// Specify whether to print the DropDown field.
isPrint: true,
// Set the text to be displayed as a tooltip.
tooltip: 'DropDown',
// Set the thickness of the DropDown field. To hide the borders, set the value to 0 (zero).
thickness: 4,
// Set the value of the form field element.
value:'DropDown',
// Set the font family of the DropDown field.
fontFamily: 'Courier',
// Set the font size of the DropDown field.
fontSize: 10,
// Specify the font style
fontStyle: 'None',
// Set the font color of the DropDown field.
color: 'black',
// Set the border color of the DropDown field.
borderColor: 'black',
// Set the background color of the DropDown field.
backgroundColor: '#daeaf7ff',
// Set the alignment of the text.
alignment: 'Left',
// Set the DropDown items.
options: customOptions
}
};
</script>
```

Create form fields with UI interaction

The PDF viewer control provides the option for interaction with Form Fields such as Drag and resize. you can draw a Form Field dynamically by clicking the Form Field icon on the toolbar and draw it in the PDF document. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Enable or Disable form designer toolbar

We should inject FormDesigner module and set enableFormDesignerToolbar as true to enable the Form designer icon on the toolbar. By default, enableFormDesignerToolbar is set as true. Use the following code to inject FormDesigner module and to enable the enableFormDesignerToolbar property.

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableFormDesignerToolbar(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnableFormDesignerToolbar(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

Add the form field dynamically

Click the Form Field icon on the toolbar and then click on to the PDF document to draw a Form Field. Refer the below GIF for further reference.

1. Name:
First Name Middle Name Last Name

2. Gender: ☐ Male ☐ Female

3. Date of Birth:
MM DD YY

4. Initial Below:

I DO Agree Initial

I DO NOT Agree Initial

Drag the form field

We provide options to drag the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.

1. Name:
First Name Middle Name Last Name

2. Gender: ☐ Male ☐ Female

3. Date of Birth:
MM DD YY

4. Initial Below:

I DO Agree Initial

I DO NOT Agree Initial

Resize the form field

We provide options to resize the Form Field which is currently selected in the PDF document. Refer the below GIF for further reference.

1 of 1

Submit Form

Add and Edit Form Fields

Workshop

Geek Out Day!

1. Name:

First Name Middle Name Last Name

2. Gender:

☐ Male ☐ Female

3. Date of Birth:

MM DD YY

4. Initial Below:

I DO Agree

I DO NOT Agree

Edit or Update the form field dynamically

The properties of the Form Fields can be edited using the Form Field Properties window. It can be opened by selecting the Properties option in the context menu that appears on the right by clicking the Form Field object. Refer the below image for the properties available to customize the appearance of the Form Field.

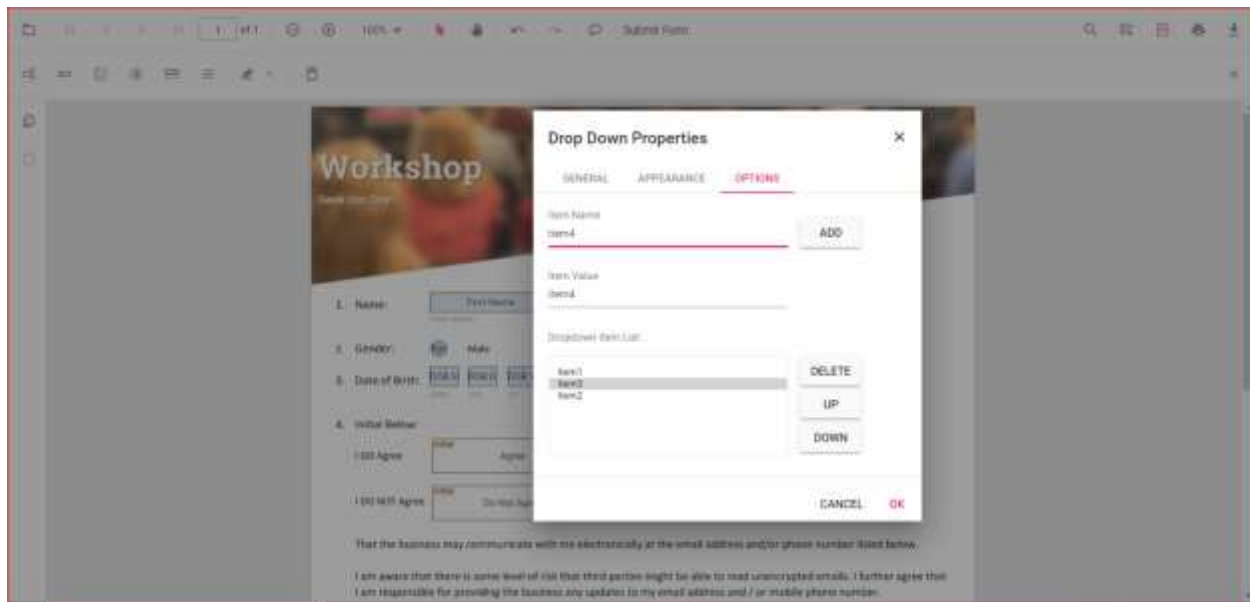

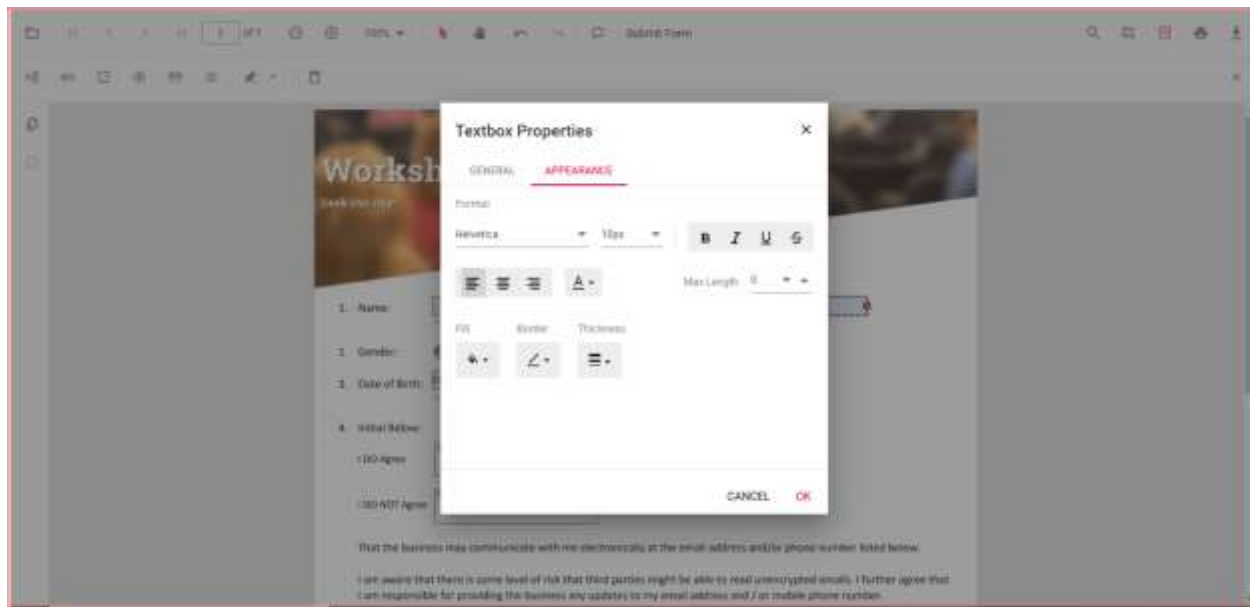

The screenshot shows a web browser window with a 'Textbox Properties' dialog box open. The dialog box has two tabs: 'GENERAL' and 'APPEARANCE'. The 'GENERAL' tab is active, showing the following fields:

- Name:** Surname
- Left Name:** (empty)
- Value:** (empty)
- Form Field Width:** width

At the bottom of the dialog, there are three checkboxes:

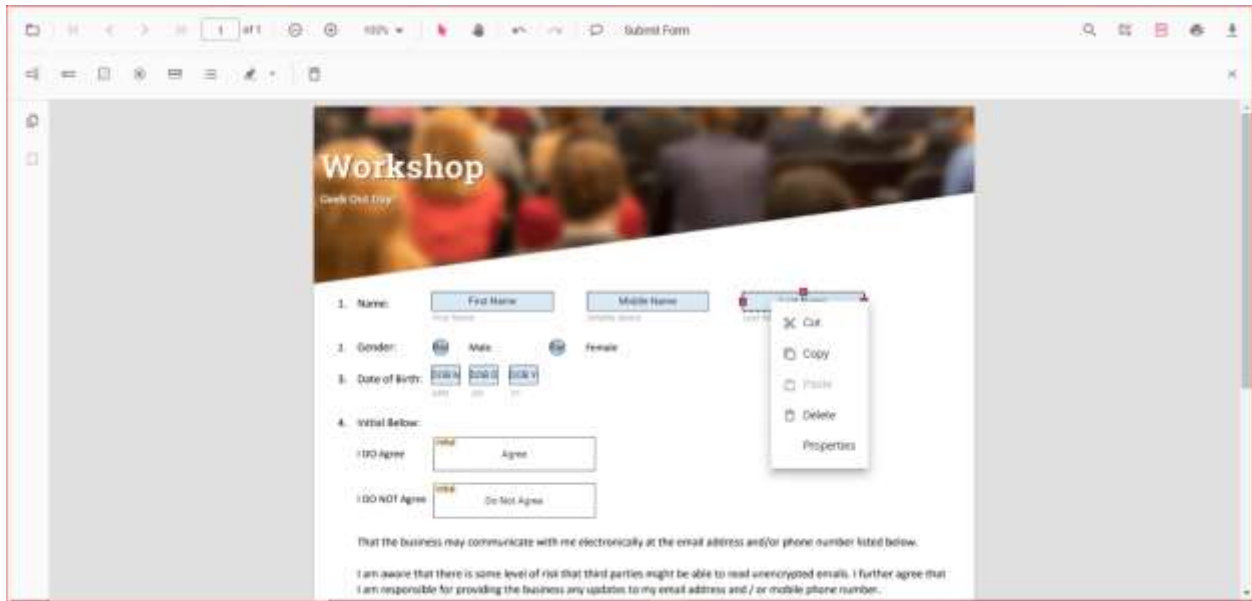

- ☐ Read Only
- ☐ Required
- ☒ Show Printing

The 'OK' button is highlighted in red.

Clipboard operation with form field

The PDF Viewer control supports the clipboard operations such as cut, copy and paste for Form Fields. You can right click on the Form Field object to view the context menu and select to the clipboard options that you would like to perform. Refer the below image for the options in the context menu.

Undo and Redo

We provided support to undo/redo the Form Field actions that are performed at runtime. Use the following code example to perform undo/redo actions.

STANDALONE

```

<<<html
<button id="undo">Undo</button>
<button id="redo">Redo</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
document.getElementById('undo').addEventListener('click', function () {
var pdfviewer = document.getElementById("pdfviewer").ej2_instances[0];
pdfviewer.undo();
});
document.getElementById('redo').addEventListener('click', function () {
var pdfviewer = document.getElementById("pdfviewer").ej2_instances[0];
pdfviewer.redo();
});
</script>
>>>
  
```

SERVER-BACKED

```

<<<html
<button id="undo">Undo</button>
<button id="redo">Redo</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/hi
ve-succinctly.pdf").Render()
</div>
<script>
  
```

```
document.getElementById('undo').addEventListener('click', function () {
    var pdfviewer = document.getElementById("pdfviewer").ej2_instances[0];
    pdfviewer.undo();
});
document.getElementById('redo').addEventListener('click', function () {
    var pdfviewer = document.getElementById("pdfviewer").ej2_instances[0];
    pdfviewer.redo();
});
</script>
```

```

## Print

The PDF Viewer supports printing the loaded PDF file. You can enable/disable the print using the following code snippet.

### STANDALONE

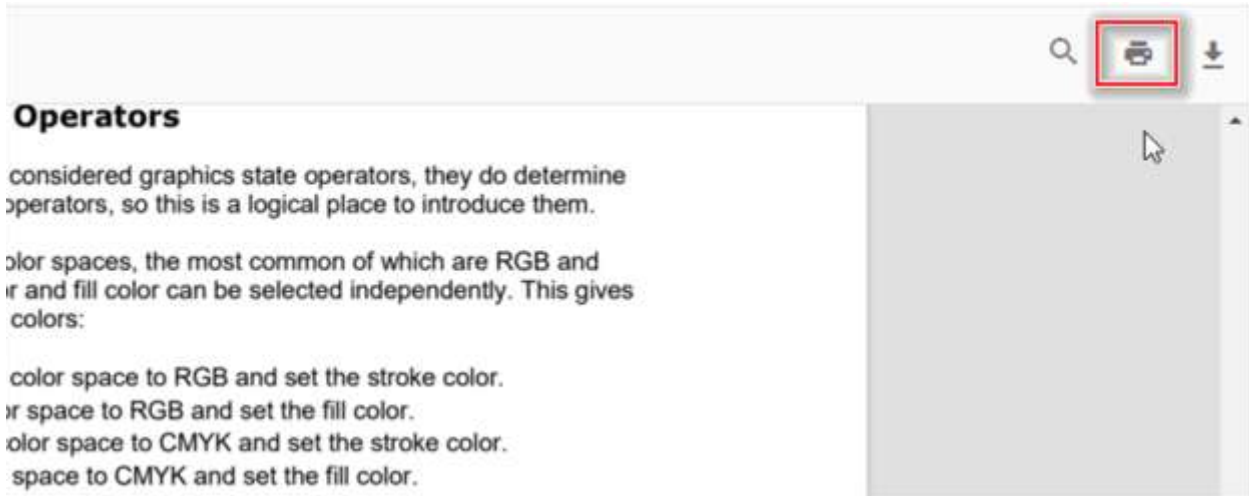

```
```html
<div style="width:100%;height:600px">
    @Html.EJS().PdfViewer("pdfviewer").EnablePrint(true).DocumentLoad("print").DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function print() {
    var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
    pdfViewer.print.print();
}
</script>
```

```

### SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnablePrint(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function print() {
    var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
    pdfViewer.print.print();
}
</script>
```

```

## Download a PDF document in PDF Viewer component

The PDF Viewer supports downloading the loaded PDF file. You can enable/disable the download using the following code snippet.

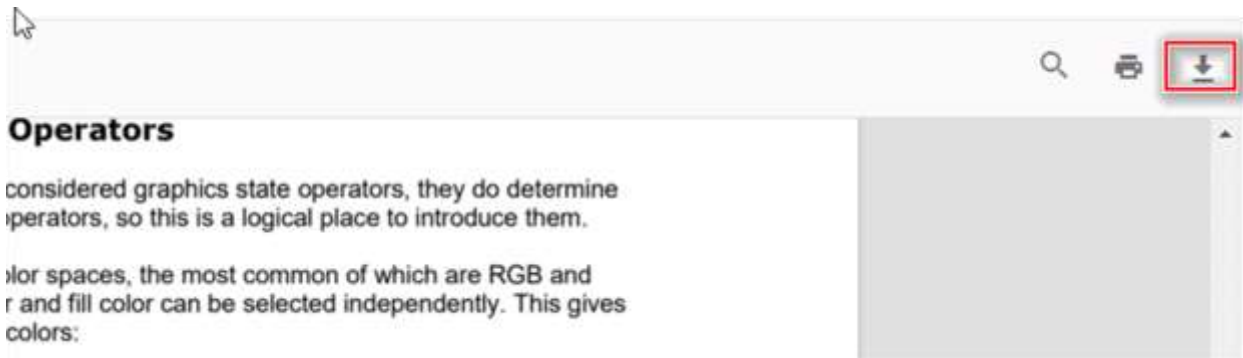

### STANDALONE

```
```html
<div style="width:100%;height:600px">
  @Html.EJS().PdfViewer("pdfviewer").DocumentLoad("download").EnableDownload(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function download() {
  var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
  pdfViewer.download();
}
</script>
```
```

### SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
  @Html.EJS().PdfViewer("pdfviewer").DocumentLoad("download")..ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnableDownload(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function download() {
  var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
  pdfViewer.download();
}
```
```

```
</script>
```

## Localization

The text contents provided in the PDF Viewer can be localized using the collection of localized strings for different cultures. By default, the PDF Viewer is localized in “**en-US**”.

The following table shows the default text values used in Syncfusion PDF Viewer in 'en-US' culture:

| Keywords               | Values                                                        |
|------------------------|---------------------------------------------------------------|
| ---                    | ---                                                           |
| PdfViewer              | PDF Viewer                                                    |
| Cancel                 | Cancel                                                        |
| Download file          | Download file                                                 |
| Download               | Download                                                      |
| Enter Password         | This document is password protected. Please enter a password. |
| File Corrupted         | File corrupted                                                |
| File Corrupted Content | The file is corrupted and cannot be opened.                   |
| Fit Page               | Fit page                                                      |
| Fit Width              | Fit width                                                     |
| Automatic              | Automatic                                                     |
| Go To First Page       | Show first page                                               |
| Invalid Password       | Incorrect password. Please try again.                         |
| Next Page              | Show next page                                                |
| OK                     | OK                                                            |
| Open                   | Open file                                                     |

|Page Number|Current page number|  
|Previous Page|Show previous page|  
|Go To Last Page|Show last page|  
|Zoom|Zoom|  
|Zoom In|Zoom in|  
|Zoom Out|Zoom out|  
|Page Thumbnails|Page thumbnails|  
|Bookmarks|Bookmarks|  
|Print|Print file|  
|Password Protected|Password required|  
|Copy|Copy|

|Server error|Web-service is not listening. PDF Viewer depends on web-service for all it's features.  
Please start the web service to continue.|

|Open text|Open|

|First text|First Page|

|Previous text|Previous Page|

|Next text|Next Page|

|Last text|Last Page|

|Zoom in text|Zoom In|

|Zoom out text|Zoom Out|

|Selection text|Selection|

|Pan text|Pan|

|Print text|Print|

|Search text|Search|

|Annotation Edit text|Edit Annotation|

The different locale value for the PDF Viewer can be specified using the locale property.

