriate time ranges specified through **StartTime** and **EndTime** fields.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsBlock = true,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
}

```

```

public DateTime EndTime { get; set; }
public bool IsBlock { get; set; }
}

```

Block events can also be defined to repeat on several days as shown in the following code example.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsBlock = true,
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=5"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string RecurrenceRule { get; set; }
 public bool IsBlock { get; set; }
}

```

### Readonly

An interaction with the appointments of Scheduler can be enabled/disabled using the **Readonly** property. With this property enabled, you can simply navigate between the Scheduler dates, views and can be able to view the appointment details in the quick info window. Most importantly, the users are not allowed to perform any CRUD actions on Scheduler, when this property is set to true. By default, it is set as **false**.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Readonly(true)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Explosion of Betelgeuse Star",
 StartTime = new DateTime(2018, 2, 15, 9, 30, 0),
 EndTime = new DateTime(2018, 2, 15, 11, 0, 0)
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Make specific events readonly**

There are scenarios where you need to restrict the CRUD action on specific appointments alone based on certain conditions. In the following example, the events that has occurred on the past hours from the current date of the Scheduler are made as read-only and the CRUD actions has been prevented only on those appointments. This can be achieved by setting **IsReadonly** field of read-only events to **true**.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
```

```
.Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsReadOnly = true,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsReadOnly { get; set; }
}
```

**Note:** By default, the event editor is prevented to open on the read-only events when `isReadOnly` (for Core) / `IsReadOnly` (for MVC) field is set to `true`.

#### Restricting event creation on specific time slots

You can restrict the users to create and update more than one appointment on specific time slots. Also, you can disable the CRUD action on those time slots if it is already occupied, which can be achieved using Scheduler's public method `isSlotAvailable`.

**Note:** The `isSlotAvailable` is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
```

```

 .Render()
)
 <script type="text/javascript">
 function onActionBegin(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 if ((args.requestType === 'eventCreate' || args.requestType ===
'eventChange') && args.data.length > 0) {
 var eventData = args.data[0];
 var eventField = scheduleObj.eventFields;
 var startDate = eventData[eventField.startTime];
 var endDate = eventData[eventField.endTime];
 args.cancel = !scheduleObj.isSlotAvailable(startDate, endDate);
 }
 }
 </script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Meteor Showers in 2018", StartTime = new
DateTime(2018, 2, 14, 13, 0, 0), EndTime = new DateTime(2018, 2, 14, 14, 30,
0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 12, 0, 0), EndTime = new DateTime(2018, 2, 15, 14, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Differentiate the past time events

To differentiate the appearance of the appointments based on specific criteria such as displaying the past hour appointments with different colors on Scheduler, `EventRendered` event can be used which triggers before the appointment renders on the Scheduler.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventRendered("onEventRendered")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 29))
 .Render()
)
<style>
 .e-past-app {
 background-color: chocolate !important;
 }
</style>
<script type="text/javascript">
 function onEventRendered(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 if (args.data.EndTime < scheduleObj.selectedDate) {
 args.element.classList.add('e-past-app');
 }
 }
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2018, 1, 28, 10, 0, 0),
 EndTime = new DateTime(2018, 1, 28, 12, 30, 0),
 CategoryColor = "#357cd2"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
```

```

public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public string CategoryColor { get; set; }
}

```

### Appointments occupying entire cell

The Scheduler allows the event to occupies the full height of the cell without its header part by setting true for **EnableMaxHeight** Property.

We can show more indicator if more than one appointment is available in a same cell by setting true to **EnableIndicator** property whereas its default value is false.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource, EnableMaxHeight = true, EnableIndicator = false })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
 Subject = "Server Maintenance",
 StartTime = new DateTime(2023, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2023, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
 });
 eventsData.Add(new EventsData

```

```

 {
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2023, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
 });
 return eventsData;
}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string EventType { get; set; }
 public string City { get; set; }
 public string CategoryColor { get; set; }
}

```

#### How to limit maximum number of events to display

In the Scheduler, the default behavior is to display concurrent events based on cell height, with each new event represented as **+n more** characters. However, you may want to improve the quality of the presentation by limiting the number of concurrent events. This can be accomplished by using the `maxEventsPerRow` property, which is defaulted to the `views` property.

The `maxEventsPerRow` property is specific to the month, timeline month, and timeline year views, allowing you to view events visually in these rows. Below is a code example that demonstrates how to use this constraint and the events displayed in a cell have been created:

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Month).MaxEventsPerRow(3).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2023, 11, 10))
 .Render()
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()

```

```

{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {Id: 1, Subject: 'Explosion of Betelgeuse Star', StartTime: new
Date(2023, 11, 11, 9, 30), EndTime: new Date(2023, 11, 11, 11, 0) });
 appData.Add(new AppointmentData
 {Id: 2, Subject: 'Thule Air Crash Report', StartTime: new Date(2023, 11,
11, 12, 30), EndTime: new Date(2023, 11, 11, 13, 0) });
 appData.Add(new AppointmentData
 {Id: 3, Subject: 'Blue Moon Eclipse', StartTime: new Date(2023, 11, 11,
13, 30), EndTime: new Date(2023, 11, 11, 15, 30) });
 appData.Add(new AppointmentData
 {Id: 4, Subject: 'Meteor Showers in 2023', StartTime: new Date(2023, 11,
14, 13, 0), EndTime: new Date(2023, 11, 14, 14, 30) });
 appData.Add(new AppointmentData
 {Id: 5, Subject: 'Milky Way as Melting pot', StartTime: new Date(2023,
11, 14, 15, 0), EndTime: new Date(2023, 11, 14, 15, 30) });
 appData.Add(new AppointmentData
 {Id: 6, Subject: 'Mysteries of Bermuda Triangle', StartTime: new
Date(2023, 11, 15, 9, 30), EndTime: new Date(2023, 11, 15, 11, 0) });
 appData.Add(new AppointmentData
 {Id: 7, Subject: 'Glaciers and Snowflakes', StartTime: new Date(2023,
11, 15, 11, 0), EndTime: new Date(2023, 11, 15, 12, 30) });
 appData.Add(new AppointmentData
 {Id: 8, Subject: 'Life on Mars', StartTime: new Date(2023, 11, 17, 9,
0), EndTime: new Date(2023, 11, 17, 10, 0) });
 appData.Add(new AppointmentData
 {Id: 9, Subject: 'Alien Civilization', StartTime: new Date(2023, 11, 17,
12, 0), EndTime: new Date(2023, 11, 17, 13, 0) });
 appData.Add(new AppointmentData
 {Id: 10, Subject: 'Wildlife Galleries', StartTime: new Date(2023, 11,
17, 15, 0), EndTime: new Date(2023, 11, 17, 17, 0) });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

The property `maxEventsPerRow` will be applicable only when [rowAutoHeight](#) feature is disabled in the Scheduler.

| Sunday | Monday                                                                                            | Tuesday                                                                                           | Wednesday                                                                                | Thursday                                                                                       | Friday                                                                                                  | Saturday |

### Display tooltip for appointments

The tooltip shows the Scheduler appointment's information in a formatted style by making use of the tooltip related options.

#### Show or hide built-in tooltip

The tooltip can be displayed for appointments by setting `true` to the `EnableTooltip` option within the `EventSettings` property.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource, EnableTooltip = true })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
```

```

 Subject = "Server Maintenance",
 StartTime = new DateTime(2023, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2023, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
 });
 eventsData.Add(new EventsData
 {
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2023, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
 });
 return eventsData;
}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string EventType { get; set; }
 public string City { get; set; }
 public string CategoryColor { get; set; }
}

```

### Customizing event tooltip using template

After enabling the default tooltip, it is possible to customize the display of needed event information on tooltip by making use of the `TooltipTemplate` option within the `EventSettings`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@{
 var template = "<div class='tooltip-wrap'>" +
 "<div class='content-area'><div class='name'>${Subject}</div> " +
 "${if(City != null && City != undefined)}<div"
 class='city'>${City}</div>${if}</div> " +
 "<div class='time'>From : ${StartTime.toLocaleString()} </div> " +
 "<div class='time'>To : ${EndTime.toLocaleString()} "
 </div></div></div>";
}

```

```

@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings {
 DataSource = ViewBag.datasource,
 EnableTooltip = true,
 TooltipTemplate = template
 })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
 Subject = "Server Maintenance",
 StartTime = new DateTime(2023, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2023, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
 });
 eventsData.Add(new EventsData
 {
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2023, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
 });
 return eventsData;
}
public class EventsData
{

```

```

public int Id { get; set; }
public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public string EventType { get; set; }
public string City { get; set; }
public string CategoryColor { get; set; }
}

```

**Note:** All the field names that are mapped from the Scheduler dataSource to the appropriate field properties such as subject, description, location, startTime and endTime within the `EventSettings` can be accessed within the template.

### Appointment selection

Appointment selection can be done either through mouse or keyboard actions. The selected events in UI will have a box shadow effect around to differentiate it from other appointments.

| Action                                               | Description                    |
|------------------------------------------------------|--------------------------------|
| ----- -----                                          |                                |
| Mouse click or Single tap on appointments            | Selects single appointment.    |
| Ctrl + [Mouse click] or [Single tap] on appointments | Selects multiple appointments. |

### Deleting multiple appointments

With the options available to select multiple appointments, it is also possible to delete the multiple selected appointments simply by pressing the `Delete` key. In case of deleting multiple selected occurrences of an event series, only those occurrences will be deleted and not the entire series.

### Retrieve event details from the UI of an event

It is possible to access the information about the event fields of an appointment element displayed on the Scheduler UI. This can be achieved by passing an appointment element as argument to the public method `getEventDetails`.

In the following example, the subject of the appointment clicked has been displayed.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
<div class="col-lg-9 control-section">
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventClick("onEventClick")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<div class="col-lg-3 property-section">
 <table id="property" title="Event Trace">
 <tbody>
 <tr>
 <td>

```

```

 <div class="eventarea" style="height: 245px;overflow:
auto">
 <span class="EventLog" id="EventLog" style="word-
break: normal;">
 </div>
 </td>
</tr>
<tr>
 <td>
 <div class="eventbtn" style="padding-bottom: 10px">
 <input id="clear" type="button" class="btn btn-
default" value="Clear">
 </div>
 </td>
</tr>
</tbody>
</table>
</div>
<style>
 #EventLog b {
 color: #388e3c;
 }
 hr {
 margin: 1px 10px 1px 0px;
 border-top: 1px solid #eee;
 }
</style>
<script type="text/javascript">
 document.querySelector('.eventbtn').onclick = function () {
 document.querySelector('.EventLog').innerHTML = '';
 };
 function onEventClick(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 var event = scheduleObj.getEventDetails(args.element);
 appendElement(event.Subject + '<hr>');
 }
 function appendElement(html) {
 var span = document.createElement('span');
 span.innerHTML = html;
 var log = document.querySelector('.EventLog');
 log.insertBefore(span, log.firstChild);
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData

```

```

{
 Id = 1,
 Subject = "Server Maintenance",
 StartTime = new DateTime(2018, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
});
eventsData.Add(new EventsData
{
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2018, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
});
eventsData.Add(new EventsData
{
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2018, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
});
return eventsData;
}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string EventType { get; set; }
 public string City { get; set; }
 public string CategoryColor { get; set; }
}

```

### Get the current view appointments

To retrieve the appointments present in the current view of the Scheduler, you can make use of the `getCurrentViewEvents` public method. In the following example, the count of current view appointment collection rendered has been traced in `DataBound` event.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
<div class="col-lg-9 control-section">
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .DataBound("onDataBound")

```

```

 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<div class="col-lg-3 property-section">
 <table id="property" title="Event Trace">
 <tbody>
 <tr>
 <td>
 <div class="eventarea" style="height: 245px;overflow:
auto">
 <span class="EventLog" id="EventLog" style="word-
break: normal;">
 </div>
 </td>
 </tr>
 <tr>
 <td>
 <div class="evtbtn" style="padding-bottom: 10px">
 <input id="clear" type="button" class="btn btn-
default" value="Clear">
 </div>
 </td>
 </tr>
 </tbody>
 </table>
</div>
<style>
 #EventLog b {
 color: #388e3c;
 }
 hr {
 margin: 1px 10px 1px 0px;
 border-top: 1px solid #eee;
 }
</style>
<script type="text/javascript">
 document.getElementById('clear').onclick = function () {
 document.getElementById('EventLog').innerHTML = '';
 };
 function onDataBound(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var event = scheduleObj.getCurrentViewEvents();
 if (event.length > 0) {
 appendElement('Events present on current view ' +
event.length + '<hr>');
 } else {
 appendElement('No Events available in this view.<hr>');
 }
 }
 function appendElement(html) {
 var span = document.createElement('span');
 span.innerHTML = html;
 var log = document.getElementById('EventLog');

```

```

 log.insertBefore(span, log.firstChild);
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
 Subject = "Server Maintenance",
 StartTime = new DateTime(2018, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2018, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
 });
 eventsData.Add(new EventsData
 {
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2018, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
 });
 return eventsData;
}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string EventType { get; set; }
 public string City { get; set; }
 public string CategoryColor { get; set; }
}

```

### Get the entire appointment collections

The entire collection of appointments rendered on the Scheduler can be accessed using the `getEvents` public method. In the following example, the count of entire appointment collection rendered on the Scheduler has been traced in `DataBound` event.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
<div class="col-lg-9 control-section">
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .DataBound("onDataBound")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<div class="col-lg-3 property-section">
 <table id="property" title="Event Trace">
 <tbody>
 <tr>
 <td>
 <div class="eventarea" style="height: 245px;overflow:
auto">
 <span class="EventLog" id="EventLog" style="word-
break: normal;">
 </div>
 </td>
 </tr>
 <tr>
 <td>
 <div class="evtbtn" style="padding-bottom: 10px">
 <input id="clear" type="button" class="btn btn-
default" value="Clear">
 </div>
 </td>
 </tr>
 </tbody>
 </table>
</div>
<style>
 #EventLog b {
 color: #388e3c;
 }
 hr {
 margin: 1px 10px 1px 0px;
 border-top: 1px solid #eee;
 }
</style>
<script type="text/javascript">
 document.getElementById('clear').onclick = function () {
 document.getElementById('EventLog').innerHTML = '';
 };
</script>
```

```

function onDataBound(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var event = scheduleObj.getEvents();
 appendElement('Events present on scheduler ' + event.length
+ '<hr>');
}
function appendElement(html) {
 var span = document.createElement('span');
 span.innerHTML = html;
 var log = document.getElementById('EventLog');
 log.insertBefore(span, log.firstChild);
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetEventsData();
 return View();
}
public List<EventsData> GetEventsData()
{
 List<EventsData> eventsData = new List<EventsData>();
 eventsData.Add(new EventsData
 {
 Id = 1,
 Subject = "Server Maintenance",
 StartTime = new DateTime(2018, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 14, 11, 30, 0),
 EventType = "maintenance",
 City = "Seattle",
 CategoryColor = "#1aaa55"
 });
 eventsData.Add(new EventsData
 {
 Id = 2,
 Subject = "Art & Painting Gallery",
 StartTime = new DateTime(2018, 2, 15, 12, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 14, 0, 0),
 EventType = "public-event",
 City = "Costa Rica",
 CategoryColor = "#357cd2"
 });
 eventsData.Add(new EventsData
 {
 Id = 3,
 Subject = "Dany Birthday Celebration",
 StartTime = new DateTime(2018, 2, 16, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 16, 11, 30, 0),
 EventType = "family-event",
 City = "Kirkland",
 CategoryColor = "#7fa900"
 });
 return eventsData;
}

```

```

}
public class EventsData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string EventType { get; set; }
 public string City { get; set; }
 public string CategoryColor { get; set; }
}

```

### Refresh appointments

If your requirement is to simply refresh the appointments instead of refreshing the entire Scheduler elements from your application end, make use of the `refreshEvents` public method.

```
`sh
```

```
scheduleObj.refreshEvents();
```

```
,
```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Data-binding

The Scheduler uses `DataManager`, which supports both RESTful JSON data services binding and local JavaScript object array binding. The `DataSource` property can be assigned either with the instance of `DataManager` or JavaScript object array collection. It supports two kinds of data binding method:

- Local data
- Remote data

### Binding local data

To bind local JSON data to the Scheduler, you can simply assign a JavaScript object array to the `DataSource` option of the scheduler within the `EventSettings` property. The local data source can also be provided as an instance of the `DataManager`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 12, 9, 30, 0), EndTime = new DateTime(2018, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 14, 9, 30, 0), EndTime = new DateTime(2018, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** By default, `DataManager` uses `JsonAdaptor` for local data-binding.

You can also bind different field names to the default event fields as well as include additional custom fields to the event object collection which can be referred [here](#).

#### Binding remote data

Any kind of remote data services can be bound to the Scheduler. To do so, create an instance of `DataManager` and provide the service URL to the `Url` option of `DataManager` and then assign it to the `DataSource` property within `EventSettings`.

#### Using ODataV4Adaptor

[ODataV4](#) is a standardized protocol for creating and consuming data. Refer to the following code example to retrieve the data from ODataV4 service using the `DataManager`. To connect with ODataV4 service end points, it is necessary to make use of `ODataV4Adaptor` within `DataManager`.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Readonly(true)
 .EventSettings(e =>
 e.DataSource(d =>
 d.Url("https://ej2services.syncfusion.com/production/web-
services/api/Schedule")
 .Adaptor("ODataV4Adaptor")
 .CrossDomain(true)
)
)
)

```

```

)
 .SelectedDate(new DateTime(2020, 9, 20))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

#### *Filter events using the in-built query*

To enable server-side filtering operations based on predetermined conditions, the [includeFiltersInQuery](#) API can be set to true, this allows the filter query to be constructed using the start date, end date, and recurrence rule which in turn enables the request to be filtered accordingly.

This method greatly improves the component's performance by reducing the data that needs to be transferred to the client side. As a result, the component's efficiency and responsiveness are significantly enhanced, resulting in a better user experience. However, it is important to consider the possibility of longer query strings, which may cause issues with the maximum URL length or server limitations on query string length.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Readonly(true)
 .EventSettings(e =>
 e.DataSource(d =>

 d.Url("https://services.odata.org/V4/Northwind/Northwind.svc/Orders/")
 .Adaptor("ODataV4Adaptor")
 .CrossDomain(true)
)
 .Fields(f =>
 f.Subject(sub => sub.Name("ShipName"))
 .Id("Id")
 .Location(loc => loc.Name("ShipCountry"))
 .Description(des => des.Name("ShipAddress"))
 .StartTime(st => st.Name("OrderDate"))
 .EndTime(et => et.Name("RequiredDate"))
 .RecurrenceRule(rec => rec.Name("ShipRegion"))
)
 .Query("new ej.data.Query()")
 .IncludeFiltersInQuery(true)
)
 .SelectedDate(new DateTime(1996, 7, 9))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}
public class AppointmentData
{
 public int Id { get; set; }
 public string ShipName { get; set; }
 public DateTime OrderDate { get; set; }
 public DateTime RequiredDate { get; set; }
 public string ShipCountry { get; set; }
 public string ShipAddress { get; set; }
 public string ShipRegion { get; set; }
}

```

The following image represents how the parameters are passed using ODataV4 filter.

**Request URL:** https://localhost:44360/api/Events?\$filter=(((Start Time%20ge%202022-11-26T18:30:00.000Z)%20and%20(EndTime%20ge%202022-11-26T18:30:00.000Z))%20and%20(StartTime%20lt%202022-12-31T18:30:00.000Z))%20or%20((StartTime%20le%202022-11-26T18:30:00.000Z)%20and%20(EndTime%20gt%202022-11-26T18:30:00.000Z))%20or%20((RecurrenceRule%20ne%20null)%20and%20(RecurrenceRule%20ne%20%27%27))&readOnly=true

**Request Method:** GET

**Status Code:** 200

**Remote Address:** [::1]:44360

**Referrer Policy:** strict-origin-when-cross-origin

#### Using custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field **EventID** for the appointments by overriding the built-in response processing using the **processResponse** method of the **ODataV4Adaptor**.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Readonly(true)

```

```

 .SelectedDate(new DateTime(2020, 9, 20))
 .Created("created")
 .Render()
)
 <script type="text/javascript">
 function created(args) {
 class CustomAdaptor extends ej.data.ODataV4Adaptor {
 processResponse() {
 var i = 0;
 // calling base class processResponse function
 var original = super.processResponse.apply(this, arguments);
 // adding employee id
 original.forEach(function (item) { item['EmpID'] = ++i });
 return original;
 }
 }
 var dataManager = new ej.data.DataManager({
 url: 'https://ej2services.syncfusion.com/production/web-
services/api/Schedule',
 adaptor: new CustomAdaptor
 });
 var schObj = document.querySelector('.e-schedule').ej2_instances[0];
 schObj.eventSettings.dataSource = dataManager;
 }
 </script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

### Loading data via AJAX post

You can bind the event data through external ajax request and assign it to the **DataSource** property of Scheduler. In the following code example, we have retrieved the data from server with the help of ajax request and assigned the resultant data to the **DataSource** property of Scheduler within the **onSuccess** event of Ajax.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
<input type="button" value="Click me to load Event" onclick="GetData()" />

@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .ReadOnly(true)
 .SelectedDate(new DateTime(2017, 6, 11))
 .Render()
)
<script type="text/javascript">
 function GetData() {
 var ajax = new ej.base.Ajax('/Home/GetData', 'Post', false);
 ajax.send().then(

```

```

 function (value) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 scheduleObj.eventSettings.dataSource = JSON.parse(value);
 scheduleObj.dataBind();
 },
 function (reason) {
 console.log(reason);
 });
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

**Note:** Definition for the controller method `GetData` can be referred [here](#).

### Passing additional parameters to the server

To send an additional custom parameter to the server-side post, you need to make use of the `addParams` method of `Query`. Now, assign this `Query` object with additional parameters to the `Query` property of `Scheduler`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Readonly(true)
 .EventSettings(e =>
 e.DataSource(d =>
 d.Url("https://ej2services.syncfusion.com/development/web-services/odata/")
 .Adaptor("ODataV4Adaptor")
 .CrossDomain(true)
)
 .Query("new ej.data.Query().from('Events').addParams('readOnly',
'true')")
)
 .SelectedDate(new DateTime(2017, 6, 11))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

**Note:** The parameters added using the **Query** property will be sent along with the data request sent to the server on every scheduler actions.

### Handling failure actions

During the time of Scheduler interacting with server, there are chances that some server-side exceptions may occur. You can acquire those error messages or exception details in client-side using the [ActionFailure](#) event of Scheduler.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(e =>
 e.DataSource(d =>
 d.Url("http://some.com/invalidUrl").Adaptor("UrlAdaptor").CrossDomain(true)
)
).ActionFailure("onActionFailure")
 .SelectedDate(new DateTime(2017, 6, 11))
 .Render()
)
<script type="text/javascript">
 function onActionFailure(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var span = document.createElement('span');
 scheduleObj.element.parentNode.insertBefore(span,
scheduleObj.element);
 span.style.color = '#FF0000';
 span.innerHTML = 'Server exception: 404 Not found';
 }
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 return View();
}
```

The argument passed to the **ActionFailure** event contains the error details returned from the server.

### Scheduler CRUD actions

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Scheduler appointments using the various adaptors available within the **DataManager**. Most preferably, we will be using **UrlAdaptor** for performing CRUD actions on scheduler appointments.

```
`sh
```

```
@(Html.EJS().Schedule("schedule")
.Width("100%")
```

```

.Height("550px")
.EventSettings(e => e.DataSource(d =>
d.Url("Home/GetData").CrudUrl("Home/UpdateData").Adaptor("UrlAdaptor").CrossDomain(true)))
.SelectedDate(new DateTime(2017, 6, 5))
.Render()
)
,

```

The server-side controller code to handle the CRUD operations are as follows.

```

`sh
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using ScheduleSample.Models;
namespace ScheduleSample.Controllers
{
public class HomeController : Controller
{
ScheduleDataDataContext db = new ScheduleDataDataContext();
public ActionResult Index()
{
return View();
}

public ActionResult LoadData() // Here we get the Start and End Date and based on that can filter the
data and return to Scheduler
{
var data = db.ScheduleEventDatas.ToList();
return Json(data);
}

[HttpPost]
public ActionResult UpdateData([FromBody] EditParams param)
{

```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime,
EndTime = endTime,
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);

### Configuring Scheduler with Google API service

We have assigned our custom created Google Calendar url to the DataManager and assigned the same to the Scheduler **DataSource**. Since the events data retrieved from the Google Calendar will be in its own object format, therefore it needs to be resolved manually within the Scheduler's **DataBinding** event. Within this event, the event fields needs to be mapped properly and then assigned to the result.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Schedule
@{
 var calendarId = "5105trob9dasha31vuqek6qgp0@group.calendar.google.com";
 var publicKey = "AIzaSyD76zjMDsL_jkenM5AAnNsORypS1Icuqyg";
 var dataManager = new DataManager() { Url =
"https://www.googleapis.com/calendar/v3/calendars/" + calendarId +
"/events?key=" + publicKey, Adaptor = "WebApiAdaptor", CrossDomain = true };
}
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .EventSettings(new ScheduleEventSettings { DataSource = dataManager })
 .DataBinding("onDataBinding")
 .Readonly(true)
 .SelectedDate(new DateTime(2018, 11, 14))
 .Render()
)
<script type="text/javascript">
 function onDataBinding(e) {
 var items = e.result.items;
 var scheduleData = [];
 if (items.length > 0) {
 for (var i = 0; i < items.length; i++) {

```

```

 var event = items[i];
 var when = event.start.dateTime;
 var start = event.start.dateTime;
 var end = event.end.dateTime;
 if (!when) {
 when = event.start.date;
 start = event.start.date;
 end = event.end.date;
 }
 scheduleData.push({
 Id: event.id,
 Subject: event.summary,
 StartTime: new Date(start),
 EndTime: new Date(end),
 IsAllDay: !event.start.dateTime
 });
 }
 e.result = scheduleData;
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### CRUD Actions

Events, a.k.a. Appointments, play an important role in Scheduler with which the users mostly interact. You can easily manipulate (add/edit/delete) the desired appointments as and when required either using the editor window or through the drag and resize action.

#### Add

Any kind of appointments such as normal, all-day, spanned or recurring events can be easily added on Scheduler using any one of the following ways.

- [Creation using editor window](#)
- [Creation using addEvent method](#)

#### Creation using editor window

The default editor window opens when you double click on the Scheduler cells. It provides you with event related options such as Subject, Location, Start and End time, All-day, Timezone, Description and other recurrence options. With these available fields, you can choose to provide detailed information to the events. Once the fields are filled with proper values, enter the **Save** button to add an event.

In case, if you want to simply provide the Subject alone for appointments, just single click on the required cells which will open the quick popup expecting you to enter subject alone and save it. You can also select multiple cells and press **Enter** key to open the quick popup for selected time range and save the appointment for that time range.

In case, if you need to add some other additional fields to the editor window, then you can opt for [custom editor window](#) which allows you to include fields as per your application needs. If you need to add just one or two [additional fields to the existing default editor window](#), you can do so by defining it manually and then appending it to the editor window.

#### *Creation using addEvent method*

The appointments can be created dynamically by using **addEvent** method. Either you can add a single or a collection of appointment objects using **addEvent** method. The following code example let you know how to use the **addEvent** method to create multiple appointments simultaneously.

#### **CSHTML**

```
@using Syncfusion.EJ2.Schedule
@using Syncfusion.EJ2.Buttons
@ (Html.EJS().Button("btn1")
 .Content("ADD")
 .Render()
)
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var data = [{
 Id: 1,
 Subject: 'Conference',
 StartTime: new Date(2018, 1, 12, 9, 0),
 EndTime: new Date(2018, 1, 12, 10, 0),
 IsAllDay: false
 }, {
 Id: 2,
 Subject: 'Meeting',
 StartTime: new Date(2018, 1, 15, 10, 0),
 EndTime: new Date(2018, 1, 15, 11, 30),
 IsAllDay: false
 }
];
 scheduleObj.addEvent(data);
 };
</script>
```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 3,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
 });
 appData.Add(new AppointmentData
 {
 Id = 4,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 13, 10, 0, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

#### Inserting events into database at server-side

While adding the normal or recurring events to the Scheduler, **insert** action takes place and the following code example describes how to add a new event into database at server side.

```
`sh
```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
```

```
{
```

```
var value = (param.action == "insert") ? param.value : param.added[0];
```

```
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
 Id = intMax + 1,
 StartTime = startTime,
 EndTime = endTime,
 Subject = value.Subject,
 IsAllDay = value.IsAllDay,
 StartTimezone = value.StartTimezone,
 EndTimezone = value.EndTimezone,
 RecurrenceRule = value.RecurrenceRule,
 RecurrenceID = value.RecurrenceID,
 RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}
```

### Restricting add action based on specific criteria

In the following example, the specific fields of Scheduler editor window such as Subject and Location are made to undergo validation such that if it is left as blank, then the default **required** validation message will be displayed, while clicking on a save button.

Additionally, the regex condition has been added to the Location field, so that if any special characters are typed into it, then the custom validation message will be displayed.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@{
 var validationRules = new Dictionary<string, object>() { { "required",
true } };
 var locationValidationRules = new Dictionary<string, object>() { {
"required", true }, { "regex", new string[] { "^[a-zA-Z0-9-]*$", "Special
character(s) not allowed in this field" } } };
 var descriptionValidationRules = new Dictionary<string, object>() { {
"required", true }, { "minLength", 5 }, { "maxLength", 500 } };
}
@(Html.EJS().Schedule("schedule")
.Width("100%")
.Height("650px")
.EventSettings(e => e.Fields(f => f.Subject(sub =>
sub.Name("Subject").Validation(validationRules))
.Location(loc =>
loc.Name("Location").Validation(locationValidationRules))
.Description(des =>
des.Name("Description").Validation(descriptionValidationRules))
.StartTime(st =>
st.Name("StartTime").Validation(validationRules))
.EndTime(et => et.Name("EndTime").Validation(validationRules))
)
.DataSource(ViewBag.datasources))
```

```

)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Meteor Showers in 2018", StartTime = new
DateTime(2018, 2, 14, 13, 0, 0), EndTime = new DateTime(2018, 2, 14, 14, 30,
0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 12, 0, 0), EndTime = new DateTime(2018, 2, 15, 14, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

You can also dynamically prevent the creation of appointments on Scheduler. For example, say if you want to decline the creation of appointments on weekend days, you can check for its appropriate condition within the **ActionBegin** event.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
)

```

```

 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onActionBegin(args) {
 var weekEnds = [0, 6];
 if ((args.requestType === 'eventCreate' &&
weekEnds.indexOf((args.data[0].StartTime).getDay()) >= 0)) {
 args.cancel = true;
 }
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Meteor Showers in 2018", StartTime = new
DateTime(2018, 2, 14, 13, 0, 0), EndTime = new DateTime(2018, 2, 14, 14, 30,
0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 12, 0, 0), EndTime = new DateTime(2018, 2, 15, 14, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

## Edit

The same way the appointments such as normal, all-day, spanned or recurring events are created, it can be easily edited using any of the following ways.

- [Update using editor window](#)
- [Update using saveEvent method](#)

### Update using editor window

You can open the default editor window filled with appointment details by double clicking on the required events. It gets pre-filled with event options such as Subject, Location, Start and End time, All-day, timezone, description and other recurrence options, from which you can edit the desired field values and, then enter the **Save** button to update it.

**Note:** You can also single click on appointments, which opens the quick info popup with edit and delete options. Clicking on the **edit** option will open the default editor filled with event details and **delete** option will prompt for delete confirmation.

### Update using saveEvent method

The appointments can be edited and updated manually using the **saveEvent** method. The following code examples shows how to edit the normal and recurring events.

**Normal event** - Here, an event with ID **3** is edited and its subject is changed with a new text. When the modified data object is passed onto the **saveEvent** method, the changes gets reflected onto the original event. The **Id** field is mandatory in this edit process, where the modified event object should hold the valid **Id** value that exists in the Scheduler data source.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@using Syncfusion.EJ2.Buttons
@(Html.EJS().Button("btn1")
 .Content("EDIT")
 .Render()
)
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var data = {
 Id: 3,
 Subject: 'Testing-edited',
 StartTime: new Date(2018, 1, 11, 10, 0),
 EndTime: new Date(2018, 1, 11, 11, 0),
 IsAllDay: false
 };
 };
```

```

 scheduleObj.saveEvent(data);
 };
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 3,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
 });
 appData.Add(new AppointmentData
 {
 Id = 4,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 13, 10, 0, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Recurring event** - The following code example shows how to edit a single occurrence of a recurring event. In this case, the modified data should hold an additional field namely **RecurrenceID** mapping to its parent recurring event's Id value. Also, this modified occurrence will be considered as a new event in the Scheduler dataSource, where it is linked with its parent event through the **RecurrenceID** field value.

The `saveEvent` method takes 2 arguments, first one accepting the modified event data object and second argument accepting either of the 2 text values - `EditOccurrence` or `EditSeries`.

When the second argument is passed as `EditOccurrence`, which means that the passed event data is a single modified occurrence - whereas if the second argument is passed as `EditSeries`, it means that the modified data needs to be edited as a whole series and therefore no new event object will be maintained in the Scheduler dataSource.

In case of modifying the single occurrence, it is also necessary to update the `RecurrenceException` field of parent event altogether with the occurrence editing. To know more about how to set `RecurrenceException` values, refer the [recurring events](#) topic.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@using Syncfusion.EJ2.Buttons
@(Html.EJS().Button("btn1")
 .Content("EDIT")
 .Render()
)
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var data = new
ej.data.DataManager(scheduleObj.getCurrentViewEvents()).executeLocal(new
ej.data.Query().where('RecurrenceID', 'equal', 3))[0];
 data.Subject = "Edited";
 scheduleObj.saveEvent(data, 'EditOccurrence');
 };
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
```

```

}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 3,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=3",
 });
 appData.Add(new AppointmentData
 {
 Id = 4,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 12, 11, 0, 0),

 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public string RecurrenceRule { get; set; }
}

```

#### Updating events in database at server-side

While editing the normal events in the Scheduler, **update** action takes place and the following code example describes how to update event into database at server side.

```
`sh
```

```
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
```

```
{
```

```
var value = (param.action == "update") ? param.value : param.changed[0];
```

```
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
```

```
if (filterData.Count() > 0)
```

```
{
```

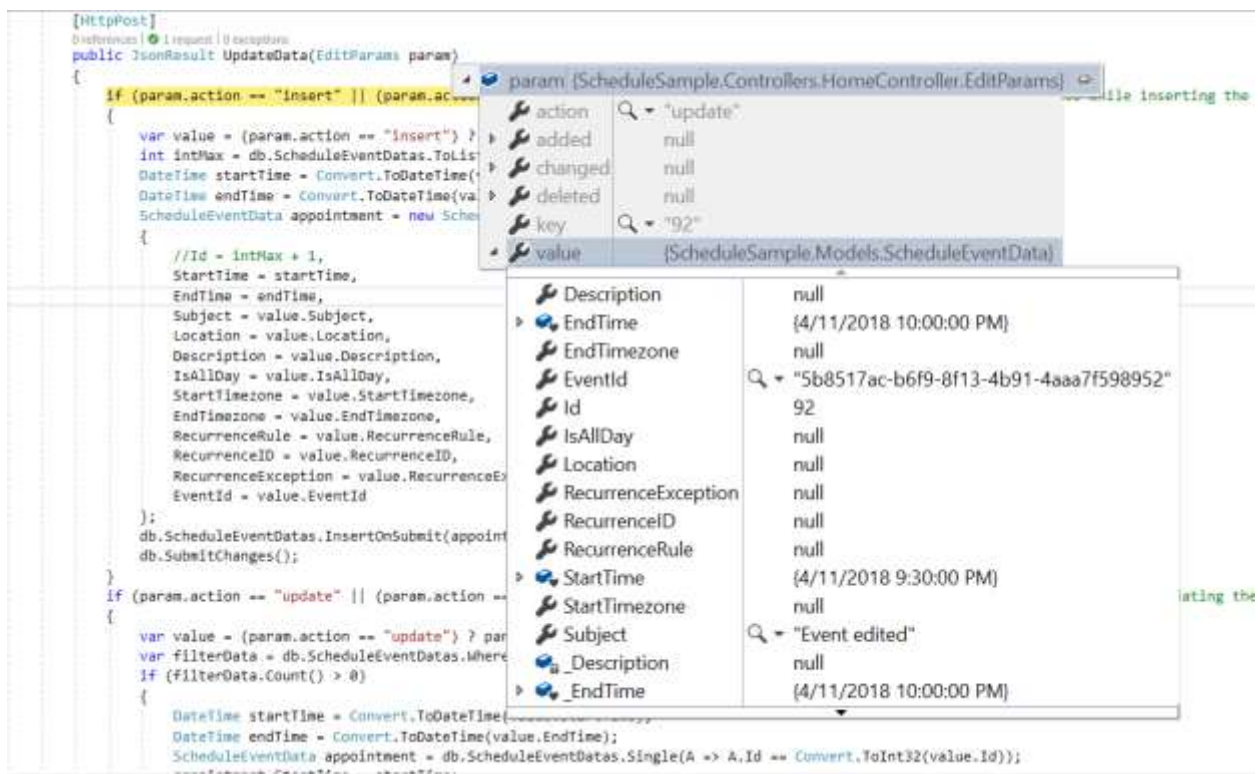

```
DateTime startTime = Convert.ToDateTime(value.StartTime);
```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```

ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime;
appointment.EndTime = endTime;
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}

```

*How to edit a single occurrence or entire series and update it in database at server-side*  
The recurring appointments can be edited in either of the following two ways.

- Single occurrence

- Entire series

**Editing single occurrence** - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or entire series. From this, if you choose to select **EDIT EVENT** option, a single occurrence of the recurring appointment alone will be edited. The following process takes place while editing a single occurrence,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the **RecurrenceID** field will be added to it, that holds the **Id** value of the parent recurring event. Also, a new **Id** will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate **RecurrenceException** field to hold the edited occurrence appointment's date collection.

Therefore, when a single occurrence is edited from a recurring event, the batch action takes place by allowing both the **Add** and **Edit** action requests to take place together.

**Note:** In case, if you edit an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get updated. In this case, **update** action alone takes place on the edited occurrence object on the database.

```
`sh
```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
```

```
{
```

```
var value = (param.action == "insert") ? param.value : param.added[0];
```

```
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
```

```
DateTime startTime = Convert.ToDateTime(value.StartTime);
```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = new ScheduleEventData()
```

```
{
```

```
Id = intMax + 1,
```

```
StartTime = startTime,
```

```
EndTime = endTime,
```

```
Subject = value.Subject,
```

```
IsAllDay = value.IsAllDay,
```

```
StartTimezone = value.StartTimezone,
```

```
EndTimezone = value.EndTimezone,
```

```
RecurrenceRule = value.RecurrenceRule,
```

```
RecurrenceID = value.RecurrenceID,
```

```

FollowingID = value.FollowingID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime;
appointment.EndTime = endTime;
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.FollowingID = value.FollowingID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}

```

**Editing entire series** - When you select an option **EDIT SERIES** from the popup that opens on double clicking the recurring event, the whole recurring series will be updated with the newly provided value. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences will be removed from the dataSource and simply the single parent data will be updated.

This action of editing entire series also leads to the batch process, as both the **Delete** and **Edit** action takes place together.

```
`sh
```

```
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment
```

```
{
```

```
var value = (param.action == "update") ? param.value : param.changed[0];
```

```
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
```

```
if (filterData.Count() > 0)
```

```
{
```

```
DateTime startTime = Convert.ToDateTime(value.StartTime);
```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id == Convert.ToInt32(value.Id));
```

```
appointment.StartTime = startTime;
```

```
appointment.EndTime = endTime;
```

```
appointment.StartTimezone = value.StartTimezone;
```

```
appointment.EndTimezone = value.EndTimezone;
```

```
appointment.Subject = value.Subject;
```

```
appointment.IsAllDay = value.IsAllDay;
```

```
appointment.RecurrenceRule = value.RecurrenceRule;
```

```
appointment.RecurrenceID = value.RecurrenceID;
```

```
appointment.RecurrenceException = value.RecurrenceException;
```

```
}
```

```
db.SubmitChanges();
```

```
}
```

```
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of code will execute while removing the appointment
```

```
{
```

```
if (param.action == "remove")
```

```
{
```

```
int key = Convert.ToInt32(param.key);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
```

```
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
```

```

}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`

```

**Note:** To know more about handling recurrence exceptions, refer the [Adding exceptions](#) topic.

#### *How to edit from the current and following events of a series*

The recurring appointments can be edited from current and following events when enable the property `editFollowingEvents`.

**Editing Following Events** - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or Edit Following Events or entire series. From this, if you choose to select **EDIT FOLLOWING EVENTS** option, a current and following events of the recurring appointment will be edited. The following process takes place while editing a following events,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the `followingID` field will be added to it, that holds the `id` value of the immediate parent recurring event. Also, a new `id` will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate `recurrenceRule` field to hold the modified occurrence appointment's end date.

Therefore, when a following events are edited from a recurring event, the batch action takes place by allowing the `Add`, `Edit` and `Delete` action requests to take place together.

```
`sh
```

```

if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);

```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
 Id = intMax + 1,
 StartTime = startTime,
 EndTime = endTime,
 Subject = value.Subject,
 IsAllDay = value.IsAllDay,
 StartTimezone = value.StartTimezone,
 EndTimezone = value.EndTimezone,
 RecurrenceRule = value.RecurrenceRule,
 RecurrenceID = value.RecurrenceID,
 FollowingID = value.FollowingID,
 RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
 var value = (param.action == "update") ? param.value : param.changed[0];
 var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
 if (filterData.Count() > 0)
 {
 DateTime startTime = Convert.ToDateTime(value.StartTime);
 DateTime endTime = Convert.ToDateTime(value.EndTime);
 ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
 Convert.ToInt32(value.Id));
 appointment.StartTime = startTime;
 appointment.EndTime = endTime;
 appointment.StartTimezone = value.StartTimezone;
 appointment.EndTimezone = value.EndTimezone;
 appointment.Subject = value.Subject;
 }
}
```

```

appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.FollowingID = value.FollowingID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDats.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDats.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDats.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDats.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
,

```

#### *Restricting edit action based on specific criteria*

You can also dynamically prevent the editing of appointments on Scheduler. For example, say if you want to decline the updating of appointments on non-working hours, you can check for its appropriate condition within the `ActionBegin` event.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")

```

```

.Width("100%")
.Height("550px")
.Views(ViewBag.view)
.ActionBegin("onActionBegin")
.EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
.SelectedDate(new DateTime(2018, 2, 15))
.Render()
)
<script type="text/javascript">
 function onActionBegin(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 if (args.requestType == 'eventChange') {
 var weekEnds = [0, 6];
 var data = args.data;
 var weekDay = weekEnds.indexOf(data.StartTime.getDay()) >= 0;
 var workHours =
((parseInt(scheduleObj.workHours.start.toString().slice(0, 2), 10) <=
data.StartTime.getHours())
 && (parseInt(scheduleObj.workHours.end.toString().slice(0,
2), 10)) >= data.StartTime.getHours());
 if (weekDay || !workHours) {
 args.cancel = true;
 }
 }
 }
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Meteo Showers in 2018", StartTime = new
DateTime(2018, 2, 14, 13, 0, 0), EndTime = new DateTime(2018, 2, 14, 14, 30,
0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 12, 0, 0), EndTime = new DateTime(2018, 2, 15, 14, 0,
0) });
}

```

```

 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

## Delete

The appointments can be deleted in either of the following ways,

- Selecting an appointment and clicking the delete icon from the quick popup that opens.
- Selecting an appointment and pressing **Delete** key.
- Selecting multiple appointments by tap holding an event and then continuously single clicking on other consecutive events and then clicking the **Delete** key.
- Double clicking on an event which opens the default event editor pre-filled with event details, and then choosing **Delete** button in it.

While performing all these above mentioned actions, a pop-up with a delete confirmation message will be displayed prompting either to proceed with deleting an appointment.

### *Deletion using editor window*

When you double click an event, the default editor window will be opened which includes a **Delete** button at the bottom left position to allow you to delete that particular appointment. When deleting an appointment through this editor window, the delete alert confirmation will not be asked and the event will be deleted immediately.

### *Deletion using deleteEvent method*

The appointments can be removed manually using the **deleteEvent** method. The following code examples shows how to edit the normal and recurring events.

**Normal event** - You can delete the normal appointments of Scheduler by simply passing its **Id** value or the entire event object collection to the **deleteEvent** method.

## CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Button("btn1")
 .Content("DELETE")
 .Render()
)
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

```
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.deleteEvent(2);
 };
</script>
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 13, 10, 0, 0),
 IsAllDay = false,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}
```

**Recurring Event** - The recurring events can be removed as an entire series or simply removing single occurrence by using the `deleteEvent` method which takes in either the `DeleteSeries` or `DeleteOccurrence` parameters. The following code example shows how to delete entire series.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Button("btn1")
 .Content("DELETE")
 .Render()
)
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var Data = {
 Id: 2,
 Subject: 'Vacation',
 RecurrenceID: 2,
 StartTime: new Date(2018, 1, 12, 11, 0),
 EndTime: new Date(2018, 1, 12, 12, 0),
 IsAllDay: false,
 RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=3'
 };
 scheduleObj.deleteEvent(Data, 'DeleteSeries');
 };
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
```

```

{
 Id = 1,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=3",
});
appData.Add(new AppointmentData
{
 Id = 2,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 12, 11, 0, 0),
 EndTime = new DateTime(2018, 2, 12, 12, 0, 0),
 IsAllDay = false,
 RecurrenceRule = "FREQ=DAILY;INTERVAL=1;COUNT=2"
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public string RecurrenceRule { get; set; }
}

```

#### *Removing events from database at server-side*

While deleting the event from the Scheduler, **remove** action takes place and the following code example describes how to delete event from database at server side.

```
`sh
```

```
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
```

```
{
```

```
if (param.action == "remove")
```

```
{
```

```
int key = Convert.ToInt32(param.key);
```

```
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
```

```
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
```

```
}
```

```
else
```

```
{
```

```
foreach (var apps in param.deleted)
```

```
{
```

```

ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}

db.SubmitChanges();
}

```

*How to delete a single occurrence or entire series from Scheduler and update it in database at server-side*  
 The recurring events can be deleted in either of the following two ways.

- Single occurrence
- Entire series

**Single occurrence** - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or entire series. From this, if you choose to select **DELETE EVENT** option, a single occurrence of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate **RecurrenceException** field, to hold the deleted occurrence appointment's date collection.

Therefore, when a single occurrence is deleted from a recurring event, the **update** action takes place on the parent recurring event as shown in the following code example.

**Note:** In case, if you delete an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get removed. In this case, **delete** action takes place instead of **update** action and the parent recurring event object remains same with no changes.

```
`sh
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime;
appointment.EndTime = endTime;
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`
```

**Entire series** - When you select an option **DELETE SERIES** from the popup, the whole recurring series will be deleted. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences which are maintained as separate event objects will also be removed from the dataSource. This action of deleting entire series leads to **remove** action and removes one or more event objects at the same time.

```
`sh
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
```

```

{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
,

```

#### *How to delete only the current and following events of a series*

The recurring events can be deleted from current and following events only when enable `editFollowingEvents` property.

**Delete Following Events** - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or Following Events or entire series. From this, if you choose to select **FOLLOWING EVENT** option, a current and following events of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence and the following events in same series will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceRule` field, to update the end date of the recurring events.

Therefore, when following events are deleted from a recurring event, the `remove` and `update` action takes place on the immediate parent recurring event as shown in the following code example.

```

`sh
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));

```

```
if (filterData.Count() > 0)
{
 DateTime startTime = Convert.ToDateTime(value.StartTime);
 DateTime endTime = Convert.ToDateTime(value.EndTime);
 ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
 Convert.ToInt32(value.Id));
 appointment.StartTime = startTime;
 appointment.EndTime = endTime;
 appointment.StartTimezone = value.StartTimezone;
 appointment.EndTimezone = value.EndTimezone;
 appointment.Subject = value.Subject;
 appointment.IsAllDay = value.IsAllDay;
 appointment.RecurrenceRule = value.RecurrenceRule;
 appointment.RecurrenceID = value.RecurrenceID;
 appointment.FollowingID = value.FollowingID;
 appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
 if (param.action == "remove")
 {
 int key = Convert.ToInt32(param.key);
 ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
 if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
 }
 else
 {
 foreach (var apps in param.deleted)
 {
 ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
 if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
 }
 }
}
```

```

}
}
db.SubmitChanges();
}
`

```

### Drag and drop

When you drag and drop a normal event on the Scheduler, the event editing action takes place. When a recurring event is drag and dropped on a desired time range, the batch action explained in [Editing a single occurrence](#) process will takes place - thus allowing both the [Add](#) and [Edit](#) action to take place together.

**Note:** By default, when you drag a recurring instance, only the occurrence of the event gets edited and not a whole series.

### Resize

When you resize a normal event on the Scheduler, the event editing action takes place. When a recurring event is resized to a new desired time, the batch action explained in [Editing a single occurrence](#) process will takes place - thus allowing both the [Add](#) and [Edit](#) action to take place together.

**Note:** By default, when you resize a recurring instance, only the occurrence of the event gets edited and not a whole series.

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to knows how to present and manipulate data.

### Virtual scrolling in ASP.NET MVC Schedule control

To achieve better performance in the Scheduler when loading a large number of resources and events, we have added virtual scrolling support to load a large set of resources and events instantly as you scroll. You can dynamically load large number of resources and events in the Scheduler by setting [true](#) to the [allowVirtualScrolling](#) property within the view specific settings. The virtual loading of events is possible in Agenda view, by setting [allowVirtualScrolling](#) property to [true](#) within the agenda view specific settings.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .SelectedDate(new DateTime(DateTime.Today.Year, 4, 1))
 .CurrentView(View.TimelineMonth)
 .Views(view => {
 view.Option(View.TimelineMonth).AllowVirtualScrolling(true).Add();

 view.Option(View.TimelineYear).Orientation(Orientation.Vertical).AllowVirtualScrolling(true).Add();
 })
 .Group(group =>
 group.EnableCompactView(false).Resources(ViewBag.Resource)
 .Resources(res => {

```

```

res.DataSource(ViewBag.resourcesData).Field("ResourceId").Title("Resource").
Name("Resources").TextField("Text").IdField("Id").ColorField("Color").AllowMultiple(true).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = this.generateStaticEvents(new DateTime(2018, 4, 1),
300, 12);
 ViewBag.resourcesData = this.GenerateResourceData(1, 300);

}

```

**Note:** For now, the virtual loading of resources and events is not supported in **MonthAgenda**, **Year** and **TimelineYear** (Horizontal Orientation) views.

#### Enabling lazy loading for appointments

The lazy loading feature provides a convenient way to efficiently load resource appointments into the Scheduler using an on-demand approach. With this feature, you can seamlessly load a large volume of appointment data into the Scheduler without experiencing any performance degradation.

By default, the Scheduler fetches all the relevant appointments from the server with in the current date range. However, enabling this feature will trigger query requests to the server for appointment retrieval whenever new resources are rendered due to scroll actions. These queries contain the resource IDs of currently displayed resources along with current date range, which can be passed as a comma-separated string. In the server controller, these resource IDs are parsed to filter the necessary appointments to render in the scheduler.

When you enable this feature, the Scheduler becomes capable of fetching events from remote services only for the current view port alone to optimize the data retrieval. The remaining appointment data is fetched from the server on-demand based on currently rendered view port resources as you scroll through the scheduler content.

To enable this feature, you have to set the [EnableLazyLoading](#) property to `true` within the view specific settings.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .SelectedDate(new DateTime(DateTime.Today.Year, 4, 1))
 .CurrentView(View.TimelineMonth)
 .Views(view => {
 view.Option(View.TimelineMonth).EnableLazyLoading(true).Add();
 })
 .Group(group =>
group.EnableCompactView(false).Resources(ViewBag.Resource)
 .Resources(res => {

res.DataSource(ViewBag.resourcesData).Field("ResourceId").Title("Resource").
Name("Resources").TextField("Text").IdField("Id").ColorField("Color").Add();
 }).EventSettings(es => es.DataSource(dataManager =>
 {

dataManager.Url("https://services.syncfusion.com/aspnet/production/api/VirtualEventData").CrossDomain(true).Adaptor("WebApiAdaptor");
 })).Readonly(true)
 .Render()
)
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.resourcesData = this.GenerateResourceData(1, 1000);
 string[] resources = new string[] { "Resources" };
 ViewBag.Resource = resources;
 return View();
}
private List<ResourceData> GenerateResourceData(int start, int end)
{
 List<ResourceData> resources = new List<ResourceData>(300);
 var colors = new string[] { "#ff8787", "#9775fa", "#748ffc", "#3bc9db",
"#69db7c",
"#fdd835", "#748ffc", "#9775fa", "#df5286", "#7fa900",
"#fec200", "#5978ee", "#00bdae", "#ea80fc" };
 for (int a = start; a <= end; a++)
 {
 int index = a % colors.Length;
 index = index == 0 ? (colors.Length / a):index;
 resources.Add(new ResourceData
 {

```

```

 Id = a,
 Text = "Resource " + a,
 Color = colors[index]
 });
}
return resources;
}
class ResourceData
{
 public int Id { get; set; }
 public string Text { get; set; }
 public string Color { get; set; }
}

```

Here's the server-side controller code that retrieves appointment data based on the resource IDs provided as query parameters:

```

`c#
using Microsoft.AspNetCore.Mvc;
using System.Collections.Generic;
using System;
using Microsoft.EntityFrameworkCore;
using System.Linq;
using System.ComponentModel.DataAnnotations;
using Microsoft.AspNetCore.OData.Query;
namespace LazyLoadingServices.Controllers
{
 public class VirtualEventDataController : Controller
 {
 private readonly EventsContext dbContext;
 [HttpGet]
 [EnableQuery]
 [Route("api/VirtualEventData")]
 public IActionResult GetData([FromQuery] Params param)
 {
 IQueryable<EventData> query = dbContext.Events;
 // Filter the appointment data based on the ResourceId query params.
 if (!string.IsNullOrEmpty(param.ResourceId))
 {
 string[] resourceId = param.ResourceId.Split(',');
 }

```

```

query = query.Where(data => resourceId.Contains(data.ResourceId.ToString()));
}
return Ok(query.ToList());
}
}
public class Params
{
public DateTime? StartDate { get; set; }
public DateTime? EndDate { get; set; }
public string ResourceId { get; set; }
}
}
`

```

**Note:**

- The property will be effective, when large number of resources and appointments bound to the Scheduler.
- This property is applicable only when [resource grouping](#) is enabled in Scheduler.

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Editor window and quick popups

Scheduler makes use of popups and dialog to display the required notifications, as well as includes an editor window with event fields for making the appointment creation and editing process easier. You can also easily customize the editor window and the fields present in it, and can also apply validations on those fields.

#### Event editor

The editor window usually opens on the Scheduler, when a cell or event is double clicked. When a cell is double clicked, the detailed editor window opens in "Add new" mode, whereas when an event is double clicked, the same is opened in an "Edit" mode.

In mobile devices, you can open the detailed editor window in edit mode by clicking the edit icon on the popup, that opens on single tapping an event. You can also open it in add mode by single tapping a cell, which will display a **+** indication, clicking on it again will open the editor window.

**Note:** You can also prevent the editor window from opening, by rendering Scheduler in a **Readonly** mode or by doing code customization within the **PopupOpen** event.

#### *How to change the editor window header title and text of footer buttons*

You can change the header title and the text of buttons displayed at the footer of the editor window by changing the appropriate localized word collection used in the Scheduler.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 var L10n = ej.base.L10n;
 L10n.load({
 'en-US': {
 'schedule': {
 'saveButton': 'Add',
 'cancelButton': 'Close',
 'deleteButton': 'Remove',
 'newEvent': 'Add Event',
 },
 },
 });
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
}

```

```

public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public bool IsAllDay { get; set; }
}

```

#### *How to change the label text of default editor fields*

To change the default labels such as Subject, Location and other field names in the editor window, make use of the **Title** property available within the field option of **EventSettings**.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .SelectedDate(new DateTime(2018, 2, 15))
 .EventSettings(e => e.Fields(f => f.Subject(sub =>
sub.Name("Subject").Title("Summary"))
 .Location(loc => loc.Name("Location").Title("Location"))
 .Description(des => des.Name("Description").Title("Comments"))
 .StartTime(st => st.Name("StartTime").Title("From"))
 .EndTime(et => et.Name("EndTime").Title("To"))
)
 .DataSource(ViewBag.datasource)
)
.Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

```

```

}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Field validation

It is possible to validate the required fields of the editor window from client-side before submitting it, by adding appropriate validation rules to each field. The appointment fields have been extended to accept both **string** and **object** type values. To perform validations, it is necessary to specify object values for the event fields.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@{
 var validationRules = new Dictionary<string, object>() { { "required",
true } };
 var locationValidationRules = new Dictionary<string, object>() { {
"required", true }, { "regex", new string[] { "[a-zA-Z0-9-]*$", "Special
character(s) not allowed in this field" } } };
 var descriptionValidationRules = new Dictionary<string, object>() { {
"required", true }, { "minLength", 5 }, { "maxLength", 500 } };
}
@(Html.EJS().Schedule("schedule")
.Width("100%")
.Height("650px")
.EventSettings(e => e.Fields(f => f.Subject(sub =>
sub.Name("Subject").Validation(validationRules))
.Location(loc =>
loc.Name("Location").Validation(locationValidationRules))
.Description(des =>
des.Name("Description").Validation(descriptionValidationRules))
.StartTime(st =>
st.Name("StartTime").Validation(validationRules))
.EndTime(et => et.Name("EndTime").Validation(validationRules))
)
.DataSource(ViewBag.datasource)
)
.SelectedDate(new DateTime(2018, 2, 15))
.Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 }
}

```

```

 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Note:** Applicable validation rules can be referred from [form validation](#) documentation.

#### Add additional fields to the default editor

The additional fields can be added to the default event editor by making use of the **PopupOpen** event which gets triggered before the event editor opens on the Scheduler. The **PopupOpen** is a client-side event that triggers before any of the generic popups opens on the Scheduler. The additional field (any of the form elements) should be added with a common class name **e-field**, so as to handle and process those additional data along with the default event object. In the following example, an additional field **Event Type** has been added to the default event editor and its value is processed accordingly.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 if (args.type === 'Editor') {
 // Create required custom elements in initial time

```

```

 if (!args.element.querySelector('.custom-field-row')) {
 var row = ej.base.createElement('div', { className: 'custom-
field-row' });
 var formElement = args.element.querySelector('.e-schedule-
form');
 formElement.firstChild.insertBefore(row,
args.element.querySelector('.e-title-location-row'));
 var container = ej.base.createElement('div', { className:
'custom-field-container' });
 var inputEle = ej.base.createElement('input', {
 className: 'e-field', attrs: { name: 'EventType' }
 });
 container.appendChild(inputEle);
 row.appendChild(container);
 var dropDownList = new ej.dropdowns.DropDownList({
 dataSource: [
 { text: 'Public Event', value: 'public-event' },
 { text: 'Maintenance', value: 'maintenance' },
 { text: 'Commercial Event', value: 'commercial-
event' },
 { text: 'Family Event', value: 'family-event' }
],
 fields: { text: 'text', value: 'value' },
 value: (args.data).EventType,
 floatLabelType: 'Always', placeholder: 'Event Type'
 });
 dropDownList.appendTo(inputEle);
 inputEle.setAttribute('name', 'EventType');
 }
 }
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 });
}

```

```

 IsAllDay = false,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

#### *Customizing the default time duration in editor window*

In default event editor window, start and end time duration are processed based on the **interval** value set within the **TimeScale** property. By default, **interval** value is set to 30, and therefore the start/end time duration within the event editor will be in a 30 minutes time difference. You can change this duration value by changing the **duration** option within the **PopupOpen** event as shown in the following code example.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 if (args.type === 'Editor') {
 args.duration = 60;
 }
 }
</script>

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

```

```

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

#### *How to prevent the display of editor and quick popups*

It is possible to prevent the display of editor and quick popup windows by passing the value `true` to `cancel` option within the `PopupOpen` event.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 args.cancel = true;
 }
</script>

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 }
}

```

```

 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the **PopupOpen** event are as follows.

| Type            | Description                                     |
|-----------------|-------------------------------------------------|
| Editor          | For Detailed editor window.                     |
| QuickInfo       | For Quick popup which opens on cell click.      |
| EditEventInfo   | For Quick popup which opens on event click.     |
| ViewEventInfo   | For Quick popup which opens on responsive mode. |
| EditorContainer | For more event indicator popup.                 |

### Quick popups

The quick info popups are the ones that gets opened, when a cell or appointment is single clicked on the desktop mode. On single clicking a cell, you can simply provide a subject and save it. Also, while single clicking on an event, a popup will be displayed where you can get the overview of the event information. You can also edit or delete those events through the options available in it.

By default, these popups are displayed over cells and appointments of Scheduler and to disable this action, set **false** to **ShowQuickInfo** property.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")

```

```

 .Width("100%")
 .Height("550px")
 .ShowQuickInfo(false)
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Note:** The quick popup that opens while single clicking on the cells are not applicable on mobile devices.

### [How to open Quick Info popup on multiple cell selection](#)

By default the **QuickInfo** popup will open on single click of the cell. To open the quick info popup on multiple cell selection, you need to select the cells and press **enter** key. You can open this popup immediately after multiple cell selection by setting up **true** to **QuickInfoOnSelectionEnd** property where as its default value is **false**.

## CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS() .Schedule ("schedule")
 .Width ("100%")
 .Height ("550px")
 .QuickInfoOnSelectionEnd (true)
 .Render ()
)
```

### DATA.CS

```
public ActionResult Index()
{
 return View();
}
```

#### *How to change the watermark text of quick popup subject*

By default, **Add Title** text is displayed on the subject field of quick popup. To change the default watermark text, change the value of the appropriate localized word collection used in the Scheduler.

```
`csharp
var L10n = ej.base.L10n;
L10n.load({
 'en-US': {
 'schedule': {
 'addTitle' : 'New Title'
 }
 }
});
`
```

#### *Customizing quick popups*

The look and feel of the built-in quick popup window, which opens when single clicked on the cells or appointments can be customized by making use of the **QuickInfoTemplates** property of the Scheduler. There are 3 sub-options available to customize them easily,

- header - Accepts the template design that customizes the header part of the quick popup.
- content - Accepts the template design that customizes the content part of the quick popup.
- footer - Accepts the template design that customizes the footer part of the quick popup.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS() .Schedule ("schedule")
 .Width ("100%")
 .Height ("550px")
 .QuickInfoTemplates (qt => qt.Header ("#headerTemplate")
 .Content ("#contentTemplate")
)
)
```

```

 .Footer("#footerTemplate")
)
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<style>
 .e-textlabel {
 font-weight: bold;
 padding-right: 5px;
 }
 .custom-event-editor td {
 padding: 5px;
 }
 .e-quick-popup-wrapper .e-cell-content {
 padding: 0 10px 10px 10px;
 }
 .e-quick-popup-wrapper .e-cell-content div {
 padding-bottom: 10px;
 }
 .e-quick-popup-wrapper .e-cell-content .e-field {
 border-left-width: 0;
 border-top-width: 0;
 border-right-width: 0;
 height: 25px;
 width: 100%;
 }
 .e-quick-popup-wrapper .e-event-content {
 display: flex;
 }
 .e-quick-popup-wrapper .e-event-content img {
 width: 100px;
 }
 .e-quick-popup-wrapper .e-event-header {
 position: absolute;
 right: 0;
 }
 .e-quick-popup-wrapper .e-cell-footer .e-event-create,
 .e-quick-popup-wrapper .e-event-footer .e-event-edit {

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Note:** The quick popup in adaptive mode can also be customized using `QuickInfoTemplates` using `e-device` class.

*Customizing timezone collection in the editor window*

By default, the timezone collections in the editor window have been loaded with built-in timezone collections. Now we can be able to customize the timezone collections using the `TimezoneDataSource` property with the collection of `TimezoneFields` data.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .TimezoneDataSource : ([
 { Value: 'Pacific/Niue', Text: 'Niue' },

```

```

 { Value: 'Pacific/Pago_Pago', Text: 'Pago Pago' },
 { Value: 'Pacific/Honolulu', Text: 'Hawaii Time' },
 { Value: 'Pacific/Rarotonga', Text: 'Rarotonga' },
 { Value: 'Pacific/Tahiti', Text: 'Tahiti' },
])
 .SelectedDate(new DateTime(2020, 1, 15))
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Explosion of Betelgeuse Star",
 StartTime= new DateTime(2023, 1, 15, 10, 0, 0),
 EndTime= new DateTime(2023, 1, 15, 12, 30, 0),
 IsAllDay= false
 });
 appData.Add(new AppointmentData
 {

 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

## Customizing event editor using template

The event editor window can be customized by making use of the `EditorTemplate` option. Here, the custom window design is built with the required fields using the script template and its type should be of **text/x-template**.

Each field defined within template should contain the **e-field** class, so as to allow the processing of those field values internally. The ID of this customized script template section is assigned to the

**EditorTemplate** option, so that these customized fields will be replaced onto the default editor window.

Note: **e-field** class only applicable for **DropDownList**, **DateTimePicker**, **MultiSelect**, **DatePicker**, **CheckBox** and **TextBox** components. Since we have processed the field values internally for the above mentioned components.

As we are using our Syncfusion sub-components within our editor using template in the following example, the custom defined form elements needs to be configured as required Syncfusion components such as **DropDownList** and **DateTimePicker** within the **PopupOpen** event. This particular step can be skipped, if the user needs to simply use the usual form elements.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .EditorTemplate("#EventEditorTemplate")
 .ShowQuickInfo(false)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<style>
 .custom-event-editor .e-textlabel {
 padding-right: 15px;
 text-align: right;
 }
 .custom-event-editor td {
 padding: 7px;
 padding-right: 16px;
 }
</style>
<script id="EventEditorTemplate" type="text/template">
 <table class="custom-event-editor" width="100%" cellpadding="5">
 <tbody>
 <tr>
 <td class="e-textlabel">Summary</td>
 <td colspan="4">
 <input id="Subject" class="e-field e-input" type="text"
value="" name="Subject" style="width: 100%" />
 </td>
 </tr>

 public bool IsAllDay { get; set; }
}

```

#### *How to customize header and footer using template*

The editor window's header and footer can be enhanced with custom designs using the [EditorHeaderTemplate](#) and [EditorFooterTemplate](#) options. To achieve this, create a script template that includes the necessary fields. Ensure that the template type is set to **text/x-template**.

In this demo, we tailor the editor's header according to the appointment's subject field using the [EditorHeaderTemplate](#). Furthermore, we make use of the [EditorFooterTemplate](#) to handle the functionality of validating specific fields before proceeding with the save action or canceling it if validation requirements are not

met.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("scheduler")
.Width("100%")
.Height("550px")
.PopupOpen("onPopupOpen")
.EventSettings(new ScheduleEventSettings { DataSource = ViewBag.datasource
}))
.EditorHeaderTemplate("#editor-header")
.EditorFooterTemplate("#editor-footer")
.Render()
)

```

```

<style>

}

```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the `popupClose` event are as follows.

| Type                      | Description                                     |
|---------------------------|-------------------------------------------------|
| ----- -----               |                                                 |
| Editor                    | For Detailed editor window.                     |
| QuickInfo                 | For Quick popup which opens on cell click.      |
| EditEventInfo             | For Quick popup which opens on event click.     |
| ViewEventInfo             | For Quick popup which opens on responsive mode. |
| EventContainer            | For more event indicator popup.                 |
| RecurrenceAlert           | For edit recurrence event alert popup.          |
| DeleteAlert               | For delete confirmation popup.                  |
| ValidationAlert           | For validation alert popup.                     |
| RecurrenceValidationAlert | For recurrence validation alert popup.          |

#### More events indicator and popup

When the number of appointments count that lies on a particular time range \* default appointment height exceeds the default height of a cell in month view and all other timeline views, a + more text indicator will be displayed at the bottom of those cells. This indicator denotes that the cell contains few more appointments in it and clicking on that will display a popup displaying all the appointments present on that day.

**Note:** To disable this option of showing popup with all hidden appointments, while clicking on the text indicator, you can do code customization within the `PopupOpen` event.

The same indicator is displayed on all-day row in calendar views such as day, week and work week views alone, when the number of appointment count present in a cell exceeds three. Clicking on the text

indicator here will not open a popup, but will allow the expand/collapse option for viewing the remaining appointments present in the all-day row.

The following code example shows how to disable the display of such popups while clicking on the more text indicator.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .CurrentView(View.Month)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 if (args.type === 'EventContainer') {
 args.cancel = true;
 }
 }
</script>
```

### DATA.CS

```

#### *How to customize the popup that opens on more indicator*

The following code example shows you how to customize the default more indicator popup in which number of events rendered count on the day has been shown in the header.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .CurrentView(View.Month)
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 if (args.type === 'EventContainer') {
 var instance = new ej.base.Internationalization();
 var date = instance.formatDate(args.data.date, { skeleton:
'MMEd' });
 args.element.querySelector('.e-header-date').innerText = date;
 args.element.querySelector('.e-header-day').innerText = 'Event
count: ' + args.data.event.length;
 }
 }
</script>

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 }
}

```

```

 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();

#### *How to close the quick info popup manually*

You can close the quick info popup in scheduler by using the `closeQuickInfoPopup` public method. The following code example demonstrates the how to close quick info popup manually.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("Close Quick Info Popup").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings {
 dataSource: [{
 Id: 2,
 Subject: 'Milky Way as Melting pot',
 StartTime: new Date(2022, 2, 5, 20, 0, 0),
 EndTime: new Date(2022, 2, 5, 21, 0, 0)
 }]
 })
 .SelectedDate(new DateTime(2022, 2, 5))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
 document.getElementById('schedule').ej2_instances[0];
 scheduleObj.closeQuickInfoPopup();
 };
</script>

```

**DATA.CS**

```

 appData.Add(new AppointmentData

```

```

 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2022, 2, 15, 9, 30, 0), EndTime = new DateTime(2022, 2, 15, 11, 0,
0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Timezone

The Scheduler makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the **Timezone** property needs to be used. Apart from the default action of applying specific timezone to the Scheduler, it is also possible to set different time zone values for each appointments through the properties **StartTimezone** and **EndTimezone** which can be defined as separate fields within the event fields collection.

**Note:** **Timezone** property only applicable for the appointment processing and current time indication.

### Understanding date manipulation in JavaScript

The **new Date()** in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as **Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)** which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

### Scheduler with no timezone

When no specific time zone is set to Scheduler, appointments will be displayed based on the client system's timezone which is the default behavior. Here, the same appointment when viewed from different timezone will have different start and end times.

The following code example displays an appointment from 9.00 AM to 10.00 AM when you open the Scheduler from any of the timezone. This is because, we are providing the start and end time enclosing with **new Date()** which works based on the client browser's timezone.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Scheduler set to specific timezone**

When a time zone is set to Scheduler through **Timezone** property, the appointments will be displayed exactly based on the Scheduler timezone regardless of its client timezone. In the following code example, appointments will be displayed based on Eastern Time (UTC -05:00).

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Timezone("America/New_York")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{
 Id = 2,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

Display events on same time everywhere with no time difference

Setting **Timezone** to UTC for Scheduler will display the appointments on same time as in the database for all the users in different time zone.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Timezone("UTC")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData

```

```
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Set specific timezone for events

It is possible to set different timezone for Scheduler events by setting **StartTimezone** and **EndTimezone** properties within the **EventSettings** option. It allows each appointment to maintain different timezone and displays on Scheduler with appropriate time differences.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 StartTimezone = "Europe/Moscow",
 EndTimezone = "Europe/Moscow"
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string StartTimezone { get; set; }
 public string EndTimezone { get; set; }
}
```

Add or remove timezone names to/from the timezone collection

Instead of displaying all the timezone names within the timezone collection (more than 200 are displayed on the editor window timezone fields by default), you can customize the timezone collection at application end as shown in the following example.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 var data = [
 { Value: 'America/New_York', Text: '(UTC-05:00) Eastern Time' },
 { Value: 'UTC', Text: 'UTC' },
 { Value: 'Asia/Kolkata', Text: '(UTC+05:30) India Standard Time' }
];
 var timezoneData = ej.schedule.timezoneData;
 timezoneData.splice.apply(timezoneData, [0,
 timezoneData.length].concat(data));
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0)
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
```

```

public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
}

```

## Timezone methods

### offset

This method is used to calculate the difference between passed UTC date and timezone.

| Parameters        | Type   | Description              |
|-------------------|--------|--------------------------|
| ----- ----- ----- |        |                          |
| Date              | Date   | UTC time as date object. |
| Timezone          | String | Timezone.                |

Returns **number**

```

`sh
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
var timeZoneOffset = timezone.offset(date,"Europe/Paris");
console.log(timeZoneOffset); //-60
`

```

### convert

This method is used to convert the passed date from one timezone to another timezone.

| Parameters        | Type          | Description                                    |
|-------------------|---------------|------------------------------------------------|
| ----- ----- ----- |               |                                                |
| Date              | Date          | UTC time as date object.                       |
| fromOffset        | number/string | Timezone from which date need to be converted. |
| toOffset          | number/string | Timezone to which date need to be converted.   |

Returns **Date**

```

`sh
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
var convertedDate = timezone.convert(date, "Europe/Paris", "Asia/Tokyo");
var convertedDate1 = timezone.convert(date, 60, -360);
console.log(convertedDate); //2018-12-05T17:55:11.000Z
`

```

```
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
```

,

#### *add*

This method is used to add the time difference between passed UTC date and timezone.

| Parameters | Type | Description |
|------------|------|-------------|
|------------|------|-------------|

|       |       |       |
|-------|-------|-------|
| ----- | ----- | ----- |
|-------|-------|-------|

|      |      |                          |
|------|------|--------------------------|
| Date | Date | UTC time as date object. |
|------|------|--------------------------|

|          |        |           |
|----------|--------|-----------|
| Timezone | String | Timezone. |
|----------|--------|-----------|

Returns **Date**

```
`sh
```

```
// Assume your local timezone as IST/UTC+05:30
```

```
var timezone = new ej.schedule.Timezone();
```

```
var date = new Date(2018,11,5,15,25,11);
```

```
var convertedDate = timezone.add(date, "Europe/Paris");
```

```
console.log(convertedDate); //2018-12-05T05:25:11.000Z
```

,

#### *remove*

This method is used to remove the time difference between passed UTC date and timezone.

| Parameters | Type | Description |
|------------|------|-------------|
|------------|------|-------------|

|       |       |       |
|-------|-------|-------|
| ----- | ----- | ----- |
|-------|-------|-------|

|      |      |                     |
|------|------|---------------------|
| Date | Date | UTC as date object. |
|------|------|---------------------|

|          |        |           |
|----------|--------|-----------|
| Timezone | String | Timezone. |
|----------|--------|-----------|

Returns **Date**

```
`sh
```

```
// Assume your local timezone as IST/UTC+05:30
```

```
var timezone = new ej.schedule.Timezone();
```

```
var date = new Date(2018,11,5,15,25,11);
```

```
var convertedDate = timezone.remove(date, "Europe/Paris");
```

```
console.log(convertedDate); //2018-12-05T14:25:11.000Z
```

,

#### *removeLocalOffset*

This method is used to remove the local offset time from the date passed.

| Parameters | Type | Description |
|------------|------|-------------|
|------------|------|-------------|

|       |       |       |
|-------|-------|-------|
| ----- | ----- | ----- |
|-------|-------|-------|

| Date | Date | UTC as date object. |

Returns **Date**

```
`sh
```

```
// Assume your local timezone as IST/UTC+05:30
var timezone = new ej.schedule.Timezone();
var date = new Date(2018,11,5,15,25,11);
var convertedDate = timezone.removeLocalOffset(date);
console.log(convertedDate); //2018-12-05T15:25:11.000Z
`
```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

## Views

The Scheduler includes wide variety of view modes with unique configuration options for each view. The available view modes are Day, Week, Work Week, Month, Year, Agenda, Month Agenda, Timeline Day, Timeline Week, Timeline Work Week and Timeline Month, Timeline Year, out of which the **Week** view is set as active.

To navigate between different views and dates, the navigation options are available at the Scheduler header bar. The active view option is usually highlighted by default. The date range of the active view will also be displayed at the left corner of the header bar, clicking on which will open a calendar popup for the ease of desired date selection.

**Note:** By default, Scheduler displays the calendar views such as day, week, work week, month and agenda.

### Setting specific view on scheduler

As the Scheduler displays **Week** view by default, therefore to change the active view, set **currentView** property with the desired view name. The applicable view names that the Scheduler accepts are as follows,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

It is possible to display only the desired views on the Scheduler using the [e-schedule-views](#) property.

In the following example, the Scheduler displays 2 views namely, Week, and TimelineDay.

#### **CSHTML**

```
@using Syncfusion.EJ2.Schedule
@model List<ScheduleView>
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(Model)
 .Height("550px")
 .SelectedDate(new DateTime(2022, 2, 15))
 .Render()
)
```

#### **DATA.CS**

```
public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineDay }
 };
 ViewBag.view = viewOption;
 return View();
}
```

To configure Scheduler with different configurations on each view, refer the following code example. Here, the Week view displays the dates in **dd-MM-yyyy** format whereas the Month view hides the weekend days and also displays it in readonly mode.

#### **CSHTML**

```
@using Syncfusion.EJ2.Schedule
@model List<ScheduleView>
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(Model)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

#### **DATA.CS**

```
public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week,
 DateFormat = "dd-MMM-yyyy" },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month,
 ShowWeekend = false, Readonly = true }
 };
 ViewBag.view = viewOption;
 return View();
}
```

```
};
ViewBag.view = viewOption;
return View();
}
```

### View specific configuration

There are scenarios where each view may need to have different configurations. For such cases, you can define the applicable scheduler properties within the `views` Property for each view option as depicted in the following examples. The fields available to be used within each view options are as follows.

| Property                            | Type       | Description                                                                                                                                                                         | Applicable views                                        |
|-------------------------------------|------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------|
| <code>option</code>                 | String     | It accepts the Scheduler view name, based on which we can define its related properties. The view names can be <code>Day</code> , <code>Week</code> and so on.                      | All views.                                              |
| <code>isSelected</code>             | Boolean    | It acts similar to the <code>currentView</code> property and defines the active view of the Scheduler.                                                                              | All views.                                              |
| <code>dateFormat</code>             | Date       | By default, Scheduler follows the date format as per the default culture assigned to it. When it is defined under specific view, only those assigned views follow this date format. | All views.                                              |
| <code>readonly</code>               | Boolean    | When set to <code>true</code> , prevents the CRUD actions on the respective view under where it is defined.                                                                         | All views.                                              |
| <code>resourceHeaderTemplate</code> | String     | The template option which is used to customize the resource header cells on the Scheduler. It gets applied only on the views, wherever it is defined.                               | All views.                                              |
| <code>dateHeaderTemplate</code>     | String     | The template option which is used to customize the date header cells and is applied only on the views, wherever it is defined.                                                      | All views.                                              |
| <code>eventTemplate</code>          | String     | The template option to customize the events background. It will get applied to the events of the view to which it is currently being defined.                                       | All views.                                              |
| <code>showWeekend</code>            | Boolean    | When set to <code>false</code> , it hides the weekend days of a week from the views on which it is defined.                                                                         | All views.                                              |
| <code>group</code>                  | GroupModel | Allows to set different resource grouping options on all available Scheduler view modes.                                                                                            | All views.                                              |
| <code>cellTemplate</code>           | String     | The template option to customize the work cells of the Scheduler and is applied only on the views, on which it is defined.                                                          | Applicable on all views except Agenda view.             |
| <code>workDays</code>               | Number[]   | It is used to set the working days on the Scheduler views.                                                                                                                          | Applicable on all views except Agenda view.             |
| <code>displayName</code>            | String     | When a particular view is customized to display with different intervals, this property allows the user to set different display name for each of the views.                        | Applicable on all views except Agenda and Month Agenda. |
| <code>interval</code>               | Number     | It allows to customize the default Scheduler views with different set of days, weeks, work weeks or months on the applicable view type.                                             | Applicable on all views except Agenda and Month Agenda. |

| **startHour** | String | It is used to specify the start hour, from which the Scheduler should be displayed. It accepts the time string in a short skeleton format and also, hides the time beyond the specified start time. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. |

| **endHour** | String | It is used to specify the end hour, at which the Scheduler ends. It accepts the time string in a short skeleton format. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| **timeScale** | [TimeScaleModel](#) | Allows to set different timescale configuration on each applicable view modes. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| **showWeekNumber** | Boolean | When set to **true**, shows the week number on the respective weeks. | Applicable on Day, Week, Work Week, and Month views. |

| **allowVirtualScrolling** | Boolean | It is used to enable or disable the virtual scrolling functionality. | Applicable on Agenda and Timeline views. |

| **headerRows** | [HeaderRowsModel](#) | Allows defining the custom header rows on timeline views of the Scheduler to display the year, month, week, date and hour label as an individual row. | Applicable only on all timeline views. |

#### Day view

Usually a day view displays a single day with all its related appointments. It is possible to customize the day view to display more number of days by extending the **e-schedule-views** property with **interval** option. You can also define any of the above defined properties within the **e-schedule-views** object definition as depicted in the following code example.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).DisplayName("3 Days").Interval(3).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 13))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
```

```

 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 3, 10, 10, 0, 0), EndTime = new DateTime(2023, 3, 10, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 3, 11, 9, 30, 0), EndTime = new DateTime(2023, 3, 11, 12, 0, 0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

**Note:** All the above defined properties can be accessed within Day view except `allowVirtualScrolling` and `headerRows`.

#### Week view

The Week view displays a count of 7 days (from Sunday to Saturday) with all its related appointments. The first day of the week can be changed using the `firstDayOfWeek` which accepts the integer (Sunday=0, Monday=1, Tuesday=2 and so on) value. You can navigate to a particular date in day view from the week view by clicking on the appropriate dates on the date header bar.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Week).DisplayName("2 Weeks").Interval(2).IsSelected(true).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource = ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 1, 19, 10, 0, 0), EndTime = new DateTime(2023, 1, 19, 12, 0, 0) });
 appData.Add(new AppointmentData

```

```

 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 1, 21,
9, 30, 0) , EndTime = new DateTime(2023, 1, 21, 12, 0, 0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

**Note:** All the above defined properties in the table can be accessed within Week and Work week views except `allowVirtualScrolling` and `headerRows`.

#### Work Week view

The Work week view displays only the working days of a week (count of 5 days) and its associated appointments. It is possible to customize the working days on the work week view by using the `workDays` property which accepts an array of integer values (such as Sunday=0, Monday=1, Tuesday=2 and so on). By default, it displays from Monday to Friday (5 days). You can also navigate to a particular date in the day view from the work week view by clicking on the appropriate dates in the date header bar.

The following code example depicts how to change the working days only on the **Work Week** view of the Scheduler.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.WorkWeek).WorkDays(ViewBag.workDays).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 14))
 .Render()
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workDays = new int[] { 1, 3, 5 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData

```

```

 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 1, 17, 10, 0, 0) , EndTime = new DateTime(2023, 1, 17, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 1, 19, 9, 30, 0) , EndTime = new DateTime(2023, 1, 19, 12, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** The Week, Work week and Day views can display the all-day row appointments in a separate all-day row with an expand/collapse option to view it.

#### Month view

A Month view displays the entire days of a particular month and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the month cells.

By default, when you try to create an appointment through Month view, it is considered as created for an entire day. You can explicitly change this behavior by unchecking the **All-day** option from editor window, so that it defaults to the start time duration as 9.00 AM and end time as 9.30 AM.

You can also have the **+ more** text indicator on each day cell of a Month view, clicking on which will allow you to view the hidden appointments of a day.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.ReadOnly(true).Option(View.Month).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
}

```

```

 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 2, 13, 10, 0, 0) , EndTime = new DateTime(2023, 2, 13, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 2, 17, 9, 30, 0) , EndTime = new DateTime(2023, 2, 17, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Seminar", StartTime = new DateTime(2023, 2, 22, 14, 30, 0) , EndTime = new DateTime(2023, 2, 22, 18, 0, 0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

### Year view

A Year view displays all the days of a particular year with months and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the year cells.

Year view is available in both the **Horizontal** and **Vertical** orientations. You can manage the orientation of year view through **views** property.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.ReadOnly(true).Option(View.Year).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData

```

```

 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 3, 4, 0, 0, 0) , EndTime = new DateTime(2023, 3, 5, 0, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 5, 1, 9, 30, 0) , EndTime = new DateTime(2023, 5, 1, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Seminar", StartTime = new DateTime(2023, 1, 2, 9, 30, 0) , EndTime = new DateTime(2023, 1, 2, 12, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** The year view also has module support. In that, you can get all the months of a particular year in a calendar view format. In that calendar view, appointment contained dates are highlighted with dots placed under the individual date. When you click on the date, the event popup will be displayed and the events will be listed.

#### Agenda view

The Agenda view lists out the appointments in a grid-like view for the next 7 days by default from the current date. The count of the days can be changed using the API `agendaDaysCount`. It allows virtual scrolling of dates by enabling the `allowVirtualScrolling` property. Also, you can enable or disable the display of days on Scheduler that has no appointments by setting true or false to the `hideEmptyAgendaDays` property.

The following code example depicts how to customize the display of events within Agenda view alone.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view =>
 {
 view.Option(View.Agenda)
 .EventTemplate("<div class='template-wrap'><div class='subject'>${Subject}</div></div>")
 .AllowVirtualScrolling(false)
 .Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource = ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 2, 13, 10, 0, 0), EndTime = new DateTime(2023, 2, 13, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 12, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** Schedule Height is mandatory to set in pixels for Agenda view alone.

#### *Month Agenda view*

A Month-Agenda view shows a month calendar, where clicking on a particular day will display the appointments present on that date below the calendar. The day with appointments are differentiated with a circular dot below the date of the calendar.

The following code example shows how to hide the weekend days on **MonthAgenda** view as well as the working days list is modified on Month Agenda view alone.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {

view.Option(View.MonthAgenda).WorkDays(ViewBag.workDays).ShowWeekend(false).
Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()

```

```

{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workDays = new int[] { 0, 3, 6 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 2, 12, 10, 0, 0), EndTime = new DateTime(2023, 2, 12, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Seminar", StartTime = new DateTime(2023, 2, 22, 14, 30, 0), EndTime = new DateTime(2023, 2, 22, 18, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

#### *Timeline views – Day, Week, Work Week*

Similar to the day view, timeline day view shows a single day with all its appointments where the time slots are displayed horizontally. By default, the cell height adjusts as per the height set to Scheduler.

When the number of appointments exceeds the visible area of the cells, the **+ more** text indicator will be displayed at the bottom to denote the presence of few more appointments in that time range.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {

view.Option(View.TimelineDay).StartHour("08:00").EndHour("20:00").Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
}

```

```

 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 13, 0, 0), EndTime = new DateTime(2023, 2, 15, 14, 0,
0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

Similar to the Week view, the timeline week view shows 7 days with its associated appointments with the time slots displayed horizontally.

### C#HTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.TimelineWeek).TimeScale(ts =>
ts.Enable(false)).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

 public ActionResult Index()
 {
 ViewBag.datasource = GetScheduleData();
 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData

```

```

 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

The following code example depicts how to display the timeline work week view on Scheduler,

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.TimelineWorkWeek).WorkDays(ViewBag.workDays).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workDays = new int[] { 1, 3, 5 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
}

```

```

 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** Clicking on the dates in the date header bar of Timeline day, Timeline week and Timeline work week will allow you to navigate to the Agenda view.

#### *Timeline Month view*

A Timeline Month view displays the current month days along with its appointments.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.TimelineMonth).ShowWeekend(false).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workDays = new int[] { 1, 2, 3 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 2, 10, 10, 0, 0), EndTime = new DateTime(2023, 2, 10, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 2, 10, 9, 30, 0), EndTime = new DateTime(2023, 2, 10, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Seminar", StartTime = new DateTime(2023, 2, 22, 14, 30, 0), EndTime = new DateTime(2023, 2, 22, 18, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** Clicking on the dates in the date header bar of Timeline month will allow you to navigate to the Timeline day view.

#### Timeline Year view

In Timeline Year view, each row depicts a single resource. Whereas in the vertical view, each resource is grouped parallelly as columns. Here, the resource grouping follows the tree-view like hierarchical grouping structure and can contain any level of child resources.

To make use of the timeline Year view on Scheduler, import and inject `TimelineYear` module from the `ej2-schedule` package.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.TimelineYear).ShowWeekend(false).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workDays = new int[] { 1, 2, 3 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Meeting", StartTime = new DateTime(2023, 3, 4, 0, 0, 0), EndTime = new DateTime(2023, 3, 5, 0, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Conference", StartTime = new DateTime(2023, 5, 1, 9, 30, 0), EndTime = new DateTime(2023, 5, 1, 12, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Seminar", StartTime = new DateTime(2023, 1, 2, 9, 30, 0), EndTime = new DateTime(2023, 1, 2, 12, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Resource grouping

The following code example depicts how to group the multiple resources on Timeline Year view and its relevant events are displayed accordingly under those resources.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").Add();

res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.TimelineYear).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasource))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor = "#cb6bb2" });
 rooms.Add(new RoomResource { RoomText = "ROOM 2", Id = 2, RoomColor = "#56ca85" });
 ViewBag.Rooms = rooms;
 // datasource for owner resources
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerGroupId = 1, OwnerColor = "#ffaa00" });
 owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2, OwnerGroupId = 2, OwnerColor = "#f8a398" });
 owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3, OwnerGroupId = 1, OwnerColor = "#7499e1" });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Rooms", "Owners" };
 return View();
}

public List<ResourceData> GetResourceData()
{

```

```

List<ResourceData> resourceData = new List<ResourceData>();
resourceData.Add(new ResourceData
{
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 1,
 RoomId = 1
});
resourceData.Add(new ResourceData
{
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 3,
 RoomId = 1
});
resourceData.Add(new ResourceData
{
 Id = 3,
 Subject = "Resource planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 2,
 RoomId = 2
});
return resourceData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
 public int RoomId { get; set; }
}
public class RoomResource
{
 public string RoomText { set; get; }
 public int Id { set; get; }
 public string RoomColor { set; get; }
}
public class OwnerResource
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
 public int OwnerGroupId { set; get; }
}

```

### Auto row height

Timeline Year view supports Auto row height. When the feature `rowAutoHeight` is enabled, the row height gets auto-adjusted based on the number of overlapping events occupied in the same time range. If you disable the Auto row height, you have the `+ more` text indicator on each day cell of a Timeline Year view, clicking on which will allow you to view the hidden appointments of a day.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .RowAutoHeight(true)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Seminar",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false
 });
 appData.Add(new AppointmentData
 {
 Id = 3,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false
 });
 appData.Add(new AppointmentData
 {
```

```

 Id = 4,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 12, 30, 0),
 IsAllDay = false
 });
 return appData;
}
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Extending view intervals

It is possible to customize the display of default number of days on different Scheduler view modes. For example, a day view can be extended to display 3 days by setting the `interval` option as 3 for the `Day` option within the `e-schedule-views` property as depicted in the following code example. In the same way, you can also display 2 weeks by setting interval 2 for the `Week` option.

You can provide the alternative display name for such customized views on the Scheduler header bar, by setting the appropriate `displayName` property.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).DisplayName("3 Days").Interval(3).Add();
 view.Option(View.Week).DisplayName("2
Weeks").Interval(2).IsSelected(true).Add();
 view.Option(View.Month).DisplayName("4 Months").Interval(4).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
}

```

```

 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

**Note:** The view intervals can be extended on all the Scheduler view modes except Agenda and Month-Agenda views.

## Calendar mode

The Scheduler supports the following two types of calendar mode.

- Gregorian Calendar
- Islamic Calendar

### Gregorian Calendar

The Scheduler by default displays the gregorian calendar dates which is the most widely used calendar in the world. The Gregorian calendar is a solar calendar which has 12 months with 28 to 31 days each. A year which is divisible by four is said to be a leap year in this calendar mode. A leap year usually has 366 days whereas the regular year has 365 days.

### Islamic Calendar

The Islamic Calendar, also known as the Hijri or Muslim calendar, is a lunar calendar which has 12 months in a year with 354 or 355 days. Each month of this calendar denotes the birth of the new lunar cycle and therefore, each month can have 29 or 30 days depending on the visibility of the moon. Here, the odd-numbered months have 30 days and the even months have 29 days.

**Note:** The current Islamic year is 1440 AH. Usually the Gregorian calendar runs from approximately 11 September 2018 to 30 August 2019 for this 1440 AH year.

The Scheduler has a property `CalendarMode` which is used to switch between the gregorian and islamic calendar modes. By default, it is set to `Gregorian` and to use it with Islamic calendar dates,

define the **CalendarMode** of Scheduler to **Islamic**. The following example depicts, how to display the Islamic calendar dates on Scheduler.

It requires the following CLDR data to be loaded using loadCldr function.

- numberingSystems.json
- ca-gregorian.json
- numbers.json
- timeZoneNames.json
- ca-islamic.json

**Note:** To know more information on, how to install the CLDR data, refer the [Internationalization](#) topic.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .CalendarMode(CalendarType.Islamic)
 .EnableRtl(true)
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script>
 document.addEventListener('DOMContentLoaded', function () {
 var scheduleObject =
 document.getElementById('schedule').ej2_instances[0];
 loadCultureFiles('de');
 scheduleObject.locale = 'de';
 });
 function loadCultureFiles(name) {
 var files = ['ca-gregorian.json', 'numberingSystems.json',
 'numbers.json', 'timeZoneNames.json', 'ca-islamic.json'];
 var loader = ej.base.loadCldr;
 var loadCulture = function (prop) {
 var val, ajax;
 if (files[prop] === 'numberingSystems.json') {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
 data/supplemental/' + files[prop], 'GET', false);
 } else {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
 data/main/' + name + '/' + files[prop], 'GET', false);
 }
 ajax.onSuccess = function (value) {
 val = value;
 };
 ajax.send();
 loader(JSON.parse(val));
 };
 for (var prop = 0; prop < files.length; prop++) {
 loadCulture(prop);
 }
 }
}
```

```
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2018, 2, 14, 9, 30, 0), EndTime = new DateTime(2018, 2, 14, 11, 0,
 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", StartTime = new
 DateTime(2018, 2, 15, 12, 0, 0), EndTime = new DateTime(2018, 2, 15, 14, 0,
 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
 2, 16, 9, 30, 0), EndTime = new DateTime(2018, 2, 16, 11, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Note:** However, this feature does not yet support recurrence options, which we are planning to add them in the next release.

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Multiple resources and grouping

Resources and grouping support allows the Scheduler to be shared by multiple resources. Also, the appointments of each resource are displayed under relevant resources. Each resource in the Scheduler is arranged in a column/row wise order, with individual spacing to display all its respective appointments on a single page. It also supports the multiple levels of grouping of resources, thus enabling the categorization of resources in a hierarchical structure and shows it either in expandable groups (Timeline views) or else vertical hierarchy one after the other (Calendar views).

It is also possible to assign one or more resources to the same appointment, by allowing multiple selection of resource options available in the event editor window.

The Scheduler groups the resources based on different criteria. It includes grouping appointments based on resources, grouping resources based on dates, and timeline scheduling. Also, the data for resources bind with Scheduler either as a local JSON collection or URL, retrieving data from remote data services.

### Resource fields

The default options available within the **Resources** collection are as follows,

| Field name     | Type    | Description                                                                                                                                                                                                                                                                                                                                                                                            |
|----------------|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Field          | String  | A value that binds to the resource field of event object.                                                                                                                                                                                                                                                                                                                                              |
| Title          | String  | It holds the title of the resource field to be displayed on the event editor window.                                                                                                                                                                                                                                                                                                                   |
| Name           | String  | A unique resource name used for differentiating various resource objects while grouping.                                                                                                                                                                                                                                                                                                               |
| AllowMultiple  | Boolean | When set to <b>true</b> , allows multiple selection of resource names, thus creating multiple instances of same appointment for the selected resources.                                                                                                                                                                                                                                                |
| DataSource     | Object  | Assigns the resource <b>DataSource</b> , where data can be passed either as an array of JavaScript objects, or else can create an instance of <a href="#">DataManager</a> in case of processing remote data and can be assigned to the <b>DataSource</b> property. With the remote data assigned to <b>DataSource</b> , check the available <a href="#">adaptors</a> to customize the data processing. |
| Query          | Query   | Defines the external <a href="#">Query</a> that will be executed along with the data processing.                                                                                                                                                                                                                                                                                                       |
| IdField        | String  | Binds the resource ID field name from the resources <b>DataSource</b> .                                                                                                                                                                                                                                                                                                                                |
| ExpandedField  | String  | Binds the <b>ExpandedField</b> name from the resources <b>DataSource</b> . It usually holds boolean value which decide whether the resource of timeline views is in collapse or expand state on initial load.                                                                                                                                                                                          |
| TextField      | String  | Binds the text field name from the resources <b>DataSource</b> . It usually holds the resource names.                                                                                                                                                                                                                                                                                                  |
| GroupIDField   | String  | Binds the group ID field name from the resource <b>DataSource</b> . It usually holds the value of resource IDs of parent level resources.                                                                                                                                                                                                                                                              |
| ColorField     | String  | Binds the color field name from the resource <b>DataSource</b> . The color value mapped in this field will be applied to the events of resources.                                                                                                                                                                                                                                                      |
| StartHourField | String  | Binds the start hour field name from the resource <b>DataSource</b> . It allows to provide different work start hour for the resources.                                                                                                                                                                                                                                                                |
| EndHourField   | String  | Binds the end hour field name from the resource <b>DataSource</b> . It allows to provide different work end hour for the resources.                                                                                                                                                                                                                                                                    |
| WorkDaysField  | String  | Binds the work days field name from the resources <b>DataSource</b> . It allows to provide different working days collection for the resources.                                                                                                                                                                                                                                                        |
| CssClassField  | String  | Binds the custom CSS class field name from the resources <b>DataSource</b> . It maps the CSS class written for the specific resources and applies it to the events of those resources.                                                                                                                                                                                                                 |

### Resource data binding

The data for resources can bind with Scheduler either as a local JSON collection or a service URL, retrieving resource data from remote data services.

#### Using local JSON data

The following code example depicts how to bind the local JSON data to the **DataSource** of **Resources** collection.

- Give the resource datasource in Index method
- Add the Scheduler code in View page

### CSHTML

```
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => { res.DataSource(ViewBag.Owners)
 .Field("OwnerId")
 .Title("Owners")
 .Name("Owners")
 .TextField("text")
 .IdField("id")
 .ColorField("color")
 .Add();
 })
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 string[] resources = new string[] { "Owners" };
 ViewBag.Resources = resources;
 List<OwnerRes> owners = new List<OwnerRes>();
 owners.Add(new OwnerRes { text = "Nancy", id = 1, color = "#ffaa00" });
 owners.Add(new OwnerRes { text = "Steven", id = 2, color = "#f8a398" });
 owners.Add(new OwnerRes { text = "Michael", id = 3, color = "#7499e1" });
});
ViewBag.Owners = owners;
return View();
}

public class OwnerRes
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
}
```

#### Using remote service URL

The following code example depicts how to bind the remote data for resources **dataSource**.

- Give the resource datasource in Index method
- Add the Scheduler code in View page

**CSHTML**

```
@(Html.EJS().Schedule("schedule")
.Width("100%")
.Height("550px")
.Group(group => group.Resources(ViewBag.Resources))
.Resources(res => {
 res.AllowMultiple(true)
 .DataSource(d =>
 d.Url("Home/GetResourceData")
 .Adaptor("UrlAdaptor")
 .CrossDomain(true)
)
 .Field("OwnerId")
 .Title("Owner")
 .Name("Owners")
 .TextField("text")
 .IdField("id")
 .ColorField("color")
 .Add();
})
.SelectedDate(new DateTime(2018, 4, 1))
.Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 string[] resources = new string[] { "Owners" };
 ViewBag.Resources = resources;
 return View();
}

public JsonResult GetResourceData()
{
 List<OwnerRes> owners = new List<OwnerRes>();
 owners.Add(new OwnerRes { text = "Nancy", id = 1, color = "#ffaa00" });
 owners.Add(new OwnerRes { text = "Steven", id = 2, color = "#f8a398" });
 owners.Add(new OwnerRes { text = "Michael", id = 3, color = "#7499e1" });
 return Json(owners);
}

public class OwnerRes
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
}
```

### Scheduler with multiple resources

It is possible to display the Scheduler in default mode without visually showcasing all the resources in it, but allowing to assign the required resources to the appointments through the event editor resource options.

The appointments belonging to the different resources will be displayed altogether on the default Scheduler, which will be differentiated based on the resource color assigned in the **Resources** (depicting to which resource that particular appointment belongs) collection.