### **STANDALONE**

```

`html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").Locale("ar-
AE").DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
`

```

### **SERVER-BACKED**

```

`html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).Locale("ar-
AE").DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
`

```

You have to map the text content based on locale like the following script in sample level.,

```

`html
<script>
ej.base.L10n.load({
'ar-AE': {
'PdfViewer': {

```

'PdfViewer': 'قوات الدفاع الشعبي المشاهد',  
'Cancel': 'إلغاء',  
'Download file': 'تحميل الملف',  
'Download': 'تحميل',  
'Enter Password': 'هذا المستند محمي بكلمة مرور. يرجى إدخال كلمة مرور',  
'File Corrupted': 'ملف تالف',  
'File Corrupted Content': 'الملف تالف ولا يمكن فتحه',  
'Fit Page': 'لائق بدنيا الصفحة',  
'Fit Width': 'لائق بدنيا عرض',  
'Automatic': 'تلقائي',  
'Go To First Page': 'عرض الصفحة الأولى',  
'Invalid Password': 'كلمة سر خاطئة. حاول مرة أخرى',  
'Next Page': 'عرض الصفحة التالية',  
'OK': 'حسنًا',  
'Open': 'افتح الملف',  
'Page Number': 'رقم الصفحة الحالية',  
'Previous Page': 'عرض الصفحة السابقة',  
'Go To Last Page': 'عرض الصفحة الأخيرة',  
'Zoom': 'تكبير',  
'Zoom In': 'تكبير في',  
'Zoom Out': 'تكبير خارج',  
'Page Thumbnails': 'مصغرات الصفحة',  
'Bookmarks': 'المرجعية',  
'Print': 'اطبع الملف',  
'Password Protected': 'كلمة المرور مطلوبة',  
'Copy': 'نسخ',  
'Text Selection': 'أداة اختيار النص',  
'Panning': 'وضع عموم',  
'Text Search': 'بحث عن نص',  
'Find in document': 'ابحث في المستند',  
'Match case': 'حالة مباراة',  
'Apply': 'تطبيق',  
'GoToPage': 'انتقل إلى صفحة'

```
// tslint:disable-next-line:max-line-length
'No matches': 'انتهى العارض من البحث في المستند. لم يتم العثور على مزيد من التطابقات',
'No Text Found': 'لم يتم العثور على نص',
// tslint:disable-next-line:max-line-length
'Undo': 'فك',
'Redo': 'فعل ثانية',
'Annotation': 'إضافة أو تعديل التعليقات التوضيحية',
'Highlight': 'تسليط الضوء على النص',
'Underline': 'تسطير النص',
'Strikethrough': 'نص يتوسطه خط',
>Delete': 'حذف التعليق التوضيحي',
'Opacity': 'غموض',
'Color edit': 'غير اللون',
'Opacity edit': 'تغيير التعقيم',
'Highlight context': 'تسليط الضوء',
'Underline context': 'أكد',
'Strikethrough context': 'يتوسطه',
// tslint:disable-next-line:max-line-length
'Server error': 'خدمة الانترنت لا يستمع. يعتمد قوات الدفاع الشعبي المشاهد على خدمة الويب لجميع ميزاته. يرجى بدء خدمة',
'Open text': 'افتح',
'First text': 'الصفحة الأولى',
'Previous text': 'الصفحة السابقة',
'Next text': 'الصفحة التالية',
'Last text': 'آخر صفحة',
'Zoom in text': 'تكبير',
'Zoom out text': 'تصغير',
'Selection text': 'اختيار',
'Pan text': 'مقالة',
'Print text': 'طباعة',
'Search text': 'بحث',
'Annotation Edit text': 'تحرير التعليق التوضيحي'
}
```

```

}
});
</script>
`

```

### Server Actions with ASP.NET MVC PDFViewer Control

Syncfusion PDF Viewer control is client-server oriented. It processes the PDF document on the server-side and sends the processed PDF data to the client to render the PDF document and for further operations in the PDF Viewer.

The server actions or server methods in the MVC PDF Viewer controller are:

- Load
- RenderPdfPages
- RenderThumbnailImages
- Bookmarks
- RenderAnnotationComments
- Unload
- ExportAnnotations
- ImportAnnotations
- ImportFormFields
- ExportFormFields
- Download
- PrintImages

#### Load action

**Note:** public ActionResult Load(jsonObjects jsonObject)

The [Load](#) action will be triggered initially on loading a PDF file. Syncfusion PDF Viewer control will store the document in the cache based on the hashid during the initial loading of the pdf file. Initially, the request will be sent for 100 pages only and another request will be sent for the remaining pages. So the Load action will get triggered twice when loading a PDF file with pages more than 100, which is called virtual loading.

This action on its first trigger calls the GetDocumentPath method in the PdfViewerController.cs with which the path of the document is determined. The PDF file to be loaded must be located in the folder structure as specified in the GetDocumentPath method.

The Load action calls the [Load](#) method to load the PDF file in the PDF Viewer.

```

`cs
[System.Web.Mvc.HttpPost]
public ActionResult Load(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 MemoryStream stream = new MemoryStream();
 var jsonData = JsonConvert(jsonObject);

```

```
object jsonResult = new object();
if (jsonObject != null && jsonData.ContainsKey("document"))
{
 if (bool.Parse(jsonData["isFileName"]))
 {
 string documentPath = GetDocumentPath(jsonData["document"]);
 if (!string.IsNullOrEmpty(documentPath))
 {
 byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
 stream = new MemoryStream(bytes);
 }
 else
 {
 string fileName = jsonData["document"].Split(new string[] { "://" }, StringSplitOptions.None)[0];
 if (fileName == "http" || fileName == "https")
 {
 var WebClient = new WebClient();
 byte[] pdfDoc = WebClient.DownloadData(jsonData["document"]);
 stream = new MemoryStream(pdfDoc);
 }
 else
 {
 return this.Content(jsonData["document"] + " is not found");
 }
 }
 }
 else
 {
 byte[] bytes = Convert.FromBase64String(jsonData["document"]);
 stream = new MemoryStream(bytes);
 }
}
jsonResult = pdfviewer.Load(stream, jsonData);
```

```
return Content(JsonConvert.SerializeObject(jsonResult));
}
`cs
```

### RenderPdfPages

**Note:** public ActionResult RenderPdfPages(jsonObjects jsonObject)

Whenever a new page is loaded, [RenderPdfPages](#) action will be called. When a PDF file is loaded with PDF Viewer, only two pages will be loaded initially by hitting this action for loading each page. Further pages will be loaded on demand by hitting this action.

The RenderPdfPages action calls the [GetPage](#) method to render each PDF pages.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult RenderPdfPages(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 object jsonResult = pdfviewer.GetPage(jsonData);
 return Content(JsonConvert.SerializeObject(jsonResult));
}
`cs
```

### RenderThumbnailImages action

**Note:** public ActionResult RenderThumbnailImages(jsonObjects jsonObject)

The [RenderThumbnailImages](#) action will be triggered initially on loading a PDF file. It renders the thumbnails images of all the pages in the PDF file. When a thumbnail image is clicked, the RenderPdfPages action will be triggered to load the selected page.

This action calls the [GetThumbnailImages](#) method.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult RenderThumbnailImages(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 object result = pdfviewer.GetThumbnailImages(jsonData);
 return Content(JsonConvert.SerializeObject(result));
}
`cs
```

### Bookmarks

**Note:** public ActionResult Bookmarks(jsonObjects jsonObject)

The Bookmarks action will be triggered initially on loading a PDF file. All the headings in the PDF file will get added to the Bookmarks collection in the bookmarks panel with the help of this action. When a bookmark is selected, the page containing the selected heading will be rendered or opened.

This action calls the [GetBookmarks](#) method.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult Bookmarks(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 object jsonResult = pdfviewer.GetBookmarks(jsonData);
 return Content(JsonConvert.SerializeObject(jsonResult));
}
`
```

### RenderAnnotationComments

**Note:** public ActionResult RenderAnnotationComments(jsonObjects jsonObject)

The [RenderAnnotationComments](#) action will be triggered initially on loading a PDF file.

It calls the [GetAnnotationComments](#) method to retrieve the annotation comments in the PDF file.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult RenderAnnotationComments(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 object jsonResult = pdfviewer.GetAnnotationComments(jsonData);
 return Content(JsonConvert.SerializeObject(jsonResult));
}
`
```

### Unload action

**Note:** public ActionResult Unload(jsonObjects jsonObject)

The [Unload](#) action will be triggered on unloading a PDF file by closing or refreshing the browser.

This action calls the [ClearCache](#) method to clear the cache objects while closing the PDF Viewer.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult Unload(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 pdfviewer.ClearCache(jsonData);
 return this.Content("Document cache is cleared");
}
`
```

#### [ExportAnnotations action](#)

**Note:** public ActionResult ExportAnnotations(jsonObjects jsonObject)

The [ExportAnnotations](#) action will be triggered by clicking either the “Export annotation to JSON file” option or the “Export annotation to XFDF file” option in the annotation toolbar.

This action calls the [ExportAnnotation](#) method to export the annotations in the PDF Viewer to a JSON file or an XFDF file.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult ExportAnnotations(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 string jsonResult = pdfviewer.ExportAnnotation(jsonData);
 return Content((jsonResult));
}
`
```

#### [ImportAnnotations](#)

**Note:** public ActionResult ImportAnnotations(jsonObjects jsonObject)

The [ImportAnnotations](#) action will be triggered by clicking the “Import annotation from XFDF file” option in the annotation toolbar.

This action calls the [ImportAnnotation](#) method to import the annotations from an XFDF file.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult ImportAnnotations(jsonObjects jsonObject)
```

```

{
PdfRenderer pdfviewer = new PdfRenderer();
string jsonResult = string.Empty;
var jsonData = JsonConvert.DeserializeObject(jsonObject);
if (jsonObject != null && jsonData.ContainsKey("fileName"))
{
string documentPath = GetDocumentPath(jsonData["fileName"]);
if (!string.IsNullOrEmpty(documentPath))
{
jsonResult = System.IO.File.ReadAllText(documentPath);
}
else
{
return this.Content(jsonData["document"] + " is not found");
}
}
return Content(JsonConvert.SerializeObject(jsonResult));
}

```

#### ImportFormFields action

**Note:** public ActionResult ImportFormFields(jsonObjects jsonObject)

The [ImportFormFields](#) action will be triggered by calling it from the UI code.

This action calls the [ImportFormFields](#) method to import the form fields into the PDF Viewer from a JSON object or file.

```

`cs
[System.Web.Mvc.HttpPost]
public ActionResult ImportFormFields(jsonObjects jsonObject)
{
PdfRenderer pdfviewer = new PdfRenderer();
var jsonData = JsonConvert.DeserializeObject(jsonObject);
object jsonResult = pdfviewer.ImportFormFields(jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}

```

### ExportFormFields action

**Note:** public ActionResult ExportFormFields(jsonObjects jsonObject)

The [ExportFormFields](#) action will be triggered by clicking the Submit Form option in the PDF Viewer toolbar. The Submit Form option is enabled only when there are form fields. It exports the form fields into a JSON file.

This action calls the [ExportFormFields](#) method to export the form fields into a JSON string.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult ExportFormFields(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 string jsonResult = pdfviewer.ExportFormFields(jsonData);
 return Content(jsonResult);
}
```

### Download action

**Note:** public ActionResult Download(jsonObjects jsonObject)

The [Download](#) action will be triggered by clicking the Download option in the PDF Viewer toolbar to download the PDF file.

This action calls the [GetDocumentAsBase64](#) method to get the PDF file as a base64 string.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult Download(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
 return Content(documentBase);
}
```

### PrintImages

**Note:** public ActionResult PrintImages(jsonObjects jsonObject)

The [PrintImages](#) action will be triggered by clicking the Print option in the PDF Viewer toolbar.

It calls the [GetPrintImage](#) method multiple times to get each page in the PDF file as images to print the entire file.

```
`cs
[System.Web.Mvc.HttpPost]
public ActionResult PrintImages(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConverter(jsonObject);
 object pageImage = pdfviewer.GetPrintImage(jsonData);
 return Content(JsonConvert.SerializeObject(pageImage));
}
`
```

#### Other methods

##### [GetDocumentPath](#)

**Note:** private string GetDocumentPath(string document)

The GetDocumentPath method will be called inside the Load method to get the path of the document to be loaded.

```
`cs
private string GetDocumentPath(string document)
{
 string documentPath = string.Empty;
 if (!System.IO.File.Exists(document))
 {
 var path = HttpContext.Request.PhysicalApplicationPath;
 if (System.IO.File.Exists(path + "/App_Data/" + document))
 documentPath = path + "/App_Data/" + document;
 }
 else
 {
 documentPath = document;
 }
 return documentPath;
}
`
```

*JsonConverter method*

**Note:** public Dictionary<string, string> JsonConverter(jsonObjects results)

The JsonConverter method will be called by other server action methods to convert the jsonObjects into JSON data of type Dictionary<string, string>.

```
`cs
public Dictionary<string, string> JsonConverter(jsonObjects results)
{
 Dictionary<string, object> resultObjects = new Dictionary<string, object>();
 resultObjects = results.GetType().GetProperties(BindingFlags.Instance |
 BindingFlags.Public).ToDictionary(prop => prop.Name, prop => prop.GetValue(results, null));
 var emptyObjects = (from kv in resultObjects
 where kv.Value != null
 select kv).ToDictionary(kv => kv.Key, kv => kv.Value);
 Dictionary<string, string> jsonResult = emptyObjects.ToDictionary(k => k.Key, k => k.Value.ToString());
 return jsonResult;
}
`
```

*GetPlainText method*

**Note:** private HttpResponseMessage GetPlainText(string pageImage)

The GetPlainText method will be useful when you want to perform a server action without downloading the action result in the browser. This method just provides the status of the action result as a HttpResponseMessage by preventing the file download.

```
`cs
private HttpResponseMessage GetPlainText(string pageImage)
{
 var responseText = new HttpResponseMessage(HttpStatusCode.OK);
 responseText.Content = new StringContent(pageImage, System.Text.Encoding.UTF8, "text/plain");
 return responseText;
}
`
```

*jsonObjects class*

The jsonObjects used as the parameter in each method is a class with various properties needed for different features in the PDF Viewer. This class must be defined in the PdfViewerController to perform all the above actions.

```
`cs
public class jsonObjects
```

```
{
public string document { get; set; }
public string password { get; set; }
public string zoomFactor { get; set; }
public string isFileName { get; set; }
public string xCoordinate { get; set; }
public string yCoordinate { get; set; }
public string pageNumber { get; set; }
public string documentId { get; set; }
public string hashId { get; set; }
public string sizeX { get; set; }
public string sizeY { get; set; }
public string startPage { get; set; }
public string endPage { get; set; }
public string stampAnnotations { get; set; }
public string textMarkupAnnotations { get; set; }
public string stickyNotesAnnotation { get; set; }
public string shapeAnnotations { get; set; }
public string measureShapeAnnotations { get; set; }
public string action { get; set; }
public string pageStartIndex { get; set; }
public string pageEndIndex { get; set; }
public string fileName { get; set; }
public string elementId { get; set; }
public string pdfAnnotation { get; set; }
public string importPageList { get; set; }
public string uniqueId { get; set; }
public string data { get; set; }
public string viewPortWidth { get; set; }
public string viewportHeight { get; set; }
public string tilecount { get; set; }
public string freeTextAnnotation { get; set; }
public string signatureData { get; set; }
```

```

public string fieldsData { get; set; }
public string FormDesigner { get; set; }
public string inkSignatureData { get; set; }
public string tileXCount { get; set; }
public string tileYCount { get; set; }
public string digitalSignaturePageList { get; set; }
public string annotationCollection { get; set; }
public string annotationsPageList { get; set; }
public string formFieldsPageList { get; set; }
public string documentLiveCount { get; set; }
public string annotationDataFormat { get; set; }
public bool isCompletePageSizeNotReceived { get; set; }
public bool hideEmptyDigitalSignatureFields { get; set; }
public bool showDigitalSignatureAppearance { get; set; }
public bool digitalSignaturePresent { get; set; }
public bool isAnnotationsExist { get; set; }
public bool isFormFieldAnnotationsExist { get; set; }
}

```

## How To

### Customize the toolbar

The PDF Viewer provides API for user interactions options provided in it's built-in toolbar. Using this we can create our own User Interface for toolbar actions in application level by hiding the default toolbar. The following steps are used to create the custom toolbar for PDF Viewer,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Add EJ2 Toolbar for perform primary actions like Open, Previous page, Next page, Go to page, Print and Download using the following code snippet,

```
`html
```

```
@using Syncfusion.EJ2.Navigations;
```

```
@Html.EJS().Toolbar("topToolbar").Height("56px").Items(new List<ToolbarItem> {
 new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-open-document-icon", TooltipText =
"Open", Align=ItemAlign.Left, Click="openFile"},
 new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-previous-page-navigation-
icon", TooltipText = "Previous Page", Align=ItemAlign.Center, Click="previousClicked", Id="previousPage"},

```

```

new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-next-page-navigation-icon", TooltipText =
"Next Page",Align=ItemAlign.Center,Click="nextClicked",Id="nextPage"},

new ToolbarItem {Template="<div class='><input type='text' class='e-input-group e-pv-current-page-
number' id='currentPage'/></div>" ,PrefixIcon = "e-pv-next-page-navigation-icon", TooltipText = "Page
Number",Align=ItemAlign.Center},

new ToolbarItem { Type = ItemType.Input, Template="<div class='><span class='e-pv-total-page-
number' id='totalPage'>of 0</div>" , PrefixIcon = "e-pv-next-page-navigation-icon", TooltipText
= "Page Number",Click="currentPageClicked" ,Align=ItemAlign.Center},

new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-print-document-icon" ,TooltipText =
"Print",Align=ItemAlign.Right,Click="printClicked"},

new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-download-document-icon" ,TooltipText =
"Download",Align=ItemAlign.Right,Click="downloadClicked"},

}).Render()

<input type="file" id="fileUpload" accept=".pdf"
style="display:block;visibility:hidden;width:0;height:0;">

```

**Step 3:** Hide the default toolbar of PDF Viewer using below code snippet,

#### **STANDALONE**

```

`html
@Html.EJS().PdfViewer("pdfviewer")
.EnableToolbar(false).EnableThumbnail(false)
.DocumentLoad("documentLoaded").PageChange("pageChanged")
.DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
`

```

#### **SERVER-BACKED**

```

`html
@Html.EJS().PdfViewer("pdfviewer")
.ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/"))
.EnableToolbar(false).EnableThumbnail(false)
.DocumentLoad("documentLoaded").PageChange("pageChanged")
.DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
`

```

**Step 4:** Add EJ2 Toolbar for perform magnification actions in PDF Viewer using following code snippet,

```

`html

@Html.EJS().Toolbar("magnificationToolbar").Items(new List<ToolbarItem> {

new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-fit-page", TooltipText = "Fit to
page",Click="pageFitClicked"},

```

```

new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-zoom-in-icon", TooltipText = "Zoom
in", Click = "zoomInClicked" },
new ToolbarItem { Type = ItemType.Button, PrefixIcon = "e-pv-zoom-out-icon", TooltipText = "Zoom
out", Click = "zoomOutClicked" },
}).Render()
,

```

**Step 5:** Add the following style to achieve the custom toolbar styling,

```

`html
<style>
pdfviewer {
display: block;
height: 641px;
}
magnificationToolbar {
background: transparent;
height: auto;
width: 200px;
position: absolute;
z-index: 1001;
top: calc(100% - 110px);
left: calc(100% - 120px);
transform: rotate(90deg);
border-width: 0px;
}
.e-pv-zoom-out-icon {
transform: rotate(-90deg);
}
.material .e-pv-current-page-number {
border-width: 1px;
}
div#magnificationToolbar.e-toolbar .e-toolbar-items {
background: transparent;
}
magnificationToolbar.e-toolbar .e-tbar-btn {
border-radius: 50%;

```