**Example:** To display default Scheduler with multiple resource options in the event editor, ignore the group option and simply define the **Resources** property with all its internal options.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS() .Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Resources(res => {
 res.AllowMultiple(true)
 .DataSource(ViewBag.Owners)
 .Field("OwnerId")
 .Title("Owner")
 .Name("Owners")
 .TextField("OwnerText")
 .IdField("Id")
 .ColorField("OwnerColor")
 .Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 List<OwnerResources> owners = new List<OwnerResources>();
 owners.Add(new OwnerResources { OwnerText = "Nancy", Id = 1, OwnerColor
= "#ffaa00" });
 owners.Add(new OwnerResources { OwnerText = "Steven", Id = 2, OwnerColor
= "#f8a398" });
 owners.Add(new OwnerResources { OwnerText = "Michael", Id = 3,
OwnerColor = "#7499e1" });
 ViewBag.Owners = owners;
 return View();
}

public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
```

```

 Subject = "Workflow Analysis",
 StartTime = new DateTime(2023, 4, 3, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 3, 13, 0, 0),
 IsAllDay = false,
 OwnerId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 4, 13, 0, 0),
 IsAllDay = false,
 OwnerId = 2
 });
 resourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 5, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 5, 13, 0, 0),
 IsAllDay = false,
 OwnerId = 3
 });
 return resourceData;
}
public class OwnerResources
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
}

```

**Note:** Setting `AllowMultiple` to `true` in the above code example allows you to select multiple resources from the event editor and also creates multiple copies of the same appointment in the Scheduler for each resources while rendering.

### Resource grouping

Resource grouping support allows the Scheduler to group the resources in a hierarchical structure both as an expandable groups (Timeline views) and as vertical hierarchy displaying resources one after the other (Resources view).

Scheduler supports both single and multiple levels of resource grouping that can be customized both in timeline and vertical Scheduler views.

*Vertical resource view*

The following code example displays how the multiple resources are grouped and its events are portrayed in the default calendar views.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.ByGroupID(false).Resources(ViewBag.Resources))
 .Resources(res => {
 res.DataSource(ViewBag.Projects).Field("ProjectId").Title("Choose
Project").Name("Projects").TextField("text").IdField("id").ColorField("color")
 }.Add());

res.AllowMultiple(true).DataSource(ViewBag.Categories).Field("CategoryId").Title("Category").Name("Categories").TextField("text").IdField("id").ColorField("color").Add();
 })
 .Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.Month).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetTimelineResourceData();
 // datasource for project resources
 List<ResourceFields> projects = new List<ResourceFields>();
 projects.Add(new ResourceFields { text = "PROJECT 1", id = 1, color = "#cb6bb2" });
 projects.Add(new ResourceFields { text = "PROJECT 2", id = 2, color = "#56ca85" });
 projects.Add(new ResourceFields { text = "PROJECT 3", id = 3, color = "#df5286" });
 ViewBag.Projects = projects;
 // datasource for category resources
 List<ResourceFields> categories = new List<ResourceFields>();
 categories.Add(new ResourceFields { text = "Development", id = 1, color = "#df5286" });
 categories.Add(new ResourceFields { text = "Testing", id = 2, color = "#7fa900" });
 ViewBag.Categories = categories;
 ViewBag.Resources = new string[] { "Projects", "Categories" };
 return View();
}

public List<ResourceData> GetTimelineResourceData()
```

```
{
 List<ResourceData> timelineResourceData = new List<ResourceData>();
 timelineResourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Decoding",
 StartTime = new DateTime(2023, 4, 3, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 3, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 1,
 CategoryId = 1
 });
 timelineResourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Bug Automation",
 StartTime = new DateTime(2023, 4, 4, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 4, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 2,
 CategoryId = 1
 });
 timelineResourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Functionality testing",
 StartTime = new DateTime(2023, 4, 5, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 5, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 3,
 CategoryId = 1
 });
 timelineResourceData.Add(new ResourceData
 {
 Id = 4,
 Subject = "Resolution-based testing",
 StartTime = new DateTime(2023, 4, 3, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 3, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 1,
 CategoryId = 2
 });
 timelineResourceData.Add(new ResourceData
 {
 Id = 5,
 Subject = "Test report Validation",
 StartTime = new DateTime(2023, 4, 4, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 4, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 2,
 CategoryId = 2
 });
 timelineResourceData.Add(new ResourceData
 {
 Id = 6,
 Subject = "Test case correction",
 StartTime = new DateTime(2023, 4, 5, 9, 30, 0),
```

```

 EndTime = new DateTime(2023, 4, 5, 11, 30, 0),
 IsAllDay = false,
 ProjectId = 3,
 CategoryId = 2
 });
 return timelineResourceData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int ProjectId { get; set; }
 public int CategoryId { get; set; }
}
public class ResourceFields
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
}

```

#### *Timeline resource view*

The following code example depicts how to group the multiple resources on Timeline Scheduler views and its relevant events are displayed accordingly under those resources.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

 res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").Add();

 res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)

```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor =
"#cb6bb2" });
 rooms.Add(new RoomResource { RoomText = "ROOM 2", Id = 2, RoomColor =
"#56ca85" });
 ViewBag.Rooms = rooms;
 // datasource for owner resources
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerGroupId
= 1, OwnerColor = "#ffaa00" });
 owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2,
OwnerGroupId = 2, OwnerColor = "#f8a398" });
 owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3,
OwnerGroupId = 1, OwnerColor = "#7499e1" });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Rooms", "Owners" };
 return View();
}

public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 1,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 3,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Resource planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 2,
 RoomId = 2
 });
}
```

```

 return resourceData;
 }
 public class ResourceData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
 public int RoomId { get; set; }
 }
 public class RoomResource
 {
 public string RoomText { set; get; }
 public int Id { set; get; }
 public string RoomColor { set; get; }
 }
 public class OwnerResource
 {
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
 public int OwnerGroupId { set; get; }
 }
}

```

#### Grouping single-level resources

This kind of grouping allows the Scheduler to display all the resources at a single level simultaneously. The appointments mapped under resources will be displayed with the colors as per the **ColorField** defined on the resources collection.

**Example:** To display the Scheduler with single level resource grouping,

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

 res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner")
 .Name("Owners").TextField("OwnerText").IdField("Id").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.Month).Add();
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)

```

```
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerColor =
"#ffaa00" });
 owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2, OwnerColor
= "#f8a398" });
 owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3, OwnerColor
= "#7499e1" });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Owners" };
 return View();
}

public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 3, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 3, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 4, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 2
 });
 resourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Resource planning",
 StartTime = new DateTime(2023, 4, 5, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 5, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 3
 });
 return resourceData;
}

public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
```

```

 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
}
public class OwnerResource
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
}

```

**Note:** The **Name** field defined in the **resources** collection namely **Owners** will be mapped within the **Group** property, in order to enable the grouping option with those resource levels on the Scheduler.

#### *Grouping multi-level resources*

It is possible to group the resources of Scheduler in multiple levels, by mapping the child resources to each parent resource. In the following example, there are 2 levels of resources, on which the second level resources are defined with **GroupIDField** mapping to the first level resource's ID so as to establish the parent-child relationship between them.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").Add();

res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasource))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)

```

#### **DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor = "#cb6bb2" });
}

```

```

rooms.Add(new RoomResource { RoomText = "ROOM 2", Id = 2, RoomColor =
"#56ca85" });
ViewBag.Rooms = rooms;
// datasource for owner resources
List<OwnerResource> owners = new List<OwnerResource>();
owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerGroupId
= 1, OwnerColor = "#ffaa00" });
owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2,
OwnerGroupId = 2, OwnerColor = "#f8a398" });
owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3,
OwnerGroupId = 1, OwnerColor = "#7499e1" });
ViewBag.Owners = owners;
ViewBag.Resources = new string[] { "Rooms", "Owners" };
return View();
}
public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 1,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 3,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Resource planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 2,
 RoomId = 2
 });
 return resourceData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

```

 public int OwnerId { get; set; }
 public int RoomId { get; set; }
}
public class RoomResource
{
 public string RoomText { set; get; }
 public int Id { set; get; }
 public string RoomColor { set; get; }
}
public class OwnerResource
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
 public int OwnerGroupId { set; get; }
}

```

### One-to-One grouping

In multi-level grouping, Scheduler usually groups the resources on the child level based on the **GroupIdField** that maps with the **IdField** field of parent level resources (as **ByGroupId** set to true by default). There are also option which allows you to group all the child resource(s) against each of its parent resource(s). To enable this kind of grouping, set **false** to the **ByGroupId** option within the **Group** property. In the following code example, there are two levels of resources, on which all the 3 resources at the child level is mapped one to one with each resource on the first level.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .CurrentView(View.WorkWeek)
 .Group(group => group.ByGroupId(false).Resources(ViewBag.Resources))
 .Resources(res =>
 {
 res.DataSource(ViewBag.Projects).Field("ProjectId").Title("Choose Project").Name("Projects").TextField("text").IdField("id").ColorField("color").Add();

 res.DataSource(ViewBag.Categories).Field("CategoryId").Title("Category").Name("Categories").TextField("text").IdField("id").GroupIdField("groupId").ColorField("color").AllowMultiple(true).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetResourceTeamData();
 // datasource for project resources
 List<ProjectResource> projects = new List<ProjectResource>();
}

```

```

 projects.Add(new ProjectResource { text = "PROJECT 1", id = 1, color =
"#cb6bb2" });
 projects.Add(new ProjectResource { text = "PROJECT 2", id = 2, color =
"#56ca85" });
 ViewBag.Projects = projects;
 // datasource for category resources
 List<CategoryResource> categories = new List<CategoryResource>();
 categories.Add(new CategoryResource { text = "Development", id = 1,
groupId = 1, color = "#1aaa55" });
 categories.Add(new CategoryResource { text = "Testing", id = 2, groupId
= 2, color = "#7fa900" });
 categories.Add(new CategoryResource { text = "Documentation", id = 3,
groupId = 2, color = "#7499e1" });
 ViewBag.Categories = categories;
 ViewBag.Resources = new string[] { "Projects", "Categories" };
 return View();
}
public List<ResourceTeamData> GetResourceTeamData()
{
 List<ResourceTeamData> resourceTeamData = new List<ResourceTeamData>();
 resourceTeamData.Add(new ResourceTeamData
 {
 Id = 1,
 Subject = "Developers Meeting",
 StartTime = new DateTime(2023, 4, 3, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 3, 12, 0, 0),
 RecurrenceRule = "FREQ=WEEKLY; INTERVAL=1; BYDAY=MO, TU, WE, TH, FR",
 ProjectId = 1,
 CategoryId = 1
 });
 resourceTeamData.Add(new ResourceTeamData
 {
 Id = 2,
 Subject = "Test report Validation",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 4, 12, 0, 0),
 RecurrenceRule = "FREQ=WEEKLY; INTERVAL=1; BYDAY=MO, WE, FR",
 ProjectId = 1,
 CategoryId = 3
 });
 resourceTeamData.Add(new ResourceTeamData
 {
 Id = 3,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 5, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 5, 12, 0, 0),
 RecurrenceRule = "FREQ=WEEKLY; INTERVAL=1; BYDAY=MO, TU, WE, TH, FR",
 ProjectId = 2,
 CategoryId = 2
 });
 return resourceTeamData;
}
public class ProjectResource
{

 public int id { set; get; }
 public string color { set; get; }
}

```

```

}
public class CategoryResource
{
 public string text { set; get; }
 public int id { set; get; }
 public int groupId { set; get; }
 public string color { set; get; }
}
public class ResourceTeamData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public int ProjectId { get; set; }
 public int CategoryId { get; set; }
 public string RecurrenceRule { get; set; }
}

```

### Grouping resources by date

It groups the number of resources under each date and is applicable only on the calendar views such as Day, Week, Work Week, Month, Agenda and Month-Agenda. To enable such grouping, set **ByDate** option to **true** within the **Group** property.

**Example:** To display the Scheduler with resources grouped by date,

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.ByDate(true).Resources(ViewBag.Resources))
 .Resources(res => {

res.DataSource(ViewBag.Owners).Field("OwnerId").Title("Assignee").Name("Owners")
.TextField("text").IdField("id").ColorField("color").AllowMultiple(true)
.Add();
 })
 .Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.Month).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasources = GetResourceData();
 List<OwnerResource> owners = new List<OwnerResource>();
}

```

```

 owners.Add(new OwnerResource { text = "Alice", id = 1, color = "#ffaa00"
 });
 owners.Add(new OwnerResource { text = "Smith", id = 2, color = "#f8a398"
 });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Owners" };
 return View();
}
public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 3, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 3, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),

 IsAllDay = false,
 OwnerId = 2
 });
 return resourceData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
}
public class OwnerResource
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
}

```

**Note:** This kind of grouping by date is not applicable on any of the **timeline views**.

#### Customizing parent resource cells

In timeline view work cells of parent resource can be customized by checking the `elementType` as `resourceGroupCells` in the event `RenderCell`. In the following code example, background color of the work hours has been changed.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .RenderCell("onRender")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res =>
 {

res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").Add();

res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view =>
 {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasource))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
<script type="text/javascript">
 function onRender(args) {
 if (args.elementType == 'resourceGroupCells' &&
args.element.className.indexOf('e-work-hours') > 0) {
 args.element.style.background = "#FAFAE3";
 }
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor = "#cb6bb2" });

public int Id { set; get; }
public string OwnerColor { set; get; }
public int OwnerGroupId { set; get; }
}

```

### Working with shared events

Multiple resources can share the same events, thus allowing the CRUD action made on it to reflect on all other shared instances simultaneously. To enable such option, set `AllowGroupEdit` option to `true` within the `Group` property. With this property enabled, a single appointment object will be maintained within the appointment collection, even if it is shared by more than one resource – whereas the resource fields of such appointment object will be in array which hold the IDs of the multiple resources.

**Note:** Any actions such as create, edit or delete held on any one of the shared event instances, will be reflected on all other related instances visible on the UI.

**Example:** To edit all the resource events simultaneously,

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.AllowGroupEdit(true).Resources(ViewBag.Resources))
 .Resources(res => {

res.DataSource(ViewBag.Conferences).Field("ConferenceId").Title("Attendees")
.Name("Conferences").TextField("text").IdField("id").ColorField("color").All
owMultiple(true).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasource))
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 14))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month },
 new ScheduleView { Option =
Syncfusion.EJ2.Schedule.View.TimelineWeek },
 new ScheduleView { Option =
Syncfusion.EJ2.Schedule.View.TimelineMonth },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Agenda }
 };
 ViewBag.view = viewOption;
 List<ConferenceRes> conferences = new List<ConferenceRes>();
}

```

```

 conferences.Add(new ConferenceRes { text = "Margaret", id = 1, color =
"#1aaa55" });
 conferences.Add(new ConferenceRes { text = "Robert", id = 2, color =
"#357cd2" });
 conferences.Add(new ConferenceRes { text = "Laura", id = 3, color =
"#7fa900" });
 ViewBag.Conferences = conferences;
 string[] resources = new string[] { "Conferences" };
 ViewBag.Resources = resources;
 return View();
 }
 public List<AppointmentData> GetScheduleData()
 {
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2023, 2, 13, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 13, 12, 30, 0),
 IsAllDay = false,
 ConferenceId = new int[] { 1, 2 }
 });
 appData.Add(new AppointmentData
 {
 Id = 2,
 Subject = "Testing",
 StartTime = new DateTime(2023, 2, 14, 10, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 12, 30, 0),
 IsAllDay = false,
 ConferenceId = new int[] { 1, 2, 3 }
 });
 return appData;
 }
 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int[] ConferenceId { get; set; }
 }
 public class ConferenceRes
 {
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 }

```

### Simple resource header customization

It is possible to customize the resource header cells using built-in template option and change the look and appearance of it in both the vertical and timeline view modes. All the resource related fields and other information can be accessed within the resource header template option.

**Example:** To customize the resource header and display it along with designation field, refer the below code example.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .ResourceHeaderTemplate("#resourceTemplate")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res =>
 {
 res.DataSource(ViewBag.Doctors).Field("DoctorId").Title("Doctor
Name").Name("Doctors").TextField("text").IdField("id").ColorField("color").A
dd();
 })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
<script id="resourceTemplate" type="text/x-template">
 <div class='template-wrap'>
 <div class="resource-image"></div>
 <div class="resource-details">
 <div class="resource-name">${getDoctorName(data)}</div>
 <div class="resource-designation">${getDoctorLevel(data)}</div>
 </div>
 </div>
</script>
<script type="text/javascript">
 window.getDoctorName = function (value) {
 return (value.resourceData) ?
value.resourceData[value.resource.textField] : value.resourceName;
 };
 window.getDoctorImage = function (value) {
 var resourceName = window.getDoctorName(value);
 return resourceName.replace(' ', '-').toLowerCase();
 };
 window.getDoctorLevel = function (value) {
 var resourceName = window.getDoctorName(value);
 return (resourceName === 'Nancy') ? 'Cardiologist' : (resourceName
=== 'Alice') ? 'Neurologist' : 'Orthopedic Surgeon';
 };
</script>
<style>
 .e-schedule .e-vertical-view .e-resource-cells {
 height: 62px;
 }
 .e-schedule .template-wrap {
 display: flex;
 text-align: left;
 }

 .e-schedule .template-wrap .resource-image img {
```

```

 width: 45px;
 height: 45px;
 }
 .e-schedule .template-wrap .resource-details {
 padding-left: 10px;
 }
 .e-schedule .template-wrap .resource-details .resource-name {
 font-size: 16px;
 font-weight: 500;
 margin-top: 5px;
 }
 .e-schedule.e-device .template-wrap .resource-details .resource-name {
 font-size: inherit;
 font-weight: inherit;
 }
 .e-schedule.e-device .e-resource-tree-popup .e-fullrow {
 height: 50px;
 }
 .e-schedule.e-device .template-wrap .resource-details .resource-
designation {
 display: none;
 }
</style>

```

**DATA.CS**

```

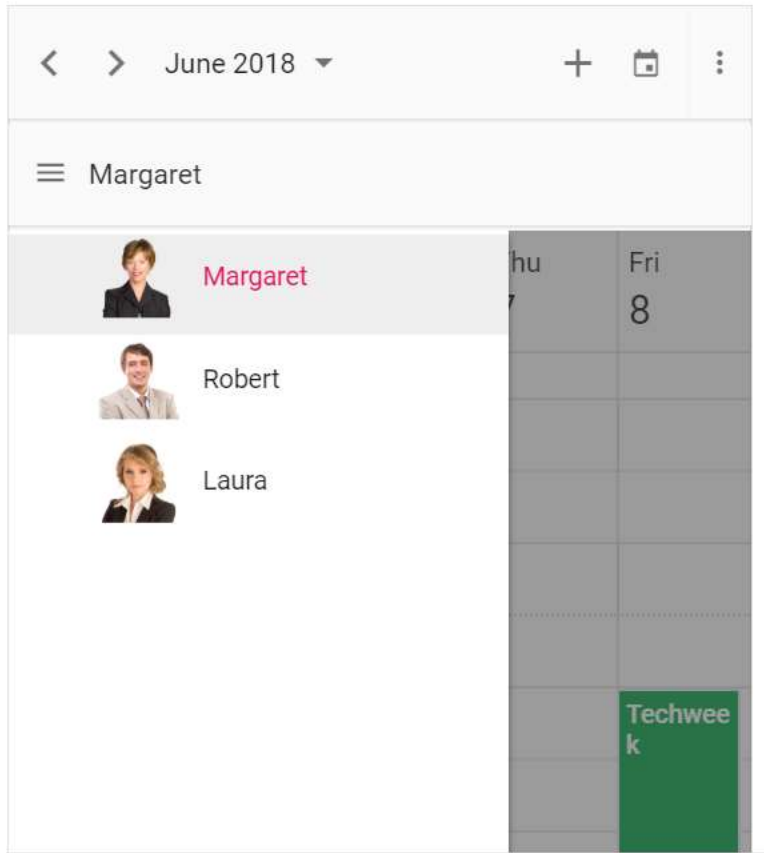

public ActionResult Index()
{
 List<DoctorResources> doctors = new List<DoctorResources>();
 doctors.Add(new DoctorResources { text = "Nancy", id = 1, color =
"#ea7a57" });
 doctors.Add(new DoctorResources { text = "Alice", id = 2, color =
"#7fa900" });
 doctors.Add(new DoctorResources { text = "Robson", id = 3, color =
"#7499e1" });
 ViewBag.Doctors = doctors;
 string[] resources = new string[] { "Doctors" };
 ViewBag.Resources = resources;
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month },
 new ScheduleView { Option =
Syncfusion.EJ2.Schedule.View.TimelineWeek },
 new ScheduleView { Option =
Syncfusion.EJ2.Schedule.View.TimelineMonth },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Agenda }
 };
 ViewBag.view = viewOption;
 return View();
}
public class DoctorResources
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
}

```

```
}

```

**Note:** To customize the resource header in compact mode properly make use of the class `e-device` as in the code example.

#### Customizing resource header with multiple columns

It is possible to customize the resource headers to display with multiple columns such as Room, Type and Capacity. The following code example depicts the way to achieve it and is applicable only on timeline views.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .ResourceHeaderTemplate("#resourceTemplate")
 .Group(group => group.Resources(ViewBag.ResourceNames))
 .Resources(res =>
 {
 res.AllowMultiple(true).DataSource(ViewBag.RoomDatas).Field("RoomId").Title("Room
 Type").Name("MeetingRoom").TextField("name").IdField("id").ColorField("color")
 .Add();
 })
 .Views(view =>
```

```

 {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .RenderCell("onRenderCell")
 .SelectedDate(new DateTime(2018, 7, 30))
 .Render()
)
<script id="resourceTemplate" type="text/x-template">
<div class='template-wrap'>
 <div class="room-name">${getRoomName(data)}</div>
 <div class="room-type">${getRoomType(data)}</div>
 <div class="room-capacity">${getRoomCapacity(data)}</div>
</div>
</script>
<script type="text/javascript">
 window.getRoomName = function (value) {
 return value.resourceData[value.resource.textField];
 };
 window.getRoomType = function (value) {
 return value.resourceData.type;
 };
 window.getRoomCapacity = function (value) {
 return value.resourceData.capacity;
 };
 function onRenderCell(args) {
 if (args.elementType === 'emptyCells' &&
args.element.classList.contains('e-resource-left-td')) {
 var target = args.element.querySelector('.e-resource-text');
 target.innerHTML = '<div class="name">Rooms</div><div
class="type">Type</div><div class="capacity">Capacity</div>';
 }
 }
</script>
<style>
 .e-schedule .e-timeline-view .e-resource-left-td,
 .e-schedule .e-timeline-month-view .e-resource-left-td {
 vertical-align: bottom;
 }
 .e-schedule.e-device .e-timeline-view .e-resource-left-td,
 .e-schedule.e-device .e-timeline-month-view .e-resource-left-td {
 width: 75px;
 }
 .e-schedule .e-timeline-view .e-resource-left-td .e-resource-text,
 .e-schedule .e-timeline-month-view .e-resource-left-td .e-resource-text

 public int RoomId { get; set; }
}

```

### Collapse/Expand child resources in timeline views

It is possible to expand and collapse the resources which have child resource in timeline views dynamically. By default, resources are in expanded state with their child resource. We can collapse and expand the child resources in UI by setting `ExpandedField` option as `false` whereas its default value is `true`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

 res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").ExpandedField("IsExpand").Add();
 }

```

```

res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2023, 4, 1))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasources = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor = "#cb6bb2", IsExpand = false });
 rooms.Add(new RoomResource { RoomText = "ROOM 2", Id = 2, RoomColor = "#56ca85", IsExpand = true });
 ViewBag.Rooms = rooms;
 // datasource for owner resources
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerGroupId = 1, OwnerColor = "#ffaa00" });
 owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2, OwnerGroupId = 2, OwnerColor = "#f8a398" });
 owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3, OwnerGroupId = 1, OwnerColor = "#7499e1" });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Rooms", "Owners" };
 return View();
}

public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 1,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",

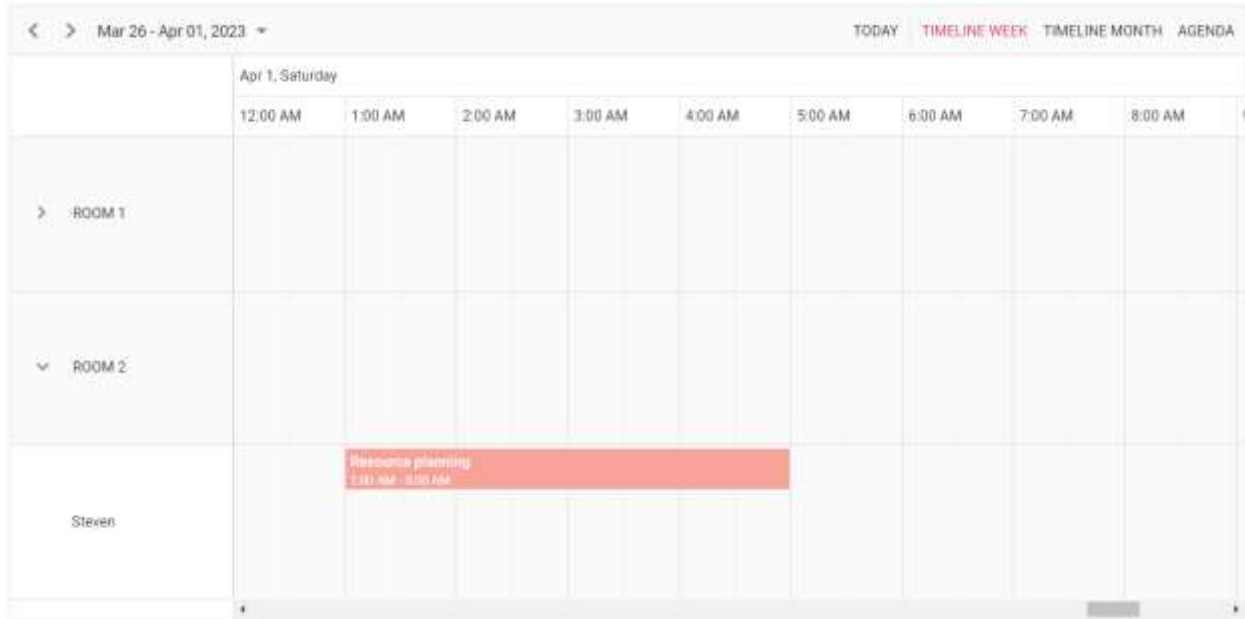

```

```
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 3,
 RoomId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 3,
 Subject = "Resource planning",
 StartTime = new DateTime(2023, 4, 1, 1, 0, 0),
 EndTime = new DateTime(2023, 4, 1, 5, 0, 0),
 IsAllDay = false,
 OwnerId = 2,
 RoomId = 2
 });
 return resourceData;
}

public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
 public int RoomId { get; set; }
}

public class RoomResource
{
 public string RoomText { set; get; }
 public int Id { set; get; }
 public string RoomColor { set; get; }
 public bool IsExpand { get; set; }
}

public class OwnerResource
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
 public int OwnerGroupId { set; get; }
}
```

### Displaying tooltip for resource headers

It is possible to display tooltip over the resource headers showing the resource information. By default, there won't be any tooltip displayed on the resource headers, and to enable it, you need to assign the customized template design to the `HeaderTooltipTemplate` option within the `Group` property.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group =>
group.Resources(ViewBag.Resources).HeaderTooltipTemplate("#tooltipTemplate")
)
 .Resources(res => {
res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.Month).Add();
 view.Option(View.Agenda).Add();
 })
 .Render()
)
<script id="tooltipTemplate" type="text/x-template">
 <div class='template-wrap'>
 <div class="res-text">Name: ${resourceData.OwnerText} </div>
 </div>
</script>
<style>
 .e-schedule .e-vertical-view .e-resource-cells {
 height: 45px;
```

```

 }

 .e-schedule .e-agenda-view .template-wrap .resource-text {
 text-align: center;
 }

 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineMonth },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Agenda }
 };
 ViewBag.view = viewOption;
 return View();
}

public class OwnerResources
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
}

```

### Choosing between resource colors for appointments

By default, the colors defined on the top level resources collection will be applied for the events. In case, if you want to apply specific resource color to events irrespective of its top-level parent resource color, it can be achieved by defining `ResourceColorField` option within the `EventSettings` property.

In the following example, the colors mentioned in the second level will get applied over the events.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@Html.EJS().RadioButton("radio1").Label("Rooms").Name("default").Value("Rooms").Checked(true).Change("onChange").Render()
@Html.EJS().RadioButton("radio2").Label("Owners").Name("default").Value("Owners").Checked(false).Change("onChange").Render()
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res =>
 {

res.DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").GroupIDField("RoomGroupId").ColorField("RoomColor").AllowMultiple(false).Add();

res.DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").AllowMultiple(true).Add();
 })
 .EventSettings(e =>
e.DataSource(ViewBag.datasource).ResourceColorField("Rooms")
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 4, 3))
 .Render()
)
<script type="text/javascript">
 function onChange(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.eventSettings.resourceColorField = args.value;
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetResourceTeamData();
 // datasource for Room resources
 List<RoomResources> rooms = new List<RoomResources>();
 rooms.Add(new RoomResources { RoomText = "ROOM 1", Id = 1, RoomGroupId = 1, RoomColor = "#cb6bb2" });
 rooms.Add(new RoomResources { RoomText = "ROOM 2", Id = 2, RoomGroupId = 2, RoomColor = "#56ca85" });
 ViewBag.Rooms = rooms;
 // datasource for Owner resources
 List<OwnerResources> owners = new List<OwnerResources>();
 owners.Add(new OwnerResources { OwnerText = "Nancy", Id = 1, OwnerGroupId = 1, OwnerColor = "#1aaa55" });

 OwnerId = 2
 });
 return resourceTeamData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int RoomId { get; set; }
 public int OwnerId { get; set; }
}
public class RoomResources
{
 public string RoomText { set; get; }
 public int Id { set; get; }
 public int RoomGroupId { set; get; }
 public string RoomColor { set; get; }
}

```

```
public class OwnerResources
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public int OwnerGroupId { set; get; }
 public string OwnerColor { set; get; }
}
```

**Note:** The value of the `ResourceColorField` field should be mapped with the `Name` value given within the `Resources` property.

#### Dynamically add and remove resources

It is possible to add or remove the resources dynamically to and from the Scheduler respectively. In the following example, when the checkbox is checked and unchecked, the respective resources gets added up or removed from the Scheduler layout. To add new resource dynamically, `addResource` method is used which accepts the arguments such as resource object, resource name (within which level, the resource object to be added) and index (position where the resource needs to be added).

To remove the resources dynamically, `removeResource` method is used which accepts the index (position from where the resource to be removed) and resource name (within which level, the resource object presents) as parameters.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@Html.EJS().CheckBox("company").Change("onChange").Checked(true).Disabled(true).Label("Company").Value("1").Render()
@Html.EJS().CheckBox("birthdays").Change("onChange").Checked(false).Label("Birthday").Value("2").Render()

```

### Setting different working days and hours for resources

Each resource in the Scheduler can have different working hours as well as different working days set to it. There are default options available within the **Resources** collection, to customize the default working hours and days of the Scheduler.

*Set different work days*

Different working days can be set for the resources of Scheduler using the **WorkDaysField** property which maps the working days field from the resource dataSource. This field accepts the collection of day indexes (from 0 to 6) of a week. By default, it is set to [1, 2, 3, 4, 5] and in the following example, each resource has been set with different values and therefore each of them will render only those working days. This option is applicable only on the calendar views and is not applicable on timeline views.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {
 res.DataSource(ViewBag.Doctors).Field("DoctorId").Title("Doctor
Name").Name("Doctors").TextField("text").IdField("id").ColorField("color").W
orkDaysField("workDays").Add(); }).Views(view => {
view.Option(View.WorkWeek).Add(); view.Option(View.Month).Add();
}))
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasources = GetDoctorData();
 List<DoctorRes> doctors = new List<DoctorRes>();
 doctors.Add(new DoctorRes { text = "Will Smith", id = 1, color =
"#ea7a57", workDays = new List<int> { 1, 2, 4, 5 } });
 doctors.Add(new DoctorRes { text = "Alice", id = 2, color = "rgb(53,
124, 210)", workDays = new List<int> { 1, 3, 5 } });
 doctors.Add(new DoctorRes { text = "Robson", id = 3, color =
"#7fa900" });
 ViewBag.Doctors = doctors;
 string[] resources = new string[] { "Doctors" };
 ViewBag.Resources = resources;
 return View();
}

public class DoctorRes
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 public List<int> workDays { set; get; }
 public string startHour { set; get; }
 public string endHour { set; get; }
}

public List<DoctorData> GetDoctorData()
{
 List<DoctorData> doctorData = new List<DoctorData>();
 doctorData.Add(new DoctorData
 {
```

```

 Id = 1,
 Subject = "Echocardiogram",
 StartTime = new DateTime(2023, 4, 3, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 3, 11, 30, 0),
 IsAllDay = false,
 DoctorId = 1
 });
 doctorData.Add(new DoctorData
 {
 Id = 2,
 Subject = "Lumbar punctures",
 StartTime = new DateTime(2023, 4, 3, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 3, 10, 45, 0),
 IsAllDay = false,
 DoctorId = 2
 });
 doctorData.Add(new DoctorData
 {
 Id = 3,
 Subject = "Osteoarthritis",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 4, 12, 0, 0),
 IsAllDay = false,
 DoctorId = 3
 });
 return doctorData;
}
public class DoctorData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int DoctorId { get; set; }
}

```

### Set different work hours

Working hours indicates the work hour duration of a day, which is highlighted visually with active color over the work cells. Each resource on the Scheduler can be defined with its own set of working hours as depicted in the following example.

- **StartHourField** - Denotes the start time of the working/business hour in a day.
- **EndHourField** - Denotes the end time limit of the working/business hour in a day.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

```

```

 res.DataSource(ViewBag.Doctors).Field("DoctorId").Title("Doctor
Name").Name("Doctors").TextField("text").IdField("id").ColorField("color").S
tartHourField("startHour").EndHourField("endHour").Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 4, 1))
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasources = GetDoctorData();
 List<DoctorRes> doctors = new List<DoctorRes>();
 doctors.Add(new DoctorRes { text = "Will Smith", id = 1, color =
"#ea7a57", startHour = "08:00", endHour = "15:00" });
 doctors.Add(new DoctorRes { text = "Alice", id = 2, color = "rgb(53,
124, 210)", startHour = "09:00", endHour = "17:00" });
 doctors.Add(new DoctorRes { text = "Robson", id = 3, color = "#7fa900",
startHour = "08:00", endHour = "16:00" });
 ViewBag.Doctors = doctors;
 // Scheduler views
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineWeek
 },
 new ScheduleView { Option =
Syncfusion.EJ2.Schedule.View.TimelineMonth }
 };
 ViewBag.view = viewOption;
 string[] resources = new string[] { "Doctors" };
 ViewBag.Resources = resources;
 return View();
}

public class DoctorRes
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 public string startHour { set; get; }
 public string endHour { set; get; }
}

public List<DoctorData> GetDoctorData()
{
 List<DoctorData> doctorData = new List<DoctorData>();
 doctorData.Add(new DoctorData
 {
 Id = 1,
 Subject = "Echocardiogram",
 StartTime = new DateTime(2023, 4, 2, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 2, 11, 30, 0),
 IsAllDay = false,
 }

```

```

 DoctorId = 1
 });
 doctorData.Add(new DoctorData
 {
 Id = 2,
 Subject = "Lumbar punctures",
 StartTime = new DateTime(2023, 4, 2, 9, 30, 0),
 EndTime = new DateTime(2023, 4, 2, 10, 45, 0),
 IsAllDay = false,
 DoctorId = 2
 });
 doctorData.Add(new DoctorData
 {
 Id = 3,
 Subject = "Osteoarthritis",
 StartTime = new DateTime(2023, 4, 4, 10, 0, 0),
 EndTime = new DateTime(2023, 4, 4, 12, 0, 0),
 IsAllDay = false,
 DoctorId = 3
 });
 return doctorData;
}
public class DoctorData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int DoctorId { get; set; }
}

```

In this example, a resource named **Will Smith** is depicted with working hours ranging from 8.00 AM to 3.00 PM and is visually illustrated with active colors, whereas the other two resources have different working hours set.

#### Hide non-working days when grouped by date

In Scheduler, you can set custom work days for each resource and group the Scheduler by date to display these work days. By default, the Scheduler will show all days when it is grouped by date, even if they are not included in the custom work days for the resources. However, you can use the **HideNonWorkingDays** property to only display the custom work days in the Scheduler.

To use the **HideNonWorkingDays** property, you need to include it in the configuration options for your Scheduler component. Set the value of **HideNonWorkingDays** to **true** to enable this feature.

**Example:** To display the Scheduler with resources grouped by date for custom working days,

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Group(group =>
 group.ByDate(true).HideNonWorkingDays(true).Resources(ViewBag.Resources))

```

```

 .Resources(res => {

res.DataSource(ViewBag.Owners).Field("OwnerId").Title("Assignee").Name("Owners").TextField("text").IdField("id").ColorField("color").AllowMultiple(true).WorkDaysField("workDays").Add();
 })
 .Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.Month).Add();
 view.Option(View.Agenda).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2023, 18, 1))
 .Render()
)
}

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasources = GetResourceData();
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { text = "Alice", id = 1, color = "#ffaa00", workDays: [1, 2, 3, 4] });
 owners.Add(new OwnerResource { text = "Smith", id = 2, color = "#f8a398", workDays: [2, 3, 5] });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Owners" };
 return View();
}

public List<ResourceData> GetResourceData()
{
 List<ResourceData> resourceData = new List<ResourceData>();
 resourceData.Add(new ResourceData
 {
 Id = 1,
 Subject = "Requirement planning",
 StartTime = new DateTime(2022, 18, 3, 10, 0, 0),
 EndTime = new DateTime(2022, 18, 3, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 1
 });
 resourceData.Add(new ResourceData
 {
 Id = 2,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2022, 18, 4, 10, 0, 0),
 EndTime = new DateTime(2022, 18, 4, 12, 0, 0),
 IsAllDay = false,
 OwnerId = 2
 });
 return resourceData;
}

public class ResourceData
{
 public int Id { get; set; }
}

```

```
public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public bool IsAllDay { get; set; }
public int OwnerId { get; set; }
}
public class OwnerResource
{
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 public int[] workDays { set; get; }
}
```

**Note:** The `HideNonWorkingDays` property only applies when the Scheduler is grouped `byDate`.

#### Compact view in mobile

Although the Scheduler views are designed keeping in mind the responsiveness of the control in mobile devices, however when using Scheduler with multiple resources - it is difficult to view all the resources and its relevant events at once on the mobile. Therefore, we have introduced a new compact mode specially for displaying multiple resources of Scheduler on mobile devices. By default, this mode is enabled while using Scheduler with multiple resources on mobile devices. If in case, you need to disable this compact mode, set `false` to the `EnableCompactView` option within the `Group` property. Disabling this option will display the exact desktop mode of Scheduler view on mobile devices.

With this compact view enabled on mobile, you can view only single resource at a time and to switch to other resources, there is a TreeView at the left listing out all other available resources - clicking on which will display that particular resource and its related appointments.

### Adaptive UI in desktop

By default, the Scheduler layout adapts automatically in the desktop and mobile devices with appropriate UI changes. In case, if the user wants to display the Adaptive scheduler in desktop mode with adaptive enhancements, then the property `EnableAdaptiveUI` can be set to true. Enabling this option will display the exact mobile mode of Scheduler view on desktop devices.

Some of the default changes made for compact Scheduler to render in desktop devices are as follows,

- View options displayed in the Navigation drawer.
- Plus icon is added to the header for new event creation.
- Today icon is added to the header instead of the Today button.
- With Multiple resources – only one resource has been shown to enhance the view experience of resource events details clearly. To switch to other resources, there is a TreeView on the left that lists all other available resources, clicking on which will display that particular resource and its related events.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@Html.EJS()
 .Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .EnableAdaptiveUI(true)
 .CurrentView(View.Month)
```

```

.Views(view =>
{
view.Option(View.Day).Add();
view.Option(View.Week).Add();
view.Option(View.Month).Add();
}).Group(group => group.Resources(ViewBag.Resources)).Resources(res =>
{
res.DataSource(ViewBag.Projects).Field("ProjectId").Title("Choose
Project").Name("Projects").TextField("text").IdField("id").ColorField("color
").Add();

res.DataSource(ViewBag.Categories).Field("TaskId").Title("Category").Name("C
ategories").TextField("text").IdField("id").GroupIDField("groupId").ColorFie
ld("color").AllowMultiple(true).Add();
})
.EventSettings(e => e.Fields(f => f.Subject(sub =>
sub.Name("Subject").Title("Summary")).Description(des =>
des.Name("Description").Title("Comments"))).DataSource(ViewBag.datasources)
.SelectedDate(new DateTime(2018, 4, 4))
.Render()

```

### DATA.CS

```

### Timeline header rows

The Timeline views can have additional header rows other than its default date and time header rows. It is possible to show individual header rows for displaying year, month and week separately using the `HeaderRows` property. This property is applicable only on the timeline views. The possible rows which can be added using `HeaderRows` property are as follows.

- Year
- Month
- Week
- Date
- Hour

**Note:** The `Hour` row is not applicable for Timeline month view.

The following example shows the Scheduler displaying all the available header rows on timeline views.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .HeaderRows(headerRow => {
 headerRow.Option(HeaderRowType.Year).Add();
 }

```

```

 headerRow.Option(HeaderRowType.Month).Add();
 headerRow.Option(HeaderRowType.Week).Add();
 headerRow.Option(HeaderRowType.Date).Add();
 headerRow.Option(HeaderRowType.Hour).Add();
 })
 .Views(view => { view.Option(View.TimelineWeek).Add(); })
 .SelectedDate(new DateTime(2018, 1, 1))
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 return View();
}

```

**Display year and month rows in timeline views**

To display the timeline Scheduler simply with year and month names alone, define the option **Year** and **Month** within the **HeaderRows** property.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .HeaderRows(headerRow => {
 headerRow.Option(HeaderRowType.Year).Add();
 headerRow.Option(HeaderRowType.Month).Add();
 })
 .Views(view => {
 view.Option(View.TimelineMonth).Add();
 })
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 return View();
}

```

**Display week numbers in timeline views**

The week number can be displayed in a separate header row of the timeline Scheduler by setting **Week** option within **HeaderRows** property.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")

```

```

 .HeaderRows(headerRow => {
 headerRow.Option(HeaderRowType.Week).Add();
 headerRow.Option(HeaderRowType.Date).Add();
 headerRow.Option(HeaderRowType.Hour).Add();
 })
 .Views(view => {
 view.Option(View.TimelineMonth).Interval(24).Add();
 view.Option(View.TimelineWeek).Interval(3).Add();
 view.Option(View.TimelineDay).Interval(4).Add();
 })
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 return View();
}

```

**Timeline view displaying dates of a complete year**

It is possible to display a complete year in a timeline view by setting **Interval** value as 12 and defining **TimelineMonth** view option within the **Views** property of Scheduler.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .HeaderRows(headerRow => {
 headerRow.Option(HeaderRowType.Month).Add();
 headerRow.Option(HeaderRowType.Date).Add();
 })
 .Views(view => {
 view.Option(View.TimelineMonth).Interval(12).Add();
 })
 .Render()
)

```

**DATA.CS**

```

public ActionResult Index()
{
 return View();
}

```

**Customizing the header rows using template**

You can customize the text of the header rows and display any images or formatted text on each individual header rows using the built-in **Template** option available within the **HeaderRows** property.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule

```

```
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .HeaderRows(headerRow => {
 headerRow.Option(HeaderRowType.Month).Template("#month-
template").Add();
 headerRow.Option(HeaderRowType.Week).Template("#week-
template").Add();
 headerRow.Option(HeaderRowType.Date).Add();
 })
 .Views(view => {
 view.Option(View.TimelineDay).Add();
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineWorkWeek).Add();
 view.Option(View.TimelineMonth).Add();
 })
 .Render()
)
<script id="month-template" type="text/x-template">
 ${getMonthDetails(data)}
</script>
<script id="week-template" type="text/x-template">
 ${getWeekDetails(data)}
</script>
<script type="text/javascript">
 var instance = new ej.base.Internationalization();
 window.getMonthDetails = function (value) {
 return instance.formatDate(value.date, { skeleton: 'yMMMM' });
 };
 window.getWeekDetails = function (value) {
 return 'Week ' + ej.schedule.getWeekNumber(value.date);
 };
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 return View();
}
```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Row Auto Height

By default, the height of the Scheduler rows in Timeline views are static and therefore, when the same time range holds multiple overlapping appointments, a **+n more** text indicator will be displayed. With this feature enabled, you can now view all the overlapping appointments present in those specific time range by auto-adjusting the row height based on the presence of the appointments count, instead of displaying the **+n more** text indicators.

To enable auto row height adjustments on Scheduler Timeline views and Month view, set **true** to the **rowAutoHeight** property whose default value is **false**.

**Note:** This auto row height adjustment is applicable only on all the Timeline views as well as on the calendar Month view.

Now, let's see how it works on those applicable views with examples.

### Calendar month view

By default, the rows of the calendar Month view can hold only the limited appointments count based on its row height, and the rest of the overlapping appointments are indicated with a +n more text indicator. The following example shows how the month view row auto-adjusts based on the number of appointments count, when this RowAutoHeight feature is enabled.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Month).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .RowAutoHeight(true)
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",
 StartTime = new DateTime(2023, 1, 10, 9, 30, 0), EndTime = new
 DateTime(2023, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", Location = "Texas",
 StartTime = new DateTime(2023, 1, 10, 12, 0, 0), EndTime = new
 DateTime(2023, 1, 10, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", Location = "Australia",
 StartTime = new DateTime(2023, 1, 10, 10, 30, 0), EndTime = new
 DateTime(2023, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2019", Location = "Canada",
 StartTime = new DateTime(2023, 1, 10, 13, 0, 0), EndTime = new
 DateTime(2023, 1, 10, 14, 30, 0) });
 appData.Add(new AppointmentData
```

```

 { Id = 5, Subject = "Milky Way as Melting pot", Location = "Mexico",
 StartTime = new DateTime(2023, 1, 10, 12, 0, 0), EndTime = new
 DateTime(2023, 1, 10, 14, 0, 0) });
 return appData;
 }
 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public string Location { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

### Timeline views

When the feature **RowAutoHeight** is enabled in Timeline views, the row height gets auto-adjusted based on the number of overlapping events occupied on the same time range, which is demonstrated in the following example.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .RowAutoHeight(true)
 .SelectedDate(new DateTime(2019, 1, 10))
 .CurrentView(View.TimelineWeek)
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineDay
 },
 new ScheduleView { Option =
 Syncfusion.EJ2.Schedule.View.TimelineWeek },
 new ScheduleView { Option =
 Syncfusion.EJ2.Schedule.View.TimelineWorkWeek },
 new ScheduleView { Option =
 Syncfusion.EJ2.Schedule.View.TimelineMonth },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Agenda }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()

```

```

{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",
 StartTime = new DateTime(2023, 1, 10, 9, 30, 0), EndTime = new
 DateTime(2023, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", Location = "Texas",

### Timeline views with multiple resources

The following example shows how the auto row adjustment feature works on timeline views with multiple resources.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .RowAutoHeight(true)
 .SelectedDate(new DateTime(2018, 2, 11))
 .CurrentView(View.TimelineWeek)
 .Views(view => {
 view.Option(View.TimelineDay).Add();
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineWorkWeek).Add();
 view.Option(View.TimelineMonth).Add();
 }
)

```

```

 view.Option(View.Agenda).Add();
 })
 .Group(group =>
group.EnableCompactView(false).Resources(ViewBag.ResourceNames))
 .Resources(res => {
 res.DataSource(ViewBag.RoomDatas).Field("RoomId").Title("Room
Type").Name("MeetingRoom").TextField("name").IdField("id").ColorField("color
").AllowMultiple(true).Add();
 })
 .EventSettings(e => e.Fields(f =>
 f.Subject(sub => sub.Name("Subject").Title("Summary"))
 .Location(loc => loc.Name("Location").Title("Location"))
 .Description(des => des.Name("Description").Title("Comments"))
 .StartTime(st => st.Name("StartTime").Title("From"))
 .EndTime(et => et.Name("EndTime").Title("To"))
)
 .DataSource(ViewBag.datasources))
 .Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasources = GetScheduleData();
 List<RoomData> rooms = new List<RoomData>();
 rooms.Add(new RoomData { name = "Room A", id = 1, color = "#98AFC7" });
 rooms.Add(new RoomData { name = "Room B", id = 2, color = "#99c68e" });
 rooms.Add(new RoomData { name = "Room C", id = 3, color = "#C2B280" });
 rooms.Add(new RoomData { name = "Room D", id = 4, color = "#3090C7" });
 rooms.Add(new RoomData { name = "Room E", id = 5, color = "#95b9" });
 rooms.Add(new RoomData { name = "Room F", id = 6, color = "#95b9c7" });
 rooms.Add(new RoomData { name = "Room G", id = 7, color = "#deb887" });
 rooms.Add(new RoomData { name = "Room H", id = 8, color = "#3090C7" });
 rooms.Add(new RoomData { name = "Room I", id = 9, color = "#98AFC7" });
 rooms.Add(new RoomData { name = "Room J", id = 10, color = "#778899" });
 ViewBag.RoomDatas = rooms;
 string[] resources = new string[] { "MeetingRoom" };
 ViewBag.ResourceNames = resources;
 return View();
}

public class RoomData
{
 public int id { set; get; }
 public string name { set; get; }
 public string color { set; get; }
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 11, 9, 30, 0), EndTime = new DateTime(2023, 2, 11, 11, 0,
0), RoomId = 1 });
 appData.Add(new AppointmentData

```

```

 { Id = 2, Subject = "Thule Air Crash Report", StartTime = new
DateTime(2023, 2, 11, 9, 30, 0), EndTime = new DateTime(2023, 2, 11, 11, 0,
0), RoomId = 1 });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 11, 9, 30, 0), EndTime = new DateTime(2023, 2, 11, 11, 0, 0), RoomId = 1
});
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2018", StartTime = new
DateTime(2023, 2, 11, 9, 30, 0), EndTime = new DateTime(2023, 2, 11, 11, 0,
0), RoomId = 1 });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 11, 9, 0, 0), EndTime = new DateTime(2023, 2, 11, 11, 30,
0), RoomId = 2 });
 return appData;
 }
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public int RoomId { get; set; }
}

```

### Appointments occupying entire cell

By default, with the feature **RowAutoHeight**, there will be a space in the bottom of the cell when appointment is rendered. To avoid this space, we can set true to the property **IgnoreWhitespace** with in **EventSettings** whereas its default property value is false. In the following code example, the whitespace below the appointments has been ignored.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .RowAutoHeight(true)
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

 res.AllowMultiple(false).DataSource(ViewBag.Rooms).Field("RoomId").Title("Room").Name("Rooms").TextField("RoomText").IdField("Id").ColorField("RoomColor").Add();

 res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").GroupIDField("OwnerGroupId").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineMonth).Add();
 })
)

```

```

.EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource, IgnoreWhitespace = true})
.SelectedDate(new DateTime(2021, 7, 4))
.Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetResourceData();
 // datasource for room resources
 List<RoomResource> rooms = new List<RoomResource>();
 rooms.Add(new RoomResource { RoomText = "ROOM 1", Id = 1, RoomColor =
"#cb6bb2" });
 rooms.Add(new RoomResource { RoomText = "ROOM 2", Id = 2, RoomColor =
"#56ca85" });
 ViewBag.Rooms = rooms;
 // datasource for owner resources
 List<OwnerResource> owners = new List<OwnerResource>();
 owners.Add(new OwnerResource { OwnerText = "Nancy", Id = 1, OwnerGroupId =
1, OwnerColor = "#ffaa00" });
 owners.Add(new OwnerResource { OwnerText = "Steven", Id = 2,
OwnerGroupId = 2, OwnerColor = "#f8a398" });
 owners.Add(new OwnerResource { OwnerText = "Michael", Id = 3,
OwnerGroupId = 1, OwnerColor = "#7499e1" });
 ViewBag.Owners = owners;
 ViewBag.Resources = new string[] { "Rooms", "Owners" };
 return View();
}

```

 Subject = "Resource planning",
 StartTime = new DateTime(2023, 7, 5, 10, 0, 0),
 EndTime = new DateTime(2023, 7, 5, 12, 30, 0),
 IsAllDay = false,
 OwnerId = 2,
 RoomId = 2
 });
 return resourceData;
}
public class ResourceData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
 public int OwnerId { get; set; }
 public int RoomId { get; set; }
}
public class RoomResource
{
 public string RoomText { set; get; }
 public int Id { set; get; }
 public string RoomColor { set; get; }
}
public class OwnerResource
{
 public string OwnerText { set; get; }
 public int Id { set; get; }
 public string OwnerColor { set; get; }
 public int OwnerGroupId { set; get; }
}

```

**Note:** The property `IgnoreWhitespace` will be applicable only when `RowAutoHeight` feature is enabled in the Scheduler

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Header customization

The header part of Scheduler can be customized easily with the built-in options available.

#### Show or Hide header bar

By default, the header bar holds the date and view navigation options, through which the user can switch between the dates and various views. This header bar can be hidden from the UI by setting `false` to the `ShowHeaderBar` property. Its default value is `true`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")

```

```

 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .ShowHeaderBar(false)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Customizing header bar using template

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the [ToolBarItems](#) property. To display the default items, it's essential to assign a [ToolBarName](#) field to each item. The names of the default items are **Previous**, **Next**, **Today**, **DateRangeText**, **NewEvent**, and **Views**. For custom items you can give the name as **Custom** to the name field. Here, the default items such as previous, next, date range text, and today have been used along with external icon as custom items.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@using Syncfusion.EJ2.Navigations;
@using Syncfusion.EJ2.DropDowns
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .Resources(res =>
 {
 res.DataSource(ViewBag.Calendars); res.Query("new
ej.data.Query().where('OwnerId', 'equal',

```

```

1)").Field("OwnerId").Title("Owners").Name("Owners").TextField("OwnerText").
IdField("OwnerId").ColorField("Color").AllowMultiple(true).Add();
 })
 .ToolBarItems(ViewBag.toolbarItems)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource,
 .Query("new ej.data.Query().where('OwnerId', 'equal', 1)") })
 .SelectedDate(new DateTime(2023, 10, 15))
 .Render()
)
<div style="width: 125px;">

@Html.EJS().DropDownList("dropelement").Width("125px").showClearButton(false
).Value("0").DataSource(ViewBag.Calendars).Fields(new
DropDownListFieldSettings { Text = "OwnerText", Value = "OwnerId"
}).Change("onResChange").Render()
</div>
<script type="text/javascript">
 function onResChange(args) {
 var value = args.value;
 var resourcePredicate;
 resourcePredicate = new ej.data.Predicate('OwnerId', 'equal',
value);
 scheduleObj.resources[0].query = resourcePredicate ? new
ej.data.Query().where(resourcePredicate) :
 new ej.data.Query().where('OwnerId', 'equal', 1);
 scheduleObj.eventSettings.query = new
ej.data.Query().where('OwnerId', 'equal', value);
 }
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 List<CalendarRes> ownerCollections = new List<CalendarRes>()
 {
 new CalendarRes { OwnerText = 'Margaret', OwnerId = 1, Color =
'#ea7a57' },
 new CalendarRes { OwnerText = 'Robert', OwnerId = 2, Color =
'#df5286' },
 new CalendarRes { OwnerText = 'Laura', OwnerId = 3, Color =
'#865fcf' }
 };
 ViewBag.Calendars = ownerCollections;

}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Customizing header bar using events

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the `ActionBegin` event. Here, an employee image is added to the header bar, clicking on which will open the popup showing that person's short profile information.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .ActionComplete("onActionComplete")
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

```

<style>
 .e-schedule .e-schedule-toolbar .user-icon {
 background-image:
url('https://ej2.syncfusion.com/demos/src/schedule/images/nancy.png');
 background-position: center center;
 background-repeat: no-repeat;
 background-size: cover;
 border-radius: 50%;
 height: 24px;
 min-width: 24px !important;
 width: 24px !important;
 }
 .e-schedule .e-schedule-toolbar .e-toolbar-items span.e-btn-icon.user-
icon.e-icons {
 line-height: 24px !important;
 min-height: 24px !important;
 }
 .e-schedule .e-schedule-toolbar .e-toolbar-items .e-schedule-user-icon
.e-tbar-btn:hover {
 background-color: inherit;
 }
 .e-schedule .e-schedule-toolbar .e-toolbar-items .e-schedule-user-icon
.e-tbar-btn-text {
 display: none;
 }
 .e-schedule .e-schedule-toolbar .e-toolbar-pop .e-schedule-user-icon .e-
tbar-btn-text {
 padding-left: 8px !important;
 }
 .e-profile-wrapper {

 padding-left: 10px;
 }
 .e-profile-wrapper .name {
 font-size: 14px;
 }

```

```

 line-height: 20px;
 font-weight: 500;
 margin-top: 2px;
 }
 .e-profile-wrapper .destination {
 font-size: 12px;
 }
 .e-profile-wrapper .status-icon {
 height: 6px;
 width: 6px;
 background: green;
 border-radius: 100%;
 float: left;
 margin-right: 4px;
 margin-top: 4px;
 }
 .e-profile-wrapper .status {
 font-size: 11px;
 }
</style>
<script type="text/javascript">
 var profilePopup;
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var userIconItem = {
 align: 'Right', prefixIcon: 'user-icon', text: 'Nancy',
 cssClass: 'e-schedule-user-icon'
 };
 args.items.push(userIconItem);
 }
 }
 function onActionComplete(args) {
 var scheduleElement = document.getElementById('schedule');
 if (args.requestType === 'toolBarItemRendered') {
 var userIconEle = scheduleElement.querySelector('.e-schedule-
user-icon');
 userIconEle.onclick = function () {
 profilePopup.relateTo = userIconEle;
 profilePopup.dataBind();
 if (profilePopup.element.classList.contains('e-popup-
close')) {
 profilePopup.show();
 } else {
 profilePopup.hide();
 }
 };
 }
 var userContentEle = ej.base.createElement('div', {
 className: 'e-profile-wrapper'
 });
 scheduleElement.parentElement.appendChild(userContentEle);
 var userIconEle = scheduleElement.querySelector('.e-schedule-user-
icon');
 var getDOMString = ej.base.compile('<div class="profile-
container"><div class="profile-image">' +
 '</div><div class="content-wrap"><div class="name">Nancy</div>'
+

```

```

 '<div class="destination">Product Manager</div><div
class="status">' +
 '<div class="status-icon"></div>Online</div></div></div>');
 var output = getDOMString({});
 profilePopup = new ej.popups.Popup(userContentEle, {
 content: output[0],
 relateTo: userIconEle,
 position: { X: 'left', Y: 'bottom' },
 collision: { X: 'flip', Y: 'flip' },
 targetType: 'relative',
 viewPortElement: scheduleElement,
 width: 210,
 height: 80
 });
 profilePopup.hide();
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### How to display the view options within the header bar popup

By default, the header bar holds the view navigation options, through which the user can switch between various views. You can move this view options to the header bar popup by setting `true` to the `EnableAdaptiveUI` property.

## CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .EnableAdaptiveUI(true)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

## DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Note:** Refer [here](#) to know more about adaptive UI in resources scheduler.

### Date header customization

The Scheduler UI that displays the date text on all views are considered as the date header cells. You can customize the date header cells of Scheduler either using `DateHeaderTemplate` or `RenderCell` event.

#### Using date header template

The `DateHeaderTemplate` option is used to customize the date header cells of day, week and work-week views.

## CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
```

```

 .DateHeaderTemplate("#template")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
 <style>
 .weather-text {
 font-size: 11px;
 }
 </style>
 <script id="template" type="text/template">
 <div class="date-text">${getDateHeaderText(data.date)}</div>
 ${getWeather(data.date)}
 </script>
 <script type="text/javascript">
 var instance = new ej.base.Internationalization();
 window.getDateHeaderText = function (value) {
 return instance.formatDate(value, { skeleton: 'Ed' });
 };
 function getWeather(value) {
 switch (value.getDay()) {
 case 0:
 return '<div class="weather-text">25°C</div>';
 case 1:
 return '<div class="weather-text">18°C</div>';
 case 2:
 return '<div class="weather-text">10°C</div>';
 case 3:
 return '<div class="weather-text">16°C</div>';
 case 4:
 return '<div class="weather-text">8°C</div>';
 case 5:
 return '<div class="weather-text">27°C</div>';
 case 6:
 return '<div class="weather-text">17°C</div>';
 default:
 return null;
 }
 }
 </script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{
 Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Using renderCell event

In month view, the date header template is not applicable and therefore the same customization can be added beside the date text in month cells by making use of the `RenderCell` event.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .RenderCell("onRenderCell")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<style>
 .weather-text {
 font-size: 11px;
 }
</style>
<script type="text/javascript">
 function getWeather(value) {
 switch (value.getDay()) {
 case 0:
 return '<div class="weather-text">25°C</div>';
 case 1:
 return '<div class="weather-text">18°C</div>';
 case 2:
 return '<div class="weather-text">10°C</div>';
 case 3:
 return '<div class="weather-text">16°C</div>';
 case 4:
 return '<div class="weather-text">8°C</div>';
 case 5:
 return '<div class="weather-text">27°C</div>';
 case 6:
 return '<div class="weather-text">17°C</div>';
 default:

```

```

 return null;
 }
}
function onRenderCell(args) {
 if (args.elementType === 'monthCells') {
 var ele = document.createElement('div');
 ele.innerHTML = getWeather(args.date);
 (args.element).appendChild(ele.firstChild);
 }
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Customizing the date range text

The **DateRangeTemplate** option allows you to customize the text content of the date range displayed in the scheduler. By default, the date range text is determined by the scheduler view being used.

However, you can use the **DateRangeTemplate** option to override the default text and specify your own custom text to be displayed.

The **DateRangeTemplate** property includes **startDate**, **endDate** and **currentView** options, you can customize the date range text using these available options.

## CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")

```

```

 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .DateRangeTemplate("#template")
 .Render()
)
<script id="template" type="text/template">
 <div class="date-text">${getDateRange(data.date)}</div>
</script>
<script type="text/javascript">
 var instance = new ej.base.Internationalization();
 window.getDateRange = function (value) {
 return value.toLocaleString('en-us', { month: 'long' }) + ' ' +
value.getFullYear();
 };
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

## TimeScale Customization

The time slots are usually the time cells that are displayed on the Day, Week and Work Week views of both the calendar (to the left most position) and timeline views (at the top position). The **TimeScale** property allows you to control and set the required time slot duration for the work cells displayed on Scheduler. It includes the following sub-options such as,

- **Enable** - When set to **true**, allows the Scheduler to display the appointments accurately against the exact time duration. If set to **false**, all the appointments of a day will be displayed one below the other with no grid lines displayed. Its default value is **true**.
- **Interval** – Defines the time duration on which the time axis to be displayed either in 1 hour or 30 minutes interval and so on. It accepts the values in minutes and defaults to 60.
- **SlotCount** – Decides the number of slot count to be split for the specified time interval duration. It defaults to 2, thus displaying two slots to represent an hour(each slot depicting 30 minutes duration).

Note: The upper limit for rendering slots within a single day, utilizing the **Interval** and **SlotCount** properties of the **TimeScale**, stands at 1000. This constraint aligns with the maximum **colspan** value permissible for the **table** element, also capped at 1000. This particular restriction is relevant exclusively to the **TimelineDay**, **TimelineWeek** and **TimelineWorkWeek** views.

### Setting different time slot duration

The **Interval** and **SlotCount** properties can be used together on the Scheduler to set different time slot duration which is depicted in the following code example. Here, six time slots together represents an hour.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .TimeScale(ts => ts.Enable(true).Interval(60).SlotCount(6))
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Render()
)
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{ Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
appData.Add(new AppointmentData
{ Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Customizing time cells using template

The **TimeScale** property also provides template option to allow customization of time slots which are as follows,

- **MajorSlotTemplate** - The template option to be applied for major time slots. Here, the template accepts either the string or **HTMLElement** as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.
- **MinorSlotTemplate** - The template option to be applied for minor time slots. Here, the template accepts either the string or **HTMLElement** as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .TimeScale(ts =>
 ts.Enable(true)
 .Interval(60)
 .SlotCount(6)
 .MajorSlotTemplate("#majorSlotTemplate")
 .MinorSlotTemplate("#minorSlotTemplate")
)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Render()
)
<script id="majorSlotTemplate" type="text/x-template">

```

```

<div>${majorSlotTemplate(data.date)}</div>
</script>
<script id="minorSlotTemplate" type="text/x-template">
 <div style="text-align: right; margin-right:
15px">${minorSlotTemplate(data.date)}</div>
</script>
<script type="text/javascript">
 window.majorSlotTemplate = function (date) {
 var instance = new ej.base.Internationalization();
 return instance.formatDate(date, { skeleton: 'hm' });
 };
 window.minorSlotTemplate = function (date) {
 var instance = new ej.base.Internationalization();
 return instance.formatDate(date, { skeleton: 'ms' }).replace(':00',
'');
 };
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Hide the timescale

The grid lines which indicates the exact time duration can be enabled or disabled on the Scheduler, by setting `true` or `false` to the `Enable` option within the `TimeScale` property. It's default value is `true`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
.Width("100%")

```

```

 .Height("550px")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .TimeScale(ts => ts.Enable(false))
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Highlighting current date and time

By default, Scheduler indicates current date with a highlighted date header on all views, as well as marks accurately the system's current time on specific views such as Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. To stop highlighting the current time indicator on Scheduler views, set `false` to the `ShowTimeIndicator` property which defaults to `true`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 })
)

```

```

 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 view.Option(View.TimelineDay).Add();
 view.Option(View.TimelineWeek).Add();
 view.Option(View.TimelineWorkWeek).Add();
 })
 .ShowTimeIndicator(false)
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Setting working days and hours

The Scheduler can be customized on various aspects as well as it inherits almost all the calendar-specific features such as options,

- To set custom time range display on Scheduler
- To set different working hours
- To set different working days
- To set different first day of week
- To show/hide weekend days
- To show the week number

### Set working days

By default, Scheduler considers the week days from Monday to Friday as **Working days** and therefore defaults to [1,2,3,4,5] - where 1 represents Monday, 2 represents Tuesday and so on. The days which are not defined in this working days collection are considered as non-working days. Therefore, when the weekend days are set to hide from Scheduler, all those non-working days too get hidden from the layout.

The Work week and Timeline Work week views display exactly the defined working days on Scheduler layout, whereas other views display all the days and simply differentiate the non-working days on UI with inactive cell color.

**Note:** The working or business hours depiction on Scheduler are usually valid only on these specified working days.

The following example code depicts how to set the Scheduler to display Monday, Wednesday and Friday as working days of a week.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
```

```
@(Html.EJS().Schedule("schedule")
.Width("100%")
.Height("550px")
.Views(view => {
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 view.Option(View.Month).Add();
}))
.EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
.WorkDays(ViewBag.workday)
.SelectedDate(new DateTime(2018, 2, 15))
.Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workday = new int[] { 1, 3, 5 };
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 9, 30, 0), EndTime = new DateTime(2023, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Hiding weekend days

The **ShowWeekend** property is used to either show or hide the weekend days of a week and it is not applicable on Work week view (as non-working days are usually not displayed on work week view). By default, it is set to **true**. The days which are not a part of the working days collection of a Scheduler are usually considered as non-working or weekend days.

Here, the working days are defined as [1, 3, 4, 5] on Scheduler and therefore the remaining days (0, 2, 6 – Sunday, Tuesday and Saturday) are considered as non-working or weekend days and will be hidden from all the views when **ShowWeekend** property is set to **false**.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.TimelineMonth).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .ShowWeekend(false)
 .WorkDays(ViewBag.workday)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workday = new int[] { 1, 3, 4, 5 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Show week numbers**

It is possible to show the week number count of a week in the header bar of the Scheduler by setting true to **ShowWeekNumber** property. By default, its default value is **false**. In Month view, the week numbers are displayed as a first column.

**Note:** The **ShowWeekNumber** property is not applicable on Timeline views, as it has the equivalent [HeaderRows](#) property to handle such requirement with additional customization.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .ShowWeekNumber(true)
 .WorkDays(ViewBag.workday)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workday = new int[] { 1, 3, 4, 5 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

*Different options in showing week numbers*

By default, week numbers are shown in the Scheduler based on the first day of the year. However, the week numbers can be determined based on the following criteria.

**FirstDay** – The first week of the year is calculated based on the first day of the year.

**FirstFourDayWeek** – The first week of the year begins from the first week with four or more days.

**FirstFullWeek** – The first week of the year begins when meeting the first day of the week (firstDayOfWeek) and the first day of the year.

For more details refer to [this link](#)

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .ShowWeekNumber(true)
 .WeekRule(WeekRule.FirstFourDayWeek)
 .WorkDays(ViewBag.workday)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 ViewBag.workday = new int[] { 1, 3, 5 };
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 9, 30, 0), EndTime = new DateTime(2018, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Note:** Enable the `showWeekNumber` property to configure the `weekRule` property. Also, the `weekRule` property depends on the value of the `firstDayOfWeek` property.

### Set working hours

Working hours indicates the work hour limit within the Scheduler, which is visually highlighted with an active color on work cells. The working hours can be set on Scheduler using the `WorkHours` property which is of object type and includes the following sub-options,

- **Highlight** – enables/disables the highlighting of work hours.
- **Start** - sets the start time of the working/business hour of a day.
- **End** - sets the end time limit of the working/business hour of a day.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .WorkHours(wh =>
 wh.Highlight(true)
 .Start("11:00")
 .End("20:00")
)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 13, 11, 0, 0), EndTime = new DateTime(2023, 2, 13, 13, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 15, 11, 0, 0), EndTime = new DateTime(2023, 2, 15, 13, 0,
0) });
 return appData;
}
```

```
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Scheduler displaying custom hours

It is possible to display the event Scheduler layout with specific time durations by hiding the unwanted hours. To do so, set the start and end hour for the Scheduler using the `StartHour` and `EndHour` properties respectively.

The following code example displays the Scheduler starting from the time range 7.00 AM to 6.00 PM and the remaining hours are hidden on the UI.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .StartHour("07:00")
 .EndHour("18:00")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}
```

```
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Setting start day of the week

By default, Scheduler defaults to **Sunday** as its first day of a week. To change the Scheduler's start day of a week with different day, set the **FirstDayOfWeek** property with the values ranging from 0 to 6.

Here, Sunday is always denoted as 0, Monday as 1 and so on.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .FirstDayOfWeek(1)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 12, 9, 30, 0), EndTime = new DateTime(2023, 2, 12, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
}
```

```

public string Subject { get; set; }
public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
}

```

### Scroll to specific time and date

You can manually scroll to a specific time on Scheduler by making use of the `scrollTo` method as depicted in the following code example.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
<table style="width: 100%">
 <tbody>
 <tr>
 <td>
 <div>
 Scroll To
 </div>
 </td>
 <td>
 <div>
 @(Html.EJS().TimePicker("ScrollToHour")
 .Width("120")
 .Change("onChange")
 .Value(new DateTime(2000, 1, 1, 9, 0, 0))
 .Format("HH:mm")
 .Render())
 </div>
 </td>
 </tr>
 </tbody>
</table>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .Render())
</div>
<script type="text/javascript">
 function onChange(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.scrollTo(args.text);
 }
</script>

```

#### DATA.CS

```

public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()

```

```

{
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
};
ViewBag.view = viewOption;
return View();
}

```

#### *How to scroll to current time on initial load*

There are scenarios where you may need to load the Scheduler displaying the system's current time on the currently visible view port area. In such cases, the Scheduler needs to be scrolled to a specific time based on the system's current time which is depicted in the following code example.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(view => {
 view.Option(View.Day).Add();
 view.Option(View.Week).Add();
 view.Option(View.WorkWeek).Add();
 })
 .Created("onCreate")
 .Render()
)
<script type="text/javascript">
 function onCreate() {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var curTime = new Date();
 var hours = curTime.getHours() < 10 ? '0'
+curTime.getHours().toString() : curTime.getHours().toString();
 var minutes = curTime.getMinutes().toString();
 var time = hours + ':' + minutes;
 scheduleObj.scrollTo(time);
 }
</script>

```

#### **DATA.CS**

```

public ActionResult Index()
{
 return View();
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

## Cell Customization

The cells of the Scheduler can be easily customized either using the cell template or **RenderCell** event.

## Setting cell dimensions in all views

The height and width of the Scheduler cells can be customized either to increase or reduce its size through the **CssClass** property, which overrides the default CSS applied on cells.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .CssClass("schedule-cell-dimension")
 .Height("550px")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<style>
 .schedule-cell-dimension.e-schedule .e-vertical-view .e-date-header-wrap
table col,
 .schedule-cell-dimension.e-schedule .e-vertical-view .e-content-wrap
table col {
 width: 200px;
 }
 .schedule-cell-dimension.e-schedule .e-vertical-view .e-time-cells-wrap
table td,
 .schedule-cell-dimension.e-schedule .e-vertical-view .e-work-cells {
 height: 100px;
 }
 .schedule-cell-dimension.e-schedule .e-month-view .e-work-cells,
 .schedule-cell-dimension.e-schedule .e-month-view .e-date-header-wrap
table col {
 width: 200px;
 }
 .schedule-cell-dimension.e-schedule .e-month-view .e-work-cells {
 height: 200px;
 }
</style>
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetEmployeeEventData();
}
```

```

List<ScheduleView> viewOption = new List<ScheduleView>()
{
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Month }
};
ViewBag.view = viewOption;
return View();
}
public List<EmployeeEventData> GetEmployeeEventData()
{
 List<EmployeeEventData> employeeEventData = new
List<EmployeeEventData>();
 employeeEventData.Add(new EmployeeEventData
 { Id = 1,
 Subject = "Project Workflow Analysis",
 StartTime = new DateTime(2023, 2, 14, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 14, 11, 0, 0),
 CategoryColor = "#1aaa55"
 });
 employeeEventData.Add(new EmployeeEventData
 {
 Id = 2,
 Subject = "Project Requirement Planning",
 StartTime = new DateTime(2023, 2, 15, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 15, 11, 0, 0),
 CategoryColor = "#357cd2"
 });
 employeeEventData.Add(new EmployeeEventData
 {
 Id = 3,
 Subject = "Quality Analysis",
 StartTime = new DateTime(2023, 2, 16, 9, 0, 0),
 EndTime = new DateTime(2023, 2, 16, 11, 0, 0),
 CategoryColor = "#7fa900"
 });
 return employeeEventData;
}
public class EmployeeEventData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public string CategoryColor { get; set; }
}

```

### Check for cell availability

You can check whether the given time range slots are available for event creation or already occupied by other events using the `isSlotAvailable` method. In the following code example, if a specific time slot already contains an appointment, then no more appointments can be added to that cell.

Note: The **isSlotAvailable** is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onActionBegin(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 if (args.requestType === 'eventCreate' && args.data.length > 0) {
 var eventData = args.data[0];
 var eventField = scheduleObj.eventFields;
 var startDate = eventData[eventField.startTime];
 var endDate = eventData[eventField.endTime];
 args.cancel = !scheduleObj.isSlotAvailable(startDate, endDate);
 }
 }
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView {Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2023,
2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Meteor Showers in 2018", StartTime = new
DateTime(2023, 2, 15, 9, 30, 0), EndTime = new DateTime(2023, 2, 15, 11, 0,
0) });
 appData.Add(new AppointmentData
```

```

 { Id = 3, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2023, 2, 16, 9, 30, 0), EndTime = new DateTime(2023, 2, 16, 11, 0,
0) });
 return appData;
 }

 public class AppointmentData
 {
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 }

```

### Customizing cells in all the views

It is possible to customize the appearance of the cells using both template options and **RenderCell** event on all the views.

#### Using template

The **CellTemplate** option accepts the template string and is used to customize the cell background with specific images or appropriate text on the given date values.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@{
 var template = "${if(type === 'monthCells')}<div
class='templatewrap'>${getCellContent(data.date)}</div>${/if}";
}
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(ViewBag.view)
 .Height("550px")
 .CellTemplate(@template)
 .SelectedDate(new DateTime(2017, 12, 15))
 .Render()
)
<style>
 .e-schedule .e-month-view .e-work-cells {
 position: relative;
 }
 .e-schedule .templatewrap {
 text-align: center;
 position: absolute;
 width: 100%;
 }
 .e-schedule .templatewrap img {
 width: 25px;
 height: 25px;
 }
 .e-schedule .caption {
 overflow: hidden;
 text-overflow: ellipsis;
 vertical-align: middle;
 }
</style>

```

```

<script type="text/javascript">
 function getCellContent(date) {
 if (date.getMonth() === 9 && date.getDate() === 31) {
 return '<div class="caption">Thanksgiving day</div>';
 } else if (date.getMonth() === 11 && date.getDate() === 9) {
 return '<div class="caption">Party time</div>';
 } else if (date.getMonth() === 11 && date.getDate() === 13) {
 return '<div class="caption">Party time</div>';
 } else if (date.getMonth() === 11 && date.getDate() === 22) {
 return '<div class="caption">Happy birthday</div>';
 } else if (date.getMonth() === 11 && date.getDate() === 24) {
 return '<div class="caption">Christmas Eve</div>';
 } else if (date.getMonth() === 11 && date.getDate() === 25) {
 return '<div class="caption">Christmas Day</div>';
 } else if (date.getMonth() === 0 && date.getDate() === 1) {
 return '<div class="caption">New Year"s Day</div>';
 } else if (date.getMonth() === 0 && date.getDate() === 14) {
 return '<div class="caption">Get together</div>';
 }
 return '';
 }
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}

```

### Using renderCell event

An alternative to **CellTemplate** is the **RenderCell** event, which can also be used to customize the cells with appropriate images or formatted text values.

## CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(ViewBag.view)
 .Height("550px")
 .RenderCell("onRenderCell")
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onRenderCell(args) {
 if (args.element.classList.contains('e-work-hours') &&
 (args.date.getDay() === 1)) {
 args.element.style.background = '#1aaa55';
 }
 }

```

```

 } else if (args.element.classList.contains('e-work-hours') &&
(args.date.getDay() === 2)) {
 args.element.style.background = '#357cd2';
 } else if (args.element.classList.contains('e-work-hours') &&
(args.date.getDay() === 3)) {
 args.element.style.background = '#e2ff89';
 } else if (args.element.classList.contains('e-work-hours') &&
(args.date.getDay() === 4)) {
 args.element.style.background = '#f57f17';
 } else if (args.element.classList.contains('e-work-hours') &&
(args.date.getDay() === 5)) {
 args.element.style.background = '#00bdae';
 }
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}

```

You can customize cells such as work cells, month cells, all-day cells, header cells, resource header cells using `RenderCell` event by checking the `elementType` option within the event. You can check `elementType` with any of the following.

| Element type                    | Description                                              |
|---------------------------------|----------------------------------------------------------|
| ----- -----                     |                                                          |
| <code>dateHeader</code>         | triggers on header cell rendering.                       |
| <code>monthDay</code>           | triggers on header cell in month view rendering.         |
| <code>resourceHeader</code>     | triggers on resource header cell rendering.              |
| <code>alldayCells</code>        | triggers on all day cell rendering.                      |
| <code>emptyCells</code>         | triggers on empty cell rendering on header bar.          |
| <code>resourceGroupCells</code> | triggers on rendering of work cells for parent resource. |
| <code>workCells</code>          | triggers on work cell rendering.                         |
| <code>monthCells</code>         | triggers on month cell rendering.                        |
| <code>majorSlot</code>          | triggers on major time slot cell rendering.              |
| <code>minorSlot</code>          | triggers on minor time slot cell rendering.              |

| `weekNumberCell` | triggers on cell displaying week number. |

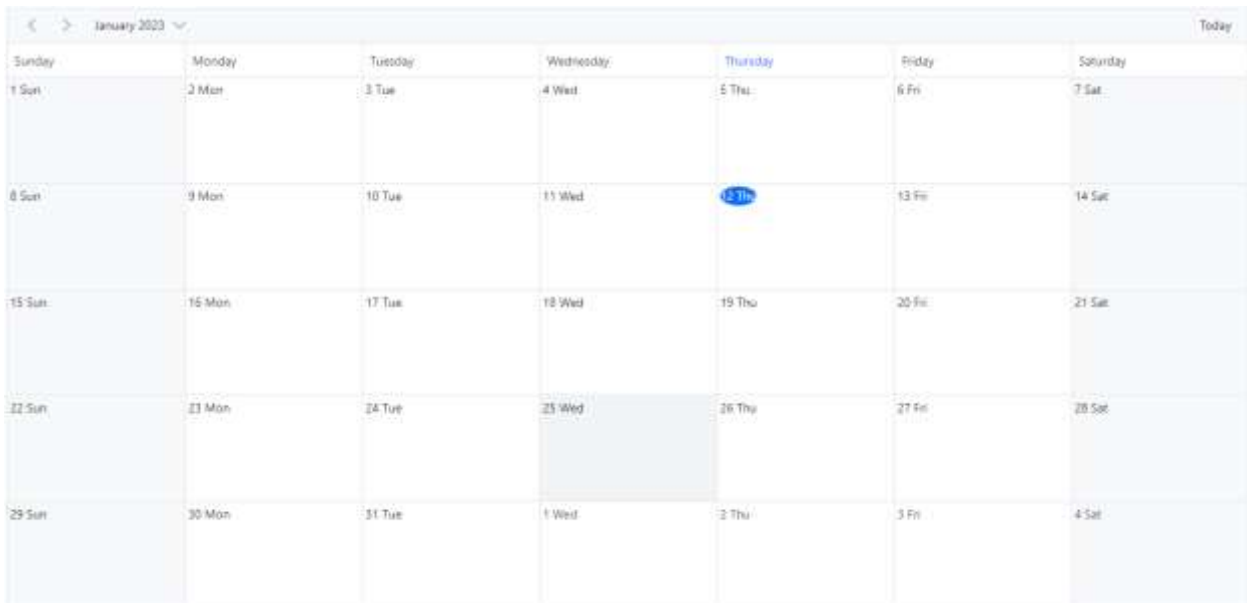

### Customizing cell header in month view

The month header of each date cell in the month view can be customized using the `CellHeaderTemplate` option which accepts the string or `HTMLElement`. The corresponding date can be accessed with the template.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@{
 var template = "<div>${getCellHeaderContent(data.date)}</div>";
}
@(Html.EJS().Schedule("schedule")
 .Views(view => { view.Option(View.Month).Add(); })
 .Height("550px")
 .CellHeaderTemplate(@template)
 .Render()
)
<script type="text/javascript">
 var instance = new ej.base.Internationalization();
 function getCellHeaderContent(date) {
 return instance.formatDate(date, { skeleton: "Ed" });
 }
</script>
```

#### CELL-HEADER-CUSTOMIZATION.CS

### Customizing the minimum and maximum date values

Providing the `minDate` and `maxDate` property with some date values, allows the Scheduler to set the minimum and maximum date range. The Scheduler date that lies beyond this minimum and maximum

date range will be in a disabled state so that the date navigation will be blocked beyond the specified date range.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Views(ViewBag.view)
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 17))
 .minDate(new DateTime(2017, 4, 17))
 .maxDate(new DateTime(2018, 5, 17))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.TimelineDay }
 };
 ViewBag.view = viewOption;
 return View();
}
```

**Note:** By default, the `minDate` property value is set to new Date(1900, 0, 1) and `maxDate` property value is set to new Date(2099, 11, 31). The user can also set the customized `minDate` and `maxDate` property values.

### How to disable multiple cell and row selection in Schedule

By default, the `AllowMultiCellSelection` and `AllowMultiRowSelection` properties of the Schedule are set to `true`. So, the Schedule allows user to select multiple cells and rows. If the user want to disable this multiple cell and row selection. The user can disable this feature by setting up `false` to these properties.

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Set state persistence

State persistence allowed Scheduler to retain the `CurrentView`, `SelectedDate` and Scroll position values in the `localStorage` for state maintenance even if the browser is refreshed or if you move to the next page within the browser. This action is handled through the `EnablePersistence` property which is set to `false` by default. When it is set to `true`, `CurrentView`, `SelectedDate` and Scroll position values of the scheduler component will be retained even after refreshing the page.

**Note:** Scheduler `id` is essential to set state persistence.

The following sample demonstrates how to set state persistence of the Scheduler component.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .EnablePersistence(true)
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",
 StartTime = new DateTime(2019, 1, 10, 9, 30, 0), EndTime = new
 DateTime(2019, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", Location = "Texas",
 StartTime = new DateTime(2019, 1, 10, 12, 0, 0), EndTime = new
 DateTime(2019, 1, 10, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", Location = "Australia",
 StartTime = new DateTime(2019, 1, 10, 10, 30, 0), EndTime = new
 DateTime(2019, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2019", Location = "Canada",
 StartTime = new DateTime(2019, 1, 10, 13, 0, 0), EndTime = new
 DateTime(2019, 1, 10, 14, 30, 0) });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", Location = "Mexico",
 StartTime = new DateTime(2019, 1, 10, 12, 0, 0), EndTime = new
 DateTime(2019, 1, 10, 14, 0, 0) });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public string Location { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Exporting in ASP.NET MVC Schedule Component

The Scheduler supports exporting all its appointments both to an Excel or ICS extension file at client-side. It offers different client-side methods to export its appointments in an Excel or iCal format file. Let's look onto the ways on how to implement the exporting functionality in Scheduler.

#### Excel Exporting

The Scheduler allows you to export all its events into an Excel format file by using the `[exportToExcel]` client-side method. By default, it exports all the default fields of Scheduler mapped through `eventSettings` property.

**Note:** Before you start with excel exporting functionality, you need to import and inject the `ExcelExport` module from the '@syncfusion/ej2-schedule' package using the `Inject` method of Scheduler.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-excel-export::before {
 content: '\e242';
 }
 .e-schedule-toolbar .e-toolbar-item.e-today {
 display: none !important;
 }
</style>
<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var exportItem = {
 align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
 text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
 };
 args.items.push(exportItem);
 }
 }
 function onExportClick() {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.exportToExcel();
 }
</script>
```

```
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week }
 };
 ViewBag.view = viewOption;
 return View();
}

public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",
 StartTime = new DateTime(2019, 1, 8, 9, 30, 0), EndTime = new DateTime(2019,
 1, 8, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", Location = "Texas",
 StartTime = new DateTime(2019, 1, 9, 12, 0, 0), EndTime = new DateTime(2019,
 1, 9, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", Location = "Australia",
 StartTime = new DateTime(2019, 1, 10, 10, 30, 0), EndTime = new
 DateTime(2019, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2019", Location = "Canada",
 StartTime = new DateTime(2019, 1, 11, 13, 0, 0), EndTime = new
 DateTime(2019, 1, 11, 14, 30, 0) });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", Location = "Mexico",
 StartTime = new DateTime(2019, 1, 12, 12, 0, 0), EndTime = new
 DateTime(2019, 1, 12, 14, 0, 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public string Location { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

#### Exporting with custom fields

By default, Scheduler exports all the default event fields that are mapped to it through the `eventSettings` property. To limit the number of fields on the exported excel file, it provides an option to export only the custom fields of the event data. To export such custom fields alone, define the required fields and pass it as argument to the `exportToExcel` method as shown in the following example. For example: `['Id', 'Subject', 'StartTime', 'EndTime', 'Location']`.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-excel-export::before {
 content: '\e242';
 }
 .e-schedule-toolbar .e-toolbar-item.e-today {
 display: none !important;
 }
</style>
<script type="text/javascript">
 function onActionBegin(args) {

#### Exporting individual occurrences of a recurring series

By default, the Scheduler exports recurring events as a single data by exporting only its parent record into the excel file. If you want to export each individual occurrences of a recurring series appointment as separate records in an Excel file, define the `includeOccurrences` option as `true` and pass it as argument to the `exportToExcel` method. By default, the `includeOccurrences` option is set to `false`.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-excel-export::before {
 content: '\e242';
 }

```

```

 }
 .e-schedule-toolbar .e-toolbar-item.e-today {
 display: none !important;
 }
</style>
<script type="text/javascript">

public string RecurrenceRule { get; set; }
}

```

### Exporting custom event data

By default, the whole event collection bound to the Scheduler gets exported as an excel file. To export only specific events of Scheduler or some custom event collection, you need to pass those custom data collection as a parameter to the `exportToExcel` method as shown in this following example, through the `customData` option.

**Note:** By default, the event data are taken from Scheduler dataSource.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-excel-export::before {
 content: '\e242';
 }
 .e-schedule-toolbar .e-toolbar-item.e-today {
 display: none !important;
 }
</style>
<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {

### Export with custom file name

By default, the Scheduler allows you to download the exported Excel file with a name `Schedule.xlsx`. It also provides an option to export the excel file with a custom file name, define the desired `fileName` and passing it as an argument to the `exportToExcel` method.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("650px")
 .Views(ViewBag.view)
 .ActionBegin("onActionBegin")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-excel-export::before {
 content: '\e242';
 }
 .e-schedule-toolbar .e-toolbar-item.e-today {
 display: none !important;
 }
</style>
<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var exportItem = {
 align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
 text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
 };
 args.items.push(exportItem);
 }
 function onExportClick() {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var exportValues = { fileName: "SchedulerData" };
 scheduleObj.exportToExcel(exportValues);
 }
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
}

```

```

List<ScheduleView> viewOption = new List<ScheduleView>()
{
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week }
};
ViewBag.view = viewOption;
return View();
}

```

### Excel file formats

By default, the Scheduler exports event data to an excel file in the .xlsx format. You can also export the Scheduler data in either of the file type such as .xlsx or csv formats, by defining the `exportType` option as either `csv` or `xlsx`. By default, the `exportType` is set to `xlsx`.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")

### Exporting calendar events as ICS file

You can export the Scheduler events to a calendar (.ics) file format, and open it on any of the other default calendars such as Google or Outlook.

The following code example shows how the Scheduler events are exported to a calendar (.ics) file by making use of the `exportToCalendar` public method.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@Html.EJS().Button("ics-export").Content("Export").Render()
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .calendar-import.e-upload {
 border: 0;
 padding-left: 0 !important;
 }
 .calendar-import.e-upload .e-file-select-wrap {
 padding: 0
 }
 .calendar-import.e-upload .e-file-select-wrap .e-file-drop {
 display: none;
 }
</style>
<script type="text/javascript">
 document.getElementById('ics-export').onclick = function () {
 var scheduleObj =
 document.getElementById('schedule').ej2_instances[0];
 scheduleObj.exportToICalendar();
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",

}

```

*Customizing column header with custom fields exporting*

Using fields property, we can only export the defined fields into excel without customizing the header. Now we can provide the alternate support to customize the header of custom fields exporting using the `fieldsInfo` option through the `ExportFieldInfo` interface and pass it as an argument to the `exportToExcel` method as shown in the following example.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")

```

```

 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .ActionBegin("onActionBegin")
 .Render()
)
</style>
<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var exportItem = {
 align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',

 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

#### *Exporting calendar with custom file name*

By default, the calendar is exported with a file name `Calendar.ics`. To change this file name on export, pass the custom string value as `fileName` to the method argument so as to get the file downloaded with this provided name.

The following example downloads the iCal file with a name `ScheduleEvents.ics`.

#### **CSHTML**

```

@using Syncfusion.EJ2.Schedule
@Html.EJS().Button("ics-export").Content("Export").Render()
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .calendar-import.e-upload {
 border: 0;
 padding-left: 0 !important;
 }
 .calendar-import.e-upload .e-file-select-wrap {
 padding: 0
 }
 .calendar-import.e-upload .e-file-select-wrap .e-file-drop {
 display: none;
 }
</style>
<script type="text/javascript">
 document.getElementById('ics-export').onclick = function () {

```

```

var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.exportToICalendar('ScheduleEvents');
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",

```

## Import events from other calendars

The events from external calendars (ICS files) can be imported into Scheduler by using the `importICalendar` method. This method accepts the `blob` object of an .ics file to be imported, as a mandatory argument.

The following example shows how to import an ICS file into Scheduler, using the `importICalendar` method.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
@Html.EJS().Uploader("ics-
import").AllowedExtensions(".ics").CssClass("calendar-
import").Multiple(false).ShowFileList(false).Buttons(new
Syncfusion.EJ2.Inputs.UploaderButtonsProps { Browse = "Choose file"
}).Selected("onSelected").Render()
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2019, 1, 10))
 .Render()
)
<style>
 .calendar-import.e-upload {
 border: 0;
 padding-left: 0 !important;
 }
 .calendar-import.e-upload .e-file-select-wrap {
 padding: 0
 }
 .calendar-import.e-upload .e-file-select-wrap .e-file-drop {
 display: none;
 }
</style>
<script type="text/javascript">
 window.onload = function (args) {
 var uploaderObj = document.getElementById("ics-
import").ej2_instances[0];
 uploaderObj.setProperties({
 buttons: {
 browse: 'Choose file',
 }
 })
 }
 function onSelected(args) {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.importICalendar(args.event.target.files[0]);
 }
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData

```

```

```

### How to print the Scheduler element

The Scheduler allows you to print the Scheduler element by using the `print` client-side method. The `print` method works in two ways. You can find it below.

- Using `print` method without options.
- Using a `print` method with options.

#### Using `print` method without options

You can print the Schedule element with the current view by using the `print` method without passing the options. The following example shows how to print the Scheduler using the `print` method without passing options.

#### CSHTML

```

@using Syncfusion.EJ2.Schedule

@Html.EJS().Schedule("schedule").Width("100%").Height("100%").ActionBegin("o
nActionBegin").EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource }).SelectedDate(new DateTime(2019, 1, 10)).Render()

<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-print::before {
 content: '\e813';
 }
</style>

```

```

<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var exportItem = {
 align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-print',
 text: 'Print', cssClass: 'e-print', click: onPrintIconClick
 };
 args.items.push(exportItem);
 }
 }
 function onPrintIconClick() {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.print();
 }
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",
 StartTime = new DateTime(2019, 1, 8, 9, 30, 0), EndTime = new DateTime(2019,
 1, 8, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Thule Air Crash Report", Location = "Texas",
 StartTime = new DateTime(2019, 1, 9, 12, 0, 0), EndTime = new DateTime(2019,
 1, 9, 14, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 3, Subject = "Blue Moon Eclipse", Location = "Australia",
 StartTime = new DateTime(2019, 1, 10, 10, 30, 0), EndTime = new
 DateTime(2019, 1, 10, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 4, Subject = "Meteor Showers in 2019", Location = "Canada",
 StartTime = new DateTime(2019, 1, 11, 13, 0, 0), EndTime = new
 DateTime(2019, 1, 11, 14, 30, 0) });
 appData.Add(new AppointmentData
 { Id = 5, Subject = "Milky Way as Melting pot", Location = "Mexico",
 StartTime = new DateTime(2019, 1, 12, 12, 0, 0), EndTime = new
 DateTime(2019, 1, 12, 14, 0, 0) });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public string Location { get; set; }
 public DateTime StartTime { get; set; }
}

```

```
public DateTime EndTime { get; set; }
}
```

### Using a print method with options

You can print the Schedule element based on your needs using the `print` method by passing the print options used in this example with its values. The following example shows how to print the Scheduler using the `print` method by passing the options.

### CSHTML

```
@using Syncfusion.EJ2.Schedule

@Html.EJS().Schedule("schedule").Width("100%").Height("100%").ActionBegin("onActionBegin").EventSettings(new ScheduleEventSettings { DataSource = ViewBag.datasource }).SelectedDate(new DateTime(2019, 1, 10)).Render()

<style>
 .e-schedule .e-schedule-toolbar .e-icon-schedule-print::before {
 content: '\e813';
 }
</style>
<script type="text/javascript">
 function onActionBegin(args) {
 if (args.requestType === 'toolbarItemRendering') {
 var exportItem = {
 align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-schedule-print',
 text: 'Print', cssClass: 'e-print', click: onPrintIconClick
 };
 args.items.push(exportItem);
 }
 }
 function onPrintIconClick() {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 let printModel = {
 agendaDaysCount: 14,
 cssClass: 'e-print-schedule',
 currentView: scheduleObj.currentView,
 dateFormat: 'dd-MMM-yyyy',
 enableRtl: false,
 endHour: '18:00',
 firstDayOfWeek: 1,
 firstMonthOfYear: 0,
 group: {},
 height: 'auto',
 locale: scheduleObj.locale,
 maxDate: scheduleObj.selectedDate,
 minDate: scheduleObj.getCurrentViewDates()[0],
 readonly: true,
 resources: [],
 rowAutoHeight: false,
 selectedDate: new Date(),
 showHeaderBar: false,
 showTimeIndicator: false,
 showWeekNumber: false,
 showWeekend: false,
```

```

 startHour: '06:00',
 timeFormat: 'HH',
 timeScale: { enable: true },
 width: 'auto',
 workDays: [1, 2, 3, 4, 5],
 workHours: { highlight: true, start: '10:00', end: '20:00' }
 };
 scheduleObj.print(printModel);
}
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", Location = "Dallas",

}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

## Context menu

You can display context menu on work cells and appointments of Scheduler by making use of the **ContextMenu** control manually from the application end. In the following code example, context menu control is being added from sample end and set its target as **Scheduler**.

On Scheduler cells, you can display the menu items such as **New Event**, **New Recurring Event** and **Today** option. For appointments, you can display its related options such as **Edit Event** and **Delete Event**. The default event window can be opened for appointment creation and editing using the **openEditor** method of Scheduler.

The deletion of appointments can be done by using the **deleteEvent** public method. Also, the **SelectedDate** property can be used to navigate between different dates.

**Note:** You can also display custom menu options on Scheduler cells and appointments. Context menu will open on tap-hold in responsive mode.

## CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")

}
```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Scheduler dimensions

The Scheduler dimensions refers to both height and width of the entire layout and it accepts 3 types of values.

- auto
- pixel
- percentage

### Auto Height and Width

When height and width of the Scheduler are set to **auto**, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Scheduler, its width/height will be the sum of its children. By default, Scheduler is assigned with **auto** values for both height and width properties.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("auto")
 .Width("auto")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
```

```

 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}

 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Height and Width in pixel

The Scheduler height and width will be rendered exactly as per the given pixel values. It accepts both string and number values.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .Width("650px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public DateTime StartTime { get; set; }
public DateTime EndTime { get; set; }
public bool IsAllDay { get; set; }
}

```

### Height and Width in percentage

When height and width of the Scheduler are given as percentage, it will make the Scheduler as wide as the parent container.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("100%")
 .Width("100%")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Meeting",
 StartTime = new DateTime(2018, 2, 15, 10, 0, 0),
 EndTime = new DateTime(2018, 2, 15, 12, 30, 0),
 IsAllDay = false,
 });
 return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

- [How to Change Scheduler Cell Dimensions](#)

## Recurrence editor

The Recurrence editor is integrated into Scheduler editor window by default, to process the recurrence rule generation for events. Apart from this, it can also be used as an individual component referring from the Scheduler repository to work with the recurrence related processes.

**Note:** All the valid recurrence rule string mentioned in the [iCalendar](#) specifications are applicable to use with the recurrence editor.

## Customizing the repeat type option in editor

By default, there are 5 types of repeat options available in recurrence editor such as,

- Never
- Daily
- Weekly
- Monthly
- Yearly

It is possible to customize the recurrence editor to display only the specific repeat options such as **Daily** and **Weekly** options alone by setting the appropriate **frequencies** option.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .PopupOpen("onPopupOpen")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script type="text/javascript">
 function onPopupOpen(args) {
 if (args.type === 'Editor') {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.eventWindow.recurrenceEditor.frequencies = ['none',
'daily', 'weekly'];
 }
 }
</script>
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
```

```

 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2018, 2, 14, 9, 30, 0), EndTime = new DateTime(2018, 2, 14, 11, 0,
 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

The other properties available in recurrence editor are tabulated below,

| Properties        | Type    | Description                                                                |
|-------------------|---------|----------------------------------------------------------------------------|
| ----- ----- ----- |         |                                                                            |
| FirstDayOfWeek    | number  | Sets the first day of the week on recurrence editor.                       |
| StartDate         | Date    | Sets the start date from which date the recurrence event starts.           |
| DateFormat        | string  | Sets the specific date format on recurrence editor.                        |
| Locale            | string  | Sets the locale to be applied on recurrence editor.                        |
| CssClass          | string  | Allows styling to be applied on recurrence editor with custom class names. |
| EnableRtl         | boolean | Allows recurrence editor to render in RTL mode.                            |
| MinDate           | Date    | Sets the minimum date on recurrence editor.                                |
| MaxDate           | Date    | Sets the maximum date on recurrence editor.                                |
| Value             | string  | Sets the recurrence rule value on recurrence editor.                       |
| SelectedType      | number  | Sets the specific repeat type on the recurrence editor.                    |

#### Customizing the End Type Option in Editor

By default, there are 3 types of end options available in the recurrence editor such as:

- Never
- Until

- Count

It is possible to customize the recurrence editor to display only the specific end options, such as the **Until** and **Count** options alone, by setting the appropriate [endTypes](#) option.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().RecurrenceEditor("RecurrenceEditor").SelectedType(1).Render())
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 var recObject =
document.getElementById('RecurrenceEditor').ej2_instances[0];
 recObject.endTypes = ["until", "count"];
 });
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 return View();
}
```

### Accessing the recurrence rule string

The recurrence rule is usually generated based on the options selected from the recurrence editor and also it follows the [iCalendar](#) specifications. The generated recurrence rule string is a valid one to be used with the Scheduler event's recurrence rule field.

There is a **Change** event available in recurrence editor, that triggers on every time the fields of recurrence editor tends to change. Within this event argument, you can access the generated recurrence value through the **value** option as shown in the following code example.

### CSHTML

```
@using Syncfusion.EJ2.Schedule

<div class="recurrence-editor-wrap">
 <div style="padding-bottom:15px;">
 <label>Rule Output</label>
 <div class="rule-output-container">
 <div id="rule-output">FREQ=DAILY; INTERVAL=1;</div>
 </div>
 </div>

 @(Html.EJS().RecurrenceEditor("RecurrenceEditor").SelectedType(1).Change("onchange").Render())
</div>

<style>
 .recurrence-editor-wrap {
 margin: 0 25%;
 }
 .rule-output-container {
 height: auto;
 }
</style>
```

```

 border: 1px solid #969696;
 }
 #rule-output {
 padding: 8px 4px;
 text-align: center;
 min-height: 20px;
 overflow: hidden;
 overflow-wrap: break-word;
 }
 @@media (max-width: 580px) {
 .recurrence-editor-wrap {
 margin: 0 5%;
 }
 }
</style>
<script type="text/javascript">
 function onChange(args) {
 var outputElement = document.querySelector('#rule-output');
 if(args.value == "") {
 outputElement.innerText = 'Select Rule';
 } else {
 outputElement.innerText = args.value;
 }
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

### Set specific value on recurrence editor

It is possible to display the recurrence editor with specific options loaded initially, based on the rule string that we provide. The fields of recurrence editor will change its values accordingly, when we provide a particular rule through the `setRecurrenceRule` method.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
<div class="recurrence-editor-wrap">
 <div style="padding-bottom:15px;">
 <label>Rule Output</label>
 <div class="rule-output-container">
 <div id="rule-output"></div>
 </div>
 </div>

 @Html.EJS().RecurrenceEditor("RecurrenceEditor").Change("onChange").Render()
</div>

<style>
 .recurrence-editor-wrap {
 margin: 0 25%;
 }

```

```

 }
 .rule-output-container {
 height: auto;
 border: 1px solid #969696;
 }
 #rule-output {
 padding: 8px 4px;
 text-align: center;
 min-height: 20px;
 overflow: hidden;
 overflow-wrap: break-word;
 }
 @@media (max-width: 580px) {
 .recurrence-editor-wrap {
 margin: 0 5%;
 }
 }
</style>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 var recObject =
document.getElementById('RecurrenceEditor').ej2_instances[0];
 recObject.setRecurrenceRule('FREQ=DAILY;INTERVAL=2;COUNT=8');
 });
 function onChange(args) {
 var outputElement = document.querySelector('#rule-output');
 if(args.value == "") {
 outputElement.innerText = 'Select Rule';
 } else {
 outputElement.innerText = args.value;
 }
 }
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

### Recurrence date generation

You can parse the **RecurrenceRule** of an event to generate the date instances on which that particular event is going to occur, using the **getRecurrenceDates** method. It generates the dates based on the **RecurrenceRule** that we provide. The parameters to be provided for **getRecurrenceDates** method are as follows.

| Field name        | Type   | Description                                 |
|-------------------|--------|---------------------------------------------|
| ----- ----- ----- | -----  | -----                                       |
| startDate         | Date   | Appointment start date.                     |
| rule              | String | Recurrence rule present in an event object. |

| **excludeDate** | String | Date collection (in ISO format) to be excluded. It is **optional**. |

| **maximumCount** | Number | Number of date count to be generated. It is **optional**. |

| **viewDate** | Date | Current view range's first date. It is **optional**. |

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
<div>
 <div style="padding-bottom:15px;">
 <label id="rule-label">Rule Output</label>
 <div class="rule-output-container">
 <div id="rule-output"></div>
 </div>
 </div>
 @Html.EJS().RecurrenceEditor("RecurrenceEditor").Render()
</div>
<style>
 .recurrence-editor-wrap {
 margin: 0 25%;
 }
 .rule-output-container {
 height: auto;
 border: 1px solid #969696;
 }
 #rule-output {
 padding: 8px 4px;
 text-align: center;
 min-height: 20px;
 overflow: hidden;
 overflow-wrap: break-word;
 }
 #RecurrenceEditor {
 display: none;
 }
</style>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 var outputElement = document.querySelector('#rule-output');
 var labelElement = document.querySelector('#rule-label');
 var recObject = new ej.schedule.RecurrenceEditor();
 var dates = recObject.getRecurrenceDates(new Date(2018, 0, 7, 10, 0), 'FREQ=DAILY;INTERVAL=1', '20180108T114224Z,20180110T114224Z', 4, new Date(2018, 0, 7))
 labelElement.innerText = 'Date Collections';
 outputElement.innerHTML = '';
 for (var index = 0; index < dates.length; index++) {
 outputElement.appendChild(new ej.base.createElement('div', {
 innerHTML: new Date(dates[index]).toString()
 }));
 }
 });
</script>
```

**DATA.CS**

```
public ActionResult Index()
```

```
{
 return View();
}
```

**Note:** Above example will generate two dates January 7, 2018 & January 9 2018 by excluding the in between dates January 8 2018 & January 10 2018, since those dates were given in the exclusion list. Generated dates can then be utilized to create appointments.

#### Recurrence date generation in server-side

It is also possible to generate recurrence date instances from server-side by manually referring the `RecurrenceHelper` class, which is specifically written and referred from application end to handle this date generation process.

**Note:** Refer [here](#) for the step by step procedure to achieve date generation in server-side.

#### Restrict date generation with specific count

In case, if the rule is given in "NEVER ENDS" category, then you can mention the maximum count when you actually want to stop the date generation starting from the provided start date. To do so, provide the appropriate `maximumCount` value within the `getRecurrenceDates` method as shown in the following code example.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
<div>
 <div style="padding-bottom:15px;">
 <label id="rule-label">Rule Output</label>
 <div class="rule-output-container">
 <div id="rule-output"></div>
 </div>
 </div>
 @Html.EJS().RecurrenceEditor("RecurrenceEditor").Render()
</div>
<style>
 .recurrence-editor-wrap {
 margin: 0 25%;
 }
 .rule-output-container {
 height: auto;
 border: 1px solid #969696;
 }
 #rule-output {
 padding: 8px 4px;
 text-align: center;
 min-height: 20px;
 overflow: hidden;
 overflow-wrap: break-word;
 }
 #RecurrenceEditor {
 display: none;
 }
</style>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 var outputElement = document.querySelector('#rule-output');
```

```

var labelElement = document.querySelector('#rule-label');
var recObject = new ej.schedule.RecurrenceEditor();
var dates = recObject.getRecurrenceDates(new Date(2018, 0, 7, 10, 0), 'FREQ=DAILY;INTERVAL=1; COUNT=30', '20180108T114224Z,20180110T114224Z', 10, new Date(2018, 0, 7));
labelElement.innerText = 'Date Collections';
outputElement.innerHTML = '';
for (var index = 0; index < dates.length; index++) {
 outputElement.appendChild(new ej.base.createElement('div', {
 innerHTML: new Date(dates[index]).toString() }));
}
});
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 return View();
}

```

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

### Globalization and Localization

The Scheduler integrates different date-time formats and cultures, which allows it to function globally, thus meeting the diverse needs of different regions.

You can adapt the Scheduler to various languages by parsing and formatting the date or number ([Internationalization](#)), adding culture specific customization and translation to the text ([Localization](#)).

#### Globalization

The Internationalization library provides support for formatting and parsing the number, date, and time by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, Scheduler is set to follow the English culture ('en-US'). If you want to go with different culture other than English, follow the below steps.

Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

,

```
npm install cldr-data --save
```

,

Once the package is installed, you can find the culture specific JSON data under the location `node_modules/cldr-data`.

Once the `CLDR-Data` is installed create a folder `cldr-data` inside the `Scripts` folder. Then create the folder directory like shown below in the structure inside the `Scripts` folder.

- Scripts/cldr-data/supplemental
- Scripts/cldr-data/main

The files named as below are required to setup the specific culture to the Schedule.

- numberingSystems.json
- ca-gregorian.json
- numbers.json
- timeZoneNames.json
- ca-islamic.json

The file named `numberingSystems.json` is available in the location `node_modules/cldr-data/supplemental` which is common for all the cultures. Now you can move this file to the location `Scripts/cldr-data/supplemental`.

The other required files mentioned above are available in the location `node_modules/cldr-data/main/culturecode`. In this location every culture having the culture files inside the folder named as its language culture code. For example if we are loading the German culture we can find the German culture files inside the location `node_modules/cldr-data/main/de`. Now create a folder named `de` inside the location `Scripts/cldr-data/main` and move the files inside it.

Now use the `loadCultureFiles` method to load the culture specific CLDR JSON data.

```
`sh
loadCultureFiles('de');
function loadCultureFiles(name) {
var files = ['ca-gregorian.json', 'numbers.json', 'timeZoneNames.json'];
var loader = ej.base.loadCldr;
var loadCulture = function (prop) {
var val, ajax;

ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-data/main/' + name + '/' + files[prop], 'GET',
false);

ajax.onSuccess = function (value) {
val = value;
};

ajax.send();
loader(JSON.parse(val));
};

for (var prop = 0; prop < files.length; prop++) {
loadCulture(prop);
}
}
```

```
}
,
```

Set the culture to Scheduler by using the `Locale` property.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Locale("fr-CH")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script>
 loadCultureFiles('fr-CH');
 function loadCultureFiles(name) {
 var files = ['ca-gregorian.json', 'numberingSystems.json',
'numbers.json', 'timeZoneNames.json', 'ca-islamic.json'];
 var loader = ej.base.loadCldr;
 var loadCulture = function (prop) {
 var val, ajax;
 if (files[prop] === 'numberingSystems.json') {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
data/supplemental/' + files[prop], 'GET', false);
 } else {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
data/main/' + name + '/' + files[prop], 'GET', false);
 }
 ajax.onSuccess = function (value) {
 val = value;
 };
 ajax.send();
 loader(JSON.parse(val));
 };
 for (var prop = 0; prop < files.length; prop++) {
 loadCulture(prop);
 }
 }
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
```

```

 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2018, 2, 14, 9, 30, 0), EndTime = new DateTime(2018, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Localizing the static Scheduler text

[Localization](#) library allows to display all the static text, date content, and time mode of the Scheduler following the localized language. To achieve this, set the `Locale` property of Scheduler, as well as define the translation text of static words of Scheduler through the `load` method of `L10n` class.

For example, the following code example lets you to define the Hungarian translation words for all the static words used in Scheduler.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Locale("hu")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
<script>
 var L10n = ej.base.L10n;
 L10n.load({
 "hu": {
 "schedule": {
 "day": "Nap",
 "week": "Hét",
 "workWeek": "Munkahét",

 var loader = ej.base.loadCldr;
 var loadCulture = function (prop) {

```

```

 var val, ajax;
 if (files[prop] === 'numberingSystems.json') {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
data/supplemental/' + files[prop], 'GET', false);
 } else {
 ajax = new ej.base.Ajax(location.origin + '/../Scripts/cldr-
data/main/' + name + '/' + files[prop], 'GET', false);
 }
 ajax.onSuccess = function (value) {
 val = value;
 };
 ajax.send();
 loader(JSON.parse(val));
 };
 for (var prop = 0; prop < files.length; prop++) {
 loadCulture(prop);
 }
}
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Setting date format

Scheduler can be used with all valid date formats and by default it follows the universal date format "MM/dd/yyyy". If the `DateFormat` property is not specified particularly, then it will work based on the locale that is assigned to the Scheduler. As the default locale applied on Scheduler is "en-US", this makes it to follow the "MM/dd/yyyy" pattern.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule"))

```

```

.Width("100%")
.Height("550px")
.DateFormat("yyyy/MM/dd")
.EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
.SelectedDate(new DateTime(2018, 2, 15))
.Render()
)

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

## Setting the time format

Time formats is a way of representing the time value in different string formats in the Scheduler. By default, the time mode of the Scheduler can be either 12 or 24 hours format which is completely based on the **locale** set to the Scheduler. Since the default **locale** value of the Scheduler is en-US, the time mode will be set to 12 hours format automatically. You can also customize the format by using the **timeFormat** property. To know more about the time format standards, refer to the [Date and Time Format](#) section.

The following example demonstrates the Scheduler component in 24 hours format.

## CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
.Width("100%")
.Height("550px")
.TimeFormat("HH:mm")
.EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
.SelectedDate(new DateTime(2018, 2, 15))
.Render())

```

```
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
 DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
 0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

**Note:** `timeFormat` property only accepts the valid time format's.

**Displaying Scheduler in RTL mode**

The Scheduler layout and its behavior can be changed as per the common RTL (Right to Left) conventions by setting `EnableRtl` to `true`. By doing so, the Scheduler will display its usual layout from right to left. Its default value is `false`.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
 ViewBag.datasource })
 .EnableRtl(true)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
```

```

{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Explosion of Betelgeuse Star", StartTime = new
DateTime(2023, 2, 14, 9, 30, 0), EndTime = new DateTime(2023, 2, 14, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Accessibility in ASP.NET MVC Schedule control

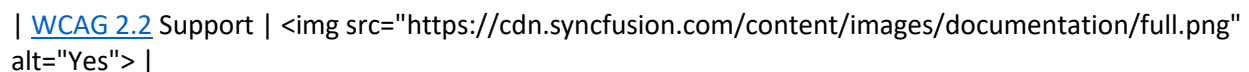

The Scheduler has been designed based on the WAI-ARIA specifications, thus applying the appropriate ARIA roles, states and properties for the Scheduler elements. It is also available with a built-in keyboard navigation support, making it easier for the people who use assistive technologies or who completely rely on the Keyboard support. As per the accessibility standard, the navigated dates, views and other interactive actions performed on the Scheduler will be read out to the target users who use assistive technologies such as screen readers.

The Scheduler makes use of the most required ARIA attributes such as `aria-label` and `role` to support the accessibility in it. To be more accurate, it must be used with an ARIA compliant browser along with the screen reader running from backend.

The accessibility compliance for the Schedule control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" |

| [Section 508](#) Support |  alt="Yes" |

| Screen Reader Support |  alt="Yes" |

| Right-To-Left Support |  alt="Yes" |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

### ARIA attributes

The Scheduler parent element is assigned with a role of **main**, to denote it as the main content of a control as well as a unique element of the entire document.

The following ARIA attributes are used in the Scheduler.

| Attributes | Description |

|-----|-----|

| role="main" | Attribute added to the Scheduler element describes the actual role of the element and denote it as a main and unique content. |

| role="button" | Attribute is assigned to the appointments of Scheduler, to denote it as a clickable element. |

| aria-label | Attribute is set to the Scheduler parent element and its default value is Scheduler's current date. On every time, the date is navigated, this attribute is updated with appropriate current date values. It is also assigned to other scheduler UI elements such as previous and next date navigation buttons depicting its purpose, div element displaying date range in the header bar and appointment elements. |

| aria-labelledby | It indicates editor dialog title to the user through assistive technologies. |

| aria-describedby | It indicates editor dialog content description to the user through assistive technologies. |

| aria-disabled | Attribute is set to the appointment element to indicates the disabled state of the Scheduler.

### Keyboard interaction

All the Scheduler actions can be controlled via keyboard keys by using the `allowKeyboardInteraction` property which is set to `true` by default. The following are the standard keys that work on Scheduler.

| Keys | Description |

|-----|-----|

| Alt + j | Focuses the Scheduler element [provided from application end]. |

| Tab | Focuses the first or active item on the Scheduler header bar and then move the focus to the next available event elements. If no events present, then focus moves out of the control. |

| Shift + Tab | Reverse focusing of the `Tab` key functionality. Inverse focusing of event elements from the last one and then move onto the first or active item on Scheduler header bar and then moves out of the control. |

| Enter | Opens the quick info popup on the selected cells or events. |

| Escape | Closes any of the popup that are in open state. |

| Arrow | To move onto the next available cells in either of the needed directions. (left, right, top and right) |

| Shift + Arrow | For multiple cell selection on either direction. |

| Delete | Deletes one or more selected events. |

| Ctrl + Click on events | To select multiple events. |

| Alt + Number (from 1 to 6) | To switch between the views of Scheduler. |

| Ctrl + Left Arrow | To navigate to the previous date period. |

| Ctrl + Right Arrow | To navigate to the next date period. |

| Left or Right Arrow | On pressing any of these keys, when focus is currently on the Schedule header bar, moves the focus to the previous or next items in the header bar. |

| Space or Enter | It activates any of the focused items. |

| Page Up & Page Down | To scroll through the work cells area. |

| Home | To move the selection to the first cell of Scheduler. |

### Ensuring accessibility

The Scheduler control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Scheduler control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Scheduler control with accessibility tools.

## Styling and appearance

To modify the Scheduler appearance, you need to override the default CSS of Scheduler. Also, you have an option to create your own custom theme using our [Theme Studio](#). Find the list of CSS classes in Scheduler.

| Css class                                                                                | Purpose                                                      |
|------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| ----- -----                                                                              |                                                              |
| .e-schedule .e-vertical-view .e-work-cells                                               | Work cells in vertical views of scheduler                    |
| .e-schedule .e-month-view .e-work-cells                                                  | Work cells in month view of scheduler                        |
| .e-schedule .e-month-view .e-other-month                                                 | Work cells of other month in month view of scheduler         |
| .e-schedule .e-timeline-view .e-work-cells                                               | Work cells in timeline views of scheduler                    |
| .e-schedule .e-timeline-month-view .e-work-cells                                         | Work cells in timeline month view of scheduler               |

| .e-schedule .e-timeline-view .e-work-hours                                               | Work hour cells in timeline views of scheduler               |
| .e-schedule .e-timeline-month-view .e-work-days                                          | Work day cells in timeline month view of scheduler           |
|                                                                                          |                                                              |
| .e-schedule .e-timeline-year-view .e-work-cells.e-work-days                              | Work day cells in timeline year view of scheduler            |
| .e-schedule .e-vertical-view .e-day-wrapper .e-appointment                               | Appointment in vertical views of scheduler                   |
| .e-schedule .e-vertical-view .e-all-day-appointment-wrapper .e-appointment               | All day Appointment in vertical views of scheduler           |

| .e-schedule .e-month-view .e-appointment | Appointment in month view of scheduler |

| .e-schedule .e-timeline-view .e-appointment | Appointment in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-appointment | Appointment in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-event-table .e-appointment | Appointment in timeline year view of scheduler |

| .e-schedule .e-year-view .e-calendar-wrapper .e-month-calendar.e-calendar .e-appointment | Appointment in year view of scheduler |

| .e-schedule .e-agenda-view .e-appointment | Appointment in agenda view of scheduler |

| .e-schedule .e-month-agenda-view .e-appointment-indicator | Appointment in month agenda view of scheduler |

| .e-schedule .e-block-appointment | Block appointment in scheduler |

| .e-schedule .e-read-only | Read only appointment in scheduler. |

| e-appointment-border | Appointment which are currently selected, use the appointment class hierarchical based on your views. |

| e-selected-cells | work cells which are currently selected, use the work cell class hierarchical based on your views. |

| e-header-cells | Header cells of scheduler, use the work cells hierarchical based on your views. |

| .e-schedule .e-vertical-view .e-resource-cells| Resource cells in vertical views of scheduler. |

| .e-schedule .e-month-view .e-resource-cells| Resource cells in month view of scheduler. |

| .e-schedule .e-timeline-view .e-resource-cells | Resource cells in timeline views of scheduler. |

| .e-schedule .e-timeline-month-view .e-resource-cells| Resource cells in timeline month view of scheduler. |

| e-parent-node | Parent resource cells in timeline views of scheduler. |

| e-child-node | Child resource cells in timeline views of scheduler. |

**Note:** You can refer to our [ASP.NET MVC Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Scheduler](#) example to know how to present and manipulate data.

## Migration from Essential JS 1

This topic shows the API equivalent of JS2 Scheduler component to be used, while migrating your project that uses JS1 Scheduler.

### Scheduler

#### Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| To change the display of days count in agenda view | **Property:** *DaysInAgenda* <br/> <br/>  
@ (Html.EJ().Schedule("schedule").CurrentView(CurrentView.Agenda)<br>.AgendaViewSettings(

```

agendaViewSettings => agendaViewSettings.DaysInAgenda(5)) | Property: AgendaDaysCount

@Html.EJS().Schedule("schedule").CurrentView(View.Agenda).AgendaDaysCount(5).Render() |
| Preventing deletion of appointment | Property: AllowDelete

@Html.EJ().Schedule("schedule").AllowDelete(true)) | Not applicable |
| Allows dragging and dropping of appointments | Property: AllowDragAndDrop

@Html.EJ().Schedule("schedule").AllowDragAndDrop(false)) | Property: AllowDragAndDrop

 @Html.EJS().Schedule("schedule").AllowDragAndDrop(false).Render() |
| Enable inline editing of appointments | Property: AllowInline

@Html.EJ().Schedule("schedule").AllowInline(true)) | Not applicable |
| Allow keyboard interactions | Property: AllowKeyboardNavigation

@Html.EJ().Schedule("schedule").AllowKeyboardNavigation(false)) | Property:
AllowKeyboardInteraction

@Html.EJS().Schedule("schedule").AllowKeyboardInteraction(false).Render() |
| Enable resizing of appointments | Property: EnableAppointmentResize

@Html.EJ().Schedule("schedule").EnableAppointmentResize(false)) | Property: AllowResizing

 @Html.EJS().Schedule("schedule").AllowResizing(false).Render() |
| Blocking time intervals | Property: BlockoutSettings

@Html.EJ().Schedule("schedule").BlockoutSettings(fields =>
fields.Enable(true)
.Datasource(blockData)
.Id("Id")
.Subject("Subject")
.StartTime
e
("StartTime")

## How To

### Perform CRUD Actions Dynamically

CRUD actions can be manually performed on appointments using `addEvent`, `saveEvent` and `deleteEvent` methods as shown below.

#### Normal event

##### CSHTML

```
@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("ADD").Render()
 @Html.EJS().Button("btn2").Content("EDIT").Render()
 @Html.EJS().Button("btn3").Content("DELETE").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px"))
```

```

 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var Data = [{
 Id: 1,
 Subject: 'Conference',
 StartTime: new Date(2018, 1, 12, 9, 0),
 EndTime: new Date(2018, 1, 12, 10, 0),
 IsAllDay: false
 }, {
 Id: 2,
 Subject: 'Meeting',
 StartTime: new Date(2018, 1, 15, 10, 0),
 EndTime: new Date(2018, 1, 15, 11, 30),
 IsAllDay: false
 }];
 scheduleObj.addEvent(Data);
 document.getElementById('btn1').setAttribute('disabled', 'true');
 };
 document.getElementById('btn2').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var Data = {
 Id: 3,
 Subject: 'Testing-edited',
 StartTime: new Date(2018, 1, 11, 10, 0),
 EndTime: new Date(2018, 1, 11, 11, 0),
 IsAllDay: false
 };
 scheduleObj.saveEvent(Data);
 document.getElementById('btn2').setAttribute('disabled', 'true');
 };
 document.getElementById('btn3').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.deleteEvent(4);
 document.getElementById('btn3').setAttribute('disabled', 'true');
 };
</script>

```

## DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{

```

```

List<AppointmentData> appData = new List<AppointmentData>();
appData.Add(new AppointmentData
{
 Id = 3,
 Subject = "Testing",
 StartTime = new DateTime(2018, 2, 11, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 11, 10, 0, 0),
 IsAllDay = false,
});
appData.Add(new AppointmentData
{
 Id = 4,
 Subject = "Vacation",
 StartTime = new DateTime(2018, 2, 13, 9, 0, 0),
 EndTime = new DateTime(2018, 2, 13, 10, 0, 0),
 IsAllDay = false,
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Recurrence event

#### CSHTML

```

@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("ADD").Render()
 @Html.EJS().Button("btn2").Content("EDIT").Render()
 @Html.EJS().Button("btn3").Content("DELETE").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var Data = [{
 Id: 1,
 Subject: 'Conference',
 StartTime: new Date(2018, 1, 15, 9, 0),

```

```

 EndTime: new Date(2018, 1, 15, 10, 0),
 IsAllDay: false,
 RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=2'
 }];
 scheduleObj.addEvent(Data);
 document.getElementById('btn1').setAttribute('disabled', 'true');
 };

}

```

### Set Default Value for Event Fields

Event window default fields name like Title, Location, etc.. can be customized and default value can be set to Subject field using **Default** property which will be added if an appointment is created with empty subject.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(e => e.Fields(f =>
 f.Subject(sub => sub.Title("Event
Name").Name("Subject").Default("Add Name"))
 .Location(loc => loc.Title("Event Location").Name("Location"))
 .Description(des => des.Title("Summary").Name("Description"))
 .StartTime(st => st.Title("From").Name("StartTime"))
 .EndTime(et => et.Title("To").Name("EndTime"))
)
 .DataSource(ViewBag.datasource)
)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)

```

### DATA.CS

```

public ActionResult Index()
{

```

```

 }

```

## Open Editor Window in different ways

### Open Editor Window Manually

Scheduler allows the user to manually open the event editor on specific time or on certain events using **openEditor** method. To open the editor on specific range of time, user need to pass the cell details as first argument and **Add** as second argument whereas to open it on event pass that event detail and **Save** as arguments. In the following code example, on clicking the respective button will open the respective editor window manually.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("Click to open Editor").Render()
 @Html.EJS().Button("btn2").Content("Click to open Event
Editor").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .Views(ViewBag.view)
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];

```

```

 var cellData = {
 startTime: new Date(2018, 1, 15, 10, 0),
 endTime: new Date(2018, 1, 15, 11, 0),
 };
 scheduleObj.openEditor(cellData, 'Add');
 };
 document.getElementById('btn2').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var eventData = {
 Id: 3,
 Subject: 'Meteor Showers in 2018',
 StartTime: new Date(2018, 1, 14, 13, 0),
 EndTime: new Date(2018, 1, 14, 14, 30)
 };
 scheduleObj.openEditor(eventData, 'Save');
 };
</script>

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 9, 30, 0), EndTime = new DateTime(2018, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

*Open editor window on single click*

By default, Scheduler Editor window will open when double clicking the cells or appointments. You can also open the editor window with single click by using `openEditor` method in `EventClick` and `CellClick` events of scheduler and setting false to `ShowQuickInfo`. The following example shows how to open editor window on single click of cells and appointments.

**CSHTML**

```
@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .ShowQuickInfo(false)
 .CellClick("onCellClick")
 .EventClick("onEventClick")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.appointments })
 .SelectedDate(new DateTime(2021, 7, 15))
 .Render()
)
<script type="text/javascript">
 function onCellClick(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 scheduleObj.openEditor(args, 'Add');
 }
 function onEventClick(args) {
 var scheduleObj = document.querySelector('.e-
schedule').ej2_instances[0];
 if (!(args.event).RecurrenceRule) {
 scheduleObj.openEditor(args.event, 'Save');
 }
 else {
 scheduleObj.quickPopup.openRecurrenceAlert();
 }
 }
</script>
```

**DATA.CS**

```
public ActionResult Index()
{
 ViewBag.appointments = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Paris",
 StartTime = new DateTime(2021, 7, 15, 10, 0, 0),
 EndTime = new DateTime(2021, 7, 15, 12, 30, 0)
 });
 return appData;
}
```

```
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}
```

### Prevent the Date Navigation

We can prevent navigation while clicking on the date header by simply removing `e-navigate` class from header cells which can be achieved in the `RenderCell` event as shown in the following code example.

#### CSHTML

```
@using Syncfusion.EJ2.Schedule
@(Html.EJS().Schedule("schedule")
 .Height("550px")
 .RenderCell("onRenderCell")
 .EventSettings(e => e.DataSource(ViewBag.datasource))
 .SelectedDate(new DateTime(2018, 1, 28))
 .Render()
)
<script type="text/javascript">
 function onRenderCell(args) {
 if(args.elementType === "dateHeader" || args.elementType ===
"monthCells") {
 ej.base.removeClass(args.element.childNodes, "e-navigate");
 }
 }
</script>
```

#### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 { Id = 1, Subject = "Blue Moon Eclipse", StartTime = new DateTime(2018,
2, 13, 9, 30, 0), EndTime = new DateTime(2018, 2, 13, 11, 0, 0) });
 appData.Add(new AppointmentData
 { Id = 2, Subject = "Milky Way as Melting pot", StartTime = new
DateTime(2018, 2, 15, 9, 30, 0), EndTime = new DateTime(2018, 2, 15, 11, 0,
0) });
 return appData;
}

public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
}
```

```

 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
}

```

### Half-yearly view

The year view of our scheduler displays all the 365 days and their related appointments of a particular year. You can customize the year view by using the following properties.

- [FirstMonthOfYear](#)
- [MonthsCount](#)
- [MonthHeaderTemplate](#)

In the following code example, you can see how to render only the last six months of a year in the scheduler. To start with the month of June, `FirstMonthYear` is set to 6 and `MonthsCount` is set to 6 to render only 6 months.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .FirstMonthOfYear(6)
 .MonthsCount(6)
 .MonthHeaderTemplate("#monthHeaderTemplate")
 .ResourceHeaderTemplate("#resourceHeaderTemplate")
 .Group(group => group.Resources(ViewBag.Resources))
 .Resources(res => {

res.AllowMultiple(true).DataSource(ViewBag.Owners).Field("OwnerId").Title("Owner").Name("Owners").TextField("OwnerText").IdField("Id").ColorField("OwnerColor").Add();
 })
 .Views(view => {
 view.Option(View.Year).Add();
 view.Option(View.TimelineYear).DisplayName("Horizontal Timeline Year").IsSelected(true).Add();
 view.Option(View.TimelineYear).DisplayName("Vertical Timeline Year").Orientation(Orientation.Vertical).Add();
 })
 .EventSettings(e => e.DataSource(ViewBag.datasources))
 .SelectedDate(new DateTime(2021, 8, 1))
 .Render()
)
<script id="monthHeaderTemplate" type="text/x-template">
 <div>${getMonthHeaderText(data.date)}</div>
</script>
<script id="resourceHeaderTemplate" type="text/x-template">
 <div class='template-wrap'>
 <div class="resource-details">
 <div class="resource-name">${getResourceName(data)}</div>
 </div>
 </div>
</script>

```

```

<script type="text/javascript">
 window.getMonthHeaderText = function (date) {
 var instance = new ej.base.Internationalization();
 return date.toLocaleString('en-us', { month: 'long' }) + ' ' +
date.getFullYear()
 };
 window.getResourceName = function (value) {
 return value.resourceData[value.resource.textField];
 };
</script>
<style>
 .e-schedule .e-vertical-view .e-resource-cells {
 height: 62px;
 }
 .e-schedule .template-wrap {
 display: flex;

```

### Set Different Working Hours on Different Days

By default, the work hours of the Scheduler is highlighted based on the start and end values provided within the `WorkHours` property which remains same for all days. To highlight different work hours range for different days, `setWorkHours` method. You can pass date object/ multiple date objects collection as first argument and start and end time need to be added as work hours should be passed as second and third arguments respectively. In the following code example, on button click 11:00 AM to 08:00 PM of 15th and 17th February has been added in work hours.

**CSHTML**

```

@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("Change the work hours").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .WorkHours(wh =>
 wh.Highlight(true)
 .Start("09:00")
 .End("11:00")
)
 .Views(ViewBag.view)
 .SelectedDate(new DateTime(2018, 2, 15))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 var dates = [new Date(2018, 1, 15), new Date(2018, 1, 17)];
 scheduleObj.setWorkHours(dates, '11:00', '20:00');
 };
</script>

```

**DATA.CS**

```

public ActionResult Index()
{
 List<ScheduleView> viewOption = new List<ScheduleView>()
 {
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleView { Option = Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
}

```

[Show quick info Template](#)

This demo showcases the quick popups for cells and appointments with the customized templates.

**CSHTML**

```

@using Syncfusion.EJ2

 var typeObj = new ej.dropdowns.DropDownList({
 dataSource: scheduleObj.getResourceCollections().slice(-
1) [0].dataSource,
 placeholder: 'Choose Type',
 fields: { text: 'Name', value: 'Id' },
 index: 0
 });
 typeObj.appendTo(args.element.querySelector('#eventType'));
 var notesObj = new ej.inputs.TextBox({ placeholder: 'Notes' });
 notesObj.appendTo(args.element.querySelector('#notes'));
 var moreDetailsBtn = args.element.querySelector('#more-
details');
 if (moreDetailsBtn) {
 var moreObj = new ej.buttons.Button({
 content: 'More Details', cssClass: 'e-flat',
 isPrimary:
args.element.firstElementChild.classList.contains('e-event-popup')
 });
 moreObj.appendTo(moreDetailsBtn);
 moreDetailsBtn.onclick = function (e) {
buttonClickActions(e); };
 }
 var addBtn = args.element.querySelector('#add');
 if (addBtn) {
 new ej.buttons.Button({ content: 'Add', cssClass: 'e-flat',
isPrimary: true }, addBtn);
 addBtn.onclick = function (e) { buttonClickActions(e); };
 }
 var deleteBtn = args.element.querySelector('#delete');
 if (deleteBtn) {
 new ej.buttons.Button({ content: 'Delete', cssClass: 'e-
flat' }, deleteBtn);
 deleteBtn.onclick = function (e) { buttonClickActions(e); };
 }
 }
 }
}
</script>

```

public string Type { get; set; }
}

```

### Enable scroll option on all-day section

When you have larger number of appointments in all-day row, it is difficult to view all the appointments properly. In that case you can enable scroller option for all-day row by setting true to **EnableAllDayScroll** whereas its default value is false. When setting this property to true, individual scroller for all-day row is enabled when it reaches its maximum height on expanding.

**Note:** This property is not applicable for Scheduler with Height **auto**.

### CSHTML

```

@using Syncfusion.EJ2.Schedule
@ (Html.EJS().Schedule("schedule")
 .Height("550px")
 .EventSettings(e => e.Fields(f => f.Subject(sub => sub.Name("Subject")))
 .Id("Id")
 .IsAllDay(allday => allday.Name("IsAllDay"))
 .StartTime(st => st.Name("StartTime"))
 .EndTime(et => et.Name("EndTime"))
)
 .DataSource(ViewBag.appointments)
)
.SelectedDate(new DateTime(2021, 3, 28))
.EnableAllDayScroll(true)
.Render()
)

```

### DATA.CS

```

public ActionResult Index()
{
 ViewBag.appointments = generateObject();
 return View();
}
public List<AppointmentData> generateObject()
{
 List<AppointmentData> appData = new List<AppointmentData>(25);
 for (int a = 0; a <= 25; a++)
 {
 appData.Add(new AppointmentData
 {
 Id = a + 1,
 Subject = 'Testing',
 StartTime = new Date(2021, 3, 28),
 EndTime = new Date(2021, 3, 29),
 IsAllDay = true
 });
 }
 return appData;
}
public class AppointmentData

```

```
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}
```

### Refresh Layout

In Scheduler, we can be able to refresh the layout manually without re-render the DOM element by using the `refreshLayout` public method. The following example code explains to know how to use the `refreshLayout` method.

### CSHTML

```
@using Syncfusion.EJ2.Schedule
<div>
 @Html.EJS().Button("btn1").Content("Refresh Layout").Render()
</div>
<div>
 @(Html.EJS().Schedule("schedule")
 .Width("100%")
 .Height("550px")
 .EventSettings(new ScheduleEventSettings { DataSource =
ViewBag.datasource })
 .SelectedDate(new DateTime(2021, 10, 15))
 .Render()
)
</div>
<script type="text/javascript">
 document.getElementById('btn1').onclick = function () {
 var scheduleObj =
document.getElementById('schedule').ej2_instances[0];
 scheduleObj.refreshLayout();
 };
</script>
```

### DATA.CS

```
public ActionResult Index()
{
 ViewBag.datasource = GetScheduleData();
 return View();
}
public List<AppointmentData> GetScheduleData()
{
 List<AppointmentData> appData = new List<AppointmentData>();
 appData.Add(new AppointmentData
 {
 Id = 1,
 Subject = "Conference",
 StartTime = new Date(2021, 10, 16, 10, 0),
 EndTime = new Date(2021, 10, 16, 12, 0),
 IsAllDay = false
 });
}
```

```

appData.Add(new AppointmentData
{
 Id = 2,
 Subject = "Meeting",
 StartTime = new Date(2021, 10, 18, 10, 0),
 EndTime = new Date(2021, 10, 18, 12, 30),
 IsAllDay = false
});
return appData;
}
public class AppointmentData
{
 public int Id { get; set; }
 public string Subject { get; set; }
 public DateTime StartTime { get; set; }
 public DateTime EndTime { get; set; }
 public bool IsAllDay { get; set; }
}

```

### Set Different Time Duration on Event Editor

In event window, start/end time duration will be processed based on the **interval** value within the **timeScale** property. By default, **interval** value is 30, therefore in event window start/end time duration will be in 30 mins duration. You can set custom interval range to the start/end time in event window using **popupOpen** event as shown below.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Schedule
<div class="control-section">
 <div class="content-wrapper">

@Html.EJS().Schedule("schedule").Width("100%").Height("550px").PopupOpen("on
PopupOpen").EventSettings(e =>
e.DataSource(ViewBag.datasource).Views(ViewBag.view).SelectedDate(new
DateTime(2018, 2, 15)).Render()
 </div>
 </div>
 <script type="text/javascript">
 function onPopupOpen(args) {
 args.duration = 40;
 }
 </script>

```

### DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public partial class ScheduleController : Controller

```

```

{
 public ActionResult event-duration()
 {
 ViewBag.datasource = new ScheduleData().GetScheduleData();
 List<ScheduleViewsModel> viewOption = new
List<ScheduleViewsModel>()
 {
 new ScheduleViewsModel {Option =
Syncfusion.EJ2.Schedule.View.Day },
 new ScheduleViewsModel {Option =
Syncfusion.EJ2.Schedule.View.Week },
 new ScheduleViewsModel {Option =
Syncfusion.EJ2.Schedule.View.WorkWeek },
 new ScheduleViewsModel {Option =
Syncfusion.EJ2.Schedule.View.Month }
 };
 ViewBag.view = viewOption;
 return View();
 }
}

```

### Prioritize the Resource Color for Events

By default top level resource color will be applied for the events. If user wants to apply specific resource color to events irrespective of its parent resource color, it can be achieved by `resourceColorField` field within `eventSettings` property as shown below.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Schedule
@section ControlsSection{
 <div class="control-section">
 <div class="content-wrapper">

@Html.EJS().Schedule("schedule").Width("100%").Height("550px").CurrentView(V
iew.WorkWeek).SelectedDate(new DateTime(2018, 6, 5)).Group(group =>
group.ByGroupID(false).Resources(ViewBag.Resources)).Resources(res =>
{

res.DataSource(ViewBag.Projects).Field("ProjectId").Title("Project").Name("P
rojects").TextField("text").IdField("id").ColorField("color").Add();

res.DataSource(ViewBag.Categories).Field("CategoryId").Title("Category").Nam
e("Categories").TextField("text").IdField("id").ColorField("color").AllowMul
tiple(true).Add();
 }).EventSettings(e => e.DataSource(ViewBag.datasource)).Render()
 </div>
 </div>
}

```

### DATA.CS

```

using System;
using System.Collections.Generic;

```

```

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
 public partial class ScheduleController : Controller
 {
 public ActionResult resource-color()
 {
 ViewBag.datasource = new ScheduleData().GetResourceTeamData();
 List<ProjectResource> projects = new List<ProjectResource>();
 projects.Add(new ProjectResource { text = "PROJECT 1", id = 1,
color = "#cb6bb2" });
 projects.Add(new ProjectResource { text = "PROJECT 2", id = 2,
color = "#56ca85" });
 ViewBag.Projects = projects;
 List<CategoryResource> categories = new
List<CategoryResource>();
 categories.Add(new CategoryResource { text = "Development", id =
1, color = "#1aaa55" });
 categories.Add(new CategoryResource { text = "Testing", id = 2,
color = "#7fa900" });
 ViewBag.Categories = categories;
 ViewBag.Resources = new string[] { "Projects", "Categories" };
 return View();
 }
 }
 public class ProjectResource
 {
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 }
 public class CategoryResource
 {
 public string text { set; get; }
 public int id { set; get; }
 public string color { set; get; }
 }
}

```

**Note:** The `resourceColorField` field value should be as same as the `name` field value given with in `resources` property.

## SideBar

### Getting Started with ASP.NET MVC Sidebar Control

This section briefly explains about how to include [ASP.NET MVC Sidebar](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/ \_LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC

controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC Sidebar control

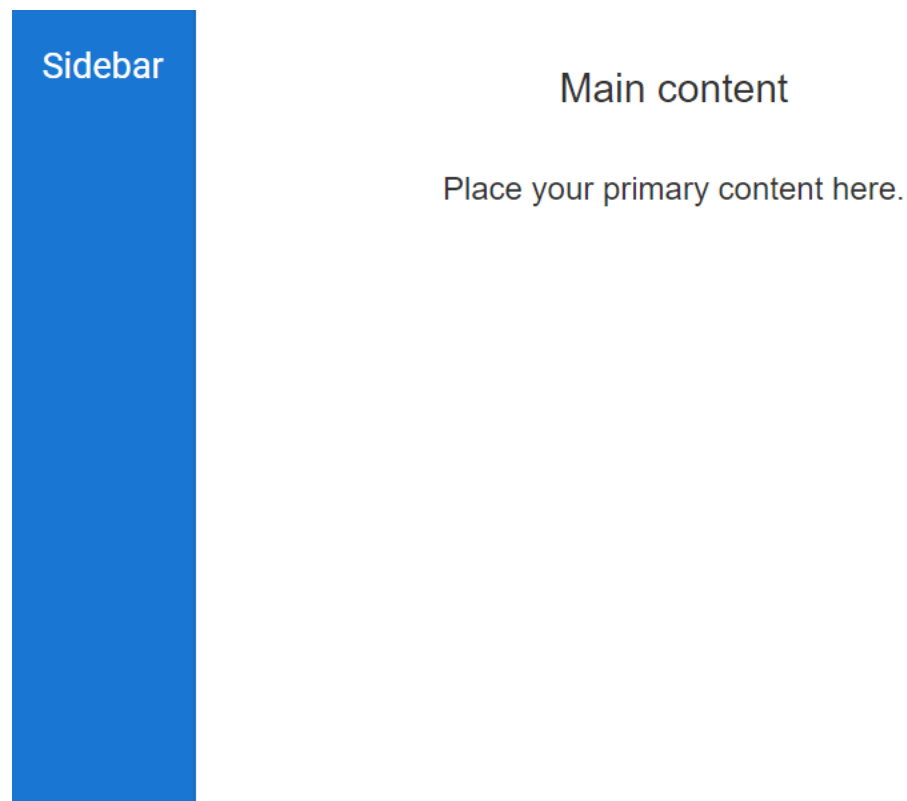

Now, add the Syncfusion ASP.NET MVC Sidebar control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").CloseOnDocumentClick(false).ContentTemplate(
@<div>
 <div class="title-header">
 <div style="display:inline-block"> Sidebar </div>
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- Main Content declaration -->
<div>
 <div class="title default">Main content</div>
 <div class="sub-title">
 Place your primary content here.
 </div>
</div>
<style>
/* sample level styles */
.center-align {
 text-align: center;
 padding: 20px;
}
.title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
}
.sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
}
body {
 padding-top: 0px;
 padding-bottom: 0px;
```

```
}
.title-header {
 text-align: center;
 font-size: 18px;
 padding: 15px;
}
.title.default {
 padding: 25px 15px 15px;
}
/* sidebar element styles */
#default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
}
</style>
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Sidebar control will be rendered in the default web browser.

#### Enable backdrop

Enabling the [ShowBackdrop](#) in the Sidebar component will prevent the main content from user interactions. Here, the DOM elements will not get changed. It only closes the main content by covering with a black backdrop overlay and focuses the Sidebar in the screen. Sidebar can be rendered with specific width by setting [width](#) property.

**Note:** To achieve a proper **backdrop**, we suggest that you create a wrapper parent container for the div block in which you intend to enable the backdrop. Set the class name of this parent container as the **target** for the Sidebar. Alternatively, you can place an empty div container after the target container.

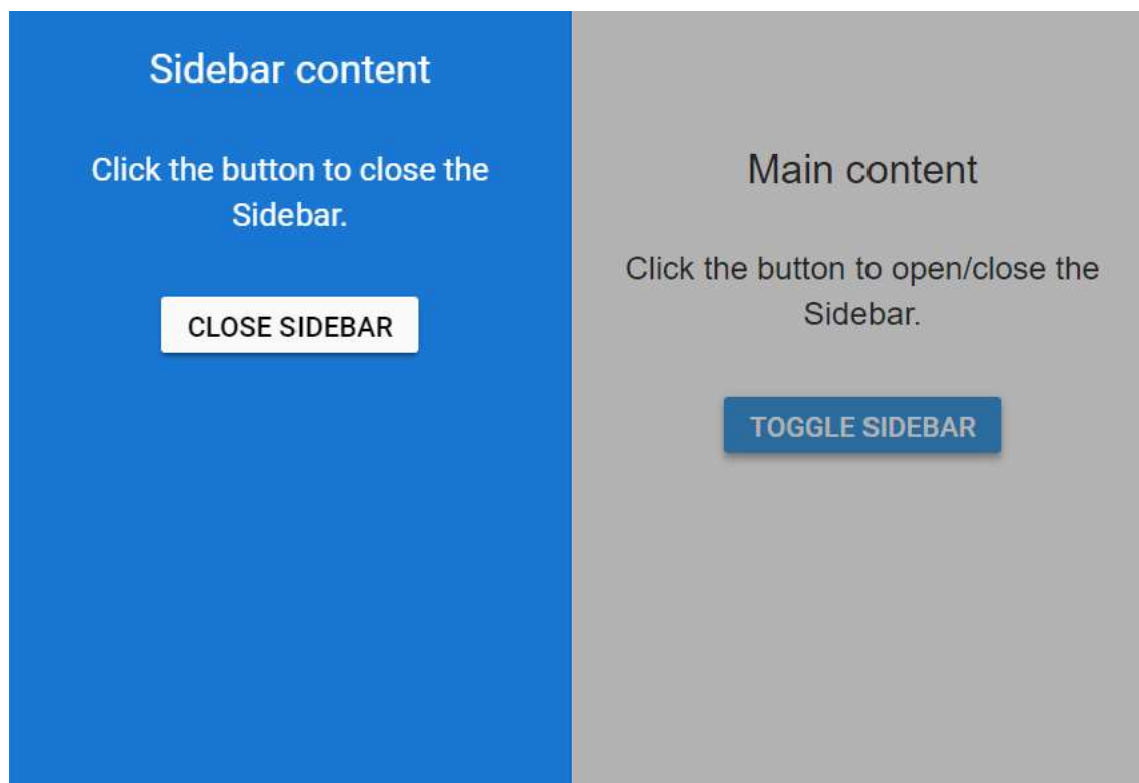

**CSHTML**

```

<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").ShowBackdrop(true).Type(Syncfusion.EJ2.Navigations.SidebarType.Push)
.Width("280px").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 Click the button to close the Sidebar.
 </div>
 <div class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("toggle").Content("Toggle Sidebar").CssClass("e-
info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 //create instances for sidebar element
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
 // Toggle button to close and open the sidebar
 document.getElementById('toggle').onclick = function () {
 defaultSidebar.toggle();
 }
 // Close the sidebar
 document.getElementById('close').onclick = function () {
 defaultSidebar.hide();
 }
 });
</script>
<style>
 /* sample level styles */
 .center-align {
 text-align: center;
 padding: 20px;
 }
 .title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;

```

```
padding: 10px;
}
/* Button styles */
#close, #close:hover, #close:active, #close:focus { /* csslint allow:
adjoining-classes*/
background: #fafafa;
color: black
}
/* sidebar element styles */
#default-sidebar {
background-color: rgb(25, 118, 210);
color: #ffffff;
}
</style>
```

### Position

Positioning the Sidebar to the right or left of the main content can be achieved by using the [Position](#) property. If the position is not set, the Sidebar will expand from the left to the body element. [EnablePersistence](#) will persist the component's state between page reloads. [Change](#) event will be triggered when the state(expand/collapse) of the component is changed.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Type(Syncfusion.EJ2.Navigations.SidebarType.Push).Width("280px").E
nablePersistence(true).Target(".maincontent").ContentTemplate(@<div>
<div class="title"> Sidebar content</div>
<div class="sub-title">
```

```

 Click the button to close the Sidebar.
 </div>
 <div class="center-align">
 <!-- Button element declaration -->
 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- Main Content declaration -->
<div id="head">
 <!-- Button element declaration -->
 @Html.EJS().Button("toggle").Content("Open").IsToggle(true).CssClass("e-
info").IconCss("e-icons burg-icon").Render()
</div>

## Animate

Animation transitions can be set while expanding or collapsing the Sidebar using the [Animate](#) property. By default, [Animate](#) property is set to true. [EnableRtl](#) will display the sidebar in the right-to-left direction.

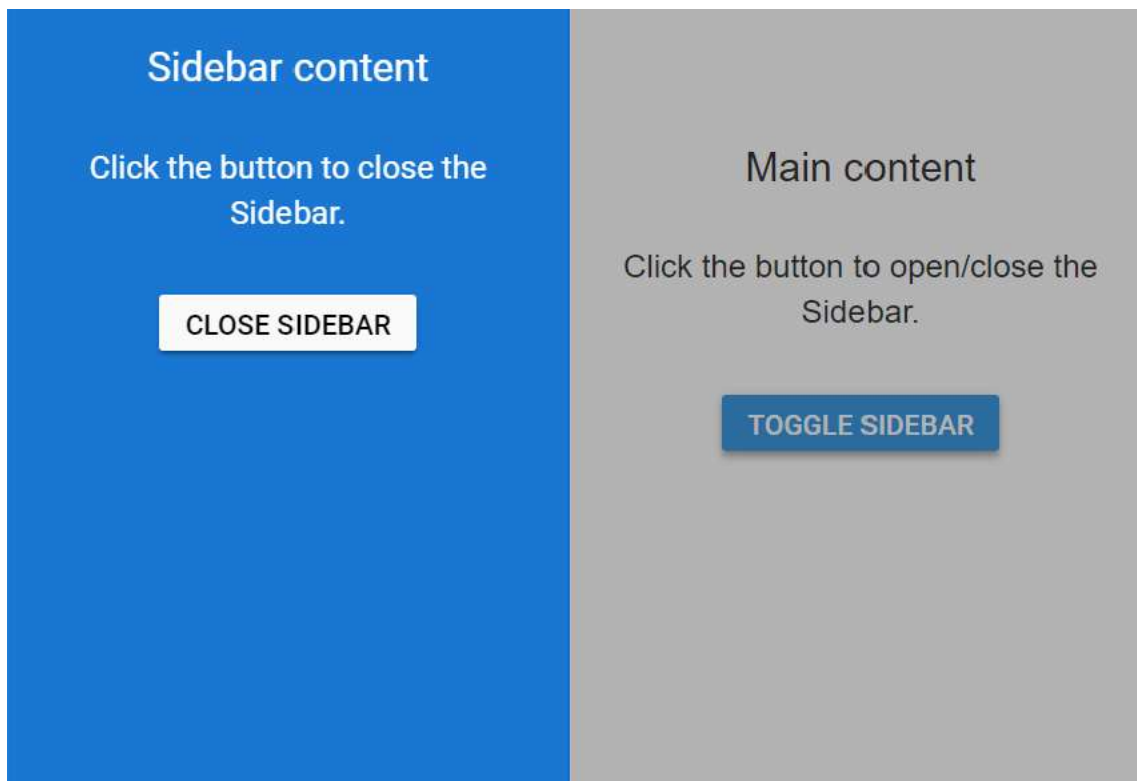

## CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Animate(false).EnableRtl(true).Type(Syncfusion.EJ2.Navigations.Sid
ebarType.Push).Width("280px").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 Click the button to close the Sidebar
 </div>
 <div class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("toggle").Content("Toggle Sidebar").CssClass("e-
info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 //create instances for sidebar element
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
 // Toggle button to close and open the sidebar
 document.getElementById('toggle').onclick = function () {
 defaultSidebar.toggle();
 }
 // Close the sidebar
 document.getElementById('close').onclick = function () {
 defaultSidebar.hide();
 }
 });
</script>
<style>
 /* sample level styles */
 .center-align {
 text-align: center;
 padding: 20px;
 }
 .title {
 text-align: center;
```

```

 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 /* Button styles */
 #close, #close:hover, #close:active, #close:focus { /* csslint allow:
adjoining-classes*/
 background: #fafafa;
 color: black
 }
 /* sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
</style>

```

#### Close on document click

SideBar can be closed on document click by setting [CloseOnDocumentClick](#) to true. If this property is not set, the SideBar will not close on document click since its default value is false. SideBar can be kept opened during rendering using [IsOpen](#) property.

#### CSHTML

```
<!-- sidebar element declaration -->
```

```

@{Html.EJS().Sidebar("default-
sidebar").CloseOnDocumentClick(true).IsOpen(true).Type(Syncfusion.EJ2.Naviga
tions.SidebarType.Push).Width("280px").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("toggle").Content("Open Sidebar").CssClass("e-
info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 //create instances for sidebar element
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
 // Toggle button to close and open the sidebar
 document.getElementById('toggle').onclick = function () {
 defaultSidebar.show();
 }
 });
</script>
<style>
 /* sample level styles */
 .center-align {
 text-align: center;
 padding: 20px;
 }
 .title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 /* Button styles */
 #close, #close: hover, #close: active, #close: focus { /* csslint allow:
adjoining-classes*/
 background: #fafafa;
 color: black
 }
 /* sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
</style>

```

### Enable gestures

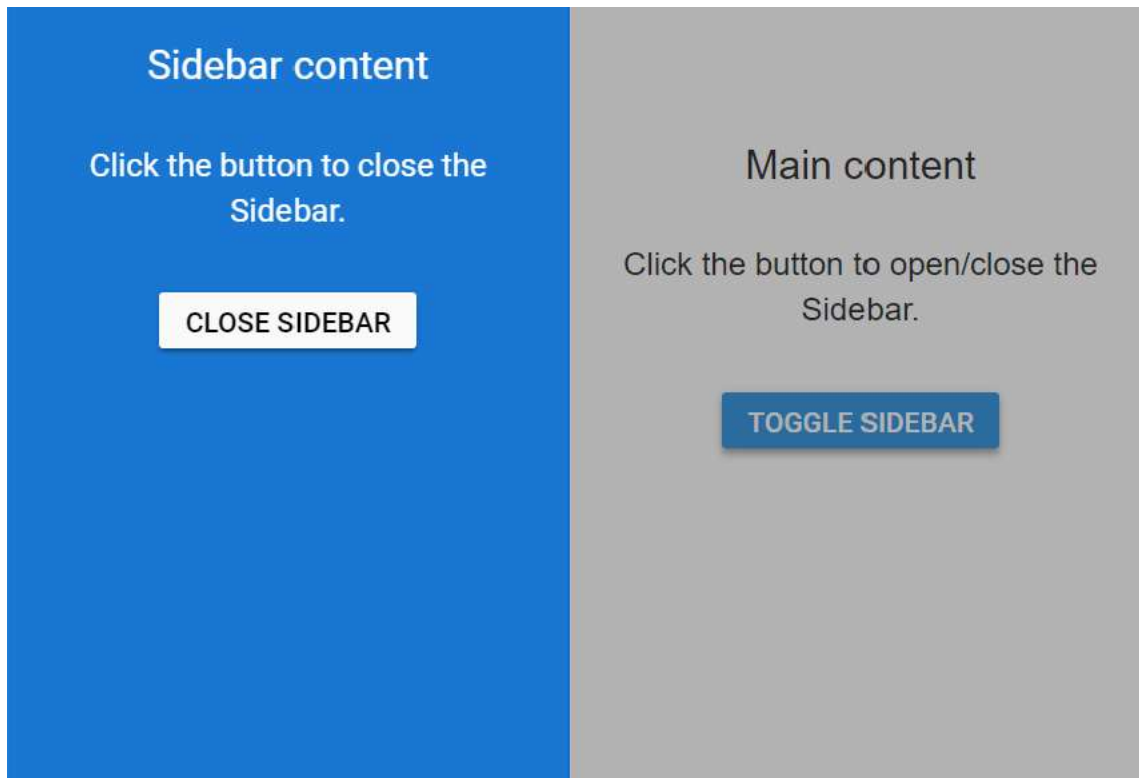

Expand or collapse the Sidebar while swiping in touch devices using [EnableGestures](#) property. By default, [EnableGestures](#) is set to true.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").EnableGestures(true).Type(Syncfusion.EJ2.Navigations.SidebarType.P
ush).Width("280px").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 Click the button to close the Sidebar
 </div>
 <div class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("toggle").Content("Toggle Sidebar").CssClass("e-
info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 //create instances for sidebar element
```

```
var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
// Toggle button to close and open the sidebar
document.getElementById('toggle').onclick = function () {
 defaultSidebar.toggle();
}
// Close the sidebar
document.getElementById('close').onclick = function () {
 defaultSidebar.hide();
}
});
</script>
<style>
/* sample level styles */
.center-align {
 text-align: center;
 padding: 20px;
}
.title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
}
.sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
}
/* Button styles */
#close, #close:hover, #close:active, #close:focus { /* csslint allow:
adjoining-classes*/
 background: #fafafa;
 color: black
}
/* sidebar element styles */
#default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
}
</style>
```

**Note:** [View Sample in GitHub.](#)

## Context

By default, Sidebar initializes context to the body element. Using the [target](#) property, set context element to initialize Sidebar inside any HTML element apart from the body element.

**Note:** If required, `zIndex` can be set when sidebar act as overlay type.

In the following sample, click the toggle button to expand or collapse the sidebar and add button in sidebar element.

## CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Type(Syncfusion.EJ2.Navigations.SidebarType.Push).Width("280px").T
arget(".maincontent").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 Click the button to close the Sidebar.
 </div>
 <div class="center-align">
 <!-- Button element declaration -->
```

```

 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<div id="head">
 <!-- Button element declaration -->
 @Html.EJS().Button("toggle").Content("Open").IsToggle(true).CssClass("e-
info").IconCss("e-icons burg-icon").Render()
</div>
<!-- main content declaration -->
<div class="maincontent" style="height:335px;border:1px solid gray">
 <div>

## CONTEXT.CS

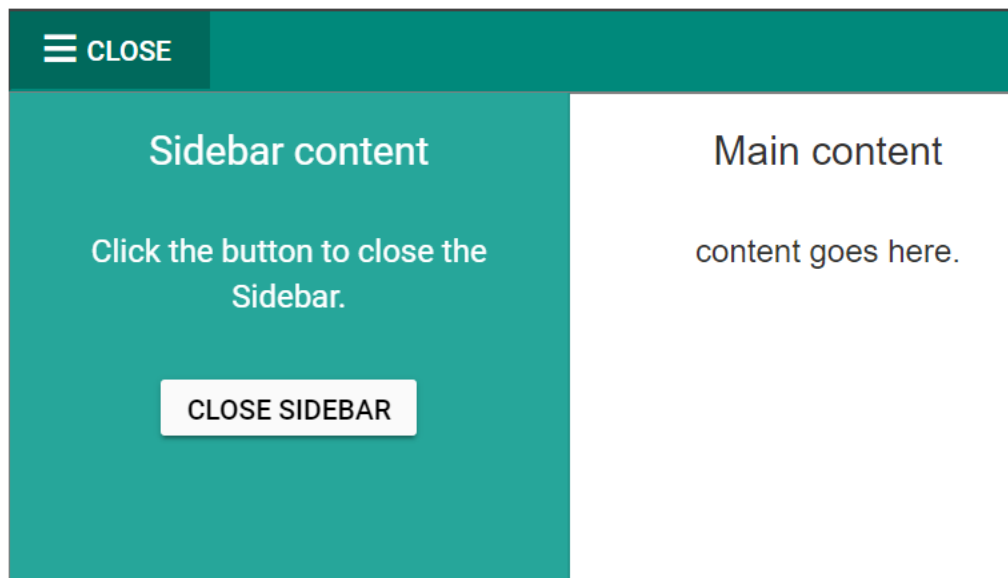

```
using System;
```

```

using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult context()
 {
 return View();
 }
 }
}

```

Output be like the below.

- [Hide sidebar](#)

## Types

The Sidebar component's expand behaviour can be modified based on the purpose of use.

### Expanding types of Sidebar

The Sidebar can be set to initialize based on four different types that are consistent with the main component as explained below. When `dataBind` is invoked, this applies the pending property changes immediately to the component.

| Item | Description |
|------|-------------|
|      |             |

| ----- | -----  
----- |

| [Over](#) | Sidebar floats over the main content area.

| [Push](#) | Sidebar pushes the main content area to appear side-by-side, and shrinks the main content within the screen width.

| [Slide](#) | Sidebar translates the x and y positions of main content area based on the Sidebar width. The main content area will not be adjusted within the screen width. |

| [Auto](#) | Sidebar with [Over](#) type in mobile resolution, and [Push](#) type in other higher resolutions.

**Note:** [Auto](#) is the default expand mode.

In the following sample, Sidebar component's expand behaviour are demonstrated.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Type(Syncfusion.EJ2.Navigations.SidebarType.Push).Target(".maincon
tent").ContentTemplate(@<div>

- [How to add multiple sidebar](#)

### Auto-close

SideBar often behaves differently on a mobile versus a desktop display. It has an effective feature that offers to set it in opened or closed state corresponding to the specified resolution. This is achieved through [mediaQuery](#) property that allows you to set the SideBar in an expanded state or collapsed state only in user-defined resolution.

In the following sample, mediaQuery has been used for specific resolution to close and open sidebar.

### CSHTML

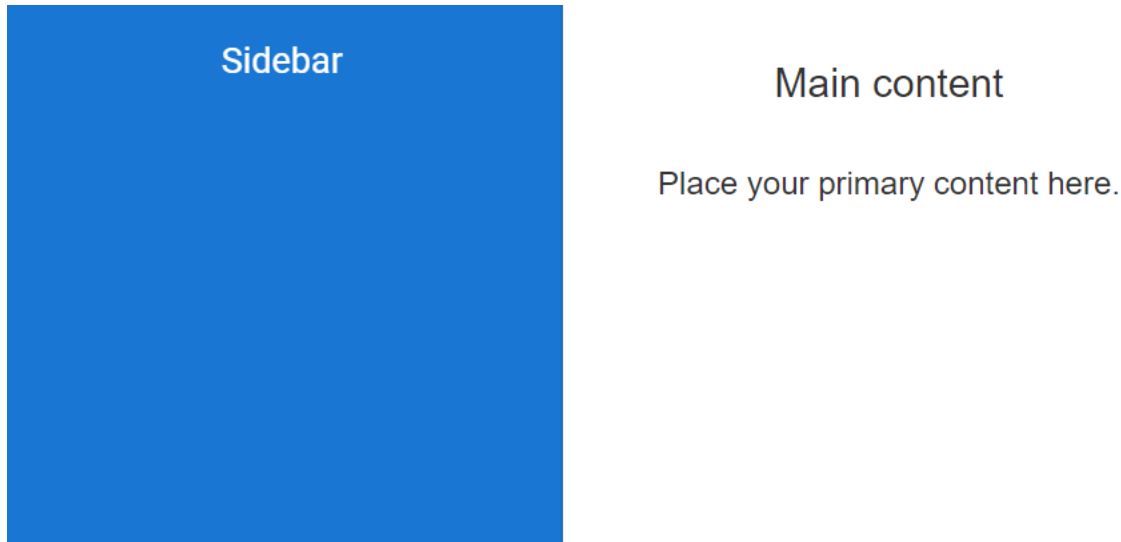

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-sidebar").Width("280px").MediaQuery("(min-width: 600px)").ContentTemplate(@<div>
 <div class="title-header">
 <div style="display:inline-block"> Sidebar </div>
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title default">Main content</div>
 <div class="sub-title">
 Place your primary content here.
 </div>
</div>
```

```
</div>
<style>
 /* main content styles */
 .title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 body {
 padding-top: 0px;
 padding-bottom: 0px;
 }
 /* sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
 .title-header {
 text-align: center;
 font-size: 18px;
 padding: 15px;
 }
 .title.default {
 padding: 25px 15px 15px;
 }
</style>
```

### AUTOCLOSE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult autoclose()
 {
 return View();
 }
 }
}
```

Output be like the below.

- In this sample, the Sidebar will be in an expanded state only in resolution below 400px using [mediaQuery](#) for max-width.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-sidebar").Width("280px").MediaQuery("(max-width: 500px)").ContentTemplate(@<div>
 <div class="title-header">
 <div style="display:inline-block"> Sidebar </div>
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title default">Main content</div>
 <div class="sub-title">
 Place your primary content here.
 </div>
</div>
<style>
/* main content styles */
.title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
}
.sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
}
body {
 padding-top: 0px;
 padding-bottom: 0px;
}
```

```

/* sidebar element styles */
#default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
}
.title-header {
 text-align: center;
 font-size: 18px;
 padding: 15px;
}
.title.default {
 padding: 25px 15px 15px;
}
</style>

```

### AUTOCLOSE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult autoclose()
 {
 return View();
 }
 }
}

```

Output be like the below.

### Dock

Dock state of the Sidebar reserves some space on the page that always remains in a visible state when the Sidebar is collapsed. It is used to show the short term of a content like icons alone instead of lengthy text. To achieve this, set [EnableDock](#) as true along with required [DockSize](#).

In the following sample, the list item has icon with text representation. On dock state only the icon listed out to interact. It can be achieved by using [EnableDock](#) property.

### CSHTML

```

<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("dockSidebar").Width("220px").DockSize("72px").EnableDo
ck(true).ContentTemplate(@<div>
 <div class="dock">

 <li class="sidebar-item" id="toggle">

```

## DOCK.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult dock()
 {
 return View();
 }
 }
}
```

In Collapsed state,the output be like the below

Main content

Click the expand icon to open and collapse icons to close the Sidebar

In Expanded state, the output be like the below

## Main content

Click the expand icon to open and collapse icons to close the Sidebar

See Also

- [How to add sidebar navigation](#)

## Styles and Appearance

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user's preference.

### Customizing the sidebar

Use the below CSS to customize the sidebar root element.

```
`css
.e-sidebar {
background: #898b2b
}
`
```

### Customizing the sidebar based on the positions

Use the below CSS to customize the left positioned sidebar.

```
`css
.e-sidebar.e-left {
border-right: 2px solid red;
}
`
```

Use the below CSS to customize the right positioned sidebar.

```
`css
.e-sidebar.e-right {
```

```
border-left: 2px solid red;
}
```

,

#### Customizing the sidebar based on the active state

Use the below CSS to customize the open state of the left positioned sidebar.

```
`css
.e-sidebar.e-left.e-open {
transition: transform 2.5s ease;
}
```

,

Use the below CSS to customize the open state of the right positioned sidebar.

```
`css
.e-sidebar.e-right.e-open {
transition: transform 2.5s ease;
}
```

,

Use the below CSS to customize the closed state of the left positioned sidebar.

```
`css
.e-sidebar.e-left.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
```

,

Use the below CSS to customize the closed state of the right positioned sidebar.

```
`css
.e-sidebar.e-right.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
```

,

#### Customizing the sidebar with dock state

When you enable the Dock support, the "e-dock" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element with a dock state.

```
`css
.e-sidebar.e-dock {
```

```
background: #2d323e;
}
```

,

### Customizing the different types of sidebar

Use the below CSS to customize the auto type sidebar.

```
`css
```

```
.e-sidebar.e-left.e-auto {
background-color: pink;
}
```

,

Use the below CSS to customize the push type sidebar.

```
`css
```

```
.e-sidebar.e-left.e-push {
background-color: beige;
}
```

,

Use the below CSS to customize the over type sidebar.

```
`css
```

```
.e-sidebar.e-left.e-over {
background-color: aqua;
}
```

,

Use the below CSS to customize the slide type sidebar.

```
`css
```

```
.e-sidebar.e-left.e-slide {
background-color: green;
}
```

,

### Customizing the backdrop of the sidebar

Use the below CSS to customize the backdrop of the sidebar.

```
`css
```

```
.e-sidebar-overlay {
background-color: aqua;
}
```

### Customizing the sidebar in the RTL direction

When you enable the RTL (right to left direction) support, the "e-rtl" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element in the RTL (right to left direction) mode.

```
`css
.e-sidebar.e-left.e-rtl {
background-color: antiquewhite;
}
```

### Prevent the animation transition for the Sidebar component

Use the below CSS to prevent the animation transition for the Sidebar component.

```
`css
.e-sidebar-context .e-content-animation {
transition: none !important;
transform: none !important;
}
```

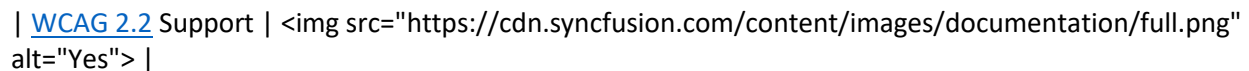

### Accessibility in ASP.NET MVC Sidebar component

The Sidebar component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sidebar component is outlined below.

| Accessibility Criteria | Compatibility |

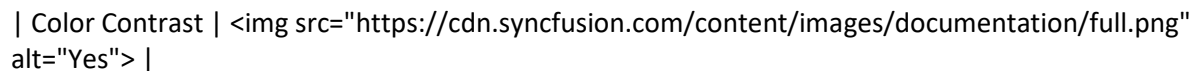

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes"> |

| [Section 508](#) Support |  alt="Yes"> |

| Screen Reader Support |  alt="Yes"> |

| Right-To-Left Support |  alt="Yes"> |

| Color Contrast |  alt="Yes"> |

| Mobile Device Support |  alt="Yes"> |

```

| Keyboard Navigation Support | |
| Accessibility Checker Validation | |
| Axe-core Accessibility Validation | |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Sidebar component followed the [WAI-ARIA](#) patterns to meet accessibility standards. By default, the Sidebar utilizes the [complementary](#) role, with the option to modify the ARIA role based on provided attributes to the root element, depending on the specific use case.

If there are multiple complementary landmark roles or aside elements in a document, it is important to provide a label for each landmark using the `aria-label` attribute. Alternatively, if the aside has a descriptive title, it can be referenced using the `aria-labelledby` attribute. This label will help assistive technology users quickly understand the purpose of each landmark.

For optimal accessibility, it is recommended to incorporate a trigger component that is navigable via a keyboard, such as a button. If this is not feasible, inclusion of the `tabIndex` attribute becomes necessary. Furthermore, explicit handling of the `aria-expanded` attribute is required for the trigger element.

### Keyboard interaction

The Sidebar component does not have any inbuilt keyboard interaction support. However, you can utilize the keyboard interactions of focusable elements within the Sidebar component.

### Ensuring accessibility

The Sidebar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sidebar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sidebar component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## How To

### Initialize the Sidebar with ListView

Any HTML element can be placed in the Sidebar content area. Sidebar supports all types of HTML structures like `TreeView`, `ListView`, etc.

In the following example, the Sidebar is rendered with `ListView` component in its content area.

- Add the HTML div tag with its id attribute as `default` in your `index.html` file to initialize the Sidebar.

## CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Type(Syncfusion.EJ2.Navigations.SidebarType.Over).Width("100%").Co
ntentTemplate(@<div>
 <div class="title1"> Menu </div>
 <div class="closebtn">
 <!-- Button element declaration -->
 @Html.EJS().Button("close").CssClass("e-btn close-
btn").Content("CLOSE SIDEBAR").IconCss("e-icons close-icon").Render()
 </div>
 <div id="listcontainer">
 <!-- Listview element declaration -->

@Html.EJS().ListView("list").DataSource((IEnumerable<object>)ViewBag.dataSou
rce).Render()
 </div>
 <div class="sub-title">
 * ListView component is placed inside the sidebar content area.
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- Main Content declaration -->
<div>
 <div class="title2">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- Button element declaration -->
 @Html.EJS().Button("toggle").Content("Toggle
Sidebar").IsToggle(true).CssClass("e-info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 // Create instances for sidebar element
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
```

```

 // Toggle button to open and close the sidebar
 document.getElementById('toggle').onclick = function () {
 defaultSidebar.toggle();
 }
 // Close the sidebar
 document.getElementById('close').onclick = function () {
 defaultSidebar.hide();
 }
 });
</script>
<style>
/* ListView element styles */
#listcontainer {
 width: 100%;
}
#list {
 margin: 0 auto;
 width: 30%;
}
.e-listview .e-list-item {
 text-align: center;
 font-size: 14px;
 padding: 0;
}
/* Button element styles */
.e-btn.close-btn :hover { /* csslint allow: adjoining-classes*/
 box-shadow: none;
 background: transparent;
}
.close-btn, .e-listview .e-list-item, #default-sidebar {
 background-color: rgb(20, 118, 210);
 color: #ffffff;
}
.close-icon::before {
 content: '\e945';
}
.close-btn {
 box-shadow: none;
}
.close-btn:hover {
 color: #fafafa;
}
.e-icons.close-icon { /* csslint allow: adjoining-classes*/
 line-height: 2.2;
}
.closebtn {
 top: 15px;
 line-height: 36px;
 height: 42px;
 color: black;
 position: absolute;
 right: 10px;
}
/* Sample level styles */
.title1 {
 text-align: center;
 font-size: 20px;
}

```

```

 padding: 15px;
 }
 .title2 {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 .center-align {
 text-align: center;
 padding: 20px;
 }
 body {
 margin: 0;
 }
</style>

```

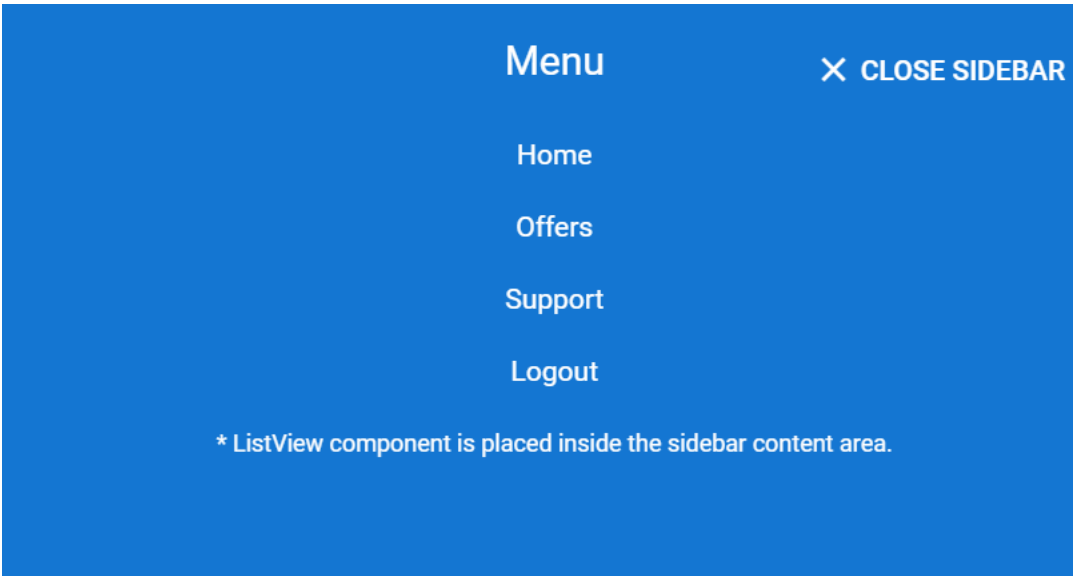

### SIDEBAR.CS

```

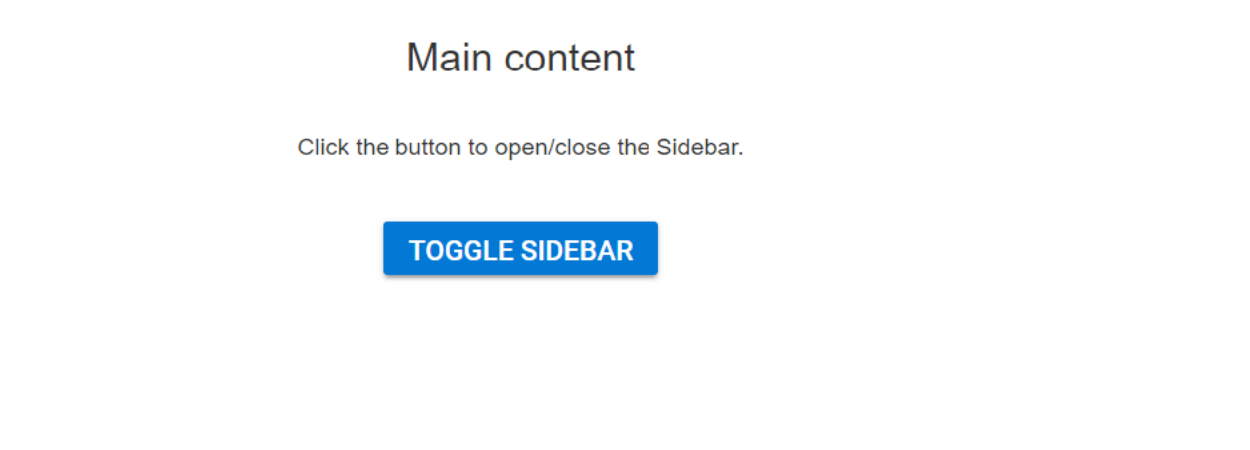

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult sidebar()
 {
 List<object> data = new List<object>();
 data.Add(new { text = "Home", id = "list-01" });
 data.Add(new { text = "Offers", id = "list-02" });
 data.Add(new { text = "Support", id = "list-03" });
 data.Add(new { text = "Logout", id = "list-04" });
 ViewBag.dataSource = data;
 return View();
 }
 }
}

```

Output be like the below in Expanded state, the sidebar width is set as 100%.

In Collapsed state, the output be like the below.

Open and close the Sidebar

Opening and closing the Sidebar can be achieved with built-in public methods.

| Method   | Description                                           |
|----------|-------------------------------------------------------|
| show()   | Method to open the Sidebar.                           |
| hide()   | Method to close the Sidebar.                          |
| toggle() | Method to toggle the open/close state of the Sidebar. |

In the following sample, toggle method has been used to show or hide the Sidebar on button click.

CSHTML

```
<!-- sidebar element declaration -->
```

```

@{Html.EJS().Sidebar("default-
sidebar").ShowBackdrop(false).Open("Open").Close("Close").ContentTemplate(@<
div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 Click the button to close the Sidebar.
 </div>
 <div class="center-align">
 <!-- Button element declaration -->
 @Html.EJS().Button("close").Content("CloseSidebar").Render()
 </div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- Main Content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- Button element declaration -->
 @Html.EJS().Button("toggle").Content("Toggle Sidebar").CssClass("e-
info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 // Create instances for sidebar element
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
 // Toggle button to open and close the sidebar
 document.getElementById('toggle').onclick = function () {
 defaultSidebar.toggle();
 }
 // Close the sidebar
 document.getElementById('close').onclick = function () {
 defaultSidebar.hide();
 }
 });
 function Open() {
 console.log("Sidebar Opened");
 }
 function Close() {
 console.log("Sidebar Closed");
 }
</script>
<style>
 /* Button element styles */
 #close, #close:hover, #close:active, #close:focus { /* csslint allow:
adjoining-classes*/
 background: #fafafa;
 color: black
 }
 /* sample level styles */
 .title {
 text-align: center;
 font-size: 20px;

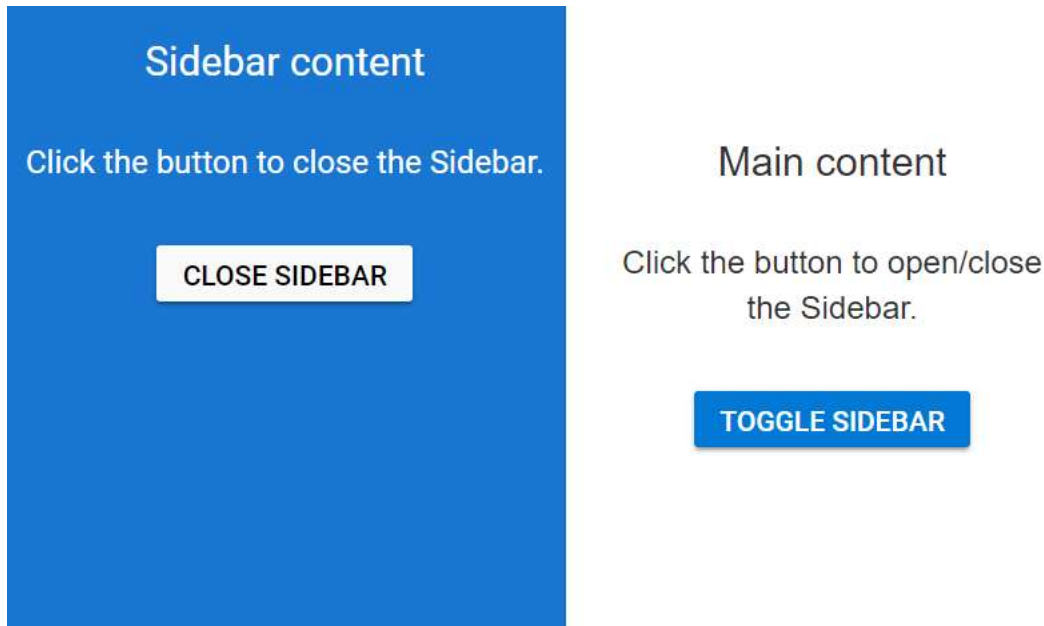

```

```
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 .center-align {
 text-align: center;
 padding: 20px;
 }
 body {
 margin: 0;
 }
 /* Sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
</style>
```

### OPEN.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult open()
 {
 return View();
 }
 }
}
```

Output be like the below.

### Multiple Sidebar in SideBar Control

Two Sidebars can be initialized in a web page with same main content. Sidebars can be initialized on right side or left side of the main content using [position](#) property.

**Note:** The HTML element with class name `e-main-content` will be considered as the main content and both the Sidebars will behave as side content to this main content area of a web page.

In the following sample, more than one sidebar is rendered based on [position](#) property.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Type(Syncfusion.EJ2.Navigations.SidebarType.Push).Width("280px").C
ontentTemplate(@<div>
 <div class="title"> Left Sidebar content</div>
</div>).Render();
}
@{Html.EJS().Sidebar("default-
sidebar1").Type(Syncfusion.EJ2.Navigations.SidebarType.Push).Width("280px").
Position(Syncfusion.EJ2.Navigations.SidebarPosition.Right).ContentTemplate(@
<div>
 <div class="title"> Right Sidebar content</div>
</div>).Render();
}
<!-- end of sidebar element -->
<!-- main content declaration -->
<div>
 <div class="title">Main content</div>
 <div class="sub-title"> Click the button to open/close the
Sidebar.</div>
 <div style="padding:20px" class="center-align">
 <!-- button element declaration -->
 @Html.EJS().Button("toggle").Content("Left Toggle
Sidebar").CssClass("e-info").Render()
```

```

 @Html.EJS().Button("toggle1").Content("Right Toggle
Sidebar").CssClass("e-info").Render()
 </div>
</div>
<script type="text/javascript">
 document.addEventListener('DOMContentLoaded', function () {
 // Toggle button to close and open the sidebar
 document.getElementById('toggle').onclick = function () {
 var defaultSidebar = document.getElementById("default-
sidebar").ej2_instances[0];
 defaultSidebar.toggle();
 }
 // Close the sidebar
 document.getElementById('toggle1').onclick = function () {
 var defaultSidebar1 = document.getElementById("default-
sidebar1").ej2_instances[0];
 defaultSidebar1.toggle();
 }
 });
</script>
<style>
 /* sample level styles */
 .center-align {
 text-align: center;
 padding: 20px;
 }
 .title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
 /* Button styles */
 #close, #close:hover, #close:active, #close:focus { /* csslint allow:
adjoining-classes*/
 background: #fafafa;
 color: black
 }
 /* sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
 #default-sidebar1 {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
</style>

```

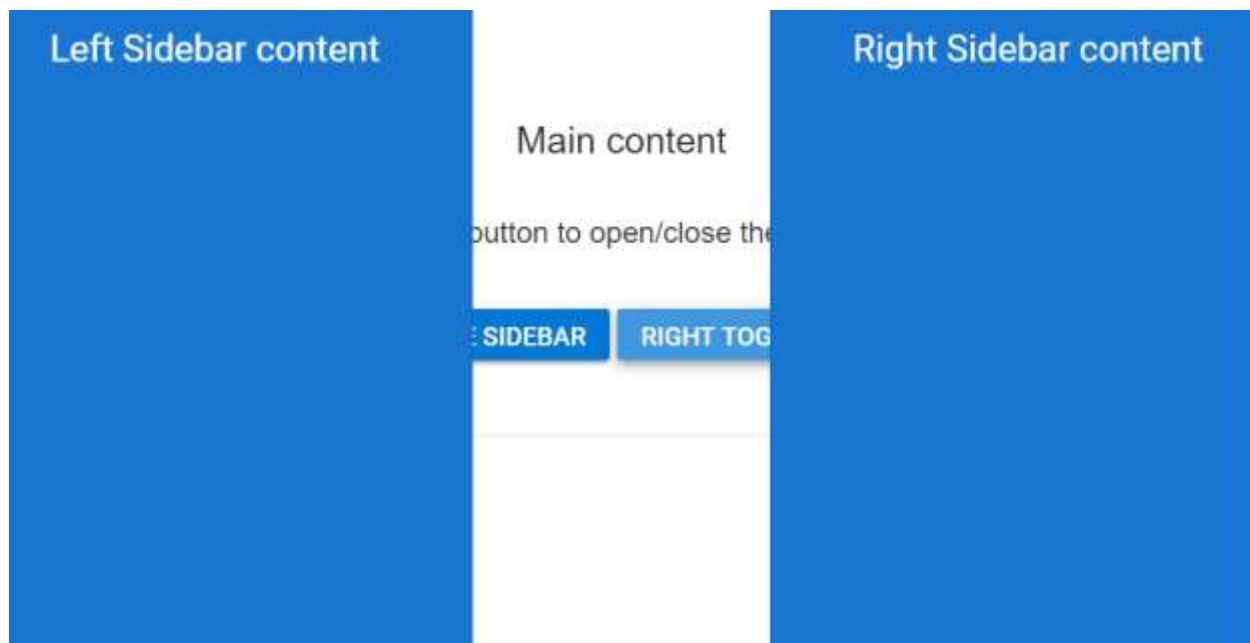

## MULTIPLE.CS

```
using System;
```

```
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult multiple()
 {
 return View();
 }
 }
}
```

Output be like the below.

### Sidebar with fixed position

The Sidebar does not require any specific style to make it as a fixed one. By default, the Sidebar position will be in fixed state. The following example demonstrates that the Sidebar is rendered with a fixed position. The position of the Sidebar will not change when scrolling the main content area.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").CloseOnDocumentClick(false).Width("260px").ContentTemplate(
@<div>
 <div class="sidebar-header header-cover" style="background-
color:#0378d5">
 <div class="image-container">
 <div class="sidebar-image">
 </div>
 </div>
 </div>
 </div>
</div>
```

```

 <div style="padding: 0 0 5px 0;">

### FIXED\_POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult fixed_position()
 {
 return View();
 }
 }
}

```

Output be like the below.

### Custom animation effects with sidebar

In the following example, the sidebar is rendered with custom animation effects. Click the buttons available in the main content area to check how the custom animations works with sidebar.

Sidebar will automatically adjust expanding animation to match any custom size specified in CSS styles.

#### CSHTML

```

<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("sidebar-
element").ShowBackdrop(true).Width("280px").ContentTemplate(@<div>
 <div class="title"> Sidebar content</div>
 <div class="sub-title">
 * Sidebar is rendered with animation effect

## ANIMATION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller

```

```

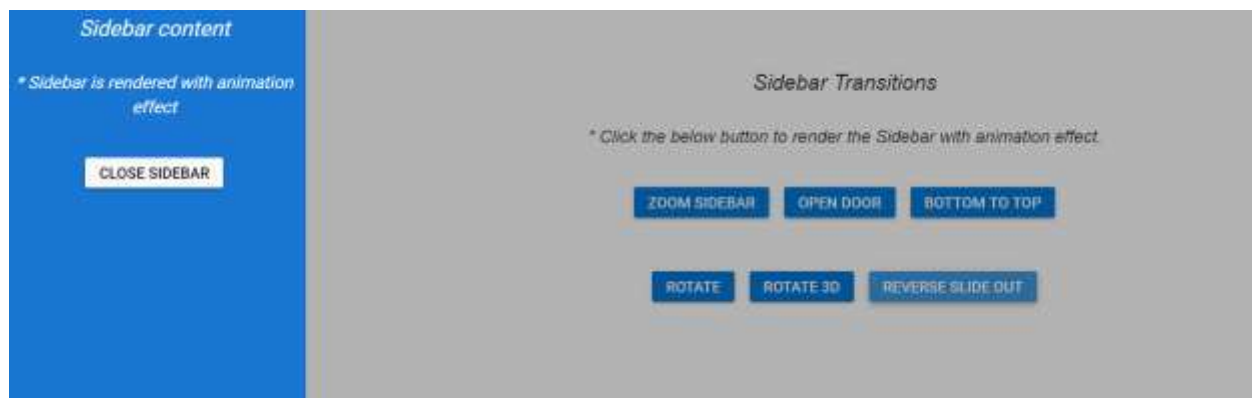

{
 public IActionResult animation()
 {
 return View();
 }
}

```

Output be like the below without animation.

Output be like the below, after applying animation to the Sidebar element.

### Layout Sidebar

The following example demonstrates how to render sidebar in layout page. Sidebar is displayed in all the view page. While navigate to other view page, main content of sidebar changes.

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
<!DOCTYPE html>

```

```

<html>
 <head>
 <meta charset="utf-8" />

Output be like the below.

### Initialize the Sidebar with TreeView

The following example demonstrates how to render TreeView component inside the Sidebar with dock state and how to achieve expand and collapse the functionalities simultaneously in the sidebar and Treeview.

On collapse, the LI elements of TreeView show icons only to represent the short sign of the hidden text content. On expand, hidden text content will be set to be visible.

```

<div class="main-content" id="main-text">
 <div class="sidebar-content">
 <h2 class="sidebar-heading"> Responsive Sidebar With Treeview</h2>

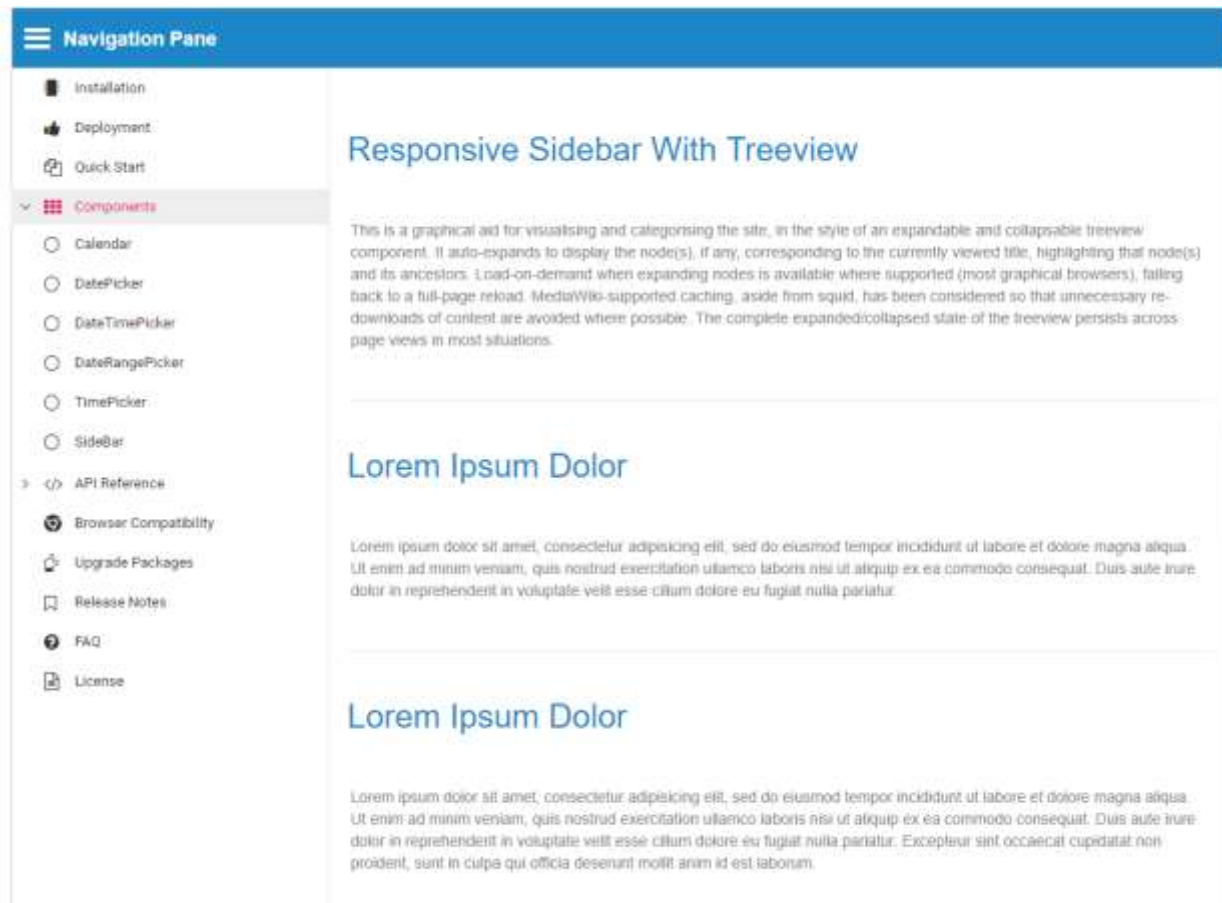

```

```

 <p class="paragraph-content">
 This is a graphical aid for visualising and categorising the
 site, in the style of an expandable and
 collapsable treeview component. It auto-expands to display the
 node(s), if any, corresponding to the currently
 viewed title, highlighting that node(s) and its ancestors. Load-
 on-demand when expanding nodes is available
 where supported (most graphical browsers), falling back to a
 full-page reload. MediaWiki-supported caching,
 aside from squid, has been considered so that unnecessary re-
 downloads of content are avoided where possible.
 The complete expanded/collapsed state of the treeview persists
 across page views in most situations.
 </p>
 <div class="line"></div>
 <h2 class="sidebar-heading">Lorem Ipsum Dolor</h2>

 </div>
</div>

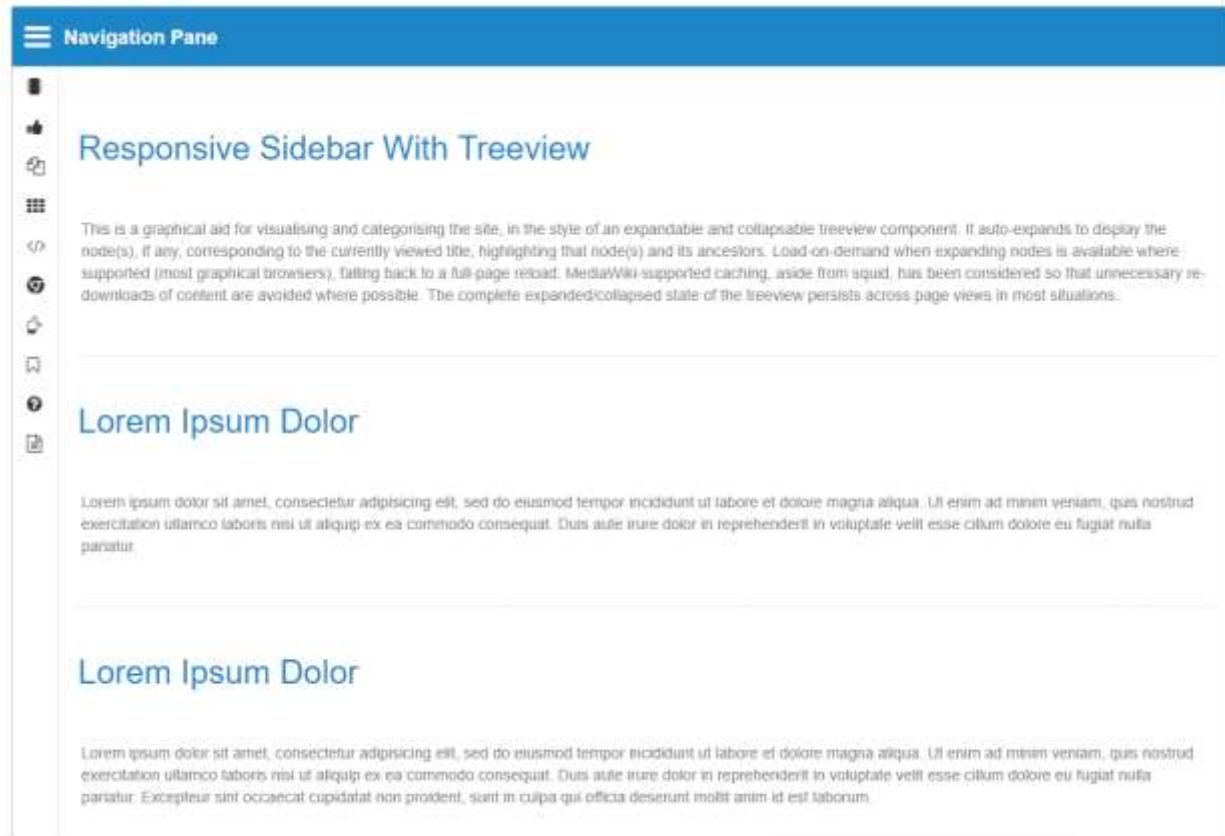

```

Output be like the below in Expanded state.

Output be like the below in Collapsed state.

### Layout Sidebar using Content Template

In the following example, Menu component is rendered inside the Sidebar using content template. Initially, the Sidebar renders in the dock state with icons, and expands when the hamburger icon at the top-left corner of the header section is clicked.

```

## INDEX.CSHTML

```

<div class="content">
 <div> Responsive Sidebar using Content Template</div>
</div>
<style>
 .content {
 margin-top: 15vw;
 text-align: center;
 font-size: 32px;
 color: #1784c7;
 }
</style>

```

Output be like the below.

## Hide Sidebar

The following example demonstrates how to hide layout page sidebar. Initially sidebar is rendered with layout page. While navigate to another page, it hides the layout page sidebar.

## CSHTML

```

 <h2 class="sidebar-heading"> Responsive Sidebar With Treeview</h2>
 <p class="paragraph-content">
 This is a graphical aid for visualising and categorising the
 site, in the style of an expandable and
 collapsable treeview component. It auto-expands to display the
 node(s), if any, corresponding to the currently
 viewed title, highlighting that node(s) and its ancestors. Load-
 on-demand when expanding nodes is available
 where supported (most graphical browsers), falling back to a
 full-page reload. MediaWiki-supported caching,
 aside from squid, has been considered so that unnecessary re-
 downloads of content are avoided where possible.
 The complete expanded/collapsed state of the treeview persists
 across page views in most situations.
 </p>

```

Output be like the below in layout page.

Output be like the below, while navigate to other page, it hides the layout page sidebar.

## Sidebar with partial view

The following example demonstrates how to render the sidebar with partial view. Sidebar element is placed inside the `RenderPartialView.cshtml` and refer that sidebar element in layout page.

### CSHTML

```
<!DOCTYPE html>
<html>
 <head>
 <meta charset="utf-8" />
 <meta name="viewport" content="width=device-width, initial-
scale=1.0">
 <title>@ViewBag.Title - My ASP.NET Application</title>
 <link rel="stylesheet"
href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-
awesome.min.css">
 @Styles.Render("~/Content/css")
 @Styles.Render("~/Content/styles.css")
 @Scripts.Render("~/bundles/modernizr")
```

```

 <link rel="stylesheet"
href="https://cdn.syncfusion.com/ej2/material.css" />
 <script
src="https://cdn.syncfusion.com/ej2/dist/ej2.min.js"></script>
 </head>
 <body>
 @Html.Partial("_RenderPartialView")
 <div id="body_content" class="maincontent">
 <div style="padding: 1.5vw 3vw;">
 @RenderBody()
 </div>
 </div>
 @Html.EJS().ScriptManager()
 @Scripts.Render("~/bundles/jquery")
 @Scripts.Render("~/bundles/bootstrap")
 @RenderSection("scripts", required: false)
 </body>
</html>

```

### TEXTBOX.CSHTML

```

@using Syncfusion.EJ2
<table class="table">
 <div id="top-bar">
 <div class="component">
 Components
 <i class="fa fa-angle-right" style="font-size:16px"></i>
 Inputs

 <input id="search-by" type="text" placeholder="Search
Components">
 <i class="fa fa-search"
style="font-size:20px"></i>
 </div>
 </div>
 </div>
 <div class="control-section">
 <div class="control_wrapper accordion-control-section">

@Html.EJS().Accordion("accordion").ExpandMode(ExpandMode.Single).EnablePersi
stence(true).Items(new List<AccordionAccordionItem>
 {
 new AccordionAccordionItem { Header =
"Navigations",Expanded=true, Content = "#navigation" },

```

```

 new AccordionsAccordionItem { Header = "Layouts", Content =
"#layouts" },
 new AccordionsAccordionItem { Header = "Inputs", Content =
"#inputs" },
 }).Render()
</div>
<ul id="navigation" style="display:none">
 Sidebar
 ContextMenu
 Accordion

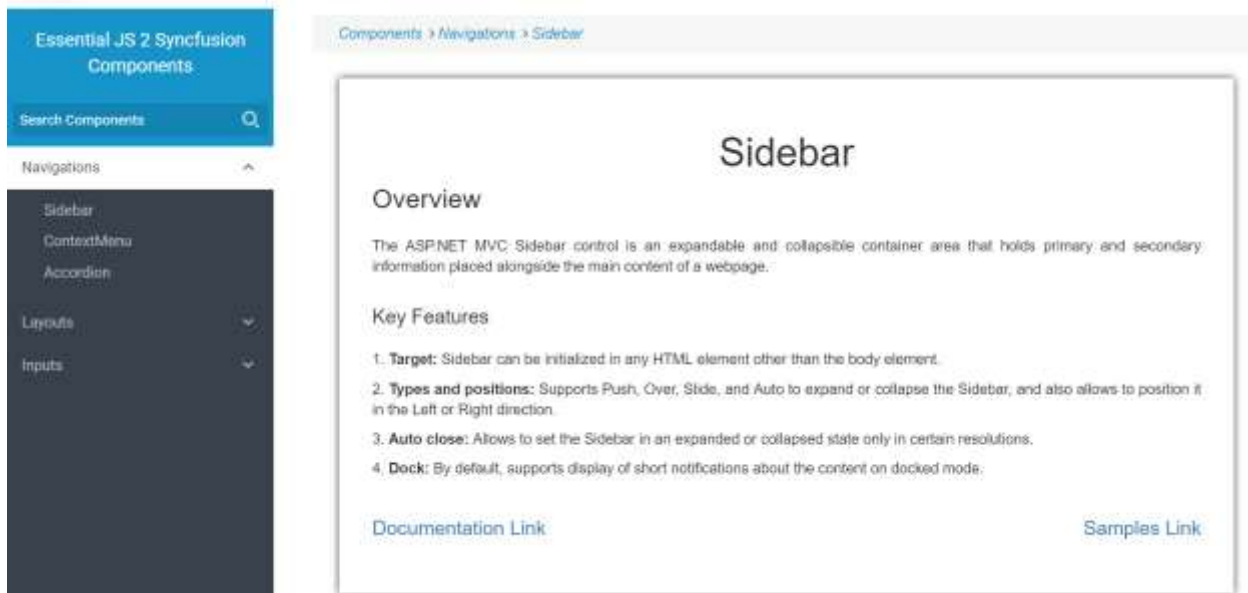

<ul id="layouts" style="display:none">
 Avatar
 Card
 Splitter

<ul id="inputs" style="display:none">
 Input Mask
 TextBox

</div>
<!-- end of normal state element declaration -->
</div>).Render();

```

Output be like the below in layout page.

### Adding Dropdownlist inside the sidebar

While clicking the dropdownlist items inside the sidebar element, it closes the sidebar component. By default, the `closeonDocumentClick` property will close the Sidebar element whenever the click action will be triggered outside of the Sidebar element. The `DropDownList` popup element placed outside of the Sidebar element (body tag instead of sidebar element). So, during the popup element interactions (click, mousedown) the `closeonDocumentClick` will trigger and close the sidebar.

To overcome this behavior in your application, you can add one common class by using `cssClass` property to all the components that has appended their elements outside of the sidebar component. Based on that class you can prevent the Sidebar close action by using close event.

The following example shows how to prevent the closes of sidebar while click the dropdownlist.

### CSHTML

```
<!-- sidebar element declaration -->
@{Html.EJS().Sidebar("default-
sidebar").Width("280px").CloseOnDocumentClick(true).ContentTemplate(@<div>
 <div class="title-header">
 <div style="display:inline-block"> Dropdownlist </div>
 </div>

@Html.EJS().DropDownList("games").DataSource((IEnumerable<object>)ViewBag.da
ta).CssClass("custom_class").Render()
</div>).Close("onClose").Render();
}
<!-- end of sidebar element -->
<!-- Main Content declaration -->
<div>
 <div class="title default">Main content</div>
 <div class="sub-title">
 Place your primary content here.
 </div>
</div>
<script>
 // Prevent the sidebar element from closing.
 function onClose() {
 if(document.activeElement.classList.contains("custom_class")){
 args.cancel = true;
 }
 }
</script>
<style>
 /* sidebar element styles */
 #default-sidebar {
 background-color: rgb(25, 118, 210);
 color: #ffffff;
 }
 .title {
 text-align: center;
 font-size: 20px;
 padding: 15px;
 }
 .sub-title {
 text-align: center;
 font-size: 16px;
 padding: 10px;
 }
</style>
```

### SIDEBAR-DROPDOWNLIST.CS

```
using System;
using System.Collections.Generic;
```

```
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication.Controllers
{
 public partial class SidebarController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}
```

Output be like the below.