```
min-height: 30px;
min-width: 30px;
}
topToolbar {
top: 0px;
z-index: 1001;
}
.e-pv-current-page-number {
width: 46px;
height: 28px;
text-align: center;
}
.e-icons {
font-family: "e-icons";
font-style: normal;
font-variant: normal;
font-weight: normal;
line-height: 1;
text-transform: none;
}
.e-pv-icon::before {
font-family: 'e-icons';
}
.e-pv-icon-search::before {
font-family: 'e-icons';
font-size: 12px;
}
.e-pv-download-document-icon::before {
content: '\e914';
}
.e-pv-print-document-icon::before {
content: '\e917';
}
```

```
.e-pv-previous-page-navigation-icon::before {
content: '\e910';
}
```

```
.e-pv-next-page-navigation-icon::before {
content: '\e911';
}
```

```
.e-pv-zoom-out-icon::before {
content: '\e912';
}
```

```
.e-pv-zoom-in-icon::before {
content: '\e91d';
}
```

```
.e-pv-fit-page::before {
content: '\e91b';
}
```

```
.e-pv-open-document-icon::before {
content: '\e91c';
}
```

```
@font-face {
font-family: "e-icons";
font-style: normal;
font-weight: normal;
```

```

}
</style>
`

```

**Note:** The icons are embedded in the font file used in above code snippet.

**Step 6:** Add the following scripts for performing user interaction in PDF Viewer in code behind

```

`html
<script type="text/javascript">
var currentPageBox;
var matchCase = false;
var filename;
window.onload = function () {
currentPageBox = document.getElementById('currentPage');
currentPageBox.value = '1';

```

```
document.getElementById('fileUpload').addEventListener('change', readFile, false);
currentPageBox.addEventListener('keypress', () => {
 var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
 var currentPage = document.getElementById('currentPage');
 if ((event.which < 48 || event.which > 57) && event.which !== 8 && event.which !== 13) {
 event.preventDefault();
 return false;
 }
 else {
 var currentPageNumber = parseInt((currentPage).value);
 if (event.which === 13) {
 if (currentPageNumber > 0 && currentPageNumber <= pdfViewer.pageCount) {
 pdfViewer.navigation.goToPage(currentPageNumber);
 } else {
 (currentPage).value = pdfViewer.currentPageNumber.toString();
 }
 }
 return true;
 }
});
function openFile() {
 document.getElementById('fileUpload').click();
}
function readFile(evt) {
 var uploadedFiles = evt.target.files;
 var uploadedFile = uploadedFiles[0];
 filename = uploadedFiles[0].name;
 var reader = new FileReader();
 reader.readAsDataURL(uploadedFile);
 reader.onload = function () {
 var obj = document.getElementById('pdfviewer').ej2_instances[0];
 var uploadedFileUrl = this.result;
```

```
obj.load(uploadedFileUrl, null);
obj.fileName = filename;
var currentPageBox = document.getElementById('currentPage');
currentPageBox.value = '1';
var pageCount = document.getElementById('totalPage');
pageCount.textContent = 'of ' + obj.pageCount;
}
}
function previousClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.navigation.goToPreviousPage();
}
function nextClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.navigation.goToNextPage();
}
function printClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.print.print();
}
function downloadClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.download();
}
function pageFitClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.magnification.fitToPage();
}
function zoomInClicked() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.magnification.zoomIn();
}
function zoomOutClicked() {
```

```
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.magnification.zoomOut();
}

### Exporting PDFs as raster images

The PDF Viewer server library allows the PDF document pages to be exported as raster images. Exporting can be done using the `ExportAsImage()` method. This option helps to convert a PDF into an image. The APIs available to export the PDF document pages as images are listed as follows:

#### *ExportAsImage(int pageIndex)*

Exports the specified page as image using the Pdfium rendering engine.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap bitmapimage = pdfExportImage.ExportAsImage(0);
//Save the exported image in disk
bitmapimage.Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
`

```

#### *ExportAsImage(int pageIndex, float dpiX, float dpiY)*

Exports the specified page as image with respect to the specified DPI values.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap bitmapimage = pdfExportImage.ExportAsImage(0, 200, 200);
//Save the exported image in disk
bitmapimage.Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
`

```

*ExportAsImage(int pageIndex, SizeF customSize, bool keepAspectRatio)*

Exports the specified page as image with respect to the specified custom size.

```
`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap bitmapimage = pdfExportImage.ExportAsImage(0, new SizeF(200, 300), true);
//Save the exported image in disk
bitmapimage.Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
`
```

*ExportAsImage(int pageIndex, SizeF customSize, float dpiX, float dpiY, bool keepAspectRatio)*

Exports the specified page as image with respect to the custom size and the specified DPI values.

```
`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap bitmapimage = pdfExportImage.ExportAsImage(0, new SizeF(200, 300), 200, 200, true);
//Save the exported image in disk
bitmapimage.Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
`
```

*ExportAsImage(int startIndex, int endIndex)*

Exports the specified pages as images using the Pdfium rendering engine.

```
`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap[] bitmapimage = pdfExportImage.ExportAsImage(0, pdfExportImage.PageCount-1);
`
```

```

for (int i =0; i < pdfExportImage.PageCount; i++)
{
// Save the exported image in disk
bitmapimage[i].Save(@"currentDirectory/../../../../../Images/" + "bitmapImage.png");
}
`

```

*ExportAsImage(int startIndex, int endIndex, float dpiX, float dpiY)*

Exports the specified pages as images with respect to the specified DPI values.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../../../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap[] bitmapimage = pdfExportImage.ExportAsImage(0, pdfExportImage.PageCount-1, 200, 200);
for (int i =0; i < pdfExportImage.PageCount; i++)
{
//Save the exported image in disk
bitmapimage[i].Save(@"currentDirectory/../../../../../Images/" + "bitmapImage.png");
}
`

```

*ExportAsImage(int startIndex, int endIndex, SizeF customSize, bool keepAspectRatio)*

Exports the specified pages as images with respect to the specified custom size.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../../../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap[] bitmapimage = pdfExportImage.ExportAsImage(0, pdfExportImage.PageCount-1, new
SizeF(200, 300), false);
for (int i =0; i < pdfExportImage.PageCount; i++)
{
//Save the exported image in disk

```

```

bitmapimage[i].Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
}
`

```

*ExportAsImage(int startIndex, int endIndex, SizeF customSize, float dpiX, float dpiY, bool keepAspectRatio)*

Exports the specified pages as images with respect to the custom size and the specified DPI values.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExportImage = new PdfRenderer();
//Loads the PDF document
pdfExportImage.Load(@"currentDirectory/../../Data/HTTP Succinctly.pdf");
//Exports the PDF document pages into images
Bitmap[] bitmapimage = pdfExportImage.ExportAsImage(0, pdfExportImage.PageCount-1, new
SizeF(200, 300),200,200,false);
for (int i = 0; i < pdfExportImage.PageCount; i++)
{
//Save the exported image in disk
bitmapimage[i].Save(@"currentDirectory/../../Images/" + "bitmapImage.png");
}
`

```

**Note:** Ensure the provided document path and output image saved locations in your application level.

#### Extract Text from PDF document

The PDF Viewer server library allows you to extract the text from a page along with the bounds. Text extracting can be done using the `ExtractText()` method. Add the following dependency to your application using the [NuGet Package Manager](#).

- Syncfusion.EJ2.PdfViewer.AspNet.Mvc5

**Note:** From Volume 2 2019 release Syncfusion.Pdf.AspNet.Mvc5 and Syncfusion.Compression.Base packages are added as dependency for PDF Viewer control. Ensure the dependency packages are referred in your application properly.

The following code snippet explains how to extract the text from a page.

```

`cs
//Uses the Syncfusion.EJ2.PdfViewer assembly
PdfRenderer pdfExtractText = new PdfRenderer();
pdfExtractText.Load("../Data/HTTP Succinctly.pdf");
//Returns the bounds of the text

```

```
List<Syncfusion.EJ2.PdfViewer.TextData> textCollection = new
List<Syncfusion.EJ2.PdfViewer.TextData>();

//Extracts the text from the first page of the PDF document along with its bounds
string text = pdfExtractText.ExtractText(0, out textCollection);
System.IO.File.WriteAllText("../Data/data.txt", text);
`
```

Sample:

<https://www.syncfusion.com/downloads/support/directtrac/general/ze/ExtractText853154752>

**Note:** Ensure the provided document path and output text saved locations in your application level.

Delete a specific annotation using `deleteAnnotationById`

The PDF Viewer server library allows you to delete a specific annotation from a PDF document. Deleting a specific annotation can be done using the **`deleteAnnotationById()`** method. This method is used to delete a specific annotation using its id.

The following steps are used to delete a specific annotation from PDF Document.

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Use the following code snippet to delete a specific annotation using `deleteAnnotationById()` method.

```
`html
<button type="button" onclick="deleteAnnotationById()">Delete Annotation by Id</button>
<script>
// Delete Annotation by ID.
function deleteAnnotationById() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.annotationModule.deleteAnnotationById(viewer.annotationCollection[0].annotationId);
}
</script>
`
```

Download the sample [how to delete a specific annotation using deleteAnnotationById](#)

Unload the PDF document programmatically

The PDF Viewer library allows you to unload the PDF document being displayed in the PDF Viewer control programmatically using the [unload\(\)](#) method.

The following steps are used to unload the PDF document programmatically.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Add the following code snippet to perform the unload operation.

```
`html
```

```

<button type="button" onclick="unLoad()">Unload Document</button>
<script>
// Unload the PDF document.
function unLoad() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.unload();
}
</script>
`

```

Download the Sample, [how to unload the PDF document programmatically](#)

#### Set author name to annotation

The PDF Viewer server library allows you to set author name to all annotations in the PDF document. Use the **author** property to set author name to all annotations.

The following steps are used to set author name to all annotation for PDF Viewer,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Set author name to annotations using below code snippet.

```

`html
<script>
function documentLoad()
{
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// set author name to annotation.
viewer.annotationSettings.author = "user1";
}
</script>
`

```

Download the sample [how to set author name to annotation](#)

#### Identify the loaded document is edited

The PDF Viewer server library allows you to identify whether loaded PDF document is edited or not. Use the **isDocumentEdited** property to identify whether the changes made in PDF document.

The following steps are used to identify loaded document is edited in PDF viewer control,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Add the following code snippet with button click event to identity loaded document edited.

```

`html

```

```

<button onclick="beforeEdit()">BeforeDocumentEdit</button>
<button onclick="afterEdit()">AfterDocumentEdit</button>
<script>
function beforeEdit() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
console.log("Is Document Edited = " + viewer.isDocumentEdited);
}
function afterEdit() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
console.log("Is Document Edited = " + viewer.isDocumentEdited);
}
</script>
`

```

Download the sample [how to identify the loaded document is edited](#)

#### Close the comment panel

The PDF Viewer server library allows you to close the comment panel programmatically using the external button event.

The following steps are used to close the comment panel programmatically in PDF Viewer,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Add the following code snippet to close the comment panel using button click event

```

`html
<button type="button" onclick="closeCommentPanel()">CloseCommentPanel</button>
<script>
function closeCommentPanel() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.viewerBase.navigationPane.closeCommentPanelContainer();
}
</script>
`

```

Download the sample [how to close comment panel](#)

#### Access file name

The PDF Viewer server library allows you to can access the filename of the loaded PDF document using the **documentLoad** and **downloadEnd** event. Using these events, we can access the filename while loading and downloading the PDF document.

The following steps are used to access the file name of loaded PDF document in PDF viewer control,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Access file name using below code snippet,

### **STANDALONE**

```

`html
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/hive-
succinctly.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Re
nder()
<script>
function documentLoad(args) {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
args.fileName = "pdfsuccinctly.pdf";
//Sets the name of the file to be downloaded
viewer.downloadFileName = "pdfsuccinctly.pdf";
console.log(args);
}
</script>
`

```

### **SERVER-BACKED**

```

`html
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/hive-
succinctly.pdf").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).D
ocumentLoad("documentLoad").DownloadEnd("documentLoad").Render()
<script>
function documentLoad(args) {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
args.fileName = "pdfsuccinctly.pdf";
//Sets the name of the file to be downloaded
viewer.downloadFileName = "pdfsuccinctly.pdf";
console.log(args);
}
</script>
`

```

Download the sample [how to access file name](#)

### **Include Authorization token**

The PDF Viewer server library allows you to include the Authorization token in the PDF Viewer AJAX request using the ajaxRequest headers properties available in AjaxRequestSettings and it will be included in every AJAX request send from PDF Viewer.

The following steps are used to include the Authorization token for PDF viewer control,

**Step 1:** Follow the steps provided in the [link](#) to create simple PDF Viewer sample.

**Step 2:** Add the following code snippet to include the authorization token,

```

`html

@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).Docume
ntPath("PDF_Succinctly.pdf").AjaxRequestSettings(new PdfViewerAjaxRequestSettings { WithCredentials

```

```
= true, AjaxHeaders = new object[] { new { headerName = "Testingabc", headerValue = "Testing123" } }
}).Render()
```

Download the sample [how to include authorization token](#)

#### Achieve Load balancing environment in MVC framework

The PDF Viewer server library allows you to achieve a Load balancing environment in the MVC framework using the .NET 4.5 framework with the help of **StackExchange Redis package V1.2.6**.

**Note:** We have considered the support from the .NET framework 4.5 version and it won't work in the lower .NET framework version.

#### *Steps to achieve load balancing environment in the MVC framework*

**Step 1:** Install the [StackExchange.Redis.StrongName](#) NuGet in the web-service sample.

**Step 2:** Create a new class in the web-service project (Example: CacheManager.cs) and implement the **Syncfusion.EJ2.PdfViewer.ICacheManager** interface in the class.

```
`cs
public class CacheManager:ICacheManager{}
```

**Step 3:** Connect the Redis database in the constructor by using the **redisconnectionstring** as provided in the below code.

```
`cs
private IDatabase m_redisDatabase = null;
private int m_slidingExpiration = 0;
public CacheManager(string redisConnectionString = null, int slidingExpiration = 0)
{
 if (!string.IsNullOrEmpty(redisConnectionString))
 {
 ConnectionMultiplexer connection = new Lazy<ConnectionMultiplexer>(() =>
 {
 return ConnectionMultiplexer.Connect(redisConnectionString);
 }).Value;
 if (connection != null)
 {
 m_redisDatabase = connection.GetDatabase();
 m_slidingExpiration = slidingExpiration;
 }
 }
}
```

```
}
,
```

**Step 4:** Override the **ICacheManager** interface methods into the newly created class for adding, retrieving, and deleting the data from the Redis cache.

```
`cs
//Adding the data in the redis database.
public void AddCache(string key, byte[] data)
{
 if (m_redisDatabase != null)
 {
 TimeSpan time = mslidingExpiration > 0 ? new TimeSpan(0, mslidingExpiration, 0) : new TimeSpan(24, 0, 0); // Provided the sliding expiration time
 m_redisDatabase.StringSet(key, data, time);
 }
}

//Retrieve the data in the redis database.
public byte[] GetCache(string key)
{
 byte[] documentContent = null;
 if (m_redisDatabase != null)
 {
 documentContent = m_redisDatabase.StringGet(key);
 }
 return documentContent;
}

//Delete the data in the redis database.
public void DeleteCache(string key)
{
 if (m_redisDatabase != null)
 {
 mredisDatabase.KeyDelete("PDFCONTENT" + key);
 mredisDatabase.KeyDelete("PDFINFO" + key);
 }
}
```

**Step 5:** In the controller, create a new object by passing the **redisconnectionstring** and the sliding expiration time.

```
`cs
```

```
pdfviewer.CacheManager = new CacheManager(redisconnectonstring, slidingexpiration);
```

**Note:** The sliding expiration is the time in which the data has to be stored in the cache for a specific minutes. If 0 then it will store for 24 hours.

**Step 6:** Set the newly created object to **CacheManager** property by using the below code-snippet.

```
`cs
```

```
PdfRenderer pdfviewer = new PdfRenderer();
```

```
pdfviewer.CacheManager = new CacheManager(redisconnectonstring, 0);
```

**Step 7:** Use this code in all our controller methods (Load, RenderPdfPage).

```
`cs
```

```
public string redisconnectonstring = "xxxx,ssl=True,abortConnect=False,syncTimeout=100000";
```

```
[System.Web.Mvc.HttpPost]
```

```
public object Load(Dictionary<string, string> jsonObject)
```

```
{
```

```
PdfRenderer pdfviewer = new PdfRenderer();
```

```
MemoryStream stream = new MemoryStream();
```

```
object jsonResult = new object();
```

```
if (jsonObject != null && jsonObject.ContainsKey("document"))
```

```
{
```

```
if (bool.Parse(jsonObject["isFileName"]))
```

```
{
```

```
string documentPath = GetDocumentPath(jsonObject["document"]);
```

```
if (!string.IsNullOrEmpty(documentPath))
```

```
{
```

```
byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
```

```
stream = new MemoryStream(bytes);
```

```
}
```

```
else
```

```
{
```

```

return (jsonObject["document"] + " is not found");
}
}
else
{
byte[] bytes = Convert.FromBase64String(jsonObject["document"]);
stream = new MemoryStream(bytes);
}
}

pdfviewer.CacheManager = new CacheManager(redisconnectonstring, 0);
jsonResult = pdfviewer.Load(stream, jsonObject);
return (JsonConvert.SerializeObject(jsonResult));
}

```

**Note: Add the bold lines in all the controller methods.**

Find the Web-service sample and Nuget package below:

- [Web service](#)
- [Nuget](#)

#### Extract Text using TextLineCollection

The PDF Viewer server library allows you to extract the text from a page along with the bounds using TextLineCollection. Text extracting can be done using the **ExtractText()** method.

Add the following dependency to your application using the **NuGet Package Manager**.

- Syncfusion.EJ2.PdfViewer.AspNet.Mvc5

**Note:** From Volume 2 2019 release Syncfusion.Pdf.AspNet.Mvc5 and Syncfusion.Compression.Base packages are added as dependency for PDF Viewer control. Ensure the dependency packages are referred in your application properly.

The following code snippet explains how to extract the text from a page using TextLineCollection.

```

`cs
var path = @"currentDirectory/../../Data/Simple.pdf";
var fileInfo = new FileInfo(path);
var docStream = new FileStream(fileInfo.FullName, FileMode.Open, FileAccess.Read);
// Load the PDF document.
PdfLoadedDocument document = new PdfLoadedDocument(docStream);

```

```
// Loading page collections
PdfPageBase page = document.Pages[0] as PdfLoadedPage;
//Extract text from the page.
var text = page.ExtractText(out TextLineCollection textLineCollection);
`
```

Find the sample [How to extract text using TextLineCollection](#)

**Note:** Ensure the provided document path and output text saved locations in your application level.

#### Load the PDF document

The PDF Viewer server library allows you to load the PDF document in the PDF Viewer Control. PDF Document can be loaded by adding the necessary JSON object Properties in the **PdfViewerController.cs** file.

The following steps are used to load a PDF document.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Add the following code snippet in PdfViewerController.cs file to load a PDF document.