## Signature

### Getting Started with ASP.NET MVC Signature Control

This section briefly explains about how to include [ASP.NET MVC Signature](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

## PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
```

```
</body>
```

### Add ASP.NET MVC Signature control

Now, add the Syncfusion ASP.NET MVC Signature control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
<div class='wrap'>
 @Html.EJS().Signature("signature").Render()
</div>
<style>
 .wrap {
 margin: 0 auto;
 width: 300px;
 text-align: center;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
</style>
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Signature control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

### Customization of Signature Control

The Signature control draws stroke/path using `moveTo()` and `lineTo()` methods to connect one or more points while drawing in canvas. The stroke width can be modified by using its color and width. And the background can be modified by using its background color and background image.

#### Stroke Width

The variable stroke width is based on the values of [MaxStrokeWidth](#), [MinStrokeWidth](#) and [Velocity](#) for smoother and realistic signature. The default value of minimum stroke width is set as 0.5, maximum stroke width is set as 2.5 and velocity is set as 0.7.

In the following example, minimum stroke width is set as 0.5, maximum stroke width is set as 3 and velocity is set as 0.7.

### CSHTML

```
<div class='wrap'>

@Html.EJS().Signature("signature").MaxStrokeWidth(3).MinStrokeWidth(0.5).Velocity(0.7).Render()
</div>
<style>
 .wrap {
 margin: 0 auto;
 width: 300px;
 text-align: center;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
</style>
```

### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

### Stroke Color

Color of the stroke can be specified by using [StrokeColor](#) property and it accepts hexadecimal code, RGB, and text. The default value of this property is "#000000".

### CSHTML

```
<div class='wrap'>
 <div id='input'>
 <input type='text' id='text' placeholder='Enter the Stroke Color Value'>
 @Html.EJS().Button("btn").Content("Set Stroke Color").IsPrimary(true).Render()
 </div>
```

```
<div id="signature-control">
 @Html.EJS().Signature("signature").Render()
</div>
</div>
<script>
 document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var color = document.getElementById("text").value;
 signature.strokeStyle = color;
 });
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
 #input {
 margin-bottom: 30px;
 }
 #text {
 height: 30px;
 width: 300px;
 }
</style>
```

#### **DEFAULT.CS**

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

### Background Color

Background color of a signature can be specified by using [BackgroundColor](#) property and it accepts hexadecimal code, RGB, and text. The default value of this property is “#ffffff”.

### CSHTML

```
<div class='wrap'>
 <div id="input">
 <input type="text" id="text" placeholder="Enter the Background Color Value">
 @Html.EJS().Button("btn").Content("Set Background Color").IsPrimary(true).Render()
 </div>
 <div id="signature-control">
 @Html.EJS().Signature("signature").Render()
 </div>
</div>
<script>
 document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var bgColor = document.getElementById("text").value;
 signature.backgroundColor = bgColor;
 });
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
 #input {
 margin-bottom: 30px;
 }
 #text {
```

```

 height: 30px;
 width: 300px;
 }
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

Output be like the below.

### Background Image

Background image of a signature can be specified by using [BackgroundImage](#) property. The background image can be set by either hosting the image in our local IIS or online image.

### CSHTML

```

<div class='wrap'>
 <div id="input">
 <input type="text" id="text" placeholder="Enter the URL of the
background Image">
 @Html.EJS().Button("btn").Content("Set Background
Image").IsPrimary(true).Render()
 </div>
 <div id="signature-control">
 @Html.EJS().Signature("signature").Render()
 </div>
</div>
<script>

```

```
document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var bgImage = document.getElementById("text").value;
 signature.backgroundImage = bgImage;
});
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 text-align: center;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
 #input {
 margin-bottom: 30px;
 }
 #text {
 height: 30px;
 width: 350px;
 }
</style>
```

#### **DEFAULT.CS**

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

Set Background Image

See Also

- [Save with Background](#)

### Open and Save Signature

The Signature control supports to open the signature by using hosted/online URL or base64. And it also supports various save options like image, base64, and blob.

### Open Signature

The signature control opens a pre-drawn signature as either base64 or hosted/ online URL using the `load` method. It supports the PNG, JPEG, and SVG image's base64.

### CSHTML

```
<div class='wrap'>
 <div id="input">
```

```

<input type="text" id="text" placeholder="Enter the Base64 or URL of
signature">
 @Html.EJS().Button("btn").Content("Open").IsPrimary(true).Render()
</div>
<div id="signature-control">
 @Html.EJS().Signature("signature").Render()
</div>
</div>
<script>
 document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var sign = document.getElementById("text").value;
 signature.load(sign);
 });
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 text-align: center;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
 #input {
 margin-bottom: 30px;
 }
 #text {
 height: 30px;
 width: 350px;
 }
</style>

```

#### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

Output be like the below.

Open

### Save Signature

The Signature control saves the signature as base64, blob, and image like PNG, JPEG, and SVG.

#### Save as Base64

The `getSignature` method is used to get the signature as base64 with the PNG, JPEG, and SVG type. This can be loaded to signature using `load` method.

### CSHTML

```
<div class='wrap'>
 <h4>Sign here</h4>
 <div id="signature-control">
 @Html.EJS().Signature("signature").Render()
 </div>
 @Html.EJS().Button("btn").Content("Save as
Base64").IsPrimary(true).Render()
 @Html.EJS().Dialog("dialog").Width("80%").Header("Base64 of the
signature").Visible(false).ShowCloseIcon(true).Render()
</div>
<script>
 document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var dialogObj =
ej.base.getInstance(document.getElementById("dialog"), ej.popups.Dialog);
 dialogObj.content = signature.getSignature();
 dialogObj.show();
 });
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 }
</style>
```

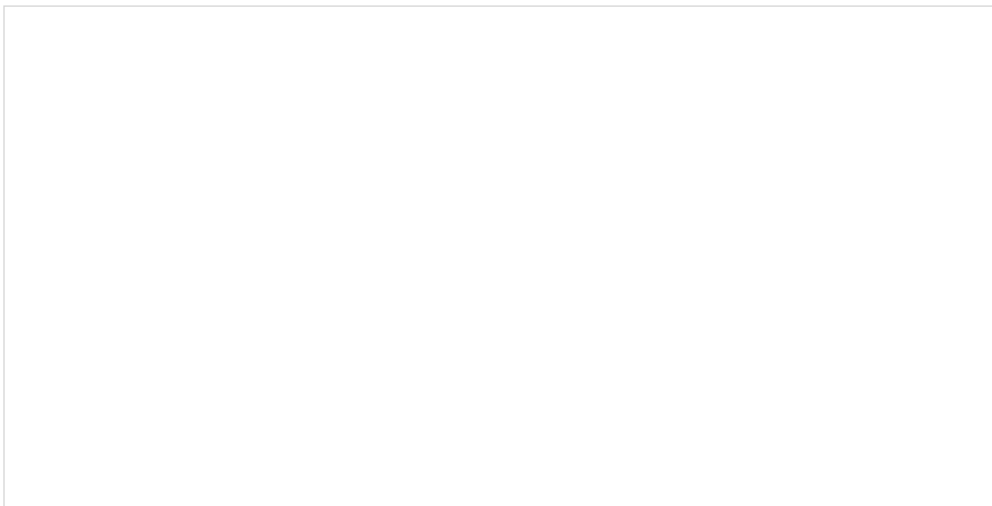

```
#signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
}
#btn {
 margin-top: 30px;
}
</style>
```

### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

## Sign here

Save as Base64

### *Save as Blob*

The `saveAsBlob` method is used to save the signature as a Blob. It is defined as the chunk of binary data stored as a single entity in a database system.

### *Save as Image*

The `save` method is used to save the signature as an image. And it accepts file name and file type as parameter. The file type parameter supports PNG, JPEG, and SVG and the default file type is PNG.

### CSHTML

```
<div class='wrap'>
```

```
<div>
 Sign here
 @Html.EJS().SplitButton("btn").IconCss("e-sign-icons e-
save").Content("Save").Items(ViewBag.datasource).Select("onSelect").Render()
</div>
<div id="signature-control">
 @Html.EJS().Signature("signature").Render()
</div>
</div>
<script>
function onSelect(args) {
 var signature =
document.getElementById("signature").ej2_instances[0];
 signature.save(args.item.text, "Signature");
}
</script>
<style>
.wrap {
 margin: 0 auto;
 width: 500px;
}
#signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
}

 Save ▼

### Save with Background

The [saveWithBackground](#) property is used to save the signature with its background and its default value is true. So, by default the signature is saved with its background.

In the following sample, the background color is set as 'rgb(103 58 183)' and save with background as true.

**CSHTML**

```

<div class='wrap'>
 <div>
 Sign here
 @Html.EJS().SplitButton("btn").IconCss("e-sign-icons e-
save").Content("Save").Items(ViewBag.datasource).Select("onSelect").Render()
 </div>
 <div id="signature-control">
 @Html.EJS().Signature("signature").BackgroundColor("rgb(103 58
183)").Render()
 </div>
</div>
<script>
 function onSelect(args) {
 var signature =
document.getElementById("signature").ej2_instances[0];
 signature.save(args.item.text, "Signature");
 }
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
 .e-split-btn-wrapper {

## Draw a Signature

### Draw

The `draw` method is used to draw a text as signature with different font families like Arial, Serif, with different font sizes. It accepts text, font family, font size as its parameters. The default font family is "Arial", and the default font size is "30".

### CSHTML

```
<div class='wrap'>
 <div id="input">
 <table>
 <tbody>
 <tr>
 <td><div>Enter the Text:</div></td>
 <td><input type="text" id="text" placeholder="Enter the
Text"></td>
 </tr>
 <tr>
 <td style="padding-top:10px"><div>Font
Family:</div></td>
 <td style="padding-top:10px">
 @Html.EJS().DropDownList("font").Placeholder("Select
a font").Value("Arial").PopupHeight("200px").DataSource(
 (IEnumerable<object>)ViewBag.data).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Text"
}).Render()
 </td>
 </tr>
 <tr>
 <td style="padding-top:10px"><div>Font Size:</div></td>
 <td style="padding-top:10px">
 @Html.EJS().DropDownList("size").Placeholder("Select
a size").Value("20").PopupHeight("200px").DataSource(
 (IEnumerable<object>)ViewBag.size).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Text"
}).Render()
 </td>
 </tr>
 </tbody>
 </table>

 @Html.EJS().Button("btn").Content("Draw").IsPrimary(true).Render()
 </div>
 <div id="signature-control">
 @Html.EJS().Signature("signature").Render()
 </div>
</div>
<script>
 document.getElementById("btn").addEventListener('click', function () {
 var signature =
document.getElementById("signature").ej2_instances[0];
 var text = document.getElementById("text").value;
 var font = document.getElementById("font").ej2_instances[0].value;
 var size = document.getElementById("size").ej2_instances[0].value;
 signature.draw(text, font, size);
 });
</script>
```

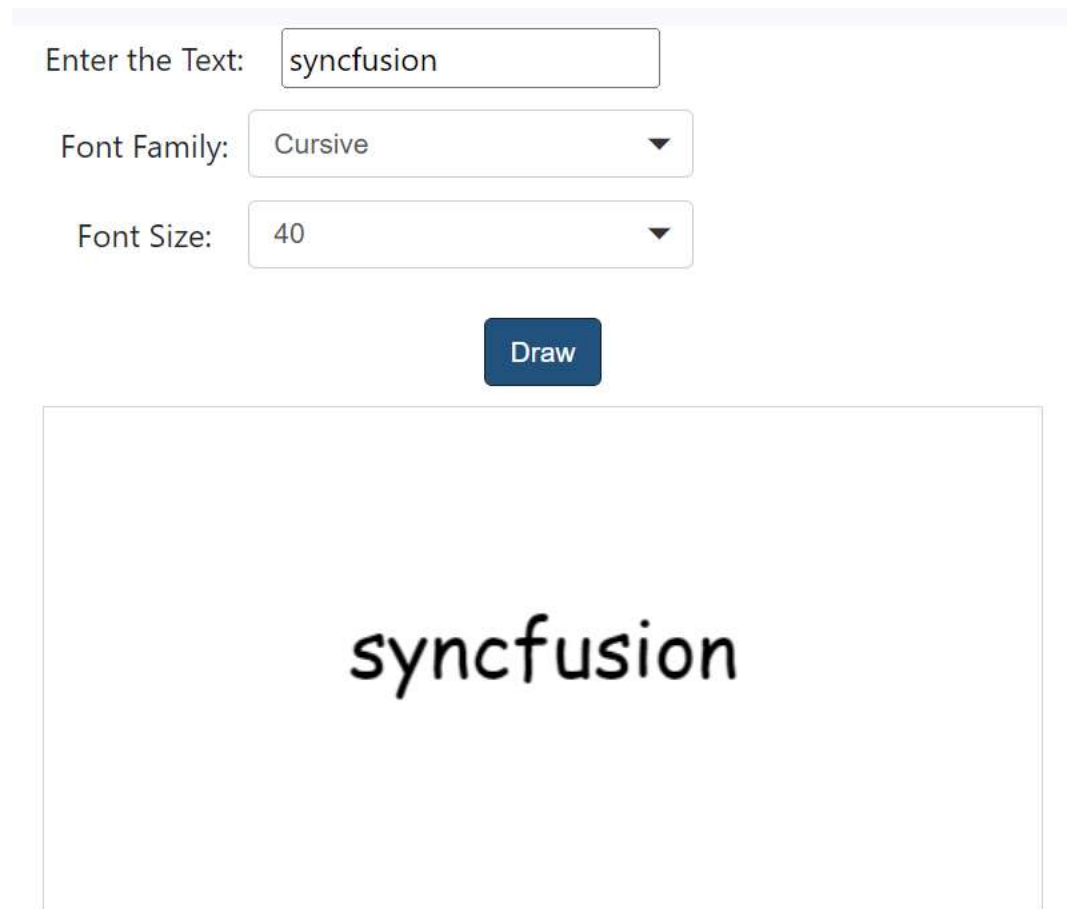

```
</script>
<style>
 .wrap {
 margin: 0 auto;
 width: 500px;
 text-align: center;
 }
 #signature {
 border: 1px solid lightgray;
 height: 100%;
 width: 100%;
 }
</style>
```

### DEFAULT.CS

```
public ActionResult Default()
{
 List<object> fontData = new List<object>();
 fontData.Add(new { Text = "Arial" });
 fontData.Add(new { Text = "Serif" });
 fontData.Add(new { Text = "Sans-serif" });
 fontData.Add(new { Text = "Cursive" });
 fontData.Add(new { Text = "Fantasy" });
 ViewBag.data = fontData;
 List<object> sizeData = new List<object>();
 sizeData.Add(new { Text = "20" });
 sizeData.Add(new { Text = "30" });
 sizeData.Add(new { Text = "40" });
 sizeData.Add(new { Text = "50" });
 ViewBag.size = sizeData;

 return View();
}
```

Output be like the below.

The screenshot displays the Signature application's user interface. At the top, there is a light purple header bar. Below it, the 'Enter the Text:' label is followed by a text input field containing 'syncfusion'. Below this, the 'Font Family:' label is followed by a dropdown menu showing 'Cursive'. The 'Font Size:' label is followed by a dropdown menu showing '40'. A blue 'Draw' button is positioned below the font settings. At the bottom, a large white canvas displays the word 'syncfusion' in a cursive font.

### User Interactions

The below interactions were available in Signature, and we can walk through one by one.

- Undo and Redo
- Clear
- Disabled
- ReadOnly

### Undo and Redo

In the Signature, every action can be maintained as a snap for undo and redo operations. And maintained `SnapIndex` for indexing the snap collection.

The `undo` method reverts the last action of signature by decreasing `SnapIndex` value to index previous snap. Here, `canUndo` method is used to ensure whether undo can be performed or not.

The `redo` method reverts the last undo action of the signature by increasing the `SnapIndex` to get the next snap. Here, `canRedo` method is used to ensure whether redo can be performed or not.

### Clear

The `clear` method is used to clears the signature and makes the canvas empty. This is also considered in Undo/ Redo. Here, `isEmpty` method is used to ensure whether the signature is empty or not.

### Disabled

The `disabled` property is used to enables/disables the signature control. In the disabled state, the user is not allowed to draw signature. And it can't be focused until the user enabled the signature.

### ReadOnly

The `isReadOnly` property is used to enables/disables the ReadOnly Signature. It can be focused but it prevents drawing in Signature.

The following sample explains about user interactions available in signature.

### CSHTML

```
<div class='wrap'>
 <div id="option">
 <table>
 <tr>
 <td>

@Html.EJS().Button("undoBtn").Content("Undo").IsPrimary(true).Disabled(true)
.Render()

 </td>
 <td>

@Html.EJS().Button("redoBtn").Content("Redo").IsPrimary(true).Disabled(true)
.Render()

 </td>
 <td>

@Html.EJS().Button("clearBtn").Content("Clear").IsPrimary(true).Disabled(true)
.Render()

 </td>
 <td>
 <div style="margin-bottom: 5px; margin-left: 200px;">

@Html.EJS().CheckBox("disable").Label("Disabled").Change("disableChange").Render()

 </div>
 <div style="margin-left: 200px;">

@Html.EJS().CheckBox("readonly").Label("ReadOnly").Change("readOnlyChange").Render()

 </div>
 </td>
 </tr>
 </table>
 </div>
 <div id="signature-control">

#### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

Undo Redo Clear

☐ Disable

☐ ReadOnly

#### Accessibility in Signature Component

The Signature component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Signature component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support | Not Applicable |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### Keyboard interaction

The Signature component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Signature component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + Z** | **Undo the last action.** |

| **Ctrl + Y** | **Redo the last action.** |

| **Ctrl + S** | **To save the signature.** |

| **delete** | **Erases all the signature strokes signed by user.** |

### Ensuring accessibility

The Signature component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Signature component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Signature component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET Core controls](#)

### How To

#### Integration with Toolbar

The Signature control integrates with the toolbar and the interaction performed using the `change` event of the toolbar. In that, `canUndo`, `canRedo` and `isEmpty` methods were used to enable/disable undo, redo, and clear buttons.

#### CSHTML

```

 border-radius: 20px;
 display: inline-block;
 transform: scale(0);
 transition: transform 1.2s ease-in;
 }
 .e-circle-palette.e-selected .e-circle-selection {
 transform: scale(0.8);
 background-color: #fff;
 transition: transform .2s ease-out;
 }
 #circle-palette + .e-container,
 #scroll-palette + .e-container {
 background-color: transparent;
 border-color: transparent;
 box-shadow: none;
 }
}

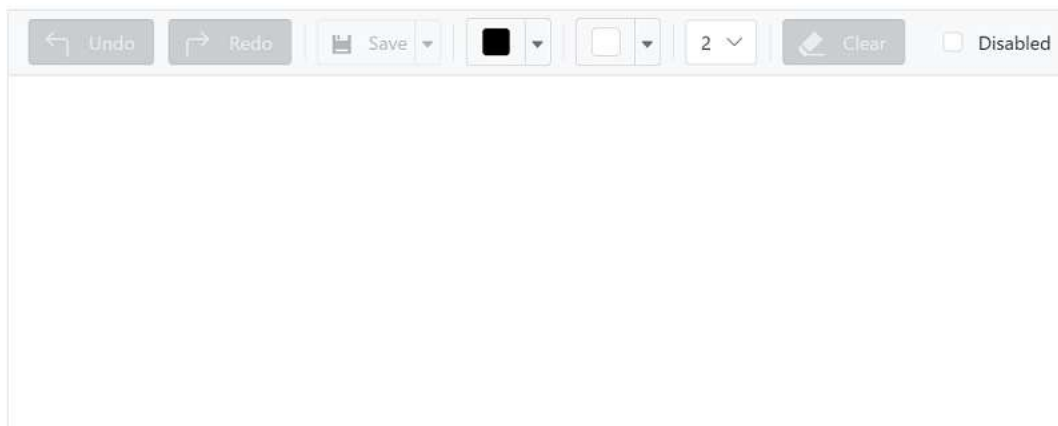

```

```
.e-container .e-palette .e-circle-palette.e-selected {
 outline: none;
}
.e-bg-color .e-circle-palette.e-nocolor-item.e-selected .e-circle-
selection {
 background: transparent;
}
.e-bg-color .e-circle-palette.e-nocolor-item.e-selected {
 border: 3px solid lightgray;
}
</style>
```

### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

Output be like the below.

## Skeleton

### Getting Started with ASP.NET MVC Skeleton Control

This section briefly explains about how to include **ASP.NET MVC Skeleton** control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Add ASP.NET MVC Skeleton control

Now, add the Syncfusion ASP.NET MVC Skeleton control in `~/Views/Home/Index.cshtml` page.

**CSHTML**

```
@using Syncfusion.EJ2.Notifications;
<div class="col-sm-6">
<h5>Circle</h5>
@Html.EJS().Skeleton("skeletonCircleSmall").Shape(SkeletonType.Circle).Width
("3rem").Render()
@Html.EJS().Skeleton("skeletonCircleMedium").Shape(SkeletonType.Circle).Width
("48px").Render()
@Html.EJS().Skeleton("skeletonCircleLarge").Shape(SkeletonType.Circle).Width
("64px").Render()
@Html.EJS().Skeleton("skeletonCircleLarger").Shape(SkeletonType.Circle).Width
("80px").Render()
</div>
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Skeleton control will be rendered in the default web browser.

## Skeleton Types

The Skeleton control has the following different type of shapes.

- Circle
- Square
- Text
- Rectangle

**CSHTML**

```
@using Syncfusion.EJ2.Notifications;
<div class="row skeleton-default">
<div class="col-sm-6">
<h5>Circle</h5>
```

```

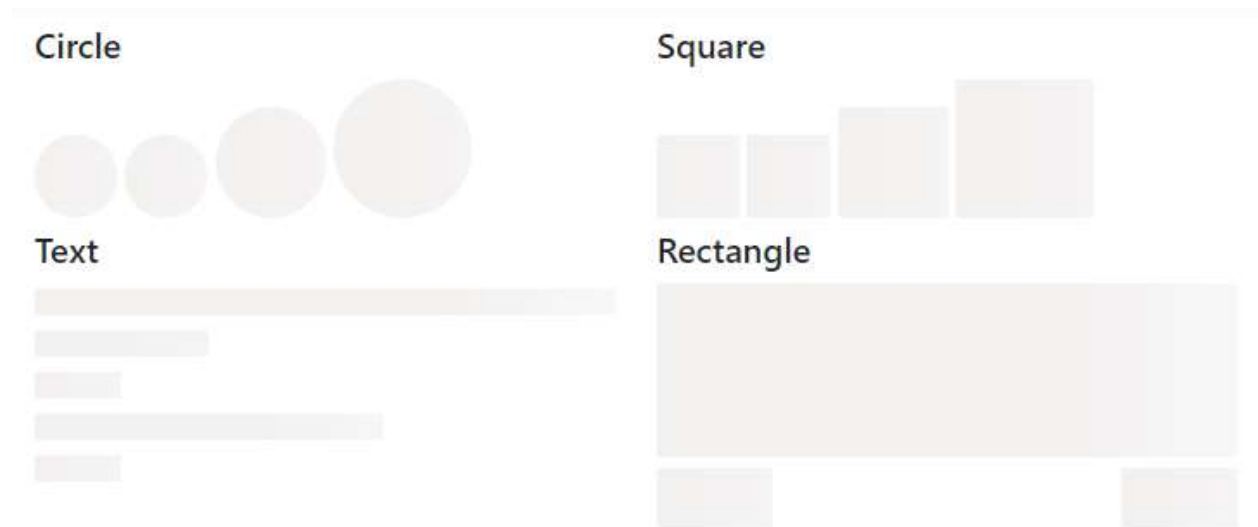

@Html.EJS().Skeleton("skeletonCircleSmall").Shape(SkeletonType.Circle).Width
("3rem").Render()
@Html.EJS().Skeleton("skeletonCircleMedium").Shape(SkeletonType.Circle).Width
("48px").Render()
@Html.EJS().Skeleton("skeletonCircleLarge").Shape(SkeletonType.Circle).Width
("64px").Render()
@Html.EJS().Skeleton("skeletonCircleLarger").Shape(SkeletonType.Circle).Width
("80px").Render()
</div>
<div class="col-sm-6">
<h5>Square</h5>
@Html.EJS().Skeleton("skeletonSquareSmall").Shape(SkeletonType.Square).Width
("3rem").Render()
@Html.EJS().Skeleton("skeletonSquareMedium").Shape(SkeletonType.Square).Width
("48px").Render()
@Html.EJS().Skeleton("skeletonSquareLarge").Shape(SkeletonType.Square).Width
("64px").Render()
@Html.EJS().Skeleton("skeletonSquareLarger").Shape(SkeletonType.Square).Width
("80px").Render()
</div>
</div>
<div class="row skeleton-default">
<div class="col-sm-6">
<h5>Text</h5>
@Html.EJS().Skeleton("skeletonText").Shape(SkeletonType.Text).Width("100%").
Height("15px").Render()
@Html.EJS().Skeleton("skeletonTextMedium").Width("30%").Height("15px").Rende
r()

@Html.EJS().Skeleton("skeletonTextSmall").Width("15%").Height("15px").Render
()

@Html.EJS().Skeleton("skeletonTextMedium1").Width("60%").Height("15px").Rend
er()

@Html.EJS().Skeleton("skeletonTextSmall1").Width("15%").Height("15px").Rende
r()
</div>
<div class="col-sm-6">
<h5>Rectangle</h5>
@Html.EJS().Skeleton("skeletonRectangle").Shape(SkeletonType.Rectangle).Width
("100%").Height("100px").Render()
@Html.EJS().Skeleton("skeletonRectangleMedium").Shape(SkeletonType.Rectangle)
.Width("20%").Height("35px").Render()
@Html.EJS().Skeleton("skeletonRectangleMediumRight").Shape(SkeletonType.Rect
angle).Width("20%").Height("35px").Render()
</div>
</div>

```

## Shapes in ASP.NET MVC Skeleton Control

The Skeleton control support various built-in shape variants to design layout of the page. You can use the [Shape](#) property to create a preview of any layout.

The Skeleton control supports the following content shapes:

### Circle skeleton shape

#### **CSHTML**

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("48px").Render()
```

#### **CIRCLESHAPE.CS**

```
public ActionResult Circle()
{
 return View();
}
```

### Square skeleton shape

#### **CSHTML**

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Square).Width("48px").Render()
```

**SQUARESHAPE.CS**

```
public ActionResult Square()
{
 return View();
}
```

## Rectangle skeleton shape

**CSHTML**

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Rectangle).Height("50px")
.Render()
```

**RECTANGLESHAPE.CS**

```
public ActionResult Rectangle()
{
 return View();
}
```

## Text skeleton shape

**CSHTML**

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Text).Height("15px").Render()
```

**TEXTSHAPE.CS**

```
public ActionResult Text()
{
 return View();
}
```

Below example demonstrates the above functionalities of a Skeleton control.

### CSSHTML

```
@using Syncfusion.EJ2.Notifications
<div id="skeletonCard">
 <div class='cardProfile'>

@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("60px").Render()
 </div>
 <div class="cardinfo">

@Html.EJS().Skeleton("skeleton1").Width("30%").Height("15px").Render()

@Html.EJS().Skeleton("skeleton2").Width("15%").Height("15px").Render()
 </div>
 <div class="cardContent">

@Html.EJS().Skeleton("skeleton3").Shape(SkeletonType.Rectangle).Width("100%")
).Height("150px").Render()
 </div>
 <div class="cardoptions">

@Html.EJS().Skeleton("skeleton4").Shape(SkeletonType.Rectangle).Width("20%")
.Height("32px").Render()

@Html.EJS().Skeleton("skeleton5").Shape(SkeletonType.Rectangle).Width("20%")
.Height("32px").Render()
 </div>
</div>
<style>
 #skeletonCard {
 padding: 10px;
 line-height: inherit;
 height: 330px;
 }
 #skeletonCard .cardProfile {
 float: left;
 margin-right: 15px;
 }
 #skeletonCard .cardinfo {
 margin-top: 10px;
 overflow: hidden;
 }
 #skeletonCard .cardContent {
 margin: 20px 0px 20px;
 }
 #skeletonCard .cardoptions {
 display: flex;
 justify-content: space-between;
 }
</style>
```

### SHAPE.CS

```
public ActionResult Shape()
```

```
{
 return View();
}
```

### Shimmer Effect in ASP.NET MVC Skeleton Control

You can use the [ShimmerEffect](#) property to change animation effect in the skeleton control. Skeleton supports Wave, Pulse and Fade effects and by default, the ShimmerEffect is set to Wave effect.

#### CSHTML

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("60px").ShimmerEffect(ShimmerEffect.Pulse).Render()
```

#### PULSEEFFECT.CS

```
public ActionResult PulseEffect()
{
 return View();
}
```

Below example demonstrates a list with pulse effect skeleton.

#### CSHTML

```
@using Syncfusion.EJ2.Notifications
```

```

<ul id="skeleton-list" class="e-card">

 <div class='cardProfile'>
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("40px").ShimmerEffect(ShimmerEffect.Pulse).Render()
 </div>
 <div>
@Html.EJS().Skeleton("skeleton1").Width("60%").Height("15px").ShimmerEffect(ShimmerEffect.Pulse).Render()

@Html.EJS().Skeleton("skeleton2").Width("40%").Height("15px").ShimmerEffect(ShimmerEffect.Pulse).Render()
 </div>

 <div class='cardProfile'>
@Html.EJS().Skeleton("skeleton3").Shape(SkeletonType.Circle).Width("40px").ShimmerEffect(ShimmerEffect.Pulse).Render()
 </div>
 <div>
@Html.EJS().Skeleton("skeleton4").Width("60%").Height("15px").ShimmerEffect(ShimmerEffect.Pulse).Render()

@Html.EJS().Skeleton("skeleton5").Width("40%").Height("15px").ShimmerEffect(ShimmerEffect.Pulse).Render()
 </div>

<style>
 #skeleton-list {
 padding-left: 12px;
 padding-top: 7px;
 line-height: inherit;
 }
 #skeleton-list li {
 list-style: none;
 display: flow-root;
 margin-bottom: 9px;
 }
 .cardProfile {
 float: left;
 margin-right: 15px;
 }
</style>

```

**EFFECT.CS**

```

public ActionResult Effect()
{
 return View();
}

```

## Styles in ASP.NET MVC Skeleton Control

You can customize skeleton control in the below ways.

### CssClass

You can customize the style of a Skeleton control by using [CssClass](#). The appearance of ASP.NET MVC Skeleton can be customized by changing the wave color, background color, width, and height.

### CSHTML

```
@using Syncfusion.EJ2.Notifications
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("60px").CssClass("e-customize").Render()

<style>
 .e-customize.e-skeleton.e-shimmer-wave::after {
 background-image: linear-gradient(90deg, transparent calc(50% - 100px), rgb(30 128 234 / 50%) 50%, transparent calc(50% + 100px));
 }
 .e-customize.e-skeleton.e-skeleton-circle {
 background-color: #a8c1f2;
 }
</style>
```

### CUSTOMIZE.CS

```
public ActionResult Customize()
{
 return View();
}
```

### Visible

You can use the [Visible](#) property which defines the visible state of Skeleton.

### CSHTML

```
@using Syncfusion.EJ2.Notifications
```

```
@Html.EJS().Skeleton("skeleton").Shape(SkeletonType.Circle).Width("60px").Visible(false).Render()
```

## VISIBLE.CS

```
public ActionResult Visible()
{
 return View();
}
```

## Accessibility in ASP.NET MVC Skeleton Control

Accessibility is achieved in the Skeleton control through WAI-ARIA standard. The Skeleton control can be effectively accessed through assistive technologies such as screen readers.

### ARIA attributes

The Skeleton control characterized with complete ARIA accessibility support that helps to be accessible by on-screen readers and other assistive technology devices. The following ARIA attributes are applicable for Skeleton control.

| Properties | Functionality                                                                     |
|------------|-----------------------------------------------------------------------------------|
| role       | This attribute is added to the input element to describe the actual role.         |
| aria-label | Attribute provides the text label with some default description for the Skeleton. |
| aria-live  | The aria-live attribute indicates the priority of updates to a live region.       |
| aria-busy  | This attribute is set to true when component is shown.                            |

## Smith Chart

### Getting Started with ASP.NET MVC SmithChart Control

This section briefly explains about how to include [ASP.NET MVC SmithChart](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

### Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

## PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add script resources

Here, the script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC SmithChart control

Now, add the Syncfusion ASP.NET MVC SmithChart control in **~/Views/Home/Index.cshtml** page.

##### CSHTML

```
@Html.EJS().Smithchart("smith").Render();
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC SmithChart control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

### Working with Data

Smithchart can visualise the data bound from local data. The data you bind for the smithchart, should be an array of object and that should contain the field resistance and reactance. This should be bind to points or datasource in the smithchart.

### Data Binding

You can bind simple JSON data to smithchart using point property in series. JSON data should contain [resistance] and [reactance] fields. This JSON data should be bind to points or datasource in the smithchart. You can any number of JSON for points or datasource as per your requirement.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

<script>
function loaded(args) {
 window.smithchart = args.smithchart;
```

```

 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 }
];
 args.smithchart.series[1].points = [{ resistance: 0, reactance:
0.15 }, { resistance: 0, reactance: 0.15 },
 { resistance: 20, reactance: -50 }, { resistance: 10,
reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

## WORKING-WITH-DATA.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

```
}
```

## Smithchart Dimensions

You can render the smithchart either corresponding to its container size or you can set the size of the smithchart as per your requirement. To render the smithchart corresponding to its container size, you need to set the size for the smithchart container. Else to set the size for the smithchart as per your requirement, you can use the width and height properties in the smithchart.

### Size for Container

You can render smithchart to it's container size. To achieve this, you need to specify the width and height of the smithchart's container via inline or CSS as demonstrated below.

```
`javascript
<div id='container'>
<div id='element' style="width:650px; height:350px;"></div>
</div>
`
```

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()

<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>
```

### CONTAINER.CS

```
using System;
using System.Collections.Generic;
```

```
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}
```

### Size for Smithchart

<!-- markdownlint-disable MD036 -->

You can also set size for smithchart directly through [width] and [height] properties. Using this properties, you can directly mention the width and height of the smithchart in pixels or you can set the width and height in percentage.

#### In Pixel

In smithchart's width and height property, you can directly give values in pixels like below demonstration. This will render smithchart in same size as you mentioned in you code.

#### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Height("300px").Width(
"650px").Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
}
```

```

 args.smithchart.refresh();
 }
</script>

```

### SIZE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### In percentage

You can also specify the width and height of the smithchart in percentage. If you mention the width and height in percentage, then smithchart will be render as per the percentage of it's container size. You can set the values in percentage like below demonstration.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Height("90%").Width("85%").Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
]
}

```

```

];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

## PERCENTAGE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

## Title and Subtitle

### Enable title

Title and subtitle is used to depicts the information about the data plotted in the smithchart. You can set the title and subtitle of the smithchart using the [text] property in title and subtitle. By default visibility of the title as well as subtitle is enabled. You need to set simply text for title and subtitle in your sample as like below.

## CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Title(title =>
title.Text("Transmission details").Visible(true).Subtitle(subtitle
=>subtitle.Text('Transmission')).Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },

```

```

 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },

namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Title trim

Both title and subtitle of the smithchart can be trimmed if it exceeds the certain length. Trimming is enabled using [enableTrim] for title as well as subtitle. This length can be changed using the property [maximumWidth]. Also [font], [textAlignment] and [visibility] can be customized for title as well as subtitle.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Title(title =>
title.Text("Transmission
details")).Visible(true).EnableTrim(true).Subtitle(subtitle
=>subtitle.Text('Transmission')).Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()
<script>

### Axis in Smithchart Control

Like chart, Smithchart is having support for two types of axis.

- Horizontal axis - axis drawn as straight line in the horizontal direction of the chart.
- Radial axis - axis is drawn as circular path.

### Labels Customization

Axis labels are used to denote what kind of data is bound for smithchart. Using axis labels, you can easily identify in which interval chart is rendered. Using following properties we can customize the axis labels for horizontal and radial axis.

- `[labelPosition]` - used to place the labels either inside or outside the axis line.
- `[labelIntersectAction]` - used to hide the labels when intersect with other one.

- `[labelStyle]` - used to customize the properties such as font size, family, weight, opacity.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.horizontalAxis.majorGridLines.visible = true;
 args.smithchart.horizontalAxis.majorGridLines.opacity = 0.8;
 args.smithchart.horizontalAxis.majorGridLines.width = 10;
 args.smithchart.horizontalAxis.axisLine.visible = true;
 args.smithchart.horizontalAxis.axisLine.width = 10;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },

 }
}

```

### Gridlines

To make the data in a chart that displays axes easier to read, you can display horizontal and radial axis gridlines. Gridlines extend from any horizontal and radial axes across the plot area of the smithchart.

Both horizontal and radial axis are having support for major as well as minor gridlines. Major gridlines are drawn from the position in which labels are rendered. Minor gridlines are drawn between two major gridlines as per the count we set in settings.

We can customize following things, in major as well as minor gridlines.

- [width] - used to customize the width of gridlines.
- [dashArray] - used to customize whether gridline have to render as normal line or dashed line.
- [visible] - used to enable or disable the visibility of the gridlines.
- [opacity] - used to customize the opacity of the major gridlines.
- [count] - used to customize the count of the minor gridlines.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.horizontalAxis.majorGridLines.visible = true;
 args.smithchart.horizontalAxis.majorGridLines.opacity = 0.8;
 args.smithchart.horizontalAxis.majorGridLines.width = 10;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },

```

```

 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

### GRID-LINE.CS

using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Axisline

As name suggests that, it is a line in smithchart that can be configured to denotes the axis. By default, visibility of the axis line is true. You can customize its visibility by using visible property in axis Line. Other than visibility of the axis line, you can customize the following properties of the axis line.

- **[width]** - used to customize the width of the axis line.
- **[dashArray]** - used to render the axis line as dashed line.
- **[visible]** - used to enable or disable the visibility of the axis line.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.horizontalAxis.labelPosition = 'Inside';
 args.smithchart.horizontalAxis.labelIntersectAction = 'Hide';
 args.smithchart.radialAxis.labelPosition = 'Inside';
 args.smithchart.radialAxis.labelIntersectAction = 'Hide';
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },

 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

<!-- markdownlint-disable MD036 -->

### Legend

Legend is a key used in smithchart, that contains symbol and descriptions. It provides valuable information for interpreting what the smithchart is displaying and can be represented in various colors, shapes or other identifiers based on the data. In simple words, we can define that legend is used to denote the series rendered in the smithchart.

### Position and Alignment

By default visibility of the legend is false. To enable the legend, set visible as true in legendSettings. Default position for the legend is bottom. By using [position] property, you can change the position of the legend. You can either place the legend at bottom, top, right and left side of the smithchart. To use the legend in smithchart, you need to import and inject the SmithchartLegend from chart.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).Position('Top'))Series(series =>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()
<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [

```

```

 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

## POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

Other than these positions, you can place the legend anywhere in the smithchart. To achieve this, you have to set position as custom in legendSettings and specify the x and y coordinates using the x and y properties in the location.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).Position('Top').Location =>(new
SmithchartLocation{x:80,y:90}))Series(series =>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>
```

### CUSTOM-POSITION.CS

```
using System;
```

```

using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Legend Alignment

Other than positioning the legend in the smithchart, you can customize its alignment also. By default, legend is aligned at center. Using the [alignment] property, you can align the legend in near and far locations of the smithchart.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).Position('Top').Alignment('Near'))Series(series =>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },

```

```

 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

### ALIGNMENT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Customization

#### Legend Shape

By default, legend is rendered in the circle shape and the color of the shape is as same as series color in the smithchart. Using the property [shape] in legend settings, you can change the icon shape of the legend as rectangle, triangle and so on.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).Position('Top').Shape('Rectangle'))Series(series =>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()

```

```

<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,
reactance: 0.4 },
 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

### CUSTOM-SHAPE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

```

 }
}

```

### Legend Size

By default, legend takes 20% - 25% of the chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the chart. You can change this default legend size by using the `[width]` and `[height]` property of the `legendSettings`.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).Position('Top').ItemPadding(5).ShapePadding(10))Series
(series =>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()
<script>

using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}
```

### Padding

You can customize the space between two legend items and space between legend shape and text as per your requirement. For customizing the space between two legend items, you can use `[itemPadding]` property. To control space between legend shape and text, you can use `[shapePadding]` property.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").LegendSettings(legend=
>legend.Visible(true).position('Top').Height(100).Width(200))Series(series
=>
 {
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
 }).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
```

```

 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.series[1].points = [{ resistance: 20, reactance:
-50 }, { resistance: 10, reactance: -10 },
 { resistance: 9, reactance: -4.5 }, { resistance: 8,
reactance: -3.5 },
 { resistance: 7, reactance: -2.5 }, { resistance: 6,
reactance: -1.5 },
 { resistance: 5, reactance: -1 }, { resistance: 4.5,
reactance: -0.5 },
 { resistance: 3.5, reactance: 0 }, { resistance: 2.5,

```

## Tooltip

Smithchart will display details about the points through tooltip, when the mouse is moved over the point. By default, tooltip is disabled. To enable the tooltip for smithchart, you need to import and inject TooltipRender module from chart. And also set the property visible as true, in tooltip settings. You can customize the tooltip's visibility and appearance differently each series in the smithchart.

## CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Tooltip(new { visible = true
}).Marker(marker => marker.Visible(true)).Add();
 series.Name("Transmission2").Tooltip(new { visible = true
}).Marker(marker => marker.Visible(true)).Add();
}).Render()
<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,

 { resistance: 2, reactance: 0.5 }, { resistance: 1.5,
reactance: 0.5 },
 { resistance: 1, reactance: 0.4 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0,
reactance: 0.05 },,];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

### TOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

<!-- markdownlint-disable MD036 -->

### Marker & Datalabels

Markers and Datalabels are used to provide information about the data points in the series. You can add a shape to adorn each data point. By default marker and datalabel both are disabled in smithchart. You can enable both of them by setting visible property as true in marker and datalabel settings

#### Marker

Default visibility of marker is false. You can enable the marker by setting property visible as true in marker settings. This will add marker for each point in the series. Using marker setting, you can customize marker differently for each series in smithchart.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

```

```

<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].marker = {
 shape: 'Circle',
 visible: true,
 border: {
 width: 2,
 }
 };
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

### MARKER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Marker Customization

Using marker settings in series, you can customize the marker for each series differently. Using marker settings, you can customize following properties differently for each series in the smithchart.

- [width] - To control the width of the marker.
- [height] - To control the height of the marker.
- [fill] - Used to customize the fill color of the marker.
- [opacity] - Used to customize the opacity of the marker.
- [border] - Used to control the width and color of the marker's border.
- [shape] - Used to change the shape of the marker.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].marker = {
 visible: true,
 height: 10,
 width: 10,
 fill: '#ff99ff',
 opacity: 1,
 shape: 'rectangle',
 border: {
 color: '#cc00cc',
 width: 2
 }
 };
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}

</script>
```

### CUSOM-MARKER.CS

```
using System;
using System.Collections.Generic;
```

```

using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Datalabels

By default, datalabel is disabled. You can enable the datalabel by setting property visible as true in datalabel settings. For each point in series, data label is created. Datalabel for each series can be customized differently using datalabel settings.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].marker = {
 dataLabel: {
 visible: true,
 fill: '#99ffcc',
 opacity: 1,
 border: {
 color: '#1aff8c',
 width: 2,
 }
 }
 };
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },

```

```

 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

### DATA-LABEL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Datalabel customization

Using datalabel settings in marker, you can customize the datalabel for each series differently. In datalabel, you can customize the following properties differently for each series.

- **[fill]** - Used to changes the fill color of the data label's shape.
- **[opacity]** - Used to control the opacity of the data label's shape.
- **[border]** - Used to customize the width and color of the border.
- **[textStyle]** - Used to customize the font color, width and size.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].marker = {
 dataLabel: {
 visible: true,

```

```

 }
 };
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

### CUSTOM-LABEL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Series

You can add any number of series to the smithchart as per your requirement. You can use series setting to either add or customize the data. For the points or datasource added in the series, line is drawn. You can customize the each series as per your requirement with marker, datalabel, animation, opacity and so on.

#### points or datasource

For adding values in the smithchart, you can use either points or datasource in the series. Points and datasource both should be array of object which should contain the field names resistance and reactance.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{

series.Name("Transmission1").Fill('#009933').Visibility('visible').Opacity('
0.75').Width(2.5).Marker(marker => marker.Visible(true).DataLabel(dataLabel
=> dataLabel.Visible(true))).Add();
}).Render()

<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },
 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
 }
</script>

```

### SERIES.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Series customization

Using following options in series settings, you can customize each series in smithchart as per your requirement.

- [fill] - Used to customize the fill color for the series.
- [enableSmartLabels] - Used to place the data labels on the smithchart without overlapping with each other.
- [visibility] - Used to handle the visibility of the series.
- [opacity] - Used to control the opacity of the series line.
- [width] - Used to customize the width of the series line.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [

```

```

 { resistance: 3.5, reactance: 1.6 }, { resistance: 3.5,
reactance: 1.6 },
 { resistance: 4.5, reactance: 2.0 }, { resistance: 6.0,
reactance: 4.5 },
 { resistance: 8, reactance: 6 }, { resistance: 10, reactance: 25
 }];

 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
</script>

```

### CUSTOM-SERIES.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

## Print and Export

### Print

The rendered smithchart can be printed directly from the browser by calling the public method print. ID of the smithchart's div element must be passed as argument to that method.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Print").CssClass("e-flat").Render()
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
}).Render()
<script>
function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 10, reactance: 25 }, { resistance: 8,
reactance: 6 },
 { resistance: 6, reactance: 4.5 }, { resistance: 4.5,
reactance: 2 },

```

```

 { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
 { resistance: 2, reactance: 1.2 }, { resistance: 1.5,
reactance: 1 },
 { resistance: 1, reactance: 0.8 }, { resistance: 0.5,
reactance: 0.4 },
 { resistance: 0.3, reactance: 0.2 }, { resistance: 0,
reactance: 0.15 },
];
 args.smithchart.loaded = null;
 args.smithchart.refresh();
}
document.getElementById('togglebtn').onclick = function () {
 var smithchart =
document.getElementById('smithchart').ej2_instances[0];
 smithchart.print();
};
</script>

```

### PRINT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 return View();
 }
 }
}

```

### Export

The rendered smithchart can be exported to JPEG , PNG, SVG or PDF format by using export method in smithchart. Input parameters for this method are Export Type for format and fileName of result.

### CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Charts;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Print").CssClass("e-flat").Render()
@Html.EJS().Smithchart("smithchart").Loaded("loaded").Series(series =>
{
 series.Name("Transmission1").Add();
 series.Name("Transmission2").Add();
}).Render()

```

```

<script>
 function loaded(args) {
 window.smithchart = args.smithchart;
 args.smithchart.series[0].points = [
 { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
 { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
 { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
 { resistance: 0, reactance: 0.05 }, { resistance: 0,
reactance: 0.05 },
 { resistance: 0.3, reactance: 0.1 }, { resistance: 0.5,
reactance: 0.2 },
 { resistance: 1.5, reactance: 0.5 }, { resistance: 2.0,
reactance: 0.5 },
 { resistance: 2.5, reactance: 0.4 }, { resistance: 3.5,

### Accessibility in ASP.NET MVC Smith chart component

The Smith chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Smith chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Smith chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Smith chart component:

- `img (role)`
- `region (role)`
- `aria-label (attribute)`
- `aria-hidden (attribute)`

### Keyboard interaction

The Smith chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Smith chart component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the next element in the Smith chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Smith chart. |

| **Ctrl + P** | Prints the Smith chart. |

### Ensuring accessibility

The Smith chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Smith chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Smith chart component with accessibility tools.

## Sparkline

### Getting Started with ASP.NET MVC Sparkline Control

This section briefly explains about how to include [ASP.NET MVC Sparkline](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add script resources

Here, the script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/\_LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
```

```
</head>
```

**Note:** Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Sparkline control

Now, add the Syncfusion ASP.NET MVC Sparkline control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
<h2> Essential JS 2 for ASP.NET MVC Sparkline </h2>
@Html.EJS().Sparkline("spark").DataSource(Model).XName("xval").YName("yval")
.Height("100").Width("70").Render()
```

#### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(DataSource.GetData());
 }
}

public class DataSource
{
 public int x;
 public string xval;
 public double yval;
 public static List<DataSource> GetData()
 {
 List<DataSource> data1 = new List<DataSource>();
 data1.Add(new DataSource() { x = 0, xval = "2005", yval = 20090440 });
 data1.Add(new DataSource() { x = 1, xval = "2006", yval = 20264080 });
 data1.Add(new DataSource() { x = 2, xval = "2007", yval = 20434180 });
 data1.Add(new DataSource() { x = 3, xval = "2008", yval = 21007310 });
 data1.Add(new DataSource() { x = 4, xval = "2009", yval = 21262640 });
 data1.Add(new DataSource() { x = 5, xval = "2010", yval = 21515750 });
 data1.Add(new DataSource() { x = 6, xval = "2011", yval = 21766710 });
 data1.Add(new DataSource() { x = 7, xval = "2012", yval = 22015580 });
 data1.Add(new DataSource() { x = 8, xval = "2013", yval = 22262500 });
 data1.Add(new DataSource() { x = 9, xval = "2014", yval = 22507620 });
 return data1;
 }
}
```

```
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Sparkline control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

## Sparkline Dimensions

Size for container

Sparkline can be rendered to its container size. You can set the size through inline or CSS as shown in the following code.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("350px").Width("650px").XName("xval").YName("yval").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

### SIZE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
```

```

public class HomeController : Controller
{
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval =
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval =
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval =
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval =
21007310 });
 data2.Add(new DataSource() { x = 4, xval = "2009", yval =
21262640 });
 data2.Add(new DataSource() { x = 5, xval = "2010", yval =
21515750 });
 data2.Add(new DataSource() { x = 6, xval = "2011", yval =
21766710 });
 data2.Add(new DataSource() { x = 7, xval = "2012", yval =
22015580 });
 data2.Add(new DataSource() { x = 8, xval = "2013", yval =
22262500 });
 data2.Add(new DataSource() { x = 9, xval = "2014", yval =
22507620 });
 return data2;
 }
 }
}

```

<!-- markdownlint-disable MD036 -->

Size for sparkline

<!-- markdownlint-disable MD036 -->

You can also set the size for sparkline directly using the [width](#) and [height](#) properties.

### In pixel

You can set the size for sparkline in pixel as demonstrated in the following code.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">

```

```

@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150").Width("350")
.XName("xval").YName("yval").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

**PIXEL.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval =
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval =
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval =
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval =
21007310 });
 }
 }
 }
}

```

```

21262640 });
data2.Add(new DataSource() { x = 4, xval = "2009", yval =
21515750 });
data2.Add(new DataSource() { x = 6, xval = "2011", yval =
21766710 });
data2.Add(new DataSource() { x = 7, xval = "2012", yval =
22015580 });
data2.Add(new DataSource() { x = 8, xval = "2013", yval =
22262500 });
data2.Add(new DataSource() { x = 9, xval = "2014", yval =
22507620 });
return data2;
 }
}
}

```

### In percentage

By setting values in percentage, sparkline gets its dimension with respect to its container. For example, when the height is set to '50%', sparkline is rendered to half of its container height.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("50%").Width("350%")
.XName("xval").YName("yval").DataSource(ViewBag.sparkData).Render()
</div>
<style>
.spark {
border: 1px solid rgb(209, 209, 209);
border-radius: 2px;
width: 100%;
height: 100%;
}
</style>
<script>
function loaded(args)
{
window.sparkline = args.sparkline;
args.sparkline.loaded = null;
args.sparkline.refresh();
}
</script>

```

### PERCENTAGE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;

```

```

using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval =
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval =
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval =
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval =
21007310 });
 data2.Add(new DataSource() { x = 4, xval = "2009", yval =
21262640 });
 data2.Add(new DataSource() { x = 5, xval = "2010", yval =
21515750 });
 data2.Add(new DataSource() { x = 6, xval = "2011", yval =
21766710 });
 data2.Add(new DataSource() { x = 7, xval = "2012", yval =
22015580 });
 data2.Add(new DataSource() { x = 8, xval = "2013", yval =
22262500 });
 data2.Add(new DataSource() { x = 9, xval = "2014", yval =
22507620 });
 return data2;
 }
 }
 }
}

```

## Sparkline Types

Different types of shapes can be used to represent the sparkline. You can change the sparkline type by setting the type property. Sparkline supports the following types:

- Line
- Column
- Win-Loss
- Pie
- Area

The following code sample shows different types of sparklines.

<!-- markdownlint-disable MD036 -->

## Line

The [Line](#) type is used to render the sparkline series as line.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("100px").Width("70%").XName("xval").YName("yval").Type(SparklineType.Line).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

### LINE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
```

```

 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval =
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval =
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval =
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval =
21007310 });
 data2.Add(new DataSource() { x = 4, xval = "2009", yval =
21262640 });
 data2.Add(new DataSource() { x = 5, xval = "2010", yval =
21515750 });
 data2.Add(new DataSource() { x = 6, xval = "2011", yval =
21766710 });
 data2.Add(new DataSource() { x = 7, xval = "2012", yval =
22015580 });
 data2.Add(new DataSource() { x = 8, xval = "2013", yval =
22262500 });
 data2.Add(new DataSource() { x = 9, xval = "2014", yval =
22507620 });
 return data2;
 }
 }
}

```

## Column

The [Column](#) type is used to render the sparkline series as column.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("200px").XName("xval").YName("yval").Type(SparklineType.Line).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

**COLUMN.CS**

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval =
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval =
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval =
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval =
21007310 });
 data2.Add(new DataSource() { x = 4, xval = "2009", yval =
21262640 });
 data2.Add(new DataSource() { x = 5, xval = "2010", yval =
21515750 });
 data2.Add(new DataSource() { x = 6, xval = "2011", yval =
21766710 });
 data2.Add(new DataSource() { x = 7, xval = "2012", yval =
22015580 });
 data2.Add(new DataSource() { x = 8, xval = "2013", yval =
22262500 });
 data2.Add(new DataSource() { x = 9, xval = "2014", yval =
22507620 });
 return data2;
 }
 }
 }
}

```

## Pie

The [Pie](#) type is used to render the sparkline series as pie.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("70%").XName("xval").YName("yval").Type(SparklineType.Pie).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

### PIE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
```

```

20090440 });
20264080 });
20434180 });
21007310 });
21262640 });
21515750 });
21766710 });
22015580 });
22262500 });
22507620 });

 return data2;
 }
}
}
}

```

## Win Loss

The [WinLoss](#) type is used to render the sparkline series as Win Loss.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("100px").Width("70%").XName("xval").YName("yval").Type(SparklineType.WinLoss).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### WINLOSS.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()

 data2.Add(new DataSource() { x = 0, xval = "2005", yval = -
20090440 });
 data2.Add(new DataSource() { x = 1, xval = "2006", yval = -
20264080 });
 data2.Add(new DataSource() { x = 2, xval = "2007", yval = -
20434180 });
 data2.Add(new DataSource() { x = 3, xval = "2008", yval = -
21007310 });
 data2.Add(new DataSource() { x = 4, xval = "2009", yval = -
21262640 });
 data2.Add(new DataSource() { x = 5, xval = "2010", yval = -
21515750 });
 data2.Add(new DataSource() { x = 6, xval = "2011", yval = -
21766710 });
 data2.Add(new DataSource() { x = 7, xval = "2012", yval = -
22015580 });
 data2.Add(new DataSource() { x = 8, xval = "2013", yval = -
22262500 });
 data2.Add(new DataSource() { x = 9, xval = "2014", yval = -
22507620 });
 return data2;
 }
 }
 }
}

```

## Area

The [Area](#) type is used to render the sparkline series as area.

**CSHTML**

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("100px").Width("70%").XName("xval").YName("yval").Type(SparklineType.Area).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

**AREA.CS**

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { x = 0, xval = "2005", yval = 20090440 });
 }
 }
 }
}
```

```

20264080 });
20434180 });
21007310 });
21262640 });
21515750 });
21766710 });
22015580 });
22262500 });
22507620 });
 return data2;
 }
}
}

```

## Axis Customization

You can customize axis value types and min and max values of the sparkline.

### Change value type of the sparkline

You can change the sparkline value type by setting the [valueType](#) property to **Numeric**, **Category**, or **DateTime**.

```
<!-- markdownlint-disable MD036 -->
```

### DateTime

You can assign date-time values to the sparkline by setting the [valueType](#) property to **DateTime**.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">

@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("130px").DataSource(ViewBag.datetime).Type(SparklineType.Column).XName("xDate").YName("yval").ValueType(SparklineValueType.DateTime).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)

```

```

 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

## DATETIME.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.datetime = DataSource.GetDatetimeData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetDatetimeData()
 {
 List<DataSource> data1 = new List<DataSource>();
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
1), yval = 4 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
2), yval = 4.5 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
3), yval = 8 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
4), yval = 7 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
5), yval = 6 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
8), yval = 8 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
9), yval = 8 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
10), yval = 6.5 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
11), yval = 4 });
 data1.Add(new DataSource() { xDate = new DateTime(2018, 1,
12), yval = 5.5 });
 return data1;
 }
 }
 }
}

```

```

 }
}
}
}

```

<!-- markdownlint-disable MD036 -->

## Category

You can assign category values to the sparkline by setting [valueType](#) to **Category**.

## C#HTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("1
30px").DataSource(ViewBag.category).Type(SparklineType.Column).XName("xval")
.YName("yval").ValueType(SparklineValueType.Category).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

## CATEGORY.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.category = DataSource.GetCategoryData();
 return View();
 }
 public class DataSource

```

```

 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetCategoryData()
 {
 List<DataSource> data2 = new List<DataSource>();
 data2.Add(new DataSource() { xval = "Robert", yval = 60 });
 data2.Add(new DataSource() { xval = "Andrew", yval = 65 });
 data2.Add(new DataSource() { xval = "Suyama", yval = 70 });
 data2.Add(new DataSource() { xval = "Michael", yval = 80 });
 data2.Add(new DataSource() { xval = "Janet", yval = 55 });
 data2.Add(new DataSource() { xval = "Davolio", yval = 90 });
 data2.Add(new DataSource() { xval = "Fuller", yval = 75 });
 data2.Add(new DataSource() { xval = "Nancy", yval = 85 });
 return data2;
 }
 }
}

```

## Numeric

You can assign numeric values to the sparkline by setting [valueType](#) to **Numeric**.

## CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("130px").DataSource(ViewBag.numeric).Type(SparklineType.Column).XName("x").YName("yval").ValueType(SparklineValueType.Numeric).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

## NUMERIC.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;

```

```

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.numeric = DataSource.GetNumericData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetNumericData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { x = 1, yval = 190});
 data3.Add(new DataSource() { x = 2, yval = 165});
 data3.Add(new DataSource() { x = 3, yval = 158});
 data3.Add(new DataSource() { x = 4, yval = 175});
 data3.Add(new DataSource() { x = 5, yval = 200});
 data3.Add(new DataSource() { x = 6, yval = 180});
 data3.Add(new DataSource() { x = 7, yval = 210});
 return data3;
 }
 }
 }
}

```

<!-- markdownlint-disable MD036 -->

### Change min and max values of axis

You can change the min and max values of x-axis by setting the [minX](#) and [maxX](#) values to the [axisSettings](#) property. You can also change the min and max values of y-axis by setting the [minY](#) and [maxY](#) values to the [axisSettings](#) property.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("130px").AxisSettings(axis =>
 axis.Value(25).DataSource(ViewBag.numeric).Type(SparklineType.Column).XName("x").YName("yval").ValueType(SparklineValueType.Numeric).Render()
)
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 }
</style>

```

```

 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### MINMAX.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.numeric = DataSource.GetNumericData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetNumericData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { x = 0, yval = 50});
 data3.Add(new DataSource() { x = 1, yval = 30});
 data3.Add(new DataSource() { x = 2, yval = 20});
 data3.Add(new DataSource() { x = 3, yval = 30});
 data3.Add(new DataSource() { x = 4, yval = 50});
 data3.Add(new DataSource() { x = 5, yval = 40});
 data3.Add(new DataSource() { x = 6, yval = 20});
 data3.Add(new DataSource() { x = 7, yval = 10 });
 data3.Add(new DataSource() { x = 8, yval = 30 });
 data3.Add(new DataSource() { x = 9, yval = 10 });
 data3.Add(new DataSource() { x = 10, yval = 40 });
 return data3;
 }
 }
 }
}

```

```
}

```

### Change value of axis

You can set horizontal axis line value of the sparkline by setting [value](#) to the [axisSettings](#) property. The following code example shows this.

#### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("130px").AxisSettings(axis =>
axis.MinY(0).MaxY(150)).DataSource(ViewBag.numeric).Type(SparklineType.Column).XName("x").YName("yval").ValueType(SparklineValueType.Numeric).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

#### VALUE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.numeric = DataSource.GetNumericData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 }
 }
}
```

```

public int x;
public string yval;
public static List<DataSource> GetNumericData()
{
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { x = 0, yval = 50});
 data3.Add(new DataSource() { x = 1, yval = 30});
 data3.Add(new DataSource() { x = 2, yval = 20});
 data3.Add(new DataSource() { x = 3, yval = 30});
 data3.Add(new DataSource() { x = 4, yval = 50});
 data3.Add(new DataSource() { x = 5, yval = 40});
 data3.Add(new DataSource() { x = 6, yval = 20});
 data3.Add(new DataSource() { x = 7, yval = 10 });
 data3.Add(new DataSource() { x = 8, yval = 30 });
 data3.Add(new DataSource() { x = 9, yval = 10 });
 data3.Add(new DataSource() { x = 10, yval = 40 });
 return data3;
}
}
}

```

### Axis line customization

Axis of the sparkline can be collapsed using the [visible](#) property in [lineSettings](#); this is not applicable for win-loss. You can customize the [color](#), [width](#), [opacity](#), and [dashArray](#) of axis line.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("130px").AxisSettings(axis => axis.LineSettings(new SparklineLineSettings {
Visible = true, Color = "#ff14ae", DashArray = "5"
})).DataSource(ViewBag.numeric).Type(SparklineType.Column).XName("x").YName("yval").ValueType(SparklineValueType.Numeric).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### AXIS\_LINE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.numeric = DataSource.GetNumericData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetNumericData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { x = 0, yval = 50});
 data3.Add(new DataSource() { x = 1, yval = 30});
 data3.Add(new DataSource() { x = 2, yval = 20});
 data3.Add(new DataSource() { x = 3, yval = 30});
 data3.Add(new DataSource() { x = 4, yval = 50});
 data3.Add(new DataSource() { x = 5, yval = 40});
 data3.Add(new DataSource() { x = 6, yval = 20});
 data3.Add(new DataSource() { x = 7, yval = 10 });
 data3.Add(new DataSource() { x = 8, yval = 30 });
 data3.Add(new DataSource() { x = 9, yval = 10 });
 data3.Add(new DataSource() { x = 10, yval = 40 });
 return data3;
 }
 }
 }
}

```

### Special points customization

You can customize the points by initializing the point colors. The customization options allows to differentiate the [start](#), [end](#), [positive](#), [negative](#), and [low](#) points. This customization is only applicable for line, column, and area type sparklines.

<!-- markdownlint-disable MD036 -->

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("1
30px").XName("xval").YName("yval").Type(SparklineType.Column).ValueType(Spar

```

```

klineValueType.Category).HighPointColor("blue").LowPointColor("orange").StartPointColor("green").EndPointColor("green").NegativePointColor("red").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### CUSTOM.CS

```

 data2.Add(new DataSource() { x = 11, xval = "MAZDA", yval =
3 });
 return data2;
}
}
}
}

```

### Tie point color

Tie point color is used to configure the win-loss series type sparkline's y-value point color. The following code sample shows the tie point color of sparkline series.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("150px").Width("1
30px").Type(SparklineType.WinLoss).ValueType(SparklineValueType.Numeric).Tie
PointColor("blue").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### TIE POINT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 12, 15, -10, 13, 15, 6, -12, 17,
13, 0, 8, -10 };
 return View();
 }
 }
}

```

## Range Band

This section explains how to customize the sparkline with multiple range bands.

### Range band customization

The range band feature is used to highlight a particular range along with the y-axis using the [startRange](#) and [endRange](#) properties. You can also customize the [color](#) and [opacity](#) of the range band.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("1
50px").LineWidth(2).Fill("#0d3c9b").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
function loaded(args)
{
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.rangeBandSettings[0] = {
 startRange: 1,
 endRange: 3,
 color: "#bfd4fc",
 opacity: 0.4
 };
 args.sparkline.refresh();
}

```

```
</script>
```

### RANGE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 0, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}
```

### Multiple range band customization

You can define multiple range bands to a sparkline as shown in the following code sample.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("150px").LineWidth(2).Fill("#0d3c9b").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
function loaded(args)
{
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.rangeBandSettings[0] = {
 startRange: 1,
 endRange: 3,
 color: "#bfd4fc",
 opacity: 0.4
 };
 args.sparkline.rangeBandSettings[1] = {
 startRange: 4,
 endRange: 5,
```

```

 color: 'red',
 opacity: 0.4
 };
 args.sparkline.refresh();
}
</script>

```

## MULTI RANGE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 0, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

## Markers

This section explains how to add markers to the sparklines.

### Adding marker to the sparkline

To add marker to the sparkline, specify the [visible](#) of [markerSettings](#) as following values. The [visible](#) will accept multiple values too.

- All - Enables markers for all points.
- Start - Enables marker for the start point.
- End - Enables marker for the end point.
- High - Enables marker for the high point.
- Low - Enables marker for the low point.
- Negative - Enables markers for the negative points.

The following code example shows enabling markers for all points.

## CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).DataSource(ViewBag.sparkData).Render()
</div>

```

```

<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.markerSettings = {
 visible: ['All']
 };
 args.sparkline.refresh();
 }
</script>

```

### ALLPOINT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 0, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

### Adding marker to special point

In sparkline, markers can be enabled for particular points such as the start, end, low, high, or negative. The following code examples shows enabling markers for the high and low points.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).HighPointColor("blue").LowPointColor("red").DataSource(ViewBag.sparkData).Render()
</div>

```

```

<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.markerSettings = {
 visible: ['high', 'Low']
 };
 args.sparkline.refresh();
 }
</script>

```

### SPECIALPOINT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

### Customizing markers

Sparkline markers can be customized in terms of fill color, border color, width, opacity, and size. The following code example shows customizing marker's fill, border, and size.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).Fill("blue").DataSource(ViewBag.sparkData).Render()
</div>
<style>

```

```

 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
 </style>
 <script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.markerSettings = {
 visible: ['all'],
 size: 5,
 fill: 'white',
 border: { color: 'blue', width: 2 }
 };
 args.sparkline.refresh();
 }
 </script>

```

### CUSTOM.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

### Data Labels

Data labels are used to display values of data points to improve the readability.

#### Enable data label

To enable data label for sparkline series, provide [visible](#) of the [dataLabelSettings](#) as following possible values:

- All - Enables data label of all points.
- Start - Enables data label of the start point.
- End - Enables data label of the end point.

- High - Enables data label of the high point.
- Low - Enables data label of the low point.
- Negative - Enables data labels of the negative points.

The following example shows enabling sparkline data label for all points.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).Fill("blue").DataLabelSettings(data => data.Visible(ViewBag.sparkVisible)).DataSource(ViewBag.sparkData).Render()
</div>
<style>
.spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
}
</style>
<script>
function loaded(args)
{
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
}
</script>
```

### ENABLE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkVisible = new string[] { "All" };
 ViewBag.sparkData = new int[] { 0, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}
```

### Customize data label

Data labels can be customized using the fill, border, opacity, and text Style. The following code example shows customizing data label border, text color, and fill color.

#### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).Fill("blue").DataLabelSettings(data => data.Fill("blue").Opacity(0.4).Visible(ViewBag.sparkVisible)).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

#### CUSTOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkVisible = new string[] { "All" };
 ViewBag.sparkData = new int[] { 0, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}
```

### Format data label text

The text of data labels can be formatted using the [format](#) API in the sparkline [dataLabelSettings](#). By default, data label shows the y-value of point. The following code example shows how to display x and y-values for points.

#### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("500px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(7)).DataLabelSettings(data => data.Format("{xval} : {yval}").Visible(ViewBag.sparkVisible).Fill("blue").Opacity(0.4).Fill("blue").DataSource(ViewBag.numeric).XName("xval").YName("yval").ValueType(SparklineValueType.Category)).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

#### FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkVisible = new string[] { "All" };
 ViewBag.numeric = DataSource.GetNumericData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
```

```

public double yval;
public int x;
public string xval;
public static List<DataSource> GetNumericData()
{
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { xval = "Mon", yval = 3});
 data3.Add(new DataSource() { xval = "Tue", yval = 5});
 data3.Add(new DataSource() { xval = "Wed", yval = 2});
 data3.Add(new DataSource() { xval = "Thu", yval = 4});
 data3.Add(new DataSource() { xval = "Fri", yval = 6});
 return data3;
}
}
}
}

```

## User interactions

Sparkline has two user interaction features: tooltip and tracker line.

### Tooltip

The sparkline provides options to display details about values of data points through tooltips when hovering the mouse over data point. To use tooltip in sparkline, inject the [SparklineTooltip](#) module to sparkline using the inject method.

The following code example shows enabling tooltip for sparkline with format.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("500px").AxisSettings(axis => axis.MinX(-1).MaxX(8)).Fill("blue").ValueType(SparklineValueType.Category).XName("xval").YName("yval").TooltipSettings(tool => tool.Visible(true).Format("${xval} : ${yval}")).DataSource(ViewBag.data).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### TOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.data = DataSource.GetData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { xval = "Mon", yval = 3});
 data3.Add(new DataSource() { xval = "Tue", yval = 5});
 data3.Add(new DataSource() { xval = "Wed", yval = 2});
 data3.Add(new DataSource() { xval = "Thu", yval = 4});
 data3.Add(new DataSource() { xval = "Fri", yval = 6});
 return data3;
 }
 }
 }
}

```

### Tooltip customization

The fill color, text styles, format, and border of the tooltip can be customized. The following code example shows customization of tooltip's fill color and text style.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("500px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(8)).Fill("#033e96").ValueType(SparklineValueType.Category).XName("xval").YName("yval").TooltipSettings(tool =>
tool.Visible(true).Format("${xval} : ${yval}").Fill("#033e96")).DataSource(ViewBag.data).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 }

```

```
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

### TOOLTIP-CUSTOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.data = DataSource.GetData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { xval = "Mon", yval = 3});
 data3.Add(new DataSource() { xval = "Tue", yval = 5});
 data3.Add(new DataSource() { xval = "Wed", yval = 2});
 data3.Add(new DataSource() { xval = "Thu", yval = 4});
 data3.Add(new DataSource() { xval = "Fri", yval = 6});
 return data3;
 }
 }
 }
}
```

*Tooltip template*

Sparkline tooltip has template support. By using tooltip template, you can customize tooltips. The following code example shows more customization options provided to `sparktooltip` class that is used in tooltip template div. Using this template, images also can be added to tooltip.

**CSHTML**

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("500px").AxisSettings(axis => axis.MinX(-1).MaxX(7).MinY(-1).MaxY(8)).Fill("#033e96").ValueType(SparklineValueType.Category).XName("xval").YName("yval").TooltipSettings(new SparklineSparklineTooltipSettings { Visible = true, Template = "#tooltip" }).DataSource(ViewBag.data).Render()
</div>
<div id="tooltip">
 ${xval} : ${yval}
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
 #tooltip {
 border-radius: 5px;
 background: #008cff;
 color: #FFFFFF !important;
 font-size: 16px;
 font-style: italic;
 padding: 8px;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

**TOOLTIP\_TEMPLATE.CS**

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
```

```

{
 public IActionResult Index()
 {
 ViewBag.data = DataSource.GetData();
 return View();
 }
 public class DataSource
 {
 public DateTime xDate;
 public double yval;
 public int x;
 public string xval;
 public static List<DataSource> GetData()
 {
 List<DataSource> data3 = new List<DataSource>();
 data3.Add(new DataSource() { xval = "Mon", yval = 3});
 data3.Add(new DataSource() { xval = "Tue", yval = 5});
 data3.Add(new DataSource() { xval = "Wed", yval = 2});
 data3.Add(new DataSource() { xval = "Thu", yval = 4});
 data3.Add(new DataSource() { xval = "Fri", yval = 6});
 return data3;
 }
 }
}

```

### Track line

The track line tracks data points that are closer to the mouse position or touch contact.

To enable track lines for sparkline, specify the [visible](#) option of [trackLineSettings](#) to true. Based on theme, tracker color will be changed. The default value of tracker color is black.

To use track line in sparkline, inject the [SparklineTooltip](#) module to sparkline using the inject method.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("500px").AxisSettings(axis => axis.MinX(-1).MaxX(46).MinY(-1).MaxY(10)).Fill("#033e96").TooltipSettings(tool => tool.Visible(true).TrackLineSettings(new SparklineTrackLineSettings { Visible = true, Color = "#033e96", Width = 1})).DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {

```

```

 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### TOOLTIP\_TRACKLINE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 5, 3, 4, 6, 8, 7, 9, 1, 3, 5, 3,
4, 6, 8, 7, 9, 1, 3, 5, 2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7, 4, 2, 5, 2, 4, 6,
7, 9, 5, 8, 3, 6, 1, 7, 4, 2 };
 return View();
 }
 }
}

```

### Appearance

The appearance of the sparkline can be customized using margin, container Area border, and container Area background.

#### Sparkline border

The [containerArea border](#) of the sparkline is used to render border to cover sparkline area.

The following code example shows the sparkline with overall border.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
@Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").ContainerArea(con => con.Border(new SparklineSparklineBorder { Color = "#033e96", Width = 2 })).Border(bod => bod.Color("#033e96").Width(1)).Type(SparklineType.Area).Fill("#b2cfff").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }

```

```

</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

## BORDER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

## Sparkline padding

Padding is used to specify padding value between container and sparkline. By default, padding value of the sparkline is 5. Sparkline [padding](#) values are specified by the left, right, top, and bottom.

The following code example shows the sparkline with overall padding is set to 20.

## CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").ContainerArea(con => con.Border(new SparklineSparklineBorder { Color = "#033e96", Width = 2 })).Padding(pad => pad.Left(20).Right(20).Bottom(20).Top(20)).Border(bod => bod.Color("#033e96").Width(1)).Type(SparklineType.Area).Fill("#b2cfff").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }

```

```

</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

## PADDING.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

## Sparkline area customization

The background color of the sparkline area can be customized using the [containerArea background](#) color. By default, the sparkline background color is transparent.

## CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").ContainerArea(con => con.Background("#eff1f4").Border(new SparklineSparklineBorder { Color = "#033e96", Width = 2 })).Padding(pad => pad.Left(20).Right(20).Bottom(20).Top(20)).Border(bod => bod.Color("#033e96").Width(1)).Type(SparklineType.Area).Fill("#b2cfff").DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>

```

```
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>
```

### AREA\_CUSTOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}
```

### Sparkline theme

Datalabel and track line colors of the sparkline will be changed based on theme. For example, for dark theme, the color of datalabel and track line should be white; for light theme, their value should be black. The possible values for sparkline theme are [Material](#), [Fabric](#), [Bootstrap](#), and [Highcontrast](#).

The following code example shows the color for datalabel and track line is set to white for dark theme.

### CSHTML

```
@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").Theme(SparklineTheme.Highcontrast).DataLabelSettings(data =>
 data.Visible(ViewBag.sparkVisible)).TooltipSettings(tool =>
 tool.TrackLineSettings(new SparklineTrackLineSettings { Visible = true
 })).AxisSettings(axis => axis.MinX(-1).MaxX(7)).LineWidth(3).Border(bor =>
 bor.Color("transparent").Width(2)).Type(SparklineType.Line).Fill("#007dd1").
 DataSource(ViewBag.sparkData).Render()
</div>
<style>
 .spark {
 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
```

```

 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### THEME.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 3, 6, 4, 1, 3, 2, 5 };
 return View();
 }
 }
}

```

### Localization

The sparkline control supports localization. The default culture for localization is **en-US**. You can change the culture using the **setCulture** method.

#### Tooltip format

Sparkline tooltip supports localization. The following code sample shows tooltip text with currency format based on culture.

### CSHTML

```

@using Syncfusion.EJ2;
<div class="spark" align="center">
 @Html.EJS().Sparkline("sparkline").Loaded("loaded").Height("200px").Width("350px").TooltipSettings(tool =>
 tool.Visible(true)).Format("c0").UseGroupingSeparator(true).LineWidth(3).Padding(pad => pad.Left(20).Right(20).Bottom(20).Top(20)).Border(bod =>
 bod.Color("#033e96").Width(2)).Type(SparklineType.Area).Fill("#b2cfff").DataSource(ViewBag.sparkData).Render()
 </div>
<style>
 .spark {

```

```

 border: 1px solid rgb(209, 209, 209);
 border-radius: 2px;
 width: 100%;
 height: 100%;
 }
</style>
<script>
 function loaded(args)
 {
 window.sparkline = args.sparkline;
 args.sparkline.loaded = null;
 args.sparkline.refresh();
 }
</script>

```

### TOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
 public class HomeController : Controller
 {
 public IActionResult Index()
 {
 ViewBag.sparkData = new int[] { 30000, 60000, 40000, 10000,
30000, 20000, 50000 };
 return View();
 }
 }
}

```

### Accessibility in ASP.NET MVC Sparkline component

The Sparkline component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sparkline component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

```

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Sparkline component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Sparkline component:

- `img (role)`
- `aria-label (attribute)`
- `aria-hidden (attribute)`

### Keyboard interaction

The Sparkline component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Sparkline component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + P** | Prints the Sparkline. |

### Ensuring accessibility

The Sparkline component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sparkline component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sparkline component with accessibility tools.

### Migration from Essential JS 1

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

#### Sparkline Types

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Type| **Property:** *type*<br/><br/>

@(Html.EJ().Sparkline("container").Type(SparklineType.Column))| **Property:** *type*<br/><br/>

@Html.EJS().Sparkline("container").Type(Syncfusion.EJ2.Charts.SparklineType.Area).Render() |

#### Databinding

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Datasource| **Property:** *dataSource*<br/><br/>

@(Html.EJ().Sparkline("container").DataSource(ViewBag.SparklineData)) | **Property:**

*dataSource*<br/><br/>

@Html.EJS().Sparkline("container").DataSource(ViewBag.datasource).Render() |

|Binding X values with datasource| **Property:** *xName*<br/><br/>

@(Html.EJ().Sparkline("container").XName("Month")) | **Property:** *xName*<br/><br/>

@Html.EJS().Sparkline("container").XName("Month").Render() |

|Binding Y values with datasource| **Property:** *yName*<br/><br/>

@(Html.EJ().Sparkline("container").YName("Sales")) | **Property:** *yName*<br/><br/>

@Html.EJS().Sparkline("container").YName("Sales").Render() |

#### Markers

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Enable markers| **Property:** *markerSettings.visible*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Visible(true))) | **Property:**

*markerSettings.visible*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Visible(new string[] { "All" })).Render() |

|Color| **Property:** *markerSettings.fill*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Fill("red"))) | **Property:** *markerSettings.fill*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Fill("red")).Render()|

|Size| **Property:** *markerSettings.width*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Width(10))) | **Property:** *markerSettings.size*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Size(10)).Render()|

|Opacity| **Property:** *markerSettings.opacity*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Opacity(0.5))) | **Property:** *markerSettings.opacity*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Opacity(0.5)).Render()|

|Border color| **Property:** *markerSettings.border.color*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Border(br=> br.Color("black")))| **Property:** *markerSettings.border.color*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Border(br=> br.Color("Black"))).Render()|

|Border width| **Property:** *markerSettings.border.width*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Border(br=> br.Width(1))) | **Property:** *markerSettings.border.width*<br/><br/> @Html.EJS().Sparkline("container").MarkerSettings(ms =>ms.Border(br=> br.Width(1))).Render()|

|Border opacity| **Property:** *markerSettings.border.opacity*<br/><br/>

@(Html.EJ().Sparkline("container").MarkerSettings(mr => mr.Border(br=> br.Opacity(0.5)))) | Not applicable|

## Data labels

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Enable data labels| Not applicable | **Property:** *dataLabelSettings.visible*<br/><br/>

@Html.EJS().Sparkline("container").DataLabelSettings(dl => dl.Visible(new string[] { "All" })).Render()|

|Color| Not applicable | **Property:** *dataLabelSettings.fill*<br/><br/>

@Html.EJS().Sparkline("container").DataLabelSettings(dl => dl.Fill("red")).Render()|

|Opacity| Not applicable | **Property:**

*dataLabelSettings.opacity*<br/><br/>@Html.EJS().Sparkline("container").DataLabelSettings(dl => dl.Opacity(0.5)).Render() |

|Border color| Not applicable | **Property:** *dataLabelSettings.border.color*<br/><br/>

@Html.EJS().Sparkline("container").DataLabelSettings(dl => dl.Border(ViewBag.border)).Render()<br/><br/>ViewBag.border = new {color="red"}|

| Border width | Not applicable | **Property:** *dataLabelSettings.border.width*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.Border(ViewBag.border)).Render() | *ViewBag.border = new {width=2}* |

| Format | Not applicable | **Property:** *dataLabelSettings.format*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl => dl.Format("{xval}:"  
 "{yval}")).Render() |

| Horizontal Offset | Not applicable | **Property:** *dataLabelSettings.offset.x*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.Offset(ViewBag.offset)).Render() | *ViewBag.offset = new {x=100}* |

| Vertical Offset | Not applicable | **Property:** *dataLabelSettings.offset.y*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.Offset(ViewBag.offset)).Render() | *ViewBag.offset = new {y=100}* |

| Font color | Not applicable | **Property:** *dataLabelSettings.textStyle.color*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new {color="green"}* |

| Font family | Not applicable | **Property:** *dataLabelSettings.textStyle.fontFamily*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new  
 {fontFamily="Arial"}* |

| Font style | Not applicable | **Property:** *dataLabelSettings.textStyle.fontStyle*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new  
 {fontStyle="normal"}* |

| Font weight | Not applicable | **Property:** *dataLabelSettings.textStyle.fontWeight*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new  
 {fontWeight="bold"}* |

| Font opacity | Not applicable | **Property:** *dataLabelSettings.textStyle.opacity*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new {opacity=0.5}* |

| Font size | Not applicable | **Property:** *dataLabelSettings.textStyle.fontSize*  
 @Html.EJS().Sparkline("container").DataLabelSettings(dl =>  
 dl.TextStyle(ViewBag.textStyle)).Render() | *ViewBag.textStyle = new {fontSize="12px"}* |

## Range band

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Color | **Property:**  
*rangeBandSettings.color* | @Html.EJ().Sparkline("container").RangeBandSettings(range  
 => range.Color("red")) | **Property:** *rangeBandSettings.color*  
 @Html.EJS().Sparkline("container").RangeBandSettings(rbs => rbs.Color("red")).Render() |

|Opacity| **Property:** *rangeBandSettings.opacity*<br/><br/>  
 <@Html.EJ().Sparkline("container").RangeBandSettings(range => range.Opacity(0.4)) | **Property:** *rangeBandSettings.opacity*<br/><br/> @Html.EJS().Sparkline("container").RangeBandSettings(rbs => rbs.Opacity(0.5)).Render()|

|Start range| **Property:** *rangeBandSettings.startRange*<br/><br/>  
 @Html.EJ().Sparkline("container").RangeBandSettings(range => range.StartRange(4)) | **Property:** *rangeBandSettings.startRange*<br/><br/>  
 @Html.EJS().Sparkline("container").RangeBandSettings(rbs => rbs.StartRange(5)).Render()|

|End range| **Property:** *rangeBandSettings.endRange*<br/><br/>  
 @Html.EJ().Sparkline("container").RangeBandSettings(range => range.EndRange(30)) | **Property:** *rangeBandSettings.endRange*<br/><br/>  
 @Html.EJS().Sparkline("container").RangeBandSettings(rbs => rbs.EndRange(15)).Render()|

### Special points customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|High point color| **Property:** *highPointColor*<br/><br/>  
 @Html.EJ().Sparkline("container").HighPointColor("Blue")) | **Property:** *highPointColor*<br/><br/>  
 @Html.EJS().Sparkline("container").HighPointColor("red").Render()|

|Low point color| **Property:** *lowPointColor*<br/><br/>  
 @Html.EJ().Sparkline("container").LowPointColor("Orange")) | **Property:** *lowPointColor*<br/><br/>  
 @Html.EJS().Sparkline("container").LowPointColor("blue").Render()|

|Negative point color| **Property:** *negativePointColor*<br/><br/>  
 @Html.EJ().Sparkline("container").NegativePointColor("Red")) | **Property:** *negativePointColor*<br/><br/>  
 @Html.EJS().Sparkline("container").NegativePointColor("green").Render()|

|Start point color| **Property:** *startPointColor*<br/><br/>  
 @Html.EJ().Sparkline("container").StartPointColor("Green")) | **Property:** *startPointColor*<br/><br/>  
 <@Html.EJS().Sparkline("container").StartPointColor("black").Render()|

|End point color| **Property:** *endPointColor*<br/><br/>  
 @Html.EJ().Sparkline("container").EndPointColor("Green")) | **Property:** *endPointColor*<br/><br/>  
 @Html.EJS().Sparkline("container").EndPointColor("orange").Render()|

|Tie point color| **Property:** *tiePointColor*<br/><br/>Not Applicable | **Property:** *tiePointColor*<br/><br/>  
 @Html.EJS().Sparkline("container").TiePointColor("grey").Render()|

### Axis customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Show axis line| **Property:** *axisSettings.visible*<br/><br/>  
 @Html.EJ().Sparkline("container").AxisLineSettings(as => as.Visible(true))) | **Property:**

*axisSettings.lineSettings.visible*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.LineSettings(ls => ls.Visible(true))).Render()

| Line color | **Property:** *axisSettings.color*  
@Html.EJ().Sparkline("container").AxisLineSettings(as => as.Color("#ff14ae")) | **Property:** *axisSettings.lineSettings.color*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.LineSettings(ls => ls.Color("red"))).Render()

| Line width | **Property:** *axisSettings.width*  
@Html.EJ().Sparkline("container").AxisLineSettings(as => as.Width(2)) | **Property:** *axisSettings.lineSettings.width*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.LineSettings(ls => ls.Width(2))).Render()

| Dash array | **Property:** *axisSettings.dashArray*  
@Html.EJ().Sparkline("container").AxisLineSettings(as => as.DashArray("5,3")) | **Property:** *axisSettings.lineSettings.dashArray*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.LineSettings(ls => ls.DashArray("5,3"))).Render()

| X axis minimum value | Not applicable | **Property:** *axisSettings.minX*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.MinX(0)).Render()

| X axis maximum value | Not applicable | **Property:** *axisSettings.maxX*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.MaxX(100)).Render()

| Y axis minimum value | Not applicable | **Property:** *axisSettings.minY*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.MinY(0)).Render()

| Y axis maximum value | Not applicable | **Property:** *axisSettings.maxY*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.MaxY(100)).Render()

| Horizontal axis line position | Not applicable | **Property:** *axisSettings.value*  
@Html.EJS().Sparkline("container").AxisSettings(axis => axis.Value(10)).Render()

#### Appearance customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Background color | **Property:** *background*  
@Html.EJ().Sparkline("container").Background("gray") | **Property:** *containerArea.background*  
@Html.EJS().Sparkline("container").ContainerArea(ca => ca.Background("red")).Render()

| Border color | Not applicable | **Property:** *containerArea.border.color*  
@Html.EJS().Sparkline("container").ContainerArea(ca => ca.Border(ViewBag.border)).Render()  
ViewBag.border = new {color="green"}

| Border width | Not applicable | **Property:** *containerArea.border.width*  
@Html.EJS().Sparkline("container").ContainerArea(ca => ca.Border(ViewBag.border)).Render()  
ViewBag.border = new {color="green"}

|Series color| **Property:** `fill`  
**Property:** `@Html.EJ().Sparkline("container").Fill("gray")` | **Property:** `fill`  
**Property:** `@Html.EJS().Sparkline("container").Fill("green").Render()` |

|Series opacity| **Property:** `opacity`  
**Property:** `@Html.EJ().Sparkline("container").Opacity(0.5)` | **Property:** `opacity`  
**Property:** `@Html.EJS().Sparkline("container").Opacity(0.5).Render()` |

|Line series width| **Property:** `width`  
**Property:** `@Html.EJ().Sparkline("container").Width(2)` | **Property:** `lineWidth`  
**Property:** `@Html.EJS().Sparkline("container").LineWidth(2).Render()` |

|Series border color| **Property:** `border.color`  
**Property:** `@Html.EJ().Sparkline("container").Border(border=>border.Color("green"))` | **Property:** `border.color`  
**Property:** `@Html.EJS().Sparkline("container").Border(br=>br.Color("red")).Render()` |

|Series border width| **Property:** `border.width`  
**Property:** `@Html.EJ().Sparkline("container").Border(border=>border.Width(2))` | **Property:** `border.width`  
**Property:** `@Html.EJS().Sparkline("container").Border(br=>br.Width(2)).Render()` |

|Series palette| **Property:** `palette`  
**Property:** `@Html.EJ().Sparkline("container").Palette(ViewBag.palettes)`  
**Property:** `@Html.EJS().Sparkline("container").Palette(ViewBag.palettes).Render()`  
**Property:** `ViewBag.palettes = new string[] { "red", "green", "orange", "blue" }` | **Property:** `palette`  
**Property:** `@Html.EJS().Sparkline("container").Palette(ViewBag.palettes).Render()`  
**Property:** `ViewBag.palettes = new string[] { "red", "green", "orange", "blue" }` |

|Theme| **Property:** `theme`  
**Property:** `@Html.EJ().Sparkline("container").Theme(SparkTheme.FlatDark)` | **Property:** `theme`  
**Property:** `@Html.EJS().Sparkline("container").Theme("Material").Render()` |

|Width| **Property:** `size.width`  
**Property:** `@Html.EJ().Sparkline("container").Width("300px")` | **Property:** `width`  
**Property:** `@Html.EJS().Sparkline("container").Width("300px").Render()` |

|Height| **Property:** `size.height`  
**Property:** `@Html.EJ().Sparkline("container").Height("300px")` | **Property:** `height`  
**Property:** `@Html.EJS().Sparkline("container").Height("300px").Render()` |

### Tooltip

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

|Show tooltip| **Property:** `tooltip.visible`  
**Property:** `@Html.EJ().Sparkline("container").Tooltip(tooltip => tooltip.Visible(true))` | **Property:** `tooltipSettings.visible`  
**Property:** `@Html.EJS().Sparkline("container").TooltipSettings(tooltip => tooltip.Visible(true)).Render()` |

|Background| **Property:** `tooltip.fill`  
**Property:** `@Html.EJ().Sparkline("container").Tooltip(tooltip => tooltip.Fill("red"))` | **Property:** `tooltipSettings.fill`  
**Property:** `@Html.EJS().Sparkline("container").TooltipSettings(tooltip => tooltip.Fill("red")).Render()` |

|Format| Not applicable | **Property:** `tooltipSettings.format`  
**Property:** `@Html.EJS().Sparkline("container").TooltipSettings(tooltip => tooltip.Format("{xval}: {yval}"))` | **Property:** `tooltipSettings.format`  
**Property:** `@Html.EJS().Sparkline("container").TooltipSettings(tooltip => tooltip.Format("{xval}: {yval}"))` |

|Template| **Property:** `tooltip.template`  
**Property:** `@Html.EJ().Sparkline("container").Tooltip(tooltip =>`

```

tooltip.Template("tooltip"))

<div id="tooltip"></div>
<div>#point.x#</div></br> <div>#point.y#</div></br></div>| Property:
tooltipSettings.template

 @Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.Template("tooltip")).Render()

<div id="tooltip">${x} : ${y}</div>|

|Font color| Property: tooltip.font.color

@(Html.EJ().Sparkline("container").Tooltip(tooltip => tooltip.Font(font=>font.Color("red"))))
| Property: tooltipSettings.textStyle.color

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { color="gray"};|

|Font opacity| Property: tooltip.font.opacity

@(Html.EJ().Sparkline("container").Tooltip(tooltip => tooltip.Font(font=>font.Opacity(0.5))))
| Property: tooltipSettings.textStyle.opacity

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { opacity=0.5};|

|Font size| Property: tooltip.font.size

 @(Html.EJ().Sparkline("container").Tooltip(tooltip
=> tooltip.Font(font=>font.Size('12px')))) | Property: tooltipSettings.textStyle.size

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { size="14px"};|

|Font family| Property: tooltip.font.fontFamily

@(Html.EJ().Sparkline("container").Tooltip(tooltip =>
tooltip.Font(font=>font.FontFamily('Algerian')))) | Property:
tooltipSettings.textStyle.fontFamily

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { fontFamily="Arial"};|

|Font style| Property: tooltip.font.fontStyle

@(Html.EJ().Sparkline("container").Tooltip(tooltip =>
tooltip.Font(font=>font.FontStyle('Italic')))) | Property: tooltipSettings.textStyle.fontStyle

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { fontStyle="normal"};|

|Font weight| Property: tooltip.font.fontWeight

@(Html.EJ().Sparkline("container").Tooltip(tooltip =>
tooltip.Font(font=>font.FontWeight('Lighter')))) | Property:
tooltipSettings.textStyle.fontWeight

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TextStyle(ViewBag.font)).Render()

ViewBag.font = new { fontWeight="bold"};|

|Enable track line| Not applicable | Property: tooltipSettings.trackLineSettings.visible

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TrackLineSettings(ts=>ts.Visible(true))).Render()|

|Track line color| Not applicable | Property: tooltipSettings.trackLineSettings.color

@Html.EJS().Sparkline("container").TooltipSettings(tooltip =>
tooltip.TrackLineSettings(ts=>ts.Color("red"))).Render()|

```

|Track line width| Not applicable | **Property:** *tooltipSettings.trackLineSettings.width*<br/><br/>  
 @Html.EJS().Sparkline("container").TooltipSettings(tooltip =>  
 tooltip.TrackLineSettings(ts=>ts.Width(2)).Render() |

### Rendering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Enable canvas rendering| **Property:** *enableCanvasRendering*<br/><br/>  
 @Html.EJ().Sparkline("container").EnableCanvasRendering(true)) | Not applicable |

### Localization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Localization| **Property:** *locale*<br/><br/> @Html.EJ().Sparkline("container").Locale("en-US")) |  
**Property:** *type*<br/><br/> @Html.EJS().Sparkline("container").Locale("en-US").Render() |

### Methods

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Dynamically updating sparkline| **Method:** *redraw*<br/><br/> var sparkline =  
 \$("#container").ejSparkline("instance");<br/>sparkline.redraw(); | **Method:** *refresh*<br/><br/> var  
 sparkline = document.getElementById("container").ej2\_instances[0];<br/>sparkline.refresh(); |

### Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Load| **Event:** *load*<br/><br/> @Html.EJ().Sparkline("container").Load("load")<br/><br/>function  
 load(args) { } | **Event:** *load*<br/><br/> `@Html.EJS().Sparkline("container").Load("load").Render()

## SpeedDial

### Getting Started with ASP.NET MVC SpeedDial Control

This section briefly explains about how to include [ASP.NET MVC SpeedDial] control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

**~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC SpeedDial control

Now, add the Syncfusion ASP.NET MVC SpeedDial control in `~/Views/Home/Index.cshtml` page.

**CSHTML**

```
<div id="target" style="min-height:200px; position:relative; width:300px;
border:1px solid;">

@Html.EJS().SpeedDial("speeddial").Target("#target").Content("Edit").Items(V
iewBag.datasource).Render()
</div>
```

**DEFAULT.CS**

```
public ActionResult Demo()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 Text="Copy"
 });
}
```

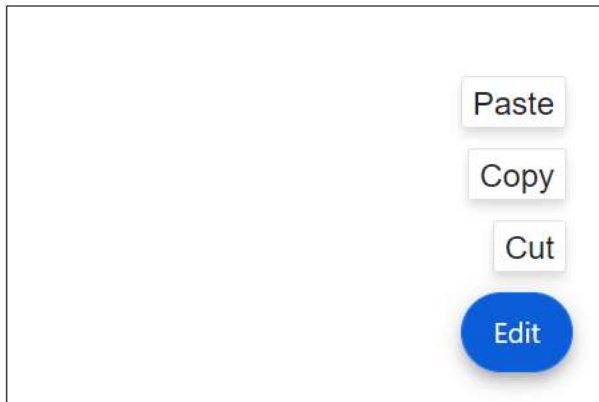

```

 items.Add(new SpeedDialItem
 {
 Text="Paste"
 });
 ViewBag.datasource = items;

 return View();
 }

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET Core SpeedDial control will be rendered in the default web browser.

### Positioning

The speed dial can be positioned using the [position](#) property. The speed dial is positioned based on the [target](#), if target is defined else positioned based on the browser viewport. The position values are TopLeft, TopCenter, TopRight, MiddleLeft, MiddleCenter, MiddleRight, BottomLeft, BottomCenter and BottomRight.

### CSHTML

```

<div id="target" style="min-height:200px; position:relative; width:300px;
border:1px solid;">

@Html.EJS().SpeedDial("element").Target("#target").Content("Edit").Position(
FabPosition.BottomLeft).Items(ViewBag.datasource).Render()
</div>

```

### POSITION.CS

```

public ActionResult Position()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut",
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy",
 Text="Copy"
 });
}

```

```

});
items.Add(new SpeedDialItem
{
 IconCss="e-icons e-paste",
 Text="Paste"
});
ViewBag.datasource = items;

return View();
}

```

### Linear and radial display modes

You can use the [Mode](#) property to either display the menu in linear order like a list or like a radial menu in radial (circular) direction.

### CSHTML

```

<div id="target" style="min-height:200px; position:relative; width:300px;
border:1px solid;">

@Html.EJS().SpeedDial("speeddial").Target("#target").Position(FabPosition.BottomLeft).Content("Edit").Mode(SpeedDialMode.Radial).OpenIconCss("e-icons e-edit").Items(ViewBag.datasource).Render()

@Html.EJS().SpeedDial("speeddial1").Target("#target").Position(FabPosition.BottomRight).Content("Edit").Mode(SpeedDialMode.Linear).OpenIconCss("e-icons e-edit").Items(ViewBag.datasourceLabel).Render()
</div>

```

### MODE.CS

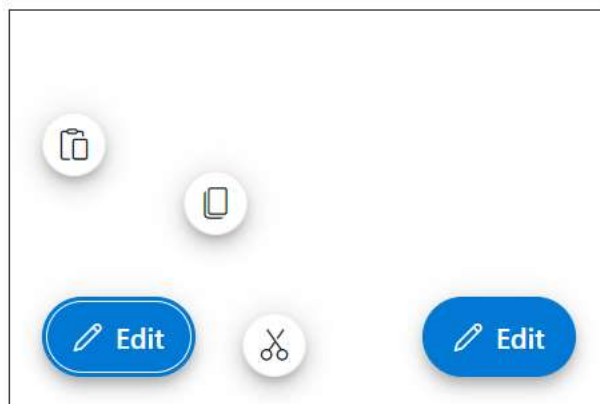

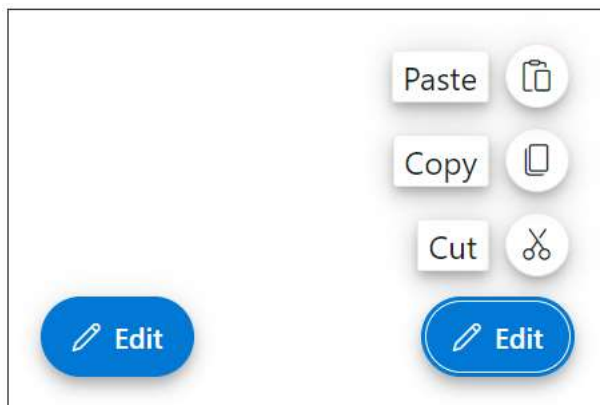

```

public ActionResult Mode()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 List<SpeedDialItem> items1 = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {

```

```
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 items1.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut",
 Text="Cut"
 });
 items1.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy",
 Text="Copy"
 });
 items1.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste",
 Text="Paste"
 });
 ViewBag.datasource = items;
 ViewBag.datasourceLabel = items1;

 return View();
}
```

### Clicked event

The speed dial control triggers the [Clicked](#) event when an action item is clicked.

You can use this event to perform the required action.

### CSHTML

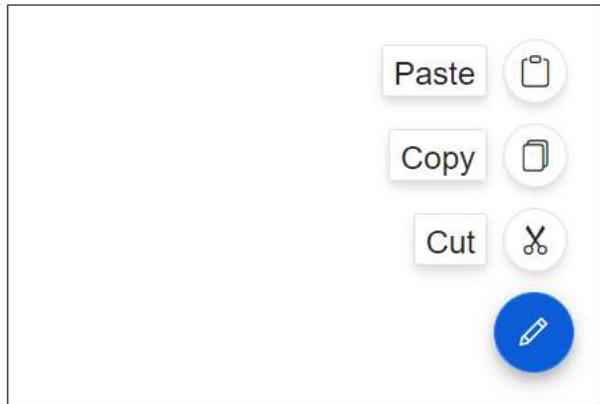

```
<div id="target" style="min-height:200px; position:relative; width:300px;
border:1px solid;">
 @Html.EJS().SpeedDial("speeddial").Target("#target").OpenIconCss("e-
icons e-
edit").Items(ViewBag.datasource).Clicked("function(args){clicked(args)}").Re
nder()
</div>
<script>
 function clicked(args) {
 alert(args.item.text + " is clicked");
 }
</script>
```

### ITEMCLICK.CS

```
public ActionResult ItemClick()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut",
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy",
 Text="Copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste",
 Text="Paste"
 });
 ViewBag.datasource = items;

 return View();
}
```

### Items in ASP.NET MVC Speed Dial Control

The action items in ASP.NET MVC Speed Dial can be added by using [Items](#) property.

| Fields                   | Type    | Description                                                                                        |
|--------------------------|---------|----------------------------------------------------------------------------------------------------|
| <a href="#">Text</a>     | string  | Defines the text content of SpeedDialItem.                                                         |
| <a href="#">IconCss</a>  | string  | Defines one or more CSS classes to include an icon or image in speed dial item.                    |
| <a href="#">Disabled</a> | boolean | Defines whether to enable or disable the SpeedDialItem.                                            |
| <a href="#">Id</a>       | string  | Defines a unique value for the SpeedDialItem which can be used to identify the item in event args. |
| <a href="#">Title</a>    | string  | Defines the title of SpeedDialItem to display tooltip.                                             |

### Icons in speeddial items

You can customize the icon and text of Speed Dial action items using [IconCss](#) and [Text](#) properties.

#### Icon only

You can show icon only in SpeedDial items by setting [IconCss](#) property. You can show tooltip on hover to show additional details to end-user by setting [Title](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpenIconCss("e-
icons e-edit").CloseIconCss("e-icons e-close").Render()
```

### ICON.CS

```
public ActionResult Icon()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Title="Cut",
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
```

```

 Title="Copy",
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 Title="Paste",
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}

```

### Text Only

You can show only text in Speed Dial items by setting [Text](#) property.

### CSHTML

```

@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Content("Edit")
.Render()

```

### TEXT.CS

```

public ActionResult Text()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 Text="Copy"
 });
 items.Add(new SpeedDialItem
 {
 Text="Paste"
 });
 ViewBag.datasource = items;

 return View();
}

```

### Icon with Text

You can show icon along with text in Speed Dial items by setting [IconCss](#) and [Text](#) properties.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpenIconCss("e-
icons e-edit").CloseIconCss("e-icons e-close").Content("Edit").Render()
```

### TEXTICON.CS

```
public ActionResult TextIcon()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut",
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy",
 Text="Copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste",
 Text="Paste"
 });
 ViewBag.datasource = items;
}
```

### Disabled

You can disable Speed Dial items by setting [Disabled](#) property as `true`.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Content("Edit")
.Render()
```

### DISABLED.CS

```
public ActionResult Icon()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text="Cut",
 Disabled=true
 });
 items.Add(new SpeedDialItem
 {
 Text="Copy"
 });
 items.Add(new SpeedDialItem
 {
 Text="Paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Animation

The Speed Dial items can be animated during the opening and closing of the popup action items. You can customize the animation's Effect, Delay, and Duration by setting [Animation](#) property. By default, Speed Dial animates with a `Fade` effect and supports all [SpeedDialAnimationEffect](#) effects.

Below example demonstrates the Speed Dial items with applied Zoom effect.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Animation(new SpeedDialAnimationSettings
{
 Effect=SpeedDialAnimationEffect.Zoom}).Items(ViewBag.datasource).OpenIconCss
("e-icons e-edit").CloseIconCss("e-icons e-close").Content("Edit").Render()
```

### ANIMATION.CS

```
public ActionResult Animation()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text = "Cut",
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 Text = "Copy",
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 Text = "Paste",
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Template

The Speed Dial supports to customize the action items and entire pop-up container by setting [ItemTemplate](#) and [PopupTemplate](#) property. For more details about templates, check out the link [here](#)

### Positions in ASP.NET MVC Speed Dial Control

The Speed dial control can be positioned anywhere on the [Target](#) using the [Position](#) property. If the [Target](#) is not defined, then Speed Dial is positioned based on the browser viewport.

The position values of Speed Dial are as follows:

- TopLeft
- TopCenter
- TopRight
- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft

- BottomCenter
- BottomRight

**CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Position(FabPosition.BottomLeft).Content("Add").Render()
```

**POSITION.CS**

```
public ActionResult Position()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text="Cut"
 });
 items.Add(new SpeedDialItem
 {
 Text="Copy"
 });
 items.Add(new SpeedDialItem
 {
 Text="Paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

**Opens on hover**

You can open the Speed Dial action items on mouse hover by setting the [OpensOnHover](#) property as true.

**CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpensOnHover(true).OpenIconCss("e-icons e-edit").CloseIconCss("e-icons e-close").Render()
```

**HOVER.CS**

```
public ActionResult Hover()
{
}
```

```

List<SpeedDialItem> items = new List<SpeedDialItem>();
items.Add(new SpeedDialItem
{
 IconCss="e-icons e-cut"
});
items.Add(new SpeedDialItem
{
 IconCss="e-icons e-copy"
});
items.Add(new SpeedDialItem
{
 IconCss="e-icons e-paste"
});
ViewBag.datasource = items;
return View();
}

```

### Programmatically show/hide

You can open/close the Speed Dial action items programmatically using **show** and **hide** methods.

### CSHTML

```

@using Syncfusion.EJ2.Buttons
<div id="target" style="height:200px; position:relative; width:300px;
border:1px solid;">

@Html.EJS().Button("showbtn").Content("Show").Click("ShowItems()").Render()

@Html.EJS().Button("hidebtn").Content("Hide").Click("HideItems()").Render()

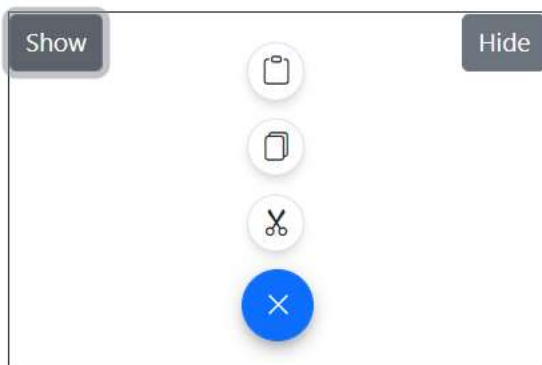

@Html.EJS().SpeedDial("speeddial").Target("#target").Items(ViewBag.datasource).Position(FabPosition.BottomCenter).OpenIconCss("e-icons e-edit").CloseIconCss("e-icons e-close").Render()
</div>
<style>
 #hidebtn{
 float:right;
 }
</style>
<script>
 function ShowItems()
 {

```

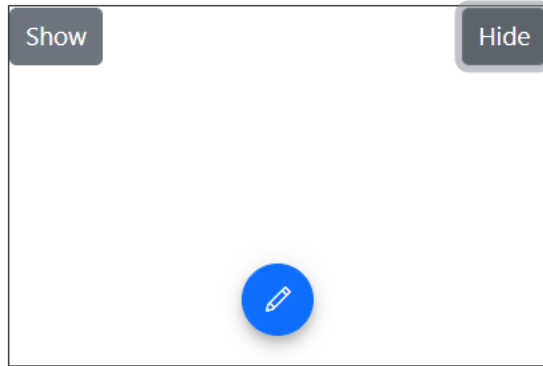

```
var speeddial =
document.getElementById('speeddial').ej2_instances[0];
speeddial.show();
}
function HideItems() {
var speeddial =
document.getElementById('speeddial').ej2_instances[0];
speeddial.hide();
}
</script>
```

## DISPLAY.CS

```
public ActionResult Display()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Programmatically refresh the position

You can refresh the position of the Speed Dial using `refreshPosition` method when the `Targetposition` is changed.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
<div id="target" style="min-height:350px; position:relative; border:1px
solid;">

@Html.EJS().Button("refresh").Content("Refresh").Click("Refresh()").Render()

@Html.EJS().SpeedDial("speeddial").Target("#target").Items(ViewBag.datasourc
e).Position(FabPosition.MiddleRight).OpenIconCss("e-icons e-
edit").CloseIconCss("e-icons e-close").Render()
</div>
<script>
 function Refresh() {
 var speeddial =
document.getElementById('speeddial').ej2_instances[0];
 document.getElementById("target").style.minHeight = "300px";
 speeddial.refreshPosition();
 }
</script>
```

### REFRESH.CS

```
public ActionResult RefreshPosition()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
```

```
return View();
}
```

## Display Modes in ASP.NET MVC Speed Dial Control

The action items in ASP.NET MVC Speed Dial can be displayed in **Linear** and **Radial** display modes by setting **Mode** property.

### Linear display mode

In **Linear** display mode, Speed Dial action items are displayed in a list-like format either horizontally or vertically. By default, Speed Dial items are displayed in **Linear** mode.

### Direction

You can open the action items on the top, left, up, and down side of the Speed Dial button by setting **Direction** property. The default value is **Auto** where the action items are displayed based on the **Position** of the Speed Dial.

The **Linear** directions of Speed Dial are as follows:

- Left - Action items are displayed on the left side of the button.
- Right - Action items are displayed on the right side of the button.
- Up - Action items are displayed on the top of the button.
- Down - Action items are displayed on the bottom of the button.
- Auto - Action items display direction auto calculated based on **Position** of the Speed Dial. If Speed Dial is position at bottom right, then action items displayed at top.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Mode(SpeedDialMode.Linear).Direction(LinearDirection.Left).OpenIconCss("e-icons e-edit").Render()
```

### LINEARMODE.CS

```
public ActionResult LinearMode()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Radial display mode (Radial Menu)

In **Radial** mode, Speed Dial action items are displayed in a circular pattern like a radial menu. For more details about radial mode, check out the link [here](#).

### Radial Menu in ASP.NET MVC Speed Dial Control

The action items in ASP.NET MVC Speed Dial can be displayed in a circular pattern like a radial menu by setting **Mode** property. You can customize the **Direction**, **StartAngle**, **EndAngle** and **Offset** by setting [SpeedDialRadialSettings](#).

### Radial Menu direction

You can open the action items in either clockwise or anticlockwise by setting **Direction** property. The default value is **Auto** where the action items are displayed based on the **Position** property of the Speed Dial.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Mode(SpeedDialMode.Radial).RadialSettings
(new SpeedDialRadialSettings {
 Direction=RadialDirection.AntiClockwise}).Items(ViewBag.datasource).OpenIcon
Css("e-icons e-edit").Render()
```

### DIRECTION.CS

```
public ActionResult Direction()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Start and end angle

You can modify the start and end angle of action items by setting [StartAngle](#) and [EndAngle](#) properties. If the angle is not defined, the action items are displayed based on the **Position** property of the Speed Dial.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Mode(SpeedDialMode.Radial).RadialSettings
(new SpeedDialRadialSettings { Direction = RadialDirection.AntiClockwise,
StartAngle=180, EndAngle=360
}).Items(ViewBag.datasource).Position(FabPosition.MiddleCenter).OpenIconCss(
"e-icons e-edit").Render()
```

### ANGLES.CS

```
public ActionResult Angles()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Offset

You can modify the offset distance between action items and Speed Dial button using [Offset](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Mode(SpeedDialMode.Radial).RadialSettings
(new SpeedDialRadialSettings { Offset="80px"
}).Items(ViewBag.datasource).OpenIconCss("e-icons e-edit").Render()
```

### OFFSET.CS

```
public ActionResult Offset()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss = "e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Template in ASP.NET MVC SpeedDial Control

This section explains available templates in Speed Dial Control and its usage.

## Item template

You can use the [ItemTemplate](#) property to set a template content for the `SpeedDialItem`.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).ItemTemplate("#itemTemplate").Position(FabPosition.BottomRight).OpenIconCss("e-icons e-edit").Content("Edit").Render()
<script type="text/x-jsrender" id="itemTemplate">
 <div class="itemlist">

 ${text}
 </div>
</script>
<style>
 .e-speeddial-li .itemlist {
 display: inherit;
 width: 100%;
 border: 1px solid transparent;
 align-items: center;
 padding: 5px;
 border-radius: 500px;
 background-color: rgba(104, 99, 104, 0.1);
 box-shadow: 0 0 4px grey;
 }
</style>
```

### ITEMTEMPLATE.CS

```
public ActionResult ItemTemplate()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 Text="Cut",
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 Text="Copy",
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 Text="Paste",
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Popup template

You can use the [PopupTemplate](#) property to set a template content for popup of SpeedDial control.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").PopupTemplate("#popupTemplate").Content("
FeedBack").Render()
<script type="text/x-jsrender" id="popupTemplate">
 <div class="speeddial-form">
 <p>Here you can customize your code.</p>
 </div>
</script>
<style>
 .speeddial-form {
 width: 200px;
 height: 80px;
 text-align: center;
 border-radius: 15px;
 box-shadow: rgb(0 0 0 / 10%) 0px 10px 15px -3px, rgb(0 0 0 / 5%) 0px
4px 6px -2px;
 background: #f5f5f5;
 padding: 15px;
 }
</style>
```

Here you can  
customize your code.

### Styles in ASP.NET MVC SpeedDial Control

This section briefs different ways to style SpeedDial Control.

### SpeedDial button

You can customize the icon and text of ASP.NET MVC SpeedDial using [OpenIconCss](#), [CloseIconCss](#) and [Content](#) properties.

#### *SpeedDial with Icon*

You can use the [OpenIconCss](#) and [CloseIconCss](#) property to show icons in speed dial button. You can also show tooltip on hover to show additional details to end-user by setting `title` attribute.

#### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpenIconCss("e-icons e-edit").CloseIconCss("e-icons e-close").Render()
```

#### **ICON.CS**

```
public ActionResult Icon()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

#### *SpeedDial with Text*

You can show text only in SpeedDial button by setting [Content](#) property without setting icon properties.

#### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Content("Edit").Render()
```

**TEXT.CS**

```

public ActionResult Text()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}

```

*SpeedDial with Icon and Text*

You can show the icon and text of ASP.NET MVC Speed Dial Button using [OpenIconCss](#), [CloseIconCss](#) and [Content](#) properties together.

**CSHTML**

```

@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpenIconCss("e-
icons e-edit").CloseIconCss("e-icons e-close").Content("Edit").Render()

```

**ICONTEXT.CS**

```

public ActionResult IconText()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
}

```

```
items.Add(new SpeedDialItem
{
 IconCss="e-icons e-paste"
});
ViewBag.datasource = items;
return View();
}
```

### Disabled

You can enable or disable the Speed Dial Control using [Disabled](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Disabled(true).
Content("Edit").Render()
```

### DISABLED.CS

```
public ActionResult Disabled()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### CssClass

The ASP.NET MVC Speed Dial supports the following predefined styles that can be defined using the [CssClass](#) property. You can customize by setting the `CssClass` property with the below defined class.

| CssClass  | Description                                             |
|-----------|---------------------------------------------------------|
| -----     | -----                                                   |
| e-primary | Used to represent a primary action.                     |
| e-outline | Used to represent an appearance of button with outline. |
| e-info    | Used to represent an informative action.                |
| e-success | Used to represent a positive action.                    |
| e-warning | Used to represent an action with caution.               |
| e-danger  | Used to represent a negative action.                    |

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).CssClass("e-
warning").Content("Edit").Render()
```

### CSSCLASS.CS

```
public ActionResult CssClass()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

## Visible

You can set the Speed Dial Control to visible/hidden state using **Visible** property.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Visible(false).
Content("Edit").Render()
```

### VISIBLE.CS

```
public ActionResult Visible()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

## Tooltip

You can show tooltip on hover to show additional details to end-user by setting **Title** property to speed dial items.

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Content("Edit")
.Render()
```

### TOOLTIP.CS

```
public ActionResult Tooltip()
{
```

```

List<SpeedDialItem> items = new List<SpeedDialItem>();
items.Add(new SpeedDialItem
{
 Title="Cut",
 IconCss="e-icons e-cut"
});
items.Add(new SpeedDialItem
{
 Title="Copy",
 IconCss="e-icons e-copy"
});
items.Add(new SpeedDialItem
{
 Title="Paste",
 IconCss="e-icons e-paste"
});
ViewBag.datasource = items;
return View();
}

```

### Opens on hover

You can use [OpensOnHover](#) property to open actions items on hover itself. By default action items displayed only when clicking the speed dial button.

### CSHTML

```

@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).OpensOnHover(true).Content("Edit").Render()

```

### HOVER.CS

```

public ActionResult Hover()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}

```

### Modal in ASP.NET MVC SpeedDial Control

You can use the [Modal](#) property to set the Speed Dial as modal which adds an overlay to prevent the background interaction.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").Items(ViewBag.datasource).Modal(true).Position(FabPosition.BottomRight).OpenIconCss("e-icons e-edit").Render()
```

#### MODAL.CS

```
public ActionResult Modal()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

## Events in ASP.NET MVC SpeedDial Control

This section describes the Speed Dial events that will be triggered when appropriate actions are performed. The following events are available in the Speed Dial Control.

### Clicked event

The speed dial control triggers the [Clicked](#) event when an action item is clicked. You can use this event to perform the required action.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").Clicked("ClickedEvent").Items(ViewBag.datasource).Render()
<script>
 function ClickedEvent(args) {
 //Your required action here
 }
</script>
```

#### CLICKEDEVENT.CS

```
public ActionResult ItemClick()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Created

The speed dial control triggers the [Created](#) event when SpeedDial control rendering is completed.

#### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").Created("CreatedEvent").Items(ViewBag.datasource).Render()
<script>
 function CreatedEvent() {
 //Your required action here
 }
</script>
```

**CREATEDEVENT.CS**

```
public ActionResult ItemClick()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

**Before open**

The speed dial control triggers the [BeforeOpen](#) event before the SpeedDial popup is opened.

**CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").BeforeOpen("BeforeOpenEvent").Items(ViewBag.datasource).Render()
<script>
 function BeforeOpenEvent() {
 //Your required action here
 }
</script>
```

**BEFOREOPENEVENT.CS**

```
public ActionResult BeforeOpenEvent()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### On open

The speed dial control triggers the [OnOpen](#) event when SpeedDial popup is opened.

#### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").OnOpen("OnOpenEvent").Items(ViewBag.datasource).Render()
<script>
 function OnOpenEvent() {
 //Your required action here
 }
</script>
```

#### **ONOPENEVENT.CS**

```
public ActionResult OnOpenEvent()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });

 ViewBag.datasource = items;
 return View();
}
```

### Before close

The speed dial control triggers the [BeforeClose](#) event before the SpeedDial popup is closed.

#### **CSHTML**

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").BeforeClose("BeforeCloseEvent").Items(ViewBag.datasource).Render()
<script>
 function BeforeCloseEvent() {
 //Your required action here
 }
</script>
```

#### **BEFORECLOSEEVENT.CS**

```
public ActionResult BeforeCloseEvent()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
```

```

 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
 }

```

### On close

The speed dial control triggers the [OnClose](#) event when SpeedDial popup is closed.

### CSHTML

```

@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").OnClose("OnCloseEvent").Items(ViewBag.datasource).Render()
<script>
 function OnCloseEvent() {
 //Your required action here
 }
</script>

```

### ONCLOSEEVENT.CS

```

public ActionResult OnCloseEvent()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}

```

### Before item render

The speed dial control triggers the [BeforeItemRender](#) event for each `SpeedDialItem` once its rendered..

### CSHTML

```
@using Syncfusion.EJ2.Buttons
@Html.EJS().SpeedDial("speeddial").OpenIconCss("e-icons e-
edit").BeforeItemRender("BeforeItemRenderEvent").Items(ViewBag.datasource).R
ender()
<script>
 function BeforeItemRenderEvent() {
 //Your required action here
 }
</script>
```

### ITEMRENDEREVENT.CS

```
public ActionResult ItemRenderEvent()
{
 List<SpeedDialItem> items = new List<SpeedDialItem>();
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-cut"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-copy"
 });
 items.Add(new SpeedDialItem
 {
 IconCss="e-icons e-paste"
 });
 ViewBag.datasource = items;
 return View();
}
```

### Accessibility in ASP.NET MVC SpeedDial Control

Accessibility is achieved in the Speed Dial control through WAI-ARIA standard and keyboard navigations. The Speed Dial control can be effectively accessed through assistive technologies such as screen readers.

#### Keyboard interaction

The Speed Dial control is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|-----|-----|

| Enter | Open/close the menu. If a SpeedDial item is focused, should triggers the clicked event for the item. |

| ArrowUp | Navigates up or to the previous menu item. |

| ArrowLeft | Navigates left or to the previous menu item. |

| ArrowDown- | Navigates down or to the previous menu item. |

| ArrowRight | Navigates right or to the previous menu item. |

| Home | Navigates to the first menu item. |

| End | Navigates to the last menu item. |

| Esc | Closes the menu. |

### ARIA attributes

The following ARIA attributes are applicable for SpeedDial Control based on its state.

| Properties | Functionality |

| ----- | ----- |

| role | This attribute is added to the input element to describe the actual role. |

| aria-label | Attribute provides the text label with some default description for the SpeedDial and its items. |

| aria-expanded | It indicates whether the SpeedDial current state is expanded or collapsed. |

| aria-haspopup | It indicates whether the SpeedDial has popup items or not. |

| aria-controls | Attribute is set to the SpeedDial button and it points to the corresponding content. |

| aria-disabled | It indicates the disabled state of the SpeedDial and its items. |

## Spinner

### Getting Started with ASP.NET MVC Spinner Control

This section briefly explains about how to include ASP.NET MVC Spinner control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
`
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
`
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Spinner Control

Initialize the Spinner using `createSpinner` method and show/hide the spinner using `showSpinner` and `hideSpinner` methods accordingly. Set the target to the spinner to render it based on specific target.

Now, add the `Spinner` using Syncfusion Essential JavaScript library in `~/Views/Home/Index.cshtml` page.

```
`cshtml
....
<div id="container" style="position:center; height: 300px;">
```

<p>If you click the <b>Show Spinner</b> button you can create the <b>ASP.NET MVC Spinner component</b> </p>

```
<button id="showSpinnerButton">Show Spinner</button>
```

```
</div>
```

```
<script>
```

```
var spinTarget = document.getElementById('container');
```

```
ej.popups.createSpinner({
```

```
target: spinTarget
```

```
});
```

```
// Attach a click event handler to the "Show Spinner" button
```

```
document.getElementById('showSpinnerButton').addEventListener('click', function () {
```

```
ej.popups.showSpinner(spinTarget);
```

```
setInterval(function () {
```

```
//hideSpinner() method is used to hide the Spinner
```

```
ej.popups.hideSpinner(spinTarget);
```

```
, 5000);
```

```
});
```

```
</script>
```

```
,
```

- Show and hide this spinner by using `showSpinner` and `hideSpinner` methods for loading in your page.

### Set the template to the Spinner

You can use custom templates on the Spinner instead of the default Spinner by specifying the template in the `setSpinner` method.

The following steps explain you on how to define template for Spinner.

- Pass your custom template to the `setSpinner` method like as below.

```
`typescript
```

```
// Specify the template content to be displayed in the Spinner
```

```
setSpinner({ template: '<div style="width:100%;height:100%" class="custom-rolling"><div></div></div>' });
```

```
,
```

**Note:** You should set the template to the Spinner before creating the respective Essential JS 2 component. Also, until we replace `setSpinner` template, the further Essential JS 2 component rendering is created with given template only.

- Now, render the Essential JS 2 component. It's render the Spinner with the template specified in the `setSpinner` method.

**Note:** In the below sample, we have rendered the Grid component with custom Spinner using `setSpinner` method. You have to define the styles for the template in style section.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Grid
<div class="col-lg-12 control-section">
 <div class="e-sample-resize-container">

@Html.EJ().Grid("ej2Grid1").DataSource(ViewBag.datasources).Created("grid1Created").AllowPaging(true).Columns(new List<GridColumn> {
 new GridColumn { Field = "OrderID", HeaderText = "Order ID",
Width = "120" },
 new GridColumn { Field = "CustomerID", HeaderText = "Customer
Name", Width = "150" },
 new GridColumn { Field = "OrderDate", HeaderText = "Order Date",
Width = "130", Format="yMd" },
 new GridColumn { Field = "Freight", HeaderText = "Freight",
Width = "120" },
 new GridColumn { Field = "ShippedDate", HeaderText = "Shipped
Date", Width = "140", Format="yMd" },
 new GridColumn { Field = "ShipCountry", HeaderText = "Ship
Country", Width = "150" },
}).Render()

@Html.EJ().Grid("ej2Grid2").DataSource(ViewBag.datasources).Created("grid2Created").AllowPaging(true).Columns(new List<GridColumn> {
 new GridColumn { Field = "OrderID", HeaderText = "Order ID",
Width = "120" },
 new GridColumn { Field = "CustomerID", HeaderText = "Customer
Name", Width = "150" },
 new GridColumn { Field = "OrderDate", HeaderText = "Order Date",
Width = "130", Format="yMd" },
 new GridColumn { Field = "Freight", HeaderText = "Freight",
Width = "120" },
 new GridColumn { Field = "ShippedDate", HeaderText = "Shipped
Date", Width = "140", Format="yMd" },
 new GridColumn { Field = "ShipCountry", HeaderText = "Ship
Country", Width = "150" },
}).Render()
 </div>
</div>
<style>
#container {
```

```

 visibility: hidden;
 }
 #loader {
 color: #008cff;
 font-family: 'Helvetica Neue','calibiri';
 font-size: 14px;

## TEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using Syncfusion.EJ2.Grid;
namespace WebApplication1.Controllers
{
 public partial class SpinnerController : Controller
 {
 public static List<OrderDetails> order = new List<OrderDetails>();
 public IActionResult template()
 {
 if (order.Count() == 0)
 BindDataSource();
 ViewBag.datasource = order;
 return View();
 }
 public void BindDataSource()
 {
 int code = 10000;
 for (int i = 1; i < 10; i++)
 {
 order.Add(new OrderDetails(code + 1, "ALFKI", i + 0, 2.3 *
i, false, new DateTime(1991, 05, 15), "Berlin", "Simons bistro", "Denmark",
new DateTime(1996, 7, 16), "Kirchgasse 6"));
 }
 }
 }
}

```

```

 this.Freight = Freight;
 this.ShipCity = ShipCity;
 this.Verified = Verified;
 this.OrderDate = OrderDate;
 this.ShipName = ShipName;
 this.ShipCountry = ShipCountry;
 this.ShippedDate = ShippedDate;
 this.ShipAddress = ShipAddress;
 }
 public int? OrderID { get; set; }
 public string CustomerID { get; set; }
 public int? EmployeeID { get; set; }
 public double? Freight { get; set; }
 public string ShipCity { get; set; }
 public bool Verified { get; set; }
 public DateTime OrderDate { get; set; }
 public string ShipName { get; set; }
 public string ShipCountry { get; set; }
 public DateTime ShippedDate { get; set; }
 public string ShipAddress { get; set; }
}
}
}

```

## Change the type of the Spinner

By default, the Spinner is loaded in the applicable Essential JS 2 component based on the theme imported into the page. Based on the theme, the type is set to the Spinner.

The available types are:

- Material
- Fabric
- Bootstrap

You can change the Essential JS 2 component spinner type by passing the type of the spinner as parameter to the `setSpinner` method like as below.

```
`typescript
// Specify the type of the Spinner to be displayed
setSpinner({ type: 'Bootstrap'});
`
```

**Note:** After Essential JS 2 component creation only, you can change the Essential JS 2 component spinner type.

### CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Grid;
<div class="col-lg-12 control-section">
 <div class="e-sample-resize-container">

@Html.EJ().Grid("ej2Grid").DataSource(ViewBag.datasources).Created("gridCreated").AllowPaging(true).Columns(new List<GridColumn> {
 new GridColumn { Field = "OrderID", HeaderText = "Order ID",
Width = "120" },
 new GridColumn { Field = "CustomerID", HeaderText = "Customer
Name", Width = "150" },
 new GridColumn { Field = "OrderDate", HeaderText = "Order Date",
Width = "130", Format="yMd" },
 new GridColumn { Field = "Freight", HeaderText = "Freight",
Width = "120" },
 new GridColumn { Field = "ShippedDate", HeaderText = "Shipped
Date", Width = "140", Format="yMd" },
 new GridColumn { Field = "ShipCountry", HeaderText = "Ship
Country", Width = "150" },
}).Render()
 </div>
</div>
<style>
 #container {
 visibility: hidden;
 }
 #loader {
 color: #008cff;
 font-family: 'Helvetica Neue','calibiri';
 font-size: 14px;
 height: 40px;
```

```

 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
 }
 .wrap {
 margin: 0 auto;
 width: 240px;
 }
 h5 {
 font-weight: bold;
 text-align: center;
 }
</style>
<script type="text/javascript">
 function gridCreated() {
 var grid = document.getElementById("ej2Grid").ej2_instances[0];
 grid.hideSpinner = () => true;
 ej.popups.setSpinner({ type: 'Bootstrap' });
 }
</script>

```

## TYPE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using Syncfusion.EJ2.Grid;
namespace WebApplication1.Controllers
{
 public partial class SpinnerController : Controller
 {

```

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the spinner

Use the following CSS to customize the spinner stroke color.

### *Material theme*

`CSS

```
.e-spinner-pane .e-spinner-inner .e-spin-material {
stroke: green;
}
,
```

### *Fabric theme*

`CSS

```
.e-spinner-pane .e-spinner-inner .e-spin-fabric {
stroke: green;
}
,
```

### *Bootstrap theme*

`CSS

```
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap {
fill: green;
stroke: green;
}
,
```

### *Bootstrap4 theme*

`CSS

```
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap4 {
stroke: green;
}
,
```

### *High Contrast theme*

`CSS

```
.e-spinner-pane .e-spinner-inner .e-spin-high-contrast .e-path-arc {
stroke: green;
}
,
```

## How To

### Real Time Example Using Spinner

In the following sample, you can see the Spinner when expanding the collapsed swimlane rows in Kanban control. The Spinner indicates the loading data while fetching the data.

**CSHTML**

```

@using Syncfusion.EJ2.Popups
<div id="container" style="position: relative; height: 300px;">

@Html.EJS().Kanban("kanban").KeyField("Status").ActionBegin("actionBegin").D
ataBound("onDataBound").DataSource((IEnumerable<object>
) ViewBag.data).Columns(col =>
{
 col.HeaderText("To Do").KeyField("Open").Add();
 col.HeaderText("In Progress").KeyField("InProgress").Add();
 col.HeaderText("Testing").KeyField("Testing").Add();
 col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card =>
{
 card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim =>
{
 swim.KeyField("Assignee");
}).Render()
</div>
<script>
var spinTarget = document.getElementById('container');
ej.popups.createSpinner({
 target: spinTarget
});
var flag = true;
function onDataBound() {
 if (flag) {
 var ele = document.querySelectorAll(".e-icons.e-swimlane-row-
expand");
 for (var i = 0; i < ele.length; i++) {
 ele[i].click();
 }
 flag = false;
 }
}
function actionBegin(args) {
 if (args.requestType === "rowExpandCollapse") {
 ej.popups.showSpinner(spinTarget);
 setInterval(function () {
 //hideSpinner() method is used to hide the Spinner
 ej.popups.hideSpinner(spinTarget);
 }, 5000);
 }
}
</script>

```

**CONTROLLER.CS**

```

public class HomeController : Controller
{

the IE browser.", Type = "Story", Priority = "Normal", Tags = "Testing",
Estimate = 5.5, Assignee = "Janet Leverling", RankId = 10 });

 return TaskDetails;
 }
}

```

Output will be like the below.

## Split Button

### Getting Started with ASP.NET MVC Split Button Control

This section briefly explains about how to include [ASP.NET MVC Split Button](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
,
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/\_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/\_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Split Button control

Now, add the Syncfusion ASP.NET MVC Split Button control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@model List<object>
@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)Model).Render()
```

#### HOMECONTROLLER.CS

```
public ActionResult Index()
{
 List<object> items = new List<object>();
```

```

items.Add(new
{
 text = "Cut"
});
items.Add(new
{
 text = "Copy"
});
items.Add(new
{
 text = "Paste"
});
return View(items);
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Split Button control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

See also

- [SplitButton with icons](#)

## Icons in SplitButton Control

### SplitButton Icons

SplitButton can have an icon to provide the visual representation of the action. To place the icon on a SplitButton, set the [IconCss](#) property to `e-icons` with the required icon CSS. By default, the icon is positioned to the left side of the SplitButton. You can customize the icon's position by using the [IconPosition](#) property.

The following example illustrates how to place icon in SplitButton component.

### CSHTML

```

@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)ViewBag.items).IconCss("e-sb-icons e-paste").Render()
@Html.EJS().SplitButton("element_1").Content("Paste").Items((IEnumerable<object>)ViewBag.items).IconCss("e-sb-icons e-paste").IconPosition(Syncfusion.EJ2.SplitButtons.SplitButtonIconPosition.Top).Render()
<style>
 .e-split-btn-wrapper{
 margin: 20px 20px 5px 5px;
 }

 /* csslint ignore:start */
 @@font-face {
 font-family: 'ddb-icons';
 src:

```

```

**ICONBUTTON.CS**

```
using System;
```

```

using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
 public class SplitButtonController : Controller
 {
 public ActionResult IconButton()
 {
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Cut"
 });
 items.Add(new
 {
 text = "Copy"
 });
 items.Add(new
 {
 text = "Paste"
 });
 ViewBag.items = items;
 return View();
 }
 }
}

```

**Note:** The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element.

You can also use third party icons on the SplitButton using the [IconCss](#) property.

### Vertical Button

Vertical Button in SplitButton can be achieved by adding **e-vertical** class using [CssClass](#) property.

The following example illustrates how to vertical support in SplitButton component.

### CSHTML

```

@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)ViewBag.items).IconCss("e-sb-icons e-paste").CssClass("e-vertical").Render()
<style>
 .e-split-btn-wrapper{
 margin: 20px 20px 5px 5px;
 }

 /* csslint ignore:start */

- [SplitButton popup with icons](#)

## Popup Items

### Icons

The Popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for Cut, Copy, Paste, Undo and Redo menu items are added using the iconCss property.

### CSHTML

```

@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)ViewBag.items).IconCss("e-sb-icons e-paste").Render()
<style>
 .e-split-btn-wrapper{
 margin: 20px 20px 5px 5px;
 }

**POPUPICONS.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
 public class SplitButtonController : Controller
 {
 public ActionResult PopupIcons()
 {
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Cut",
 iconCss = "e-sb-icons e-cut"
 });
 items.Add(new
 {
 text = "Copy",
 iconCss = "e-icons e-copy"
 });
 items.Add(new
 {
 text = "Paste",
 iconCss = "e-sb-icons e-paste"
 });
 ViewBag.items = items;
 return View();
 }
 }
}

```

## Template

*Item Templating*

Popup items can be customized by using the [beforeItemRender](#) event. The item render event triggers while rendering each Popup action item. The event argument will be used to identify the action item and customize it based on the requirement.

**CSHTML**

```

@Html.EJS().SplitButton("element").Items((IEnumerable<object>)ViewBag.items)
.IconCss("e-sb-icons e-paste").BeforeItemRender("beforeItemRender").Render()
<script>
 function beforeItemRender(args) {
 if (args.item.text === 'Edit') {
 args.element.innerHTML = '<div>Paste
Text<div>Provides option to paste only the
selected
text.</div></div>';
 args.element.style.height = '80px';
 var span = args.element.children[0];
 span.setAttribute('class', 'e-cm-icons e-pastetext e-align');
 }
 }

```

```

 var div = args.element.children[1];
 div.setAttribute('class', 'e-div-align');
 } else {
 args.element.innerHTML = '<div>Paste
Special<div>Provides options to paste formulas,
 values, comments,
validations etc...</div></div>';
 args.element.style.height = '80px';
 var span = args.element.children[0];
 span.setAttribute('class', 'e-cm-icons e-pastespecial e-align');
 var div = args.element.children[1];
 div.setAttribute('class', 'e-div-align');
 }
}
</script>

### ITEMTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
 public class SplitButtonController : Controller
 {
 public ActionResult ItemTemplate()
 {
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Edit"
 });
 items.Add(new
 {
 text = "Cut"
 });
 ViewBag.items = items;
 return View();
 }
 }
}

```

*Popup Templating*

The whole popup can be customized as per the requirement. In the following example, the popup can be customized by handling it in [target](#) property.

**CSHTML**

```
<div id='dropdowntarget' style='width:112px;'>
 <div id= "first">
 <div id='black'></div>
 <div id='red'></div>
 <div id='green'></div>
 <div id='gray'></div>
 <div id='blue'></div>
 <div id='violet'></div>
 <div id='brown'></div>
 <div id='darkgoldenrod'></div>
 <div id='aquamarine'></div>
 </div>
</div>
@Html.EJS().SplitButton("element").Target("#dropdowntarget").IconCss("e-sb-
icons e-color").Render()
<style>
 .shortcut {
 float: right;
 margin-top: 9px;
 padding-left: 30px;
 }
 /* csslint ignore:start */
 @@font-face {

### Accessibility in Split Button Controls

The Split button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Split button component is outlined below.

| Accessibility Criteria | Compatibility |

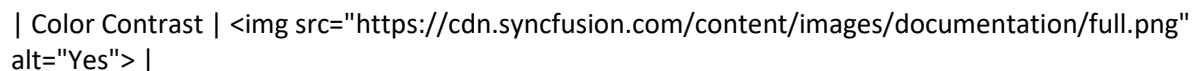

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  alt="Yes" > |

| Screen Reader Support |  alt="Yes" > |

| Right-To-Left Support |  alt="Yes" > |

| Color Contrast |  alt="Yes" > |

| Mobile Device Support |  alt="Yes" > |

| Keyboard Navigation Support |  alt="Yes" > |

| [Accessibility Checker](#) Validation |  alt="Yes" > |

| [Axe-core](#) Accessibility Validation |  alt="Yes" > |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Split button component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the Split button component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Split button component as **button**, Split button popup as **menu**, and the Split button popup action items as **menuitem**. |

| **aria-haspopup** | Indicates the availability and type of interactive Split button popup element. |

| **aria-expanded** | Indicates whether the Split button popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Split button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Split button component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | Closes the opened popup. |

| **Enter** | Opens the popup, or activates the highlighted item and closes the popup. |

| **Spacer** | Opens the popup. |

| **Up** | Navigates up or to the previous action item. |

| **Down** | Navigates down or to the next action item. |

| **Alt + Up Arrow** | Closes the popup. |

| **Alt + Down Arrow** | Opens the popup. |

### Ensuring accessibility

The Split button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Split button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Split button component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET Core controls](#)

## Styles and Appearances

To modify the SplitButton appearance, you need to override the default CSS of SplitButton component. Find the list of CSS classes and its corresponding section in SplitButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

### CSS Class | Purpose of Class

|.e-dropdown-btn|To customize the button part in splitbutton

|.e-split-btn|To customize the dropdown part in split button

|.e-dropdown-popup ul .e-item|To customize the progress button list items

|.e-dropdown-popup ul .e-item .e-menu-icon |To customize the progress button list items icon

## How To

### Create right-to-left SplitButton

SplitButton component has RTL support. This can be achieved by setting [enableRtl](#) as **true**.

The following example illustrates how to enable right-to-left support in SplitButton component.

### CSHTML

```
@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>
t>)ViewBag.items).IconCss("e-sb e-sigma").EnableRtl(true).Render()
<style>
/* csslint ignore:start */

## RTL.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
 public class SplitButtonController : Controller
 {
 public ActionResult Rtl()
 {
 // define the array of JSON
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Autosum"
 });
 items.Add(new
 {
 text = "Average"
 });
 items.Add(new
 {
 text = "Count numbers"
 });
 items.Add(new

```

```

 {
 text = "Min"
 });
 items.Add(new
 {
 text = "Max"
 });
 ViewBag.items = items;
 return View();
 }
}

```

### Group items in Popup

Grouped items are possible in SplitButton by templating entire popup with ListView. Check [ListView grouping](#) and create such items. Create ListView with id `listview` and provide element of the ListView as target of SplitButton to render it in popup area.

In this following example, ListView is created and its element is set as [target](#) for SplitButton.

### CSHTML

```

@using Syncfusion.EJ2.Lists;
@Html.EJS().ListView("listview").Enable(true).DataSource((IEnumerable<object>)ViewBag.items).Fields(new ListViewFieldSettings { GroupBy = "category" })
.SortOrder(SortOrder.Descending).Render()
@Html.EJS().SplitButton("element").Content("Clipboard").Target("#listview").Render()
<style>
 .e-split-btn-wrapper{
 margin: 20px 20px 5px 5px;
 }
</style>

```

### LISTVIEW.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using Syncfusion.EJ2.SplitButtons;
namespace EJ2CoreSampleBrowser.Controllers.Button
{
 public partial class ButtonController : Controller
 {
 public ActionResult SplitButton()
 {
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Cut",
 category = "Basic"
 });
 items.Add(new

```

```

 {
 text = "Copy",
 category = "Basic"
 });
 items.Add(new
 {
 text = "Paste",
 category = "Basic"
 });
 items.Add(new
 {
 text = "Paste as Formula",
 category = "Advanced"
 });
 items.Add(new
 {
 text = "Paste as Hyperlink",
 category = "Advanced"
 });
 ViewBag.items = items;
 return View();
 }
}

```

### Open a dialog on popup item click

This section explains about how to open a dialog on SplitButton popup item click. This can be achieved by handling dialog open in [select](#) event of the SplitButton.

In the following example, Dialog will open while selecting **Update...** item:

### CSHTML

```

@Html.EJS().Dialog("dialog").Header("Software Update").Content("Are you sure
want to
update?").Width("250px").Visible(false).Buttons(ViewBag.button).Render()
@Html.EJS().SplitButton("element").Content("Help").Items((IEnumerable<object
>)ViewBag.items).Select("onSelect").Render()
<script>
 function onSelect(args) {
 if (args.item.text === 'Update...') {
 ej.base.getComponent(document.getElementById('dialog'),
"dialog").show();
 }
 }
 function okBtnClick() {
 ej.base.getComponent(document.getElementById('dialog'),
"dialog").hide();
 }
 function cancelBtnClick() {
 ej.base.getComponent(document.getElementById('dialog'),
"dialog").hide();
 }
</script>
<style>
.e-split-btn-wrapper{

```

```
margin: 20px 20px 5px 5px;
}
</style>
```

### DIALOGBUTTON-CORE.CS

```
public ActionResult DialogButton()
{
 List<object> buttons = new List<object>() { };
 buttons.Add(new
 {
 isPrimary = true,
 cssClass = "e-flat",
 content = "ok",
 click = "okBtnClick"
 });
 buttons.Add(new
 {
 isPrimary = true,
 cssClass = "e-flat",
 content = "cancel",
 click = "cancelBtnClick"
 });
 ViewBag.DialogButtons = buttons;
 return View();
}
```

### Set the disabled state

SplitButton component can be enabled or disabled by disabled property. To disable SplitButton component, set the [disabled](#) property as true.

The following example illustrates how to set the disable state in SplitButton component.

### CSHTML

```
@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)ViewBag.items).IconCss("e-sb e-sigma").Disabled(true).Render()
<style>
/* csslint ignore:start */
@@font-face {

```

## DISABLED.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
 public class SplitButtonController : Controller
 {
 public ActionResult Disabled()
 {
 // Define the array of JSON
 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Autosum"
 });
 items.Add(new
 {
 text = "Average"
 });
 items.Add(new

```

```

 {
 text = "Count numbers"
 });
 items.Add(new
 {
 text = "Min"
 });
 items.Add(new
 {
 text = "Max"
 });
 ViewBag.items = items;
 return View();
 }
}

```

### Underline a character in a text

To underline a particular character in a text, it can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

In the following example, **C** is underlined in the text **Copy**:

#### CSHTML

```

@Html.EJS().SplitButton("element").Content("Paste").Items((IEnumerable<object>)ViewBag.items).BeforeItemRender("itemRender").Render()
<script>
 function itemRender(args){
 if (args.item.text === 'Copy') {
 //To underline a particular text.
 args.element.innerHTML = '<u>C</u>opy';
 }
 }
</script>
<style>
 .e-split-btn-wrapper{

{
 public partial class ButtonController : Controller
 {
 public ActionResult SplitButton()
 {

```

```

 List<object> items = new List<object>();
 items.Add(new
 {
 text = "Cut"
 });
 items.Add(new
 {
 text = "Copy"
 });
 items.Add(new
 {
 text = "Paste"
 });
 ViewBag.items = items;
 return View();
 }
}

```

## Migration from Essential JS 1

This article describes the API migration process of SplitButton component from Essential JS 1 to Essential JS 2.

### Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Specifies the text of the splitbutton | **Property:** *text* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login") | **Property:** *content* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("Paste").Render() |

| Popup content | **Property:** *target* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target") | **Property:** *target*

<br/><br/> @Html.EJS().SplitButton("splitbutton").Content("Paste").Target("#target").Render() |

| Popup items | Not applicable | **Property:** *items* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("Paste").Items("ViewBag.items").Render() |

| Arrow position | **Property:** *arrowPosition* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ArrowPosition("@ArrowPosition.Left") | Not applicable |

| Button mode | **Property:** *buttonMode* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ButtonMode("@ButtonMode.Dropdown") | Not applicable |

| Content type | **Property:** *contentType* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ContentType("TextOnly")

| Not applicable |

| Icons | **Property:** *prefixIcon* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ContentType("TextAndImage").PrefixIcon("e-icon e-handup") | **Property:** *iconCss* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("Paste").Target("#target").IconCss("e-icons e-paste").Render() |

| Icon position | **Property:** *imagePosition* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ContentType("TextAndImage").PrefixIcon("e-icon e-handup").ImagePosition("@ImagePosition.ImageTop") | **Property:** *iconPosition* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("Paste").Item("ViewBag.items").IconCss("e-icons e-paste").IconPosition(Syncfusion.EJ2.SplitButtons.SplitButtonIconPosition.Top).Render() |

| Secondary icon | **Property:** *suffixIcon* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("login").Target("#target").ContentType("TextAndImage").PrefixIcon("e-icon e-handup").SuffixIcon("e-icon e-palette") | Not applicable |

| Adding custom class | **Property:** *cssClass* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").CssClass("custom-class") | **Property:** *cssClass* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").CssClass("custom-class").Render() |

| Disabled state | **Property:** *enabled* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Enabled(false) |

**Property:** *disabled* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Target("#target").Disabled(true).Render() |

| RTL | **Property:** *enableRTL* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").EnableRTL(true) |

**Property:** *enableRtl* <br/><br/>

@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").EnableRtl(true).Render() |

| Height | **Property:** *height* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Height(30) | Not applicable |

| Width | **Property:** *width* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Width(100) | Not applicable |

| HTML attributes | **Property:** *htmlAttributes* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").HtmlAttributes("")

| Not applicable |

| Show rounded corner | **Property:** *showRoundedCorner* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").ShowRoundedCorner(true) | Not applicable |

| Size | **Property:** *size* <br/><br/>

@Html.EJ().SplitButton("splitbutton").Text("Small").Target("#target").Size(ButtonSize.Small) |

**Property:** *cssClass* <br/><br/>

```
@Html.EJS().SplitButton("splitbutton").Content("Small").Item("ViewBag.items").IconCss("e-small").Render() |
```

## Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy method | **Method:** *destroy* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target")
var splitButton = $("#splitbutton").data("ejSplitButton");
splitButton.destroy(); | Method: destroy

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Render()
var splitButton = document.getElementById("splitbutton").ej2_instances[0];
splitButton.destroy(); |
```

| Disable method | **Method:** *disable* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target")
var splitButton = $("#splitbutton").data("ejSplitButton");
splitButton.disable(); | Not applicable |
```

| Enable method | **Method:** *enable* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target")
var splitButton = $("#splitbutton").data("ejSplitButton");
splitButton.enable(); | Not applicable |
```

| Hide popup | **Method:** *hide* <br/><br/>

```
<@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target")
var splitButton = $("#splitbutton").data("ejSplitButton");
splitButton.hide(); | Method: toggle

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Render()
var splitButton = document.getElementById("splitbutton").ej2_instances[0];
splitButton.toggle(); |
```

| Show popup | **Method:** *show* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target")
var splitButton = $("#splitbutton").data("ejSplitButton");
splitButton.show(); | Method: toggle

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Render()
var splitButton = document.getElementById("splitbutton").ej2_instances[0];
splitButton.toggle(); |
```

## Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeOpen event | **Event:** *beforeOpen* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").BeforeOpen("beforeOpen")
function beforeOpen(args) {
 / code block /
} |
```

**Event:** *beforeOpen* <br/><br/>

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").BeforeOpen("beforeOpen").Render()
function beforeOpen(args) {
 / code block /
} |
```

| Click event | **Event:** *click* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Click("click")

function click(args) {
 / code block /
} | Event: click

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Click("click").Re
nder()
function click(args) {
 / code block /
} |
```

| Close event | **Event:** *close* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Close("close")

function close(args) {
 / code block /
} | Event: close

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Close("close")<
br/>function close(args) {
 / code block /
} |
```

| Create event | **Event:** *create* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Create("create")

function create(args) {
 / code block /
} | Event: created

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Created("creat
ed").Render()
function created() {
 / code block /
} |
```

| Destroy event | **Event:** *destroy* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Destroy("destroy")

function destroy(args) {
 / code block */
} | Not applicable
|
```

| ItemMouseOut event | **Event:** *itemMouseOut* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").ItemMouseOut("ite
mMouseOut")
function itemMouseOut(args) {
 / code block */

} | Not applicable |
```

| ItemMouseOver event | **Event:** *itemMouseOver* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").ItemMouseOver("it
emMouseOver")
function itemMouseOver(args) {
 / code block
*/
} | Not applicable |
```

| Item select event | **Event:** *itemSelected* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Item-
selected("itemSelected")
function itemSelected(args) {
 /
code block /
} | Event: select

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Select("select")
.Render()
function select(args) {
 / code block /
} |
```

| Open event | **Event:** *open* <br/><br/>

```
@Html.EJ().SplitButton("splitbutton").Text("SplitButton").Target("#target").Open("open")

function open(args) {
 / code block /
} | Event: open

```

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").Open("open").
Render()
function open(args) {
 / code block /
} |
```

|                   |                |                                  |
|-------------------|----------------|----------------------------------|
| BeforeClose event | Not applicable | <b>Event:</b> <i>beforeClose</i> |
|-------------------|----------------|----------------------------------|

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").Item("ViewBag.items").BeforeClose("beforeClose").Render()
function beforeClose(args) {
 /
code block */
}
```

|                        |                |                                                  |
|------------------------|----------------|--------------------------------------------------|
| BeforeItemRender event | Not applicable | <b>Event:</b> <i>beforeItemRender</i> <br/><br/> |
|------------------------|----------------|--------------------------------------------------|

```
@Html.EJS().SplitButton("splitbutton").Content("SplitButton").BeforeItemRender("beforeItemRender").Item("ViewBag.items").Render()
function beforeItemRender(args) {

 // ...
} / code block */
}
```

## Splitter

## Getting Started with ASP.NET MVC Splitter Control

This section briefly explains about how to include [ASP.NET MVC Splitter](#) control in your ASP.NET MVC application using Visual Studio.

## Prerequisites

## System requirements for ASP.NET MVC controls

## Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

## Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

## PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

## Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

•

&lt;namespaces&gt;

```
<add namespace="Syncfusion.EJ2"/>
```

&lt;/namespaces&gt;

•

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Splitter control

Now, add the Syncfusion ASP.NET MVC Splitter control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("250px").PaneSettings
(item => {
 item.Content("<div></div>").Add(); item.Content("<div></div>").Add(); item.Con
tent("<div></div>").Add(); }).Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Splitter control will be rendered in the default web browser.

### Load content to the pane

You can load the pane contents in either HTML element or string types using [Content](#) property.

#### CSHTML

```
@Html.EJS().Splitter("splitter").Width("550px").Height("250px").PaneSettings
(item => {
 item.Content("<div class='content'><h3 class='h3'>HTML</h3><div
class='code-preview'>#60;!DOCTYPE
html#62;</div>#60;html#62;</div><div>#60;body#6
2;</div>#60;div id='custom-image'><div
style='margin-left: 5px'>#60;img
src='src/albert.png'></div><div>#60;div#62;</div><div>#6
0;/body#62;</div><div>#60;/html#62;</div></div>
</div>").Add();
 item.Content("<div class='content'><h3 class='h3'>CSS</h3><div
class='code-preview'>img {<div id='code-text'>margin:0
auto;</div><div id='code-text'>display:flex;</div><div
id='code-text'>height:70px;</div>
}</div></div>").Add();
 item.Content("<div class='content'><h3 class='h3'>JavaScript</h3><div
class='code-preview'>var image =
document.getElementById('custom-image');<div>image.addEventListener('click',
function() {</div><div style='padding-left: 20px;'>// Code block for click
action</div> }</div></div>").Add();}).Render()
<style>
#code-text {
 margin-left: 5px;
}
.code-preview {
 margin-top: 15px;
 font-size: 12px;
}
.h3 {
 font-size: 14px;
 margin: 4px;
}
.content {
 padding: 12px;
```

```

 }
 .splitter-image {
 margin: 0 auto;
 display: flex;
 height: 115px;
 margin-top: 10px;
 }
</style>

```

| HTML                                                                                                                                                                                                       | CSS                                                                  | JavaScript                                                                                                                                         |
|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre> &lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;div id="custom-image"&gt;   &lt;img src="https://ej2.syncfusion.com   /demos/src/albert.png"&gt; &lt;/div&gt; &lt;/body&gt; &lt;/html&gt; </pre> | <pre> img {   margin:0 auto;   display:flex;   height:70px; } </pre> | <pre> var image = document.getElementById("custom- image"); image.addEventListener("click", function() {   // Code block for click action } </pre> |

### Configure pane size

You can specify the size to each pane using [Size](#) property. It accepts pane values in percentage and pixel types.

In case of pane size is not declared, panes will equally share the sizes automatically.

**Note:** For Horizontal orientation, panes will share the total width.

<br/> For Vertical orientation, panes will share the total height.

### CSHTML

```

@Html.EJS().Splitter("splitter").Width("550px").Height("250px").PaneSettings
(item => {
 item.Size("40%").Content("<div class='content'><h3 class='h3'>HTML</h3><div
 class='code-preview'><!DOCTYPE
 html></div><html></div><div><body&#
 62;</div><div id='custom-image'><div
 style='margin-left: 5px'><img
 src='src/albert.png'></div><div><div></div><div>
 0;/body></div><div></html></div></div>
 </div>").Add();
 item.Size("20%").Content("<div class='content'><h3 class='h3'>CSS</h3><div
 class='code-preview'>img {<div id='code-text'>margin:0
 auto;</div><div id='code-text'>display:flex;</div><div
 id='code-text'>height:70px;</div>
 }</div></div>").Add();
 item.Size("40%").Content("<div class='content'><h3
 class='h3'>JavaScript</h3><div class='code-preview'>var image =
 document.getElementById('custom-image');<div>image.addEventListener('click',

```

```
function() {</div><div style='padding-left: 20px;'> // Code block for click
action</div> }</div></div>").Add();}).Render()
<style>
 #code-text {
 margin-left: 5px;
 }
 .code-preview {
 margin-top: 15px;
 font-size: 12px;
 }
 .h3 {
 font-size: 14px;
 margin: 4px;
 }
 .content {
 padding: 12px;
 }
 .splitter-image {
 margin: 0 auto;
 display: flex;
 height: 115px;
 margin-top: 10px;
 }
</style>
```

### Resizable panes

Splitter allows you to change the pane dimensions by resizing the panes. By default, all the panes are resizable. You can disable the resize by using [Resizable](#) property in each pane settings.

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("550px").Height("250px").PaneSettings
(item => {
 item.Size("40%").Min("30px").Resizable(false).Content("<div
class='content'><h3 class='h3'>HTML</h3><div class='code-
preview'><!DOCTYPE
html></div><html></div><div><body&#
62;</div><div id='custom-image'><div
style='margin-left: 5px'><img
src='src/albert.png'></div><div><div></div><div>
0;/body></div><div></html></div></div>
</div>").Add();
 item.Size("20%").Min("15%").Content("<div class='content'><h3
class='h3'>CSS</h3><div class='code-preview'>img {<div
id='code-text'>margin:0 auto;</div><div id='code-
text'>display:flex;</div><div id='code-
text'>height:70px;</div> }</div></div>").Add();
 item.Size("40%").Content("<div class='content'><h3
class='h3'>JavaScript</h3><div class='code-preview'>var image =
document.getElementById('custom-image');<div>image.addEventListener('click',
function() {</div><div style='padding-left: 20px;'> // Code block for click
action</div> }</div></div>").Add();}).Render()
```

| HTML                                                                                                                                                                                                     | CSS                                                                | JavaScript                                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|
| <pre>&lt;!DOCTYPE html&gt; &lt;html&gt; &lt;body&gt; &lt;div id="custom-image"&gt;   &lt;img src="https://ej2.syncfusion.com   /demos/src/albert.png"&gt; &lt;/div&gt; &lt;/body&gt; &lt;/html&gt;</pre> | <pre>img {   margin:0 auto;   display:flex;   height:70px; }</pre> | <pre>var image = document.getElementById("custom- image"); image.addEventListener("click", function() {   // Code block for click action }</pre> |

### Set minimum and maximum pane sizes

Splitter allows you to set the minimum and maximum sizes for each pane. Resize will happens up to the minimum and maximum values only. It will accepts the size in both percentage and pixel formats.

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("550px").Height("250px").PaneSettings
(item => {
 item.Size("40%").Min("30px").Max("60%").Resizable(false).Content("<div
 class='content'><h3 class='h3'>HTML</h3><div class='code-
 preview'><!DOCTYPE
 html><div><html></div><div><body&#
 62;</div><div id='custom-image'><div
 style='margin-left: 5px'><img
 src='src/albert.png'></div><div><div></div><div>
 0;/body></div><div></html></div></div>
 </div>").Add();
 item.Size("20%").Min("15%").Max("40%").Content("<div class='content'><h3
 class='h3'>CSS</h3><div class='code-preview'>img {<div
 id='code-text'>margin:0 auto;</div><div id='code-
 text'>display:flex;</div><div id='code-
 text'>height:70px;</div> }</div></div>").Add();
 item.Size("40%").Content("<div class='content'><h3
 class='h3'>JavaScript</h3><div class='code-preview'>var image =
 document.getElementById('custom-image');<div>image.addEventListener('click',
 function() {</div><div style='padding-left: 20px;'>// Code block for click
 action</div> }</div></div>").Add();}).Render();
```

### Orientation

Splitter supports both **Horizontal** and **Vertical** orientation for the panes. By default, it will be rendered in **Horizontal** orientation. You can change it by using [Orientation](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Layouts
@Html.EJS().Splitter("vertical").CssClass("splitterContent").Width("100%").H
eight("200px").PaneSettings(item => {
 item.Size("50%").Min("30%").Content("<div class='content'> Top
 pane</div>").Add();
```

```
item.Size("50%").Min("30%").Content("<div class='content'> Bottom
pane</div>").Add(); }).Orientation(Orientation.Vertical).Render()
<style>
 .content {
 justify-content: center;
 text-align: center;
 align-items: center;
 height: 100%;
 display: flex;
 }
</style>
```

### Nested Splitter

Splitter provides support to render the nested pane to achieve the complex layouts. You can render the nested splitter using the `<div>` element provided for parent splitter.

Also you can render the nested splitter using direct child of the splitter pane. For this, nested splitter should have `100%` width and height to match with the parent pane dimensions.

### CSHTML

```
@using Syncfusion.EJ2.Layouts
@{
 var pane4Content = @"<div class='content'>
 <h3 class='h3'>Preview of sample</h3>
 <div class='splitter-image'>
 <img class='img1'
src='https://ej2.syncfusion.com/demos/src/listview/images/albert.png'
style='width: 20%;margin: 0 auto;' />
 </div>
 </div>";
}
<div>

## Split panes

This section explain about split panes behaviours.

### Horizontal layout

By default, splitter will render in horizontal orientation. Splitter container will be splitted as panes in horizontal flow direction with vertical seperator.

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("250px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'><h4
class='h4'>Grid</h4>The ASP.NET DataGrid control, or DataTable is a feature-
rich control used to display data in a tabular format.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Schedule
</h4>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all
```

```
calendar features, thus allowing users to manage their time
efficiently.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
}).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

| Grid                                                                                                           | Schedule                                                                                                                                      | Chart                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format. | The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently. | ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications |

### Vertical layout

By setting [Orientation](#) API as `Vertical`, splitter will render in vertical orientation. Splitter container will be splitted as panes in vertical flow direction with horizontal separator.

### CSHTML

```
@using Syncfusion.EJ2.Layouts
@Html.EJS().Splitter("splitter").Width("500px").Height("300px").PaneSettings
(item => {
```

```

 item.Size("100px").Content("<div class='content'><h4
class='h4'>Grid</h4>The ASP.NET DataGrid control, or DataTable is a feature-
rich control used to display data in a tabular format.</div>").Add();
 item.Size("100px").Content("<div class='content'><h4 class='h4'>Schedule
</h4>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all
calendar features, thus allowing users to manage their time
efficiently.</div>").Add();
 item.Size("100px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
 }).Orientation(Orientation.Vertical).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
</style>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

## Grid

The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format.

## Schedule

The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently.

## Chart

ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications

### Multiple panes

You can render the multiple panes with both **Horizontal/Vertical** orientations.

**CSHTML**

```
@Html.EJS().Splitter("splitter").Width("600px").Height("280px").PaneSettings
(item => {
 item.Size("150px").Content("<div class='content'><h4 class='h4'>PARIS
</h4>Paris, the city of lights and love - this short guide is full of ideas
for how to make the most of the romanticism...</div>").Add();
 item.Size("150px").Content("<div class='content'><h4 class='h4'>CAMEMBERT
</h4>The village in the Orne département of Normandy where the famous French
cheese is originated from.</div>").Add();
 item.Size("150px").Content("<div class='content'><h4 class='h4'>GRENOBLE
</h4>The capital city of the French Alps and a major scientific center
surrounded by many ski resorts, host of the Winter Olympics in
1968.</div>").Add();
 item.Size("150px").Content("<div class='content'><h4 class='h4'>AUSTRALIA
</h4>Australia is a country and continent surrounded by the Indian and
Pacific oceans. Its major cities - Sydney, Brisbane, Melbourne, Perth,
Adelaide - are coastal. Its capital, Canberra, is inland.</div>").Add();
}).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 font-size: 14px;
 }
</style>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

| PARIS                                                                                                                 | CAMEMBERT                                                                                          | GRENOBLE                                                                                                                               | AUSTRALIA                                                                                                                                                                                          |
|-----------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Paris, the city of lights and love - this short guide is full of ideas for how to make the most of the romanticism... | The village in the Orne département of Normandy where the famous French cheese is originated from. | The capital city of the French Alps and a major scientific center surrounded by many ski resorts, host of the Winter Olympics in 1968. | Australia is a country and continent surrounded by the Indian and Pacific oceans. Its major cities – Sydney, Brisbane, Melbourne, Perth, Adelaide – are coastal. Its capital, Canberra, is inland. |

## Separator

By default, pane separator will be render with **1px** width/height. You can customize the separator size by using [SeparatorSize](#) API.

**Note:** For Horizontal orientation, it will be considered as separator width.

<br/> For Vertical orientation, it will be considered as separator height.

## CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("250px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'><h4
class='h4'>Grid</h4>The ASP.NET DataGrid control, or DataTable is a feature-
rich control used to display data in a tabular format.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Schedule
</h4>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all
calendar features, thus allowing users to manage their time
efficiently.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
}).SeparatorSize(5).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 font-size: 15px;
 }
</style>
```

## CONTROLLER.CS

```
public class HomeController : Controller
{
```

```
public ActionResult Index()
{
 return View();
}
```

Output be like the below.

|                                                                                                                                          |                                                                                                                                                                             |                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Grid</b></p> <p>The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format.</p> | <p><b>Schedule</b></p> <p>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently.</p> | <p><b>Chart</b></p> <p>ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications</p> |
|------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|

### Nested Splitter

Splitter provides support to render the nested pane to achieve the complex layouts. You can use the same `<div>` element for splitter pane and nested splitter.

**Note:** Also you can render the nested splitter using direct child of the splitter pane. For this, nested splitter should have **100%** width and height to match with the parent pane dimensions.

### CSHTML

```
<div>

@Html.EJS().Splitter("Horizontal_splitter").Created("onCreate").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'><h4
class='h4'>PARIS </h4>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the
romanticism...</div>").Add();
 item.Size("200px").Content("<div class='content'><h4
class='h4'>CAMEMBERT </h4>The village in the Orne département of Normandy
where the famous French cheese is originated from.</div>").Add();
 item.Size("200px").Content("<div id ='vertical_splitter'
class='vertical_splitter'><div class='content'><h4 class='h4'>GRENOBLE
</h4>The capital city of the French Alps and a major scientific center
surrounded by many ski resorts, host of the Winter Olympics in
1968.</div><div class='content'><h4 class='h4'>AUSTRALIA </h4>Australia is a
country and continent surrounded by the Indian and Pacific oceans. Its major
cities - Sydney, Brisbane, Melbourne, Perth, Adelaide - are coastal. Its
capital, Canberra, is inland.</div></div>").Add();
}).Height("320px").Width("600px").Render()
</div>
```

```
<style>
 .content {
 padding: 9px;
 }
 .vertical_splitter.e-splitter.e-splitter-vertical {
 border: none;
 }
 .h4 {
 font-weight: 550;
 font-size: 14px;
 }
</style>
<script type="text/javascript">
 function onCreate(args) {
 var splitterObj = new ej.layouts.Splitter({
 paneSettings: [
 { size: '150px', min: '20%' },
 { size: '100px', min: '20%' }
],
 orientation: 'Vertical'
 });
 splitterObj.appendTo('#vertical_splitter');
 }
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

|                                                                                                                                       |                                                                                                                        |                                                                                                                                                                                                                        |
|---------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>PARIS</b><br>Paris, the city of lights and love - this short guide is full of ideas for how to make the most of the romanticism... | <b>CAMEMBERT</b><br>The village in the Orne département of Normandy where the famous French cheese is originated from. | <b>GRENOBLE</b><br>The capital city of the French Alps and a major scientific center surrounded by many ski resorts, host of the Winter Olympics in 1968.                                                              |
|                                                                                                                                       | ⋮                                                                                                                      | <b>AUSTRALIA</b><br>Australia is a country and continent surrounded by the Indian and Pacific oceans. Its major cities – Sydney, Brisbane, Melbourne, Perth, Adelaide – are coastal. Its capital, Canberra, is inland. |

#### Add or remove pane

You can add the panes programmatic but it will makes you complex. For this, you can use the `addPane/removePane` methods to add and remove the panes dynamically in the splitter.

#### Add pane

You can add the panes dynamically in the splitter by passing [PaneSettings](#) along with index to the `addPane` method

#### CSHTML

```
<div>

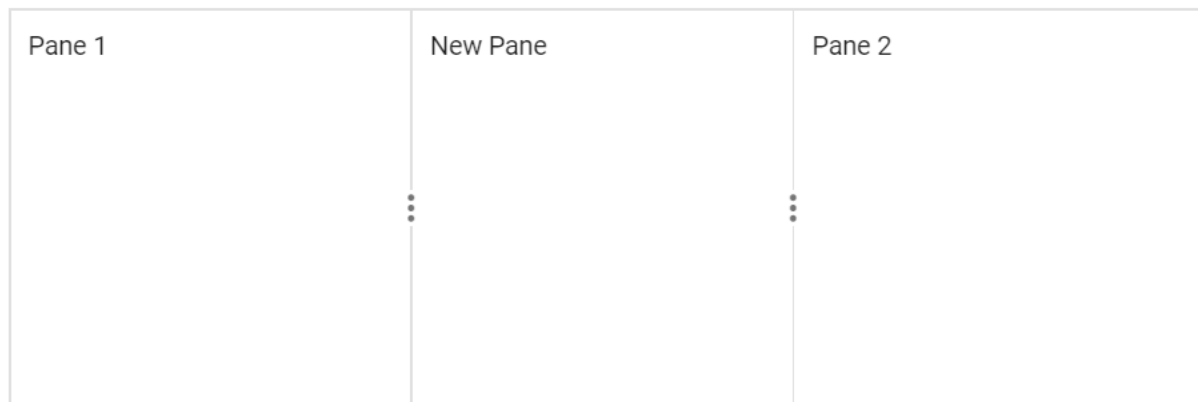

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("190px").Content("<div class='content'>Pane
1</div>").Add();
 item.Size("190px").Content("<div class='content'>Pane
2</div>").Add();
}).Render()
 <button id="addPane" class="e-btn" onclick="onClicked()">Add
pane</button>
</div>
<style>
 .content {
 padding: 9px;
 }
 #addPane {
 margin-top: 15px;
 }
</style>
<script type="text/javascript">
 function onClicked() {
 var splitterObj = document.getElementById('splitter');
```

```
var paneDetails = {
 size: '190px',
 content: '<div class="content">New Pane</div>',
 min: '30px',
 max: '250px',
}
splitterObj.ej2_instances[0].addPane(paneDetails, 1);
}
</script>
```

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

ADD PANE

[Remove pane](#)

You can remove the split panes dynamically by passing the pane index to `removePane` method.

## CSHTML

```
<div>

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Pane
1</div>").Add();
 item.Size("200px").Content("<div class='content'>Pane
2</div>").Add();
 item.Size("200px").Content("<div class='content'>Pane
3</div>").Add();
}).Render()
```

```

<button id="removePane" class="e-btn" onclick="onClicked()">Remove
pane</button>
</div>
<style>
 .content {
 padding: 9px;
 }
 #removePane {
 margin-top: 15px;
 }
</style>
<script type="text/javascript">
 function onClicked() {
 var splitterObj = document.getElementById('splitter');
 if
(!ej.base.isNullOrUndefined(document.querySelector('#splitter').querySelecto
rAll('.e-pane-horizontal')[1])) {
 splitterObj.ej2_instances[0].removePane(1);
 }
 }
</script>

```

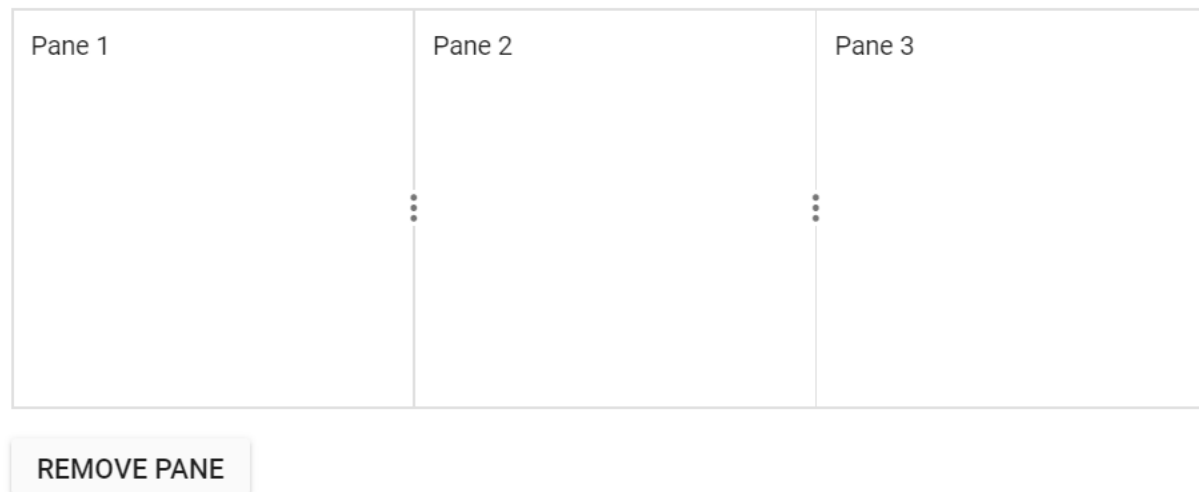

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

See Also

- [Resizable split panes](#)

- [Collapsible panes](#)
- [Define size to a panes](#)
- [Specify content to a panes](#)

## Expand and Collapse

### Collapsible panes

The Splitter panes can be configured with built-in expand and collapse functionalities. By default, the **Collapsible** behavior is disabled. Enable the **Collapsible** behavior in the [PaneSettings](#) property to show or hide the expand or collapse icons in the panes. You can dynamically expand and collapse the panes by the corresponding icons.

The following code shows how to enable collapsible behavior.

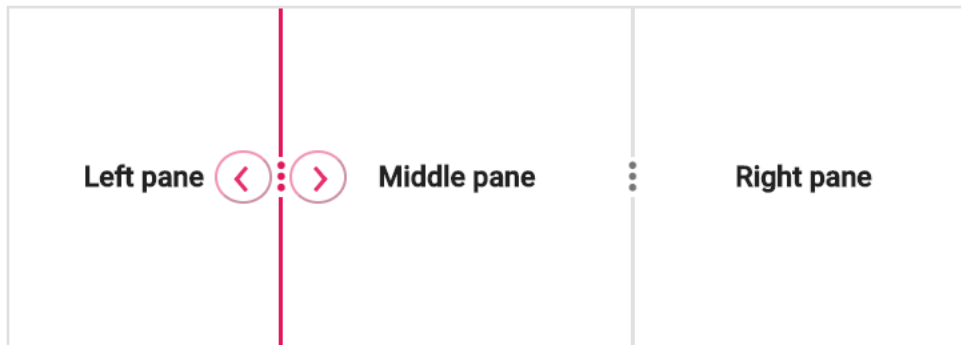

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("500px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Left
pane</div>").Collapsible(true).Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Collapsible(true).Add();
 item.Size("200px").Content("<div class='content'>Right
pane</div>").Collapsible(true).Add();
}).Render()
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Execution of above code's output will be as given below,

### Programmatically control the expand and collapse action

The Splitter provides public method to control the expand and collapse behavior programmatically using the `expand` and `collapse` methods. Refer to the following code sample.

#### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Left
pane</div>").Collapsible(true).Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Collapsible(true).Add();
 item.Size("200px").Content("<div class='content'>Right
pane</div>").Collapsible(true).Add();
}).Created("onCreated").Render()
@Html.EJS().Button("expand").Content("Expand").Render()
@Html.EJS().Button("collapse").Content("Collapse").Render()
<script>
 var splitterObj;
 function onCreated() {
 splitterObj = this;
 }
 function expandAction() {
 splitterObj.expand(0);
 }
 function collapseAction() {
 splitterObj.collapse(0);
 }
</script>
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Specify initial state to panes

You can render specific panes with collapsed state on page load. Specify a Boolean value to the [collapsed](#) property to control this behavior. The following code explains how to collapse panes on rendering (the second panes renders with collapsed state).

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Left
pane</div>").Collapsible(true).Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Collapsed(true).Add();
 item.Size("200px").Content("<div class='content'>Right
pane</div>").Collapsible(true).Add();
}).Render()
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Execution of above code's output will be as given below,

See Also

- [Resizable split panes](#)

## Resize

By default, resizing will be enable for split panes. Resizing gripper element will be add to the separator to makes the resize easy.

**Note:** Horizontal splitter will allows to resize in horizontal directions.

<br/> Vertical splitter will allows to resize in vertical directions.

While resizing, previous and next panes will be adjust its dimensions automatically.

## Min and Max validation

Splitter allows you to set the minimum and maximum sizes for each pane. Resizing will not be occur over the minimum and maximum values.

## CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Min("20%").Max("40%").Content("<div
class='content'><h4 class='h4'>Grid</h4>The ASP.NET DataGrid control, or
DataTable is a feature-rich control used to display data in a tabular
format.</div>").Add();
 item.Size("200px").Min("30%").Max("60%").Content("<div
class='content'><h4 class='h4'>Schedule </h4>The ASP.NET Scheduler, a.k.a.
event calendar, facilitates almost all calendar features, thus allowing
users to manage their time efficiently.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
}).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
</style>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

## Prevent resizing

You can disable the resizing for the pane by setting `false` to the [Resizable](#) API within [PaneSettings](#).

**CSHTML**

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Min("20%").Max("40%").Resizable(false).Content("<div
class='content'><h4 class='h4'>Grid</h4>The ASP.NET DataGrid control, or
DataTable is a feature-rich control used to display data in a tabular
format.</div>").Add();
 item.Size("200px").Min("30%").Max("60%").Content("<div
class='content'><h4 class='h4'>Schedule </h4>The ASP.NET Scheduler, a.k.a.
event calendar, facilitates almost all calendar features, thus allowing
users to manage their time efficiently.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
}).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
</style>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

|                                                                                                                                          |                                                                                                                                                                             |                                                                                                                                                        |
|------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <p><b>Grid</b></p> <p>The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format.</p> | <p><b>Schedule</b></p> <p>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently.</p> | <p><b>Chart</b></p> <p>ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications</p> |

### Refresh content on resizing

While resizing the panes, you can refresh the pane contents by using either [ResizeStart](#), [Resizing](#) or [ResizeStop](#) events.

### Customize the resize grip and cursor

You can customize the resize gripper icon and cursor in css level.

### CSHTML

```
<div class="control_wrapper">

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Min("20%").Max("40%").Content("<div
class='content'><h4 class='h4'>PARIS </h4>Paris, the city of lights and love
- this short guide is full of ideas for how to make the most of the
romanticism...</div>").Add();
 item.Size("200px").Min("30%").Max("60%").Content("<div
class='content'><h4 class='h4'>CAMEMBERT </h4>The village in the Orne
département of Normandy where the famous French cheese is originated
from.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4
class='h4'>GRENOBLE </h4>The capital city of the French Alps and a major
scientific center surrounded by many ski resorts, host of the Winter
Olympics in 1968.</div>").Add();
}).Render()
</div>
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 font-size: 15px;
 }
 .control_wrapper .e-splitter .e-split-bar .e-resize-handler:before {
 content: "\e934";
 font-family: 'e-icons';
 font-size: 11px;
 transform: rotate(90deg);
 }
 .e-splitter .e-split-bar.e-split-bar-horizontal.e-resizable-split-bar,
```

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-resizable-split-
bar::after {
 cursor: e-resize;
}
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

- [Resizable split panes](#)

### Pane content in Splitter Control

This section explains how to provide plain text content or HTML markup or integrate other Syncfusion ASP.NET MVC UI controls as content of splitter.

#### HTML Markup

Splitter is a layout based container control. You can render the pane contents from existing HTML markups. Converting HTML markup as splitter pane is easy way to add the panes content dynamically.

#### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'><h4 class='h4'>PARIS
</h4>Paris, the city of lights and love - this short guide is full of ideas
for how to make the most of the romanticism...</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>CAMEMBERT
</h4>The village in the Orne département of Normandy where the famous French
cheese is originated from.</div>").Add();
})
```

```

 item.Size("200px").Content("<div class='content'><h4 class='h4'>GRENOBLE
</h4>The capital city of the French Alps and a major scientific center
surrounded by many ski resorts, host of the Winter Olympics in
1968.</div>").Add();
 }).Render()
<style>
 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
</style>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

| PARIS                                                                                                                          | CAMEMBERT                                                                                                   | GRENOBLE                                                                                                                                           |
|--------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------|
| Paris, the city of lights and love<br>- this short guide is full of ideas<br>for how to make the most of<br>the romanticism... | The village in the Orne<br>département of Normandy<br>where the famous French<br>cheese is originated from. | The capital city of the French<br>Alps and a major scientific<br>center surrounded by many ski<br>resorts, host of the Winter<br>Olympics in 1968. |

### Syncfusion ASP.NET MVC UI controls

You can render any Syncfusion ASP.NET MVC UI controls along with their native and control events within splitter as pane content.

You can refer [Accordion within splitter](#) and [Listview within splitter](#) samples.

### Plain content

You can add the plain text as a pane contents using either inner HTML or [Content](#) API.

### CSHTML

```

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Left pane</div>").Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Add();
}

```

```

 item.Size("200px").Content("<div class='content'>Right
pane</div>").Add();
 }).Render()
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

### Pane content using selector

You can set HTML element as pane content, using the query selectors such as ID or CSS class selectors.

The following code demonstrates how to fetch an element from the document and load it to pane using its ID.

### CSHTML

```

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Min("60px").Content("#left-pane-content").Add();
 item.Size("200px").Min("60px").Content("#middle-pane-content").Add();
 item.Size("200px").Min("60px").Content("#last-pane-content").Add();
}).Render()
<!-- pane contents -->
<div id="left-pane-content" style="display: none;">

```

```
<div>Left pane<div id='panetext'>size: 25%</div>
 <div id='panetext'>min: 60px</div>
</div>
<div id="middle-pane-content" style="display: none;">
 Middle pane<div id="panetext">size: 50%</div>
 <div id="panetext">min: 60px</div>

</div>
<div id="last-pane-content" style="display: none;">
 Right pane<div id="panetext">size: 25%</div>
 <div id="panetext">min: 60px</div>

</div>
<style>
#left-pane-content,
#middle-pane-content,
#last-pane-content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: flex;
 height: 100%;
}
#panetext {
 font-size: 11px;
}
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

## Pane sizing

Splitter allows you to provide pane sizes either in pixel or percentage formats.

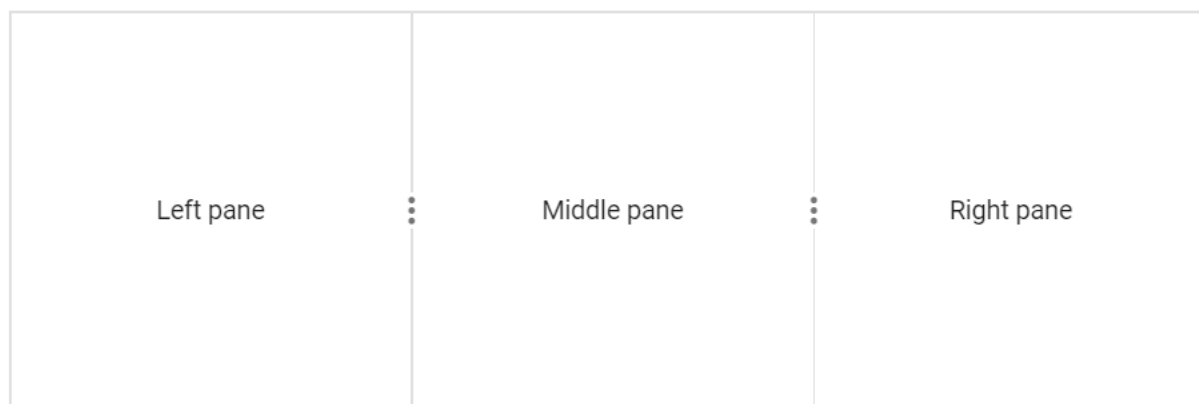

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Content("<div class='content'>Left pane</div>").Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Add();
 item.Size("200px").Content("<div class='content'>Right
pane</div>").Add();
}).Render()
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

### CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("30%").Content("<div class='content'>Left pane</div>").Add();
 item.Size("40%").Content("<div class='content'>Middle pane</div>").Add();
 item.Size("30%").Content("<div class='content'>Right pane</div>").Add();
})
```

```
}).Render()
<style>
 .content {
 text-align: center;
 align-items: center;
 justify-content: center;
 display: grid;
 height: 100%;
 }
</style>
```

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

## Auto size panes

You can render the split panes without providing the size values. It will split up the sizes automatically.

## CSHTML

```
@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Content("<div class='content'><h4 class='h4'>Grid</h4>The ASP.NET
DataGrid control, or DataTable is a feature-rich control used to display
data in a tabular format.</div>").Add();
 item.Content("<div class='content'><h4 class='h4'>Schedule </h4>The
ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar
features, thus allowing users to manage their time
efficiently.</div>").Add();
 item.Content("<div class='content'><h4 class='h4'>Chart </h4>ASP.NET
charts, a well-crafted easy-to-use charting package, is used to add
beautiful charts in web and mobile applications").Add();
}).Render()
<style>
```

```

 .content {
 padding: 9px;
 }
 .h4 {
 font-weight: 550;
 }
 }
</style>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Output be like the below.

| Grid                                                                                                           | Schedule                                                                                                                                      | Chart                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format. | The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently. | ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications |

## Fixed pane

You can render the split panes with fixed sizes. Since last pane is a flexible pane, fixed size will not be applied.

## CSHTML

```

@Html.EJS().Splitter("splitter").Width("600px").Height("200px").PaneSettings
(item => {
 item.Size("200px").Resizable(false).Content("<div class='content'><h4
class='h4'>Grid</h4>The ASP.NET DataGrid control, or DataTable is a feature-
rich control used to display data in a tabular format.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Schedule
</h4>The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all
calendar features, thus allowing users to manage their time
efficiently.</div>").Add();
 item.Size("200px").Content("<div class='content'><h4 class='h4'>Chart
</h4>ASP.NET charts, a well-crafted easy-to-use charting package, is used to
add beautiful charts in web and mobile applications").Add();
}).Render()
<style>
 .content {

```

```
padding: 9px;
}
.h4 {
font-weight: 550;
}
</style>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

Output be like the below.

| Grid                                                                                                           | Schedule                                                                                                                                      | Chart                                                                                                                       |
|----------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------|
| The ASP.NET DataGrid control, or DataTable is a feature-rich control used to display data in a tabular format. | The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost all calendar features, thus allowing users to manage their time efficiently. | ASP.NET charts, a well-crafted easy-to-use charting package, is used to add beautiful charts in web and mobile applications |

### Different layouts

By using splitter control, you can create the different layouts with multiple and nested panes.

#### Code editor style layout

##### Step 1:

Create the element with two child to render the outer splitter.

```
`html
```

```
@using Syncfusion.EJ2.Layouts
```

```
<div id="target" class="control_wrapper">
```

```
<div>
```

```
@Html.EJS().Splitter("outerSplitter").Created("onCreate").PaneSettings(item => {
```

```
item.Size("53%").Min("30%").Add();
```

```
item.Content(@"<div id='splitter2'><h3 class='h3' style='padding: 5px'>Preview of sample</h3> <div class='splitter-image'> <img class='img1'
```

```
src='https://ej2.syncfusion.com/demos/src/listview/images/albert.png' style='width: 20%;margin: 0 auto;'></div>").Add();
```

```
}).Height("400px").Width("100%).Orientation(Orientation.Vertical).Render()
```

```
</div>
```

```
</div>
```

```
,
```

## Step 2 :

Render the first pane of vertical splitter as a horizontal splitter.

```
`javascript
```

```
<script>
```

```
var HTMLContent = "<div><div class='content'><h3 class='h3'>HTML</h3><div class='code-
preview'><!DOCTYPE html><div><html></div>" +
```

```
"<div><body></div><div id='custom-image'><div style='margin-left:
5px'><img src='src/albert.png'></div>" +
```

```
"<div><div></div><div></body></div><div></html></div>
</div></div></div>";
```

```
var CSSContent = "<div><div class='content'><h3 class='h3'>CSS</h3><div class='code-
preview'>img {<div id='code-text'>margin:0 auto;</div>" +
```

```
"<div id='code-text'>display:flex;</div><div id='code-
text'>height:70px;</div>}</div></div></div>";
```

```
var javaScriptContent = "<div><div class='content'><h3 class='h3'>JavaScript</h3><div class='code-
preview'>var " +
```

```
"image = document.getElementById('custom-image');<div>image.addEventListener('click', function()
{</div>" +
```

```
"<div style='padding-left: 20px;'>// Code block for click action</div>
</div></div></div>";
```

```
function onCreate(args) {
```

```
document.getElementById('outerSplitter').querySelector('.e-pane-vertical').setAttribute('id',
'Innersplitter');
```

```
var splitObj1 = new ej.layouts.Splitter({
```

```
height: '220px',
```

```
paneSettings: [
```

```
{ size: '29%', min: '23%', content: HTMLContent },
```

```
{ size: '20%', min: '15%', content: CSSContent },
```

```
{ size: '35%', min: '35%', content: javaScriptContent }
```

```
],
```

```
width: '100%'
});
splitObj1.appendTo('#Innersplitter');
}
</script>
`
`css
<style>
code-text {
margin-left: 5px;
}
.code-preview {
margin-top: 15px;
font-size: 12px;
}
target {
margin: 20px auto;
max-width: 600px;
}
.control-section {
min-height: 370px;
margin-bottom: 15px;
margin-top: 10px;
}
.h3 {
font-size: 14px;
margin: 4px;
}
.content {
padding: 12px;
}
.splitter-image {
margin: 0 auto;
display: flex;
```

```
height: 115px;
margin-top: 10px;
}
</style>
`
```

Once the above configurations has been completed, you will get the output like [this](#)

Outlook style layout

### Step 1:

Create the element with three panes and place the elements within the pane to render **TreeView**, **ListView** and **RichTextEditor**.

```
`html
<div id="target">
<div>
@Html.EJS().Splitter("splitter").Created("onCreate").PaneSettings(item => {
item.Size("28%").Min("27%").Content(@"<div><div class='content'><div
id='tree'></div></div></div>").Add();
item.Size("33%").Min("23%").Content(@"
").Add(); item.Size("37%").Min("30%").Content(@"
To...
Cc...
Subject
Send Discard
").Add();
}).Height("493px").Width("100%").Render()
</div>
</div>
`
```

### Step 2 :

Place the template script to render the treeview.

```
`javascript
<script id="treeTemplate" type="text/x-template">
<div>
<div class="treeviewdiv">
```

```

<div style="float:left">
${name}
</div>
${if(count)}
<div style="margin-right: 5px; float:right">
${count}
</div>
${/if}
</div>
</div>
</script>
`

```

**Step 3 :**

Render the listed controls one by one.

```

`javascript
<script>
function onCreate(args) {
var inputobj1 = new ej.inputs.TextBox({});
inputobj1.appendTo('#firstname');
var inputobj2 = new ej.inputs.TextBox({});
inputobj2.appendTo('#lastname');
var inputobj3 = new ej.inputs.TextBox({});
inputobj3.appendTo('#subject');
// Data source for TreeView component
var mailBox = [
{ id: 1, name: 'Favorites', hasChild: true },
{ id: 2, pid: 1, name: 'Sales Reports', count: '4' },
{ id: 3, pid: 1, name: 'Sent Items' },
{ id: 4, pid: 1, name: 'Marketing Reports ', count: '6' },
{ id: 5, name: 'Andrew Fuller', hasChild: true, expanded: true },
{ id: 6, pid: 5, name: 'Inbox', selected: true, count: '20' },
{ id: 7, pid: 5, name: 'Drafts', count: '5' },
{ id: 15, pid: 5, name: 'Archive' },

```

```

{ id: 8, pid: 5, name: 'Deleted Items' },
{ id: 9, pid: 5, name: 'Sent Items' },
{ id: 10, pid: 5, name: 'Sales Reports', count: '4' },
{ id: 11, pid: 5, name: 'Marketing Reports', count: '6' },
{ id: 12, pid: 5, name: 'Outbox' },
{ id: 13, pid: 5, name: 'Junk Email' },
{ id: 14, pid: 5, name: 'RSS Feed' },
{ id: 15, pid: 5, name: 'Trash' }
];

// Render the TreeView using template option
var treeObj = new ej.navigations.TreeView({
 fields: { dataSource: mailBox, id: 'id', parentID: 'pid', text: 'name', hasChildren: 'hasChild' },
 nodeTemplate: '#treeTemplate',
});
treeObj.appendTo('#tree');

// tslint:disable:max-line-length
//Define an array of JSON data
var dataSource = [
 { Name: 'Selma Tally', content: '<div><div class="status">Apology marketing email</div><div id="list-message">Hello Ananya Singleton</div>', id: '1', order: 0 },
 { Name: 'Illa Russo', content: '<div><div class="status">Annual conference</div><div id="list-message">Hi jeani Moresa</div></div>', id: '4', order: 0 },
 { Name: 'Camden Macmellon', content: '<div><div class="status">Reference request- Camden hester</div><div id="list-message">Hello Kerry Best,</div></div>', order: 0 },
 { Name: 'Garth Owen', content: '<div><div class="status">Application for job Title</div><div id="list-message">Hello Illa Russo</div></div>', id: '2', order: 0 },
 { Name: 'Ursula Patterson', content: '<div><div class="status">Programmaer Position Applicant</div><div id="list-message">Hello Kerry best,</div></div>', id: '2', order: 0 }
];

// Initialize ListView component
var listObj = new ej.lists.ListView({
 //Set defined data to dataSource property
 dataSource: dataSource,
 cssClass: 'e-list-template',
 //Map the appropriate columns to fields property

```

```

fields: { text: 'Name', groupBy: 'order' },
//Set customized group-header template
groupTemplate: '<div class="e-list-wrapper"></div>',
//Set customized list template
template: '<div class="settings e-list-wrapper e-list-multi-line">' +
'${Name}' +
'${content}' +
'</div>'
});
//Render initialized ListView component
listObj.appendTo('#groupedList');
var button1 = new ej.buttons.Button({ isPrimary: true });
button1.appendTo('#rteSubmit');
var button2 = new ej.buttons.Button();
button2.appendTo('#rteCancel');
var defaultRTE = new ej.richtexteditor.RichTextEditor({ height: '262px' });
defaultRTE.appendTo('#defaultRTE');
}
</script>
`css
<style>
discard {
margin-left: 7px;
}
table {
width: 100%;
}
target {
margin: 20px auto;
max-width: 820px;
}
td {
padding: 2px;

```

Splitter

groupedList.e-listview .e-list-group-item {

```
}
.control-section{
min-height: 370px;
}
.e-treeview .e-list-text {
width: 100%;
}
groupedList.e-listview .e-list-group-item {
height: 0;
}
splitter1 .settings.e-list-wrapper.e-list-multi-line.e-list-avatar {
padding: 15px;
}
buttonSection {
padding: 7px;
}
createpostholder {
padding-left: 3px;
padding-right: 4px;
}
</style>
,
```

Once the above configurations has been completed, you will get the output like [this](#).

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the split bar

Use the following CSS to customize the split bar properties.

##### *Horizontal split bar*

`CSS

*/ default split bar color /*

```
.e-splitter .e-split-bar.e-split-bar-horizontal{
background: blue;
```

```

}
/ split bar color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active {
background: green;
}
`

```

#### Vertical split bar

```

`CSS
/ default split bar color /
.e-splitter .e-split-bar.e-split-bar-vertical {
background: blue;
}
/ split bar color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active {
background: green;
}
`

```

#### Customizing the split bar resize handle

Use the following CSS to customize the split bar resize handle.

#### Horizontal split bar resize handle

```

`CSS
/ default split bar resize handle color /
.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}
/ default split bar resize handle color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-resize-handler{
color: green;
}
`

```

*Vertical split bar resize handle*``CSS`*/ default split bar resize handle color /*

```
.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}
```

*/ default split bar resize handle color in hover and active state /*

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-resize-handler{
color: green;
}
```

`,`

*Customizing the split bar arrows*

Use the following CSS to customize the split bar arrows.

*Horizontal split bar resize arrows*``CSS`*/ split bar arrows /*

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::after {
background-color: green;
}
```

*/ split bar arrows - circular border /*

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left, .e-splitter
.e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right {
border-color: rgba(33, 227, 22, 0.5);
}
```

`,`

*Vertical split bar resize arrows*``CSS`*/ split bar arrows /*

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::after, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::after {
```

```
background-color: green;
```

```
}
```

*/ split bar arrows - circular border /*

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up, .e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down {
```

```
border-color: rgba(33, 227, 22, 0.5);
```

```
}
```

,

### To hide the resize handle in Splitter

Use the following CSS to hide the resize handler in the split bar

#### *Hide the horizontal split bar resize arrow*

`CSS

```
.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
```

```
display: none;
```

```
}
```

,

#### *Hide the vertical split bar resize arrow*

`CSS

```
.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
```

```
display: none;
```

```
}
```

,

## Expand and Collapse

### Collapsible panes

Specifies the direction of the Splitter component using the enableRtl property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

The following code shows how to enable RTL behavior.

#### **CSHTML**

```
@Html.EJS().Splitter("splitter").EnableRtl(true).Width("500px").Height("200px").PaneSettings(item => {
```

```

 item.Size("200px").Content("<div class='content'>Left pane</div>").Add();
 item.Size("200px").Content("<div class='content'>Middle
pane</div>").Add();
 item.Size("200px").Content("<div class='content'>Right
pane</div>").Add();
 }).Render()

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

Execution of above code's output will be as given below,

The Splitter component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Splitter component is outlined below.

| [Accessibility Criteria](#) | [Compatibility](#) |

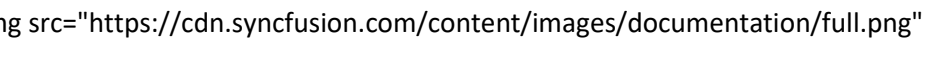

| -- | -- |

| [WCAG 2.2 Support](#) |  alt="Yes" > |

| [Section 508 Support](#) |  alt="Yes" > |

| [Screen Reader Support](#) |  alt="Yes" > |

| [Right-To-Left Support](#) |  alt="Yes" > |

| [Color Contrast](#) |  alt="Yes" > |

```

| Mobile Device Support | |
| Keyboard Navigation Support | |
| Accessibility Checker Validation | |
| Axe-core Accessibility Validation | |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

### Keyboard interaction

You can use the following key shortcuts to access the splitter without interruptions:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Helps in focusing the splitter on the page and switching between the consecutive splitter bars. |

| Shift + Tab | Helps in focusing the previous splitter bar element on the splitter. |

| Right arrow | Helps in moving the active horizontal orientated splitter bar to its Right side. |

| Left arrow | Helps in moving the active horizontal orientated splitter bar to its Left side. |

| Up arrow | Helps in moving the active vertical orientated splitter bar to its Up side. |

| Down arrow | Helps in moving the active vertical orientated splitter bar to its Down side. |

| Enter | Helps to toggle between expand and collapse actions of the splitter bar when it is active. |

### Ensuring accessibility

The Splitter component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Splitter component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Splitter component with accessibility tools.

## Migration from Essential JS 1

This article describes the API migration process of Splitter component from Essential JS 1 to Essential JS 2.

### Common

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Adding custom class | **Property:** *cssClass* <br /><br />@{Html.EJ().Splitter("splitter")<br />.CssClass("customClass")<br />.Render();} <br /> | **Property:** *cssClass* <br /><br />@Html.EJS().Splitter("splitter")<br />.CssClass("customClass")<br />.Render();<br /> |

| Adjusting Height | **Property:** *height* <br /><br />@{Html.EJ().Splitter("splitter")<br />.Height("100%").Render();} <br /> | **Property:** *height* <br /><br />@Html.EJS().Splitter("splitter")<br />.Height("100%").Render(); <br /> |

| Adjusting Width | **Property:** *width* <br /><br />@{Html.EJ().Splitter("splitter")<br />.Width("600").Render();}<br /> | **Property:** *width* <br /><br />@Html.EJS().Splitter("splitter")<br />.Width("100%").Render();<br /> |

| Orientation | **Property:** *orientation* <br /><br />@{Html.EJ().Splitter("splitter")<br />.Orientation(Orientation.Vertical)<br />.Render();}<br /> | **Property:** *orientation* <br /><br />@Html.EJS().Splitter("splitter")<br />.Orientation<br />(Syncfusion.EJ2.Layouts<br />.Orientation.Vertical)<br />.Render();<br /> |

| Separator Size | Not Available | **Property:** *separatorSize* <br /><br />@Html.EJS().Splitter("splitter")<br />.SeparatorSize(4).Render();<br /> |

| Adding HTML attributes | **Property:** *htmlAttributes* <br /><br />@{<br />IDictionary<string, object><br />htmlAttribute = new Dictionary<br /><string, object>(); <br />htmlAttribute.Add("class",<br />"my-class")<br />}<br /><br />@{Html.EJ().Splitter("splitter")<br />.HtmlAttributes(htmlAttribute)<br />.Render();}<br /> | Not Available |

| Customize expand/collapse icons | **Property:** <br /> *expanderTemplate* <br /><br />@{Html.EJ().Splitter("splitter")<br />.ExpanderTemplate<br /><img class="eimg"<br />src="expander.png"<br />alt="employee"/>}.Render();}<br /> | Not Available |

| Make control flexible for mobile view | **Property:** *isResponsive* <br /><br />@{Html.EJ().Splitter("splitter")<br />.IsResponsive(true).Render();}<br /> | By default, Splitter works with mobile mode. |

| Refresh the Splitter | **Method:** *refresh()* <br /><br />  
 @Html.EJ().Splitter("splitter")<br/>.Render();<br/>\$("#splitter").ejSplitter("refresh")<br/> |  
**Method:** *refresh()* <br /><br />  
 />@Html.EJS().Splitter("splitter")<br/>.Render();<br/>\$("#splitter").ejSplitter("refresh");<br /> |

| Destroy the Control | **Method:** *destroy()* <br /><br />  
 />@Html.EJ().Splitter("splitter")<br/>.Render();<br/>\$("#splitter").ejSplitter("destroy")<br />  
 /> | **Method:** *destroy()* <br /><br />  
 />@Html.EJS().Splitter("splitter")<br/>.Render();<br/>\$("#splitter").ejSplitter("destroy");<br /> |

| Event triggers after the Splitter created successfully | **Event:** *create* <br /><br />  
 />@Html.EJ().Splitter("splitter")<br/>.ClientSideEvents(e=><br/>e.Create("onCreate"))<br/>.Render();<br/>function onCreate(args) {}<br/> | **Event:** *created* <br /><br />  
 />@Html.EJS().Splitter("splitter")<br/>.ClientSideEvents(e=><br/>e.Create("onCreate")).Render();<br/>function onCreate(args) {}<br/> |

| Event triggers when Splitter has been destroyed | **Event:** *destroy* <br /><br />  
 />@Html.EJ().Splitter("splitter")<br/>.ClientSideEvents(e=><br/>e.Destroy("onDestroy"))<br/>.Render();<br/>function onDestroy(args) {}<br /> }); | Not Available |

#### Accessibility and Localization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Keyboard Navigation | **Property:** *allowKeyboardNavigation* <br /><br />  
 @Html.EJ().Splitter("splitter")<br/>.AllowKeyboardNavigation(true)<br/>.Render();<br/> | No  
 separate property for enable/disable keyboard navigation. Its enabled by default. |

| Right to Left | **Property:** *enableRTL* <br /><br />  
 />@Html.EJ().Splitter("splitter")<br/>.EnableRTL(false).Render();<br/> | **Property:** *enableRtl*<br />  
 /><br />@Html.EJS().Splitter("splitter")<br/>.EnableRtl(true).Render();<br/> |

#### Control State

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable/Disable the control | Not Available | **Property:** *enabled* <br /><br />  
 />@Html.EJS().Splitter("splitter")<br/>.Enabled(true).Render();<br/> |

#### State Maintenance

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Save the model value in local storage or cookies | Not Available | **Property:** *enablePersistence* <br />  
 /><br />@Html.EJS().Splitter("splitter")<br/>.EnablePersistence(true).Render();<br/> |

#### Pane Properties

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *properties* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties().Render();}<br /> | **Property:** *paneSettings* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings().Render();}<br/> |

| Pane Content | Not Available | **Property:** *content* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=>{item.Content("<div>First Pane Content</div>")})<br/>.Render();}<br/> |

| Change the size of the pane | **Property:** *paneSize* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p=><br/>{p.Add().PaneSize("30px")})<br/>.Render();}<br /> | **Property:** *size* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Size("25%")})<br/>.Render();}<br/> |

| Minimum pane size | **Property:** *minSize* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p=>{p.Add()<br/>.MinSize(30)})<br/>.Render();}<br/> | **Property:** *min* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Min("60px")})<br/>.Render();}<br/> |

| Maximum pane size | **Property:** *maxSize* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p=><br/>{p.Add().MaxSize(30)})<br/>.Render();}<br /> | **Property:** *max* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Max("60px")})<br/>.Render();}<br/> |

| Enable/Disable the Pane Resizable behavior | **Property:** *resizable* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p=><br/>{p.Add().Resizable(false)})<br/>.Render();}<br /> | **Property:** *resizable* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Resizable(false)})<br/>.Render();}<br/> |

| Collapsible | **Property:** *collapsible* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p<br/>=>{p.Add().Collapsible(true)})<br/>.Render();}<br /> | **Property:** *collapsible* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Collapsible(true)})<br/>.Render();}<br/> |

| Expandable | **Property:** *expandable* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.PaneProperties(p=><br/>{p.Add().Expandable(true)})<br/>.Render();}<br /> | Not Available |

| Collapsed | Not Available | **Property:** *collapsed* <br /><br />@{Html.EJS().Splitter("splitter")<br/>.PaneSettings(item=><br/>{item.Collapsed(true)})<br/>.Render();}<br/> |

| Add Pane | **Method:** *addItem()* <br /><br />@{Html.EJ().Splitter("splitter")<br/>.Render();}<br/>\$("#splitter").ejSplitter<br/>("addItem", "New Pane 0",<br/>{paneSize:20, minSize:20,<br/>maxSize: 100}, 0);<br/> | **Method:** *addPane()* <br /><br />

```

/>@Html.EJS().Splitter("splitter")
.Render();
$("#splitter").ejSplitter
("addPane",
"New Pane 0",
{ size: "25%",
content: "Pane"}, 0);
|

| Remove Pane | Method: removeItem()

@{Html.EJ().Splitter("splitter")
.Render();}
$("#splitter").ejSplitter
("remov
eItem", 0);
| Method: removePane()

@Html.EJS().Splitter("splitter")
.Render();
$("#splitter")
.ejSplitter("removePane
", 0);
|

| Collapse Pane | Method: collapse()

@{Html.EJ().Splitter("splitter")
.Render();}
$("#splitter")
.ejSplitter("collapse",
0);
| Method: collapse()

@Html.EJS().Splitter("splitter")
.Render();
$("#splitter")
.ejSplitter("collapse",
0);
|

| Expand Pane | Method: expand()

@{Html.EJ().Splitter("splitter")
.Render();}
$("#splitter")
.ejSplitter("expand",
0);
| Method: expand()

@Html.EJS().Splitter("splitter")
.Render();
$("#splitter").ejSplitter
("expand",
0);
|

| Event triggers when before panes get expanded/collapsed | Event: beforeExpandCollapse

@{Html.EJ().Splitter("splitter")
.ClientSideEvents(e=>
e.BeforeExpandCollapse
("
onBeforeExpandCollapse"))
.Render();}
function
onBeforeExpandCollapse
(args)
{}
| Event: beforeExpand

@Html.EJS().Splitter("splitter")
.ClientSideEvents(e=>
e.BeforeExpand("onBeforeExp
and"))
.Render();
function onBeforeExpand(args) {}
Event: beforeCollapse
@Html.EJS().Splitter("splitter")
.ClientSideEvents(e=>
e.BeforeCollapse("onBeforeCol
lapse"))
.Render();
function onBeforeCollapse(args) {}
|

| Event triggers when after panes get expanded/collapsed | Event: expandCollapse

@{Html.EJ().Splitter("splitter")
.ClientSideEvents(e=>
e.ExpandCollapse
("onExp
andCollapse"))
.Render();}
function onExpandCollapse (args) {}
| Event: expand

@Html.EJS().Splitter("splitter")
.ClientSideEvents(e=>
e.Expand("onExpand"))
.R
ender();
function onExpand(args) {}
Event: collapse

@Html.EJS().Splitter("splitter")

## SpreadSheet

### Overview of the ASP.NET MVC Spreadsheet control

The Spreadsheet is an user interactive control to organize and analyze data in tabular format with configuration options for customization. It will load data by importing an Excel/CSV file or from local and remote data sources such as JSON, RESTful services, OData services, and more. The populated data can be exported as Excel with xlsx, xls, CSV and PDF formats.