```
`cs
public class jsonObjects
{
 public string document { get; set; }
 public string password { get; set; }
 public string zoomFactor { get; set; }
 public string isFileName { get; set; }
 public string xCoordinate { get; set; }
 public string yCoordinate { get; set; }
 public string pageNumber { get; set; }
 public string documentId { get; set; }
 public string hashId { get; set; }
 public string sizeX { get; set; }
 public string sizeY { get; set; }
 public string startPage { get; set; }
 public string endPage { get; set; }
 public string stampAnnotations { get; set; }
 public string textMarkupAnnotations { get; set; }
 public string stickyNotesAnnotation { get; set; }
 public string shapeAnnotations { get; set; }
}
```

```

public string measureShapeAnnotations { get; set; }
public string action { get; set; }
public string pageStartIndex { get; set; }
public string pageEndIndex { get; set; }
public string fileName { get; set; }
public string elementId { get; set; }
public string pdfAnnotation { get; set; }
public string importPageList { get; set; }
public string uniqueId { get; set; }
public string data { get; set; }
public string viewPortWidth { get; set; }
public string viewportHeight { get; set; }
public string tilecount { get; set; }
public string isCompletePageSizeNotReceived { get; set; }
public string freeTextAnnotation { get; set; }
public string signatureData { get; set; }
public string fieldsData { get; set; }
}
`

```

Find the sample [how to load the PDF Document in MVC PDF Viewer](#)

Show the notification dialog in UI When form fields are empty

The PDF Viewer server library allows you to show the notification dialog in UI when fields in the form are not filled or empty using the following properties and events below,

- **EnableFormFieldsValidation**
- **ShowNotificationDialog**
- **validateFormFields**

The following steps are used to show the notification dialog in UI.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Use the following code snippet to show the notification dialog when form fields are empty.

```
`cs
```

```

@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/form-filling-document.pdf").ValidateFormFields("validateFormFields").EnableFormFieldsValidation(true).ShowNotificationDialog(false).Render()

```

```
<script>
function validateFormFields(args) {
var nonfilledFormFields = args.nonFillableFields;
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var errorMessage = "Kindly fill all the form fieds";
viewer.showNotificationPopup(errorMessage);
}
</script>
`
```

Find the sample of [how to show the notification dialog in UI When form fields are empty](#)

#### Load PDF documents dynamically

The PDF Viewer server library allows to switch or load the PDF documents dynamically after the initial load operation. To achieve this, load the PDF document as a base64 string or file name in PDF Viewer control using the **Load()** method dynamically.

The following steps are used to load the PDF document dynamically.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Use the following code snippet to load PDF document using base64 string.

```
`html
<button type="button" onclick="load1()">LoadDocumentFromBase64</button>
<script>
// Load a Base64 String
function load1() {
// Sending Ajax request to the controller to get base 64 string
$.ajax({
url: '/PdfViewer/GetDocument',
type: 'POST',
cache: false,
processData: false,
contentType: false,
success: function (data) {
debugger;
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.load(data, null);
},
```

```

error: function (msg, textStatus, errorThrown) {
 debugger;
 alert('Exception' + msg.responseText);
}
});
}
</script>
`

```

**Step 3:** Add the following code snippet in PdfViewerController.cs file to get the base64 string of the given document.

```

`cs
public ActionResult GetDocument()
{
 var docBytes = System.IO.File.ReadAllBytes(GetDocumentPath("PDF_Succinctly.pdf"));
 string docBase64 = "data:application/pdf;base64," + Convert.ToBase64String(docBytes);
 return Content(docBase64);
}
`

```

**Step 4:** Use the following code snippet to load PDF document using document name.

```

`html
<button type="button" onclick="load2()">LoadDocumentFromBase64</button>
<script>
// load document using document name.
function load2() {
 var viewer = document.getElementById('pdfViewer').ej2_instances[0];
 viewer.load("HTTP Succinctly.pdf", null)
}
</script>
`

```

**Tips:** Also can add the base64 string directly in the DocumentPath() method.

Download the sample, [how to load PDF documents dynamically](#)

#### Import and Export annotation as object

The PDF Viewer library allows you to import annotations from objects or streams instead of loading it as a file. To import such annotation objects, the PDF Viewer control must export the PDF annotations as

objects using the [ExportAnnotationsAsObject\(\)](#) method. Only the annotations objects that are exported from the PDF Viewer can be imported.

The following steps are used to import and export annotation as object.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Use the following code snippet to perform import and export annotation.

```
`html
<button type="button" onclick="exportAnnotation()">Export Annoatation</button>
<button type="button" onclick="importAnnotation()">Import Annoatation</button>
<script>
var exportObject;
//Export annotation as object.
function exportAnnotation() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.exportAnnotationsAsObject().then(function (value) {
exportObject = value
});
}
//Import annotation that are exported as object.
function importAnnotation() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
viewer.importAnnotation(JSON.parse(exportObject));
}
</script>
`
```

Find the Sample, [how to import and export annotation as object](#)

[Open Thumbnail pane programmatically](#)

The PDF Viewer library allows you to open the thumbnail pane programmatically using the [openThumbnailPane\(\)](#) method.

The following steps are used to open the thumbnail.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Use the following code snippet to open thumbnail.

```
`html
<button type="button" onclick="openThumbnail()">Open Thumbnail Pane</button>
<script>
```

```
function openThumbnail() {
var viewer = document.getElementById('pdfViewer').ej2_instances[0];
// Open Thumbnail Pane.
viewer.thumbnailViewModule.openThumbnailPane();
}
</script>
`
```

Find the sample, [how to open the thumbnail pane programmatically](#)

#### Redirect to a home page after submitting PDF forms

The PDF Viewer library allows you to redirect to a home page after submitting PDF forms in the PDF Viewer control programmatically using the [ExportSuccess](#) event. This event triggers once the form fields exporting is succeeded in the PDF Viewer.

The following example steps are used to redirect to a home page programmatically after submitting PDF forms.

**Step 1:** Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

**Step 2:** Add the following codes in new View pages HomePage.cshtml and FormFillingData.cshtml inside a folder(say FormFilling).

FormFillingData.cshtml:

```
`html
@{
ViewBag.Title = "FormFillingData";
}
@using Syncfusion.EJ2
@using Syncfusion.EJ2.PdfViewer
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/FormFilling/")).DocumentPath("FormFillingDocument.pdf").ToolBarSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerToolBarSettings { ShowTooltip = true, ToolbarItems = "SubmitForm,
DownloadOption, PrintOption"
}).EnableFormFields(true).ValidateFormFields("validateFormFields").EnableFormFieldsValidation(true).ShowNotificationDialog(false).ExportSuccess("exportSuccess").Render()
<style>
pdfviewer {
display: block;
}
</style>
<script>
```

```
function exportSuccess(args) {
//call the home page action
window.open(window.location.href + "FormFilling/HomePage", "_self")
}
function validateFormFields(args) {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var errorMessage = "Required Field(s): ";
var forms = viewer.formFieldCollections;
var flag = false;
var radioGroupName = "";
for (var i = 0; i < forms.length; i++) {
var text = "";
if (forms[i].isRequired == true) {
if (forms[i].type.toString() == "Checkbox" && forms[i].isChecked == false) {
text = forms[i].name;
}
else if (forms[i].type == "RadioButton" && flag == false) {
radioGroupName = forms[i].name;
if (forms[i].isSelected == true)
flag = true;
}
else if (forms[i].type.toString() != "Checkbox" && forms[i].type != "RadioButton" && forms[i].value ==
"") {
text = forms[i].name;
}
if (text != "") {
if (errorMessage == "Required Field(s): ") {
errorMessage += text;
}
else {
errorMessage += ", " + text;
}
}
}
}
```

```

}
}
if (!flag && radioGroupName != "") {
if (errorMessage == "Required Field(s): ")
errorMessage += radioGroupName;
else
errorMessage += ", " + radioGroupName;
}
if (errorMessage != "Required Field(s): ") {
viewer.showNotificationPopup(errorMessage);
}
}
</script>
`

```

HomePage.cshtml:

```

`html
@{
ViewBag.Title = "HomePage";
}
<h2>HomePage</h2>
`

```

**Step 3:** Create a new Controller file called FormFillingController.cs inside the Controllers and add the below code to it.

FormFillingController.cs:

```

`cs
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using Syncfusion.EJ2.PdfViewer;
using Newtonsoft.Json;
using System.IO;

```

```
using System.Reflection;
using Syncfusion.Pdf.Parsing;
using System.Net.Http;
using System.Net;
using System.Text.RegularExpressions;
using Syncfusion.Pdf;
using Syncfusion.Pdf.Graphics;
using System.Drawing;
using Syncfusion.Pdf.Interactive;
using System.Web.Http;
using System.Threading.Tasks;
namespace EJ2PdfViewer.Controllers
{
 public class FormFillingController : Controller
 {
 // GET: FormFilling
 public ActionResult FormFillingData()
 {
 return View();
 }
 public ActionResult HomePage()
 {
 return View("HomePage");
 }
 [System.Web.Mvc.HttpPost]
 public ActionResult Load(jsonObjects jsonObject)
 {
 PdfRenderer pdfviewer = new PdfRenderer();
 PdfRenderer.ReferencePath = "C:/"; //_hostingEnvironment.WebRootPath + "/";
 MemoryStream stream = new MemoryStream();
 var jsonData = JsonConverter(jsonObject);
 object jsonResult = new object();
 if (jsonObject != null && jsonData.ContainsKey("document"))
```

```
{
if (bool.Parse(jsonData["isFileName"]))
{
string documentPath = GetDocumentPath(jsonData["document"]);
if (!string.IsNullOrEmpty(documentPath))
{
byte[] bytes = System.IO.File.ReadAllBytes(documentPath);
stream = new MemoryStream(bytes);
}
else
{
string fileName = jsonData["document"].Split(new string[] { "://" }, StringSplitOptions.None)[0];
if (fileName == "http" || fileName == "https")
{
var WebClient = new WebClient();
byte[] pdfDoc = WebClient.DownloadData(jsonData["document"]);
stream = new MemoryStream(pdfDoc);
}
else
{
return this.Content(jsonData["document"] + " is not found");
}
}
}
else
{
byte[] bytes = Convert.FromBase64String(jsonData["document"]);
stream = new MemoryStream(bytes);
}
}

PdfLoadedDocument document = new PdfLoadedDocument(stream);
PdfBookmark bookmark = document.Bookmarks.Add("Page 1");
bookmark.Destination = new PdfDestination(document.Pages[0]);
```

```
bookmark.Color = Color.Red;
bookmark.TextStyle = PdfTextStyle.Bold;
bookmark.Destination.Location = new PointF(20, 20);
MemoryStream docStream = new MemoryStream();
document.Save(docStream);
docStream.Position = 0;
document.Close(true);
jsonResult = pdfviewer.Load(docStream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}

public ActionResult GetDocument()
{
 var docBytes = System.IO.File.ReadAllBytes(GetDocumentPath("PDF_Succinctly.pdf"));
 string docBase64 = "data:application/pdf;base64," + Convert.ToBase64String(docBytes);
 return Content(docBase64);
}

public ActionResult SaveDocument(jsonObjects jsonObject)
{
 PdfRenderer pdfviewer = new PdfRenderer();
 var jsonData = JsonConvert.SerializeObject(jsonObject);
 string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
 string base64String = documentBase.Split(new string[] { "data:application/pdf;base64," },
 StringSplitOptions.None)[1];
 if (base64String != null || base64String != string.Empty)
 {
 byte[] byteArray = Convert.FromBase64String(base64String);
 var path = GetDocumentPath(jsonData["documentId"]);
 // Document is saved in the project location
 System.IO.File.WriteAllBytes(path, byteArray);
 }
 return Content(string.Empty);
}

public Dictionary<string, string> JsonConvert(jsonObjects results)
```

```
{
Dictionary<string, object> resultObjects = new Dictionary<string, object>();
resultObjects = results.GetType().GetProperties(BindingFlags.Instance | BindingFlags.Public)
.ToDictionary(prop => prop.Name, prop => prop.GetValue(results, null));
var emptyObjects = (from kv in resultObjects
where kv.Value != null
select kv).ToDictionary(kv => kv.Key, kv => kv.Value);
Dictionary<string, string> jsonResult = emptyObjects.ToDictionary(k => k.Key, k => k.Value.ToString());
return jsonResult;
}

[System.Web.Mvc.HttpPost]
public ActionResult ExportAnnotations(jsonObjects jsonObject)
{

 public string measureShapeAnnotations { get; set; }
 public string action { get; set; }
 public string pageStartIndex { get; set; }
 public string pageEndIndex { get; set; }
 public string fileName { get; set; }
 public string elementId { get; set; }
 public string pdfAnnotation { get; set; }
 public string importPageList { get; set; }
 public string uniqueId { get; set; }
 public string data { get; set; }
 public string viewPortWidth { get; set; }
 public string viewportHeight { get; set; }
 public string tilecount { get; set; }
 public string isCompletePageSizeNotReceived { get; set; }
```

```

public string freeTextAnnotation { get; set; }
public string signatureData { get; set; }
public string fieldsData { get; set; }
public string formDesigner { get; set; }
public string inkSignatureData { get; set; }
}
}
`

```

**Step 4:** Modify the RegisterRoutes method in the RouteConfig.cs file inside the App\_Start folder to map the default path.

```

`cs
public static void RegisterRoutes(RouteCollection routes)
{
 routes.IgnoreRoute("{resource}.axd/{*pathInfo}");
 routes.MapRoute(
 name: "Default",
 url: "{controller}/{action}/{id}",
 defaults: new { controller = "FormFilling", action = "FormFillingData", id = UrlParameter.Optional }
);
}
`

```

Now, run the sample, fill in the form fields, and click the Submit Form option. You will be redirected to the home page.

Download the sample, [how to redirect to a home page programmatically after submitting PDF forms](#).

#### Resolve the Pdfium issue

The issue, “The type initializer for 'Syncfusion.EJ2.PdfViewer.PdfiumNative' threw an exception” is due to the write access permission denied in the environment. The pdfium.dll will be created based on the operating system at the runtime. Due to the denial of permission, the pdfium.dll file couldn't have been created. So, copy the below x64 and x86 folders and paste them inside the folder into your project to resolve the issue or enable the write permission for that folder.

Pdfium dll: [pdfium.dll](#)

**Note:** Use both the client and server-side of the same version in your project.

Ensure whether the pdfium.dll file is created in your project during runtime. Else, place the pdfium assemblies in any of the production environment locations and refer to the path by using the ReferencePath API.

For example, if the Pdfium assembly is available in this path C:\Pdfium\x64 or D:\Pdfium\x86, the reference path should be PdfRenderer.ReferencePath = "C:/";

The parent folder has to be provided as the path in the ReferencePath API.

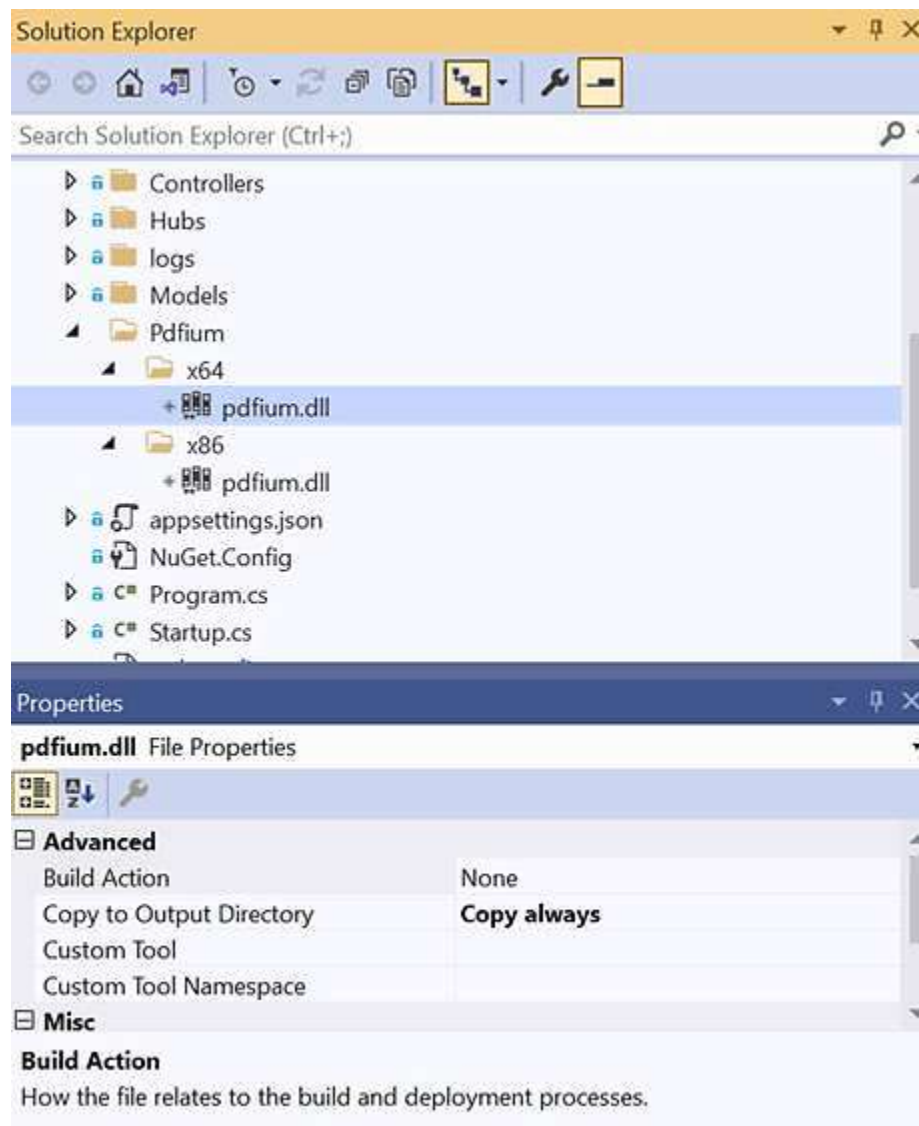

**Note:** Provide this path in the Load method of the PDFViewController.cs

**Note:** PdfRenderer PdfRenderer = new PdfRenderer();

<br/> PdfRenderer.ReferencePath = @"C:/";

*Steps to refer the Pdfium.dll*

1. Extract the given file (Pdfium folder) and copy it in the sample's root directory (parallel to Controllers folder)
2. Right-click on the pdfium.dll (both the X64 and X86 folder) and then choose the "Copy to Output Directory" property from the property window and set its value to "copy always". This setting will ship the pdfium.dll assembly to the published location.

3. Provide this path in the Load method of the PDFViewerController.cs

**Note:** You need to refer the ParentFolder up to the x64/x86 folder.