### Key features

- [Data sources](#): Bind the Spreadsheet control with an array of objects or data from a web service using `DataManager`.
- [Virtualization](#): Provides the option to load large amount of data without performance degradation.
- [Selection](#): Provides the option to select a cell or range of cells.
- [Editing](#): Provides the option to dynamically edit a cell.
- [Formulas](#): Provides built-in calculation library with pre-defined formulas and named range support.
- [Clipboard](#): Provides the option to perform clipboard operations.
- [Cell formatting](#): Provides the option to customize the appearance of cells.
- [Number formatting](#): Provides the option to format the cell value.
- [Open](#): Provides the option to open Excel and CSV files in Spreadsheet.
- [Save](#): Provides the option to save Spreadsheet data as Excel, CSV, and PDF documents.
- [Sorting](#): Helps you to arrange the data to particular order in a selected range of cells.
- [Filtering](#): Helps you to view specific rows in the Spreadsheet by hiding the other rows.
- [Undo Redo](#): Provides the option to perform undo redo operations in Spreadsheet.
- [Collaborative editing](#): Provides the option for real time changes across multiple users in the Spreadsheet.
- [Hyperlink](#): Provides the option to navigate to web link or cell reference within the sheet or to other sheet in Spreadsheet.

- [Resize](#): Allows you to change the row height and column width. Auto fit the rows and columns based on its content.
- [Wrap text](#): Provides the option to display the large content as multiple lines in a single cell.
- [Data validation](#): Provides the option to validate edited values based on data validation rules defined for a cell or range of cells.
- [Find and replace](#): Provides the option to find the data and replace it across all sheets in Spreadsheet.
- [Protect sheet](#): Provides the option to restrict user actions like cell editing, row and column insertion, deletion, and resizing.
- [Borders](#): Provides the option to customize cell gridlines such as color and its style for enhanced UI.
- [Show/hide](#): Provides the option to show/hide rows, columns and sheets.
- [Insert/delete](#): Provides the option to insert/delete rows, columns and sheets.
- [Merge cells](#): Provides the option to combine two or more cells located in the same row or column into a single cell.
- [Conditional formatting](#): Provides the option to format a cell or range of cells based on conditions applied.
- [Autofill](#): Provides the option to fill or copy a series or pattern of values and formats into adjacent cells in any direction.
- [Clear](#): Provides the option to clear the content, formats, and hyperlinks applied to a cell or range of cells in a Spreadsheet.
- [Aggregates](#): Provides the option to check the sum, average, count, and more for the selected cells or range in the sheet.
- [Picture](#): Allows you to view, insert, and modify a picture in a Spreadsheet with customizing options.
- [Chart](#): Transforms your Spreadsheet data to an intuitive overview for better understanding and to make smart business decisions.
- [Freeze panes](#): Allows you to keep the specified rows and columns always visible at the top and left side of the sheet while scrolling through the sheet.
- [Password protection](#): Allows you to protect the workbook with a password.
- [Multi-line editing](#): Allows you to insert a line break between paragraphs of the text within a cell in a Spreadsheet.
- [Calculate range selection](#): Helps you to select a range or multiple ranges when editing a formula in a cell.
- [Right-to-left \(RTL\)](#): Aligns content in the Spreadsheet control from right to left.
- [Templates](#): Templates can be used to create custom user experiences in the Spreadsheet.
- [Globalization](#): Personalize the Spreadsheet control with different languages, as well as culture-specific number, date, and time formatting.
- [Accessibility](#): Provides with built-in accessibility support which helps to access all the Spreadsheet control features through the keyboard, screen readers, or other assistive technology devices.

## Getting Started with ASP.NET MVC Spreadsheet Control

This section briefly explains about how to include [ASP.NET MVC Spreadsheet](#) control in your ASP.NET MVC application using Visual Studio.

### Prerequisites

#### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/ \_LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC

controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

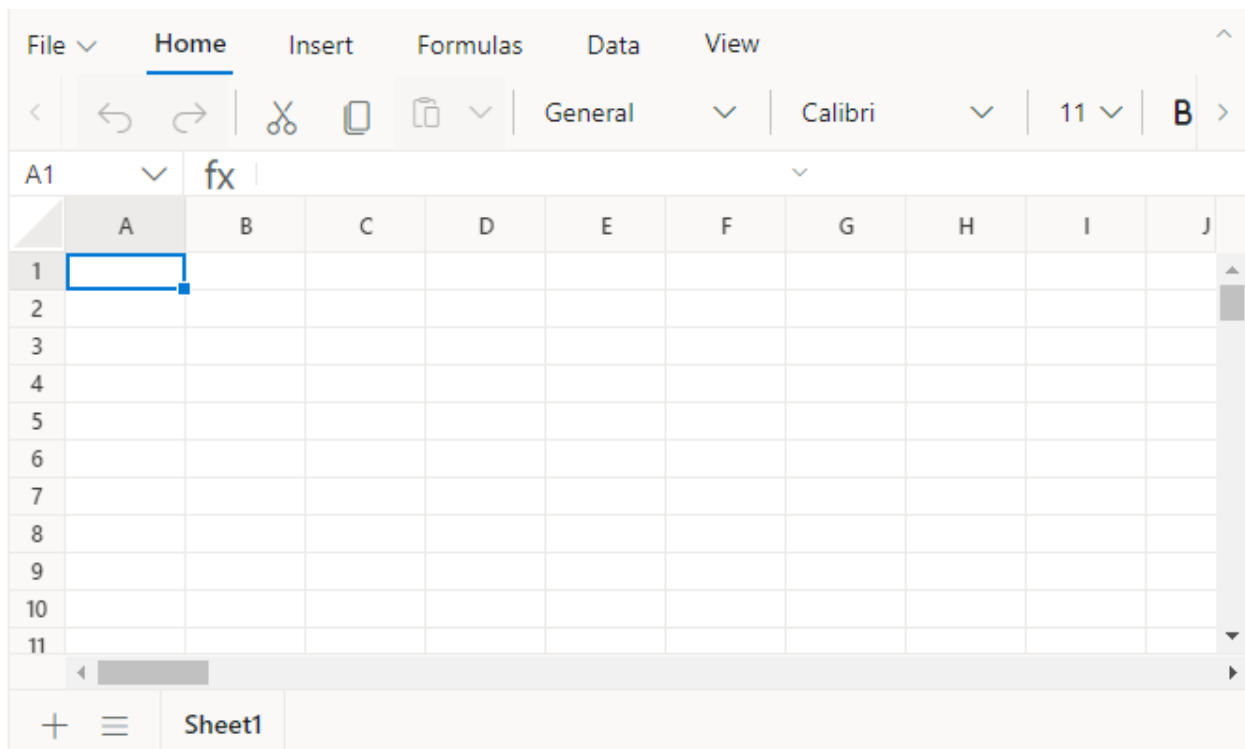

Add ASP.NET MVC Spreadsheet control

Now, add the Syncfusion ASP.NET MVC Spreadsheet control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Spreadsheet control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

See also

- [Data Binding](#)
- [Open and Save](#)

**Note:** You can refer to our [ASP.NET MVC Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Spreadsheet example](#) that shows you how present and manipulate data, including editing, formulas, formatting, importing, and exporting.

### Open and Save in Spreadsheet control

To import an excel file, it needs to be read and converted to client side Spreadsheet model. The converted client side Spreadsheet model is sent as JSON which is used to render Spreadsheet. Similarly, when you save the Spreadsheet, the client Spreadsheet model is sent to the server as JSON for processing and saved. Server configuration is used for this process.

#### Open

The Spreadsheet component opens an Excel document with its data, style, format, and more. To enable this feature, set [allowOpen](#) as `true` and assign service url to the [openUrl](#) property.

#### User Interface:

In user interface you can open an Excel document by clicking **File > Open** menu item in ribbon.

The following sample shows the **Open** option by using the [openUrl](#) property in the Spreadsheet control. You can also use the [beforeOpen](#) event to trigger before opening an Excel file.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Open").AllowOpen(true).BeforeOpen("beforeOpen").Render()
<script>
 function beforeOpen(args) {
 // your code snippets here
 }
</script>
```

#### OPENCONTROLLER.CS

```
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}
```

Find the below table for the beforeOpen event arguments.

| Parameter | Type | Description |
|-----------|------|-------------|
|-----------|------|-------------|

|       |       |       |
|-------|-------|-------|
| ----- | ----- | ----- |
|-------|-------|-------|

|      |                            |                                                                                                                                                 |
|------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|
| file | FileList or string or File | To get the file stream. <b>FileList</b> - contains length and item index. <br/><br><b>File</b> - specifies the file lastModified and file name. |
|------|----------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------|

| cancel | boolean | To prevent the open operation. |

| requestData | object | To provide the Form data. |

**Note:** \* Use **Ctrl + O** keyboard shortcut to open Excel documents.

<br/> \* The default value of the [allowOpen](#) property is true. For demonstration purpose, we have showcased the [allowOpen](#) property in previous code snippet.

#### *Open an external URL excel file while initial load*

You can achieve to access the remote excel file by using the [created](#) event. In this event you can fetch the excel file and convert it to a blob. Convert this blob to a file and **open** this file by using Spreadsheet component open method.

#### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Open").AllowOpen(true).Created("created").Render()
<script>
 function created() {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 fetch("https://cdn.syncfusion.com/scripts/spreadsheet/Sample.xlsx")
 // fetch the remote url
 .then((response) => {
 response.blob().then((fileBlob) => { // convert the excel
file to blob
 var file = new File([fileBlob], "Sample.xlsx");
 //convert the blob into file
 spreadsheet.open({ file: file }); // open the file into
Spreadsheet
 })
 })
 }
</script>
```

#### **OPENCONTROLLER.CS**

```
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}
```

#### *To add custom header during open*

You can add your own custom header to the open action in the Spreadsheet. For processing the data, it has to be sent from server to client side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [beforeOpen](#) event, the custom header can be added to the request during open action.

#### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Home/Open").AllowOpen(true).BeforeOpen("beforeOpen").Render()
<script>
```

```
function beforeOpen(args) {
 args.requestData["headers"] = {
 Authorization: "YOUR TEXT"
 };
}
</script>
```

### OPENCONTROLLER.CS

```
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}
```

### *Open excel file into a read-only mode*

You can open excel file into a read-only mode by using the [openComplete](#) event. In this event, you must protect all the sheets and lock its used range cells by using [protectSheet](#) and [lockCells](#) methods.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Home/Open").OpenComplete("openComplete").Render()
<script>

 function openComplete(args) {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var sheets = spreadsheet.sheets;
 for (var index = 0; index < sheets.length; index++) {
 var name = spreadsheet.sheets[index].name;
 var protectSetting = {
 selectCells: true,
 formatCells: false,
 };
 //To protect the sheet using sheet name
 spreadsheet.protectSheet(name, protectSetting);
 var address = ej.spreadsheet.getRangeAddress([
 0,
 0,
 sheets[index].usedRange.rowIndex,
 sheets[index].usedRange.colIndex,
]);
 //To lock the used range cells
 spreadsheet.lockCells(name + '!' + address, true);
 }
 }
</script>
```

### OPENCONTROLLER.CS

```
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
```

```
open.File = openRequest.Files[0];
return Content(Workbook.Open(open));
}
```

#### External workbook confirmation dialog

When you open an excel file that contains external workbook references, you will see a confirmation dialog. This dialog allows you to either continue with the file opening or cancel the operation. This confirmation dialog will appear only if you set the `AllowExternalWorkbook` property value to **false** during the open request, as shown below. This prevents the spreadsheet from displaying inconsistent data.

```
`csharp
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.AllowExternalWorkbook = false;
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}
```

This feature is only applicable when importing an Excel file and not when loading JSON data or binding cell data.

![External workbook confirmation dialog](./images/external-reference-dialog-alert%20.png)

#### Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- Microsoft Excel (.xlsx)
- Microsoft Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Excel Macro-Enabled Workbook (.xlsm)
- Excel Binary Workbook(.xlsb)

#### Save

The Spreadsheet component saves its data, style, format, and more as Excel file document. To enable this feature, set `allowSave` as **true** and assign service url to the `saveUrl` property.

#### User Interface:

In user interface, you can save Spreadsheet data as Excel document by clicking **File > Save As** menu item in ribbon.

The following sample shows the **Save** option by using the `saveUrl` property in the Spreadsheet control. You can also use the `beforeSave` event to trigger before saving the Spreadsheet as an Excel file.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").SaveUrl("Save").AllowSave(true).Render();
```

### SAVECONTROLLER.CS

```
public void Save(SaveSettings saveSettings)
{
 Workbook.Save(saveSettings);
}
```

Find the below table for the beforeSave event arguments.

| Parameter    | Type     | Description                                                                                                                                                              |
|--------------|----------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| url          | string   | Specifies the save url.                                                                                                                                                  |
| fileName     | string   | Specifies the file name.                                                                                                                                                 |
| saveType     | SaveType | Specifies the saveType like Xlsx, Xls, Csv and Pdf.                                                                                                                      |
| customParams | object   | Passing the custom parameters from client to server while performing save operation.                                                                                     |
| isFullPost   | boolean  | It sends the form data from client to server, when set to true. It fetches the data from client to server and returns the data from server to client, when set to false. |
| needBlobData | boolean  | You can get the blob data if set to true.                                                                                                                                |
| cancel       | boolean  | To prevent the save operations.                                                                                                                                          |

**Note:** \* Use **Ctrl + S** keyboard shortcut to save the Spreadsheet data as Excel file.

\* The default value of [allowSave](#) property is **true**. For demonstration purpose, we have showcased the [allowSave](#) property in previous code snippet.

\* Demo purpose only, we have used the online web service url link.

*To send and receive custom params from client to server*

Passing the custom parameters from client to server by using [beforeSave](#) event.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").SaveUrl("Save").AllowSave(true).BeforeSave("beforeSave").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
 function beforeSave(args) {
 args.customParams = { customParams: 'you can pass custom params in server side' }; // you can pass the custom params
 }
</script>
```

**CUSTOMPARAMSCONTROLLER.CS**

```

public IActionResult Index()

### *To add custom header during save*

You can add your own custom header to the save action in the Spreadsheet. For processing the data, it has to be sent from client to server side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [fileMenuItemSelect](#) event, the custom header can be added to the request during save action.

### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").SaveUrl("Save").AllowSave(true).FileMenuItemSelect("fileMenuItemSelect").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
function fileMenuItemSelect(args) {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (args.item.text === "Microsoft Excel") {
 args.cancel = true;
 spreadsheet.saveAsJson().then(response => {
 var formData = new FormData();
 formData.append(
 "JSONData",
 JSON.stringify(response.jsonObject.Workbook)
);
 formData.append("fileName", "Sample");
 formData.append("saveType", "Xlsx");
 fetch(
 "https://services.syncfusion.com/aspnet/production/api/spreadsheet/save",
 {
 method: "POST",
 headers: { Authorization: "YOUR TEXT" },
 body: formData
 }
).then(response => {
 response.blob().then(data => {
 var anchor = createElement("a", {
 attrs: { download: "Sample.xlsx" }
 });
 var url = URL.createObjectURL(data);
 anchor.href = url;
 document.body.appendChild(anchor);
 anchor.click();
 URL.revokeObjectURL(url);
 document.body.removeChild(anchor);
 });
 });
 });
 }
}
```

```
}
</script>
```

**CUSTOMHEADERCONTROLLER.CS**

```
public IActionResult Index()
{

```

#### To change the PDF orientation

By default, the PDF document is created in **Portrait** orientation. You can change the orientation of the PDF document by using the `args.pdfLayoutSettings.orientation` argument settings in the [beforeSave](#) event.

The possible values are:

- **Portrait** - Used to display content in a vertical layout.
- **Landscape** - Used to display content in a horizontal layout.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").SaveUrl("Save").AllowSave(true).BeforeSave("beforeSave").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
 function beforeSave(args) {
 args.pdfLayoutSettings.orientation = 'Landscape'; // You can change
 the orientation of the PDF document
 }
</script>
```

### Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- Microsoft Excel (.xlsx)
- Microsoft Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Portable Document Format (.pdf)

### Methods

To save the Spreadsheet document as an **xlsx**, **xls**, **csv**, or **pdf** file, by using **save** method should be called with the **url**, **fileName** and **saveType** as parameters. The following code example shows to save the spreadsheet file as an **xlsx**, **xls**, **csv**, or **pdf** in the button click event.

### CSHTML

```

@Html.EJS().DropDownButton("element").Content("Save").Items((IEnumerable<object>)ViewBag.items).Select("itemSelect").Render()

```

```

@Html.EJS().Spreadsheet("spreadsheet").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
 function itemSelect(args) {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (args.item.text === 'Save As xlsx')
 spreadsheetObj.save({url:
'https://services.syncfusion.com/aspnet/production/api/spreadsheet/save',
fileName: "Sample", saveType: "Xlsx"});
 if (args.item.text === 'Save As xls')
 spreadsheetObj.save({url:
'https://services.syncfusion.com/aspnet/production/api/spreadsheet/save',
fileName: "Sample", saveType: "Xls"});
 if (args.item.text === 'Save As csv')
 spreadsheetObj.save({url:
'https://services.syncfusion.com/aspnet/production/api/spreadsheet/save',fil
eName: "Sample", saveType: "Csv"});
 if (args.item.text === 'Save As pdf')
 spreadsheetObj.save({url:
'https://services.syncfusion.com/aspnet/production/api/spreadsheet/save',fil
eName: "Sample", saveType: "Pdf"});
 }
</script>

```

### Server Configuration

In Spreadsheet component, import and export operation processed in **server-side**, to use importing and exporting in your projects, it is required to create a server with any of the following web services.

- WebAPI
- WCF Service
- ASP.NET MVC Controller Action

**Note:** \* Refer the above open and save operation to shows the create a server using WebAPI configuration for Excel import and export. In ASP.NET Core and ASP.NET MVC you can configure the server in controller.

### Server Dependencies

Open and save helper functions are shipped in the Syncfusion.EJ2.Spreadsheet package, which is available in Essential Studio and [nuget.org](https://www.nuget.org). Following list of dependencies required for Spreadsheet open and save operations.

#### | Platforms | Assembly | Nuget Package |

| ---- | ---- | ---- |

| ASP.NET Core (Targeting .NET Core) | Syncfusion.EJ2.AspNet.Core <br/>  
 Syncfusion.EJ2.Spreadsheet.AspNet.Core <br/> Syncfusion.Compression.Net.Core <br/>  
 Syncfusion.XlsIO.Net.Core <br/> Syncfusion.XlsIORenderer.Net.Core <br/> |  
[Syncfusion.EJ2.Spreadsheet.AspNet.Core](#) <br/> [Syncfusion.XlsIORenderer.Net.Core](#) |

| ASP.NET MVC4 | Syncfusion.EJ2.MVC4 <br/> Syncfusion.EJ2.Spreadsheet.AspNet.MVC4 <br/>  
 Syncfusion.Compression.Base <br/> Syncfusion.XlsIO.AspNet.Mvc4 <br/>  
 Syncfusion.ExcelToPdfConverter.AspNet.Mvc4 <br/> | [Syncfusion.EJ2.Spreadsheet.AspNet.MVC4](#) <br/>  
[Syncfusion.ExcelToPdfConverter.AspNet.Mvc4](#) |

| ASP.NET MVC5 | Syncfusion.EJ2.MVC5 <br/> Syncfusion.EJ2.Spreadsheet.AspNet.MVC5 <br/>  
 Syncfusion.Compression.Base <br/> Syncfusion.XlsIO.AspNet.Mvc5 <br/>  
 Syncfusion.ExcelToPdfConverter.AspNet.Mvc5 <br/> | [Syncfusion.EJ2.Spreadsheet.AspNet.MVC5](#) <br/>  
[Syncfusion.ExcelToPdfConverter.AspNet.Mvc5](#) |

### Worksheet in Spreadsheet control

Worksheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data.

#### Add sheet

You can dynamically add or insert a sheet by one of the following ways,

- Click the **Add Sheet** button in the sheet tab. This will add a new empty sheet next to current active sheet.
- Right-click on the sheet tab, and then select **Insert** option from the context menu to insert a new empty sheet before the current active sheet.
- Using **insertSheet** method, you can insert one or more sheets at your desired index.

The following code example shows the insert sheet operation in spreadsheet.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowRibbon(false).ShowFormulaBar(false).Created("created").Sheets(sheet =>
```

```

{
 sheet.Name("Shipment Details").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();

 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
function created() {
 // Applies style formatting to the active sheet before inserting a new
 sheet
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:H1');
 this.cellFormat({ textAlign: 'center' }, 'D2:H11');
 // inserting a new sheet with data at 1st index
 // You can also insert empty sheets by specifying the start and end
 sheet index instead of sheet model
 this.insertSheet([
 index: 1,
 name: 'Inserted Sheet',
 ranges: [{ dataSource:
@Html.Raw(JsonConvert.SerializeObject(@ViewBag.DefaultData)) }],
 columns: [{ width: 150 }, { width: 110 }, { width: 110 }, {
width: 85 }, { width: 85 }, { width: 85 }, { width: 85 },
 { width: 85 }]
]]);
 // Applies style formatting for the inserted sheet
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'Inserted Sheet!A1:H1');
 this.cellFormat({ textAlign: 'center' }, 'Inserted Sheet!D2:H15');
}
</script>

```

### INSERTSHEETCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { CustomerName= "Romona Heaslip", Model= "Taurus",

 new { CustomerName= "Rosemaria Thomann", Model= "Caravan",
Color= "Violet", PaymentMode= "Net Banking", DeliveryDate= "02/08/2014",
Amount= "7685.49" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Delete sheet

The Spreadsheet has support for removing an existing worksheet. You can dynamically delete the existing sheet by the following way,

- Right-click on the sheet tab, and then select **Delete** option from context menu.
- Using **delete** method to delete the sheets.

### Rename sheet

You can dynamically rename an existing worksheet in the following way,

- Right-click on the sheet tab, and then select **Rename** option from the context menu.

## Headers

By default, the row and column headers are visible in worksheets. You can dynamically show or hide worksheet headers by using one of the following ways,

- Switch to **View** tab, and then select **Hide Headers** option to hide both the row and column headers.
- Set **showHeaders** property in sheets as **true** or **false** to show or hide the headers at initial load. By default, the **showHeaders** property is enabled in each worksheet.

## Gridlines

Gridlines act as a border like appearance of cells. They are used to distinguish cells on the worksheet. You can dynamically show or hide gridlines by using one of the following ways,

- Switch to **View** tab, and then select **Hide Gridlines** option to hide the gridlines in worksheet.
- Set **showGridLines** property in sheets as **true** or **false** to show or hide the gridlines at initial load. By default, the **showGridLines** property is enabled in each worksheet.

The following code example shows the headers and gridlines operation in spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("created").Sheets(sheet =>
{
 sheet.Name("Shipment
Details").ShowGridLines(false).ShowHeaders(false).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 })
 .Columns(column =>
 {
 column.Width(130).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 })
 .Add();
}).Render()
<script>
function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:H1');
 this.cellFormat({ textAlign: 'center' }, 'D2:H15');
 // The gridlines have been removed to set border for the range of
cells
 this.setBorder({ border: '1px solid #e0e0e0' }, 'A1:H15');
}
</script>
```

### HEADERCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { CustomerName= "Romona Heaslip", Model= "Taurus",
Color= "Aquamarine", PaymentMode= "Debit Card", DeliveryDate=

Amount= "7685.49" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Sheet visibility

Hiding a worksheet can help prevent unauthorized or accidental changes to your file.

There are three visibility state as like Microsoft Excel,

| State | Description |

|-----|-----|

| **Visible** | You can see the worksheet once the component is loaded. |

| **Hidden** | This worksheet is not visible, but you can unhide by selecting the sheet from **List All Sheets** dropdown menu. |

| **VeryHidden** | This worksheet is not visible and cannot be unhidden. Changing the state property to **Visible** is the only way to view this sheet. |

The following code example shows the three types of sheet visibility state.

### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("create
d").Sheets(sheet =>
{
 sheet.Name("Visible Sheet").State(SheetState.Visible).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Very Hidden
Sheet").State(SheetState.VeryHidden).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Hidden Sheet").State(SheetState.Hidden).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 });
});
```

```

 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
function created() {
 // Applies style formatting to active visible sheet
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:H1');
 this.cellFormat({ textAlign: 'center' }, 'D2:H11');
 // Applies style formatting to active hidden sheet
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' }, 'Hidden
Sheet!A1:H1');
 this.cellFormat({ textAlign: 'center' }, 'Hidden Sheet!D2:H15');
}
</script>

```

### SHEETVISIBILITYCONTROLLER.CS

```

## Cell Range in Spreadsheet control

A group of cells in a sheet is known as cell range.

### Wrap text

Wrap text allows you to display large content as multiple lines in a single cell. By default, the wrap text support is enabled. Use the [allowWrap](#) property to enable or disable the wrap text support in spreadsheet.

Wrap text can be applied or removed to a cell or range of cells in the following ways,

- Using the `wrap` property in `cell`, you can enable or disable wrap text to a cell at initial load.
- Select or deselect wrap button from ribbon toolbar to apply or remove the wrap text to the selected range.
- Using the `wrap` method, you can apply or remove the wrap text once the component is loaded.

The following code example shows the wrap text functionality in spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("create
d").Sheets(sheet =>
{
 sheet.Name("Movie List").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Rows(row =>
 {
 row.Height(30).Add();
 row.Cells(cell =>

```

```

 {
 cell.Index(7).Wrap(true).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(7).Wrap(true).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(7).Wrap(true).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(7).Wrap(true).Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(100).Index
 (1).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(150).Add();
 column.Width(120).Add();
 column.Width(90).Add();
 column.Width(180).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:H1');
 this.cellFormat({ verticalAlign: 'middle' }, 'A1:H5');
 this.cellFormat({ textAlign: 'center' }, 'A2:B5');
 this.cellFormat({ textAlign: 'center' }, 'D2:D5');
 // To wrap the cells from E2 to E5 range
 this.wrap('E2:E5');
 // To unwrap the H3 cell
 this.wrap('H3', false);
 }
</script>

```

### WRAPTEXTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { No= "1", ReleasedOn= "1994", Title= "Forrest Gump",
 Rating= "5 Stars", Casts= "Tom Hanks, Robin Wright, Gary Sinise",
 DirectedBy= "Robert Zemeckis", Genre= "Drama", Comments= "Based on the 1986
 novel of the same name by Winston Groom" },
 new { No= "2", ReleasedOn= "1946", Title= "It's a
 Wonderful Life", Rating= "2 Stars", Casts= "James Stewart, Donna Reed,
 Lionel Barrymore", DirectedBy= "Frank Capra", Genre= "Drama", Comments=
 "Colorized version" },
 }
}

```

```

 new { No= "3", ReleasedOn= "1988", Title= "Big", Rating=
"4 Stars", Casts= "Tom Hanks, Elizabeth Perkins, Robert Loggia",
DirectedBy= "Penny Marshall", Genre= "Comedy", Comments= "A thirteen-year-
old boy wishes to be big, and his wish comes true." },
 new { No= "4", ReleasedOn= "1954", Title= "Rear Window",
Rating= "4 Stars", Casts= "James Stewart, Grace Kelly, Wendell Corey",
DirectedBy= "Alfred Hitchcock", Genre= "Suspense", Comments= "Truly
suspenseful and masterfully crafted" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Limitations of Wrap text

The following features have some limitations in wrap text:

- Sorting with wrap text applied data.
- Merge with wrap text

### Merge cells

Merge cells allows users to span two or more cells in the same row or column into a single cell. When cells with multiple values are merged, top-left most cell data will be the data for the merged cell. By default, the merge cells option is enabled. Use [allowMerge](#) property to enable or disable the merge cells option in spreadsheet.

You can merge the range of cells in the following ways,

- Set the `rowSpan` and `colSpan` property in `cell` to merge the number of cells at initial load.
- Select the range of cells and apply merge by selecting the desired option from ribbon toolbar.
- Use `merge` method to merge the range of cells, once the component is loaded.

The available merge options in spreadsheet are,

| Type               | Action                                                           |
|--------------------|------------------------------------------------------------------|
| ----- -----        |                                                                  |
| Merge All          | Combines all the cells in a range in to a single cell (default). |
| Merge Horizontally | Combines cells in a range as row-wise.                           |
| Merge Vertically   | Combines cells in a range as column-wise.                        |
| UnMerge            | Splits the merged cells into multiple cells.                     |

The following code example shows the merge cells operation in spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("create
d").Sheets(sheet =>
{
 sheet.Name("Movie List").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }
}
)

```

```

 }).Rows(row =>
 {
 row.Height(35).Add();
 row.Height(35).Cells(cell =>
 {
 cell.Index(1).RowSpan(2).Add();
 cell.ColSpan(2).Add();
 cell.Index(6).ColSpan(3).Add();
 cell.Index(10).RowSpan(2).ColSpan(3).Add();
 cell.ColSpan(2).Index(13).Add();
 cell.ColSpan(2).Index(17).Add();
 }).Add();
 row.Height(35).Cells(cell =>
 {
 cell.Index(3).ColSpan(3).Add();
 cell.ColSpan(4).Index(6).Add();
 cell.Index(13).ColSpan(3).Add();
 cell.Index(17).ColSpan(2).Add();
 }).Add();
 row.Height(35).Cells(cell =>
 {
 cell.Index(2).ColSpan(3).Add();
 cell.ColSpan(2).Index(5).Add();
 cell.Index(7).ColSpan(3).Add();
 cell.Index(15).ColSpan(2).Add();
 cell.Index(17).ColSpan(2).Add();
 }).Add();
 row.Height(35).Cells(cell =>
 {
 cell.Index(2).ColSpan(3).Add();
 cell.ColSpan(4).Index(6).Add();
 cell.Index(16).ColSpan(2).Add();
 }).Add();
 row.Height(35).Cells(cell =>
 {
 cell.Index(2).ColSpan(4).Add();
 cell.ColSpan(3).Index(7).Add();
 cell.Index(15).ColSpan(2).Add();
 cell.Index(17).ColSpan(2).Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(90).Add();
 column.Width(150).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 }

```

```

 column.Width(120).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:S1');
 this.numberFormat('h:mm AM/PM', 'C1:S1');
 this.cellFormat({ verticalAlign: 'middle' }, 'A1:S11');
 // Merging the `K4:M4` cells using method
 this.merge('K4:M4');
 // Merging the 5th and 6th row cells across 11th, 12th and 13th
column
 this.merge('K5:M6', 'Vertically');
 // Merging the 18th and 19th column cells across 2nd, 3rd and 4th
row
 this.merge('N4:O6', 'Horizontally');
 }
</script>

```

### MERGECELLCONTROLLER.CS

 return View();
}

```

### Limitations of Merge

The following features have some limitations in Merge:

- Merge with filter.
- Merge with wrap text.

### Data Validation

Data Validation is used to restrict the user from entering the invalid data. You can use the [allowDataValidation](#) property to enable or disable data validation.

**Note:** \* The default value for `allowDataValidation` property is `true`.

### Apply Validation

You can apply data validation to restrict the type of data or the values that users enter into a cell.

You can apply data validation by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Data Validation item.
- Use the `addDataValidation()` method programmatically.

### Clear Validation

Clear validation feature is used to remove data validations from the specified ranges or the whole worksheet.

You can clear data validation rule by one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Validation item.
- Use the `removeDataValidation()` method programmatically.

### Highlight Invalid Data

Highlight invalid data feature is used to highlight the previously entered invalid values.

You can highlight an invalid data by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Highlight Invalid Data item.

- Use the `addInvalidHighlight()` method programmatically.

#### *Clear Highlighted Invalid Data*

Clear highlight feature is used to remove the highlight from invalid cells.

You can clear the highlighted invalid data by using the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Highlight item.
- Use the `removeInvalidHighlight()` method programmatically.

#### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("created").Sheets(sheet =>
{
 sheet.Name("PriceDetails").Rows(row =>
 {
 row.Cells(cell =>
 {
 cell.Value("Seller Name").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Customer Id").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Customer Name").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Product Name").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Product Price").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();

ValidationType.WholeNumber, Operator = ValidationOperator.NotEqualTo, Value1
= "1" }).Add();
 cell.Value("Sean").Add();
 cell.Value("Kango").Validation(new SpreadsheetValidation() {
Type = ValidationType.List, Value1 = "Kango, Ropes" }).Add();
 cell.Value("450").Validation(new SpreadsheetValidation() { Type
= ValidationType.List, Value1 = "450, 95" }).Add();
 cell.Value("06/25/2019").Add();
 cell.Value("01:30:11 PM").Add();
 cell.Value("545.00").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("John").Add();
 cell.Value("1").Validation(new SpreadsheetValidation() { Type =
ValidationType.WholeNumber, Operator = ValidationOperator.NotEqualTo, Value1
= "1" }).Add();
 cell.Value("Nash").Add();
 cell.Value("JCB").Validation(new SpreadsheetValidation() { Type
= ValidationType.List, Value1 = "JCB, Ropes, scaffolding" }).Add();
 cell.Value("90000").Validation(new SpreadsheetValidation() {
Type = ValidationType.List, Value1 = "90000, 95, 10000" }).Add();
 cell.Value("09/22/2019").Add();
 cell.Value("12:30:02 PM").Add();
 cell.Value("1,00,095.00").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(88).Add();
 column.Width(88).Add();
 column.Width(106).Add();
 column.Width(98).Add();
 column.Width(88).Add();
 column.Width(86).Add();
 column.Width(107).Add();
 column.Width(81).Add();
 }).Add();
}).Render()
<script>
function created() {

```

```

 //Add Data Validation to range.
 this.addDataValidation({ type: 'TextLength', Operator:
'LessThanOrEqualTo', Value1: '4' }, 'A2:A5');
 this.addDataValidation({ type: 'WholeNumber', Operator:
'NotEqualTo', Value1: '1' }, 'B2:B5');
 this.addDataValidation({ type: 'Date', Operator: 'NotEqualTo',
Value1: '04/11/2019' }, 'F2:F5');
 this.addDataValidation({ type: 'Time', Operator: 'Between', Value1:
'10:00:00 AM', value2: '11:00:00 AM' }, 'G2:G5');
 this.addDataValidation({ type: 'Decimal', Operator: 'LessThan',
Value1: '100000.00' }, 'H2:H5');
 //Highlight Invalid Data.
 this.addInvalidHighlight('A1:H5');
 }
</script>

```

### DATAVALIDATION.CS

```

public IActionResult Index()
{
 return View();
}

```

#### Limitations of Data validation

The following features have some limitations in Data Validation:

- Entire row data validation.
- Insert row between the data validation.
- Copy/paste with data validation.
- Delete cells between data validation applied range.

#### Auto Fill

Auto Fill is used to fill the cells with data based on adjacent cells. It also follows a pattern from adjacent cells if available. There is no need to enter the repeated data manually. You can use [allowAutoFill](#) property to enable/disable the auto fill support. You can also use [showFillOptions](#) property to enable/disable the fill option and [fillType](#) property to change the default auto fill option which is available in [autoFillSettings](#).

You can do this by one of the following ways,

- Using “AutoFillOptions” menu which is open, while drag and drop the cell using fill handle element.
- Use the `autoFill()` method programmatically.

The available parameters in `autoFill()` method are,

| Parameter | Type   | Description               |
|-----------|--------|---------------------------|
| dataRange | string | Specifies the data range. |

| fillRange | string | Specifies the fill range. |

| direction | AutoFillDirection | Specifies the direction("Up","Right","Down","Left")to be filled. |

| fillType | AutoFillType | Specifies the fill type("CopyCells","FillSeries","FillFormattingOnly","FillWithoutFormatting") for autofill action. |

In Auto Fill we have following options,

- Copy Cells
- Fill Series
- Fill Formatting Only
- Fill Without Formatting

**Note:** \* The default auto fill option is “FillSeries” which can be referred from fillType property.

#### *Copy Cells*

To copy the selected cell content to the adjacent cells. You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Copy Cells” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “CopyCells” as fill type in autoFill method to fill the adjacent cells.

#### *Fill Series*

To fill the series of numbers, characters, or dates based on selected cell content to the adjacent cells with their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Series” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillSeries” as fill type in autoFill method to fill the adjacent cells.

#### *Fill Formatting Only*

To fill the cell style and number formatting based on the selected cell content to the adjacent cells without their content.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Formatting Only” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillFormattingOnly” as fill type in autoFill method to fill the adjacent cells.

#### *Fill Without Formatting*

To fill series of numbers, characters, or dates based on the selected cells to the adjacent cells without their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Without Formatting” option in “AutoFillOptions” menu to fill the adjacent cells.

- Using “FillWithoutFormatting” as fill type in `autoFill` method to fill the adjacent cells.

In the following sample, you can enable/disable the fill option on the button click event by using the `showFillOptions` property in `autoFillSettings`.

### CSHTML

```
@Html.EJS().Button("showfillbtn").Content("Change
showFillOptions").Render();
@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Name("Price Details").Rows(row =>
 {
 row.Height(30).Add();
 }).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A1").
 Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ backgroundColor: '#357cd2', color: '#fff',
fontWeight: 'bold', textAlign: 'center' }, 'A1:H1');
 this.autoFill('D2:D3', 'D4:D11', 'Down', 'CopyCells');
 this.autoFill('E2:E3', 'E4:E11', 'Down', 'FillSeries');
 this.autoFill('B2:B3', 'B4:B11', 'Down', 'FillFormattingOnly');
 this.autoFill('C2:C3', 'C4:C11', 'Down', 'FillWithoutFormatting');
 }
 document.getElementById("showfillbtn").addEventListener('click',
function () {
 var spreadsheetObj =
document.getElementById("spreadsheet").ej2_instances[0];
 var showFillOptions =
spreadsheetObj.autoFillSettings.showFillOptions;
 spreadsheetObj.autoFillSettings.showFillOptions =
!showFillOptions;
 });
</script>
```

 new { Item Name= "T-Shirts", Date= "10/31/2014", Time=
"12=01=44 AM", Quantity= "50", Price= "10", Amount= "500", Discount= "9",
Profit= "55" }
 };
 ViewBag.DefaultData = data;
 return View();
}

```

## Clear

Clear feature helps you to clear the cell contents (formulas and data), formats (including number formats, conditional formats, and borders) in a spreadsheet. When you apply clear all, both the contents and the formats will be cleared simultaneously.

### Apply Clear Feature

You can apply clear feature by using one of the following ways,

- Select the clear icon in the Ribbon toolbar under the Home Tab.
- Using the `clear()` method to clear the values.

Clear has the following types in the spreadsheet,

| Options | Uses |

|-----|-----|

| **Clear All** | Used to clear all contents, formats, and hyperlinks. |

| **Clear Formats** | Used to clear the formats (including number formats, conditional formats, and borders) in a cell. |

| **Clear Contents** | Used to clear the contents (formulas and data) in a cell. |

| **Clear Hyperlinks** | Used to clear the hyperlink in a cell. |

### Methods

Clear the cell contents and formats in the Spreadsheet document by using the **clear** method. The clear method has **type** and **range** as parameters. The following code example shows how to clear the cell contents and formats in the button click event.

### CSHTML

```
@Html.EJS().DropDownButton("element").Content("Clear").Items((IEnumerable<object>)ViewBag.items).Select("itemSelect").Render()
@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
function created() {
 this.cellFormat({ fontWeight: 'bold', fontSize: '12pt', 'A1:E1' });
 this.cellFormat({ color: '#10c469' }, 'B1:B10');
}

function itemSelect(args) {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (args.item.text === 'Clear All')
 spreadsheet.clear({ type: 'Clear All', range: 'D1:D10' }); // Clear
the content, formats and hyperlinks applied in the provided range.
 if (args.item.text === 'Clear Formats')
 spreadsheet.clear({ type: 'Clear Formats', range: 'B1:B10' }); //
Clear the formats applied in the provided range
 if (args.item.text === 'Clear Contents')
 spreadsheet.clear({ type: 'Clear Contents', range: 'A1:A10' }); //
Clear the content in the provided range
 if (args.item.text === 'Clear Hyperlinks')
 spreadsheet.clear({ type: 'Clear Hyperlinks', range: 'F2:F6' }); //
Clear the hyperlinks applied in the provided range
}
</script>
```

### CLEARCONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { OrderID= "10248", CustomerID= "VINET", EmployeeID=
"5", ShipName= "Vins et alcools Chevalier", ShipCity= "Reims", Website=
"https://www.amazon.com/" },
 new { OrderID= "10249", CustomerID= "TOMSP", EmployeeID=
"6", ShipName= "Toms Spezialitäten", ShipCity= "Münster", Website=
"https://www.overstock.com/" },
 new { OrderID= "10250", CustomerID= "HANAR", EmployeeID=
"4", ShipName= "Hanari Carnes", ShipCity= "Rio de Janeiro", Website=
"https://www.aliexpress.com/" },
 }
```

```

 new { OrderID= "10251", CustomerID= "VICTE", EmployeeID=
"3", ShipName= "Victuailles en stock", ShipCity= "Lyon", Website=
"http://www.alibaba.com/" },

## Editing in Spreadsheet control

You can edit the contents of a cell directly in the cell or by typing in the formula bar. By default, the editing feature is enabled in the spreadsheet. Use the [allowEditing](#) property to enable or disable the editing feature.

### Edit cell

You can start editing by one of the following ways,

- Double click a cell to start the edit mode.
- Press **F2** key to edit the active cell.
- Use formula bar to perform editing.
- Use **BACKSPACE** or **SPACE** key to clear the cell content and start the edit mode.
- Using the **startEdit** method.

### Save cell

If the cell is in editable state, you can save the edited cell by one of the following ways,

- Perform mouse click on any other cell rather than the current editing cell.
- Press **Enter** or **Tab** keys to save the edited cell content.
- Using the `endEdit` method.

### Cancel editing

To cancel the editing without saving the changes, you can use one of the following ways,

- Press **ESCAPE** key, this will remove the editable state and update the unchanged cell content.
- Using the `closeEdit` method.

The following sample shows how to prevent the editing and cell save. Here **E** column prevent the editing by using cancel argument as true in `cellEdit` event. In **D** column, prevent saving the edited changes by using cancel argument as true in `beforeCellSave` and use `closeEdit` method in spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.CellEdit("cellEdit").BeforeCellSave("beforeCellSave").Sheets(sheet =>
{
 sheet.SelectedRange("C7").Name("Movie List").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Rows(row =>
 {
 row.Index(10).Cells(cell =>
 {
 cell.Index(3).Value("Total Amount:").Style(new
SpreadsheetCellStyle() { FontWeight = FontWeight.Bold }).Add();
 cell.Formula("=SUM(E2:E10)").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(120).Add();
 column.Width(180).Add();
 column.Width(100).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:E1');
 this.cellFormat({ textAlign: 'center' }, 'A2:A10');
 this.cellFormat({ textAlign: 'center' }, 'C2:C10');
 this.numberFormat('$#,##0.00', 'D2:D10');
 this.numberFormat('$#,##0.00', 'E2:E11');
 }
 function cellEdit(args) {
 // Preventing the editing in 5th(Amount) column.
```

```

 if (args.address.includes('E')) { args.cancel = true; }
 }
 function beforeCellSave(args) {
 // Prevent saving the edited changes in 4th(Rate) column.
 if (args.address.includes('D')) {
 args.cancel = true;
 // Manually removes the editable state without saving the
 changes. Use `endEdit` method if you want to save the changes.
 this.closeEdit();
 }
 }
}
</script>

```

## EDITINGCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { ItemCode= "I231", ItemName= "Chinese Combo Noodle",

- [Undo and Redo](#)
- [Unlock the particular cells in the protected sheet](#)

## Formulas in Spreadsheet control

Formulas are used for calculating the data in a worksheet. You can refer the cell reference from same sheet or from different sheets.

### Usage

You can set formula for a cell in the following ways,

- Using the `formula` property from `cell`, you can set the formula or expression to each cell at initial load.
- Set the formula or expression through data binding.
- You can set formula for a cell by [editing](#).
- Using the `updateCell` method, you can set or update the cell formula.

### Create User Defined Functions / Custom Functions

The Spreadsheet includes a number of built-in formulas. For your convenience, a list of supported formulas can be found [here](#).

You can define and use an unsupported formula, i.e. a user defined/custom formula, in the spreadsheet by using the `addCustomFunction` function. Meanwhile, remember that you should define a user defined/custom formula whose results should only return a single value. If a user-defined/custom formula returns an array, it will be time-consuming to update adjacent cell values.

The following code example shows an unsupported formula in the spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).StartCell("A2").
 Add();
 }).Rows(row =>
 {
 row.Height(40).CustomHeight(true).Cells(cell =>
 {
 cell.ColSpan(5).Value("Monthly Expense").Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, VerticalAlign =
 VerticalAlign.Middle, TextAlign=TextAlign.Center, FontSize="15pt",
 FontStyle= FontStyle.Italic }).Add();
 }).Add();
 row.Height(30).Add();
 row.Index(11).Cells(cell =>
 {
 cell.Value("Totals").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, FontStyle= FontStyle.Italic }).Add();
 cell.Formula("=SUM(B3:B11)").Add();
 cell.Formula("=SUM(C3:C11)").Add();
 cell.Formula("=SUM(D3:D11)").Add();
 }).Add();
 row.Cells(cell =>
 {
```

```

 cell.Index(1).Value("Number of Categories").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=COUNTA(A3:A11)").Index(3).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Average Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=AVERAGE(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Min Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=MIN(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Max Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=MAX(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(150).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(140).Add();
 column.Width(150).Add();
 }).Add();
 }).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A2:F2');
 this.numberFormat('$#,##0', 'B3:D12');
 this.numberFormat('0%', 'E3:E12');
 // Adding custom function for calculating the percentage between two
 cells.
 this.addCustomFunction(calculatePercentage, 'PERCENTAGE');
 // Adding custom function for calculating round down for the value.
 this.addCustomFunction(roundDownHandler, 'ROUNDDOWN');
 // Calculate percentage using custom added formula in E12 cell.
 this.updateCell({ formula: '=PERCENTAGE(C12,D12)' }, 'E12');
 // Calculate round down for average values using custom added
 formula in F12 cell.
 this.updateCell({ formula: '=ROUNDDOWN(F11,1)' }, 'F12');
 }
 // Custom function to calculate percentage between two cell values.
 function calculatePercentage(firstCell,secondCell) {
 return (firstCell) / (secondCell);
 }

```

```

 }
 // Custom function to calculate round down for values.
 function roundDownHandler(value, digit) {
 var multiplier = Math.pow(10, digit);
 return Math.floor(value * multiplier) / multiplier;
 }
</script>

```

### FORMULACONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { Category= "Household Utilities", MonthlySpend=
 "=C3/12", AnnualSpend= "3000", LastYearSpend= "3000", PercentageChange=
 "=C3/D3", AverageChange= "=7.9/E3"},
 new { Category= "Food", MonthlySpend= "=C4/12",
 AnnualSpend= "2500", LastYearSpend= "2250", PercentageChange= "=C4/D4",
 AverageChange= "=7.9/E4"},
 new { Category= "Gasoline", MonthlySpend= "=C5/12",
 AnnualSpend= "1500", LastYearSpend= "1200", PercentageChange= "=C5/D5",
 AverageChange= "=7.9/E5"},
 new { Category= "Clothes", MonthlySpend= "=C6/12",
 AnnualSpend= "1200", LastYearSpend= "1000", PercentageChange= "=C6/D6",
 AverageChange= "=7.9/E6"},
 new { Category= "Insurance", MonthlySpend= "=C7/12",
 AnnualSpend= "1500", LastYearSpend= "1500", PercentageChange= "=C7/D7",
 AverageChange= "=7.9/E7"},
 new { Category= "Taxes", MonthlySpend= "=C8/12",
 AnnualSpend= "3500", LastYearSpend= "3500", PercentageChange= "=C8/D8",
 AverageChange= "=7.9/E8"},
 new { Category= "Entertainment", MonthlySpend= "=C9/12",
 AnnualSpend= "2000", LastYearSpend= "2250", PercentageChange= "=C9/D9",
 AverageChange= "=7.9/E9"},
 new { Category= "Vacation", MonthlySpend= "=C10/12",
 AnnualSpend= "1500", LastYearSpend= "2000", PercentageChange= "=C10/D10",
 AverageChange= "=7.9/E10"},
 new { Category= "Miscellaneous", MonthlySpend= "=C11/12",
 AnnualSpend= "1250", LastYearSpend= "1558", PercentageChange= "=C11/D11",
 AverageChange= "=7.9/E11"},
 };
 ViewBag.DefaultData = data;
 return View();
}

```

Second, if you want to directly compute any formula or expression, you can use the [computeExpression](#) method. This method will work for both built-in and used-defined/custom formula.

The following code example shows how to use `computeExpression` method in the spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).Sheets(sheet =>
{

```

```

sheet.Ranges(ranges =>
{
ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A2").
Add();
}).Rows(row =>
{
 row.Height(40).CustomHeight(true).Cells(cell =>
 {
 cell.ColSpan(5).Value("Monthly Expense").Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, VerticalAlign =
 VerticalAlign.Middle, TextAlign=TextAlign.Center, FontSize="15pt",
 FontStyle= FontStyle.Italic }).Add();
 }).Add();
 row.Height(30).Add();
 row.Index(11).Cells(cell =>
 {
 cell.Value("Totals").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, FontStyle= FontStyle.Italic }).Add();
 cell.Formula("=SUM(B3:B11)").Add();
 cell.Formula("=SUM(C3:C11)").Add();
 cell.Formula("=SUM(D3:D11)").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Number of Categories").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=COUNTA(A3:A11)").Index(3).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Average Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=AVERAGE(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Min Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=MIN(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Max Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign=
 TextAlign.Right }).Add();
 cell.Formula("=MAX(B3:B11)").Index(3).Format("$#,##0").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(150).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 }
}

```

```

 column.Width(120).Add();
 column.Width(140).Add();
 column.Width(150).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A2:E2');
 this.numberFormat('$#,##0', 'B3:D12');
 this.numberFormat('0%', 'E3:E12');
 // Adding custom function for calculating the percentage between two
 cells.
 this.addCustomFunction(calculatePercentage, 'PERCENTAGE');
 // Calculate percentage using custom added formula in E11 cell.
 this.updateCell({ formula: '=PERCENTAGE(C11,D11)' }, 'E11');
 // Calculate expressions using computeExpression in E10 cell.
 this.updateCell({ value: this.computeExpression('C10/D10') }, 'E10');
 // Calculate custom formula values using computeExpression in E12
 cell.
 this.updateCell({ value:
 this.computeExpression('=PERCENTAGE(C12,D12)'), }, 'E12');
 // Calculate SUM (built-in) formula values using computeExpression
 in D12 cell.
 this.updateCell({ value: this.computeExpression('=SUM(D3:D11)') },
 'D12');
 }
 // Custom function to calculate percentage between two cell values.
 function calculatePercentage(firstCell,secondCell) {
 return (firstCell) / (secondCell);
 }
</script>

```

### FORMULACONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { Category= "Household Utilities", MonthlySpend=
 "=C3/12", AnnualSpend= "3000", LastYearSpend= "3000", PercentageChange=
 "=C3/D3"},
 new { Category= "Food", MonthlySpend= "=C4/12",
 AnnualSpend= "2500", LastYearSpend= "2250", PercentageChange= "=C4/D4"},
 new { Category= "Gasoline", MonthlySpend= "=C5/12",
 AnnualSpend= "1500", LastYearSpend= "1200", PercentageChange= "=C5/D5"},
 new { Category= "Clothes", MonthlySpend= "=C6/12",
 AnnualSpend= "1200", LastYearSpend= "1000", PercentageChange= "=C6/D6"},
 new { Category= "Insurance", MonthlySpend= "=C7/12",
 AnnualSpend= "1500", LastYearSpend= "1500", PercentageChange= "=C7/D7"},
 new { Category= "Taxes", MonthlySpend= "=C8/12",
 AnnualSpend= "3500", LastYearSpend= "3500", PercentageChange= "=C8/D8"},
 new { Category= "Entertainment", MonthlySpend= "=C9/12",
 AnnualSpend= "2000", LastYearSpend= "2250", PercentageChange= "=C9/D9"},
 new { Category= "Vacation", MonthlySpend= "=C10/12",
 AnnualSpend= "1500", LastYearSpend= "2000", PercentageChange= "=C10/D10"},
 }
}

```

```

 new { Category= "Miscellaneous", MonthlySpend= "=C11/12",
AnnualSpend= "1250", LastYearSpend= "1558", PercentageChange= "=C11/D11"},
 };
 ViewBag.DefaultData = data;
 return View();
 }

```

### Formula bar

Formula bar is used to edit or enter cell data in much easier way. By default, the formula bar is enabled in the spreadsheet. Use the [showFormulaBar](#) property to enable or disable the formula bar.

### Named Ranges

You can define a meaningful name for a cell range and use it in the formula for calculation. It makes your formula much easier to understand and maintain. You can add named ranges to the Spreadsheet in the following ways,

- Using the [definedNames](#) collection, you can add multiple named ranges at initial load.
- Use the `addDefinedName` method to add a named range dynamically.
- You can remove an added named range dynamically using the `removeDefinedName` method.
- Select the range of cells, and then enter the name for the selected range in the name box.

The following code example shows the usage of named ranges support.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).BeforeDataBound(
"beforeDataBound").Created("created").ShowRibbon(false).Sheets(sheet =>
{
 sheet.Name("Budget Details").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A2").
Add();
 }).Rows(row =>
 {
 row.Height(40).CustomHeight(true).Cells(cell =>
 {
 cell.ColSpan(5).Value("Monthly Expense").Style(new
SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, VerticalAlign =
VerticalAlign.Middle, TextAlign = TextAlign.Center, FontSize = "15pt",
FontStyle = FontStyle.Italic }).Add();
 }).Add();
 row.Height(30).Add();
 row.Index(11).Cells(cell =>
 {
 cell.Value("Totals").Style(new SpreadsheetCellStyle() {
FontWeight = FontWeight.Bold, FontStyle = FontStyle.Italic }).Add();
 cell.Formula("=SUM(MonthlySpending)") .Add();
 cell.Formula("=SUM(AnnualSpending)") .Add();
 cell.Formula("=SUM(LastYearSpending)") .Add();
 cell.Formula("=C12/D12") .Add();
 }).Add();
 row.Cells(cell =>
 {

```

```

 cell.Index(1).Value("Number of Categories").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign =
 TextAlign.Right }).Add();
 cell.Formula("=COUNTA(=C12/D12)").Index(3).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Average Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign =
 TextAlign.Right }).Add();

cell.Formula("=AVERAGE(MonthlySpending)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Min Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign =
 TextAlign.Right }).Add();

cell.Formula("=MIN(MonthlySpending)").Index(3).Format("$#,##0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(1).Value("Max Spend").ColSpan(2).Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, TextAlign =
 TextAlign.Right }).Add();

cell.Formula("=MAX(MonthlySpending)").Index(3).Format("$#,##0").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(150).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 column.Width(120).Add();
 }).Add();
}).DefinedNames(definedName => {
 definedName.Name("Categories").RefersTo("=Budget
Details!A3:A11").Add();
 definedName.Name("MonthlySpending").RefersTo("=Budget
Details!B3:B11").Add();
 definedName.Name("AnnualSpending").RefersTo("=Budget
Details!C3:C11").Add();
}).Render()

### Supported Formulas

The following are the list of formulas supported in spreadsheet,

| Formula | Description |
|---------|-------------|
|---------|-------------|

|       |       |
|-------|-------|
| ----- | ----- |
|-------|-------|

|     |                                                 |
|-----|-------------------------------------------------|
| ABS | Returns the value of a number without its sign. |
|-----|-------------------------------------------------|

|         |                                                                           |
|---------|---------------------------------------------------------------------------|
| ADDRESS | Returns a cell reference as text, given specified row and column numbers. |
|---------|---------------------------------------------------------------------------|

|     |                                                                      |
|-----|----------------------------------------------------------------------|
| AND | Returns TRUE if all the arguments are TRUE, otherwise returns FALSE. |
|-----|----------------------------------------------------------------------|

|         |                                                                           |
|---------|---------------------------------------------------------------------------|
| AVERAGE | Calculates average for the series of numbers and/or cells excluding text. |
|---------|---------------------------------------------------------------------------|

|          |                                                                                 |
|----------|---------------------------------------------------------------------------------|
| AVERAGEA | Calculates the average for the cells evaluating TRUE as 1, text and FALSE as 0. |
|----------|---------------------------------------------------------------------------------|

|           |                                                          |
|-----------|----------------------------------------------------------|
| AVERAGEIF | Clears content of the active cell and enables edit mode. |
|-----------|----------------------------------------------------------|

|            |                                                                 |
|------------|-----------------------------------------------------------------|
| AVERAGEIFS | Calculates average for the cells based on specified conditions. |
|------------|-----------------------------------------------------------------|

| CEILING | Rounds a number up to the nearest multiple of a given factor. |

| CHOOSE | Returns a value from list of values, based on index number. |

| CHAR | Returns the character from the specified number. |

| CODE | Returns the numeric code for the first character in a given string. |

| CONCAT | Concatenates a list or a range of text strings. |

| CONCATENATE | Combines two or more strings together. |

| COUNT | Counts the cells that contain numeric values in a range. |

| COUNTA | Counts the cells that contains values in a range. |

| COUNTBLANK | Returns the number of empty cells in a specified range of cells. |

| COUNTIF | Counts the cells based on specified condition. |

| COUNTIFS | Counts the cells based on specified conditions. |

| DATE | Returns the date based on given year, month, and day. |

| DATEVALUE | Converts a date string into date value. |

| DAY | Returns the day from the given date. |

| DAYS | Returns the number of days between two dates. |

| DECIMAL | Converts a text representation of a number in a given base into a decimal number. |

| DEGREES | Converts radians to degrees. |

| DOLLAR | Converts the number to currency formatted text. |

| EDATE | Returns a date with given number of months before or after the specified date. |

| EOMONTH | Returns the last day of the month that is a specified number of months before or after an initially supplied start date. |

| EVEN | Rounds a positive number up and negative number down to the nearest even integer. |

| EXACT | Checks whether a two text strings are exactly same and returns TRUE or FALSE. |

| EXP | Returns e raised to the power of the given number. |

| FACT | Returns the factorial of a number. |

| FIND | Returns the position of a string within another string, which is case sensitive. |

| FLOOR | Rounds a number down to the nearest multiple of a given factor. |

| HLOOKUP | Looks for a value in the top row of the array of values and then returns a value in the same column from a row in the array that you specify. |

| HOUR | Returns the number of hours in a specified time string. |

| IF | Returns value based on the given expression. |

| IFERROR | Returns value if no error found else it will return specified value. |

| IFS | Returns value based on the given multiple expressions. |

| INDEX | Returns a value of the cell in a given range based on row and column number. |

| INT | Rounds a number down to the nearest integer. |

| INTERCEPT | Calculates the point of the Y-intercept line via linear regression. |

| ISNUMBER | Returns true when the value parses as a numeric value. |

| LARGE | Returns the **k-th** largest value in a given array. |

| LEN | Returns a number of characters in a given string. |

| LN | Returns the natural logarithm of a number. |

| LOG | Returns the logarithm of a number to the base that you specify. |

| LOOKUP | Looks for a value in a one-row or one-column range, then returns a value from the same position in a second one-row or one-column range. |

| MATCH | Returns the relative position of a specified value in given range. |

| MAX | Returns the largest number of the given arguments. |

| MEDIAN | Returns the median of the given set of numbers. |

| MINUTE | Returns the number of minutes in a specified time string. |

| MIN | Returns the smallest number of the given arguments. |

| MOD | Returns a remainder after a number is divided by divisor. |

| MONTH | Returns the number of months in a specified date string. |

| NOT | Returns the inverse of a given logical expression. |

| NOW | Returns the current date and time. |

| ODD | Rounds a positive number up and negative number down to the nearest odd integer. |

| OR | Returns TRUE if any of the arguments are TRUE, otherwise returns FALSE. |

| PI | Returns the value of pi. |

| POWER | Returns the result of a number raised to power. |

| PRODUCT | Multiplies a series of numbers and/or cells. |

| RADIANS | Converts degrees into radians. |

| RAND | Returns a random number between 0 and 1. |

| RANDBETWEEN | Returns a random integer based on specified values. |

| ROUND | Rounds a number to the specified number of digits. |

| ROUNDDOWN | Rounds a number down, toward zero. |

| ROUNDUP | Rounds a number up, away from zero. |

| RSQ | Returns the square of the Pearson product moment correlation coefficient based on data points in *knowny's* and *knownx's*. |

| SECOND | Returns the number of seconds in a specified time string. |

| SMALL | Returns the **k-th** smallest value in a given array. |

| SLOPE | Returns the slope of the line from linear regression of the data points. |

- | SORT | Sorts the contents of a column, range, or array in ascending or descending order. |
- | SQRT | Returns the square root of a positive number. |
- | SUBTOTAL | Returns subtotal for a range using the given function number. |
- | SUM | Adds a series of numbers and/or cells. |
- | SUMIF | Adds the cells based on specified condition. |
- | SUMIFS | Adds the cells based on specified conditions. |
- | SUMPRODUCT | Returns the sum of the products of the corresponding array in given arrays. |
- | T | Checks whether a value is text or not and returns the text. |
- | TEXT | Converts the supplied value into text by using the user-specified format. |
- | TIME | Converts hours, minutes, seconds to the time formatted text. |
- | TODAY | Returns the current date. |
- | TRUNC | Truncates a supplied number to a specified number of decimal places. |
- | UNIQUE | Returns a unique values from a range or array. |
- | VLOOKUP | Looks for a specific value in the first column of a lookup range and returns a corresponding value from a different column within the same row. |

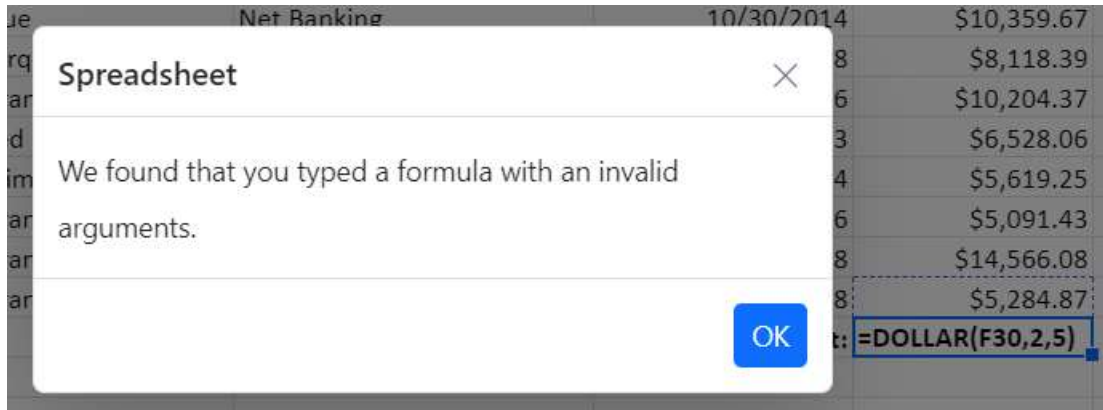

#### Formula Error Dialog

If you enter an invalid formula in a cell, an error dialog with an error message will appear. For instance, a formula with the incorrect number of arguments, a formula without parenthesis, etc.

| Error Message                                                                                                                                                  | Reason |
|----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------|
| -----                                                                                                                                                          | -----  |
| We found that you typed a formula with an invalid arguments   Occurs when passing an argument even though it wasn't needed.                                    |        |
| We found that you typed a formula with an empty expression   Occurs when passing an empty expression in the argument.                                          |        |
| We found that you typed a formula with one or more missing opening or closing parenthesis   Occurs when an open parenthesis or a close parenthesis is missing. |        |
| We found that you typed a formula which is improper   Occurs when passing a single reference but a range was needed.                                           |        |
| We found that you typed a formula with a wrong number of arguments   Occurs when the required arguments were not passed.                                       |        |
| We found that you typed a formula which requires 3 arguments   Occurs when the required 3 arguments were not passed.                                           |        |
| We found that you typed a formula with a mismatched quotes   Occurs when passing an argument with mismatched quotes.                                           |        |
| We found that you typed a formula with a circular reference   Occurs when passing a formula with circular cell reference.                                      |        |

| We found that you typed a formula which is invalid | Except in the cases mentioned above, all other errors will fall into this broad category. |

### Formatting in Spreadsheet Component

Formatting options make your data easier to view and understand. The different types of formatting options in the Spreadsheet are,

- Number Formatting
- Text Formatting
- Cell Formatting

#### Number Formatting

Number formatting provides a type for your data in the Spreadsheet. Use the [allowNumberFormatting](#) property to enable or disable the number formatting option in the Spreadsheet. The different types of number formatting supported in Spreadsheet are,

| Types | Format |

|-----|-----|

| General(default) | NA |

| Number | 0.00 |

| Currency | \$#,##0.00 |

| Accounting | (\$ #,##0.00);(\$ (#,##0.00);(\$\* "-"??);(@\_) |

| ShortDate | mm-dd-yyyy |

| LongDate | dddd, mmmm dd, yyyy |

| Time | h:mm:ss AM/PM |

| Percentage | 0.00% |

| Fraction | # ?/? |

| Scientific | 0.00E+00 |

| Text | @ |

Number formatting can be applied in following ways,

- Using the `format` property in `cell`, you can set the desired format to each cell at initial load.
- Using the `numberFormat` method, you can set the number format to a cell or range of cells.
- Selecting the number format option from ribbon toolbar.

### Custom Number Formatting

Spreadsheet supports custom number formats to display your data as numbers, dates, times, percentages, and currency values. If the pre-defined number formats do not meet your needs, you can set your own custom formats using custom number formats dialog or `numberFormat` method.

The different types of custom number formatting supported in Spreadsheet are,

| Types | Format |

|-----|-----|

| General(default) | NA |

| Number | 0 |

| Number | 0.00 |

| Number | #,##0 |

| Number | #,##0.00 |

| Number | #,##0\_);(,##0) |

| Number | `#,##0\_);Red` |

| Number | #,##0.00\_);(,##0.00) |

| Number | `#,##0.00\_);Red` |

| Currency | \$#,##0\_);(\$#,##0) |

| Currency | `\$#,##0\_);Red` |

| Currency | \$#,##0.00\_);(\$#,##0.00) |

| Currency | `\$#,##0.00\_);Red` |

| Percentage | 0% |

| Percentage | 0.00% |

| Scientific | 0.00E+00 |

| Scientific | ##0.0E+0 |

| Fraction | # ?/? |  
 | Fraction | # ??/?? |  
 | ShortDate | dd-mm-yy |  
 | Custom | dd-mmm-yy |  
 | Custom | dd-mmm |  
 | Custom | mmm-yy |  
 | Custom | h:mm AM/PM |  
 | Custom | h:mm:ss AM/PM |  
 | Custom | h:mm |  
 | Custom | h:mm:ss |  
 | Custom | dd-mm-yy h:mm |  
 | Custom | mm:ss |  
 | Custom | mm:ss.0 |  
 | Text | @ |  
 | Custom | [h]:mm:ss |  
 | Accounting | (\$ #,##0);(\$ #,##0);(\$\* "-");(@\_) |  
 | Accounting | ( #,##0);( #,##0);(\* "-");(@\_) |  
 | Accounting | (\$ #,##0.00);(\$ #,##0.00);(\$\* "-"?);(@\_) |  
 | Accounting | ( #,##0.00);( #,##0.00);(\* "-"?);(@\_) |

Custom Number formatting can be applied in following ways,

- Using the `numberFormat` method, you can set your own custom number format to a cell or range of cells.
- Selecting the custom number format option from custom number formats dialog or type your own format in dialog input and then click apply button. It will apply the custom format for selected cells.

The following code example shows the number formatting in cell data.

### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).ShowFormulaBar(false).AllowInsert(false).AllowDelete(false)
.Sheets(sheet =>
{
 sheet.SelectedRange("U15").ShowGridLines(false).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A2").
 Add();
 }
})
```

```

 }).Rows(row =>
 {
 row.Height(35).CustomHeight(true).Cells(cell =>
 {
 cell.ColSpan(6).Value("Sales Team Summary").Style(new
 SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, VerticalAlign =
 VerticalAlign.Middle, TextAlign=TextAlign.Center, FontSize="16pt",
 Border="1px solid #e0e0e0", BackgroundColor="#EEEEEE", Color="#279377"
 }).Add();
 }).Add();
 row.Index(10).Cells(cell =>
 {
 cell.Index(1).Value("Total:").Style(new SpreadsheetCellStyle() {
 FontWeight = FontWeight.Bold, FontStyle= FontStyle.Italic }).Add();
 cell.Formula("=SUM(C3:C10)").Format("$#,##0.00").Add();
 cell.Formula("=SUM(D3:D10)").Format("_($* #,##0.00_);_($*
 (#,##0.00);_($* \"-\"??_);_(@_)").Add();
 cell.Formula("=SUM(E3:E10)").Format("_($* #,##0.00_);_($*
 (#,##0.00);_($* \"-\"??_);_(@_)").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(140).Add();
 column.Width(140).Add();
 column.Width(160).Add();
 column.Width(160).Add();
 column.Width(160).Add();
 column.Width(120).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', fontSize: '12pt',
 backgroundColor: '#279377', textAlign: 'center', color: 'ffffff',
 borderBottom: '1px solid #e0e0e0' }, 'A2:F2');
 this.cellFormat({ borderTop: '1px solid #e0e0e0', backgroundColor:
 'EEEEEE' }, 'A11:F11');
 this.setBorder({ border: '1px solid #e0e0e0' }, 'A2:F11', 'Outer');
 // Applied Accounting format to the cells from C3 to E10 range.
 this.numberFormat('_($* #,##0.00_);_($* (#,##0.00);_($* "-
 ??_);_(@_) ', 'C3:E10');
 // Applied Percentage format to the cells from C3 to E11 range.
 this.numberFormat('0%', 'F3:F10');
 // applied the custom number format for cell form D3 to D10 range
 this.numberFormat(' [Red] [<=2000] $#,##0.00; [Blue] [>2000] $#,##0.00',
 'D3:D10');
 // applied the custom number format for cell from F3 to F10 range
 this.numberFormat('#,##0.00_); [Red] (#,##0.00) ', 'F3:F10');
 }
</script>

```

### NUMBERFORMATCONTROLLER.CS

```

 };
 ViewBag.DefaultData = data;
 return View();
 }
}

```

### Text and cell formatting

Text and cell formatting enhances the look and feel of your cell. It helps to highlight a particular cell or range of cells from a whole workbook. You can apply formats like font size, font family, font color, text alignment, border etc. to a cell or range of cells. Use the [allowCellFormatting](#) property to enable or disable the text and cell formatting option in Spreadsheet. You can set the formats in following ways,

- Using the `style` property, you can set formats to each cell at initial load.
- Using the `cellFormat` method, you can set formats to a cell or range of cells.
- You can also apply by clicking the desired format option from the ribbon toolbar.

### Fonts

Various font formats supported in the spreadsheet are font-family, font-size, bold, italic, strike-through, underline and font color.

### Text Alignment

You can align text in a cell either vertically or horizontally using the `textAlign` and `verticalAlign` property.

### Indents

To enhance the appearance of text in a cell, you can change the indentation of a cell content using `textIndent` property.

*Fill color*

To highlight cell or range of cells from whole workbook you can apply background color for a cell using `backgroundColor` property.

*Borders*

You can add borders around a cell or range of cells to define a section of worksheet or a table. The different types of border options available in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Top Border | Specifies the top border of a cell or range of cells. |

| Left Border | Specifies the left border of a cell or range of cells. |

| Right Border | Specifies the right border of a cell or range of cells. |

| Bottom Border | Specifies the bottom border of a cell or range of cells. |

| No Border | Used to clear the border from a cell or range of cells. |

| All Border | Specifies all border of a cell or range of cells. |

| Horizontal Border | Specifies the top and bottom border of a cell or range of cells. |

| Vertical Border | Specifies the left and right border of a cell or range of cells. |

| Outside Border | Specifies the outside border of a range of cells. |

| Inside Border | Specifies the inside border of a range of cells. |

You can also change the color, size, and style of the border. The size and style supported in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Thin | Specifies the `1px` border size (default). |

| Medium | Specifies the `2px` border size. |

| Thick | Specifies the `3px` border size. |

| Solid | Used to create the `solid` border (default). |

| Dashed | Used to create the `dashed` border. |

| Dotted | Used to create the `dotted` border. |

| Double | Used to create the `double` border. |

Borders can be applied in the following ways,

- Using the `border`, `borderLeft`, `borderRight`, `borderBottom` properties, you can set the desired border to each cell at initial load.
- Using the `setBorder` method, you can set various border options to a cell or range of cells.
- Selecting the border options from ribbon toolbar.

The following code example shows the style formatting in text and cells of the spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).ShowFormulaBar(false).AllowInsert(false).AllowDelete(false)
.AllowEditing(false).Sheets(sheet =>
{
 sheet.SelectedRange("U15").ShowGridLines(false).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A2").
Add();
 }).Rows(row =>
 {
 row.Height(40).CustomHeight(true).Cells(cell =>
 {
 cell.ColSpan(5).Value("Order Summary").Style(new
SpreadsheetCellStyle() { FontWeight = FontWeight.Bold, VerticalAlign =
VerticalAlign.Middle, TextAlign=TextAlign.Center, FontSize="18pt",
Border="1px solid #e0e0e0", BackgroundColor="#EEEEEE", Color="#279377"
}).Add();
 }).Add();
 row.Height(30).Cells(cell =>
 {
 cell.Index(2).Style(new SpreadsheetCellStyle() { TextAlign =
TextAlign.Right }).Add();
 }).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 row.Height(30).Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(200).Add();
 column.Width(110).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 }).Add();
}).Render()
<script>
function created() {
 // Setting common styles to table header cells
 this.cellFormat({ fontWeight: 'bold', fontSize: '12pt',
backgroundColor: '#279377', color: 'ffffff' }, 'A2:E2');
 // Setting common styles to whole table cells
 this.cellFormat({ verticalAlign: 'middle', fontFamily: 'Axettac
Demo' }, 'A2:E12');
 // Column wise styles setting
 this.cellFormat({ textAlign: 'center' }, 'A2:A12');
```

```

// Setting text-indent to 2 and 4 column
var style = { textAlign: 'left', textIndent: '8pt' };
this.cellFormat(style, 'B2:B12');
this.cellFormat(style, 'D2:D12');
this.cellFormat({ fontStyle: 'italic', textAlign: 'right' },
'C3:C12');
this.cellFormat({ textAlign: 'center' }, 'E2:E12');
// Applied border to range of cells using 'setBorder' method
this.setBorder({ borderLeft: '1px solid #e0e0e0', borderRight: '1px
solid #e0e0e0' }, 'A2:E2');
this.setBorder({ border: '1px solid #e0e0e0' }, 'A4:E11',
'Horizontal');
this.setBorder({ border: '1px solid #e0e0e0' }, 'A3:E12', 'Outer');
this.cellFormat({ color: '#10c469', text-decoration: 'line-through'
}, 'E3:E4');
this.cellFormat({ color: '#10c469', text-decoration: 'line-through'
}, 'E9');
this.cellFormat({ color: '#10c469', text-decoration: 'line-through'
}, 'E12');
this.cellFormat({ color: '#FFC107', text-decoration: 'underline' },
'E5');
this.cellFormat({ color: '#FFC107', text-decoration: 'underline' },
'E8');
this.cellFormat({ color: '#FFC107', text-decoration: 'underline' },
'E11');
this.cellFormat({ color: '#62c9e8' }, 'E6');

```

### Limitations of Formatting

The following features are not supported in Formatting:

- Insert row/column between the formatting applied cells.
- Formatting support for row/column.

### Conditional Formatting

Conditional formatting helps you to format a cell or range of cells based on the conditions applied. You can enable or disable conditional formats by using the `allowConditionalFormat` property.

**Note:** \* The default value for the `allowConditionalFormat` property is `true`.

### Apply Conditional Formatting

You can apply conditional formatting by using one of the following ways,

- Select the conditional formatting icon in the Ribbon toolbar under the Home Tab.
- Using the `conditionalFormat` method to define the condition.
- Using the `conditionalFormats` in sheets model.

Conditional formatting has the following types in the spreadsheet,

### Highlight cells rules

Highlight cells rules option in the conditional formatting enables you to highlight cells with a preset color depending on the cell's value.

The following options can be given for the highlight cells rules as type,

**Note:** \* 'GreaterThan', 'LessThan', 'Between', 'EqualTo', 'ContainsText', 'DateOccur', 'Duplicate', 'Unique'.

The following preset colors can be used for formatting styles,

**Note:** \* "RedFT" - Light Red Fill with Dark Red Text,

<br/>\* "YellowFT" - Yellow Fill with Dark Yellow Text,

<br/>\* "GreenFT" - Green Fill with Dark Green Text,

<br/>\* "RedF" - Red Fill,

<br/>\* "RedT" - Red Text.

### *Top bottom rules*

Top bottom rules option in the conditional formatting allows you to apply formatting to the cells that satisfy a statistical condition with other cells in the range.

The following options can be given for the top bottom rules as type,

**Note:** \* 'Top10Items', 'Bottom10Items', 'Top10Percentage', 'Bottom10Percentage', 'BelowAverage', 'AboveAverage'.

### *Data Bars*

You can apply data bars to represent the data graphically inside a cell. The longest bar represents the highest value and the shorter bars represent the smaller values.

The following options can be given for the data bars as type,

**Note:** \* 'BlueDataBar', 'GreenDataBar', 'RedDataBar', 'OrangeDataBar', 'LightBlueDataBar', 'PurpleDataBar'.

### *Color Scales*

Using color scales, you can format your cells with two or three colors, where different color shades represent the different cell values. In the Green-Yellow-Red(GYR) Color Scale, the cell that holds the minimum value is colored as red. The cell that holds the median is colored as yellow, and the cell that holds the maximum value is colored as green. All other cells are colored proportionally.

The following options can be given for the color scales as type,

**Note:** \* 'GYRColorScale', 'RYGColorScale', 'GWRCColorScale', 'RWGColorScale', 'BWRColorScale', 'RWBCColorScale', 'WRColorScale', 'RWColorScale', 'GWColorScale', 'WGColorScale', 'GYColorScale', 'YGColorScale'.

### *Icon Sets*

Icon sets will help you to visually represent your data with icons. Every icon represents a range of values. In the Three Arrows(colored) icon, the green arrow icon represents the values greater than 67%, the yellow arrow icon represents the values between 33% to 67%, and the red arrow icon represents the values less than 33%.

The following options can be given for the icon sets as type,

**Note:** \* 'ThreeArrows', 'ThreeArrowsGray', 'FourArrowsGray', 'FourArrows', 'FiveArrowsGray', 'FiveArrows', 'ThreeTrafficLights1', 'ThreeTrafficLights2', 'ThreeSigns', 'FourTrafficLights', 'FourRedToBlack', 'ThreeSymbols', 'ThreeSymbols2', 'ThreeFlags', 'FourRating', 'FiveQuarters', 'FiveRating', 'ThreeTriangles', 'ThreeStars', 'FiveBoxes'.

### *Custom Format*

Using custom format for conditional formatting you can set cell styles like color, background color, font style, font weight and underline.

In the MAY and JUN columns, we have applied conditional formatting custom format.

**Note:** \* In the Conditional format, custom format supported for Highlight cells rules and Top bottom rules.

### *Clear Rules*

You can clear the defined rules by using one of the following ways,

- Using the “Clear Rules” option in the Conditional Formatting button of HOME Tab in the ribbon to clear the rule from selected cells.
- Using the `clearConditionalFormat` method to clear the defined rules.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).Created("create
d").Sheets(sheet =>
{
 sheet.Name("Car Sales Record").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).ConditionalFormats(
 new List<ConditionalFormat> {
 new ConditionalFormat() { Type =
ConditionalFormatType.GreaterThan, CFColor: CFColor.RedFT, Value= "7700" ,
Range = "B2:B9" },
 new ConditionalFormat() { Type =
ConditionalFormatType.Bottom10Items , CFColor = CFColor.YellowFT, Value =
"4", Range = "C2:C9" },
 new ConditionalFormat() { Type =
ConditionalFormatType.BlueDataBar , Range = "D2:D9" },
 }).Columns(column =>
 {
 column.Width(120).Index(1).Add();
 }).Add();
 }).Render()
<script>
function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:N1');
 this.conditionalFormat({ type: "RYGColorScale", range: 'E2:E9' });
 this.conditionalFormat({ type: "ThreeArrows", range: 'H2:H9' });
 //Custom format
 this.conditionalFormat({ type: 'Top10Items', value: '1',
 format: { style: { color: '#ffffff', backgroundColor: '#009999',
fontWeight: 'bold' } }, range: 'F2:F9' });
 this.conditionalFormat({ type: 'Bottom10Items', value: '1',
 format: { style: { color: '#ffffff', backgroundColor: '#c68d53',
fontWeight: 'bold' } }, range: 'G2:G9' });
}
</script>
```

### CONDITIONALFORMATTINGCONTROLLER.CS

```

 ViewBag.DefaultData = data;
 return View();
}

```

### Limitations of Conditional formatting

The following features have some limitations in Conditional Formatting:

- Insert row/column between the conditional formatting.
- Conditional formatting with formula support.
- Copy and paste the conditional formatting applied cells.
- Custom rule support.

### See Also

- [Rows and columns](#)
- [Hyperlink](#)
- [Sorting](#)
- [Filtering](#)
- [Ribbon customization](#)

## Illustrations in Spreadsheet control

Illustrations helps you to insert a image, shapes and graphic objects in the Essential JS 2 spreadsheet.

### Image

Adding images to a spreadsheet can enhance the visual appeal and help convey information more clearly.

**Note:** \* The default value for [allowImage](#) property is `true`.

### Insert Image

You can insert the image by using one of the following ways,

- Selecting the Insert tab in the Ribbon toolbar, and then choose the Image tab.
- Use the `insertImage()` method programmatically.

The available parameters in `insertImage()` method are,

| Parameter | Type | Description |
|-----------|------|-------------|
|-----------|------|-------------|

|-----|-----|-----|

| images | **ImageModel** | Specifies the options to insert image in spreadsheet. |

| range(optional) | **string** | Specifies the range in spreadsheet. |

The available arguments in **ImageModel** are:

- **src**: Specifies the image source.
- **id**: Specifies image element id.
- **height**: Specifies the height of the image.
- **width**: Specifies the width of the image.
- **top**: Specifies the height of the image.
- **left**: Specifies the width of the image.

**Note:** \* In spreadsheet, you can add many types of image files, including IMAGE, JPG, PNG, GIF and JPEG files.

#### Delete Image

- If you want to delete the image, just select the image firstly, and then press the Delete key.
- Use the **deleteImage()** method programmatically.

The available parameters in **deleteImage()** method are,

| Parameter | Type | Description |

|-----|-----|-----|

| id | **string** | Specifies the id of the image element to be deleted. |

| range(optional) | **string** | Specifies the range in spreadsheet. |

#### Image Customization

Image feature allows you to view and insert a image in a spreadsheet and you can change the height and width of the image by resizing and move it to another position.

#### Height and Width

- You can change the height and width of the image by resizing.
- Use the **height** and **width** property in the **insertImage()** method programmatically.

#### Top and Left

- You can change the position of the image by drag and drop.
- Use the **top** and **left** property in the **insertImage()** method programmatically.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowFormulaBar(false).ShowRibbon(false)
.Created("created").Sheets(sheet =>
{
 sheet.Name("Employee Deatils").SelectedRange("B2").Rows(row =>
```

```

{
 row.Index(1).Height(30).Cells(cell =>
 {
 cell.Value(" Mark").Add();
 }).Add();
 row.Index(2).Height(40).Cells(cell =>
 {
 cell.Index(2).Value("Id").Style(new SpreadsheetCellStyle() {
VerticalAlign = VerticalAlign.Bottom }).Add();
 cell.Index(3).Value(": 1001").Style(new
SpreadsheetCellStyle() { VerticalAlign = VerticalAlign.Bottom }).Add();
 }).Add();
 row.Index(3).Cells(cell =>
 {

 }
</script>

```

### IMAGECONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

### Limitations of Image

The following features have some limitations in Image:

- Corner resizing option in the image element.
- Copy and paste the external image.

### Chart

A chart is a graphical representation of data, that organizes and represents a set of numerical or qualitative data. It mostly displays the selected range of data in terms of x-axis and y-axis. You can use the [allowChart](#) property to enable or disable the chart functionality.

**Note:** \* The default value for the [allowChart](#) property is `true`.

### Types of chart

The following types of charts are available in the Spreadsheet.

**Note:** \* Column Chart

<br/>\* Bar Chart

<br/>\* Area Chart

<br/>\* Line Chart

<br/>\* Pie Chart

<br/>\* Scatter Chart

### Insert Chart

You can insert the chart by using one of the following ways,

- Select the chart icon in the Ribbon toolbar under the Insert Tab.
- Use the `insertChart()` method programmatically.

The available parameter in the `insertChart()` method is,

| Parameter | Type       | Description                                                 |
|-----------|------------|-------------------------------------------------------------|
| chart     | ChartModel | Specifies the options to insert a chart in the spreadsheet. |

The available arguments in the `ChartModel` are:

- `type`: Specifies the type of chart.
- `theme`: Specifies the theme of a chart.
- `isSeriesInRows`: Specifies to switch the row or a column.
- `range`: Specifies the selected range or specified range.
- `id`: Specifies the chart element id.
- `markerSettings`: Specifies the marker settings. The marker is used to provide information about the data points in the series and is currently only applicable to the line chart.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
```

```

{
 sheet.Name("Book Sales").Rows(row =>
 {
 row.Height(30).Cells(cell =>
 {
 cell.Value("Book Sales 2016-2020").Style(new
 SpreadsheetCellStyle() { BackgroundColor = "#357cd2", Color = "#fff",
 FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center, VerticalAlign =
 VerticalAlign.Middle }).Add();
 }).Add();
 }).Ranges(ranges =>
 {

ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A3").
Add();

 }).Columns(column =>
 {
 column.Width(110).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
<script>
 function created() {
 this.merge('A1:F1');
 this.cellFormat({ backgroundColor: '#357cd2', color: '#fff',
 fontWeight: 'bold', textAlign: 'center' }, 'A3:F3');
 this.numberFormat(getFormatFromType('Currency'), 'B4:F8');
 //Render Column chart
 this.insertChart([{type: 'Column', theme: 'Bootstrap5Dark', range:
 'A3:B6', id: 'column-chart' }]);
 //Render Line chart with Marker
 this.insertChart([{type: 'Line', range: 'A3:B6', markerSettings:
 {visible: true, shape: 'Circle', isFilled: false, size: 10, border: {width:
 2, color: '#3cb371'}}}, id: 'line-chart' }]);
 }
</script>

```

### CHARTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> chartData = new List<object>()
 {
 new { Book= "Classics", Year 2016= "19033", Year 2017=
 "78453", Year 2018= "24354", Year 2019= "18757", Year 2020= "34343" },
 new { Book= "Mystery", Year 2016= "50400", Year 2017=
 "82311", Year 2018= "131003", Year 2019= "19899", Year 2020= "42200" },
 new { Book= "Romance", Year 2016= "18002", Year 2017=

 }
}

```

```

 new { Book= "Horror", Year 2016= "23454", Year 2017=
"78665", Year 2018= "81232", Year 2019= "19888", Year 2020= "20986" }
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Delete Chart

- If you want to delete the chart, just select the chart, and then press the Delete key.
- Use the `deleteChart()` method programmatically.

The available parameter in the `deleteChart()` method is,

| Parameter | Type   | Description                                          |
|-----------|--------|------------------------------------------------------|
| id        | string | Specifies the id of the chart element to be deleted. |

### Chart Customization

Chart feature allows you to view and insert a chart in a spreadsheet, and you can change the height and width of the chart by resizing and moving it to another position.

- You can change the height and width of the chart by resizing.
- You can change the position of the chart by drag and drop.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Name("Book Sales").Rows(row =>
 {
 row.Height(30).Cells(cell =>
 {
 cell.Value("Book Sales 2016-2020").Style(new
SpreadsheetCellStyle() { BackgroundColor = "#357cd2", Color = "#fff",
FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center, VerticalAlign =
VerticalAlign.Middle }).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Index(7).Chart(new
List<Syncfusion.EJ2.Spreadsheet.Chart> { new
Syncfusion.EJ2.Spreadsheet.Chart() { Type =
Syncfusion.EJ2.Spreadsheet.ChartType.Column, Range = "A3:F8" } }).Add();
 }).Add();
 }).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A3").
Add();
 }).Columns(column =>
 {

```

```

 column.Width(110).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function created() {
 this.merge('A1:F1');
 this.cellFormat({ backgroundColor: '#357cd2', color: '#fff',
 fontWeight: 'bold', textAlign: 'center' }, 'A3:F3');
 this.numberFormat(getFormatFromType('Currency'), 'B4:F8');
 }
</script>

```

### CHARTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> chartData = new List<object>()
 {
 new { Book= "Classics", Year 2016= "19033", Year 2017=
"78453", Year 2018= "24354", Year 2019= "18757", Year 2020= "34343" },
 new { Book= "Mystery", Year 2016= "50400", Year 2017=
"82311", Year 2018= "131003", Year 2019= "19899", Year 2020= "42200" },
 new { Book= "Romance", Year 2016= "18002", Year 2017=
"49529", Year 2018= "79567", Year 2019= "12302", Year 2020= "21277" },
 new { Book= "Sci-Fi & Fantasy", Year 2016= "10033", Year
2017= "51200", Year 2018= "66211", Year 2019= "12899", Year 2020= "18779" },
 new { Book= "Horror", Year 2016= "23454", Year 2017=
"78665", Year 2018= "81232", Year 2019= "19888", Year 2020= "20986" }
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Customization of line chart markers

Using the [actionBegin](#) event, you can change the shape, size, fill color, and border of the line chart marker. In the following example, you can see the modified marker appearance, such as shape and size, while creating the line chart with UI interaction.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("created").ActionBegin("onAct
ionBegin").Sheets(sheet =>
{
 sheet.Name("Book Sales").Rows(row =>
 {
 row.Height(30).Cells(cell =>
 {
 cell.Value("Book Sales 2016-2020").Style(new
SpreadsheetCellStyle() { BackgroundColor = "#357cd2", Color = "#fff",

```

```

FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center, VerticalAlign =
VerticalAlign.Middle }).Add();
 }).Add();
 }).Ranges(ranges =>
 {

ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A3").
Add();

 }).Columns(column =>
 {

 column.Width(110).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
<script>
 function created() {
 this.merge('A1:F1');
 this.cellFormat({ backgroundColor: '#357cd2', color: '#fff',

 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Limitations of Chart

The following features have some limitations in the Chart:

- Insert row/delete row between the chart data source will not reflect the chart.
- Copy/paste into the chart data source will not reflect the chart.
- Corner resizing option in chart element.

## Data Binding in Spreadsheet Control

The Spreadsheet uses **DataManager**, which supports both RESTful JSON data services and local JavaScript object array binding to a range. The **dataSource** property can be assigned either with the instance of **DataManager** or JavaScript object array collection.

**Note:** To bind data to a cell, use **cell data binding** support.

### Local data

To bind local data to the Spreadsheet, you can assign a JavaScript object array to the **dataSource** property.

Refer to the following code example for local data binding.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
```

### LOCALDATACONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { CustomerName= "Romona Heaslip", Model= "Taurus",
Color= "Aquamarine", PaymentMode= "Debit Card", DeliveryDate=
"07/11/2015", Amount= "8529.22" },
 new { CustomerName= "Clare Batterton", Model= "Sparrow",
Color= "Pink", PaymentMode= "Cash On Delivery", DeliveryDate= "7/13/2016",
Amount= "17866.19" },
 }
```

```

 new { CustomerName= "Eamon Traise", Model= "Grand
Cherokee", Color= "Blue", PaymentMode= "Net Banking", DeliveryDate=
"09/04/2015", Amount= "13853.09" },
 new { CustomerName= "Julius Gorner", Model= "GTO", Color=

Amount= "2338.74" },
 new { CustomerName= "Jenna Schoolfield", Model= "LX",
Color= "Yellow", PaymentMode= "Credit Card", DeliveryDate= "10/08/2014",
Amount= "9578.45" },
 new { CustomerName= "Marylynne Harring", Model= "Catera",
Color= "Green", PaymentMode= "Cash On Delivery", DeliveryDate=
"7/01/2017", Amount= "19141.62" },
 new { CustomerName= "Vilhelmina Leipelt", Model= "7
Series", Color= "Goldenrod", PaymentMode= "Credit Card", DeliveryDate=
"12/20/2015", Amount= "6543.30" },
 new { CustomerName= "Barby Heisler", Model= "Corvette",
Color= "Red", PaymentMode= "Credit Card", DeliveryDate= "11/24/2014",
Amount= "13035.06" },
 new { CustomerName= "Karyn Boik", Model= "Regal", Color=
"Indigo", PaymentMode= "Debit Card", DeliveryDate= "05/12/2014", Amount=
"18488.80" },
 new { CustomerName= "Jeanette Pamplin", Model= "S4",
Color= "Fuscia", PaymentMode= "Net Banking", DeliveryDate= "12/30/2014",
Amount= "12317.04" },
 new { CustomerName= "Cristi Espinos", Model= "TL", Color=
"Aquamarine", PaymentMode= "Credit Card", DeliveryDate= "12/18/2013",
Amount= "6230.13" },
 new { CustomerName= "Issy Humm", Model= "Club Wagon",
Color= "Pink", PaymentMode= "Cash On Delivery", DeliveryDate=
"02/02/2015", Amount= "9709.49" },
 new { CustomerName= "Tuesday Fautly", Model= "V8 Vantage",
Color= "Crimson", PaymentMode= "Debit Card", DeliveryDate= "11/19/2014",
Amount= "9766.10" },
 new { CustomerName= "Rosemaria Thomann", Model= "Caravan",
Color= "Violet", PaymentMode= "Net Banking", DeliveryDate= "02/08/2014",
Amount= "7685.49" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

**Note:** The local data source can also be provided as an instance of the **DataManager**. By default, **DataManager** uses **JsonAdaptor** for local data-binding.

#### Remote data

To bind remote data to the Spreadsheet control, assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, provide the service endpoint **url**.

Refer to the following code example for remote data binding.

#### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Sheets(sheet =>
{
 sheet.Name("Shipment Details").Ranges(ranges =>
 {

```

```

 ranges.ShowFieldAsHeader(false).StartCell("A2").Query("new
ej.data.Query().select(['OrderID', 'CustomerID', 'ShipName', 'ShipCity',
'ShipCountry', 'Freight']).take(200)").DataSource(dataManger =>
{
 dataManger.Url("https://services.syncfusion.com/js/production/api/Orders").C
rossDomain(true);
 }).Add();
 }).Rows(row =>
 {
 row.Cells(cell =>
 {
 cell.Value("Order ID").Add();
 cell.Value("Customer Name").Add();
 cell.Value("Freight").Add();
 cell.Value("Ship Name").Add();
 cell.Value("Ship City").Add();
 cell.Value("Ship Country").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(130).Add();
 column.Width(100).Add();
 column.Width(220).Add();
 column.Width(150).Add();
 column.Width(180).Add();
 }).Add();
 }).Render()

```

### REMOTEDATACONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

**Note:** By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

#### *Binding with OData services*

**OData** is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Name("Order Details").Ranges(ranges =>
 {
 DataSource(dataManger =>
 {
 dataManger.Url("https://ej2services.syncfusion.com/production/web-
services/api/Orders").CrossDomain(true).Adaptor("ODataAdaptor");
 }).Add();
 }
}

```

```

 })..Columns(column =>
 {
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(280).Add();
 column.Width(180).Add();
 column.Width(80).Add();
 column.Width(180).Add();
 column.Width(180).Add();
 }).Add();
 }).Render()
<script>
 function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 //Applies cell and number formatting to specified range of the
 active sheet
 spreadsheetObj.cellFormat({ fontWeight: 'bold', textAlign: 'center',
 verticalAlign: 'middle' },
 'A1:K1');
 }
</script>

```

### ODATACONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

### Web API

You can use WebApiAdaptor to bind spreadsheet with Web API created using OData endpoint.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Name("Order Details").Ranges(ranges =>
 {
 DataSource(dataManger =>
 {
 dataManger.Url("https://ej2services.syncfusion.com/production/web-
services/api/Orders").CrossDomain(true).Adaptor("WebApiAdaptor");
 }).Add();
 })..Columns(column =>
 {
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(80).Add();
 })
}

```

```

 column.Width(280).Add();
 column.Width(180).Add();
 column.Width(80).Add();
 column.Width(180).Add();
 column.Width(180).Add();
 }).Add();
}).Render()
<script>
 function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 //Applies cell and number formatting to specified range of the
active sheet
 spreadsheetObj.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' },
 'A1:K1');
 }
</script>

```

### WEBAPICONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

### Cell data binding

The Spreadsheet control can bind the data to individual cell in a sheet . To achive this you can use the **value** property.

Refer to the following code example for cell data binding.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowRibbon(false).ShowFormulaBar(false).Sheets(sheet =>
{
 sheet.Name("Monthly Budget").SelectedRange("D13").Rows(row =>
 {
 row.Cells(cell =>
 {
 cell.Value("Category").Style(new SpreadsheetCellStyle() {
FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Planned cost").Style(new SpreadsheetCellStyle() {
FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 cell.Value("Actual cost").Style(new SpreadsheetCellStyle() {
FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center }).Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Food").Add();
 cell.Value("$7000").Add();
 cell.Value("$8120").Add();
 }).Add();
 row.Cells(cell =>
 {

```

```

 cell.Value("Loan").Add();
 cell.Value("$1500").Add();
 cell.Value("$1500").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Medical").Add();
 cell.Value("$300").Add();
 cell.Value("$0").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Clothing").Add();
 cell.Value("$400").Add();
 cell.Value("$140").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Education").Add();
 cell.Value("$900").Add();
 cell.Value("$750").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Insurance").Add();
 cell.Value("$30").Add();
 cell.Value("$30").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Utilities").Add();
 cell.Value("$130").Add();
 cell.Value("$160").Add();
 }).Add();
 }).Columns(column =>
 {
 column.Width(110).Add();
 column.Width(115).Add();
 column.Width(110).Add();
 column.Width(100).Add();
 }).Add();
}).Render()

```

### CELLDATACONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

**Note:** The cell data binding also supports formula, style, number format, and more.

#### Dynamic data binding and Datasource change event

You can dynamically change the datasource of the spreadsheet by changing the `dataSource` property of the `range` object of the `sheet`. The `dataSourceChanged` event handler will be triggered when editing,

inserting, and deleting a row in the datasource range. This event will be triggered with a parameter named **action** which indicates the **edit**, **add** and **delete** actions for the respective ones.

The following table defines the arguments of the **dataSourceChanged** event.

| Property   | Type     | Description                                                                                                          |
|------------|----------|----------------------------------------------------------------------------------------------------------------------|
| action     | string   | Indicates the type of action such as <b>edit</b> , <b>add</b> , and <b>delete</b> performed in the datasource range. |
| data       | object[] | Modified data for <b>edit</b> action; New data for <b>add</b> action; Deleted data for <b>delete</b> action.         |
| rangeIndex | number   | Specifies the range index of the datasource.                                                                         |
| sheetIndex | number   | Specifies the sheet index of the datasource.                                                                         |

**Note:** For **add** action, the value for all the fields will be **null** in the data. In the case that you do not want the primary key field to be null which needs to be updated in the backend service, you can use **edit** action after updating the primary key field to update in the backend service.

For inserting a row at the end of the datasource range, you should insert a row below at the end of the range to trigger the **dataSourceChanged** event with action **add**.

### CSHTML

```
<div>
 <button id="changeDataBtn" class='e-btn'>Change Datasource</button>
</div>
@Html.EJS().Spreadsheet("spreadsheet").DataSourceChanged("dataSourceChanged")
.Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<div>
 <h4>Event Trace</h4>
 <div id="evt">
 <div style="height:173px;overflow: auto;min-
width: 250px;">
 <span id="EventLog" style="word-
break: normal;">
 </div>
 <button id="clearBtn" class='e-
btn'>Clear</button>
 </div>
</div>
<script>
document.getElementById('changeDataBtn').addEventListener('click', ()=> {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var itemData = [
 {
 'Item Name': 'Casual Shoes',

### Filtering in Spreadsheet control

Filtering helps you to view specific rows in the spreadsheet by hiding the other rows. You can use the [allowFiltering](#) property to enable or disable filtering functionality.

**Note:** \* The default value for `allowFiltering` property is `true`.

By default, the `filter` module is injected internally into Spreadsheet to perform filtering.

#### Apply filter on UI

In the active Spreadsheet, select a range of cells to filter by value of the cell. The filtering can be done by any of the following ways:

- Select the filter item in the Ribbon toolbar.
- Right-click the sheet, select the filter item in the context menu.
- Use the `applyFilter()` method programmatically.
- Use `Ctrl + Shift + L` keyboard shortcut to apply the filter.

**Note:** \* Use `Alt + Up/Down` keyboard shortcut to open the filter dialog.

#### Filter by criteria

The `applyFilter()` method will apply the filter UI, based on the predicate and range given in the arguments.

**Note:** \* The `beforeFilter` event will be triggered before filtering the specified range.

**Note:** \* The `filterComplete` event will be triggered after the filter action is completed successfully.

The following code example shows `filter` functionality in the Spreadsheet control.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").DataBound("dataBound").AllowFiltering
(true).Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
 function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (spreadsheetObj.activeSheetIndex === 0) {
 var colors = ['Pink', 'Aquamarine', 'Blue'];
 var predicateList = []
 colors.forEach((color) => { predicateList.push({ field: 'C',
predicate: 'or', operator: 'equal', value: color }); })
 spreadsheetObj.applyFilter(predicateList);
 }
 }
</script>
```

**FILTERCONTROLLER.CS**

 ViewBag.DefaultData = data;
 return View();
}

```

### Filter by cell value

To apply a filter for a cell value, right-click the cell and choose filter -> **Filter By Selected Cell's Value** option from the menu. It applies the filter based on the value of the selected cell in the current sheet.

### Clear filter

After applying filter to a certain column, you may want to clear it to make all filtered rows visible again. It can be done in the following ways,

- Choose **Clear** option in ribbon toolbar under **Filter and Sort**. It clears the filters applied in the spreadsheet for all fields.
- Use the **clearFilter()** method programmatically, to clear the applied filters in spreadsheet for all fields.

### Clear filter on a field

After filtering, you can clear/reset the filter for a field alone. It can be done in the following ways,

- Click filter icon in the column's header and then choose **Clear Filter** option from the filter dialog.
- You can right-click on a filtered column cell and choose **Clear Filter from .** option from the context menu.
- Use the **clearFilter(field)** method programmatically, to clear the filter in a particular column.

### Reapply filter

When you want to reapply the filter after some changes happened in the rows. It can be done in the following ways,

- You can choose **Reapply** option in ribbon toolbar under **Filter and Sort** to reapply the filtered columns again.
- You can right-click on a filtered cell and choose **Reapply** option from the context menu. It reapplies the filters again in the Spreadsheet for all the fields.

### Known error validations

The following errors have been handled for filtering,

- **Out of range validation:** When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message **Select a cell or range inside the used range and try again** will be displayed. No filter will be performed if the range is invalid.

### Limitations

The following features have some limitations in Filter:

- Insert/delete row/column between the filter applied cells.
- Merge cells with filter.
- Copy/cut paste the filter applied cells.

## See Also

- [Sorting](#)
- [Hyperlink](#)
- [Undo Redo](#)

## Sorting in Spreadsheet control

Sorting helps arranging the data to a specific order in a selected range of cells. You can use the [allowSorting](#) property to enable or disable sorting functionality.

**Note:** \* The default value for `allowSorting` property is `true`.

By default, the `sort` module is injected internally into Spreadsheet to perform sorting.

## Sort by cell value

In the active Spreadsheet, select a range of cells to sort by cell value. The range sort can be done by any of the following ways:

- Select the sort item in the Ribbon toolbar and choose the ascending or descending item.
- Right-click the sheet, select the sort item in the context menu and choose the ascending/descending item.
- Use the `sort()` method programmatically.

The cell values can be sorted in the following orders:

- Ascending
- Descending

**Note:** \* Ascending is the default order for sorting.

The `sort()` method with empty arguments will sort the selected range by active cell's column as sort column in ascending order.

**Note:** \* The `beforeSort` event will be triggered before sorting the specified range.

`<br/>` \* The `sortComplete` event will be triggered after the sort action is completed successfully.

The following code example shows `sort` functionality in the Spreadsheet control.

**CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").AllowSorting(true).SortComplete("sort
Complete").DataBound("dataBound").BeforeSort("beforeSort").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
```

```

 if (spreadsheetObj.activeSheetIndex === 0) {
 spreadsheetObj.sort({ containsHeader: true }, 'A1:F15');
 }
 }
 function beforeSort(args) {
 //code here to handle sorting arguments.
 }
 function sortComplete(args) {
 spreadsheet.selectRange(args.range);
 // code here.
 }
}
</script>

```

### SORTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {

Color= "Pink", PaymentMode= "Cash On Delivery", DeliveryDate=
"02/02/2015", Amount= "9709.49" },
 }
}

```

```

 new { CustomerName= "Tuesday Fautly", Model= "V8 Vantage",
Color= "Crimson", PaymentMode= "Debit Card", DeliveryDate= "11/19/2014",
Amount= "9766.10" },
 new { CustomerName= "Rosemaria Thomann", Model= "Caravan",
Color= "Violet", PaymentMode= "Net Banking", DeliveryDate= "02/08/2014",
Amount= "7685.49" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Data contains header

You can specify whether the selected range of cells contains header. To specify, you need to set the `containsHeader` property to `true` and pass it as `sortOption` arguments of the `sort()` method.

**Note:** \* If the `containsHeader` property is not set and active cell column's first cell value type is differed from the second cell value type, the first row data in the range are marked as column headers.

You can also enable or disable this property using `beforeSort` event arguments,

```

`javascript
function beforeSort(args) {
args.sortOptions.containsHeader = true;
}
`

```

In the custom sort dialog, the `Data contains header` checkbox is checked on load. Thus, the default value for `containsHeader` is `true` in custom sort dialog.

### Case sensitive sort

The default sort functionality of Spreadsheet is a case insensitive sorting. When you want to perform sorting with case sensitive, you need to set the `caseSensitive` property to `true` and pass it as `sortOption` arguments of the `sort()` method.

Case sensitive sorting is applicable only for cells with alphabets. In ascending order sorting with case sensitive enabled, the cells with lower case text will be placed above the cells with upper case text.

**Note:** \* The default value for the `caseSensitive` property is `false`.

You can also enable or disable this property using `beforeSort` event arguments,

```

`javascript
function beforeSort (args) {
args.sortOptions.caseSensitive = true;
}
`

```

In the custom sort dialog, the `Case sensitive` checkbox is unchecked on load as the default value is `false`.

### Sort multiple columns

When you want to perform sorting on multiple columns, it can be done by any of the following ways:

- Select the **Custom sort...** menu item from the Ribbon toolbar item or context menu item.
- Use the `sort()` method programmatically by providing sort criteria.

**Note:** \* The current sorting functionality supports sorting based on cell values only.

#### Custom sort dialog

The custom sort dialog helps sorting multiple columns in the selected range by utilizing the rich UI. This dialog will be appeared while choosing the **Custom sort...** from the Ribbon item or context menu item. By default, sort criteria with the first column name from the selected range will be appeared in the dialog on initial load and it cannot be removed.

You can add multiple criteria using the **Add Column** button at the bottom of the dialog. Thus, multiple columns can be specified with different sort order. The newly added sort criteria items can be removed using the **delete** icons at the end of each items.

You can refer to the [Data contains header](#) topic to learn more about **Data contains header** checkbox. To learn more about **Case sensitive** checkbox, you can refer to [Case sensitive sort](#) topic.

#### Passing sort criteria manually

The multi-column sorting can also be performed manually by passing sort options to the `sort()` method programmatically. The `sortOption` have the following arguments:

- `sortDescriptors` – Sort criteria collection that holds the collection of field name, sort order, and `sortComparer`.
- `containsHeader` – Boolean argument that specifies whether the range has headers in it.
- `caseSensitive` – Boolean argument that specifies whether the range needs to consider case.

**Note:** \* All the arguments are optional.

\* When a `sortDescriptor` is specified without field, the field of the first `sortDescriptor` from the collection will be assigned from active cell's column name and others will be ignored. Hence, it will act as single column sorting.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").AllowSorting(true).SortComplete("sortComplete").DataBound("dataBound").BeforeSort("beforeSort").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var sortDescriptors = [{
 field: 'A',
```

```

 order: 'Ascending'
 },
 {
 field: 'B',
 order: 'Ascending'
 },
 {
 field: 'C',
 order: 'Descending'
 }
]];
 if (spreadsheetObj.activeSheetIndex === 0) {
 spreadsheetObj.sort({ sortDescriptors: sortDescriptors,
containsHeader: true }, 'A1:F15');
 }
}
function beforeSort(args) {
 //code here to handle sorting arguments.
}
function sortComplete(args) {
 spreadsheet.selectRange(args.range);
 // code here.
}
</script>

```

### PASSINGSORTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { CustomerName= "Romona Heaslip", Model= "Taurus",
Color= "Aquamarine", PaymentMode= "Debit Card", DeliveryDate=

Color= "Violet", PaymentMode= "Net Banking", DeliveryDate= "02/08/2014",
Amount= "7685.49" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Custom sort comparer

The `sortDescriptor` holds the `sortComparer` property, which is a function and it is used to customize the sort comparer for specific sort criteria. Each `sortDescriptor` can be customized using the custom sort comparer function.

By customizing sort comparer, you can define the sort action as desired.

**Note:** \* The `sortComparer` is an optional property of `sortDescriptor`.

For custom sort comparer example, refer to the [Sort a range by custom list](#) in the `how-to` section.

### Known error validations

The following errors have been handled for sorting,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message `Select a cell or range inside the used range and try again` will be displayed. No sort will be performed if the range is invalid.
- *Empty field validation:* When the sort criteria does not have a column selected (empty) in the custom sort dialog, it will become invalid, and an error message `Sort criteria column should not be empty` will be displayed on `OK` button click.
- *Duplicate field validation:* When the column names of added sort criteria are repeated more than once in the custom sort dialog, it will become invalid and an error message `is mentioned more than once. Duplicate columns must be removed` will be displayed on `OK` button click.

### Limitations

- Sorting is not supported with formula contained cells.

## See Also

- [Sort a range by custom list](#)
- [Hyperlink](#)
- [Filtering](#)
- [Undo Redo](#)

## Hyperlink in Spreadsheet control

Hyperlink is used to navigate to web links or cell reference within the sheet or to other sheets in Spreadsheet. You can use the [allowHyperlink](#) property to enable or disable hyperlink functionality.

**Note:** \* The default value for `allowHyperlink` property is `true`.

### Insert Link

You can insert a hyperlink in a worksheet cell for quick access to related information.

#### User Interface:

In the active spreadsheet, click the cell where you want to create a hyperlink. Insert hyperlink can be done by any of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Hyperlink item in the context menu, or you can press Ctrl+K.
- Use the `addHyperlink()` method programmatically.

### Edit Hyperlink

You can change an existing hyperlink in your workbook by changing its destination or the text that is used to represent it.

#### User Interface:

In the active spreadsheet, Select the cell that contains the hyperlink that you want to change. Editing the hyperlink while opening the dialog can be done by any one of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Edit Hyperlink item in the context menu, or you can press Ctrl+K.

In the Edit Link dialog box, make the changes that you want, and click UPDATE.

### Remove Hyperlink

Performing this operation remove a single hyperlink without losing the display text.

#### User Interface:

In the active spreadsheet, click the cell where you want to remove a hyperlink. remove hyperlink can be done by any of the following ways:

- Right-click the cell and then click Remove Hyperlink item in the context menu.
- Use the `removeHyperlink()` method programmatically.

### How to change target attribute

There is an event named `beforeHyperlinkClick` which triggers only on clicking hyperlink. You can customize where to open the hyperlink by using the `target` property in the arguments of that event.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").BeforeHyperlinkClick("beforeHyperlinkClick").Sheets(sheet =>
{
 sheet.Name("PriceDetails").SelectedRange("D13").Rows(row =>
 {
 row.Cells(cell =>
 {
 cell.Value("Item Name").Add();
 cell.Value("Quantity").Add();
 cell.Value("Price").Add();
 cell.Value("Amount").Add();
 cell.Value("Stock Detail").Add();
 cell.Value("Website").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Casual Shoes").Add();
 cell.Value("10").Add();
 cell.Value("$20").Add();
 cell.Value("$200").Add();

 row.Cells(cell =>
 {
 cell.Value("Sports Shoes").Add();
 cell.Value("25").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Formal Shoes").Add();
 cell.Value("40").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Sandals & Floaters").Add();
 cell.Value("15").Add();
 }).Add();
 row.Cells(cell =>
 {
 cell.Value("Flip-Flops & Slippers").Add();
 cell.Value("30").Add();
 }).Add();
}).Columns(column =>
{
 column.Width(110).Add();
 column.Width(115).Add();
}).Add();
}).Render()

```

&lt;script&gt;

```
function beforeHyperlinkClick(args) {
 args.target = '_self'; //change target attribute
}
</script>
```

### **HYPERLINKCONTROLLER.CS**

```
public IActionResult Index()
{
 return View();
}
```

### Limitations

- Inserting hyperlink not supported for multiple ranges.

### See Also

- [Sorting](#)
- [Filtering](#)
- [Undo Redo](#)

### Clipboard in Spreadsheet control

The Spreadsheet provides support for the clipboard operations (cut, copy, and paste). Clipboard operations can be enabled or disabled by setting the [enableClipboard](#) property in Spreadsheet.

**Note:** By default, the `enableClipboard` property is true.

#### Cut

It is used to cut the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

#### User Interface:

Cut can be done in one of the following ways.

- Using Cut button in the Ribbon's HOME tab to perform cut operation.
- Using Cut option in the Context Menu.
- Using `Ctrl + X` | `Command + X` keyboard shortcut.
- Using the `cut` method.

#### Copy

It is used to copy the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

#### User Interface:

Copy can be done in one of the following ways.

- Using Copy button in the Ribbon's HOME tab to perform copy operation.
- Using Copy option in the Context Menu.

- Using **Ctrl + C** | **Command + C** keyboard shortcut.
- Using the **copy** method.

### Paste

It is used to paste the clipboard data to the selected range, rows or columns. You have the following options in Paste,

- **Paste Special** - You can paste the values with formatting.
- **Paste** - You can paste only the values without formatting.

It also performs for external clipboard operation. If you perform cut and paste, clipboard data will be cleared, whereas in copy and paste the clipboard contents will be maintained. If you perform paste inside the copied range, the clipboard data will be cleared.

### User Interface:

Paste can be done in one of the following ways.

- Using Paste button in the Ribbon's HOME tab to perform paste operation.
- Using Paste option in the Context Menu.
- Using **Ctrl + V** | **Command + V** keyboard shortcut.
- Using the **paste** method.

**Note:** If you use the Keyboard shortcut key for cut (**Ctrl + X**) | copy (**Ctrl + C**) from other sources, you should use **Ctrl + V** shortcut while pasting into the spreadsheet.

### CSHTML

```
@Html.EJS().DropDownButton("element").Content("Clipboard").Items((IEnumerable<object>)ViewBag.items).Select("itemSelect").Render()
@Html.EJS().Spreadsheet("spreadsheet").AllowScrolling(true).Created("createHandler").Sheets(sheet =>
{
 sheet.Name("Price Details").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(110).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 }).Add();
}).Render()
<script>
 document.getElementById("cutBtn").addEventListener('click', cut);
 document.getElementById("copyBtn").addEventListener('click', copy);
 document.getElementById("pasteBtn").addEventListener('click', paste);

}

```

### Prevent the paste functionality

The following example shows, how to prevent the paste action in spreadsheet. In [actionBegin](#) event, you can set **cancel** argument as false in paste request type.

### CSHTML

```

@Html.EJS().DropDownButton("element").Content("Clipboard").Items((IEnumerable<object>)ViewBag.items).Select("itemSelect").Render()
@Html.EJS().Spreadsheet("spreadsheet").AllowScrolling(true).Created("createHandler").ActionBegin("actionBeginHandler").Sheets(sheet =>
{
 sheet.Name("Price Details").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(110).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 }).Add();
}).Render()
<script>
 document.getElementById("cutBtn").addEventListener('click', cut);
 document.getElementById("copyBtn").addEventListener('click', copy);
 document.getElementById("pasteBtn").addEventListener('click', paste);
 function createHandler() {
 //Applies format to specified range
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' }, 'A1:G1');
 }
 // Triggers before the action begins.

```

```

function actionBeginHandler(pasteArgs) {
 // To cancel the paste action.
 if (pasteArgs.args.eventArgs.requestType === 'paste') {
 pasteArgs.args.eventArgs.cancel = true;
 }
}

function itemSelect(args) {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (args.item.text === 'Copy')
 spreadsheet.copy();
 if (args.item.text === 'Cut')
 spreadsheet.cut();
 if (args.item.text === 'Paste')
 spreadsheet.paste();
}
</script>

```

### CLIPBOARDCONTROLLER.CS

```

## Limitations

- External clipboard is not fully supported while copying data from another source and pasting into a spreadsheet, it only works with basic supports (Values, Number, cell, and Text formatting).
- If you copy =SUM(A2,B2) and paste, the formula reference will change depending on the pasted cell address but we don't have support for nested formula(formula reference will be same).
- Clipboard is not supported with conditional formatting (values only pasting).
- We have limitation while copying the whole sheet data and pasting it into another sheet.

## Selection in Spreadsheet Control

Selection provides interactive support to highlight the cell, row, or column that you select. Selection can be done through Mouse, Touch, or Keyboard interaction. To enable selection, set `mode` as `Single` or `Multiple` in [selectionSettings](#). If you set `mode` to `None`, it disables the UI selection.

**Note:** The default value for `mode` in `selectionSettings` is `Multiple`.

You have the following options in Selection,

- Cell selection
- Row selection

- Column selection

### Cell selection

Cell selection is used to select a single or multiple cells. It can be performed using the `selectRange` method.

#### User Interface:

- Click on a cell to select it (or) use the `arrow` keys to navigate to it and select it.
- To select a range, select a cell, then use the left mouse button to select and drag over to other cells (or) use the `Shift + arrow` keys to select the range.
- To select non-adjacent cells and cell ranges, hold `Ctrl` and select the cells.

You can quickly locate and select specific cells or ranges by entering their names or cell references in the Name box, which is located to the left of the formula bar, and also select named or unnamed cells or ranges by using the Go To (`Ctrl+G`) command.

### Row selection

Row selection is used to select a single or multiple rows.

#### User Interface:

You can perform row selection in any of the following ways,

- By clicking the row header.
- To select multiple rows, select a row header with the left mouse button and drag over to other row headers (or) use the `Shift + arrow` keys to select multiple rows.
- To select non-adjacent rows, hold `Ctrl` and select the row header.
- You can also use the `selectRange` method for row selection.

The following sample shows the row selection in the spreadsheet, here selecting the 5th row using the `selectRange` method.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("createHandler").SelectionSettings(selectionSettings =>
{
 selectionSettings.Mode(SelectionMode.Multiple);
}).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 }).Add();
}).Render()
<script>
```

```
function createHandler() {
 //Applies format to specified range
 this.cellFormat({ fontWeight: 'bold' }, 'A1:D1');
 var colCount = this.getActiveSheet().colCount;
 this.selectRange(ej.spreadsheet.getRangeAddress([4, 0, 4,
colCount]));
}
</script>
```

### SELECTIONCONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { Expense Type= "Housing", Projected Cost= "7000",
Actual Cost= "7500", Difference= "-500" },
 new { Expense Type= "Transportation", Projected Cost= "500",
Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Insurance", Projected Cost= "1000",
Actual Cost= "1000", Difference= "0" },
 new { Expense Type= "Food", Projected Cost= "2000", Actual
Cost= "1800", Difference= "200" },
 new { Expense Type= "Pets", Projected Cost= "300", Actual
Cost= "200", Difference= "100" },
 new { Expense Type= "Personel Care", Projected Cost= "500",
Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Loan", Projected Cost= "1000", Actual
Cost= "1000", Difference= "0" },
 new { Expense Type= "Tax", Projected Cost= "200", Actual
Cost= "200", Difference= "0" },
 new { Expense Type= "Savings", Projected Cost= "1000",
Actual Cost= "900", Difference= "100" },
 new { Expense Type= "Total", Projected Cost= "13500", Actual
Cost= "13600", Difference= "-100" },
 };
 ViewBag.DefaultData = data;
 return View();
}
```

### Column selection

Column selection is used to select a single or multiple columns.

#### User Interface:

You can perform column selection in any of the following ways,

- By clicking the column header.
- To select multiple columns, select a column header with the left mouse button and drag over to other column headers (or) use the **Shift + arrow** keys to select the multiple columns.
- To select non-adjacent columns, hold **Ctrl** and select the column header.
- You can also use the **selectRange** method for row selection.

The following sample shows the column selection in the spreadsheet, here selecting the 3rd column using the `selectRange` method.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("createHandler").SelectionSettings(selectionSettings =>
{
 selectionSettings.Mode(SelectionMode.Multiple);
}).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 }).Add();
 }).Render()
<script>
 function createHandler() {
 //Applies format to specified range
 this.cellFormat({ fontWeight: 'bold' }, 'A1:D1');
 var rowCount = this.getActiveSheet().rowCount;
 this.selectRange(ej.spreadsheet.getRangeAddress([0, 2, rowCount,
2]));
 }
</script>
```

### SELECTIONCONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { Expense Type= "Housing", Projected Cost= "7000", Actual Cost= "7500", Difference= "-500" },
 new { Expense Type= "Transportation", Projected Cost= "500", Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Insurance", Projected Cost= "1000", Actual Cost= "1000", Difference= "0" },
 new { Expense Type= "Food", Projected Cost= "2000", Actual Cost= "1800", Difference= "200" },
 new { Expense Type= "Pets", Projected Cost= "300", Actual Cost= "200", Difference= "100" },
 new { Expense Type= "Personel Care", Projected Cost= "500", Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Loan", Projected Cost= "1000", Actual Cost= "1000", Difference= "0" },
 new { Expense Type= "Tax", Projected Cost= "200", Actual Cost= "200", Difference= "0" },
 new { Expense Type= "Savings", Projected Cost= "1000", Actual Cost= "900", Difference= "100" },
 }
}
```

```

 new { Expense Type= "Total", Projected Cost= "13500", Actual
Cost= "13600", Difference= "-100" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### How to remove selection in the spreadsheet

The following sample shows, how to remove the selection in the spreadsheet. Here changing the mode as **None** in [selectionSettings](#) to disable's the UI selection.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("createHandler").CellEdit("cellEdit").SelectionSettings(selectionSettings =>
{
 selectionSettings.Mode(SelectionMode.None);
}).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(130).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 }).Add();
 }).Render()
<script>
 function createHandler() {
 //Applies format to specified range
 this.cellFormat({ fontWeight: 'bold' }, 'A1:D1');
 }
 function cellEdit (args){
 args.cancel = true;
 }
</script>

```

### SELECTIONCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { Expense Type= "Housing", Projected Cost= "7000",
Actual Cost= "7500", Difference= "-500" },
 new { Expense Type= "Transportation", Projected Cost= "500",
Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Insurance", Projected Cost= "1000",
Actual Cost= "1000", Difference= "0" },
 new { Expense Type= "Food", Projected Cost= "2000", Actual
Cost= "1800", Difference= "200" },
 }
}

```

```

 new { Expense Type= "Pets", Projected Cost= "300", Actual
Cost= "200", Difference= "100" },
 new { Expense Type= "Personel Care", Projected Cost= "500",
Actual Cost= "500", Difference= "0" },
 new { Expense Type= "Loan", Projected Cost= "1000", Actual
Cost= "1000", Difference= "0" },
 new { Expense Type= "Tax", Projected Cost= "200", Actual
Cost= "200", Difference= "0" },
 new { Expense Type= "Savings", Projected Cost= "1000",
Actual Cost= "900", Difference= "100" },
 new { Expense Type= "Total", Projected Cost= "13500", Actual
Cost= "13600", Difference= "-100" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

## Limitations

- We have a limitation while performing the Select All(**ctrl + A**). You can do this only by clicking the Select All button at the top left corner.

## Scrolling in Spreadsheet control

Scrolling helps you to move quickly to different areas of the worksheet. It moves faster if we use horizontal and vertical scroll bars. Scrolling can be enabled by setting the [allowScrolling](#) as true.

**Note:** By default, the [allowScrolling](#) property is true.

You have the following options in Scrolling by using [scrollSettings](#).

- Finite scrolling.
- Virtual scrolling.

## Finite Scrolling

Finite scrolling supports two type of modes in scrolling. You can use the [isFinite](#) property in [scrollSettings](#) to specify the mode of scrolling.

- Finite - This mode does not create a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as [true](#).
- Infinite - This mode creates a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as [false](#).

**Note:** By Default, the [isFinite](#) property is [false](#).

## Virtual Scrolling

- Virtual scrolling allows you to load data that you require (load data based on viewport size) without buffering the entire huge database. You can set the [enableVirtualization](#) property in [scrollSettings](#) as [true](#).

In virtual scrolling `enableVirtualization` is set to true means, it allows you to load the spreadsheet data while scrolling.

**Note:** By Default, the `enableVirtualization` property is `true`.

#### User Interface:

You can scroll through the worksheet using one of the following ways,

- Using the `arrow` keys.
- Using the Horizontal and Vertical `scroll` bars.
- Using the `mouse` wheel.

#### Finite scrolling with defined rows and columns

If you want to perform scrolling with defined rows and columns, you must define `rowCount` and `colCount` in the `sheets` property and set `isFinite` as true and `enableVirtualization` as false in `scrollSettings`.

The following code example shows the finite scrolling with defined rows and columns in the spreadsheet. Here, we used `rowCount` as 20 and `colCount` as 20, after reaching the 20th row or 20th column you can't able to scroll.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").AllowScrolling(true).Created("createHandler").ScrollSettings(scrollSettings =>
{
 scrollSettings.IsFinite(true);
}).Sheets(sheet =>
{
 sheet.Name("Price Details").RowCount(9).ColCount(7).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(110).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 column.Width(110).Add();
 column.Width(92).Add();
 column.Width(96).Add();
 column.Width(96).Add();
 }).Add();
}).Render()
<script>
 function createHandler() {
 //Applies format to specified range
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' }, 'A1:F1');
 }
</script>
```

#### SCROLLINGCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {

 ViewBag.DefaultData = data;
 return View();
}

```

## Protection in Spreadsheet Control

Sheet protection helps you to prevent the users from modifying the data in the spreadsheet.

### Protect Sheet

Protect sheet feature helps you to prevent the unknown users from accidentally changing, editing, moving, or deleting data in a spreadsheet. And you can also protect the sheet with password. You can use the [isProtected](#) property to enable or disable the Protecting functionality.

**Note:** The default value for `isProtected` property is `false`.

By default in protected sheet, selecting, formatting, inserting, deleting functionalities are disabled. To enable some of the above said functionalities the `protectSettings` options are used in a protected spreadsheet.

The available `protectSettings` options in spreadsheet are,

| Options        | Uses                                  |
|----------------|---------------------------------------|
| -----          | -----                                 |
| Select Cells   | Used to perform Cell Selection.       |
| Format Cells   | Used to perform Cell formatting.      |
| Format Rows    | Used to perform Row formatting.       |
| Format Columns | Used to perform Column formatting.    |
| Insert Link    | Used to perform Hyperlink Insertions. |

**Note:** \* The default value for all `protectSettings` options are `false`.

By default, the `Protect Sheet` module is injected internally into the Spreadsheet to perform sheet protection function.

#### User Interface:

In the active Spreadsheet, the sheet protection can be done by any of the following ways:

- Select the Protect Sheet item in the Ribbon toolbar under the Data Tab, and then select your desired options.
- Right-click the sheet tab, select the Protect Sheet item in the context menu, and then select your desired options.
- Use the `protectSheet()` method programmatically.

The following example shows `Protect Sheet` functionality with password in the Spreadsheet control.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").DataBound("dataBound").Sheets(sheet =>
{
 sheet.Name("Budget").IsProtected(true).ProtectSettings(new
 SpreadsheetProtectSettings { SelectCells=false }).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.budgetData).StartCell("A1").Add();
 }).Columns(column =>
 {
```

```

 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Salary").Ranges(ranges =>
 {

ranges.DataSource((IEnumerable<object>) ViewBag.salaryData).StartCell("A1").Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
<script>
 function dataBound() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:D1');
 this.cellFormat({ fontWeight: 'bold', 'A11:D11' });
 spreadsheet.protectSheet(1, { selectCells: false, "syncfusion"); //
 protect sheet with password
 }
</script>

```

### PROTECTSHEETCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data1 = new List<object>()
 {
 new { ExpenseType= "Housing", ProjectedCost= "7000",
 ActualCost= "7500", Difference= "-500"},
 new { ExpenseType= "Transportation", ProjectedCost= "500",
 ActualCost= "500", Difference= "0"},
 new { ExpenseType= "Insurance", ProjectedCost= "1000",
 ActualCost= "1000", Difference= "0"},
 new { ExpenseType= "Food", ProjectedCost= "2000",
 ActualCost= "1800", Difference= "200"},
 new { ExpenseType= "Pets", ProjectedCost= "300",
 ActualCost= "200", Difference= "100"},
 new { ExpenseType= "Personel Care", ProjectedCost= "500",
 ActualCost= "500", Difference= "0"},
 new { ExpenseType= "Loan", ProjectedCost= "1000",
 ActualCost= "1000", Difference= "0"},
 new { ExpenseType= "Tax", ProjectedCost= "200", ActualCost=
 "200", Difference= "0"},
 new { ExpenseType= "Savings", ProjectedCost= "1000",
 ActualCost= "900", Difference= "100"},
 new { ExpenseType= "Total", ProjectedCost= "13500",
 ActualCost= "13600", Difference= "-100"},
 };
 List<object> data2 = new List<object>()

```

```

 {
 new { Earnings= "Basic", CreditAmount= "20000",
Deductions= "Provident Fund", DebitAmount= "2400"},
 new { Earnings= "HRA", CreditAmount= "8000", Deductions=
"ESI", DebitAmount= "0"},
 new { Earnings= "Special Allowance", CreditAmount= "25000",
Deductions= "Professional Tax", DebitAmount= "200"},
 new { Earnings= "Incentives", CreditAmount= "2000",
Deductions= "TDS", DebitAmount= "2750"},
 new { Earnings= "Bonus", CreditAmount= "1500", Deductions=
"Other Deduction", DebitAmount= "0"},
 new { Earnings= "Total Earnings", CreditAmount= "56500",
Deductions= "Total Deductions", DebitAmount= "5350"},
 };
 ViewBag.budgetData = data1;
 ViewBag.salaryData = data2;
 return View();
 }

```

### Limitations of Protect sheet

- Password encryption is not supported

### Unprotect Sheet

Unprotect sheet is used to enable all the functionalities that are already disabled in a protected spreadsheet.

#### User Interface:

In the active Spreadsheet, the sheet Unprotection can be done by any of the following ways:

- Select the **Unprotect Sheet** item in the Ribbon toolbar under the Data Tab.
- Right-click the sheet tab, select the **Unprotect Sheet** item in the context menu.
- Use the `unprotectSheet()` method programmatically.

### Unlock the particular cells in the protected sheet

In protected spreadsheet, to make some particular cell or range of cells are editable, you can use `lockCells()` method, with the parameter `range` and `isLocked` property as false.

### CSHTML

```

<button id="customBtn" class="e-btn"> Unlock cells</button>
@Html.EJS().Spreadsheet("spreadsheet").DataBound("dataBound").Sheets(sheet
=>
{
 sheet.Name("Budget").IsProtected(true).ProtectSettings(new
SpreadsheetProtectSettings { SelectCells = false }).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.budgetData).StartCell("A1").A
dd();
 }).Columns(column =>
 {
 column.Width(100).Add();
 });
}

```

```

 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Salary").Ranges(ranges =>
 {

ranges.DataSource((IEnumerable<object>)ViewBag.salaryData).StartCell("A1").Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
 @Html.EJS().Dialog("defaultDialog").Header("Spreadsheet").ShowCloseIcon(true)
 .Width("500px").Target("#spreadsheet").Buttons(ViewBag.DefaultButtons).Content(
 "'A1:F3' range of cells has been unlocked.")
 .IsModal(true).Visible(false).Render()
 <script>

 document.getElementById("customBtn").addEventListener('click',
 showAlert);
 function dataBound() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:D1');
 this.cellFormat({ fontWeight: 'bold' }, 'A11:D11');
 }
 function lockCells() {
 var spreadsheetObj =
 ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var dialogObj =
 ej.base.getComponent(document.getElementById('defaultDialog'), 'dialog');
 spreadsheetObj.lockCells('A1:F3', false);
 dialogObj.hide();
 }
 function showAlert() {
 var dialogObj =
 ej.base.getComponent(document.getElementById('defaultDialog'), 'dialog');
 dialogObj.show();
 }
 }
 </script>

```

### LOCKCELLCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data1 = new List<object>()
 {
 new { ExpenseType= "Housing", ProjectedCost= "7000",
 ActualCost= "7500", Difference= "-500"},
 new { ExpenseType= "Transportation", ProjectedCost= "500",
 ActualCost= "500", Difference= "0"},
 }
}

```

```

 new { ExpenseType= "Insurance", ProjectedCost= "1000",
ActualCost= "1000", Difference= "0"},
 new { ExpenseType= "Food", ProjectedCost= "2000",
ActualCost= "1800", Difference= "200"},
 new { ExpenseType= "Pets", ProjectedCost= "300",
ActualCost= "200", Difference= "100"},

```

### Protect Workbook

Protect workbook feature helps you to protect the workbook so that users cannot insert, delete, rename, hide the sheets in the spreadsheet.

You can use the [password](#) property to protect workbook with password.

You can use the [isProtected](#) property to protect or unprotect the workbook without the password.

**Note:** The default value for `isProtected` property is `false`.

### User Interface:

In the active Spreadsheet, you can protect the worksheet by selecting the Data tab in the Ribbon toolbar and choosing the `Protect Workbook` item. Then, enter the password and confirm it and click on OK.

The following example shows `Protect Workbook` by using the `isProtected` property in the Spreadsheet control.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").IsProtected(true).DataBound("dataBound").Sheets(sheet =>
{
 sheet.Name("Budget").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.budgetData).StartCell("A1").Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function dataBound() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:D1');
 this.cellFormat({ fontWeight: 'bold' }, 'A11:D11');
 }
</script>
```

### PROTECTWORKBOOKCONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { ExpenseType= "Housing", ProjectedCost= "7000",
 ActualCost= "7500", Difference= "-500"},
 new { ExpenseType= "Transportation", ProjectedCost= "500",
 ActualCost= "500", Difference= "0"},
 new { ExpenseType= "Insurance", ProjectedCost= "1000",
 ActualCost= "1000", Difference= "0"},
 new { ExpenseType= "Food", ProjectedCost= "2000",
 ActualCost= "1800", Difference= "200"},
 new { ExpenseType= "Pets", ProjectedCost= "300",
 ActualCost= "200", Difference= "100"},
 new { ExpenseType= "Personel Care", ProjectedCost= "500",
 ActualCost= "500", Difference= "0"},
 new { ExpenseType= "Loan", ProjectedCost= "1000",
 ActualCost= "1000", Difference= "0"},
 }
```

```

 new { ExpenseType= "Tax", ProjectedCost= "200", ActualCost=
"200", Difference= "0"},
 new { ExpenseType= "Savings", ProjectedCost= "1000",
ActualCost= "900", Difference= "100"},
 new { ExpenseType= "Total", ProjectedCost= "13500",
ActualCost= "13600", Difference= "-100"},
 };
 ViewBag.budgetData = data;
 return View();
}

```

The following example shows **Protect Workbook** by using the [password](#) property in the Spreadsheet control. To unprotect the workbook, click the unprotect workbook button in the data tab and provide the password as syncfusion in the dialog box.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Password("syncfusion").DataBound("data
Bound").Sheets(sheet =>
{
 sheet.Name("Budget").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.budgetData).StartCell("A1").A
dd();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function dataBound() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:D1');
 this.cellFormat({ fontWeight: 'bold'}, 'A11:D11');
 }
</script>

```

### PASSWORDCONTROLLER.CS

```

public IActionResult Index()
{

ActualCost= "900", Difference= "100"},
 new { ExpenseType= "Total", ProjectedCost= "13500",
ActualCost= "13600", Difference= "-100"},
 };
 ViewBag.budgetData = data;
 return View();
}

```

### Unprotect Workbook

Unprotect Workbook is used to enable the insert, delete, rename, move, copy, hide or unhide sheets feature in the spreadsheet.

#### User Interface:

In the active Spreadsheet, the workbook Unprotection can be done in any of the following ways:

- Select the **Unprotect Workbook** item in the Ribbon toolbar under the Data Tab and provide the valid password in the dialog box.

#### See Also

- [Hyperlink](#)

### Rows and columns in Spreadsheet control

Spreadsheet is a tabular format consisting of rows and columns. The intersection point of rows and columns are called as cells. The list of operations that you can perform in rows and columns are,

- Insert
- Delete
- Show and Hide

#### Insert

You can insert rows or columns anywhere in a spreadsheet. Use the [allowInsert](#) property to enable or disable the insert option in Spreadsheet.

#### Row

The rows can be inserted in the following ways,

- Using **insertRow** method, you can insert the rows once the component is loaded.
- Using context menu, insert the empty rows in the desired position.

The following code example shows the options for inserting rows in the spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).ShowFormulaBar(false).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("B1").
 Add();

 }).Columns(column =>
 {
 column.Width(20).Add();
 column.Width(90).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
<script>
 function created() {
 // Rows model that is going to insert dynamically
 var rowsModel = [{
 index: 9, // Need to specify the index for the first row
 collection, the specified rows will be inserted in this index.
 cells: [{ value: '' }, { value: '8' }, { value: 'Northwoods
Cranberry Sauce' }, { value: '3' }, { value: '12 - 12 oz jars' },
 { value: '40.00' }, { value: '6' }, { value: 'false' }]
 },
 {
 cells: [{ value: '' }, { value: '9' }, { value: 'Mishi Kobe
Niku' }, { value: '4' }, { value: '18 - 500 g pkgs.' }, { value: '97.00' },
 { value: '29' }, { value: 'true' }]
 }
];
 // Applies style formatting before inserting the rows
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'B1:H1');
 // inserting a empty row at 0th index
 this.insertRow();
 // inserting 2 rows at the 9th index with data
 this.insertRow(rowsModel);
 // Applies style formatting after the rows are inserted
 this.cellFormat({ textAlign: 'center' }, 'B3:B12');
 this.cellFormat({ textAlign: 'center' }, 'D3:D12');
 this.cellFormat({ textAlign: 'center' }, 'F3:H12');
 }
</script>
```

### INSERTROWCONTROLLER.CS

```
public IActionResult Index()
```

```

{
 List<object> data = new List<object>()
 {
 new { ProductId= "1", ProductName= "Chai", SupplierId=
"1", QuantityPerUnit= "10 boxes x 20 bags", UnitPrice= "18.00",
UnitsInStock= "39", Discontinued= "false" },
 new { ProductId= "2", ProductName= "Chang", SupplierId=
"1", QuantityPerUnit= "24 - 12 oz bottles", UnitPrice= "19.00",
UnitsInStock= "17", Discontinued= "true" },
 new { ProductId= "3", ProductName= "Aniseed Syrup",
SupplierId= "1", QuantityPerUnit= "12 - 550 ml bottles", UnitPrice=
"10.00", UnitsInStock= "13", Discontinued= "false" },

UnitsInStock= "22", Discontinued= "false" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Column

The columns can be inserted in the following ways,

- Using `insertColumn` method, you can insert the columns once the component is loaded.
- Using context menu, insert the empty columns in the desired position.

The following code example shows the options for inserting columns in the spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).ShowFormulaBar(false).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A2").
Add();

 }).Columns(column =>
 {
 column.Width(90).Add();
 column.Width(220).Add();
 })
}
)

```

```

 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function created() {
 // Cells model that you are going to update in the inserted 5th
 column dynamically
 var cellsModel = [{ value: 'UnitPrice', style: { fontWeight: 'bold',
textAlign: 'center' } }, { value: '18.00' },
 { value: '19.00' }, { value: '10.00' }, { value: '22.00' }, { value:
'21.35' }, { value: '25.00' }, { value: '30.00' },
 { value: '21.00' }, { value: '40.00' }, { value: '97.00' }];
 // Applies style formatting before inserting the column
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A2:G2');
 // inserting a empty column at 0th index
 this.insertColumn();
 // inserting 1 column at the 5th index with column model
 this.insertColumn([{ index: 5, width: 90 }]);
 var rowIndex = 1;
 // Updating the 5th column data
 cellsModel.forEach((cell) => {
 this.updateCell(cell, ej.spreadsheet.getCellAddress(rowIndex,
5)); rowIndex++;
 });
 // Applies style formatting after the columns are inserted
 this.cellFormat({ textAlign: 'center' }, 'B3:B12');
 this.cellFormat({ textAlign: 'center' }, 'D3:D12');
 this.cellFormat({ textAlign: 'center' }, 'F3:H12');
 }
</script>

```

### INSERTCOLUMNCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()

 return View();
}

```

## Delete

Delete support provides an option for deleting the rows and columns in the spreadsheet. Use [allowDelete](#) property to enable or disable the delete option in Spreadsheet.

The rows and columns can be deleted dynamically in the following ways,

- Using `delete` method, you can delete the loaded rows and columns.
- Using context menu, you can delete the selected rows and columns.

The following code example shows the delete operation of rows and columns in the spreadsheet.

## CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").AllowDelete(true).Created("created").
ShowRibbon(false).ShowFormulaBar(false).Sheets(sheet =>
{
 sheet.Name("Sheet1").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Columns(column =>
 {
 column.Width(90).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Sheet2").Ranges(ranges =>

```

```

{
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();

}).Columns(column =>
{
 column.Width(90).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
}).Add();
}).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:H1');
 // deleting the rows from 8th to 10th index. To delete row, the
 third argument of enum type is passed as 'Row', the last argument specifies
 the sheet name or index in which the delete operation will perform. By
 default, active sheet will be considered. It is applicable only for model
 type Row and Column.
 this.delete(8, 10, 'Row', 0); // startIndex, endIndex, Row, sheet
 index
 // deleting the 2nd and 5th indexed columns
 this.delete(2, 2, 'Column', 'Sheet2');
 this.delete(5, 5, 'Column');
 this.delete(0, 0, "Sheet"); // delete the first sheet. sheet index
 starts from 0
 // Applies style formatting after deleted the rows and columns
 this.cellFormat({ textAlign: 'center' }, 'A2:A8');
 this.cellFormat({ textAlign: 'center' }, 'D2:G8');
 }
</script>

```

### DELETEROWCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { ProductId= "1", ProductName= "Chai", SupplierId=
 "1", QuantityPerUnit= "10 boxes x 20 bags", UnitPrice= "18.00",
 UnitsInStock= "39", Discontinued= "false" },
 new { ProductId= "2", ProductName= "Chang", SupplierId=

 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Hide and show

You can show or hide the rows and columns in the spreadsheet through property binding, method, and context menu.

#### Row

The rows can be hidden or shown through the following ways,

- Using `hidden` property in row, you can hide/show the rows at initial load.
- Using `hideRow` method, you can hide the rows by specifying the start and end row index, set the last argument `hide` as `false` to unhide the hidden rows.
- Right-click on the row header and select the desired option from context menu

#### Column

The columns can be hidden or shown through following ways,

- Using `hidden` property in columns, you can hide/show the columns at initial load.
- Using `hideColumn` method, you can hide the columns by specifying the start and end column index, set the last argument `hide` as `false` to unhide the hidden columns.
- Right-click on the column header and select the desired option from context menu

The following code example shows the hide/show rows and columns operation in the spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ShowSheetTabs(false).Created("created")
.ShowRibbon(false).ShowFormulaBar(false).Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {

```

```

 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();

 }).Rows(row =>
 {
 row.Index(2).Hidden(true).Add();
 row.Hidden(true).Add();
 }).Columns(column =>
 {
 column.Width(90).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 }).Render()
<script>
 function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
 'A1:H1');
 // Unhide the 2nd index hidden column
 this.hideColumn(1, 1, false);
 // Unhide the 3rd index hidden row
 this.hideRow(3, 3, false);
 // Hiding the 6th index column
 this.hideColumn(6);
 // Hiding the 8th and 9th index row
 this.hideRow(8, 9);
 this.cellFormat({ textAlign: 'center' }, 'D2:H11');
 }
</script>

```

### SHOWHIDECONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { ProductId= "1", ProductName= "Chai", SupplierId=
 "1", QuantityPerUnit= "10 boxes x 20 bags", UnitPrice= "18.00",
 UnitsInStock= "39", Discontinued= "false" },
 new { ProductId= "2", ProductName= "Chang", SupplierId=
 "1", QuantityPerUnit= "24 - 12 oz bottles", UnitPrice= "19.00",
 UnitsInStock= "17", Discontinued= "true" },
 new { ProductId= "3", ProductName= "Aniseed Syrup",

 "10.00", UnitsInStock= "13", Discontinued= "false" },
 new { ProductId= "4", ProductName= "Chef Anton\'s Cajun
 Seasoning", SupplierId= "2", QuantityPerUnit= "48 - 6 oz jars",
 UnitPrice= "22.00", UnitsInStock= "53", Discontinued= "true" },
 new { ProductId= "5", ProductName= "Chef Anton\'s Gumbo
 Mix", SupplierId= "2", QuantityPerUnit= "36 boxes", 'Unit Price',
 UnitPrice= "21.35", UnitsInStock= "0", Discontinued= "true" },
 }
}

```

```

 new { ProductId= "6", ProductName= "Grandma\'s Boysenberry
Spread", SupplierId= "3", QuantityPerUnit= "12 - 8 oz jars", UnitPrice=
"25.00", UnitsInStock= "120", Discontinued= "false" },
 new { ProductId= "7", ProductName= "Uncle Bob\'s Organic
Dried Pears", SupplierId= "3", QuantityPerUnit= "12 - 1 lb pkgs.",
UnitPrice= "30.00", UnitsInStock= "15", Discontinued= "true" },
 new { ProductId= "8", ProductName= "Queso Cabrales",
SupplierId= "5", QuantityPerUnit= "1 kg pkg.", UnitPrice= "21.00",
UnitsInStock= "22", Discontinued= "false" },
 new { ProductId= "9", ProductName= "Northwoods Cranberry
Sauce", SupplierId= "3", QuantityPerUnit= "12 - 12 oz jars", UnitPrice=
"21.00", UnitsInStock= "6", Discontinued= "false" },
 new { ProductId= "10", ProductName= "Mishi Kobe Niku",
SupplierId= "4", QuantityPerUnit= "18 - 500 g pkgs.", UnitPrice= "21.00",
UnitsInStock= "29", Discontinued= "true" },
 };
 ViewBag.DefaultData = data;
 return View();
}

```

### Size

You can change the size of rows and columns in the spreadsheet by using `setRowsHeight` and `setColumnsWidth` methods.

### Row

You can change the height of single or multiple rows by using the `setRowsHeight` method.

You can provide the following type of ranges to the method:

- Single row range: ['2:2']
- Multiple rows range: ['1:100']
- Multiple rows with discontinuous range: ['1:10', '15:25', '30:40']
- Multiple rows with different sheets: [Sheet1!1:50, 'Sheet2!1:50', 'Sheet3!1:50']

The following code example shows how to change the height for single/multiple rows in the spreadsheet.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
function created() {
 // To change height for single row
 this.setRowsHeight(40, ['2']);
 // To change height for multiple rows
 this.setRowsHeight(40, ['4:8', '10:12']);
}

```

```
</script>
```

**ROWHEIGHTCONTROLLER.CS**

```
public IActionResult Index()
{

 return View();
}
```

*Column*

You can change the width of single or multiple columns by using the `setColumnsWidth` method.

You can provide the following type of ranges to the method:

- Single column range: ['F:F']
- Multiple columns range: ['A:F']
- Multiple columns with discontinuous range: ['A:C', 'G:I', 'K:M']
- Multiple columns with different sheets: [Sheet1!A:H, 'Sheet2!A:H', 'Sheet3!A:H']

The following code example shows how to change the width for single/multiple columns in the spreadsheet.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("created").Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();

 }).Add();
}).Render()
<script>
function created() {
 // To change width of single column
 this.setColumnsWidth(100, ['F']);
 // To change width of multiple columns
 this.setColumnsWidth(120, ['A:C', 'G:I', 'K:M']);
}
</script>
```

### COLUMNWIDTHCONTROLLER.CS

```
public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { ProductId= "1", ProductName= "Chai", SupplierId=
"1", QuantityPerUnit= "10 boxes x 20 bags", UnitPrice= "18.00",
UnitsInStock= "39", Discontinued= "false" },
 new { ProductId= "2", ProductName= "Chang", SupplierId=
"1", QuantityPerUnit= "24 - 12 oz bottles", UnitPrice= "19.00",
UnitsInStock= "17", Discontinued= "true" },
 new { ProductId= "3", ProductName= "Aniseed Syrup",
SupplierId= "1", QuantityPerUnit= "12 - 550 ml bottles", UnitPrice=
"10.00", UnitsInStock= "13", Discontinued= "false" },
 new { ProductId= "4", ProductName= "Chef Anton\'s Cajun
Seasoning", SupplierId= "2", QuantityPerUnit= "48 - 6 oz jars",
UnitPrice= "22.00", UnitsInStock= "53", Discontinued= "true" },
 new { ProductId= "5", ProductName= "Chef Anton\'s Gumbo
Mix", SupplierId= "2", QuantityPerUnit= "36 boxes", Unit Price=
UnitPrice= "21.35", UnitsInStock= "0", Discontinued= "true" },
 new { ProductId= "6", ProductName= "Grandma\'s Boysenberry
Spread", SupplierId= "3", QuantityPerUnit= "12 - 8 oz jars", UnitPrice=
"25.00", UnitsInStock= "120", Discontinued= "false" },
 new { ProductId= "7", ProductName= "Uncle Bob\'s Organic
Dried Pears", SupplierId= "3", QuantityPerUnit= "12 - 1 lb pkgs.",
UnitPrice= "30.00", UnitsInStock= "15", Discontinued= "true" },
 new { ProductId= "8", ProductName= "Queso Cabrales",
SupplierId= "5", QuantityPerUnit= "1 kg pkg.", UnitPrice= "21.00",
UnitsInStock= "22", Discontinued= "false" },
 new { ProductId= "9", ProductName= "Northwoods Cranberry
Sauce", SupplierId= "3", QuantityPerUnit= "12 - 12 oz jars", UnitPrice=
"21.00", UnitsInStock= "6", Discontinued= "false" },
```

```

 new { ProductId= "10", ProductName= "Mishi Kobe Niku",
SupplierId= "4", QuantityPerUnit= "18 - 500 g pkgs.", UnitPrice= "21.00",
UnitsInStock= "29", Discontinued= "true" },
 };
 ViewBag.DefaultData = data;
 return View();
 }
}

```

### Changing text in column headers

Using the [beforeCellRender](#) event, you can change the text in the column headers. In that event, you can use the `e-header-cell` class to identify the header cell element and update its text value.

The following code example shows how to change the text in the column headers.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").BeforeCellRender("beforeCellRender").
Render()
<script>
 function beforeCellRender(args) {
 // Condition to check whether the rendered element is header cell.
 if (
 args.colIndex >= 0 &&
 args.colIndex <= 10 &&
 args.element.classList.contains('e-header-cell')
) {
 var text = 'custom header ' + args.colIndex.toString();
 // Add the custom text to the innerText of the element.
 args.element.innerText = text;
 }
 }
</script>

```

### Limitations of insert and delete

The following features have some limitations in Insert/Delete:

- Insert row/column between the formatting applied cells.
- Insert row/column between the data validation.
- Insert row/column between the conditional formatting applied cells.
- Insert/delete row/column between the filter applied cells.

### Undo and Redo in Spreadsheet control

**Undo** option helps you to undone the last action performed and **Redo** option helps you to do the same action which is reverted in the Spreadsheet. You can use the [allowUndoRedo](#) property to enable or disable undo redo functionality in spreadsheet.

**Note:** \* The default value for `allowUndoRedo` property is `true`.

By default, the `UndoRedo` module is injected internally into Spreadsheet to perform undo redo.

### Undo

It reverses the last action you performed with Spreadsheet. Undo can be done by any of the following ways:

- Select the undo item from HOME tab in Ribbon toolbar.
- Use `Ctrl + Z` keyboard shortcut to perform the undo.
- Use the `undo` method programmatically.

### Redo

It reverses the last undo action you performed with Spreadsheet. Redo can be done by any of the following ways:

- Select the redo item from HOME tab in Ribbon toolbar.
- Use `Ctrl + Y` keyboard shortcut to perform the redo.
- Use the `redo` method programmatically.

### Update custom actions in UndoRedo collection

You can update your own custom actions in `UndoRedo` collection, by using the `updateUndoRedoCollection` method. And also customize the undo redo operations of your custom action by using `actionComplete` event.

The following code example shows `How to update and customize your own actions for undo redo` functionality in the Spreadsheet control.

### CSHTML

```
<button id="customBtn" class="e-btn"> add/remove Class</button>
@Html.EJS().Spreadsheet("spreadsheet").AllowUndoRedo(true).ActionComplete("onActionComplete").Render()
<script>
 document.getElementById("customBtn").addEventListener('click',
updateCollection);
 function onActionComplete(args) {
 var actionEvents = args;
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (actionEvents.eventArgs.action == "customCSS") {
 var Element =
spreadsheetObj.getCell(actionEvents.eventArgs.rowIdx,
actionEvents.eventArgs.colIdx);
 if (actionEvents.eventArgs.requestType == "undo") {
 Element.classList.remove('customClass'); // To remove the
custom class in undo action
 }
 else {
 Element.classList.add('customClass'); // To add the custom
class in redo action
 }
 }
 }
}
```

```

 }
 function updateCollection() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet'),
 cell = spreadsheetObj.getActiveSheet().activeCell,
 cellIdx = ej.spreadsheet.getRangeIndexes(cell),
 Element = spreadsheetObj.getCell(cellIdx[0], cellIdx[1]);
 if (!Element.classList.contains("customClass")) {
 Element.classList.add('customClass'); // To add the custom class
in active cell element
 spreadsheetObj.updateUndoRedoCollection({ eventArgs: { class:
'customClass', rowIdx: cellIdx[0], colIdx: cellIdx[1], action: 'customCSS' }
}); // To update the undo redo collection
 }
 }
</script>
<style>
 .customClass.e-cell {
 background-color: red;
 }
</style>

```

### UNDOREDOCONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

### Find and Replace in Spreadsheet control

Find and Replace helps you to search for the target text and replace the found text with alternative text within the sheet or workbook. You can use the [allowFindAndReplace](#) property to enable or disable the Find and Replace functionality.

**Note:** \* The default value for `allowFindAndReplace` property is `true`.

#### Find

Find feature is used to select the matched contents of a cell within the sheet or workbook. It is extremely useful when working with large set of data source.

#### User Interface:

Find can be done by any of the following ways:

- Select the Search icon in the Ribbon toolbar or use `Ctrl + F` key to open the Find dialog.
- Use find Next and find Previous buttons to search the given value in the workbook.

- Select the option button in Find dialog to open the Find and Replace dialog. Then, select the below properties for enhanced searching.

**Note:** \* **Search within:** To search the target in a sheet (default) or in an entire workbook.

<br/> \* **Search by:** It enhance the search, either By Rows (default), or By Columns.

<br/> \* **Match case:** To find the matched value with case sensitive.

<br/> \* **Match exact cell contents:** To find the exact matched cell value with entire match cases.

- Using `find()` method to perform find operation.

## Replace

Replace feature is used to change the find contents of a cell within sheet or workbook. Replace All is used to change all the matched contents of a cell within sheet or workbook.

### User Interface:

Replace can be done by any of the following ways:

- Use `Ctrl + H` key to open the Find and Replace dialog.
- Use Replace button to change the found value in sheet or workbook.
- Using Replace All button, all the matched criteria can be replaced with find value based on sheet or workbook.
- Using `replace()` method to perform replace operation by passing the argument `args.replaceby` as `replace`.
- Using `replace()` method to perform replace all operation by passing the argument `args.replaceby` as `replaceall`.

## Go to

Go to feature is used to navigate to a specific cell address in the sheet or workbook.

### User Interface:

- Use `Ctrl + G` key to open the Go To dialog.
- Use `goTo()` method to perform Go To operation.

In the following sample, searching can be done by following ways:

- Select the Home tab in the Ribbon toolbar, and then select the Search icon.
- Enter any value in the search textbox.
- Select the next (or) previous button to find the entered value in the spreadsheet.
- You can have more options to find values by selecting the more options in the search toolbar.

## CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").AllowFindAndReplace(true).Sheets(sheet =>
{
```

```

sheet.Ranges(ranges =>
{
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();

}).Columns(column =>
{
 column.Width(110).Add();
 column.Width(220).Add();
 column.Width(90).Add();
 column.Width(140).Add();
 column.Width(90).Add();
 column.Width(100).Add();
 column.Width(100).Add();
}).Add();
}).Render()

```

### SEARCHCONTROLLER.CS

```

public IActionResult Index()

 ViewBag.DefaultData = data;
 return View();
}

```

## Limitations

- Undo/redo for Replace All is not supported in this feature.

## Accessibility in ASP.NET MVC Spreadsheet Control

The Spreadsheet control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Spreadsheet control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Spreadsheet control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Spreadsheet control:

| Attributes                              | Purpose                                                                                                    |
|-----------------------------------------|------------------------------------------------------------------------------------------------------------|
| -----                                   | -----                                                                                                      |
| <code>grid</code> (role)                | This role is added to the spreadsheet content table and describes the collection of rows and columns.      |
| <code>gridcell</code> (role)            | This role is added to the cell element and describes the rows <code>&lt;td&gt;</code> element.             |
| <code>rowheader</code> (role)           | This role is added to the row header and describes the header of the rows.                                 |
| <code>colheader</code> (role)           | This role is added to the column header and describes the header of the columns.                           |
| <code>aria-rowindex</code> (attribute)  | This attribute describes the table's row index in the spreadsheet.                                         |
| <code>aria-colindex</code> (attribute)  | This attribute describes the table's column index in the spreadsheet.                                      |
| <code>aria-selected</code> (attribute)  | This attribute describes an item's (cell, menu, checkbox, etc.) current selected state in the spreadsheet. |
| <code>aria-rowcount</code> (attribute)  | This attribute describes the total number of rows in the table.                                            |
| <code>aria-colcount</code> (attribute)  | This attribute describes the total number of columns in the table.                                         |
| <code>aria-busy</code> (attribute)      | This attribute describes a currently updated or modified element.                                          |
| <code>aria-label</code> (attribute)     | This attribute describes the accessible name for the interactive elements.                                 |
| <code>textbox</code> (role)             | This role is assigned to the textbox that accepts text input.                                              |
| <code>menu</code> (role)                | This role has been added to the menu and describes the menu items.                                         |
| <code>aria-expanded</code> (attribute)  | This attribute describes the control (for example, dropdown) is expanded or collapsed.                     |
| <code>aria-multiline</code> (attribute) | This attribute defines what the Alt + Enter key does in the spreadsheet editor.                            |

### Keyboard interaction

The Spreadsheet control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Spreadsheet control.

- | Press | To do this |
- |-----|-----|
- | Up arrow | Navigate from the active cell to the previous cell in the same column. |
- | Down arrow | Navigate from the active cell to the next cell in the same column. |
- | Left arrow | Navigate from the active cell to the previous cell in the same row. |
- | Right arrow | Navigate from the active cell to the next cell in the same row. |
- | Tab | Navigate the active cell to the next cell in the same row. |
- | Shift + Tab | Navigate the active cell to the previous cell in the same row. |
- | Home | Moves the selection to starting column in worksheet. |
- | Ctrl + Home | Move the selection to the first visible cell on a worksheet. |
- | Shift + Home | Extend the cell selection to the first column of a worksheet. |
- | Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |
- | Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |
- | Page Up | Move page up. |
- | Page Down | Move page down. |
- | Shift + Page Up | Perform page up by selecting all cells between. |
- | Shift + Page Down | Perform page down by selecting all cells between. |
- | Ctrl + Up | Navigate to the non-blank cell before the active cell in the same column. |
- | Ctrl + Down | Navigate to the last non-blank cell in the same column as the active cell. |
- | Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |
- | Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |
- | Shift + Up | Extend the selection of cells to the previous row. |
- | Shift + Down | Extend the selection of cells to the next row. |
- | Shift + Left | Extend the selection of cells to the previous column. |
- | Shift + Right | Extend the selection of cells to the next column. |
- | Ctrl + Shift + Up | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |
- | Ctrl + Shift + Down | Extend the cell selection to the last non-blank cell in the same column as the active cell. |
- | Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |

| Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

| Shift + Enter | Complete the cell editing and select the cell above in the same column. |

| Tab | Complete the cell editing and select the next cell in the same row. |

| Shift + Tab | Complete the cell editing and select the previous cell in the same row. |

| Alt | Focus on the active ribbon tab. |

| Left | Move the focus to the previous items in the ribbon content. |

| Right | Move the focus to the next items in the ribbon content. |

| Alt + Down | Open the ribbon dropdown menu. |

| Esc / Alt + Up | Close the ribbon dropdown menu. |

### Ensuring accessibility

The Spreadsheet control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Spreadsheet control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Spreadsheet control with accessibility tools.

### Keyboard Shortcuts And Navigation

The keyboard shortcuts supported in the spreadsheet are,

| Shortcut | Description |

|-----|-----|

| Ctrl + O | Displays dialog to open a file. |

| Ctrl + S / Alt + F2 | Saves the workbook. |

| F2 | Enables edit mode. |

| ESC | Cancel edit mode and discard the changes. |

| Backspace and SPACE | Clears content of the active cell and enables edit mode. |

| Ctrl + C | Copies the selected cells. |

| Ctrl + X | Cuts the selected cells. |

| Ctrl + V | Paste the clipboard(cut or copied) content in the new selected range. |

| Ctrl + B | Applies or removes **bold** formatting. |

| Ctrl + I | Applies or removes *italic* formatting. |

| Ctrl + U | Applies or removes underline. |

- | Ctrl + 5 | Applies or removes ~~strikethrough~~. |
- | Ctrl + Z | Reverses (Undo) the last action. |
- | Ctrl + Y | Repeats (Redo) the last reversed action. |
- | Ctrl + K | It opens the **Insert Hyperlink** dialog for adding new hyperlink to a cell. If the selected cell already contains hyperlink, it opens the **Edit Hyperlink** dialog. |
- | Ctrl + F / Shift + F5 | Opens **Find** dialog. |
- | Ctrl + H | Opens **Find and Replace** dialog. |
- | Ctrl + G | Opens **GoTo** dialog, which helps to navigate to cell. |
- | Ctrl + Shift + L | Applies filter to the first row of the selected range or used range. |
- | Alt + F | Opens the **File** menu. |
- | Alt + H | Go to **Home** tab. |
- | Alt + N | Go to **Insert** tab. |
- | Alt + M | Go to **Formulas** tab. |
- | Alt + A | Go to **Data** tab. |
- | Alt + W | Go to **View** tab. |
- | Tab | Navigate the active cell to the next cell in the same row. |
- | Shift + Tab | Navigate the active cell to the previous cell in the same row. |
- | Right or Left arrow | Move the focus to next or previous item in the tab if the focus is on ribbon tab. |
- | Up arrow | When a menu is open, move focus to the next item. |
- | Down arrow | When a menu is open, move focus to the previous item. |
- | Spacebar or Enter | Activate a selected button. |
- | Ctrl + F8 | Expand or collapse the ribbon content. |
- | Ctrl + Shift + U | Expand or collapse the formula bar. |
- | Ctrl + 9 | Hide the selected row. |
- | Ctrl + 0 | Hide the selected column. |
- | Home | Moves the selection to starting column in worksheet. |
- | Ctrl + Home | Move the selection to the first visible cell on a worksheet. |
- | Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |
- | Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |
- | Ctrl + & | Apply an outline border to the selected cells. |
- | Ctrl + Shift + & | Apply an outline border to the cells that you've chosen. |
- | Ctrl + Shift + ~ | Apply the **General** number format. |

- | Ctrl + Shift + \$ | Apply the **Currency** format with two decimal places (negative numbers in parentheses). |
- | Shift + F10 | Open the context menu. |
- | Ctrl + % | Apply the **Percentage** format with no decimal places. |
- | Ctrl + ^ | Apply the **Scientific** number format with two decimal places. |
- | Ctrl + Shift + # | Apply the **Date** format with the day, month, and year. |
- | Ctrl + Shift + @ | Apply the **Time** format with the hour and minute, and AM or PM. |
- | Ctrl + Shift + ! | Apply the **Number** format with two decimal places, thousands separator, and minus sign (-) for negative values. |
- | Ctrl + Spacebar | Select an entire column in a worksheet. |
- | Shift + Spacebar | Select an entire row in a worksheet. |
- | Shift + F3 | Opens **Insert Function** dialog. |
- | Ctrl + Alt + N | Opens new workbook. |
- | Shift + Page Down | Perform page down by selecting all cells between. |
- | Shift + Page Up | Perform page up by selecting all cells between. |
- | Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |
- | Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |
- | Ctrl + Up | Navigate to the first non-blank cell in the same row as the active cell. |
- | Ctrl + Down | Navigate to the last cell that is not blank in the same column as the active cell. |
- | Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |
- | Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |
- | Ctrl + Shift + Up | Extend the selection of cells to the first non-blank cell in the same row as the active cell. |
- | Ctrl + Shift + Down | Extend the selection of cells to the last non-blank cell in the same row as the active cell. |
- | Shift + Alt + K | Open the **List All Sheets** dropdown option. |
- | Up arrow | Navigate from the active cell to the previous cell in the same column. |
- | Down arrow | Navigate from the active cell to the next cell in the same column. |
- | Left arrow | Navigate from the active cell to the previous cell in the same row. |
- | Right arrow | Navigate from the active cell to the next cell in the same row. |
- | Page Up | Move page up. |
- | Page Down | Move page down. |
- | Shift + Up | Extend the selection of cells to the previous row. |

| Shift + Down | Extend the selection of cells to the next row. |

| Shift + Left | Extend the selection of cells to the previous column. |

| Shift + Right | Extend the selection of cells to the next column. |

| Ctrl + Top | Navigate to the non-blank cell before the active cell in the same column. |

| Ctrl + Shift + Top | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |

| Ctrl + Shift + Bottom | Extend the cell selection to the last non-blank cell in the same column as the active cell. |

| Enter | Navigate the active cell to the next cell in the same column. |

| Shift + Enter | Navigate to the previous cell in the same column from the active cell. |

| Alt + Down | Open the list data validation menu and filter menu. |

| Alt + Up | Close the list data validation menu and filter menu. |

| Delete | Remove the contents of the cell. |

| Shift + Home | Extend the cell selection to the first column of a worksheet. |

| Shift + F11 | Add a new sheet. |

| Ctrl + Shift + 9 | Unhide the selected rows. |

| Ctrl + Shift + 0 | Unhide the selected columns. |

| Ctrl + D | Fill the cell down. |

| Ctrl + R | Fill the cell right. |

| Alt + Enter | While editing, add a new line. |

| Enter | Complete the cell editing and select the cell below in the same column. |

| Shift + Enter | Complete the cell editing and select the cell above in the same column. |

| Tab | Complete the cell editing and select the next cell in the same row. |

| Shift + Tab | Complete the cell editing and select the previous cell in the same row. |

| Alt | Focus on the active ribbon tab. |

| Left | Move the focus to the previous items in the ribbon content. |

| Right | Move the focus to the next items in the ribbon content. |

| Alt + Down | Open the ribbon dropdown menu. |

| Esc / Alt + Up | Close the ribbon dropdown menu. |

## Ribbon in Spreadsheet control

It helps to organize a spreadsheet's features into a series of tabs. By clicking the expand or collapse icon, you can expand or collapse the ribbon toolbar dynamically.

### Ribbon Customization

You can customize the ribbon using the following methods,

- | Method                           | Action                                                  |
|----------------------------------|---------------------------------------------------------|
| <code>hideRibbonTabs</code>      | Used to show or hide the existing ribbon tabs.          |
| <code>enableRibbonTabs</code>    | Used to enable or disable the existing ribbon tabs.     |
| <code>addRibbonTabs</code>       | Used to add custom ribbon tabs.                         |
| <code>hideToolbarItems</code>    | Used to show or hide the existing ribbon toolbar items. |
| <code>enableToolbarItems</code>  | Used to enable or disable the specified toolbar items.  |
| <code>addToolbarItems</code>     | Used to add the custom items in ribbon toolbar.         |
| <code>hideFileMenuItems</code>   | Used to show or hide the ribbon file menu items.        |
| <code>enableFileMenuItems</code> | Used to enable or disable file menu items.              |
| <code>addFileMenuItems</code>    | Used to add custom file menu items.                     |

The following code example shows the usage of ribbon customization.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("created").FileMenuBeforeOpen(
 "fileMenuBeforeOpen").FileMenuItemSelect("fileMenuItemSelect").Sheets(sheet
=>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.defaultData).StartCell("A1").
 Add();
 }).Columns(column =>
 {
 column.Width(180).Add();
 column.Width(130).Add();
 column.Width(130).Add();
 column.Width(180).Add();
 column.Width(130).Add();
 column.Width(120).Add();
 })
})
```

```

 }).Add();
 }).Render()
</script>

function created() {
 this.cellFormat({ fontWeight: 'bold', textAlign: 'center' },
'A1:F1');
 // Hiding the `Insert` from ribbon.
 this.hideRibbonTabs(['Insert']);
 // Set disabled state to `View` ribbon tab.
 this.enableRibbonTabs(['View'], false);
 // Adding the `Help` ribbon tab at the last index.
 // Specify the ribbon tab header text in last optional
argument(`insertBefore`) for inserting new tab before any existing tab.
 this.addRibbonTabs([header: { text: 'Help' }, content: [{ text:
'Feedback', tooltipText: 'Feedback',
 click: (args) => { /* Any click action for this toolbar item
will come here. */ } }]]);
 // Hiding the unwanted toolbar items from `Home` by specifying its
index.
 this.hideToolbarItems('Home', [0, 1, 2, 4, 14, 15, 21, 24]);
 // Set disable state to `Underline`, `Wrap text` toolbar items from
`Home` by specifying the item id.
 this.enableToolbarItems('Home', [`_${this.element.id}_underline`,
`_${this.element.id}_wrap`], false);
 // Set disable state to `Protect Sheet` toolbar item from `Data` by
mentioning its index.
 this.enableToolbarItems('Data', [0], false);
 // Adding the new `Custom Formulas` toolbar item under `Formulas`
tab for adding custom formulas.
 this.addToolbarItems(
 'Formulas', [{ type: 'Separator' }, {
 text: 'Custom Formulas', tooltipText: 'Custom Formulas',
 // You can set click handler for each new custom toolbar
item
 click: (args) => {
 // You can add custom formulas here.
 }
 }
]);
 // Adding new custom item `Import` after the existing `Open` item.
By default, new item will add after the specified item.
 this.addFileMenuItems([{ text: 'Import', iconCss: 'e-open e-icons'
}], 'Open');
 // Adding new custom item `Export As` after the existing `Save As`
item.
 // Set `insertAfter` optional argument as `false` for adding new
item before the specified item.
 this.addFileMenuItems(
 [
 {
 text: 'Export As', iconCss: 'e-save e-icons', items: [
text: 'XLSX', iconCss: 'e-xlsx e-icons' },
 { text: 'XLS', iconCss: 'e-xls e-icons' }, { text:
'CSV', iconCss: 'e-csv e-icons' }
],
 },
 'Save As', false);
]
)
}

```

```

function fileMenuBeforeOpen() { // Because the file menu items are
 created dynamically, you need to perform the hide or show and enable/disable
 operations
 // under filemenu before open event.
 // Hiding the `Save As` and `Open` item.
 this.hideFileMenuItems(['Save As', 'Open']);
 // Set disable state to `New` item. You can perform any file menu
 items customization by specifying the item id,
 // if it has more than one same item text. Set the last argument
 `isUniqueId` as true for using the item id.
 this.enableFileMenuItems(['${this.element.id}_New'], false, true); }
function fileMenuItemSelect(args) {
 // Custom file menu items select handler
 switch (args.item.text) {
 case 'Import': select(`#${this.element.id}_fileUpload`,
this.element).click();
 break;
 case 'XLSX': this.save({ saveType: 'Xlsx' });
 break;
 case 'XLS': this.save({ saveType: 'Xls' });
 break;
 case 'CSV': this.save({ saveType: 'Csv' });
 break;
 }
}
</script>

```

## FreezePanels in Spreadsheet control

Freeze Panels helps you to keep particular rows or columns visible when scrolling the sheet content in the spreadsheet. You can specify the number of frozen rows and columns using the `frozenRows` and `frozenColumns` properties inside the `Sheet` property.

### Apply freezepanes on UI

#### User Interface:

In the active spreadsheet, click the cell where you want to create freeze panes. Freeze panes can be done in any of the following ways:

- Select the View tab in the Ribbon toolbar and choose the `Freeze Panes` item.
- Use the `freezePanels` method programmatically.

### FrozenRows

It allows you to keep a certain number of rows visible while scrolling vertically through the rest of the worksheet.

#### User Interface:

In the active spreadsheet, select the cell where you want to create frozen rows. Frozen rows can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the `Freeze Rows` item.

- You can specify the number of frozen rows using the `frozenRows` property inside the `Sheet` property.

### FrozenColumns

It allows you to keep a certain number of columns visible while scrolling horizontally through the rest of the worksheet.

#### User Interface:

In the active spreadsheet, select the cell where you want to create frozen columns. Frozen columns can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the `Freeze Columns` item.
- You can specify the number of frozen columns using the `frozenColumns` property inside the `Sheet` property.

In this demo, the `frozenColumns` is set as '2', and the `frozenRows` is set as '2'. Hence, the two columns on the left and the top two rows are frozen.

#### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").Created("createdHandler").Sheets(sheet =>
{
 sheet.Name("Gross Salary").FrozenRows(2).FrozenColumns(2).SelectedRange("C1").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>) ViewBag.DefaultData).StartCell("A2").Add();
 }).Rows(row =>{
 row.Cells(cell => {
 cell.Index(1).Value("Period").Style(new SpreadsheetCellStyle { FontSize = "12pt", FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center, VerticalAlign = VerticalAlign.Middle }).Add();
 cell.Index(3).Value("Total Gross Salary").Style(new SpreadsheetCellStyle { FontSize = "12pt", FontWeight = FontWeight.Bold, TextAlign = TextAlign.Center, VerticalAlign = VerticalAlign.Middle }).Add();

### Limitations

Freeze Panes feature is not compatible with all the features which are available in the spreadsheet. Below features are not compatible with Freeze Panes feature.

- Merging the cells between freeze and unfreeze area.
- If images and charts are added inside the freeze area cells, their portion in the unfreeze area will not move when scrolling.

### See Also

- [Sorting](#)
- [Filtering](#)
- [Undo Redo](#)

### Context Menu in Spreadsheet control

Context Menu is used to improve user interaction with Spreadsheet using the popup menu. This will open when right-clicking on Cell/Column Header/Row Header/ Pager in the Spreadsheet. You can use [enableContextMenu](#) property to enable/disable context menu.

**Note:** The default value for the `enableContextMenu` property is `true`.

#### Context Menu Items in Row Cell

Find the table below for default context menu items and their actions.

| Context Menu items   | Action                                                                                                                                      |
|----------------------|---------------------------------------------------------------------------------------------------------------------------------------------|
| ----- -----          |                                                                                                                                             |
| <b>Cut</b>           | Cut the selected cells data to the clipboard, you can select a cell where you want to move the data.                                        |
| <b>Copy</b>          | Copy the selected cells data to the clipboard, so that you can paste it to somewhere else.                                                  |
| <b>Paste</b>         | Paste the data from clipboard to spreadsheet.                                                                                               |
| <b>Paste Special</b> | <b>Values</b> - Paste the data values from clipboard to spreadsheet. <b>Formats</b> - Paste the data formats from clipboard to spreadsheet. |
| <b>Filter</b>        | Perform filtering to the selected cells based on an active cell's value.                                                                    |
| <b>Sort</b>          | Perform sorting to the selected range of cells by ascending or descending.                                                                  |
| <b>Hyperlink</b>     | Create a link in the spreadsheet to navigate to web links or cell reference within the sheet or other sheets in the Spreadsheet.            |

#### Context Menu Items in Row Header / Column Header

Find the table below for default context menu items and their actions.

| Context Menu items | Action                                                                                                           |
|--------------------|------------------------------------------------------------------------------------------------------------------|
| ----- -----        |                                                                                                                  |
| <b>Cut</b>         | Cut the selected row/column header data to the clipboard, you can select a cell where you want to move the data. |

| **Copy** | Copy the selected row/column header data to the clipboard, so that you can paste it to somewhere else. |

| **Paste** | Paste the data from clipboard to spreadsheet. |

| **Paste Special** | **Values** - Paste the data values from clipboard to spreadsheet. **Formats** - Paste the data formats from clipboard to spreadsheet. |

| **Insert Columns** | Insert new rows or columns into the worksheet. |

| **Delete Columns** | Delete existing rows or columns from the worksheet. |

| **Hide Columns** | Hide the rows and columns. |

| **UnHide Columns** | Show the hidden rows and columns. |

### Context Menu Items in Pager

Find the table below for default context menu items and their actions.

| Context Menu items | Action |

|-----|-----|

| **Insert** | Insert a new worksheet in front of an existing worksheet in the spreadsheet. |

| **Delete** | Delete the selected worksheet from the spreadsheet. |

| **Rename** | Rename the selected worksheet. |

| **Protect Sheet** | Prevent unwanted changes from others by limiting their ability to edit. |

| **Hide** | Hide the selected worksheet. |

### Context Menu Customization

You can perform the following context menu customization options in the spreadsheet

- Add Context Menu Items
- Remove Context Menu Items
- Enable/Disable Context Menu Items

### Add Context Menu Items

You can add the custom items in context menu using the **addContextMenuItems** in **contextmenuBeforeOpen** event

In this demo, Custom Item is added after the Paste item in the context menu.

### CSHTML

```

### Remove Context Menu Items

You can remove the items in context menu using the `removeContextMenuItems` in `contextmenuBeforeOpen` event

In this demo, Insert Column item has been removed from the row/column header context menu.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").contextMenuBeforeOpen("createdHandler")
.Sheets(sheet =>
{
 sheet.Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).Add();
 }
);
}
)

```

```

 }).Columns(column =>
 {
 column.Width(80).Add();
 column.Width(80).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(80).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 function createdHandler() {
 // To remove existing context menu items.
 this.removeContextMenuItems(["Insert Column"], false);
 }
</script>
<style>
 .e-spreadsheet .e-tab .e-tab-text {
 display: inherit;
 }
</style>

```

## Cell Template in Spreadsheet Control

Cell Template is used for adding HTML elements into Spreadsheet. You can add the cell template in spreadsheet by using the `template` property and specify the address using the `address` property inside the `ranges` property. You can customize the HTML elements similar to Syncfusion components (TextBox, DropDownList, RadioButton, MultiSelect, DatePicker etc) by using the `beforeCellRender` event. In this demo, Cell template is applied to `C2:C9` and instantiated with HTML input components like TextBox, RadioButton, TextArea. You need to bind the events to perform any operations through HTML elements or Syncfusion components. Here, we have added `change` event in to the MultiSelect control, and we have updated the selected data into the spreadsheet cell through that change event.

The following code example describes the above behavior.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ShowRibbon(false).ShowFormulaBar(false).AllowEditing(false).Created("createdHandler").BeforeSelect("beforeSelectHandler").BeforeCellRender("beforeCellRenderHandler").ScrollSettings(scrollSettings =>
{
 scrollSettings.EnableVirtualization(false).IsFinite(true);
}).Sheets(sheet =>
{
 sheet.Name("Registration Form").RowCount(40).ColCount(30).ShowGridLines(false).Rows(row =>
 {
 row.Height(55).Cells(cell => cell.Index(1).Value("Interview Registration Form").Style(style =>
 {
 style.FontWeight(FontWeight.Bold).TextAlign(TextAlign.Center).VerticalAlign(VERTICAL_ALIGN_MIDDLE).FontSize("12pt");
 }).Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Name").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Date of Birth:").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Gender:").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Year of Experience:").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Areas of Interest:").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Mobile Number:").Add()).Add();
 row.Height(45).Cells(cell => cell.Index(1).Value("Email:").Add()).Add();
 row.Height(82).Cells(cell => cell.Index(1).Value("Address:").Add()).Add();
 }).Columns(column =>
 {
 column.Index(1).Width(190).Add();
 column.Width(350).Add();
 }).Ranges(ranges =>
 {
 ranges.Template("<input />").Address("C2:C3").Add();
 });
});
```

```

 ranges.Template("<div><input type='radio' name='gender'
value='male' /><input type='radio' name='gender'
value='female' /></div>").Address("C4").Add();
 ranges.Template("<input />").Address("C5:C8").Add();
 ranges.Template("<textarea rows='3' />").Address("C9").Add();
 ranges.Template("<button class='e-btn e-flat'
style='float:right'>Add</button>").Address("C11").Add();
 }).Add();
}).Render()
<script>

## Globalization in ASP.NET MVC Spreadsheet control

### Localization

The [Localization](#) library allows you to localize the default text content of the Spreadsheet. The Spreadsheet has static text on some features (cell formatting, Merge, Data validation, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and their values are used in the Spreadsheet.

|Locale keywords|Text|

|-----|----|

Cut | Cut

Copy | Copy

Paste | Paste

PasteSpecial | Paste Special

All | All

Values | Values

Formats | Formats

Font | Font

FontSize | Font Size

Bold | Bold

Italic | Italic

Underline | Underline

Strikethrough | Strikethrough

PasteAlert | You can't paste it here because the copy area and paste area aren't in the same size. Try pasting in a different range.

DestroyAlert | Are you sure you want to destroy the current workbook without saving and create a new workbook?

SheetRenameInvalidAlert | Sheet name contains invalid character.

SheetRenameEmptyAlert | Sheet name cannot be empty.

SheetRenameAlreadyExistsAlert | Sheet name already exists. Enter another name.

DeleteSheetAlert | Are you sure you want to delete this sheet?

DeleteSingleLastSheetAlert | A Workbook must contain at least one visible worksheet.

PickACategory | Pick a category

Description | Description

UnsupportedFile | Unsupported File

InvalidUrl | Invalid Url

SUM | Adds a series of numbers and/or cells.

SUMIF | Adds the cells based on the specified condition.

SUMIFS | Adds the cells based on the specified conditions.

ABS | Returns the value of a number without its sign.

RAND | Returns a random number between 0 and 1.

RANDBETWEEN | Returns a random integer based on the specified values.

FLOOR | Rounds a number down to the nearest multiple of a given factor.

CEILING | Rounds a number up to the nearest multiple of a given factor.

PRODUCT | Multiplies a series of numbers and/or cells.

AVERAGE | Calculates average for the series of numbers and/or cells excluding text.

AVERAGEIF | Calculates average for the cells based on the specified criterion.

AVERAGEIFS | Calculates average for the cells based on the specified conditions.

AVERAGEA | Calculates the average for the cells evaluating TRUE as 1 text and FALSE as 0.

COUNT | Counts the cells that contain numeric values in a range.

COUNTIF | Counts the cells based on the specified condition.

COUNTIFS | Counts the cells based on specified conditions.

COUNTA | Counts the cells that contain values in a range.

MIN | Returns the smallest number of the given arguments.

MAX | Returns the largest number of the given arguments.

DATE | Returns the date based on the given year, month, and day.

DAY | Returns the day from the given date.

DAYS | Returns the number of days between two dates.

IF | Returns value based on the given expression.

IFS | Returns value based on the given multiple expressions.

AND | Returns TRUE if all the arguments are TRUE otherwise returns FALSE.

OR | Returns TRUE if any of the arguments are TRUE otherwise returns FALSE.

IFERROR | Returns value if no error found else it will return specified value.

CHOOSE | Returns a value from the list of values based on the index number.

INDEX | Returns the value of the cell in a given range based on row and column number.

FIND | Returns the position of a string within another string which is case sensitive.

CONCATENATE | Combines two or more strings together.

CONCAT | Concatenates a list or a range of text strings.

SUBTOTAL | Returns subtotal for a range using the given function number.

RADIANS | Converts degrees into radians.

MATCH | Returns the relative position of a specified value in the given range.

DefineNameExists | This name already exists try a different name.

CircularReference | When a formula refers to one or more circular references this may result in an incorrect calculation.

ShowRowsWhere | Show rows where |

CustomFilterDatePlaceHolder | Choose a date

CustomFilterPlaceHolder | Enter the value

#### *Loading translations*

To load translation object in an application, use `load` function of the `L10n` class.

The following example demonstrates the Spreadsheet in `French` culture. In the below sample we have translated the ribbon tab names and Home tab content (clipboard, cell style).

#### **CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").Locale("fr-CH").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
ej.base.L10n.load({
 'fr-CH': {
 'spreadsheet': {
 'File': 'Fichier',
 'Home': 'Accueil',
 'Insert': 'Insérer',
 'Formulas': 'Formules',
 'Data': 'Les données',
 'View': 'Vue',
 'Cut': 'Coupe',
 'Copy': 'Copie',
 'Paste': 'Pâte',
 'PasteSpecial': 'Pâte spéciale',
 'All': 'Tous les',
 'Values': 'Valeurs',
 'Formats': 'Les formats',
 'Font': 'fonte',
 'FontSize': 'Taille de police',
 'Bold': 'Audacieux',
 'Italic': 'Italique',
 'Underline': 'Souligner',
 'Strikethrough': 'Barré',
 'TextColor': 'Couleur du texte',
 'FillColor': 'La couleur de remplissage',
 'HorizontalAlignment': 'Alignement horizontal',
 'AlignLeft': 'Alignez à gauche',
 'AlignCenter': 'centre',
 'AlignRight': 'Aligner à droite',
 'VerticalAlignment': 'Alignement vertical',

```

```

 ViewBag.DefaultData = data;
 return View();
 }

```

### Internationalization

The Internationalization library is used to globalize number, date, and time values in the spreadsheet component.

The following example demonstrates the Spreadsheet in French [ fr-CH] culture. In the below sample we have globalized the Date(Date column), Time(Time column), and Currency(Amount column) formats.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Locale("fr-CH").Created("created").Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
ej.base.setCulture('fr-CH');
ej.base.setCurrencyCode('EUR');
ej.base.L10n.load({
 'fr-CH': {
 'spreadsheet': {
 'File': 'Fichier',
 'Home': 'Accueil',
 'Insert': 'Insérer',
 'Formulas': 'Formules',
 'Data': 'Les données',
 'View': 'Vue',
 'Cut': 'Coupe',
 'Copy': 'Copie',
 'Paste': 'Pâte',
 'PasteSpecial': 'Pâte spéciale',
 'All': 'Tous les',
 'Values': 'Valeurs',
 'Formats': 'Les formats',
 'Font': 'fonte',
 'FontSize': 'Taille de police',
 'Bold': 'Audacieux',
 'Italic': 'Italique',
 'Underline': 'Souligner',
 'Strikethrough': 'Barré',
 'TextColor': 'Couleur du texte',
 'FillColor': 'La couleur de remplissage',
 'HorizontalAlignment': 'Alignement horizontal',
 'AlignLeft': 'Alignez à gauche',
 'AlignCenter': 'centre',
 'AlignRight': 'Aligner à droite',
 'VerticalAlignment': 'Alignement vertical',
 'AlignTop': 'Aligner en haut',
 'AlignMiddle': 'Aligner le milieu',
 'AlignBottom': 'Aligner le bas',

```

```

 'InsertFunction': 'Insérer une fonction',
 'Delete': 'Effacer',
 'Rename': 'Rebaptiser',
 'Hide': 'Cacher',
 'Unhide': 'Démasquer',
 'NumberFormat': 'Nombre Format',
 }
}
});
function created() {
 var spreadsheet =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 //Applies cell and number formatting to specified range of the
active sheet
 spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' }, 'A1:F1');
 spreadsheet.numberFormat('$#,##0.00', 'F2:F11');
}
</script>

```

### INTERNATIONALIZATIONCONTROLLER.CS

```

public IActionResult Index()

 ViewBag.DefaultData = data;
 return View();
}

```

### Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Spreadsheet component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Spreadsheet, set the [enableRtl](#) to true.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").Locale("ar-
AE").EnableRtl(true).Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<sctipt>
ej.base.L10n.load({
 'ar-AE': {
 'spreadsheet': {
 "File": "ملف",
 "Home": "هم",

## Use Cases

### Collaborative Editing

The collaborative editing support allows you to work at a spreadsheet collaboratively with other users. Multiple users can access to the the same spreadsheet simultaneously.

#### Dependencies

The following dependent script is required to use the collaborative editing support in spreadsheet.

`js

```
<script src="https://cdnjs.cloudflare.com/ajax/libs/aspnet-signalr/1.1.4/signalr.js"></script>
```

,

#### Client configuration

To broadcast the data for every action in the spreadsheet, you need to transfer the data to the server through `send` method in `actionComplete` event and receive the same data by using the `dataReceived` method. In the `dataReceived` method, you need to update the action to the connected clients through `updateAction` method.

The following code example shows **Collaborative Editing** support in the Spreadsheet control.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ActionComplete("actionComplete").Render()
<script>
 // For signalR Hub connection.
 var connection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreads
heethub', {
 skipNegotiation: true,
 transport: signalR.HttpTransportType.WebSockets
}).build();

```

```
function actionComplete(args) {
 connection.send('BroadcastData', JSON.stringify(args));
}
connection.on('dataReceived', (data) => {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var model = JSON.parse(data);
 spreadsheetObj.updateAction(model);
});
connection.start().then(() => {
 console.log('server connected!!!');
}).catch((err) => console.log(err));
</script>
```

### **COLLABORATIVECONTROLLER.CS**

```
public IActionResult Index()
{
 return View();
}
```

#### *Server configuration*

To make the communication between the server to the connected clients and from clients to the server, you need to configure the signalR Hubs using the following code.

```
`js
// For signalR Hub connection

var connection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from ASP.NET Core service

skipNegotiation: true,

transport: signalR.HttpTransportType.WebSockets
}).build();
`
```

#### *Hub configuration*

Initially create a ASP.NET Core project and add the hub file for sending and receiving the data between server and clients.

```
`c#
using Microsoft.AspNetCore.SignalR;
using System.Threading.Tasks;
namespace WebApplication.Hubs
{
 public class SpreadsheetHub : Hub
 {

```

```
public async Task BroadcastData(string data)
{
 await Clients.Others.SendAsync("dataReceived", data);
}
}
}
,
```

To configure the SignalR middleware by registering the following service in the `ConfigureServices` method of the `Startup` class.

```
`c#
services.AddSignalR(e =>
{
 e.MaximumReceiveMessageSize = int.MaxValue; // Option to increase message size for inserting image
 feature. By default, SignalR send messages up to 32 KB.
});
,
```

To set up the SignalR routes by calling `MapHub` in the `Configure` method of the `Startup` class.

```
`c#
app.UseEndpoints(endpoints =>
{
 endpoints.MapRazorPages();
 endpoints.MapHub<SpreadsheetHub>("/hubs/spreadsheethub");
});
,
```

For hosting the service, you may use the above code snippet or download and run the [local service](#).

*Prevent the particular action update for collaborative client*

Using the `action` argument from the `actionComplete` event, you can prevent the particular action update for collaborative client.

The following code example shows how to prevent collaborative client from updating the `format` action.

### CSHTML

```
@Html.EJS().Spreadsheet("spreadsheet").ActionComplete("actionComplete").Render()
<script>
 // For signalR Hub connection
 var connection = new
 signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost from ASP.NET Core service
```

```

 skipNegotiation: true,
 transport: signalR.HttpTransportType.WebSockets
 }).build();
 function actionComplete(args) {
 if (args.action !== 'format') { // prevent the format action
 connection.send('BroadcastData', JSON.stringify(args)); // send
 the action data to the server
 }
 }
 connection.on('dataReceived', (data) => {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var model = JSON.parse(data);
 spreadsheetObj.updateAction(model);
 });
 connection.start().then(() => {
 console.log('server connected!!!');
 }).catch((err) => console.log(err));
</script>

```

### COLLABORATIVEPREVENTCONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

#### *Perform import action for collaborative clients*

Using the `action` argument from the `actionComplete` event, you can identify whether the import action is performed or not. If the action is `import`, then you need to send the `response data` to the server and also update the same to the collaborative clients.

The following code example shows how to perform the import functionality for collaborative clients.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ActionComplete("actionComplete").Render()
<script>
 // For signalR Hub connection
 var connection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreads
heethub', { // localhost from ASP.NET Core service
 skipNegotiation: true,
 transport: signalR.HttpTransportType.WebSockets
 }).build();
 function actionComplete(args) {
 if (args.action !== 'format') { // prevent the format action
 connection.send('BroadcastData', JSON.stringify(args)); // send
 the action data to the server
 }
 else {
 // Send the action data to the server for other than import
 actions.
 connection.send("BroadcastData", JSON.stringify(args));

```

```

 }
 }
 connection.on('dataReceived', (data) => {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 var model = JSON.parse(data);
 if (model['action'] === undefined || '') {
 // Load the imported excel file data as JSON to the connected
clients.
 var jsonData = { Workbook: model };
 spreadsheetObj.openFromJson({ file: jsonData });
 }
 else {
 // Update the action details to the connected clients.
 spreadsheetObj.updateAction(model);
 }
 spreadsheetObj.updateAction(model);
 });
 connection.start().then(() => {
 console.log('server connected!!!');
 }).catch((err) => console.log(err));
</script>

```

### COLLABORATIVEIMPORTCONTROLLER.CS

```

public IActionResult Index()
{
 return View();
}

```

## How To

### Sort a range by custom list

You can also define the sorting of cell values based on your own customized personal list. In this article, custom list is achieved using **custom sort comparer**.

In the following demo, the **Trustworthiness** column is sorted based on the custom lists **Perfect**, **Sufficient**, and **Insufficient**.

### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").SortComplete("sortComplete").DataBound("dataBound").AllowSorting(true).Sheets((sheet) =>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.defaultData).Add();
 }).Add();
}).Render()
<script>
 function dataBound() {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (spreadsheetObj.activeSheetIndex === 0) {
 spreadsheetObj.sort({ sortDescriptors: { field: 'C',
sortComparer: mySortComparer }, containsHeader: true }, 'A1:H20');

```

```

 }
}
function sortComplete(args) {
 spreadsheet.selectRange(args.range);
 // code here.
}
// custom sort comparer to sort based on the custom list.
var customList = ['Pink', 'Aquamarine', 'Blue'];
function mySortComparer(x, y) {
 var comparer = ej.data.DataUtil.fnSort('Ascending');
 return comparer(x ? customList.indexOf(x.value) : x, y ?
customList.indexOf(y.value) : y);
};
</script>

```

### CUSTOMSORTCONTROLLER.CS

```

public IActionResult Index()
{
 List<object> data = new List<object>()
 {
 new { CustomerName= "Romona Heaslip", Model= "Taurus",
Color= "Aquamarine", PaymentMode= "Debit Card", DeliveryDate=

### Print in Spreadsheet Control

You can use the `print` method by importing from `ej2-base` package. Here, the `Select` event in the dropdown and the `dataBound` event are used to print the single/multiple sheets of data. To print the single/multiple sheets, use the dropdown button and select the `Print` (or) `Print All` option. In the following sample, you can be able to print the single/multiple sheets.

### CSHTML

```

@Html.EJS().DropDownButton("element").Content("Print").Items((IEnumerable<object>)ViewBag.items).Select("itemSelect").Render()
@Html.EJS().Spreadsheet("spreadsheet").DataBound("dataBound").Created("created") Sheets(sheet =>
{
 sheet.Name("Budget").IsProtected(true).Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.budgetData).StartCell("A1").Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
 sheet.Name("Salary").Ranges(ranges =>
 {
 ranges.DataSource((IEnumerable<object>)ViewBag.salaryData).StartCell("A1").Add();
 }).Columns(column =>
 {
 column.Width(100).Add();
 column.Width(100).Add();
 });
}

```

```

 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 var printElement = createElement("div", {
 className: "e-sheet-panel",
 innerHTML:
 '<div class="e-spreadsheet-print"></div><div class="e-sheet"><div
class="e-main-panel style="height:100%" style="overflow: unset"><div
class="e-sheet-content" ></div></div></div>'
 }); // creating same hierarchy of element as DOM
 var isPrint = false;

*Changing the active sheet while importing a file in Spreadsheet Control*

You can change the active sheet of imported file by updating [activeSheetIndex](#) property on the [openComplete](#) event.

The following code example shows how to set the active sheet when importing an Excel file.

**CSHTML**

```
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Open").OpenComplete("openComplete").Render()
<script>
 function openComplete(args) {
 var spreadsheetObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (spreadsheetObj) {
 spreadsheetObj.activeSheetIndex = 2;
 }
 }
</script>
```

**OPENCONTROLLER.CS**

```
public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}
```

*Import an excel document using file uploader in ASP.NET MVC Spreadsheet control*

If you explore your machine to select and upload an excel document using the file uploader, you will receive the uploaded document as a raw file in the **success** event of the file uploader. In this **success** event, you should pass the received raw file as an argument to the Spreadsheet's **open** method to see the appropriate output.

The following code example shows how to import an excel document using file uploader in spreadsheet.

**CSHTML**

```
@Html.EJS().Uploader("UploadFiles").Success("onSuccess").AllowedExtensions(".xls, .xlsx, .csv").AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
@Url.Content("Home/Save"), RemoveUrl = @Url.Content("Home/Remove")
}).Render()
@Html.EJS().Spreadsheet("spreadsheet").OpenUrl("Home/Open").Render()
<script>

 function onSuccess(args) {
 var ssObj =
ej.base.getComponent(document.getElementById('spreadsheet'), 'spreadsheet');
 if (args.operation === 'upload')
 ssObj.open({ file: args.file.rawFile });
 }
</script>
```

**OPENCONTROLLER.CS**

```

public IActionResult Open(IFormCollection openRequest)
{
 OpenRequest open = new OpenRequest();
 open.File = openRequest.Files[0];
 return Content(Workbook.Open(open));
}

public void Save(IList<IFormFile> UploadFiles)
{
 long size = 0;
 try
 {
 foreach (var file in UploadFiles)
 {
 var filename = ContentDispositionHeaderValue
 .Parse(file.ContentDisposition)
 .FileName
 .Trim('"');
 filename = hostingEnv.WebRootPath + $"\"{filename}\"";
 size += file.Length;
 if (!System.IO.File.Exists(filename))
 {
 using (FileStream fs =
System.IO.File.Create(filename))
 {
 //file.CopyTo(fs);
 //fs.Flush();
 }
 }
 else
 {
 using (FileStream fs = System.IO.File.Open(filename,
FileMode.Append))
 {
 //file.CopyTo(fs);
 //fs.Flush();
 }
 }
 }
 }
 catch (Exception e)
 {
 Response.Clear();
 Response.StatusCode = 204;

 Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
 "File failed to upload";

 Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
 e.Message;
 }
}

public void Remove(string UploadFile)
{
 try
 {

```

```

var filename = hostingEnv.WebRootPath + $"{@"\{UploadFile}"}";
if (System.IO.File.Exists(filename))
{
 System.IO.File.Delete(filename);
}
catch (Exception e)
{
 Response.Clear();
 Response.StatusCode = 200;

 Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
 "File removed successfully";

 Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
 e.Message;
}
}

```

#### Identify the context menu opened in Spreadsheet control

The Spreadsheet includes several context menus that will open and display depending on the action. When you right-click on a cell, for example, a context menu with options related to the cell element appears.

The class name returned by the [contextMenuBeforeOpen](#) event can be used to identify the context menu that is opened. The context menus and their class names are tabulated below.

| Class name       | Context menu name          |
|------------------|----------------------------|
| ----- -----      |                            |
| .e-sheet-content | Cell context menu          |
| .e-toolbar-item  | Footer context menu        |
| .e-rowhdr-table  | Row header context menu    |
| .e-colhdr-table  | Column header context menu |

The following code example shows how to identify the context menu opened.

#### CSHTML

```

@Html.EJS().Spreadsheet("spreadsheet").ContextMenuBeforeOpen("ContextMenuBeforeOpen").Render()
<script>
 function ContextMenuBeforeOpen(args) {
 if (ejs.base.closest(args.event.target, '.e-sheet-content')) {
 console.log('Cell Context Menu');
 } else if (ejs.base.closest(args.event.target, '.e-colhdr-table')) {
 console.log('Column Header Context Menu');
 } else if (ejs.base.closest(args.event.target, '.e-rowhdr-table')) {
 console.log('Row Header Context Menu');
 } else if (ejs.base.closest(args.event.target, '.e-toolbar-item')) {
 console.log('Footer Context Menu');
 }
 }
</script>

```

### Save and open Spreadsheet data as a Base64 string in ASP.NET MVC Spreadsheet control

In the Spreadsheet control, there is currently no direct option to save and open data as a **Base64** string. You can achieve this by saving the Spreadsheet data as blob data and then converting that saved blob data to a **Base64** string using **FileReader**.

You can get the Spreadsheet data as blob in the [saveComplete](#) event when you set the **needBlobData** as **true** and **isFullPost** as **false** in the [beforeSave](#) event.

The following code example shows how to save and open the spreadsheet data as base64 string.

#### CSHTML

```
@Html.EJS().Button("importBtn").Content("Import Base64").Render();
@Html.EJS().Button("exportBtn").Content("Export as Base64").Render();
@Html.EJS().Spreadsheet("spreadsheet").BeforeSave("beforeSave").SaveComplete(
 "saveComplete").Sheets(sheet => {
 sheet.Name("Price Details").Ranges(ranges => {

ranges.DataSource((IEnumerable<object>)ViewBag.DefaultData).StartCell("A1").
Add();
 }).Columns(column => {
 column.Width(130).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 var base64String;
 function beforeSave(args) {
 args.needBlobData = true; // To trigger the saveComplete event.
 args.isFullPost = false; // Get the spreadsheet data as blob data in
the saveComplete event.
 }
 function saveComplete(args) {
 // Convert blob data to base64 string.
 var reader = new FileReader();
 reader.readAsDataURL(args.blobData);
 reader.onloadend = function () {
 base64String = reader.result;
 };
 }
 document.getElementById("importBtn").addEventListener('click', function
() {
 var spreadsheetObj =
document.getElementById("spreadsheet").ej2_instances[0];
 // Open the file based on saved base64 string.
 fetch(base64String)
 .then((response) => response.blob())
 .then((fileBlob) => {
 var file = new File([fileBlob], 'Sample.xlsx');
 spreadsheetObj.open({ file: file });
 });
 });
 document.getElementById("exportBtn").addEventListener('click', function
() {
```

```

var spreadsheetObj =
document.getElementById("spreadsheet").ej2_instances[0];
spreadsheetObj.save({
 url: 'Home/Save',
 fileName: 'Worksheet',
 saveType: 'Xlsx',
}); // Specifies the save URL, file name, file type need to be
saved.
// Logs base64 string into the console.
console.log('Base64 String - ', base64String);
});
</script>

```

### OPENCONTROLLER.CS

```

public IActionResult Open(IFormCollection openRequest)
{

 };
 ViewBag.DefaultData = defaultData;
 return View();
}

```

### *Insert a sheet programmatically and make it the active sheet in ASP.NET MVC Spreadsheet control*

A sheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data. Using `insertSheet` method, you can insert one or more sheets at the desired index. Then, you can make the inserted sheet as active sheet by focusing the start cell of that sheet using the `goTo` method.

The following code example shows how to insert a sheet programmatically and make it the active sheet.