```
PdfRenderer.ReferencePath = _hostingEnvironment.ContentRootPath + /Pdfium/;
```

4. Build and publish the application.

Also, install only the package related to that OS, then build and run the project on that platform. For Windows, Linux, and OSX operating systems, use the following corresponding libraries:

- Syncfusion.EJ2.PdfViewer.AspNet.Core.Linux
- Syncfusion.EJ2.PdfViewer.AspNet.Core.Windows
- Syncfusion.EJ2.PdfViewer.AspNet.Core.OSX

Following these steps should resolve the issue.

#### How to add the date to the signature text

To add a date with the signature text in Syncfusion PDF Viewer, use the `updateFormFieldsValue()` method. Add a signature field to a PDF document and get the signature field in a PDF using the `retrieveFormFields()` method and store it in a variable. Modify the value of the signature field and get the current date. Use the `Date()` method to get the current date and format it as desired.

Update the signature field in a PDF using the `updateFormFieldsValue()` method and pass the modified signature field as a parameter.

#### **STANDALONE**

```

` ``html
<div>
<div style="width:100%;height:600px">
<button type="button" onclick="signatureWithDate()">Add Signature with the
time</button>
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/form-filling-document.pdf").Render()
</div>
</div>
<script>
function signatureWithDate() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formFields = viewer.retrieveFormFields();
formFields[0].signatureType = 'Type';
formFields[0].value = 'Syncfusion \n' + new Date();
viewer.updateFormFieldsValue(formFields[0]);
}
</script>
` ``

```

#### **SERVER-BACKED**

```

` ``html
<div>
<div style="width:100%;height:600px">

```

```

<button type="button" onclick="signatureWithDate()">Add Signature with the
time</button>
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
 "~/Home/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
</div>
<script>
function signatureWithDate() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formFields = viewer.retrieveFormFields();
formFields[0].signatureType = 'Type';
formFields[0].value = 'Syncfusion \n' + new Date();
viewer.updateFormFieldsValue(formFields[0]);
}
</script>
`

```

### [View Sample in GitHub](#)

#### How to change the default width and height

To change the default width and height of the Syncfusion PDF Viewer, modify the **Width** and **Height** properties of the PdfViewer control.

```

`html
<div>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPa
th("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Height("1000px").Width("80%").Render()
</div>
</div>
`

```

In this example, the Width property is set to **80%**, and the Height property is set to **1000px**. Change these values to any desired size in pixels or percentages.

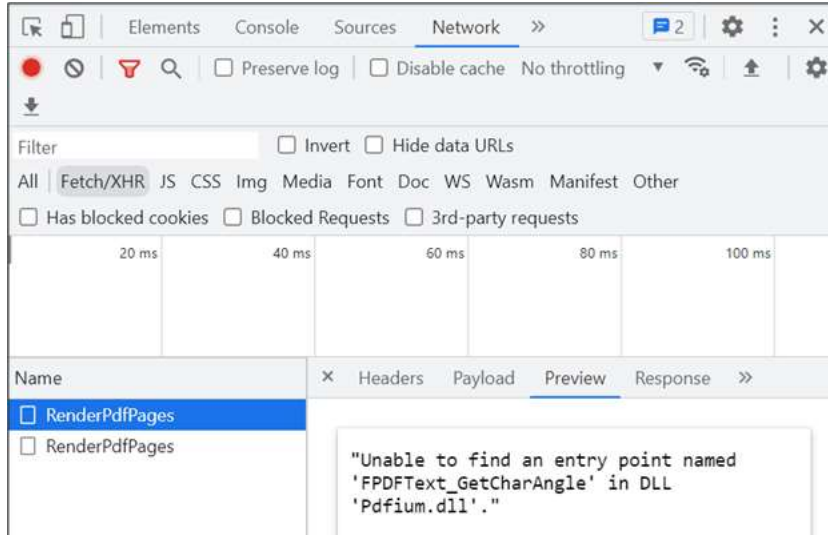

### [View sample in GitHub](#)

#### Resolve "Unable to find an entry point named FPDFText\_GetCharAngle" error

From the release of version **21.1.0.35 (2023 Volume 1)** of Essential Studio, the Pdfium package has been upgraded to improve various functionalities like text search, text selection, rendering, and even performance. If you are updating your project to this version of the Syncfusion PDF Viewer, you may encounter the **"Web-Service is not listening"** error. The Network tab can help you identify the root cause of the issue, which is typically caused by an old version of pdfium assembly being referenced in the local web service project. Below are the assemblies to be referred to in the respective operating systems.

- Windows – pdfium.dll
- Linux – libpdfium.so

- OSX – libpdfium.dylib

*To solve this issue, you should follow the below steps:*

1. Clear the bin and object files of the web-service project.
2. Re-publish the web-service project.

**Note: Note:** If you are hosting your application in Azure, AWS, or in Linux environments, delete the older published files and republish the application.

How to clear the "Web-service is not listening" to error

![Alt text](./images/web-service.png)

If you are facing a **Web-service is not listening** to error in the Syncfusion PDF Viewer, there could be several reasons for this. To troubleshoot the issue, you can use the Network tab in your browser's developer tools to gather more information. Here are the steps you can follow:

**Step 1:** Open the browser's developer tools by right-clicking on the page and selecting **Inspect** from the dropdown menu. Then Navigate to the **Network** tab. This will show you all of the requests that are being made by the page.

![Alt text](./images/networktab.png)

**Step 2:** Try to request the web service. If the service is not listening, the request will fail, and you should see an error message in the Network tab. Click on the failing request to see the details of the error, such as the error message or stack trace. This can help you identify the root cause of the issue. Check the server logs for any errors or warnings that may indicate the cause of the issue and help you to troubleshoot the problem.

**Step 3:** Check the request URL and parameters to see if they are correct. If there is a type or an incorrect parameter, the web service may be unable to process the request.

By following these steps and using the Network tab in your browser's developer tools, you can gather more information about the issue and troubleshoot the problem more effectively.

**Note:** Make sure you are connected to the internet and that your connection is stable. You can try accessing other websites or services to see if they are working, and make sure the URL you are using to access the web service is correct and properly formatted.

*Here are some common exceptions*

- File not found.
- Document cache not found.
- Document pointer does not exist in the cache.

#### *File not found*

If you are encountering an error message stating that the web service is not listening due to a file not being found in the Syncfusion PDF viewer, you can try the following steps to resolve the issue:

##### *Check the file path*

Ensure that the file path you use to access the PDF file is correct and that the file exists in that location. You will need to update the file path if the file does not exist.

##### *Document cache not found*

The **Document cache not found** exception in Syncfusion PDF Viewer typically occurs when the cache used to store the rendered pages of a PDF document is not found or has been deleted. This can happen if the cache directory is changed or deleted or if the application is running in a different environment than it was previously.

##### *Check for multiple instances*

It's possible that you have multiple instances of the Syncfusion PDF Viewer running simultaneously, which can cause issues with the document cache. To check for this, open the Task Manager on your computer and look for any instances of the Syncfusion PDF Viewer running. If you find multiple instances, try closing them all and reopening the viewer.

We can use Redis cache and distributive cache for this issue.

##### *Check your network connection*

Ensure that your network connection is stable and strong enough to support the web service you are trying to use. Sometimes, simply restarting the web service can resolve the issue. Try stopping and starting the service again to see if it resolves the problem.

##### *The document pointer does not exist in the cache.*

The **Document pointer does not exist in the cache** exception in the Syncfusion PDF Viewer usually occurs when there is an issue with loading or caching the PDF document. This error can be caused by a variety of reasons, including:

To clear this error in the Syncfusion PDF Viewer, you can try the following steps:

**Step 1:** Clearing the cache may help resolve the issue. To clear the cache, navigate to the cache location, which can be found in the Syncfusion PDF Viewer's settings or configuration files. Once you locate the cache folder, delete its contents.

**Step 2:** Try reloading the document to ensure it is loaded correctly. You can do this by calling the controller's Load() method. Ensure the document is not already loaded before attempting to load it again.

**Step 3:** Restart the application. If clearing the cache does not work, you can try restarting the PDF Viewer application. This will reload all the necessary components and may resolve the error.

### Internal server error

Server-side exceptions happen for various use cases. We can't just define them if they are document-specific, provide the document, or you may need to contact Syncfusion support for further assistance.

### Load N number of pages on initial loading

The initial rendering in a PDF viewer allows users to control the number of pages displayed when opening a PDF document. This improves the user experience by providing flexibility in loading a specific number of pages initially, while additional pages are dynamically rendered as the user scrolls through the document. This approach enhances the responsiveness of the PDF viewer and minimizes delays as users can access specific pages without waiting for the entire document to load.

To utilize this capability in Syncfusion PDF Viewer, use the [initialRenderPages](#) property. You can achieve the desired outcome by setting this property to the desired number of pages you want to load initially. However, it's important to exercise caution when setting a high value for the initialRenderPages in large documents with numerous pages. Rendering a large number of pages simultaneously can increase memory usage and slow down loading times, impacting the performance of the PDF viewer.

Using the `initialRenderPages` property judiciously is advisable, especially when dealing with larger documents. It is more suitable for scenarios where a smaller range of pages, such as 10-20, can be loaded to provide a quick initial view of the document.

### STANDALONE

```
````cs
@{
    ViewBag.Title = "Home Page";
    double InitialRenderPages = 10;
}
<div>
<div style="height:100%; width: 100%;">
    @Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-
succinctly.pdf").InitialRenderPages(InitialRenderPages).Render()
</div>
</div>
````
```

### SERVER-BACKED

```
````cs
@{
    ViewBag.Title = "Home Page";
    double InitialRenderPages = 10;
}
<div>
<div style="height:100%; width: 100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/Home/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").InitialRenderPages(InitialRenderPages).Render()
</div>
</div>
````
```

[View sample in GitHub](#)

## Retry Timeout

The [Retry Timeout](#) feature allows you to specify a duration for the PDF Viewer to retry failed AJAX requests before considering them permanent failures. It helps in handling temporary failures due to network issues or server unavailability.

The `retryTimeout` allows developers to specify a duration after which the AJAX request should retry failed requests automatically. Developers can ensure a more resilient and fault-tolerant PDF viewing experience by configuring an appropriate retry timeout value.

By default, when an AJAX request fails, the Retry Timeout property is set to `0`, indicating that no timeout is set. In this case, the PDF Viewer will wait indefinitely for a response, potentially leading to a hanging request. However, you can set the Retry Timeout property to a positive number, specifying the maximum number of seconds the PDF Viewer should wait for a response. If the response is not received within the specified time, the request will be aborted, triggering an appropriate error or timeout property.

To set the retry timeout, use the [retryTimeout](#) property in the PDF Viewer configuration. This property takes a value in seconds.

```
`cs
@{
 ViewBag.Title = "Home Page";

 double RetryTimeout = 10;
 double RetryCount = 5;
}
<div>
<div style="height:100%; width: 100%;">
 @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").RetryCount(RetryCount).RetryTimeout(RetryTimeout).Render()
</div>
</div>
`
```

In the given example, the [retryTimeout](#) is set to 10 seconds, and the [retryCount](#) is set to 5. This means that if a request made by the PDF Viewer takes longer than 10 seconds to receive a response, it will be considered a timeout. In such cases, The PDF Viewer will resend the same request based on the `retryCount`. Here, this process will repeat up to maximum of 5 retries.

When an exception occurs during the AJAX request in the context of the PDF Viewer, the request will wait for the specified [retryTimeout](#) duration. If the timeout duration is exceeded, the PDF Viewer will decrement the [retryCount](#) and attempt to load the document again. This retry process continues until the document is successfully loaded or the `retryCount` limit is reached.

The [retryCount](#) property of the PDF Viewer allows you to set the number of retries for a specific request. This feature is particularly useful for handling temporary errors such as network timeouts or server

issues. By initiating new requests according to the retry count, ensure a smoother user experience and efficiently handle network or server problems.

If the timeout duration specified by [retryTimeout](#) is exceeded during the AJAX request, the PDF Viewer will decrement the [retryCount](#) and initiate a new request. This process will continue until the document is successfully loaded or the retry count limit is reached. This functionality helps improve the handling of temporary errors and ensures a more efficient and user-friendly experience.

## Customize toolbar in PDF Viewer component

### *How to customize existing toolbar in PDF Viewer component*

PDF Viewer allows you to customize(add, show, hide, enable, and disable) existing items in a toolbar.

- Add - New items can be defined by **CustomToolbarItemModel** and with existing items in [ToolbarSettings](#) property. Newly added item click action can be defined in [toolbarclick](#).
- Show, Hide - Existing items can be shown or hidden using the [ToolbarSettings](#) property. Pre-defined toolbar items are available with [ToolbarItem](#).
- Enable, Disable - Toolbar items can be enabled or disabled using [enabletoolbaritem](#).

## STANDALONE

```
<div>
<div style="height:500px;width:1350px;">

@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-
succinctly.pdf").ResourceUrl("https://cdn.syncfusion.com/ej2/24.1.41/dist/ej
2-pdfviewer-lib").ToolbarClick("toolbarClick").Render()
</div>
</div>
<script type="text/javascript">

dataSource: LanguageList, popupWidth: 85, showClearButton: false, readonly:
false })
};
var toolItem4 = {
type: 'Input',
tooltipText: 'Text',
align: 'Right',
cssClass: 'find',
id: 'textbox',
template: new ej.inputs.TextBox({ width: 125, placeholder: 'Type Here',
created: onCreate })
}; align: 'left'
function onCreate() {
this.addIcon('prepend', 'e-icons e-search');
}
pdfViewer.toolbarSettings = {
showTooltip: true,
toolbarItems: [toolItem1, toolItem2, 'OpenOption', 'PageNavigationTool',
'MagnificationTool', toolItem3, 'PanTool', 'SelectionTool', 'SearchOption',
'PrintOption', 'DownloadOption', 'UndoRedoTool', 'AnnotationEditTool',
'FormDesignerEditTool', toolItem4, 'CommentTool', 'SubmitForm']
};
};
// Define the toolbarClick event handler
function toolbarClick(args) {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
if (args.item && args.item.id === 'print') {
pdfViewer.printModule.print();
} else if (args.item && args.item.id === 'download') {
pdfViewer.download();
}
}
}
</script>

```

**Note:** Default value of toolbar items is ['OpenOption', 'PageNavigationTool', 'MagnificationTool', 'PanTool', 'SelectionTool', 'SearchOption', 'PrintOption', 'DownloadOption', 'UndoRedoTool', 'AnnotationEditTool', 'FormDesignerEditTool', 'CommentTool', 'SubmitForm']

#### Align Property

The align property is used to specify the alignment of a toolbar item within the toolbar.

**Left:** Aligns the item to the left side of the toolbar.

**Right:** Aligns the item to the right side of the toolbar.

#### Tooltip Property

The tooltip property is used to set the tooltip text for a toolbar item. Tooltip provides additional information when a user hovers over the item.

#### CssClass Property

The cssClass property is used to apply custom CSS classes to a toolbar item. It allows custom styling of the toolbar item.

#### Prefix Property

The prefix property is used to set the CSS class or icon that should be added as a prefix to the existing content of the toolbar item.

#### ID Property

The id property within a CustomToolbarItemModel is a compulsory attribute that plays a vital role in toolbar customization. It serves as a unique identifier for each toolbar item, facilitating distinct references and interactions.

When defining or customizing toolbar items, it is mandatory to assign a specific and descriptive id to each item.

These properties are commonly used when defining custom toolbar items with the CustomToolbarItemModel in the context of Syncfusion PDF Viewer. When configuring the toolbar using the ToolbarSettings property, you can include these properties to customize the appearance and behavior of each toolbar item.

**Note:** When customizing toolbar items, you have the flexibility to include either icons or text based on your design preference.

## Troubleshooting

### Document Loading Issues in Version 23.1 or Newer

If you're experiencing problems with your document not rendering in the viewer, especially when using version 23.1 or a newer version, follow these troubleshooting steps to resolve the issue:

1. **Check for viewer.dataBind() Requirement:** Ensure that you have called `viewer.dataBind()` as required in version 23.1 or newer. This explicit call is essential for initializing data binding and document rendering correctly. It is must to call the `dataBind()` method before load.

```
`html
<button id="viewer" onclick="documentLoad()">Load</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").Render()
</div>
<script>
function documentLoad () {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
```

```
pdfViewer.serviceUrl = "https://ej2services.syncfusion.com/angular/development/api/pdfviewer";
pdfViewer.dataBind();
pdfViewer.load("https://cdn.syncfusion.com/content/pdf/annotations.pdf");
}
</script>
,
```

2. **Verify Document Source:** Confirm that the document source or URL you're trying to display is valid and accessible. Incorrect URLs or document paths can lead to loading issues.
3. **Network Connectivity:** Ensure that your application has a stable network connection. Document rendering may fail if the viewer can't fetch the document due to network issues.
4. **Console Errors:** Use your browser's developer tools to check for any error messages or warnings in the console. These messages can provide insights into what's causing the document not to load.
5. **Loading Sequence:** Make sure that you're calling `viewer.dataBind()` and initiating document loading in the correct sequence. The viewer should be properly initialized before attempting to load a document.
6. **Update Viewer:** Ensure that you're using the latest version of the viewer library or framework. Sometimes, issues related to document loading are resolved in newer releases.
7. **Cross-Origin Resource Sharing (CORS):** If you're loading documents from a different domain, ensure that CORS headers are correctly configured to allow cross-origin requests.
8. **Content Security Policies (CSP):** Check if your application's Content Security Policy allows the loading of external resources, as this can affect document loading. Refer [here](#) to troubleshoot.

By following these troubleshooting steps, you should be able to address issues related to document loading in version 23.1 or newer, ensuring that your documents render correctly in the viewer.

## Pivot Table

### Getting Started with ASP.NET MVC Pivot Table Control

This section briefly explains about how to include [ASP.NET MVC Pivot Table](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Add ASP.NET MVC Pivot Table control

- Now, add the Syncfusion ASP.NET MVC Pivot Table control in `~/Views/Home/Index.cshtml` page.
- The Pivot Table control further needs to be populated with an appropriate data source. For illustration purpose, a collection of objects mentioning the sales details of certain products over a period and region has been prepared. This sample data is assigned to the pivot table control through [DataSource](#) property under [PivotViewDataSourceSettings](#) class.

**CSHTML**

```
@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource((IEnumerable<object>)Model)).Render()
```

**HOMECONTROLLER.CS**