### **CSHTML**

```

@Html.EJS().Button("insertSheet").Content("Insert Sheet").Render();
@Html.EJS().Spreadsheet("spreadsheet").Sheets(sheet => {
 sheet.Name("Price Details").Ranges(ranges => {
 ranges.DataSource((IEnumerable < object
>)ViewBag.DefaultData).StartCell("A1").Add();
 }).Columns(column => {
 column.Width(130).Add();
 column.Width(100).Add();
 column.Width(100).Add();
 }).Add();
}).Render()
<script>
 document.getElementById("insertSheet").addEventListener('click',
function () {
 var spreadsheetObj =
document.getElementById("spreadsheet").ej2_instances[0];
 spreadsheetObj.insertSheet(
 [
 {
 index: 1,
 name: 'new_sheet',
 ranges: [
 {
 dataSource: ViewBag.ProductData,
 startCell: 'A1'
 },
],
 },
],
);
 // Use the timeout function to wait until the sheet is inserted.
 setTimeout(() => {
 // Method for switching to a new sheet.
 spreadsheet.goTo('new_sheet!A1');
 })
});
</script>

```

**INSERTSHEETCONTROLLER.CS**

```

public IActionResult Index()
{
 List<object> defaultData = new List<object>()
 {

#### Get the filtered rows in ASP.NET MVC Spreadsheet control

Filtering allows you to view specific rows in a spreadsheet while hiding the others. The [allowFiltering](#) property allows you to enable or disable filtering functionality through the UI. You can also use the [allowFiltering](#) property and [applyFilter](#) method combination to filter data via code behind. The filtered rows can be identified by iterating through the row collection on the sheet and using the [isFiltered](#) property available in each row object.

The following code example shows how to get the filtered rows.

#### CSHTML

```

@Html.EJS().Button("getFilterData").Content("Get Filtered Data").Render();
@Html.EJS().Spreadsheet("spreadsheet").AllowFiltering(true).Sheets((sheet)
=>
{
 sheet.Ranges((ranges) =>
 {
 ranges.DataSource(@ViewBag.DefaultData).Add();
 }).Add();
}).Render()
<script>
 document.getElementById("getFilterData").addEventListener('click',
function () {
 var spreadsheet =
document.getElementById("spreadsheet").ej2_instances[0];
 var activeSheet = spreadsheet.getActiveSheet();
 var usedRange = activeSheet.usedRange;
 for (var i = 0; i <= usedRange.rowIndex; i++) {
 // Get the filtered row using isFiltered property.
 var filteredRow = (activeSheet.rows[i]).isFiltered;
 if (!filteredRow) {
 var rowData = spreadsheet.getRowData(i);
 console.log("Row:", i + 1, "Cells", rowData);
 }
 }
 });
</script>

 ViewBag.DefaultData = data;
 return View();
}

```

## Mobile Responsiveness

The Spreadsheet control rendered in desktop mode will be adaptive in all mobile devices where the layout gets adjusted based on their parent element's dimensions to accommodate any resolution.

You can see the overflowed items of ribbon header, ribbon content, and sheet tab using touch and swipe action. The right navigation arrow is added at the end of the ribbon content through which the user can navigate towards overflowed items. Once you reached the rightmost end of the ribbon content, the right navigation arrow will change to left navigation arrow through which you can navigate to the left of the ribbon content.

Comparision between EJ1 & EJ2 Spreadsheet features

The following table compares Excel functionality with the availability of EJ1 and EJ2 Spreadsheet features.

| Features    | Available in EJ1 Spreadsheet | Available in EJ2 Spreadsheet | Comments |
|-------------|------------------------------|------------------------------|----------|
| ---         | ---                          | ---                          | ---      |
| Ribbon      | Yes                          | Yes                          | -        |
| Formula bar | Yes                          | Yes                          | -        |
| Sheet tab   | Yes                          | Yes                          | -        |

|                                  |           |           |                                                                   |  |
|----------------------------------|-----------|-----------|-------------------------------------------------------------------|--|
| Show / Hide gridlines and header | Yes       | Yes       | -                                                                 |  |
| Scrolling                        | Partially | Yes       | -                                                                 |  |
| Selection                        | Yes       | Yes       | -                                                                 |  |
| Editing                          | Yes       | Yes       | -                                                                 |  |
| Formulae                         | Yes       | Partially | EJ2 supports limited number of <a href="#">most used formulas</a> |  |
| Named range                      | Yes       | Partially | EJ2 Spreadsheet Named range supports only in workbook scope       |  |
| Data Binding                     | Yes       | Yes       | -                                                                 |  |
| Formatting                       | Yes       | Yes       | -                                                                 |  |

## Stepper

### Getting Started with ASP.NET MVC Stepper Control

This section briefly explains about how to include **ASP.NET MVC Stepper** control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

## PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/bootstrap5.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
```

```
</body>
```

### Add ASP.NET MVC Stepper control

Now, add the Syncfusion ASP.NET MVC Stepper control in `~/Views/Home/Index.cshtml` page.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Render()
```

### Adding steps

You can define steps by setting the `Steps` property.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
<div id="default-Stepper">
 @Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).Render()
</div>
```

#### DEFAULT.CS

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;

 return View();
}
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Stepper control will be rendered in the default web browser.

### Configure icon and label

You can define the step icon and label by setting the `IconCss` and `Label` properties using `Steps` property.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconWithLabel).Render()
<style>
 @@font-face {
```

```
font-family: 'Default';
src: url(data:application/x-font-ttf;charset=utf-

success" });
 ViewBag.IconWithLabel = iconWithLabel;

 return View();
}
```

## Steps in ASP.NET MVC Stepper control

The ASP.NET MVC Stepper allows you to add steps using the `Steps` property. Each step can be configured with options such as `IconCss`, `Text`, `Label`, `CssClass` and more.

### Adding steps

You can define the icon and text content for each step using the `IconCss`, `Text` and `Label` properties.

### Defining icon CSS

You can define the CSS class to show the icon for each step using the `IconCss` property.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconOnly).Render()
<style>

```

```
}
```

```
.sf-icon-success:before {
```

```
content: "\e715";
```

```
}
```

```
</style>
```

### ICON.CS

```
public ActionResult Demo()
{
 List<Step> iconOnly = new List<Step>();
 iconOnly.Add(new Step { IconCss = "sf-icon-cart" });
 iconOnly.Add(new Step { IconCss = "sf-icon-transport" });
 iconOnly.Add(new Step { IconCss = "sf-icon-payment" });
 iconOnly.Add(new Step { IconCss = "sf-icon-success" });
 ViewBag.IconOnly = iconOnly;

 return View();
}
```

#### Defining text content

You can define text instead of an icon by setting the [Text](#) property and display label content for a step using the [Label](#) property.

When both label and text are defined, the label takes priority for display based on the [StepType](#).

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("textOnly").Steps(ViewBag.TextOnly).Render()
@Html.EJS().Stepper("labelOnly").Steps(ViewBag.LabelOnly).Render()
```

### TEXT.CS

```
public ActionResult Demo()
{
 List<Step> textOnly = new List<Step>();
 textOnly.Add(new Step { Text = "A" });
 textOnly.Add(new Step { Text = "B" });
 textOnly.Add(new Step { Text = "C" });
 textOnly.Add(new Step { Text = "D" });
 List<Step> labelOnly = new List<Step>();
 labelOnly.Add(new Step { Label = "Cart" });
 labelOnly.Add(new Step { Label = "Delivery Address" });
 labelOnly.Add(new Step { Label = "Payment" });
 labelOnly.Add(new Step { Label = "Confirmation" });

 ViewBag.LabelOnly = labelOnly;
 ViewBag.TextOnly = textOnly;

 return View();
}
```

#### Optional steps

You can show whether the step is optional or not by using [Optional](#) property. By default, the [Optional](#) property is [false](#).

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconOnly).Render()
<style>

## STATUS.CS

```

public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
}

```

```

 iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
 iconLabel.Add(new Step { Label = "Ordered", IconCss = "sf-icon-success" });

 ViewBag.IconLabel = iconLabel;

 return View();
 }

```

### Step styling

You can use the [CssClass](#) property to customize the appearance of the each step.

### CSHTML

```

### CSSCLASS.CS

```

public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart" IconCss = "sf-icon-cart" });
 iconLabel.Add(new Step { Label = "Delivery Address" IconCss = "sf-icon-transport" });
 iconLabel.Add(new Step { Label = "Payment" IconCss = "sf-icon-payment",
 CssClass = "custom-step", Optional = true});
 iconLabel.Add(new Step { Label = "Confirmation" IconCss = "sf-icon-success" });
 ViewBag.IconLabel = iconLabel;

 return View();
}

```

### Step validation

You can set the validation state for each step to displaying a success or error icon by using [IsValid](#) property.

To know more about Stepper validation, refer the [Validation](#) section.

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("iconStepper").Steps(ViewBag.IconSteps).Render()
@Html.EJS().Stepper("labelStepper").Steps(ViewBag.LabelSteps).Render()

 labelSteps.Add(new Step { Label = "Confirmation" });
 ViewBag.IconSteps = iconSteps;
 ViewBag.LabelSteps = labelSteps;

 return View();
}

```

## Step types in ASP.NET MVC Stepper control

The Stepper control provides support for displaying steps with the following step types.

### Default type

In default type, the Stepper displays steps with a combination of both indicators and labels by setting the [StepType](#) property as [Default](#). By default, the Stepper displays steps in the [Default](#) type.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).StepType(StepType.Default).Render()

<style>

font-weight: normal;
font-style: normal;
}
[class^="sf-icon-"], [class*=" sf-icon-"] {
font-family: 'Default' !important;
speak: none;
font-style: normal;
font-weight: normal;
font-variant: normal;
text-transform: none;
line-height: inherit;
-webkit-font-smoothing: antialiased;
-moz-osx-font-smoothing: grayscale;
}
.sf-icon-cart:before {
content: "\e710";
}
.sf-icon-transport:before {
content: "\e702";
}
.sf-icon-payment:before {
content: "\e706";
}
.sf-icon-success:before {
content: "\e715";
}
}
</style>
```

**DEFAULT.CS**

```
public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
 iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
 iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
 iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });

 ViewBag.IconLabel = iconLabel;

 return View();
}
```

**Label type**

In label type, the Stepper displays the steps with only the step labels by setting the [StepType](#) property as [Label](#).

When both label and text are defined, the label takes priority in displaying the steps.

**CSHTML**

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).StepType(StepType.Label).Render()
```

**LABEL.CS**

```
public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
 iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
 iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
 iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });

 ViewBag.IconLabel = iconLabel;

 return View();
}
```

### Label positions

You can display the label on the top, bottom, left, or right side of the steps using the [LabelPosition](#) property.

The following label positions are supported in Stepper:

- | Value         | Description                                         |
|---------------|-----------------------------------------------------|
| ----- -----   |                                                     |
| <b>Top</b>    | Positions the label at the top of each step.        |
| <b>Bottom</b> | Positions the label at the bottom of each step.     |
| <b>Start</b>  | Positions the label to the left side of each step.  |
| <b>End</b>    | Positions the label to the right side of each step. |

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).LabelPosition(StepLabelPosition.Top).Render()

 List<Step> defaultSteps = new List<Step>();
 defaultSteps.Add(new Step { });
 defaultSteps.Add(new Step { });
 defaultSteps.Add(new Step { });
}

```

```

defaultSteps.Add(new Step { });

ViewBag.TextOnly = textOnly;
ViewBag.StepperSteps = defaultSteps;

return View();
}

```

## Orientation in ASP.NET MVC Stepper control

The Stepper control supports the display of steps in both horizontal and vertical orientations by using the [Orientation](#) property.

### Horizontal

In horizontal orientation, the steps are displayed in a side-by-side manner by setting the [Orientation](#) property to **Horizontal**. By default, the steps are displayed in the horizontal orientation.

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconOnly).Orientation(StepperOrientation.Horizontal).Render()
<style>

 iconOnly.Add(new Step { IconCss = "sf-icon-success" });
 ViewBag.IconOnly = iconOnly;

 return View();
}
```

### Linear flow in ASP.NET MVC Stepper control

The Stepper control enables users to progress sequentially through each step, ensuring navigation from one step to the next in a linear way by setting the [Linear](#) property to `true`. The default value is `false` allowing navigation between any steps and vice versa.

The example demonstrates the functionality of both linear and non-linear flow in the Stepper.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).Linear(true).Render(
)
<style>

 ViewBag.IconLabel = iconLabel;

 return View();
}

```

### Steps validation in ASP.NET MVC Stepper control

The Stepper control allows you to set the validation state for each step, displaying either a success or error icon. You can define the success state of a step by setting the [IsValid](#) property to `true`. If set to `false`, the step will display an error state. By default, the [IsValid](#) property is `null`.

Based on the [StepType](#), the validation state icon will be displayed either as an indicator or as part of the step label/text.

}

```

```

ViewBag.IconSteps = iconSteps;
ViewBag.LabelSteps = labelSteps;

return View();
}

```

### Template in ASP.NET MVC Stepper control

The Stepper control allows you to customize the default appearance and content of each step, creating a personalized experience for the user. You can use the [Template](#) property to set the template content for the steps.

The [StepModel](#) and current step index are passed as **Step** and **CurrentStep** properties in the template context for customization.

#### CSHTML

```

@using Syncfusion.EJ2.Navigations
<div class="default-stepper-section">

@Html.EJS().Stepper("stepperTemplate").Steps(ViewBag.IconLabel).ActiveStep(1)
.Template("#template").Render()

## Tooltip in ASP.NET MVC Stepper control

The Stepper control supports tooltip to show additional information in the steps by setting the [ShowTooltip](#) property to `true`.

The tooltip appears when the user hovers over the step, providing the information such as the label or text. By default, the `ShowTooltip` property is `false`.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).ShowTooltip(true).Render()
<style>

## TOOLTIP.CS

```

public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
 iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
 iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment" });
 iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-success" });
}

```

```

 ViewBag.IconLabel = iconLabel;

 return View();
 }

```

### Tooltip template

You can use the [TooltipTemplate](#) property to specify a custom template for the tooltips, providing detailed information about the steps.

When hovering over the step, the current step model is passed in the template context, allowing you to include dynamic information about the step.

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.TextLabelIcon).ShowTooltip(true)
.TooltipTemplate("#tooltip-template").Render()
<script id="tooltip-template" type="text/x-jsrender">

 ${value.text}

</script>
<style>

### TOOLTIPTEMPLATE.CS

```

public ActionResult Demo()
{
 List<Step> textLabelIcon = new List<Step>();
 textLabelIcon.Add(new Step { Text = "Review your cart items", Label =
"Cart", IconCss = "sf-icon-cart" });
 textLabelIcon.Add(new Step { Text = "Enter your delivery address", Label =
"Delivery Address", IconCss = "sf-icon-transport" });
 textLabelIcon.Add(new Step { Text = "Complete your purchase securely",
Label = "Payment", IconCss = "sf-icon-payment" });
 textLabelIcon.Add(new Step { Text = "Verify your order details", Label =
"Confirmation", IconCss = "sf-icon-success" });

 ViewBag.TextLabelIcon = textLabelIcon;

 return View();
}

```

### Animation in ASP.NET MVC Stepper control

The Stepper progress state can be animated, smoothly transitioning from one step to another. You can customize the animation's [Duration](#) and [Delay](#), by using the [Animation](#) property.

You can disable the animation by setting the [Enable](#) property to `false`. By default, the value is `true`.

| Fields | Type | Description |

|-----|-----|-----|

| [Duration](#) | **number** | Specifies the duration of the animated transition for each step. The default value is **2000** milliseconds. |

| [Delay](#) | **number** | Specifies the delay to initiate the animated transition for each step in milliseconds. The default value is **0**. |

The example demonstrates the animation **Duration** and **Delay** settings for the Stepper.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.default).Animation(ViewBag.animation).Render()
```

### ANIMATION.CS

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 var animationSettings = new StepperAnimationSettings { Enable = true,
 Duration = 2000, Delay = 500 };
 ViewBag.default = defaultStepper;
 ViewBag.animation = animationSettings;
 return View();
}
```

## Globalization in ASP.NET MVC Stepper control

### Localization

The Localization library allows you to localize the default text content of the Stepper. You can change the static text content used for the **Optional** property to other cultures (Arabic, Deutsch, French, etc.) by defining the **Locale** value and its translation object.

| Locale key | en-US (default) |

|-----|-----|

| optional | Optional |

In this example, the **French** culture is set to Stepper and the default text is updated with the content defined by the locale key.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconLabel).Locale("fr-BE").Render()
<script>
 ej.base.L10n.load({
 'fr-BE': {
```

```
'stepper': {
 'optional': "facultatif"
}
});
</script>

 content: "\e702";
}
.sf-icon-payment:before {
 content: "\e706";
}
.sf-icon-success:before {
 content: "\e715";
}
}
.stepper-section {
 margin: 50px 100px;
}
}
</style>

```

## LOCALIZATION.CS

```

public ActionResult Demo()
{
 List<Step> iconLabel = new List<Step>();
 iconLabel.Add(new Step { Label = "Cart", IconCss = "sf-icon-cart" });
 iconLabel.Add(new Step { Label = "Delivery Address", IconCss = "sf-icon-transport" });
 iconLabel.Add(new Step { Label = "Payment", IconCss = "sf-icon-payment", Optional = true });
}

```

```

 iconLabel.Add(new Step { Label = "Confirmation", IconCss = "sf-icon-
 success" });

 ViewBag.IconLabel = iconLabel;

 return View();
 }

```

### RTL

RTL provides an option to switch the text direction and layout of the Stepper control from right to left by setting the [EnableRtl](#) property to **true**.

### CSHTML

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.IconText).EnableRtl(true).Rende
r()
<style>
 @@font-face {
 font-family: 'Default';
 src: url(data:application/x-font-ttf;charset=utf-

## RTL.CS

```

public ActionResult Demo()
{
 List<Step> iconText = new List<Step>();
 iconText.Add(new Step { Text = "Cart", IconCss = "sf-icon-cart" });
 iconText.Add(new Step { Text = "Delivery Address", IconCss = "sf-icon-transport" });
 iconText.Add(new Step { Text = "Payment", IconCss = "sf-icon-payment" });
 iconText.Add(new Step { Text = "Confirmation", IconCss = "sf-icon-success" });

 ViewBag.IconText = iconText;

 return View();
}

```

## Accessibility in ASP.NET MVC Stepper control

Accessibility is achieved in the Stepper control through WAI-ARIA standard and keyboard navigations. The Stepper control can be effectively accessed through assistive technologies such as screen readers.

### Keyboard interaction

The Stepper control is interactive with the below keyboard shortcuts.

#### | Keyboard shortcuts | Actions |

| --- | --- |

| Up Arrow | Focuses the previous step in a vertical Stepper. |

| Down Arrow | Focuses the next step in a vertical Stepper. |

| Left Arrow | Focuses the previous step in a horizontal Stepper. |

| Right Arrow | Focuses the next step in a horizontal Stepper. |

| Home | Focuses on the first step of the Stepper. |

| End | Focuses on the last step of the Stepper. |

| Enter / Space | Activates the currently focused step. |

### ARIA attribute

The following ARIA attributes are used in Stepper control based on its state.

| Properties           | Functionality                                                                               |
|----------------------|---------------------------------------------------------------------------------------------|
| -----                | -----                                                                                       |
| <b>aria-label</b>    | Attribute provide a descriptive text that labels the interactive element for accessibility. |
| <b>aria-current</b>  | Attribute denotes the currently active step in the Stepper.                                 |
| <b>aria-disabled</b> | Indicates when the step is disabled and cannot be interacted.                               |

### Events

This section describes the Stepper events that will be triggered when an appropriate actions are performed. The following events are available in the Stepper control.

#### Created

The Stepper control triggers the [Created](#) event when the control rendering is completed.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).Created("function(args) { createdEvent() }").Render()
<script>
 function createdEvent() {
 // your required action here..
 }
</script>
```

#### CREATED.CS

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;
 return View();
}
```

#### StepChanged

The Stepper control triggers the [StepChanged](#) event after the active step is changed.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepChanged("function(args) { stepChangedEvent(args) }").Render()
<script>
 function stepChangedEvent(args) {
 alert("Step Changed from "+args.previousStep + " to " +
args.activeStep)
```

```
}
</script>
```

### STEPCHANGED.CS

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;
 return View();
}
```

### StepChanging

The Stepper control triggers the [StepChanging](#) event before the active step change.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepChanging("function(args) { stepChangingEvent(args) }").Render()
<script>
 function stepChangingEvent(args) {
 alert("Step Changing from "+args.previousStep + " to " +
args.activeStep)
 }
</script>
```

### STEPCHANGING.CS

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;
 return View();
}
```

### StepClick

The Stepper control triggers the [StepClick](#) event when the step is clicked.

### CSHTML

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).StepClick("function(args) { stepClickEvent(args) }").Render()
<script>
```

```
function stepClickEvent(args) {
 // your required action here..
}
</script>
```

**STEPCLICK.CS**

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;
 return View();
}
```

**BeforeStepRender**

The Stepper control triggers the [BeforeStepRender](#) event before rendering each step.

**CSHTML**

```
@using Syncfusion.EJ2.Navigations
@Html.EJS().Stepper("stepper").Steps(ViewBag.DefaultStepper).BeforeStepRender(
 "function(args) { beforeStepRenderEvent(args) }").Render()
<script>
 function beforeStepRenderEvent(args) {
 // your required action here..
 }
</script>
```

**BEFORESTEPRENDER.CS**

```
public ActionResult Demo()
{
 List<Step> defaultStepper = new List<Step>();
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 defaultStepper.Add(new Step { });
 ViewBag.DefaultStepper = defaultStepper;
 return View();
}
```

**Stock Chart****Getting Started with ASP.NET MVC Stock Chart Control**

This section briefly explains about how to include [ASP.NET MVC Stock Chart](#) control in your ASP.NET MVC application using Visual Studio.

## Prerequisites

### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Stock Chart control

Now, add the Syncfusion ASP.NET MVC Stock Chart control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@(Html.EJS().StockChart("container").Load("load").Series(sr => { sr.Add();
}).Render())
```

### Populate Stock Chart With Data

This section explains how to plot below JSON data to the Stock Chart.

Add a series object to the chart by using [Series](#) property and then set the JSON data to [DataSource](#) property.

Since the JSON contains category data, set the [valueType](#) for horizontal axis to Category. By default, the axis valueType is Numeric.

#### CSHTML

```
@(Html.EJS().StockChart("container").Load("stockload")
 .Series(sr =>
 {
 sr.Name("Apple").Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).
 XName("x").High("high").Low("low").Open("open").Close("close").Add();
 })
 .Render())
<script src="~/Scripts/chart/financial-data.js"></script>
<script>
 var data = chartData;
 function stockload(args) {
 args.stockChart.series[0].dataSource = data;
 }
</script>
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Stock Chart control will be rendered in the default web browser.

**Note:** [View Sample in GitHub.](#)

**Note:** You can refer to our [ASP.NET MVC Stock Chart](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC Stock Chart example](#) that shows you how to present and manipulate data.

<!-- markdownlint-disable MD036 -->

## Working with Data

Chart can visualise data bound from local or remote data.

### Local Data

You can bind a simple JSON data to the chart using [DataSource](#) property in series.

### CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add();
 })
 .ChartArea(area => area.Border(br=>br.Width(0)))
```

```

.Border(br => br.Width(1))
.Render()
<script>
var data = [
 { date: new Date('2012-04-02'), open: 85.9757, high: 90.6657, low:
85.7685, close: 90.5257, volume: 660187068 },
 { date: new Date('2012-04-09'), open: 89.4471, high: 92, low:
86.2157, close: 86.4614, volume: 912634864 },
 { date: new Date('2012-04-16'), open: 87.1514, high: 88.6071, low:
81.4885, close: 81.8543, volume: 1221746066 },
 { date: new Date('2012-04-23'), open: 81.5157, high: 88.2857, low:
79.2857, close: 86.1428, volume: 965935749 },
 { date: new Date('2012-04-30'), open: 85.4, high: 85.4857, low:
80.7385, close: 80.75, volume: 615249365 },
 { date: new Date('2012-05-07'), open: 80.2143, high: 82.2685, low:
79.8185, close: 80.9585, volume: 541742692 },
 { date: new Date('2012-05-14'), open: 80.3671, high: 81.0728, low:
74.5971, close: 75.7685, volume: 708126233 },
 { date: new Date('2012-05-21'), open: 76.3571, high: 82.3571, low:
76.2928, close: 80.3271, volume: 682076215 },
 { date: new Date('2012-05-28'), open: 81.5571, high: 83.0714, low:
80.0743, close: 80.1414, volume: 480059584 },
 { date: new Date('2012-06-04'), open: 80.2143, high: 82.9405, low:
78.3571, close: 82.9028, volume: 517577005 },
]
</script>

```

### LOCAL-DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

See Also

- [Series Types](#)

### Stock Chart Dimensions

Size for Container

Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

### CSHTML

```

<script src="~/financial-data.js"></script>
<div class="control-section">
 <div id="control-container" >
 @(Html.EJS().StockChart("container").Title("AAPL Stock
Price").Width("650").Height("350")
 .Series(sr =>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render())
 <script>
 var data = window.chartData;
 </script>
}

```

### SIZE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### Size for Stock Chart

You can also set size for chart directly through [Width](#) and [Height](#) properties.

<!-- markdownlint-disable MD036 -->

### In Pixel

<!-- markdownlint-disable MD036 -->

You can set the size of chart in pixel as demonstrated below.

### CSHTML

```

<script src="~/financial-data.js"></script>
 @(Html.EJS().StockChart("container").Title("AAPL Stock
Price").Width("650px").Height("350px")
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();

```

```

 })
 .Render ()

</script>
<script>
 var data = window.chartData;
</script>

```

**PIXEL.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

**In Percentage**

By setting value in percentage, chart gets its dimension with respect to its container. For example, when the height is '50%', chart renders to half of the container height.

**CSHTML**

```

<script src="~/financial-data.js"></script>
 @(Html.EJS().StockChart("container").Title("AAPL Stock
Price").Width("80%").Height("90%")
 .Series(sr
=>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 })
 .Render())

<script>
 var data = window.chartData;
</script>

```

**PERCENTAGE.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{

```

```

public partial class StockChartController : Controller
{
 public IActionResult Default()
 {
 return View();
 }
}

```

**Note:** When you do not specify the size, it takes 450px as the height and window size as its width.

## Axis types

### DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format. To use DateTime axis, set the [ValueType](#) of axis to `DateTime`.

### CSHTML

```

<script src="~/financial-data.js"></script>
@(Html.EJS().StockChart("container").Title("AAPL Stock
Price").IndicatorType(new List<Object>() { }).ExportType(new List<Object>()
{ }).TrendlineType(new List<Object>() { })
 .PrimaryXAxis(xaxis
=>xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render())

<script>
 var data = window.chartData;
</script>

```

### DATETIME.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### DateTimeCategory axis

DateTimeCategory axis in the stock chart is used to display only business days. To use DateTimeCategory axis, set the [ValueType](#) of axis to [DateTimeCategory](#).

### CSHTML

```
@(Html.EJS().StockChart("container").Load("stockload")
 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Width(0)).ValueType(Syncfusion.EJ2.Charts.ValueType.DateTimeCategory)
 .CrosshairTooltip(ct=>ct.Enable(true))
).Series(sr =>
 {

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).XName("x").YName("y").Add();
 })
 .Crosshair(cr=>cr.Enable(true))
 .Tooltip(tp => tp.Enable(true).Header("AAPL Stock Price")).Title("AAPL Stock Price")
 .Render())
<script>
 let datetimeCategoryData = [
 {x: new Date(2021, 1, 11) }, {x: new Date(2021, 1, 12) }, {x: new Date(2021, 1, 13) }, {x: new Date(2021, 1, 14) }, {x: new Date(2021, 1, 15) },
 },
 {x: new Date(2021, 1, 19) }, {x: new Date(2021, 1, 20) }, {x: new Date(2021, 1, 21) }, {x: new Date(2021, 1, 22) }, {x: new Date(2021, 3, 1) },
 },
 {x: new Date(2021, 3, 2) }, {x: new Date(2021, 4, 1) }, {x: new Date(2021, 4, 5) }, {x: new Date(2021, 4, 6) }, {x: new Date(2021, 4, 7) },
 {x: new Date(2021, 4, 11) }, {x: new Date(2021, 4, 13) }, {x: new Date(2021, 4, 15) }, {x: new Date(2021, 4, 16) }, {x: new Date(2021, 4, 17) },
 },
 {x: new Date(2021, 4, 18) }, {x: new Date(2021, 4, 20) }, {x: new Date(2021, 4, 21) }, {x: new Date(2021, 4, 23) }, {x: new Date(2021, 4, 25) },
 },
 {x: new Date(2021, 5, 1) }, {x: new Date(2021, 5, 2) }, {x: new Date(2021, 5, 6) }, {x: new Date(2021, 5, 7) }, {x: new Date(2021, 5, 8) },
 {x: new Date(2021, 5, 11) }, {x: new Date(2021, 5, 15) }, {x: new Date(2021, 5, 18) }, {x: new Date(2021, 5, 20) }, {x: new Date(2021, 5, 25) },
 },
 {x: new Date(2021, 6, 1) }, {x: new Date(2021, 6, 2) }, {x: new Date(2021, 6, 3) }, {x: new Date(2021, 6, 4) }, {x: new Date(2021, 6, 5) },
 {x: new Date(2021, 6, 10) }, {x: new Date(2021, 6, 11) }, {x: new Date(2021, 6, 12) }, {x: new Date(2021, 6, 13) }, {x: new Date(2021, 6, 15) },
 },
 {x: new Date(2021, 6, 16) }, {x: new Date(2021, 6, 17) }, {x: new Date(2021, 6, 18) }, {x: new Date(2021, 6, 19) }, {x: new Date(2021, 6, 20) },
 }
]
 function stockload(args) {
 let series2 = [];
 let point2;
 for (var i = 0; i < 46; i++) {
 point2 = {
 x: datetimeCategoryData[i].x,
```

```

 y: getRandomInRange(120, 130),
 high: getRandomInRange(88, 92),
 low: getRandomInRange(76, 86),
 open: getRandomInRange(75, 85),
 close: getRandomInRange(85, 90),
 volume: getRandomInRange(660187068, 965935749)
 };
 series2.push(point2);
}
args.stockChart.series[0].dataSource = series2;
}
function getRandomInRange(min, max) {
 const randomDecimal = Math.random();
 const randomValue = randomDecimal * (max - min) + min;
 return randomValue;
}
</script>

```

### DATETIMECATEGORY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult DateTimeCategory()
 {
 return View();
 }
 }
}

```

### Logarithmic axis

<!-- markdownlint-disable MD033 -->

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg:  $10^{-6}$ ) and higher order of magnitude (eg:  $10^6$ ). To use Logarithmic axis, set the [ValueType](#) of axis to [Logarithmic](#).

### CSHTML

```

<script src="~/financial-data.js"></script>
@ (Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .PrimaryXAxis(xaxis
=>xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .PrimaryYAxis(yaxis
=>yaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.Logarithmic))
 .Series(sr
=>
{

```

```

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").YName("volume").Add();
 })
 .Render())

<script>
 var data = window.chartData;
</script>

```

## LOG.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

See also

- [Axis Customization](#)

## Axis Customization

<!-- markdownlint-disable MD034 -->

### Axis Crossing

An axis can be positioned in the chart area using [CrossesAt](#) and [CrossesInAxis](#) properties. The [CrossesAt](#) property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to be intersected with the vertical axis or vice-versa, and the [CrossesInAxis](#) property specifies the axis name with which the axis line has to be crossed.

## CHTML

```

@Html.EJS().StockChart("container").PrimaryXAxis(xaxis
=>xaxis.CrossesAt(160))
 .Series(sr =>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 <script src="~/financial-data.js"></script>
 .Render()
 <script>
 var data = window.chartData;

```

```
</script>
```

### AXIS-CROSS.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Title

You can add a title to the axis using [Title](#) property to provide quick information to the user about the data plotted in the axis. Title style can be customized using [TitleStyle](#) property of the axis.

### CSHTML

```
@(Html.EJS().StockChart("container").Title("AAPL Stock Price")
.Series(sr =>
{
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
());
<script src="~/financial-data.js"></script>
.Render())
<script>
var data = window.chartData;
</script>
```

### TITLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

```
}
}
```

### Tick Lines Customization

You can customize the **Width**, **Color** and **Size** of the minor and major tick lines, using [MajorTickLines](#) and [MinorTickLines](#) properties in the axis.

#### CSHTML

```
@Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .PrimaryXAxis(xaxis
=>xaxis.MajorTickLines(mg=>mg.Color("blue").Width(5)
).MinorTickLines(mg=>mg.Color("red").Width(0)))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("green").Width(5)
).MinorTickLines(mg=>mg.Color("red").Width(0)))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render()

<script src="~/financial-data.js"></script>
<script>
 var data = window.chartData;
</script>
```

#### TICK.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Grid Lines Customization

You can customize the **Width**, **Color** and **DashArray** of the minor and major grid lines, using [MajorGridLines](#) and [MinorGridLines](#) properties in the axis.

#### CSHTML

```
@Html.EJS().StockChart("container").Title("AAPL Stock Price")
```

```

 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Color("blue").Width(1)
).MinorGridLines(mg=>mg.Color("red").Width(0)))
 .PrimaryYAxis(yaxis
=>yaxis.MajorGridLines(mt=>mt.Color("green").Width(1)
).MinorGridLines(mg=>mg.Color("red").Width(0)))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render()

<script src="~/financial-data.js"></script>
<script>
 var data = window.chartData;
</script>

```

## GRID.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Multiple Axis

In addition to primary X and Y axis, we can add n number of axis to the chart. Series can be associated with this [Axis] (<https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChartAxis.html>), by mapping with axis's unique name.

## CSHTML

```

<script src="~/goog.js"></script>
<script src="~/googl.js"></script>
@Html.EJS().StockChart("container").Title("Multiple Series")
 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Width(0)).ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).DataSource("data1").XName
("x").YName("close").Add();

```

```

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Column).YAxisName("yAxis").DataSource("data2").XName("x").YName("close").Add();
 }).Axes(ax =>
 {
 ax.OpposedPosition(true).RowIndex(0).Name("yAxis").Add();
 }
)

.Render()

<script>
 var data1 = window.goog;
 var data2 = window.googl;
</script>

```

### MULTIPLE.CS

```

public ActionResult Index()
{
 List<MultipleAxesChartData> chartData = new
List<MultipleAxesChartData>
 {
 new MultipleAxesChartData { x = "Sun", y = 35, y1 = 30 },
 new MultipleAxesChartData { x = "Mon", y = 40, y1 = 28 },
 new MultipleAxesChartData { x = "Tue", y = 80, y1 = 29 },
 new MultipleAxesChartData { x = "Wed", y = 70, y1 = 30 },
 new MultipleAxesChartData { x = "Thu", y = 65, y1 = 33 },
 new MultipleAxesChartData { x = "Fri", y = 55, y1 = 32 },
 new MultipleAxesChartData { x = "Sat", y = 50, y1 = 34 }
 };
 ViewBag.dataSource = chartData;
 return View();
}

public class MultipleAxesChartData
{
 public string x;
 public double y;
 public double y1;
}

```

### Inversed Axis

<!-- markdownlint-disable MD033 -->

When an axis is inversed, highest value of the axis comes closer to origin and vice versa. To place an axis in inversed manner set this property [IsInversed](#) to true.

### CSHTML

```

@Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .PrimaryXAxis(xaxis
=>xaxis.IsInversed(true))..PrimaryYAxis(yaxis =>yaxis.IsInversed(true))
 .Series(sr
=>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 }
)

```

```

 })
 .Render ()

<script src="~/financial-data.js"></script>
<script>
 var data = window.chartData;
</script>

```

### INVERSED.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### Opposed Position

<!-- markdownlint-disable MD012 -->

To place an axis opposite from its original position, set [OpposedPosition](#) property of the axis to true.

<!-- markdownlint-disable MD012 -->

### CSHTML

```

@Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .PrimaryXAxis(xaxis =>xaxis.OpposedPosition(true))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render ()

<script src="~/financial-data.js"></script>

<script>
 var data = window.chartData;
</script>

```

### OPPOSED.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

```

```
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

## Stock Chart Series Types

Essential JS 2 StockChart Stock Chart supports 6 major types of series namely **Line**, **Spline**, **Hilo**, **HiloOpenClose**, **Hollow Candle** and **Candle** . By using the series dropdown button you can navigate between the above listed series types.

<!-- markdownlint-disable MD036 -->

### Line

To render a line series, use series **Type** as **Line**.

### Candle

To render a candle series, use series **Type** as **Candle** .

### HollowCandle

To render a hollowcandle series, use series **Type** as **Candle** and set **EnableSolidCandle** as false.

### Spline

To render a spline series, use series **Type** as **Spline**.

### Hilo

To render a hilo series, use series **Type** as **Hilo** .

### HiloOpenClose

To render a hiloOpenClose series, use series **Type** as **HiloOpenClose**.

### CSHTML

```
<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").IndicatorType(new List<Object>() { }).ExportType(new List<Object>()
{ }).TrendlineType(new List<Object>() { })

=>

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();

.Render())
```

```
<script>
 var data = window.chartData;
</script>
```

## CANDLE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

## Trendlines

Trendlines are used to show the direction and speed of price.

Stock Chart supports 6 types of trendlines namely

Linear, Exponential, Logarithmic, Polynomial, Power, Moving Average. By using trendline dropdown button you can add or remove the required trendline type.

### Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline [Type](#) as Linear.

### Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render a exponential trendline, use trendline [Type](#) as Exponential.

### Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline [Type](#) as Logarithmic.

### Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline [Type](#) as Polynomial.

**PolynomialOrder** used to define the polynomial value.

### Power

A power trendline is a curved line that is best used with data sets that compare measurements that increase at a specific rate.

To render a power trendline, use trendline [Type](#) as **Power**.

### Moving Average

A moving average trendline smoothen out fluctuations in data to show a pattern or trend more clearly.

To render a moving average trendline, use trendline [Type](#) as **MovingAverage**.

**Period** property defines the period to find the moving average.

### CSHTML

```
<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").IndicatorType(new List<Object>() { }).ExportType(new List<Object>()
{ }).SeriesType(new List<Object>() { })

=>

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.series[0].trendlines = [{ type: 'MovingAverage',
enableTooltip: false }]
 }
</script>
```

### TRENDLINES.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Customization of Trendline

The [Fill](#) and [Width](#) properties are used to customize the appearance of the trendline.

#### CSHTML

```
<script src="~/financial-data.js"></script>
 @(Html.EJS().StockChart("container").Title("AAPL Stock
Price").IndicatorType(new List<Object>() { }).ExportType(new List<Object>()
{ }).SeriesType(new List<Object>() { })
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Trendlines(tr =>
tr.Type(Syncfusion.EJ2.Charts.TrendlineTypes.MovingAverage).EnableTooltip(false).Fill("red").Width(2)).Add();
 })

 .Crosshair(cr=>cr.Enable(true).Line(line=>line.Color("green").Width(2)))
 })
 .Render())

<script>
 var data = window.chartData;
</script>
}
```

#### CUSTOMTRENDLINES.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

<!-- markdownlint-disable MD036 -->

### Technical Indicators

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

Stock Chart supports 10 types of technical indicators namely Accumulation Distribution, ATR, EMA, SMA, TMA, Momentum, MACD, RSI, Stochastic, Bollinger Band. By using indicator dropdown box you can add and remove the required indicators types.

### Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock.

To render a Accumulation Distribution Indicator, use indicator [Type](#) as `AccumulationDistribution`.

To calculate the signal line [Volume](#) field is additionally added with `DataSource`.

### Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value.

To render a Average True Range (ATR) Indicator, use indicator [Type](#) as `Atr`.

### Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator, use indicator [Type](#) as `Ema`.

### Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator [Type](#) as `Momentum`. Momentum indicator will be represented by two lines (upperLine, signalLine). In momentum indicator the upperBand value is always renders at the value 100.

### Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator [Type](#) as `Macd`. MACD indicator will be represented by MACD line, signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

### Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator [Type](#) as `Rsi`. RSI indicator will be represented by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by [OverBought](#) and [OverSold](#) properties of indicator and the signalLine is calculated by RSI formula.

### Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator [Type](#) as `Sma`.

### Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator [Type](#) as `Stochastic`.

Stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine).

In stochastic indicator the upperBand value and lowerBand value is customized by [OverBought](#) and [OverSold](#) properties of indicators and the periodLine and signalLine is render based on stochastic formula.

### Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator [Type](#) as `Tma`.

### Bollinger Band

<!-- markdownlint-disable MD034 -->

A Stock Chart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices.

To render a Bollinger Band, use indicator [Type](#) as `BollingerBand`. Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine). (<https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChartStockChartIndicator.html#SyncfusionEJ2ChartsStockChartStockChartIndicatorType>) and [StandardDeviations](#) is 2.

### CSHTML

```
<script src="~/financial-data.js"></script>
<div class="control-section">
 <div id="control-container">

@ (Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").ExportType(new List<Object>() { }).TrendlineType(new List<Object>()
{ })
 .Series(sr
=>
 {

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).Name("Apple
Inc").DataSource("data").Add();
 })
 .Render())

 <script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.series[0].indicators = [
 {
 type: 'BollingerBands', field: 'close', seriesName:
'Apple Inc',
 period: 10, upperLine: { color: '#ffb735', width: 1 },
 lowerLine: { color: '#f2ec2f', width: 1 }
 }
]
 }
 </script>
```

### INDICATOR.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;

 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

## Tooltip

<!-- markdownlint-disable MD036 -->

Stock Chart will display details about the points through tooltip, when the mouse is moved over the point.

### Default tooltip

By default, tooltip is not visible. Enable the tooltip by setting [Enable](#) property to true .

### CSHTML

```
<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price")

 .Series(sr
=>
 {

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
());

}).Tooltip(tp => tp.Enable(true))

 .Render())

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.tooltip = { enable: true };
 }

</script>
```

### TOOLTIP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 {
 public IActionResult Default()
 {
 return View();
 }
 }
 }
}
```

<!-- markdownlint-disable MD013 -->

### Format the tooltip

<!-- markdownlint-disable MD013 -->

By default, tooltip shows information of x and y value in points. In addition to that, you can show more information in tooltip. For example the format `${series.name} ${point.x}` shows series name and point x value.

### CSHTML

```
<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock Price"))

=>
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add();
 sr.Tooltip(tp =>
 {
 tp.Enable(true).Header("Unemployment").Format("${point.x} : ${point.y}");
 })
 })
 .Render();

<script>
 var data = window.chartData;
</script>
```

### FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Position the tooltip

By default, the tooltip is positioned at the left side of the stock chart. You can move the tooltip along with the mouse by setting **Nearest** to the [Position](#) property.

### CSHTML

```
<script src="stock-chart/stockchart-feature/position/financialdata.js"></script>
@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock Price"))

 .Series(sr =>
 {
```

```

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Tooltip(tp => tp.Enable(true).Shared(true).Position("Nearest"))
 .Render()
</script>
var data = window.chartData;
</script>

```

## POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Customize the appearance of the tooltip

The [Fill](#) and [Border](#) properties are used to customize the background color and border of the tooltip respectively. The [TextStyle](#) property in the tooltip is used to customize the font of the tooltip text.

## CSHTML

```

<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price")

 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Tooltip(tp =>
tp.Enable(true).Format("${point.x} : ${point.y}").Fill("#7bb4eb"))
 .Render())

<script>
var data = window.chartData;
function stockload(args) {
 args.stockChart.tooltip = {
 border: {
 width: 2,
 color: 'grey'

```

```

 }
 };
}
</script>

```

### CUSTOMTOOLTIP.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### Add Crosshair

Crosshair has a vertical and horizontal line to view the value of the axis at mouse or touch position.

Crosshair lines can be enabled by using [Enable](#) property in the **Crosshair**.

### CSHTML

```

<script src="~/financial-data.js"></script>
@(Html.EJS().StockChart("container").Title("AAPL Stock
Price").ExportType(new List<Object>() { })
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
.Crosshair(cr=>cr.Enable(true))
 .Render())
<script>
 var data = window.chartData;
</script>

```

### CROSSHAIR.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart

```

```
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Tooltip for axis

Tooltip label for an axis can be enabled by using [Enable](#) property of `CrosshairTooltip` in the corresponding axis.

### CSHTML

```
<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").ExportType(new List<Object>() { })
 .PrimaryXAxis(xaxis
=>xaxis.MajorTickLines(mg=>mg.Width(0).Color("transparent")).CrosshairToolti
p(ct => ct.Enable(true)).LineStyle(ls=>ls.Color("transparent")

).ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime).CrosshairTooltip(ct=>c
t.Enable(true)))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("transparent")).CrosshairTooltip(ct=>
ct.Enable(true))

 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render())

<script>
 var data = window.chartData;
</script>
```

### AXIS-TOOLTIP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

```

 }
}
}

```

### Customization

The [Fill](#) and [TextStyle](#) property of the [CrosshairTooltip](#) is used to customize the background color and font style of the crosshair label respectively. Color and width of the crosshair line can be customized by using the [Line](#) property in the crosshair.

### CSHTML

```

<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").ExportType(new List<Object>() { })

=>
 .Series(sr
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 })
 .Render())

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.crosshair = { enable: true, line: { width: 2,
color: 'green' } };
 args.stockChart.primaryYAxis = {
 lineStyle: { color: 'transparent' },
 majorTickLines: { color: 'transparent', width: 0 },
 crosshairTooltip: { enable: true, fill: 'green' }
 };
 args.stockChart.primaryXAxis = {
 majorGridLines: { color: 'transparent' },
 crosshairTooltip: { enable: true, fill: 'green' }
 };
 }
</script>

```

### CUSTOM.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

```

 }
}
}

```

### Add Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the closest point and trackball tooltip displays the information about the point.

Trackball can be enabled by setting the [Enable](#) property of the crosshair to true and [Shared](#) property in **Tooltip** to true in chart.

### CSHTML

```

@Html.EJS().Chart("container-vertical").Series(series =>
{
 series.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).XName("x").YName("yValue")
 .Marker(ViewBag.marker)
 .DataSource(ViewBag.dataSource).Name("John").Width(2).Add();

 series.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).XName("x").YName("yValue1")
 .Marker(ViewBag.marker)
 .DataSource(ViewBag.dataSource).Name("Andrew").Width(2).Add();

 series.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).XName("x").YName("yValue2")
 .Marker(ViewBag.marker)
 .DataSource(ViewBag.dataSource).Name("Thomas").Width(2).Add();})\
 .PrimaryXAxis(px =>
px.EdgeLabelPlacement(Syncfusion.EJ2.Charts.EdgeLabelPlacement.Shift)
 .MajorGridLines(ViewBag.majorGridLines).LineStyle(ViewBag.lineStyle)
 .ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime)
 .Skeleton("y"))
 .PrimaryYAxis(py => py.Title("Revenue")
 .MajorTickLines(ViewBag.majorTickLines)
 .LineStyle(ViewBag.lineStyle)
 .Minimum(10)
 .Maximum(80)
 .LabelFormat("{value}M"))
 .ChartArea(area => area.Border(ViewBag.ChartBorder))
 .Tooltip(tl =>tl.Enable(true).Shared(true))
 .Crosshair(cr =>
cr.Enable(true).LineType(Syncfusion.EJ2.Charts.LineType.Vertical))
 .Title("Average Sales per Person").Render()

```

### TRACKBALL.CS

```

public ActionResult Index()
{
 List<TrackballChartData> chartData = new
List<TrackballChartData>
{
 new TrackballChartData { xValue = new DateTime(2000, 2, 11),
yValue = 14, yValue1 = 39, yValue2 = 60 },
 new TrackballChartData { xValue = new DateTime(2000, 9, 4),
yValue = 20, yValue1 = 30, yValue2 = 55 },

```

```

 new TrackballChartData { xValue = new DateTime(2001, 2, 11),
yValue = 25, yValue1 = 28, yValue2 = 48 },
 new TrackballChartData { xValue = new DateTime(2001, 9, 16),
yValue = 21, yValue1 = 35, yValue2 = 57 },
 new TrackballChartData { xValue = new DateTime(2002, 2, 7),
yValue = 13, yValue1 = 39, yValue2 = 62 },
 new TrackballChartData { xValue = new DateTime(2002, 9, 7),
yValue = 18, yValue1 = 41, yValue2 = 64 },
 new TrackballChartData { xValue = new DateTime(2003, 2, 11),
yValue = 24, yValue1 = 45, yValue2 = 57 },
 new TrackballChartData { xValue = new DateTime(2003, 9, 14),
yValue = 23, yValue1 = 48, yValue2 = 53 },
 new TrackballChartData { xValue = new DateTime(2004, 2, 6),
yValue = 19, yValue1 = 54, yValue2 = 63 },
 new TrackballChartData { xValue = new DateTime(2004, 9, 6),
yValue = 31, yValue1 = 55, yValue2 = 50 },
 new TrackballChartData { xValue = new DateTime(2005, 2, 11),
yValue = 39, yValue1 = 57, yValue2 = 66 },
 new TrackballChartData { xValue = new DateTime(2005, 9, 11),
yValue = 50, yValue1 = 60, yValue2 = 65 },
 new TrackballChartData { xValue = new DateTime(2006, 2, 11),
yValue = 24, yValue1 = 60, yValue2 = 79 },
 };
 ViewBag.dataSource = chartData;
 return View();
}
public class TrackballChartData
{
 public DateTime xValue;
 public double yValue;
 public double yValue1;
 public double yValue2;
}

```

## Legend

Legend provides information about the series rendered in the Stock Chart. Legend can be added to a Stock Chart by enabling the [Visible](#) option in the [LegendSettings](#).

## Position and Alignment

By using the [Position](#) property, legend can be placed at **Left**, **Right**, **Top**, **Bottom** or **Custom** of the Stock Chart. The legend is positioned at the bottom of the Stock Chart, by default.

## CSHTML

```

<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").Add();
 })
)

```

```

 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend => legend.Visible(true).Position("Top"))
 .Render()
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>

```

### POSITION.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

[Custom](#) position is used to position the legend anywhere in the Stock Chart using x, y coordinates.

### CSHTML

```

<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend =>
legend.Visible(true).Position("Custom").location(location =>
location.x(200).y(20)))
 .Render()
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>

```

**CUSTOM.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

**Legend Alignment**

The legend can be align as **Center**, **Far** or **Near** to the Stock Chart using [Alignment](#) property.

**CSHTML**

```
<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name
("China").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend =>
legend.Visible(true).Position("Bottom").Alignment("Near"))
 .Render())
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>
```

**ALIGNMENT.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
```

```
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Customization

To change the legend icon shape, [LegendShape](#) property in the [Series](#) can be used. By default legend icon shape is `SeriesType`.

### CSHTML

```
<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").legendShape("Pentagon").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend => legend.Visible(true))
 .Render())
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>
```

### CUSTOMIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Legend Size

By default, legend takes 20% - 25% of the Stock Chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the Stock Chart. The default legend size can be changed by using the [Width](#) and [Height](#) property of the `LegendSettings`.

### CSHTML

```
<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend =>
legend.Visible(true).width(500).height(50).border(border =>
border.width(1).color("pink")))
 .Render())
<script>
var data = window.chartData;
var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
}
</script>
```

### SIZE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Legend Item Size

The size of the legend items can be customized by using the [ShapeHeight](#) and [ShapeWidth](#) property.

**CSHTML**

```

<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend =>
legend.Visible(true).shapeHeight(15).shapeWidth(15))
 .Render())
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>

```

**ITEM-SIZE.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

**Collapsing Legend Item**

By default, series name will be displayed as legend. To skip the legend for a particular series, empty string to the series name can be given.

**CSHTML**

```

<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {

```

```

sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend => legend.Visible(true))
 .Render();
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>

```

### COLLAPSING.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### Legend Title

The title for legend can be set using [Title](#) property in [LegendSettings](#). Customize the [FontStyle](#), [Size](#), [FontWeight](#), [Color](#), [TextAlignment](#), [FontFamily](#), [Opacity](#) and [TextOverflow](#) of legend title. [TitlePosition](#) is used to set the legend position in [Top](#), [Left](#) and [Right](#) position. [MaximumTitleWidth](#) is used to set the width of the legend title. By default, it will be 100px.

### CSHTML

```

<script src="~/datasource.js"></script>
@(Html.EJS().StockChart("container").Load("load").Title("Unemployment Rates
1975-2010")
 .PrimaryXAxis(xaxis =>
xaxis.ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime))
 .Series(sr =>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Name("China").Add();
 })
 .Tooltip(tooltip => tooltip.Enable(true))
 .LegendSettings(legend =>
legend.Visible(true).title("Countries").titlePosition("Top"))

```

```

 .Render())
<script>
 var data = window.chartData;
 var load = function (args) {
 args.stockChart.indicatorType = [];
 args.stockChart.trendlineType = [];
 }
</script>

```

### TITLE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

### Period selector

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

#### Periods

<!-- markdownlint-disable MD034 -->

Periods is an array of objects that allows users to specify the range of [Periods]

([https://help.syncfusion.com/cr/aspnetcore-](https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods)

[js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods](https://help.syncfusion.com/cr/aspnetcore-js2/Syncfusion.EJ2.Charts.StockChart.html#SyncfusionEJ2ChartsStockChartPeriods)). The **Interval** property specifies the count value of the button, and the **Text** property specifies the text to be displayed on button. The **IntervalType** property allows users to customize the intervals of the buttons. The **IntervalType** property supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

**CSHTML**

```

@ (Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").ExportType(new List<Object>() { }).SeriesType(new List<Object>() {
}).IndicatorType(new List<Object>() { }).TrendlineType(new List<Object>() {
}))
 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Color("transparent")
))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("transparent").Width(0)
).LineStyle(ls=>ls.Color("transparent")).Crosshair(cr =>
cr.Enable(true)))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Line).XName("X").YName("Y").Name("google").DataSource("data").Add();
 })
 .Periods(pr =>
 {
pr.IntervalType(Syncfusion.EJ2.Charts.RangeIntervalType.Minutes).Interval(1)
.Text("1M").Add();

pr.IntervalType(Syncfusion.EJ2.Charts.RangeIntervalType.Minutes).Interval(30)
.Text("30M").Add();

pr.IntervalType(Syncfusion.EJ2.Charts.RangeIntervalType.Hours).Interval(1).Text("1H").Add();

pr.IntervalType(Syncfusion.EJ2.Charts.RangeIntervalType.Hours).Interval(12).Text("12H").Selected(true).Add();
 })
 .Render())

<script>
 var series1 = [];
 var point1;
 var value = 80;
 var i;
 for (i = 1; i < 500; i++) {
 if (Math.random() > .5) {
 value += Math.random();
 } else {
 value -= Math.random();
 }
 point1 = { x: new Date(2000, 1, 1, 0, i), y: value.toFixed(1) };
 series1.push(point1);
 }
 var data = series1;

</script>

```

**PERIOD.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

Visibility of period selector

The [EnablePeriodSelector](#) property allows users to toggle the visibility of period selector.

**CSHTML**

```

<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").EnablePeriodSelector(false)

=>

 .Series(sr
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
();
 })
 .Render())

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.crosshair = { enable: true };
 }
</script>

```

**VISIBILITYPERIOD.CS**

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

```

 }
}
}

```

### Range selector

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

### Selecting Range

The left and right thumb of RangeNavigator are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and end through Date Range button.

Following code example shows the [EnableSelector](#) property allows users to toggle the visibility of enable selector.

### CSHTML

```

<script src="~/financial-data.js"></script>

@(Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").EnableSelector(false)

=>

 .Series(sr
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
());
 })
 .Render())

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.crosshair = { enable: true };
 }
</script>

```

### RANGE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

```

 }
}
}

```

## Print and Export

The rendered stock chart can be exported to **JPEG**, **PNG**, **SVG**, or **PDF** format using the export dropdown button in the period selector toolbar. You can choose the required format using the export dropdown button in stock-chart.

The rendered stock chart can be printed directly using print button in period selector toolbar.

### CSHTML

```

<script src="~/financial-data.js"></script>
 @(Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Color("transparent")))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("transparent").Width(0))
 .LineStyle(ls=>ls.Color("transparent")))
 .Series(sr
=>
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 })
 .Render())

<script>
 var data = window.chartData;
</script>

```

### PRINT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Disable Export and print

To empty the value of **ExportType** for to disable the Export button.

### CSHTML

```

<script src="~/financial-data.js"></script>
 @Html.EJS().StockChart("container").Title("AAPL Stock
Price").ExportType(new List<Object>() { })
 .PrimaryXAxis(xaxis
=>xaxis.MajorGridLines(mg=>mg.Color("transparent")))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("transparent").Width(0))
 .LineStyle(ls=>ls.Color("transparent")))
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
());
 })
 .Render()

<script>
 var data = window.chartData;
</script>

```

### DISABLE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Appearance

### Stock Chart Title

Stock Chart can be given a title using [Title](#) property, to show the information about the data plotted.

### CSHTML

```

<script src="~/financial-data.js"></script>
 @Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .Series(sr
=>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
());
 })
 .TitleStyle(ts =>

```

```
ts.Color("#E27F2D").FontFamily("Arial").FontStyle("italic").FontWeight("regular").Size("20px"))
 .Render()

<script>
 var data = window.chartData;
</script>
```

**TITLE.CS**

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

<!-- markdownlint-disable MD036 -->

**Title Customizations**

The **TextStyle** property of chart title provides options to customize the **Size**, **Color**, **FontFamily**, **FontWeight**, **FontStyle**, **Opacity**, **TextAlignment** and **TextOverflow**.

**CSHTML**

```
<script src="~/financial-data.js"></script>
 @Html.EJS().StockChart("container").Title("AAPL Stock Price")
 .Series(sr
=> {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 })
 .TitleStyle(ts =>
ts.Color("#E27F2D").FontFamily("Arial").FontStyle("italic").FontWeight("regular").Size("20px").TextOverflow(Syncfusion.EJ2.Charts.TextOverflow.Wrap))
 .Render()

 <script>
 var data = window.chartData;
 </script>
```

**TITLEWRAP.CS**

```
using System;
using System.Collections.Generic;
```

```
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}
```

### Stock Chart Theme

Changing theme will affect background color, gridlines, tooltip colors and appearance.

[Theme](#) property of Stock chart is shipped with several built-in themes such as Material, Fabric, Bootstrap, HighContrastLight, MaterialDark, FabricDark, FabricDark, HighContrast and BootstrapDark.

### CSHTML

```
<script src="~/financial-data.js"></script>

@Html.EJS().StockChart("container").Load("stockload").Title("AAPL Stock
Price").Theme(Syncfusion.EJ2.Charts.ChartTheme.HighContrast)

=>

 .Series(sr
 {
 sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Candle).DataSource("data").Add
 ();
 })
 .Render()

<script>
 var data = window.chartData;
 function stockload(args) {
 args.stockChart.titleStyle = {
 size: '20px'
 };
 }
</script>
```

### THEME.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
```

```

 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Stock Events

Stock Events visualizes stockevents in stockchart. 'SplineSeries' is used to represent selected data value. You can customize the specific data value using **StockEvents** event.

### CSHTML

```

<script src="~/financial-data.js"></script>
@ (Html.EJS().StockChart("container")..SeriesType(new
List<Object>() { }).TrendlineType(new List<Object>() { }).IndicatorType(new
List<Object>() { })
 .PrimaryXAxis(xaxis =>xaxis.MajorGridLines(mg=>mg.Width(0)
).ValueType(Syncfusion.EJ2.Charts.ValueType.DateTime).CrosshairTooltip(ct=>c
t.Enable(true)))
 .PrimaryYAxis(yaxis
=>yaxis.MajorTickLines(mt=>mt.Color("transparent").Width(0)
).LineStyle(ls=>ls.Color("transparent").CrosshairTooltip(ct=>ct.Enable(fals
e)))
 .Series(sr =>
 {
sr.Type(Syncfusion.EJ2.Charts.ChartSeriesType.Spline).DataSource("data").XNa
me("x").YName("high").Close("high").Add();
 })
 .Crosshair(cr=>cr.Enable(true))
 .ChartArea(area => area.Border(br=>br.Width(0)))
 .StockEvents(se =>

 var data = window.aapl;
</script>

```

## STOCK-EVENTS-2.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace EJ2CoreSampleBrowser.Controllers.StockChart
{
 public partial class StockChartController : Controller
 {
 public IActionResult Default()
 {
 return View();
 }
 }
}

```

## Accessibility in ASP.NET MVC Stock chart component

The Stock chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Stock chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The Stock chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Stock chart component:

- img (role)
- button (role)
- region (role)

- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

### Keyboard interaction

The Stock chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Stock chart component.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the Stock chart element. |

| **Tab** | Moves the focus to the next element in the Stock chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Stock chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **ESC** | Cancel the tooltip for the data point. |

| **Ctrl + P** | Prints the Stock chart. |

### Ensuring accessibility

The Stock chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Stock chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Stock chart component with accessibility tools.

## Switch

### Getting Started with ASP.NET MVC Switch Control

This section briefly explains about how to include [ASP.NET MVC Switch](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Add ASP.NET MVC Switch control

Now, add the Syncfusion ASP.NET MVC Switch control in `~/Views/Home/Index.cshtml` page.

**CSHTML**

```
@Html.EJS().Switch("default").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Switch control will be rendered in the default web browser.

## Set text on Switch

This section explains how to set [OnLabel](#) and [OffLabel](#) texts on Switch. In the following example, `onLabel` is set as `ON` and `offLabel` is set as `OFF`.

**CSHTML**

```
@Html.EJS().Switch("default").OnLabel("ON").OffLabel("OFF").Render()
```

**Note:** Switch does not have text support for material themes, and does not support long custom text.

**Note:** [View Sample in GitHub](#).

## Accessibility in Switch Button Controls

The Switch component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Switch component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

```

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| Accessibility Checker Validation | |

| Axe-core Accessibility Validation | |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Switch component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Switch component:

| Attributes    | Purpose                                                                                              |
|---------------|------------------------------------------------------------------------------------------------------|
| role          | Indicates the switch component.                                                                      |
| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Switch component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Switch component.

| Press | To do this |

| --- | --- |

| Space | When the switch has focus, pressing the Space key changes the state of the switch. |

### Ensuring accessibility

The Switch component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Switch component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Switch component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET Core controls](#)

### Styles and Appearances

To modify the Switch appearance, you need to override the default CSS of Switch component. Find the list of CSS classes and its corresponding section in Switch. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

#### CSS Class | Purpose of Class

|.e-switch-wrapper|.e-switch-inner|To customize the line of the switch in off mode

|.e-switch-wrapper|.e-switch-handle|To customize the handle of the switch in off mode

|.e-switch-wrapper:not(.e-switch-disabled):hover|.e-switch-handle:not(.e-switch-active)|To customize the handle of the switch in off mode when hover

|.e-switch-wrapper:not(.e-switch-disabled):hover|.e-switch-inner:not(.e-switch-active)|To customize the line of the switch in off mode when hover

|.e-switch-wrapper|.e-switch-handle.e-switch-active|To customize the handle of the switch in on mode

|.e-switch-wrapper|.e-switch-on|To customize the line of the switch in on mode

|.e-switch-wrapper:hover|.e-switch-handle.e-switch-active|To customize the handle of the switch in on mode when hover

|.e-switch-wrapper:hover|.e-switch-inner.e-switch-active|.e-switch-on|To customize the line of the switch in on mode when hover

### How To

#### Change Size

The different Switch sizes available are default and small. To reduce the size of default Switch to small, set the [cssClass](#) property to `e-small`.

#### CSHTML

```
<div id='container'>
 <table class='size'>
 <tr>
 <td class='lSize'>Small</td>
 <td>
 @Html.EJS().Switch("switch1").cssClass("e-small").Render()
 </td>
 </tr>
 </table>
</div>
```

```

 </td>
 </tr>
 <tr>
 <td class='lSize'>Default</td>
 <td>
 @Html.EJS().Switch("switch2").Render()
 </td>
 </tr>
 </table>
 </div>
 <style>
 .size tr td {
 padding: 10px;
 }
 .size .lSize {
 font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-serif";
 font-size: 13px;
 cursor: pointer;
 user-select: none;
 }
 </style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Customize the appearance of a Switch

You can customize the appearance of the Switch component using the CSS rules. Define your own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

#### Customize Switch bar and handle

Switch bar and handle can be customized as per requirement using CSS rules. Switch bar and handle customized using `cssClass` property. In the following sample, the `border-radius` CSS property for `e-switch-inner` and `e-switch-handle` elements was changed border radius circle to square shape.

### CSHTML

```

@Html.EJS().Switch("switch1").CssClass("square").Render()
@Html.EJS().Switch("switch2").CssClass("custom-switch").Render()
@Html.EJS().Switch("switch3").CssClass("handle-text").Render()
<style>
/* Square Switch */
.e-switch-wrapper.square .e-switch-inner,
.e-switch-wrapper.square .e-switch-handle {
 border-radius: 0;
}
/* Customize Handle and Bar Switch */
.e-switch-wrapper.custom-switch {
 width: 50px;
 height: 24px;
}

```

```
.e-switch-wrapper.custom-switch .e-switch-handle {
 width: 20px;
 height: 16px;
}
.e-switch-wrapper.custom-switch .e-switch-inner,
.e-switch-wrapper.custom-switch .e-switch-handle {
 border-radius: 0;
}
.e-switch-wrapper.custom-switch .e-switch-handle.e-switch-active {
 left: 42px;
}
/* Customize Handle and Bar Switch */
.e-switch-wrapper.handle-text {
 width: 58px;
 height: 24px;
}
.e-switch-wrapper.handle-text .e-switch-handle {
 width: 26px;
 height: 20px;
 left: 2px;
 background-color: #fff;
}
.e-switch-wrapper.handle-text .e-switch-inner,
.e-switch-wrapper.handle-text .e-switch-handle {
 border-radius: 0;
}
.e-switch-wrapper.handle-text .e-switch-handle.e-switch-active {
 left: 46px;
}
.e-switch-wrapper.handle-text .e-switch-inner.e-switch-active,
.e-switch-wrapper.handle-text:hover .e-switch-inner.e-switch-active .e-switch-on {
 background-color: #4d841d;
 border-color: #4d841d;
}
.e-switch-wrapper.handle-text .e-switch-inner,
.e-switch-wrapper.handle-text .e-switch-off {
 background-color: #e3165b;
 border-color: #e3165b;
}
.e-switch-wrapper.handle-text .e-switch-inner:after,
.e-switch-wrapper.handle-text .e-switch-inner:before {
 font-size: 10px;
 position: absolute;
 line-height: 21px;
 font-family: "Helvetica", sans-serif;
 z-index: 1;
 height: 100%;
 transition: all 200ms cubic-bezier(0.445, 0.05, 0.55, 0.95);
}
.e-switch-wrapper.handle-text .e-switch-inner:before {
 content: "OFF";
 color: #e3165b;
 left: 3px;
}
.e-switch-wrapper.handle-text .e-switch-inner:after {
 content: "ON";
```

```

 right: 5px;
 color: #fff;
}
.e-switch-wrapper.handle-text .e-switch-inner.e-switch-active:before {
 color: #fff;
}
.e-switch-wrapper.handle-text .e-switch-inner.e-switch-active:after {
 color: #4d841d;
}
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Color the Switch

Switch colors can be customized as per the requirement using CSS rules. Switch bar and handle colors customized using `cssClass` property. In the following sample, the `e-switch-inner` and `e-switch-off` elements background and border colors were changed from default colors.

### CSHTML

```

@Html.EJS().Switch("switch1").CssClass("bar-color").Render()
@Html.EJS().Switch("switch2").CssClass("handle-color").Render()
@Html.EJS().Switch("switch3").CssClass("custom-ios").Render()
<style>
/* Custom color Switch */
.e-switch-wrapper.bar-color .e-switch-inner.e-switch-active,
.e-switch-wrapper.bar-color:hover .e-switch-inner.e-switch-active .e-switch-on {
 background-color: #4d841d;
 border-color: #4d841d;
}
.e-switch-wrapper.bar-color .e-switch-inner,
.e-switch-wrapper.bar-color .e-switch-off {
 background-color: #e3165b;
 border-color: #e3165b;
}
.e-switch-wrapper.bar-color .e-switch-handle {
 background-color: #fff;
}
/* handle color Switch */
.e-switch-wrapper.handle-color .e-switch-handle {
 background-color: #e3165b;
}
.e-switch-wrapper.handle-color .e-switch-handle.e-switch-active {
 background-color: #4d841d
}
.e-switch-wrapper.handle-color .e-switch-inner.e-switch-active,
.e-switch-wrapper.handle-color:hover .e-switch-inner.e-switch-active .e-switch-on {
 background-color: #fff;
}

```

```

border-color: #ccc;
}
.e-switch-wrapper.handle-color .e-switch-inner,
.e-switch-wrapper.handle-color .e-switch-off {
 background-color: #fff;
 border-color: #ccc;
}
/* iOS Switch */
.e-switch-wrapper.custom-iOS .e-switch-inner.e-switch-active,
.e-switch-wrapper.custom-iOS:hover .e-switch-inner.e-switch-active .e-
switch-on {
 background-color: #3df865;
 border-color: #3df665;
}
.e-switch-wrapper.custom-iOS {
 width: 42px;
 height: 24px;
}
.e-switch-wrapper.custom-iOS .e-switch-handle {
 width: 20px;
 height: 20px;
}
.e-switch-wrapper.custom-iOS .e-switch-handle.e-switch-active {
 margin-left: -22px;
}
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Enable ripple for Switch label

By default, label with ripple effect is not available in Switch. You can achieve this using `rippleMouseHandler` method. The following example illustrates how to enable ripple effect for labels in Switch component.

### CSHTML

```

<div id='container'>
 <table class='size'>
 <tr>
 <td class='lSize'><label for='switch1'>USB
Tethering</label></td>
 <td>
 @Html.EJS().Switch("switch1").Render()
 </td>
 </tr>
 </table>
</div>
<style>
.e-switch-wrapper {
 margin-top: 18px;
}

```

```

}
.size tr td {
 padding: 10px;
}
.size .lSize {
 padding-top: 24px;
 font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-serif";
 font-size: 13px;
}
.size .lSize label{
 cursor: pointer;
 user-select: none;
}
</style>

```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Enable RTL

Switch component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Switch component.

### CSHTML

```
@Html.EJS().Switch("default").EnableRtl(true).Render()
```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Set disabled state

Switch can be disabled by setting the [disabled](#) property to true.

The following example illustrates how to disable support in Switch component.

### CSHTML

```
@Html.EJS().Switch("default").Disabled(true).Render()
```

### DEFAULT.CS

```

public ActionResult Default()
{
 return View();
}

```

### Submit name and value in form

The name attribute of the Switch is used to group Switches. When the Switches are grouped in form, the checked items value attribute will post to the server on form submit. The disabled and unchecked Switch values will not be sent to the server on form submit.

In the following code snippet, USB and Wi-Fi in the checked state, and Bluetooth is in disabled state. Values that are in checked state only be sent on form submit.

### CSHTML

```
<div id='container'>
 <form>
 <table class='size'>
 <tr>
 <td class='lSize'>USB</td>
 <td>
 @Html.EJS().Switch("switch1").Checked(true).Render()
 </td>
 </tr>
 <tr>
 <td class='lSize'>Wi-Fi</td>
 <td>
 @Html.EJS().Switch("switch2").Checked(true).Render()
 </td>
 </tr>
 <tr>
 <td class='lSize'>Bluetooth</td>
 <td>
 @Html.EJS().Switch("switch3").Render()
 </td>
 </tr>
 <tr>
 <td>
 @Html.EJS().Button("button").Content("SUBMIT").Render()
 </td>
 </tr>
 </table>
 </form>
</div>
<style>
button {
 margin: 20px 0 0 5px;
}
.size tr td {
 padding: 10px;
}
.size .lSize {
 font-family: "Roboto", "Segoe UI", "GeezaPro", "DejaVu Serif", "sans-serif";
 font-size: 13px;
}
.size .lSize label {
 user-select: none;
}
</style>
```

**DEFAULT.CS**

```
public ActionResult Default()
{
 return View();
}
```

## Tabs

### Getting Started with ASP.NET MVC Tab Control

This section briefly explains about how to include [ASP.NET MVC Tab](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

**PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Tab control

Now, add the Syncfusion ASP.NET MVC Tab control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@(Html.EJS().Tab("ej2Tab")
 .Items(new List<TabItem> {
 new TabItem { Header = ViewBag.headerText0, Content = "Twitter is an
online social networking service that enables users to send and read short
140-character messages called tweets. Registered users can read and post
tweets, but those who are unregistered can only read them. Users access
Twitter through the website interface, SMS or mobile device app Twitter Inc.
is based in San Francisco and has more than 25 offices around the world.
Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone,
and Noah Glass and launched in July 2006. The service rapidly gained
worldwide popularity, with more than 100 million users posting 340 million
tweets a day in 2012.The service also handled 1.6 billion search queries per
day." },
 new TabItem { Header = ViewBag.headerText1, Content = "Facebook is
an online social networking service headquartered in Menlo Park, California.
Its website was launched on February 4, 2004, by Mark Zuckerberg with his
```

Harvard College roommates and fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The founders had initially limited the website's membership to Harvard students, but later expanded it to colleges in the Boston area, the Ivy League, and Stanford University. It gradually added support for students at various other universities and later to high-school students." },

```
new TabItem { Header = ViewBag.headerText2, Content = "WhatsApp
Messenger is a proprietary cross-platform instant messaging client for
smartphones that operates under a subscription business model. It uses the
Internet to send text messages, images, video, user location and audio media
messages to other users using standard cellular mobile numbers. As of
February 2016, WhatsApp had a user base of up to one billion,[10] making it
the most globally popular messaging application. WhatsApp Inc., based in
Mountain View, California, was acquired by Facebook Inc. on February 19,
2014, for approximately US$19.3 billion." }
```

```
 })
 .HeightAdjustMode(HeightStyles.Auto)
 .OverflowMode(OverflowMode.Popup)
 .Render()
}
```

```
<style>
```

```
#container {
 visibility: hidden;
}
#loader {
 color: #008cff;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
}
.e-content .e-item {
 font-size: 12px;
 margin: 10px;
 text-align: justify;
}
.container {
 min-width: 350px;
 max-width: 500px;
 margin: 0 auto;
}
```

```
</style>
```

### HOMECONTROLLER.CS

```
public ActionResult Index()
{
 ViewBag.headerText0 = new TabHeader { Text = "Twitter" };
 ViewBag.headerText1 = new TabHeader { Text = "Facebook" };
 ViewBag.headerText2 = new TabHeader { Text = "Whatsapp" };
 return View();
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Tab control will be rendered in the default web browser.

Twitter      Facebook      Whatsapp

Twitter is an online social networking service that enables users to send and read short 140-character messages called tweets. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day.

Initialize the Tab using JSON items collection

The Tab can be rendered by defining a JSON array. The item is rendered with [header](#) text and [content](#) for each Tab.

#### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@model List<TabTabItem>
@Html.EJS().Tab("ej2Tab").Items(Model).Render()

<style>
 .e-content .e-item {
 font-size: 12px;
 margin: 10px;
 text-align: justify;
 }
</style>
```

#### HOMECONTROLLER.CS

```
public ActionResult Index()
{
 List<TabTabItem> items = new List<TabTabItem>();
 items.Add(new TabTabItem { Header = new TabHeader { Text = "Twitter" },
 Content = "Twitter is an online social networking service that enables users to send and read short 140-character messages called 'tweets'. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day." });
 items.Add(new TabTabItem { Header = new TabHeader { Text = "Facebook" },
 Content = "Facebook is an online social networking service headquartered in Menlo Park, California. Its website was launched on February 4, 2004, by Mark Zuckerberg with his Harvard College roommates and fellow students Eduardo Saverin, Andrew McCollum, Dustin Moskovitz and Chris Hughes. The
```

```

founders had initially limited the website's membership to Harvard students,
but later expanded it to colleges in the Boston area, the Ivy League, and
Stanford University. It gradually added support for students at various
other universities and later to high-school students." });
items.Add(new TabBarItem { Header = new TabHeader { Text = "Whatsapp" },
Content = "WhatsApp Messenger is a proprietary cross-platform instant
messaging client for smartphones that operates under a subscription business
model. It uses the Internet to send text messages, images, video, user
location and audio media messages to other users using standard cellular
mobile numbers. As of February 2016, WhatsApp had a user base of up to one
billion,[10] making it the most globally popular messaging application.
WhatsApp Inc., based in Mountain View, California, was acquired by Facebook
Inc. on February 19, 2014, for approximately US$19.3 billion." });
return View(items);
}

```

### Initialize the Tab using HTML elements

The Tab control can be rendered based on the given HTML element using `id` as `target`. Header section must be enclosed with in a wrapper element using `e-tab-header` class and corresponding content must be mapped with `e-content` class.

You need to follow the below structure of HTML elements to render the Tab,

```
`html
```

```

<div id='ej2Tab'> --> Root Tab element
<div class="e-tab-header"> --> Tab header
<div> --> Header Item
</div>
</div>
<div class="e-content"> --> Tab content
<div> --> Content Item
</div>
</div>
</div>
,

```

- Add the HTML template data with its id attribute and add it in your `index.cshtml` file to initialize the Tab.

### CSHTML

```

<div id="ej2Tab">
 <div class="e-tab-header">
 <div>Twitter </div>
 <div>Facebook </div>
 <div>WhatsApp </div>
 </div>

```

```

<div class="e-content">
 <div>
 Twitter is an online social networking service that enables
 users to send and read short 140-character messages called 'tweets'.
 Registered users can read and post tweets, but those who are unregistered
 can only read them. Users access Twitter through the website interface, SMS
 or mobile device app Twitter Inc. is based in San Francisco and has more
 than 25 offices around the world. Twitter was created in March 2006 by Jack
 Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006.
 The service rapidly gained worldwide popularity, with more than 100 million
 users posting 340 million tweets a day in 2012.The service also handled 1.6
 billion search queries per day.
 </div>
 <div>

## Responsive Modes

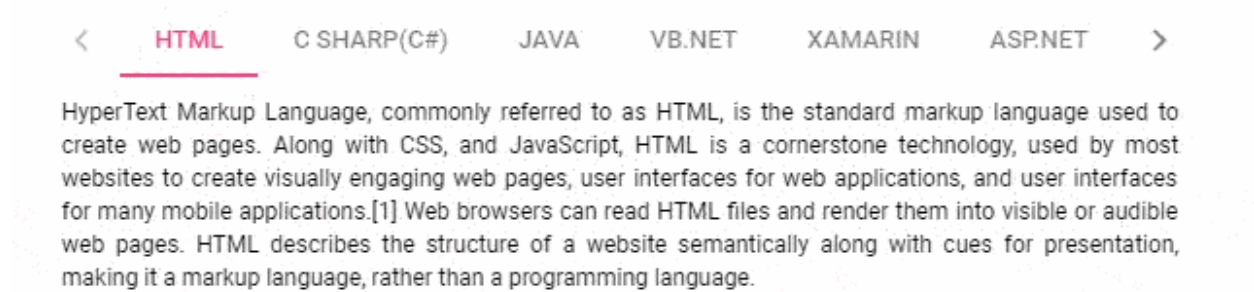

The following section explains about rendering Tab when its width exceeds the viewable area or particularly in a given width. The available modes are as follows:

- Scrollable
- Popup

### Scrollable

The default overflow mode is Scrollable. Scrollable display mode supports displaying the Tab header items in a single line with horizontal scrolling enabled, when the item overflows to the available space.

- The right and left navigation arrow is added at the start and end of the Tab header through which user can navigate towards overflowed items of the Tab header.
- You can also see the overflowed items using touch and swipe action on the header and content section.
- By default, navigation icon in the left direction is disabled, you can see the overflowed items by moving in the right direction.
- By clicking the arrow or by holding the arrow continuously, you can see the overflowed items.

- In devices the navigation icons are not available. You can touch and swipe to see the overflowed items of the Tab header.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
```

```
@(Html.EJS().Tab("ej2Tab")
.Width("500px")
.Items(new List<TabBarItem> {
 new TabBarItem { Header = ViewBag.headerText0, Content = "HyperText
Markup Language, commonly referred to as HTML, is the standard markup

```

### SCROLLABLE.CS

```
public ActionResult Index()
{
 ViewBag.headerText0 = new TabHeader { Text = "HTML" };
 ViewBag.headerText1 = new TabHeader { Text = "C Sharp(C#)" };
 ViewBag.headerText2 = new TabHeader { Text = "Java" };
 ViewBag.headerText3 = new TabHeader { Text = "VB.Net" };
 ViewBag.headerText4 = new TabHeader { Text = "Xamarin" };
 ViewBag.headerText5 = new TabHeader { Text = "ASP.NET" };
 ViewBag.headerText6 = new TabHeader { Text = "ASP.NET MVC" };
 ViewBag.headerText7 = new TabHeader { Text = "JavaScript" };
 return View();
}
```

### Popup

The Popup is the another type of **overflowMode** in which the Tab container holds the items that can be placed within the available space. The rest of the overflowing items for which there is no space to fit within the viewing area are moved to overflow popup container.

- The items placed in popup can be viewed by opening the popup with the help of drop-down icon given at the end of the Tab header.

- If the popup height exceeds the height of the visible area, you can scroll through the popup items and select one.

## Header

This section explains about modifying the style of Tab header, and configuring its icons and positions.

### Styles

You can customize header styles by adding predefined classes in the Tab root element. The pre-defined CSS class names are as follows:

- **e-fill:** The Selected Tab header background is set as solid fill.
- **e-background:** Tab header has a solid fill background, and the selected header has a highlighted border.
- **e-background e-accent:** Tab header has a solid fill background, and the selected header has a highlighted border with accent color.

**Note:** If the above custom style classes are not included in the root element, the default style is applied to the Tab items.

### CSHTML

```

@using Syncfusion.EJ2.Navigations;
<div class='row'>
 <div class="col-xs-6 col-sm-6 col-lg-6 col-md-6">
 <label> Header Style </label>
 </div>
 <div class="col-xs-6 col-sm-6 col-lg-6 col-md-6">

@Html.EJS().DropDownList("styles").Width("100%").DataSource(ViewBag.stylesData).Value("Default").Change("changeStyles").Render()
 </div>
</div>
@ (Html.EJS().Tab("ej2Tab")
 .Width("650px")
 .Items(new List<TabBarItem> {
 new TabBarItem { Header = ViewBag.headerText0, Content = "Twitter is an online social networking service that enables users to send and read short 140-character messages called tweets. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app Twitter Inc. is based in San Francisco and has more than 25 offices around the world."

```

```

Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone,
and Noah Glass and launched in July 2006. The service rapidly gained
worldwide popularity, with more than 100 million users posting 340 million
tweets a day in 2012.The service also handled 1.6 billion search queries per
day." },
 new TabBarItem { Header = ViewBag.headerText1, Content = "Facebook
is an online social networking service headquartered in Menlo Park,
California. Its website was launched on February 4, 2004, by Mark Zuckerberg
with his Harvard College roommates and fellow students Eduardo Saverin,
Andrew McCollum, Dustin Moskovitz and Chris Hughes.The founders had
initially limited the website's membership to Harvard students, but later
expanded it to colleges in the Boston area, the Ivy League, and Stanford
University. It gradually added support for students at various other
universities and later to high-school students." },
 new TabBarItem { Header = ViewBag.headerText2, Content = "WhatsApp
Messenger is a proprietary cross-platform instant messaging client for
smartphones that operates under a subscription business model. It uses the
Internet to send text messages, images, video, user location and audio media
messages to other users using standard cellular mobile numbers. As of
February 2016, WhatsApp had a user base of up to one billion,[10] making it
the most globally popular messaging application. WhatsApp Inc., based in
Mountain View, California, was acquired by Facebook Inc. on February 19,
2014, for approximately US$19.3 billion." }
 })
 .Created("tabCreated")
 .Render()
)
<style>
 #container {
 visibility: hidden;
 }
 #loader {
 color: #008cff;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
 }
 .e-content .e-item {
 font-size: 12px;
 margin: 10px;
 text-align: justify;
 }
</style>
<script type="text/javascript">
 var tabObj;
 function tabCreated() {
 tabObj = document.getElementById('ej2Tab').ej2_instances[0];
 }
 // Change event function for DropDownList component
 function changeStyles(e) {
 removeStyleClass();
 let name = e.itemData;
 if (e.itemData != null && name.value === 'Fill') {
 tabObj.element.classList.add('e-fill');
 } else if (e.itemData != null && name.value === 'Background') {

```

```

 tabObj.element.classList.add('e-background');
 } else if (e.itemData != null && name.value === 'Accent') {
 tabObj.element.classList.add('e-background');
 tabObj.element.classList.add('e-accent');
 }
}
function removeStyleClass() {
 tabObj.element.classList.remove('e-fill');
 tabObj.element.classList.remove('e-background');
 tabObj.element.classList.remove('e-accent');
}
</script>

```

## STYLES.CS

```

public ActionResult Index()
{
 ViewBag.headerText0 = new TabHeader { Text = "Twitter" };
 ViewBag.headerText1 = new TabHeader { Text = "Facebook" };
 ViewBag.headerText2 = new TabHeader { Text = "Whatsapp" };
 ViewBag.stylesData = new string[] { "Default", "Fill", "Background",
 "Accent" };
 return View();
}

```

## Icon positions

You can customize the position of the Tab header icons using the icon position property. This property depends on the header items icon CSS property. By default, Tab header icon is placed on left position. The position values are as follows:

- **Left:** Icon is placed on the left of the Tab header item.
- **Right:** Icon is placed on the right of the Tab header item.
- **Top:** Icon is placed on the top of the Tab header item.
- **Bottom:** Icon is placed on the bottom of the Tab header item.

## CSHTML

TWITTER

FACEBOOK

WHATSAPP

Twitter is an online social networking service that enables users to send and read short 140-character messages called tweets. Registered users can read and post tweets, but those who are unregistered can only read them. Users access Twitter through the website interface, SMS or mobile device app. Twitter Inc. is based in San Francisco and has more than 25 offices around the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone, and Noah Glass and launched in July 2006. The service rapidly gained worldwide popularity, with more than 100 million users posting 340 million tweets a day in 2012. The service also handled 1.6 billion search queries per day.

## Orientation

This section explains about modifying the position and modes of Tab header.

It allows placing the header section inside the Tab component at different positions by using the `headerPlacement` property. The available positions are as follows:

- **Top:** Tab header items can be arranged horizontally, and their content can be placed after the header.
- **Bottom:** Tab header items can be arranged horizontally, and their content can be placed before the header.
- **Left:** Tab header items can be arranged vertically, and their content can be placed after the header.
- **Right:** Tab header items can be arranged vertically, and their content can be placed before the header.

It is also adaptable to the available space when the tab items exceed the view space. You can customize the modes by using `overflowMode` property. The available modes are as follows:

- Scrollable
- Popup

application framework designed for web development to produce dynamic web
pages. It was developed by Microsoft to allow programmers to build dynamic
web sites, web applications and web services. It was first released in
January 2002 with version 1.0 of the .NET Framework, and is the successor to
Microsoft Active Server Pages (ASP) technology. ASP.NET is built on the
Common Language Runtime (CLR), allowing programmers to write ASP.NET code
using any supported .NET language. The ASP.NET SOAP extension framework
allows ASP.NET components to process SOAP messages." });
adaptiveItems.Add(new TabBarItem { Header = new TabHeader { Text
= "ASP.NET MVC" }, Content = "The ASP.NET MVC is a web application framework
developed by Microsoft, which implements the model-view-controller (MVC)
pattern. It is open - source software, apart from the ASP.NET Web Forms
component which is proprietary. In the later versions of ASP.NET, ASP.NET
MVC, ASP.NET Web API, and ASP.NET Web Pages (a platform using only Razor
pages) will merge into a unified MVC 6. The project is called ASP.NET vNext."
});
adaptiveItems.Add(new TabBarItem { Header = new TabHeader { Text
= "JavaScript" }, Content = "JavaScript (JS) is an interpreted computer
programming language. It was originally implemented as part of web browsers
so that client - side scripts could interact with the user, control the
browser, communicate asynchronously, and alter the document content that was
displayed. [5] More recently, however, it has become common in both game
development and the creation of desktop applications." });
ViewBag.adaptiveItems = adaptiveItems;
return View();
}
}
```

Output be like the below.

## Localization

Localization library allows to localize the default text content of Tab. In Tab, The close button's tooltip text alone will be localize based on culture.

| Locale key | en-US (default) |

|-----|-----|

| closeButtonTitle | Close |

## Loading translations

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `French` culture is set to Tab and change the close button's tooltip text.

## CSHTML

```
@using Syncfusion.EJ2.Navigations;
@Html.EJS().Tab("ej2Tab").Items(new List<TabTabItem> {
 new TabTabItem { Header = ViewBag.headerText0, Content = "HyperText Markup Language, commonly referred to as HTML, is the standard markup language used to create web pages. Along with CSS, and JavaScript, HTML is a cornerstone technology, used by most websites to create visually engaging web pages, user interfaces for web applications, and user interfaces for many mobile applications.[1] Web browsers can read HTML files and render them into visible or audible web pages. }).HeightAdjustMode(HeightStyles.Auto).ShowCloseButton(true).Locale("fr-BE").Render()
<script>
 window.onload = function () {
 ej.base.L10n.load({
 'fr-BE': {
 'tab': { 'closeButtonTitle': "Fermer" }
 }
 });
 }
</script>
<style>
 #container {
 visibility: hidden;
 max-width: 650px;
 }
 #loader {
```

```

 color: #008cff;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
 }
 .e-content .e-item {
 font-size: 12px;
 margin: 10px;
 text-align: justify;
 }
</style>

```

### LOCALIZATION.CS

```

public ActionResult Index()
{
 ViewBag.headerText0 = new TabHeader { Text = "HTML" };
 ViewBag.headerText1 = new TabHeader { Text = "C Sharp (C#)" };
 ViewBag.headerText2 = new TabHeader { Text = "Java" };
 return View();
}

```

### Drag and drop items

The Tab component allows you to drag and drop any item by setting [allowDragAndDrop](#) to **true**. Items can be reordered to any place by dragging and dropping them onto the desired location.

- If you need to prevent dragging action for a particular item, the [onDragStart](#) event can be used which will trigger when the item drag is started. If you need to prevent dropping action for a particular item, the [dragged](#) event can be used which will trigger when the drag action is stopped.
- The [dragArea](#) defines the area in which the draggable element movement will be occurring. Outside that area will be restricted for the draggable element movement.
- The [onDragStart](#) event will be triggered before dragging the item from Tab.
- The [dragging](#) event will be triggered when the Tab item is being dragged.
- The [dragged](#) event will be triggered when the Tab item is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

ViewBag.headerTextFour = new TabHeader { Text = "France" };
return View();
}

```

Output be like the below.

### Drag and drop item between tabs

It is possible to drag and drop the tab items between two tabs, by manually saving those dropped items as new tab item data through the `addTab` method of Tab and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tab control as an external source, and the item from the tab component is dragged and dropped onto another Tab. Therefore, it is necessary to use the `onDragStart` and `dragged` event of the Tab component, where we can form an event object and save it using the `addTab` method of the Tab and remove the dragged item through `removeTab` method of Tab using the dragged item index.

### TABTOTAB.CS

```

public ActionResult Index()
{
 ViewBag.headerTextOne = new TabHeader { Text = "India" };
 ViewBag.headerTextTwo = new TabHeader { Text = "Australia" };
 ViewBag.headerTextThree = new TabHeader { Text = "USA" };
 ViewBag.headerTextFour = new TabHeader { Text = "France" };
 ViewBag.headerTextFive = new TabHeader { Text = "HTML" };
 ViewBag.headerTextSix = new TabHeader { Text = "C Sharp(C#)" };
 ViewBag.headerTextSeven = new TabHeader { Text = "Java" };
 ViewBag.headerTextEight = new TabHeader { Text = "VB.Net" };
 return View();
}

```

Output be like the below.

### Drag and drop items to external source

It is possible to drag and drop the items to any of the external sources from the Tab, by manually saving those dropped items as new node data through the `addNodes` method of Treeview and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tree view control as an external source, and the item from the tab component is dragged and dropped onto the child nodes of the tree view component. Therefore, it is necessary to use the `dragged` event of the Tab component, where we can form an event object and save it using the `addNodes` method of the Treeview and remove the dragged item through the `removeTab` method of Tab using the dragged item index.

## Accessibility ASP.NET MVC Tab control

The Tab control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tab control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" |

| [Section 508](#) Support |  alt="Yes" |

| Screen Reader Support |  alt="Yes" |

| Right-To-Left Support |  alt="Yes" |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

### ARIA attributes

Tab control is designed by considering [WAI-ARIA](#) standard. Tab is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices.

The following list of attributes are added in the Tab.

#### | Roles and Attributes | Functionalities |

| --- | --- |

| tablist | Attribute is set to the Tab header element that describes actual role of the element. |

| tab | Attribute is set to the Tab items element to indicates an interactive element inside a **tablist** that, when activated, displays its associated **tabpanel**. |

| tabpanel | Attribute is set to the Tab content that describes the role for viewing the active content. |

| aria-orientation | Attribute is set to the Tab header element indicates the Tab header orientation. Default value of this attribute is horizontal. |

| aria-selected | Attribute set to the Tab items to indicates the selection state for Tab items. Active Tab is set to true for this attribute. |

| aria-labelledby | Attribute is set to the Tab content element to indicates the associated Tab header for the content. |

| aria-controls | Attribute is set to the Tab items element to indicates the associated **tabpanel** for the header. |

| aria-haspopup | Attribute is set to the Popup element to indicates the popup mode in the Tab. The default value of this attribute is false. If popup mode is enabled, the attribute value is set to true. |

| aria-disabled | Attribute set to the Tab items to It indicates the disabled state of the Tab. |

### Keyboard interaction

By default, keyboard navigation is enabled. This control implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Tab element, you can use the following key combination for interacting with the Tab.

| Key   | Description |
|-------|-------------|
| ----- | -----       |

| Left | Moves focus to the previous Tab. If focus is on the first Tab, the focus will not move to any Tab. |

| Right | Moves focus to the next Tab. If focus is on the last Tab element, the focus will not move to any Tab. |

| Enter or Space | Selects the Tab if it is not selected. Opens the popup dropdown icon if it is focussed. Select the Tab item as active when popup item is focussed. |

| Esc(Escape) | Closes the popup if popup is in opened state. |

| Down or Up | When the popup is open and focused, it will move to previous/next Tab items of the popup in the vertical direction. |

| Home | Moves focus to the first Tab. |

| End | Moves focus to the last Tab. |

| Shift + F10 | If popup mode is enabled, it opens the popup when the Tab is focused. |

| Delete | Deletes the Tab, if close button is enabled in Tab header. |

| Tab | To Move focus through the interactive elements. |

| Shift + Tab | To Move focus through the interactive elements. |

### Ensuring accessibility

The Tab control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tab control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tab control with accessibility tools.

### CSS Structure

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

#### Customizing Tab

Use the following CSS to customize the Tab.

`CSS

```
.e-tab {
border: 5px solid rgb(173, 255, 47);
}
```

,

#### Customizing the Tab items

Use the following CSS to customize the header items of Tab.

`CSS

```
.e-tab .e-tab-header .e-toolbar-items {
background: #9faed8;
border: 2px solid blue;
}
```

,

Use the following CSS to customize the content items of Tab.

`CSS

```
.e-tab .e-content .e-item {
color: #a78515;
font-size: 14px;
}
```

,

#### Customizing Tab's header

Use the following CSS to customize the header of Tab control.

`CSS

```
.e-tab .e-tab-header {
background: #badfba !important;
}
```

,

#### Customizing Tab's header icon

Use the following CSS to customize the header item icon of Tab control.

`CSS

```
.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {
color: #badfba !important;
}
`
```

### Customizing Tab's content

Use the following CSS to customize the content of Tab control.

```
`CSS
.e-tab .e-content {
background: #d1f6d1 !important;
}
`
```

### Customizing the hover state of Tab control

Use the following CSS to customize the tab item when hovering.

```
`CSS
.e-tab .e-tab-header .e-toolbar-item .e-tab-wrap:hover {
background: #d1f6d1 !important;
}
`
```

Use the following CSS to customize the tab item popup icon when hovering.

```
`CSS
.e-tab .e-tab-header .e-hor-nav .e-popup-up-icon:hover,
.e-tab .e-tab-header .e-hor-nav .e-popup-down-icon:hover {
background: #d1f6d1 !important;
}
`
```

### Customizing selected item of Tab control

Use the following CSS to customize the selected tab item.

```
`CSS
.e-tab .e-tab-header .e-toolbar-item.e-active {
background: #d1f4d1;
}
`
```

Use the following CSS to customize the selected tab item text and icon.

```
`CSS
```

```
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-text,
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-icon {
color: green !important;
}
`
```

## How To

### Load content through Ajax

The Tab supports to load external contents through AJAX library. Refer to the following steps.

- Import the Ajax module from ej2-base and initialize with URL path.
- Get the data from Ajax Success event, then initialize the Tab with retrieved external path data.

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@Html.EJS().Tab("MainTab").Created("Created").Render()
<style>
 #container {
 visibility: hidden;
 }
 #loader {
 color: #008cff;
 height: 40px;
 left: 45%;
 position: absolute;
 top: 45%;
 width: 30%;
 }
 .e-content .e-item {
 font-size: 12px;
 margin: 10px;
 text-align: justify;
 }
</style>
<script>
 function Created() {
 var TabObj = document.getElementById("MainTab").ej2_instances[0];
 var ajax = new ej.base.Ajax('./network.html', 'GET', true);
 ajax.send().then();
 ajax.onSuccess = function (data) {
 TabObj.addTab([{ header: { 'text': 'Twitter' }, content: data }],
0);
 }
 }
</script>
```

### AJAX.CS

```
public IActionResult Index()
{
 return View();
}
```

```
}

```

## Prevent content swipe selection

### CSHTML

```
@using Syncfusion.EJ2.Navigations;
@ (Html.EJS().Tab("ej2Tab")
 .Items(new List<TabBarItem> {
 new TabBarItem { Header = ViewBag.headerTextOne, Content = "Twitter
is an online social networking service that enables users to send and read
short 140-character messages called tweets. Registered users can read and
post tweets, but those who are unregistered can only read them. Users access
Twitter through the website interface, SMS or mobile device app Twitter Inc.
is based in San Francisco and has more than 25 offices around the world.
Twitter was created in March 2006 by Jack Dorsey, Evan Williams, Biz Stone,
and Noah Glass and launched in July 2006. The service rapidly gained
worldwide popularity, with more than 100 million users posting 340 million
tweets a day in 2012.The service also handled 1.6 billion search queries per
day." },
 new TabBarItem { Header = ViewBag.headerTextTwo, Content = "Facebook
is an online social networking service headquartered in Menlo Park,
California. Its website was launched on February 4, 2004, by Mark Zuckerberg
with his Harvard College roommates and fellow students Eduardo Saverin,
Andrew McCollum, Dustin Moskovitz and Chris Hughes.The founders had
initially limited the website's membership to Harvard students, but later
expanded it to colleges in the Boston area, the Ivy League, and Stanford
University. It gradually added support for students at various other
universities and later to high-school students." },
 new TabBarItem { Header = ViewBag.headerTextThree, Content =
"WhatsApp Messenger is a proprietary cross-platform instant messaging client
for smartphones that operates under a subscription business model. It uses
the Internet to send text messages, images, video, user location and audio
media messages to other users using standard cellular mobile numbers. As of
February 2016, WhatsApp had a user base of up to one billion,[10] making it
the most globally popular messaging application. WhatsApp Inc., based in
Mountain View, California, was acquired by Facebook Inc. on February 19,
2014, for approximately US$19.3 billion." }
 })

 }
}
</script>

```

## SWIPE.CS

```

public ActionResult Index()
{
 ViewBag.headerTextOne = new TabHeader { Text = "Twitter" };
 ViewBag.headerTextTwo = new TabHeader { Text = "Facebook" };
 ViewBag.headerTextThree = new TabHeader { Text = "Whatsapp" };
 return View();
}

```

### Customize selected tab styles

You can customize the Tab style by overriding its header and active tab CSS classes. Define HTML string for adding animation and customizing the Tab header and pass it to [text](#) property. Now you can override the style using custom CSS classes added to the Tab elements.

## CSHTML

```

@using Syncfusion.EJ2.Navigations;
@(Html.EJS().Tab("ej2Tab")
 .Items(new List<TabBarItem> {
 new TabBarItem { Header = ViewBag.headerTextOne, Content = "Andrew received his BTS commercial in 1974 and a Ph.D. in international marketing from the University of Dallas in 1981.He is fluent in French and Italian and reads German.He joined the company as a sales representative, was promoted to sales manager in January 1992 and to vice president of sales in March 1993.Andrew is a member of the Sales Management Roundtable, the Seattle Chamber of Commerce, and the Pacific Rim Importers Association." },
 new TabBarItem { Header = ViewBag.headerTextTwo, Content = "Margaret holds a BA in English literature from Concordia College (1958) and an MA from the American Institute of Culinary Arts (1966).She was assigned to the London office temporarily from July through November 1992." },
 new TabBarItem { Header = ViewBag.headerTextThree, Content = "Janet has a BS degree in chemistry from Boston College (1984).She has also completed a certificate program in food retailing management.Janet was hired as a sales associate in 1991 and promoted to sales representative in February 1992." },
 })
 .HeightAdjustMode(HeightStyles.Auto)
 .OverflowMode(OverflowMode.Popup)
 .Render()
)
<style type="text/css">
#container {

 }
 100% {
 opacity: 1;
 }
}
</style>
```

### CUSTOMIZE.CS

```
public ActionResult Index()
{
 ViewBag.headerTextOne = new TabHeader { Text = "<div id=\"template-
wrap\"><div class='e-image e-andrew'></div><div class='e-title fade-
in'>Andrew</div></div>" };
 ViewBag.headerTextTwo = new TabHeader { Text = "<div id=\"template-
wrap\"><div class='e-image e-margaret'></div><div class='e-title fade-
in'>Margaret</div></div>" };
 ViewBag.headerTextThree = new TabHeader { Text = "<div id=\"template-
wrap\"><div class='e-image e-janet'></div><div class='e-title fade-
in'>Janet</div></div>" };
 return View();
}
```

Output be like the below.

### Create wizard using Tab

In the below Wizard sample, each Tab is integrated with required components to complete the reservation. Each field is provided with validation for all mandatory option to proceed to next tabs. Using Tab item's template property the components are added into content.

Create the following contents for each tab in the wizard.

#### 1. Search tab:

Created with [DropDownList] to select the source, destination and type of ticket. A [DatePicker] for choosing the date of journey.

#### 2. Train tab:

Based on the selected start and end point, populated Grid with random list of available seats and train list. Initially define the columns and row selected event for validating, after the source and destination chosen update the [dataSource] for the Grid.

#### 3. Passenger tab:

A table with Textbox, Numeric, DropDownList for adding passenger name, age, gender and preferred berth/seat. Add validation on entering passenger details to proceed.

#### 4. Payment tab:

Calculate the ticket cost based on location, passenger count and ticket type. Generate data for Grid with passenger details, train number and ticket cost summary.

You can go back on each tab using buttons available in it and tabs are disabled to navigate through tab header click actions. Once you end the wizard all the data get cleared and wizard goes back to starting tab.