```
public ActionResult Index()
{
 List<PivotData> pivotData = new List<PivotData>();
 pivotData.Add(new PivotData { Sold = 31, Amount = 52824, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q1" });
 pivotData.Add(new PivotData { Sold = 51, Amount = 86904, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q2" });
 pivotData.Add(new PivotData { Sold = 90, Amount = 153360, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q3" });
 pivotData.Add(new PivotData { Sold = 25, Amount = 42600, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q4" });
 pivotData.Add(new PivotData { Sold = 27, Amount = 46008, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q1" });
 pivotData.Add(new PivotData { Sold = 49, Amount = 83496, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q2" });
 pivotData.Add(new PivotData { Sold = 95, Amount = 161880, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q3" });
 pivotData.Add(new PivotData { Sold = 67, Amount = 114168, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q4" });
 pivotData.Add(new PivotData { Sold = 75, Amount = 127800, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q1" });
 pivotData.Add(new PivotData { Sold = 67, Amount = 114168, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q2" });
 pivotData.Add(new PivotData { Sold = 69, Amount = 117576, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q3" });
 pivotData.Add(new PivotData { Sold = 90, Amount = 153360, Country =
 "France", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q4" });
 pivotData.Add(new PivotData { Sold = 16, Amount = 27264, Country = "France",
 Products = "Mountain Bikes", Year = "FY 2018", Quarter = "Q1" });
 pivotData.Add(new PivotData { Sold = 83, Amount = 124422, Country =
 "France", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q1" });
 pivotData.Add(new PivotData { Sold = 57, Amount = 85448, Country = "France",
 Products = "Road Bikes", Year = "FY 2015", Quarter = "Q2" });
 pivotData.Add(new PivotData { Sold = 20, Amount = 29985, Country = "France",
 Products = "Road Bikes", Year = "FY 2015", Quarter = "Q3" });
}
```

```

pivotData.Add(new PivotData { Sold = 67, Amount = 70008, Country = "France",
Products = "Road Bikes", Year = "FY 2016", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 89, Amount = 60496, Country = "France",
Products = "Road Bikes", Year = "FY 2016", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 75, Amount = 801880, Country =
"France", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 57, Amount = 204168, Country =
"France", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 75, Amount = 737800, Country =
"France", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 87, Amount = 884168, Country =
"France", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 39, Amount = 729576, Country =
"France", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 90, Amount = 38860, Country = "France",
Products = "Road Bikes", Year = "FY 2017", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 93, Amount = 139412, Country =
"France", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 51, Amount = 92824, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 61, Amount = 76904, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 70, Amount = 43360, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 85, Amount = 62600, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 97, Amount = 86008, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 69, Amount = 93496, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 45, Amount = 301880, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 77, Amount = 404168, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 15, Amount = 137800, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 37, Amount = 184168, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 49, Amount = 89576, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 40, Amount = 33360, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 96, Amount = 77264, Country =
"Germany", Products = "Mountain Bikes", Year = "FY 2018", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 23, Amount = 24422, Country =
"Germany", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 67, Amount = 75448, Country =
"Germany", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 70, Amount = 52345, Country =
"Germany", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 13, Amount = 135612, Country =
"Germany", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 57, Amount = 90008, Country =
"Germany", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 29, Amount = 90496, Country =
"Germany", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q2" });

```

```

pivotData.Add(new PivotData { Sold = 45, Amount = 301880, Country =
"Germany", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 77, Amount = 404168, Country =
"Germany", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 15, Amount = 137800, Country =
"Germany", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 37, Amount = 184168, Country =
"Germany", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 99, Amount = 829576, Country =
"Germany", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 80, Amount = 38360, Country =
"Germany", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 91, Amount = 67824, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 81, Amount = 99904, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 70, Amount = 49360, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 65, Amount = 69600, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2015", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 57, Amount = 90008, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 29, Amount = 90496, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 85, Amount = 391880, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 97, Amount = 904168, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2016", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 85, Amount = 237800, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 77, Amount = 384168, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 99, Amount = 829576, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 80, Amount = 38360, Country = "United
States", Products = "Mountain Bikes", Year = "FY 2017", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 76, Amount = 97264, Country = "United

pivotData.Add(new PivotData { Sold = 53, Amount = 94422, Country = "United
States", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 90, Amount = 45448, Country = "United
States", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 29, Amount = 92345, Country = "United
States", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 67, Amount = 235612, Country = "United
States", Products = "Road Bikes", Year = "FY 2015", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 97, Amount = 90008, Country = "United
States", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q1" });
pivotData.Add(new PivotData { Sold = 79, Amount = 90496, Country = "United
States", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 95, Amount = 501880, Country = "United
States", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q3" });
pivotData.Add(new PivotData { Sold = 97, Amount = 104168, Country = "United
States", Products = "Road Bikes", Year = "FY 2016", Quarter = "Q4" });
pivotData.Add(new PivotData { Sold = 95, Amount = 837800, Country = "United
States", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q1" });

```

```

pivotData.Add(new PivotData { Sold = 87, Amount = 684168, Country = "United States", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q2" });
pivotData.Add(new PivotData { Sold = 109, Amount = 29576, Country = "United States", Products = "Road Bikes", Year = "FY 2017", Quarter = "Q3" });
return View(pivotData);
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Pivot Table control will be rendered in the default web browser.

#### Adding fields to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample data, will further move to showcase the component by organizing appropriate fields in row, column, value and filter axes.

In [PivotViewDataSourceSettings](#) class, four major axes - [Rows](#), [Columns](#), [Values](#) and [Filters](#) plays a vital role in defining and organizing fields from the bound data source, to render the entire pivot table component in a desired format.

[Rows](#) – Collection of fields that needs to be displayed in row axis of the pivot table.

[Columns](#) – Collection of fields that needs to be displayed in column axis of the pivot table.

[Values](#) – Collection of fields that needs to be displayed as aggregated numeric values in the pivot table.

[Filters](#) - Collection of fields that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each field in the respective axis, the following basic properties should be set.

- [Name](#): It allows to set the field name from the bound data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will not be rendered.
- [Caption](#): It allows to set the field caption, which is the alias name of the field that needs to be displayed in the pivot table.
- [Type](#): It allows to set the summary type of the field. By default, [SummaryTypes.Sum](#) is applied.

In this illustration, "Year" and "Quarter" are added in column, "Country" and "Products" in row, and "Sold" and "Amount" in value section respectively.

#### CSHTML

```

@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
{
 dataSource.DataSource((IEnumerable<object>)Model).ExpandAll(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {

```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).Render()

```

|                 | > FY 2015  |             | > FY 2016  |             | >     |
|-----------------|------------|-------------|------------|-------------|-------|
|                 | Units Sold | Sold Amount | Units Sold | Sold Amount | Units |
| > France        | 450        | 714955      | 526        | 1542104     |       |
| > Germany       | 440        | 563515      | 496        | 1772104     |       |
| > United States | 546        | 754515      | 636        | 2263104     |       |
| Grand Total     | 1436       | 2032985     | 1658       | 5577312     |       |

### Applying formatting to a value field

Formatting defines a way in which values should be displayed. For example, format “C” denotes the values should be displayed in currency pattern. To do so, define the [FormatSetting](#) class with its [Name](#) and [Format](#) properties and add it to [PivotViewFormatSettings](#). In this illustration, the [Name](#) property is set as **Amount**, a field from value section and its format is set as currency. Likewise, we can set format for other value fields as well and add it to [PivotViewFormatSettings](#).

**Note:** Only fields from value section, which is in the form of numeric data values are applicable for formatting.

### CSHTML

```

@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)Model).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |            |

### Enable Grouping Bar

The grouping bar feature automatically populates fields from the bound data source and allows end users to drag fields between different axes such as columns, rows, values, and filters, and alter pivot table at runtime. It also provides option to sort, filter and remove fields. It can be enabled by setting the [ShowGroupingBar](#) property to **true**.

### CSHTML

```
@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>)Model).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true).FormatSettings(
 formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).Render()
```

|                        |                             |             |            |             |

### Enable Pivot Field List

The field list allows to add or remove fields and also rearrange the fields between different axes, including column, row, value, and filter along with filter and sort options dynamically at runtime. It can be enabled by setting the [ShowFieldList](#) property to **true**.

### CSHTML

```
@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Render()
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |            |

### Calculated field

The calculated field feature allows user to insert or add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. The calculated field can be included in pivot table using the [CalculatedFieldSetting](#) class from code behind. Or else, calculated fields can be added at run time through the built-in dialog by just setting the [AllowCalculatedField](#) property to **true** in pivot table. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation.

**Note:** Calculated field is applicable only for value fields.

### CSHTML

```
@model List<PivotTableSample.Controllers.PivotData>
@{var amount = "\" + "Sum(Amount)" + "\"; }
@{var sold = "\" + "Sum(Sold)" + "\"; }
@{ var totalPrice = amount + "+" + sold; }
@Html.EJS().Button("calculated-field-btn").Content("Calculated
Field").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource
=>
dataSource.DataSource((IEnumerable<object>)Model).ExpandAll(false).EnableSort
ing(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(
10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).CalculatedFieldSettings(calculatedfieldsettings =>
{
 calculatedfieldsettings.Name("Total").Formula(totalPrice).Add();
}))).AllowCalculatedField(true).Render()
<script>
 document.getElementById("calculated-field-
btn").addEventListener('click', function () {
```

```

 var pivotObj =
document.getElementById("PivotView").ej2_instances[0];
 pivotObj.createCalculatedFieldDialog();
 });
</script>

```

| Calculated Field |            |             |            |             |      |

## Data Binding in ASP.NET MVC Pivot Table Component

### JSON

For JSON data binding, the `type` property under [PivotViewDataSourceSettings](#) needs to be set as `JSON`. By default, the default value is assumed as `JSON`.

### Binding JSON data via local

In-order to bind local JSON data to the pivot table user can assign the local variable holding the JSON data to the [DataSource](#) property under [PivotViewDataSourceSettings](#).

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()

```

### LOCALDATA.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
}

```

```
return View();
}
```

Using local variable, the JSON data can also be bound to the pivot table using [DataManager](#) option with the help of [JsonAdaptor](#). Here the instance of [DataManager](#) holding JSON data is assigned to [DataSource](#) property under [PivotViewDataSourceSettings](#). The use of [DataManager](#) is optional here.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Json(ViewBag.dataSource.ToArray()).Adaptor("JsonAdaptor");
}).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### LOCALJSONDATAMANAGER.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                | FY 2015    |             | FY 2016    |             | FY 2017    |             | FY 2018    |             | Grand Total |
|----------------|------------|-------------|------------|-------------|------------|-------------|------------|-------------|-------------|
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold  |
| France         | 729        | \$1,160,100 | 609        | \$983,317   | 703        | \$1,140,998 | 68         | \$108,402   |             |
| Germany        | 528        | \$845,472   | 667        | \$1,067,220 | 579        | \$945,569   | 130        | \$211,903   |             |
| United Kingdom | 782        | \$1,263,110 | 640        | \$1,031,631 | 657        | \$1,041,051 | 161        | \$265,367   |             |
| United States  | 682        | \$1,085,399 | 480        | \$770,362   | 644        | \$1,022,552 | 232        | \$366,358   |             |
| Grand Total    | 2721       | \$4,354,080 | 2396       | \$3,852,530 | 2583       | \$4,150,169 | 591        | \$952,029   |             |

In the meantime, the JSON data from the local \*.json file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to JSON data that can be assigned to the [DataSource](#) property under [PivotViewDataSourceSettings](#). The following code example illustrates the same.

```
`html
```

```
@using Syncfusion.EJ2.PivotView
```

```

@Html.EJS().Uploader("fileupload").Render()
@Html.EJS().PivotView("pivotview").Render()
<script>
// Step 1: Initiate the file uploader
var uploadObj = new.Uploader({});
uploadObj.appendTo('#fileupload');
var input = document.querySelector('input[type="file"]');
// Step 2: Add the event listener which fires when the *.JSON file is uploaded.
input.addEventListener('change', function (e) {
// Step 3: Initiate the file reader
var reader = new FileReader();
reader.onload = function () {
// Step 4: Getting the string output which is to be parsed as JSON.
var result = JSON.parse(reader.result);
var pivotObj = document.getElementById('pivotview');
pivotObj.dataSourceSettings = {
// Step 5: The JSON result to be bound as data source.
dataSource: result
// Step 6: The appropriate report needs to be provided here.
}
}
reader.readAsText(input.files[0]);
});
</script>

```

#### *Binding JSON data via remote*

In-order to bind remote JSON data, mention the endpoint [URL](#) under [PivotViewDataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (\*.json) and web service URL.

#### **CSHTML**

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.Url("https://cdn.syncfusion.com/data/sales-analysis.json").ExpandAll(false).Rows(rows =>
{
 columns.Name("EnerType").Add();
}).Columns(columns =>
{

```

```

 columns.Name("EneSource").Add();
 }).Values(values =>
 {
 values.Name("PowUnits").Add();
 values.Name("ProCost").Add();
 })
).Render()

```

## REMOTEJSONDATA.CS

```

public ActionResult Index()
{
 return View();
}

```

|             | Bio-diesel  |           | Ethanol Fuel |           | Geo-thermal |           | Hydro-electric |           | Solar     |
|-------------|-------------|-----------|--------------|-----------|-------------|-----------|----------------|-----------|-----------|
|             | Units (GWh) | Cost (MM) | Units (GWh)  | Cost (MM) | Units (GWh) | Cost (MM) | Units (GWh)    | Cost (MM) | Units (G) |
| Biomass     | 1042        | 1439      | 595          | 1031      |             |           |                |           |           |
| Free Energy |             |           |              |           | 1528        | 2115      | 3378           | 3244      |           |
| Grand Total | 1042        | 1439      | 595          | 1031      | 1528        | 2115      | 3378           | 3244      |           |

## CSV

For CSV data binding, the `type` property under [PivotViewDataSourceSettings](#) needs to be set as `CSV` mandatorily.

**Note:** The CSV format is considered to be the most compact format compared to JSON since it is half the size of JSON. This helps to reduce the bandwidth while transferring to the browser.

### Binding CSV data via local

In-order to bind local CSV data to the pivot table, user needs to convert it as string array and then directly assign it to the [DataSource](#) property under [PivotViewDataSourceSettings](#).

## CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource
=> dataSource.DataSource('getCSVData()')
.Type(Syncfusion.EJ2.PivotView.DataSourceType.CSV)
.Rows(rows =>
{
 rows.Name("Region").Add(); rows.Name("Country").Add();
}).Columns(columns =>
{
 columns.Name("Item Type").Add();
 columns.Name("Sales Channel").Add();
}).Values(values =>
{
 values.Name("Total Cost").Add(); values.Name("Total Revenue").Add();
 values.Name("Total Profit").Add();
})).Render()
<script>
function getCSVData() {
 var dataSource = [];
 var jsonObject = window.csvdata.split(/\r?\n|\r/);
 for (var i = 0; i < jsonObject.length; i++) {

```

```

 if (!ej.base.IsNullOrEmpty(jsonObject[i]) && jsonObject[i] !=
 '') {
 dataSource.push(jsonObject[i].split(','));
 }
 }
 return dataSource;
}

window.csvdata = "Region,Country,Item Type,Sales Channel,Order

In the meantime, the CSV data from the local \*.csv file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to string array that can be assigned to the [DataSource](#) property under [PivotViewDataSourceSettings](#). The following code example illustrates the same.

```
`html
@using Syncfusion.EJ2.PivotView
@Html.EJS().Uploader("fileupload").Render()
@Html.EJS().PivotView("pivotview").Render()
<script>
// Step 1: Initiate the file uploader
var uploadObj = new Uploader({});
uploadObj.appendTo('#fileupload');
var input = document.querySelector('input[type="file"]');
// Step 2: Add the event listener which fires when the *.CSV file is uploaded.
input.addEventListener('change', function (e) {
// Step 3: Initiate the file reader
var reader = new FileReader();
reader.onload = function () {
// Step 4: Getting the string output which is to be converted as string[][]
var result = reader.result.split('\n').map(function (line) {
return line.split(',');
});
var pivotObj = document.getElementById('pivotview');
pivotObj.dataSourceSettings = {
// Step 5: The string[][] result to be bound as data source
dataSource: result,
type: 'CSV'
// Step 6: The appropriate report needs to be provided here.
}
};
reader.readAsText(input.files[0]);
});
</script>
`
```

### Binding CSV data via remote

In-order to bind remote CSV data, mention the endpoint [URL](#) under [PivotViewDataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (\*.csv) and web service URL.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.Url("https://bi.syncfusion.com/productservice/api/sales")
.ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true).Type(Syncfusion.EJ2.PivotView.DataSourceType.CSV)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Total Cost").Format("C0").UseGrouping(true).Add();
 formatsettings.Name("Total Revenue").Format("C0").UseGrouping(true).Add();
 formatsettings.Name("Total Profit").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Region").Add(); rows.Name("Country").Add();
}).Columns(columns =>
{
 columns.Name("Item Type").Add();
 columns.Name("Sales Channel").Add();
}).Values(values =>
{
 values.Name("Total Cost").Add(); values.Name("Total Revenue").Add();
 values.Name("Total Profit").Add();
})
).Render()
```

### REMOTECSVDATA.CS

```
public ActionResult Index()
{
 return View();
}
```

### Remote Data Binding

To interact with remote data source, provide the endpoint [Url](#) within [DataManager](#). By default, [DataManager](#) uses [ODataAdaptor](#) for remote data-binding.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
 }).Columns(columns =>
 {
 columns.Name("ProductName").Caption("Product Name").Add();
 }).Values(values =>
 {
 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
 })
}).Render()
```

### **REMOTEDATA.CS**

```
public ActionResult Index()
{
 return View();
}
```

### *Binding with OData services*

OData is a standardized protocol for creating and consuming data. User can retrieve data from OData service using the **DataManager** class. Refer to the following code example for remote data binding using OData service.

### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders/").CrossDomain(true).Adaptor("ODataAdaptor");
}).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("CustomerID").Caption("Customer ID").Add();
}).Values(values =>
{
 values.Name("Freight").Caption("Freight").Add();
}))
```

```
.ShowFieldList(true).Render()
```

### ODATA.CS

```
public ActionResult Index()
{
 return View();
}
```

#### *Binding with OData V4 services*

The OData V4 is an improved version of OData protocols, and the **DataManager** class can be used to retrieve and consume OData V4 services. For more details on OData V4 services, refer to the [OData documentation](#). To bind OData V4 service, use the [ODataV4Adaptor](#).

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/Orders/").CrossDomain(true).Adaptor("ODataV4Adaptor");
}).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
 }).Columns(columns =>
 {
 columns.Name("CustomerID").Caption("Customer ID").Add();
 }).Values(values =>
 {
 values.Name("Freight").Caption("Freight").Add();
 //values.Name("UnitPrice").Caption("Unit Price").Add();
 })
).ShowFieldList(true).Render()
```

### ODATAV4.CS

```
public ActionResult Index()
{
 return View();
}
```

#### *Web API*

User can use **WebApiAdaptor** to bind pivot table with Web API created using OData endpoint.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
```

```

 }).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
 }).Columns(columns =>
 {
 columns.Name("ProductName").Caption("Product Name").Add();
 }).Values(values =>
 {
 values.Name("Quantity").Caption("Quantity").Add();
values.Name("UnitPrice").Caption("Unit Price").Add();
 })
).Render()

```

### WEB-API.CS

```

public ActionResult Index()
{
 return View();
}

```

### Querying in Data Manager

By default, the data manager retrieves all the data from the provider which is mapped in it. The data from the provider can be filtered, sorted, paged, etc. by setting the own query in `defaultQuery` property in the data manager instance.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
dataManger.Url("https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders").CrossDomain(true).Adaptor("ODataAdaptor");
}).ExpandAll(false).ShowAggregationOnValueField(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
 }).Columns(columns =>
 {
 columns.Name("CustomerID").Caption("Customer ID").Add();
 }).Values(values =>
 {
 values.Name("Freight").Caption("Freight").Add();
 })
).Load("load").Render()
<script>
function load(args) {
 var dataSource = args.dataSourceSettings.dataSource;
 dataSource.defaultQuery = new ej.data.Query().take(2);
}

```

```
</script>
```

### ODATAADAPTOR.CS

```
public ActionResult Index()
{
 return View();
}
```

### Mapping

One can define field information like alias name (caption), data type, aggregation type, show and hide subtotals etc. using the [FieldMapping](#) property under [PivotViewDataSourceSettings](#). The available options are,

- [Name](#) - It is to specify the appropriate field name.
- [Caption](#) - It is to set the alias name (caption) to the specific field. Instead of actual field name, the alias name (caption) will be set in the UI of the pivot table.
- [Type](#) - It is to display values in the pivot table with appropriate aggregation such as sum, product, count, average, minimum, maximum, etc. Its default value is **sum**. This option is applicable only for relational data source.
- [Axis](#) - It will help to display the field in specified axis such as row/column/value/filter axis of the pivot table.
- [ShowNoDataItems](#) - It is to show all the members of a specific field to the pivot table, even if there are no data in the intersection of the row and column. The default value is **false**. This option is applicable only for relational data source.
- [BaseField](#) - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective field is assigned for comparison via this property.
- [BaseItem](#) - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective member in a field is assigned for comparison via this property.
- [ExpandAll](#) - It is to expand or collapse all headers of a specific field in row and column axes of the pivot table. The default value is **false**.
- [ShowSubTotals](#) - It is to show or hide sub-totals of a specific field in row and column axis of the pivot table. The default value is **true**.
- [IsNamedSet](#) - It is to set whether the specified field is named set or not. In general, the named set is a set of dimension members or a set expression (MDX query) to be created as a dimension in the SSAS OLAP cube itself. The default value is **false** and this option is applicable only for OLAP data source.
- [IsCalculatedField](#) - It is to set whether the specified field is a calculated field or not. In general, a calculated field is created from the bound data source or using simple formula with basic arithmetic operators in the pivot table. The default value is **false** and this option is applicable only for OLAP data source.
- [ShowFilterIcon](#) - It is to show or hide the filter icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This filter icon is used to filter the members of a specified field at runtime in the pivot table. The default value is **true**.
- [ShowSortIcon](#) - It is to show or hide the sort icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This sort icon is used to order members of a specified field either in ascending or descending at runtime. The default value is **true**.

- [ShowRemoveIcon](#) - It is to show or hide the remove icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This remove icon is used to remove the specified field during runtime. The default value is **true**.
- [ShowValueTypeIcon](#) - It is to show or hide the value type icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This value type icon helps to select the appropriate aggregation type to specified value field at runtime. The default value is **true**.
- [ShowEditIcon](#) - It is to show or hide the edit icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This edit icon is used to modify caption, formula, and format of a specified calculated field at runtime. The default value is **true**.
- [AllowDragAndDrop](#) - It is to restrict specific field's button from being dragged on runtime in the grouping bar and field list UI. This will prevent from altering the current report. The default value is **true**.
- [DataType](#) - It is to specify the type of the field like 'string', 'number', 'datetime', 'date', and 'boolean'.
- [GroupName](#) - It is to display fields in the field list UI by grouping them under the desired folder name.

The main purpose of these mapping options is to configure each field that is not part of the initial pivot report. Even if any field that is part of this mapping is defined here, the value set in the initial report will have the highest preceding.

**Note:** This option is applicable only for relational data source.

In the below code sample, visibility of the field button icons are configured.

#### CSHTML

```
@using Syncfusion.EJ2
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
dataSource =>
{
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true).AllowValueFilter(true).FormatSettings(
formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Production Year").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
})).FieldMapping(fields=>
{
 fields.Name("Quarter").ShowSortIcon(false).Add();
 fields.Name("Products").ShowFilterIcon(false).ShowRemoveIcon(false).Add();
 fields.Name("Amount").ShowValueTypeIcon(false).Caption("Sold Amount").Add();
}).ShowGroupingBar(true).ShowFieldList(true).Render()
```

**FIELD\_MAPPING.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

### Values in row axis

By default, the value fields are plotted in column axis. To plot those fields in row axis, use the `valueAxis` property by setting its value as `row`. By default, it holds the value `column`.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ValueAxis("row")
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()

```

### VALUESINROW.CS

```

public ActionResult Index()
{

```

```

var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

|                 | ► FY 2015 | ► FY 20...  | ► FY 20...  | ► FY 20... | Grant |

| Sold Amount     | \$563,515 | \$1,772,104 | \$1,634,808 | \$77,264   | \$4,  |
| ► United States |           |             |             |            |       |

#### Values at different positions

By default, the value fields are placed at the end of the row or column axis. To place those value fields in different positions, use the [valueIndex](#) property and set the value to an appropriate index position. Its default value is **-1**, which denotes the last position. The [valueIndex](#) property is dependent on the [valueAxis](#) property.

**Note:** This support is only available for relational data sources. Also, enable the [showValuesButton](#) property in the grouping bar and field list UI to **true** to re-arrange the values fields at different positions via user interaction.

#### CSHTML

```

@Html.EJS().PivotView("PivotView").Width("100%").Height("350").DataSourceSet
tings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
).ValueIndex(1)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Add();
 })
).Render()

```

**MEASUREATDIFFERENTPOSITION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                | ▼ FY 2015  |     |     |     |
|----------------|------------|-----|-----|-----|
|                | Units Sold |     |     |     |
|                | Q1         | Q2  | Q3  | Q4  |
| ▼ France       | 114        | 108 | 110 | 118 |
| Mountain Bikes | 31         | 51  | 90  | 25  |
| Road Bikes     | 83         | 57  | 20  | 93  |
| ▼ Germany      | 74         | 128 | 140 | 98  |
| Mountain Bikes | 51         | 61  | 70  | 85  |
| Road Bikes     | 23         | 67  | 70  | 13  |

**Show 'no data' items**

By default, the pivot table only shows the field item if it has data in its row or column combination. To show all items that do not have data in row and column combination in the pivot table, use the [ShowNoDataItems](#) property by settings its value to **true** for the desired fields. In the following code sample, rows of the "Country" and "Products" fields do not have data in all combination with "Year" and "Quarter" column field.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").ShowNoDataItems(true).Add();
 rows.Name("Products").ShowNoDataItems(true).Add();
 }).Columns(columns =>
 {
 columns.Name("Year").ShowNoDataItems(true).Add();
 columns.Name("Quarter").ShowNoDataItems(true).Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()
```

**NODATA.CS**

}

```

|                | FY 2018    |             |            |             |       |
|----------------|------------|-------------|------------|-------------|-------|
|                | Q1         |             | Q2         |             | Q3    |
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units |
| France         | 16         | \$27,264    |            |             |       |
| Mountain Bikes | 16         | \$27,264    |            |             |       |
| Road Bikes     |            |             |            |             |       |
| Germany        | 96         | \$77,264    |            |             |       |
| Mountain Bikes | 96         | \$77,264    |            |             |       |

Always shows the value headers

To show the value header always in pivot table even it holds a single value, use the [AlwaysShowValueHeader](#) property by settings its value as **true**.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).AlwaysShowValueHeader(true)
 .Rows(rows =>

```

```

{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}) .Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}) .Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
})) .Render()

```

### SINGLE-CALCULATION-HEADER.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                 | ► FY 2015   | ► FY 2016   | ► FY 2017   | ► FY 2018   | Grand Total |
|-----------------|-------------|-------------|-------------|-------------|-------------|
|                 | Sold Amount | Sold Amount | Sold Amount | Sold Amount | Sold Amount |
| ► France        | \$714,955   | \$1,542,104 | \$2,903,308 | \$27,264    | \$5,187     |
| ► Germany       | \$563,515   | \$1,772,104 | \$1,634,808 | \$77,264    | \$4,047     |
| ► United States | \$754,515   | \$2,263,104 | \$3,387,308 | \$97,264    | \$6,502     |
| Grand Total     | \$2,032,985 | \$5,577,312 | \$7,925,424 | \$201,792   | \$15,737    |

### Customize empty value cells

User can show custom string in empty value cells using the [EmptyCellsTextContent](#) property in [PivotViewDataSourceSettings](#) class of the pivot table. Since the property is of string data type, user can fill empty value cells with any value like "0", "-", "\*", "(blank)", etc. Its common for all value fields and can be configured through code behind.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).EmptyCellsTextContent("**")
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}) .Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}) .Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}

```

```
}).Render()
```

### EMPTY-CELLS.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
public List<PivotData> GetPivotData()
{
 List<PivotData> pivotData = new List<PivotData>();
 pivotData.Add(new PivotData { Amount = 100, Country = "Canada", Date =
 "FY 2005", Products = "Bike", Quantity = 2, State = "Alberta" });
 pivotData.Add(new PivotData { Amount = 200, Country = "Canada", Date =
 "FY 2006", Products = "Van", Quantity = 3, State = "British Columbia" });
 pivotData.Add(new PivotData { Amount = 150, Country = "United States",
 Date = "FY 2006", Products = "Car", Quantity = 3, State = "New Mexico" });
 pivotData.Add(new PivotData { Amount = 200, Country = "United States",
 Date = "FY 2005", Products = "Bike", Quantity = 4, State = "New York" });
 return pivotData;
}
public class PivotData
{
 public int Quantity { get; set; }
 public double Amount { get; set; }
 public string Country { get; set; }
 public string Products { get; set; }
 public string Date { get; set; }
 public string State { get; set; }
}
```

|                | FY 2015    |             |            |             |            |
|----------------|------------|-------------|------------|-------------|------------|
|                | Q1         |             | Q2         |             | Q3         |
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 114        | \$177,246   | **         | **          | 110        |
| Mountain Bikes | 31         | \$52,824    | **         | **          | 90         |
| Road Bikes     | 83         | \$124,422   | **         | **          | 20         |
| Germany        | 74         | \$117,246   | 128        | \$152,352   | 140        |
| Mountain Bikes | 51         | \$92,824    | 61         | \$76,904    | 70         |

### Events

#### Load

The event **Load** fires before initiate rendering of pivot table. In this event user can customize data source settings before initiating pivot table render module. It holds following parameters like **dataSourceSettings**, **fieldsType** and **pivotView**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource
=> dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingbar(true).Load("load").Render()
<script>
 function load(args){
 args.dataSourceSettings.columns[0].caption = 'Full Year';
 }
</script>
```

**LOAD.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*EnginePopulated*

The event **EnginePopulated** is triggered after engine is populated. It has following parameters - **dataSourceSettings**, **pivotFieldList** and **pivotValues**.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource
=> dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingbar(true).EnginePopulated("enginePopulated").Render()
<script>
 function enginePopulated(args){
 //trigger after engine populated
 }
</script>
```

**ENGINEPOPULATED.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*EnginePopulating*

The event **EnginePopulating** triggers before the pivot engine starts to populate and allows to customize the pivot datasource settings. It has following parameter **dataSourceSettings**.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingbar(true).EnginePopulating("enginePopulating").Render()
<script>
 function enginePopulating(args) {
 args.dataSourceSettings.columns[0].caption = 'Full Year';
 }
</script>
```

**ENGINEPOPULATING.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

## Connecting to data source

### MySQL in EJ2 ASP.NET MVC Pivotview Component

This section describes how to retrieve data from a MySQL database using [MySqlConnection](#) and bind it to the Pivot Table via a Web API controller.

#### *Create a Web API service to fetch MySQL data*

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

2. To connect a MySQL Server using the **MySqlConnection** in our application, we need to install the [MySQL.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MySQL.Data** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MySQLConnection** helps to connect the MySQL database. Next, using **MySQLCommand** and **MySQLDataAdapter** you can process the desired query string and retrieve data from the MySQL database. The **Fill** method of the **MySQLDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using MySQL.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 public dynamic GetMySQLResult()
 {
```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySQLCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetMySQLResult** method is used to retrieve the MySQL data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

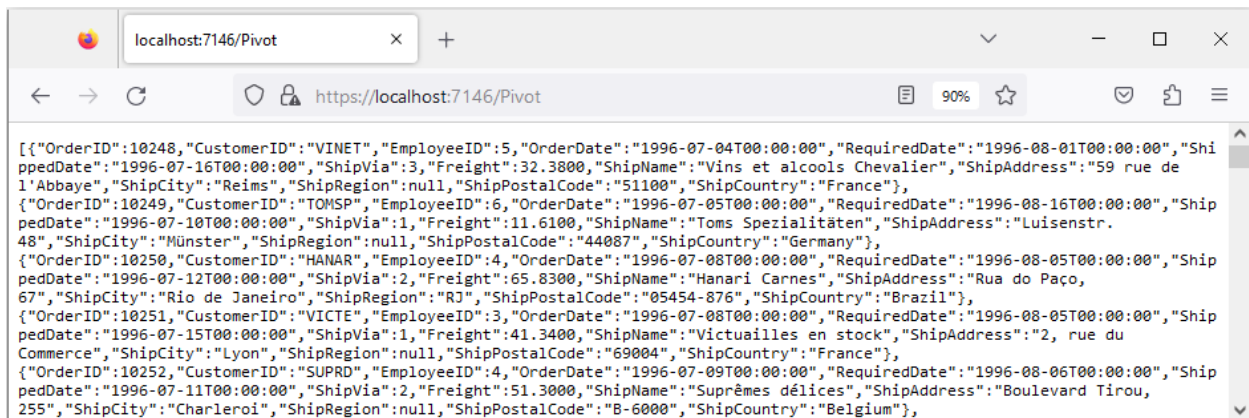

```
`csharp
using Microsoft.AspNetCore.Mvc;
using MySql.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetMySQLResult")]
 public object Get()
 {
 return JsonConvert.SerializeObject(GetMySQLResult());
 }
 public dynamic GetMySQLResult()
 {

```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySQLCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

6. Run the application and it will be hosted within the URL <https://localhost:7146>.

7. Finally, the retrieved data from MySQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:7146/Pivot>, as shown in the browser page below.

### Connecting the Pivot Table to a MySQL database using the Web API service

1. Create a simple ASP.NET MVC Pivot Table by following the **“Getting Started”** documentation [link](#).

2. Map the hosted Web API's URL link <https://localhost:7146/Pivot> to the Pivot Table in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:7146/pivot")
)
//Other codes here...
```

```

).Render()

```

3. Frame and set the report based on the data retrieved from the MySQL database.

```

`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:7146/Pivot"
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
rows.Name("ShipCity").Add();
}).Columns(columns =>
{
columns.Name("ShipName").Add();
}).Values(values =>
{
values.Name("Freight").Caption("Sum of Freight").Add();
})).ShowFieldList(true).Render()

```

When you run the sample, the resulting pivot table will look like this:

|              | Alfred's Futterkist | Alfreds Futterkist | Ana Trujillo Empa | Antonio Moreno | Around the Horn | B's |
|--------------|---------------------|--------------------|-------------------|----------------|-----------------|-----|
| Aachen       |                     |                    |                   |                |                 |     |
| Albuquerque  |                     |                    |                   |                |                 |     |
| Anchorage    |                     |                    |                   |                |                 |     |
| Barcelona    |                     |                    |                   |                |                 |     |
| Barquisimeto |                     |                    |                   |                |                 |     |
| Bergamo      |                     |                    |                   |                |                 |     |
| Berlin       | 196.12000000...     | 29.46              |                   |                |                 |     |
| Bern         |                     |                    |                   |                |                 |     |

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a MySQL database and bind to the Pivot Table in [this](#) GitHub repository.

Microsoft SQL Server in EJ2 ASP.NET MVC Pivotview Component

This section describes how to retrieve data from SQL Server database using [Microsoft SqlClient](#) and bind it to the Pivot Table via a Web API controller.

*Steps to connect the SQL Server database via Web API application*

1. Download the ASP.NET Core Web Application from [this](#) GitHub repository.

2. The application named as **PivotController** (server-side) that is downloaded from the above GitHub repository includes the following files.

- **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
- **Database1.mdf** file under **App\_Data** folder – This MDF (Master Database File) file contains example data.

3. In the Web API controller (aka, PivotController), **SqlConnection** helps to connect the SQL database (that is, Database1.mdf). Next, using **SqlCommand** and **SqlDataAdapter** you can process the desired SQL query string and retrieve data from the database. The **Fill** method of the DataAdapter is used to populate the SQL data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using System.Data;
using System.Data.SqlClient;
namespace PivotController.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 private static DataTable FetchSQLResult()
 {
 string conSTR = @"<Enter your valid connection string here>";
 string xquery = "SELECT * FROM table1";
 SqlConnection sqlConnection = new(conSTR);
 sqlConnection.Open();
 SqlCommand cmd = new(xquery, sqlConnection);
 SqlDataAdapter dataAdapter = new(cmd);
 DataTable dataTable = new();
 dataAdapter.Fill(dataTable);
 return dataTable;
 }
 }
}
```

```
}
,
```

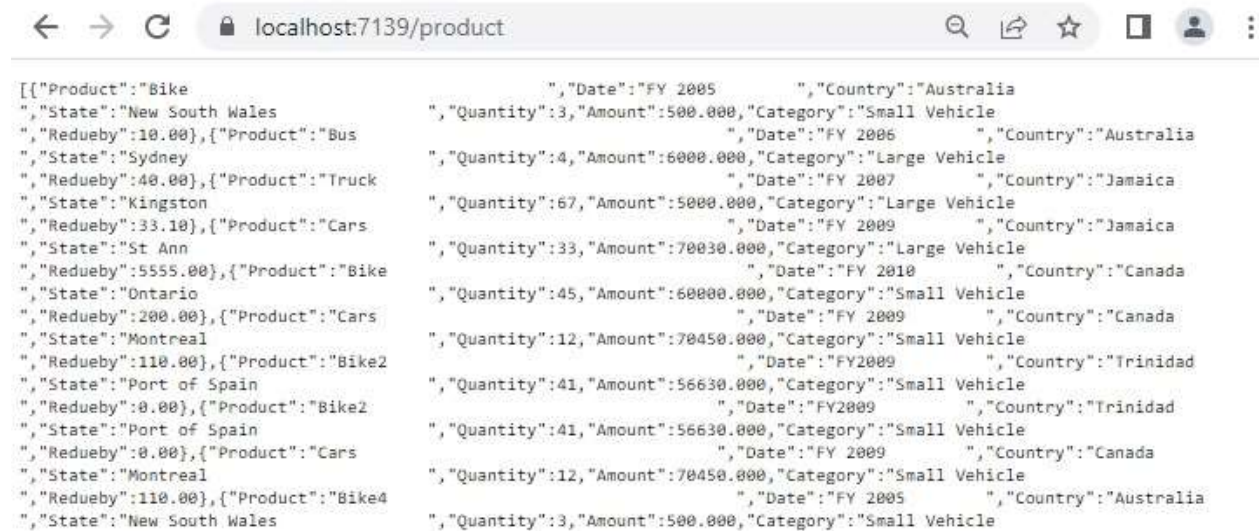

4. In the **Get()** method of the **PivotController.cs** file, the **FetchSQLResult** method is used to retrieve the SQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using System.Data.SqlClient;
namespace PivotController.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetSQLResult")]
 public object Get()
 {
 return JsonConvert.SerializeObject(FetchSQLResult());
 }
 private static DataTable FetchSQLResult()
 {
 string conSTR = @"<Enter your valid connection string here>";
 string xquery = "SELECT * FROM table1";
 SqlConnection sqlConnection = new(conSTR);
 sqlConnection.Open();
 SqlCommand cmd = new(xquery, sqlConnection);
 SqlDataAdapter dataAdapter = new(cmd);
 DataTable dataTable = new();
 dataAdapter.Fill(dataTable);
 return dataTable;
 }
 }
}
```

```
}
,
```

5. Run the web application (aka, PivotController) and it will be hosted within the URL <https://localhost:7139>.

6. Finally, the retrieved data from SQL Server which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:7139/pivot>, as shown in the browser page below.

#### Connecting the Pivot Table to the hosted Web API URL

1. Download the ASP.NET MVC Pivot Table sample from [this](#) GitHub repository.

2. Next, map the hosted Web API's URL link <https://localhost:7139/pivot> to the Pivot Table component in **app.ts** by using the [Url](#) under [PivotViewDataSourceSettings](#) property..

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:7139/pivot")
)
//Other codes here...
).Render()
,
```

3. Frame and set the report based on the data retrieved from the SQL database.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:7139/pivot")
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
```

```

rows.Name("Country").Add(); rows.Name("State").Add();
}).Columns(columns =>
{
columns.Name("Product").Add();
}).Values(values =>
{
values.Name("Quantity").Add(); values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Render()
`

```

4. Run the sample to get the following result.

|             | Large Vehicle |        | Small Vehicle |         | Grand Total |    |
|-------------|---------------|--------|---------------|---------|-------------|----|
|             | Quantity      | Amount | Quantity      | Amount  | Quantity    | Am |
| ▶ Australia | 16            | 24000  | 12            | 2000    | 28          |    |
| ▶ Canada    |               |        | 420           | 1649000 | 420         |    |
| ▶ Jamaica   | 400           | 300120 |               |         | 400         |    |
| ▶ Trinidad  |               |        | 328           | 453040  | 328         |    |
| Grand Total | 416           | 324120 | 760           | 2104040 | 1176        |    |

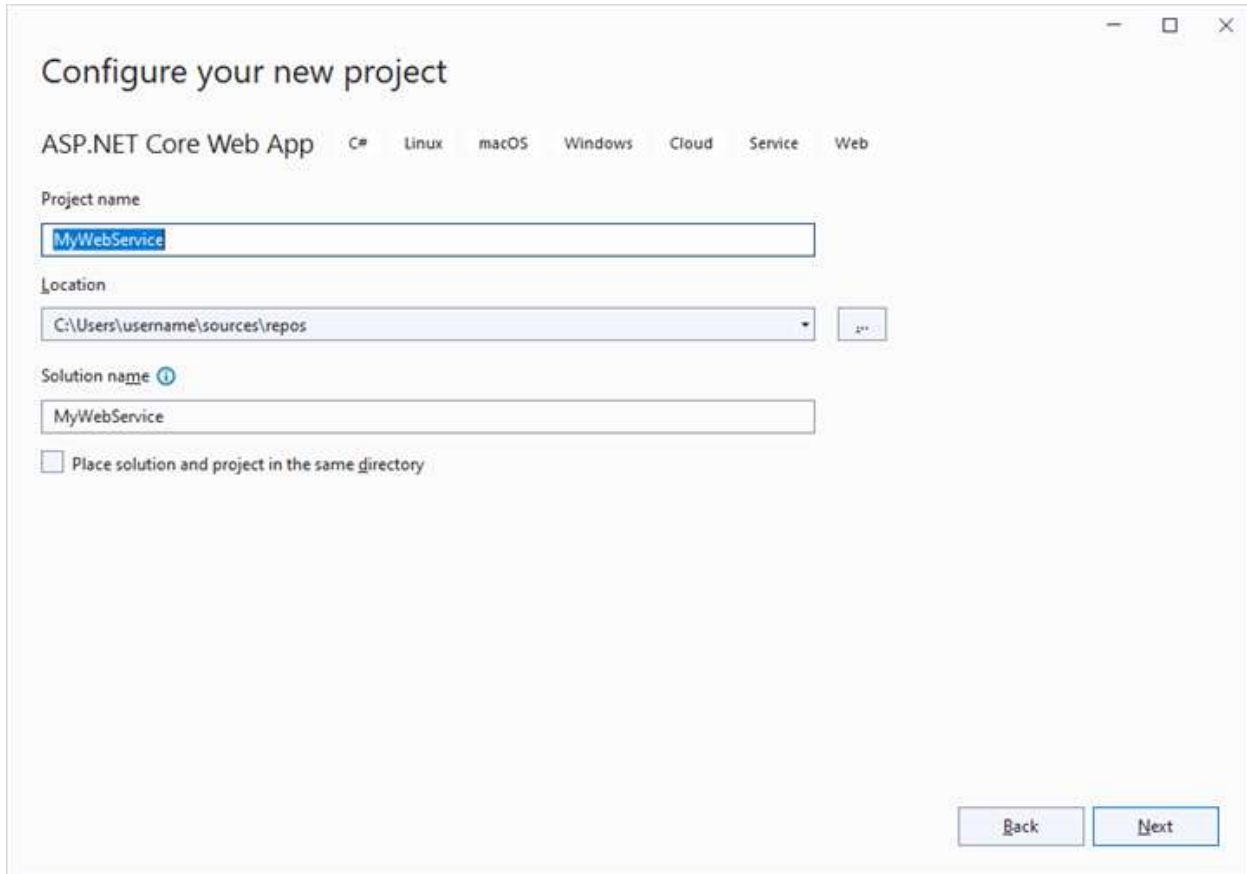

The sample for connecting the Pivot Table to a SQL Server database via an ASP.NET Web application can be found in [this](#) GitHub repository.

#### PostgreSQL in EJ2 ASP.NET MVC Pivotview Component

This section describes how to consume data from PostgreSQL database using [Microsoft Npgsql](#) and bind it to the Pivot Table via a Web API controller.

##### Create a Web API service to fetch PostgreSQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name  
MyWebService

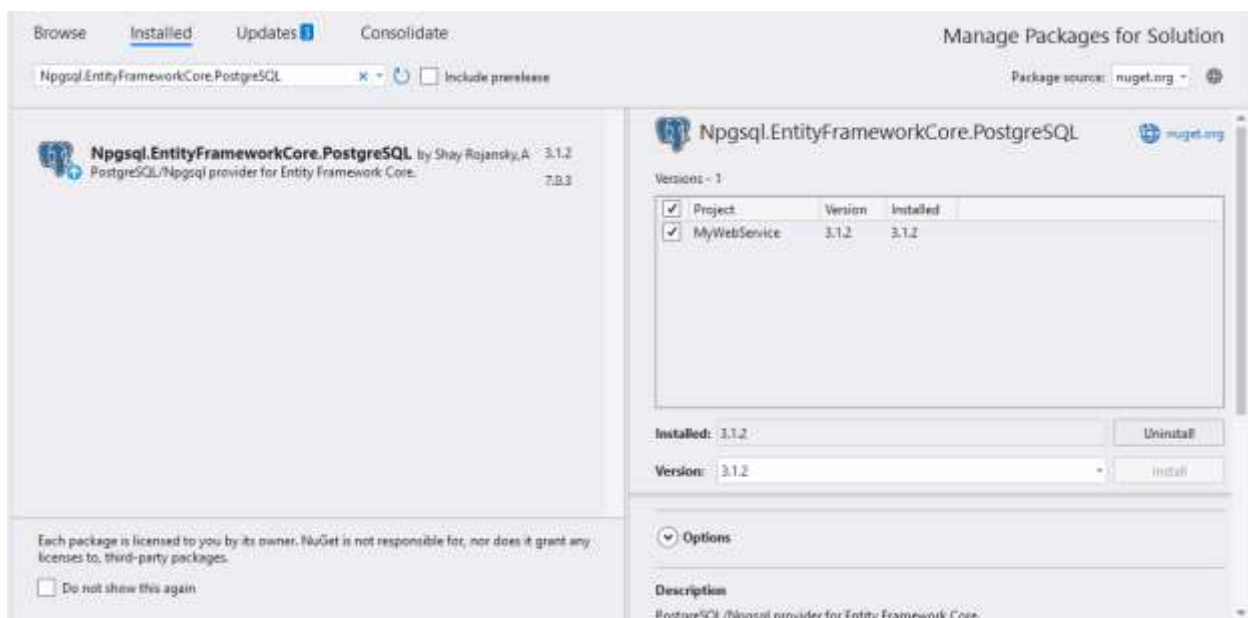

Location  
C:\Users\username\source\repos

Solution name  
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a PostgreSQL Server using the **Npgsql** in our application, we need to install the [Npgsql.EntityFrameworkCore.PostgreSQL](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Npgsql.EntityFrameworkCore.PostgreSQL** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **NpgsqlConnection** helps to connect the PostgreSQL database. Next, using **NpgsqlCommand** and **NpgsqlDataAdapter** you can process the desired PostgreSQL query string and retrieve data from the database. The **Fill** method of the **NpgsqlDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 public dynamic GetPostgreSQLResult()
 {
 // Replace with your own connection string.
 NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
 connection.Open();
 NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
 NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
 DataTable dt = new DataTable();
 da.Fill(dt);
 connection.Close();
 return dt;
 }
 }
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetPostgreSQLResult** method is used to retrieve the PostgreSQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
```

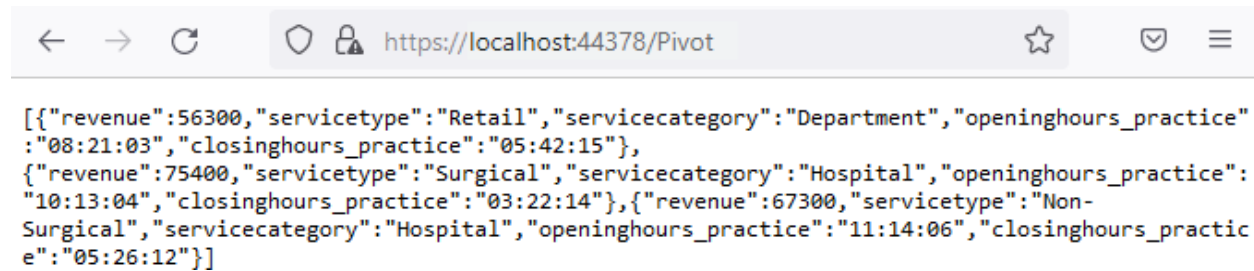

```

using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetPostgreSQLResult")]
 public object Get()
 {
 return JsonConvert.SerializeObject(GetPostgreSQLResult());
 }
 public dynamic GetPostgreSQLResult()
 {
 // Replace with your own connection string.
 NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
 connection.Open();
 NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
 NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
 DataTable dt = new DataTable();
 da.Fill(dt);
 connection.Close();
 return dt;
 }
 }
}

```

**6.** Run the application and it will be hosted within the URL <https://localhost:44378/>.

**7.** Finally, the retrieved data from PostgreSQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

*Connecting the Pivot Table to a PostgreSQL database using the Web API service*

1. Create a simple ASP.NET MVC Pivot Table by following the **“Getting Started”** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44378/Pivot` to the Pivot Table component in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44378/Pivot"
)
//Other codes here...
).Render()
`
```

3. Frame and set the report based on the data retrieved from the PostgreSQL database.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44378/Pivot"
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
rows.Name("servicetype").Add(); rows.Name("servicecategory").Add();
}).Columns(columns =>
{
columns.Name("openinghourspractice").Add(); columns.Name("closinghourspractice").Add();
}).Values(values =>
{
values.Name("revenue").Add();
})).ShowFieldList(true).Render()
`
```

When you run the sample, the resulting pivot table will look like this:

|                | ▶ 08:21:03 | ▶ 10:13:04 | ▶ 11:14:06 | Grand Total |
|----------------|------------|------------|------------|-------------|
| ▶ Non-Surgical |            |            | 67300      | 67300       |
| ▶ Retail       | 56300      |            |            | 56300       |
| ▶ Surgical     |            | 75400      |            | 75400       |
| Grand Total    | 56300      | 75400      | 67300      | 199000      |

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a PostgreSQL database and bind to the Pivot Table in [this](#) GitHub repository.

#### Oracle in EJ2 ASP.NET MVC Pivotview Component

This section describes how to retrieve data from Oracle database using [Oracle Managed Data Access](#) and bind it to the Pivot Table via a Web API controller.

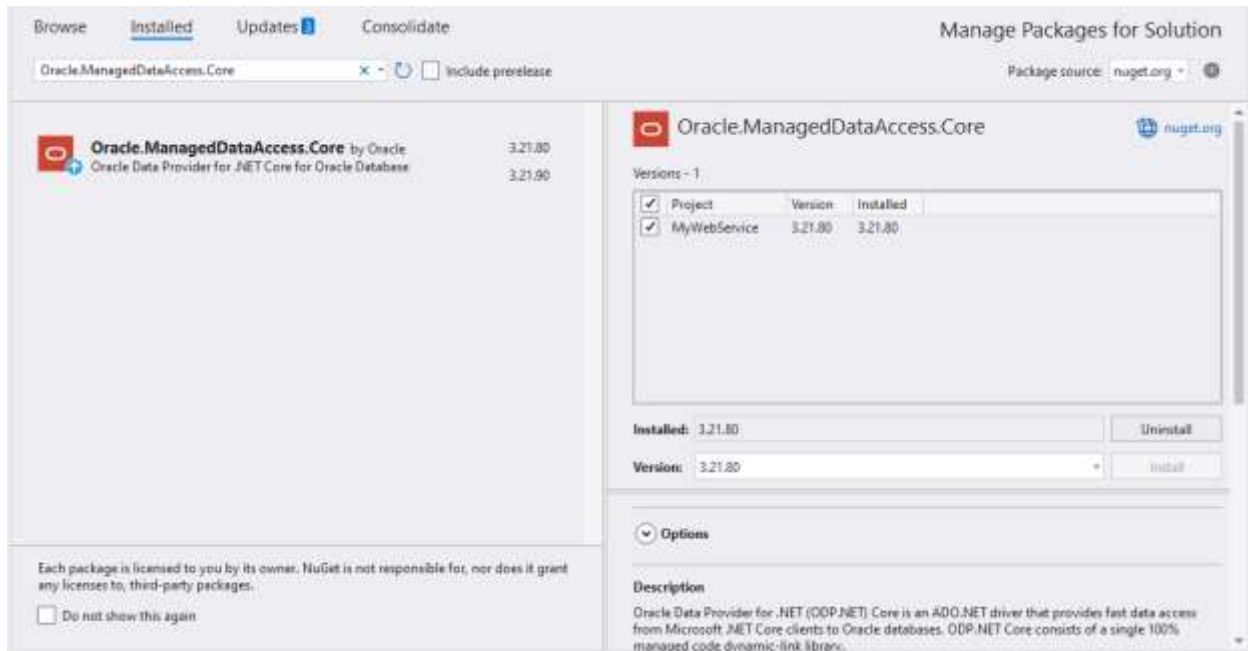

#### Create a Web API service to fetch Oracle data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

The screenshot shows the 'Configure your new project' window in Visual Studio. The 'ASP.NET Core Web App' template is selected. The 'Project name' field contains 'MyWebService'. The 'Location' field shows 'C:\Users\username\source\repos'. The 'Solution name' field also contains 'MyWebService'. There is an unchecked checkbox labeled 'Place solution and project in the same directory'. At the bottom right, there are 'Back' and 'Next' buttons.

2. To connect a Oracle Server using the **Oracle.ManagedDataAccess.Client** in our application, we need to install the [Oracle.ManagedDataAccess.Core](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Oracle.ManagedDataAccess.Core** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **OracleConnection** helps to connect the Oracle database. Next, using **OracleCommand** and **OracleDataAdapter** you can process the desired Oracle query string and retrieve data from the database. The **Fill** method of the **OracleDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 private static DataTable FetchOracleResult()
 {
 // Replace with your own connection string.
 string connectionString = "<Enter your valid connection string here>";
 OracleConnection oracleConnection = new OracleConnection(connectionString);
```

```

oracleConnection.Open();
OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
oracleConnection.Close();
return dataTable;
}
}
}
`

```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchOracleResult()** method is used to retrieve the Oracle data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetOracleResult")]
 public object Get()
 {
 return JsonConvert.SerializeObject(FetchOracleResult());
 }
 private static DataTable FetchOracleResult()
 {
 // Replace with your own connection string.
 string connectionString = "<Enter your valid connection string here>";

```

```

OracleConnection oracleConnection = new OracleConnection(connectionString);
oracleConnection.Open();
OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
oracleConnection.Close();
return dataTable;
}
}
}
`

```

6. Run the application and it will be hosted within the URL <https://localhost:44346/>.

7. Finally, the retrieved data from Oracle database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

*Connecting the Pivot Table to a Oracle database using the Web API service*

1. Create a simple ASP.NET MVC Pivot Table by following the “**Getting Started**” documentation [link](#).

2. Map the hosted Web API's URL link <https://localhost:44346/pivot> to the Pivot Table component in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```

`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44346/pivot"
)
//Other codes here...

```

```

).Render()

```

3. Frame and set the report based on the data retrieved from the Oracle database.

```

`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44346/Pivot"
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
rows.Name("JOB").Caption("Job").Add(); rows.Name("SALARY").Caption("Salary").Add();
}).Columns(columns =>
{
columns.Name("DEPARTMENTID").Caption("Department ID").Add();
columns.Name("EMPLOYEEID").Caption("Employee ID").Add();
}).Values(values =>
{
values.Name("EMPLOYEEID").Caption("Employee ID").Add();
values.Name("CCEMPLOYEES").Caption("Employees").Add();
values.Name("CCTAXPERCENTAGE").Caption("Percentage").Add();
})).ShowFieldList(true).Render()

```

When you run the sample, the resulting pivot table will look like this:

|             | ▶ 10  | ▶ 20  | ▶ 30  | Grand Total |
|-------------|-------|-------|-------|-------------|
| ▶ ANALYST   |       | 15690 |       | 15690       |
| ▶ CLERK     | 7934  | 15245 | 7900  | 31079       |
| ▶ MANAGER   | 7782  | 7566  | 7698  | 23046       |
| ▶ PRESIDENT | 7839  |       |       | 7839        |
| ▶ SALESMAN  |       |       | 30518 | 30518       |
| Grand Total | 23555 | 38501 | 46116 | 108172      |

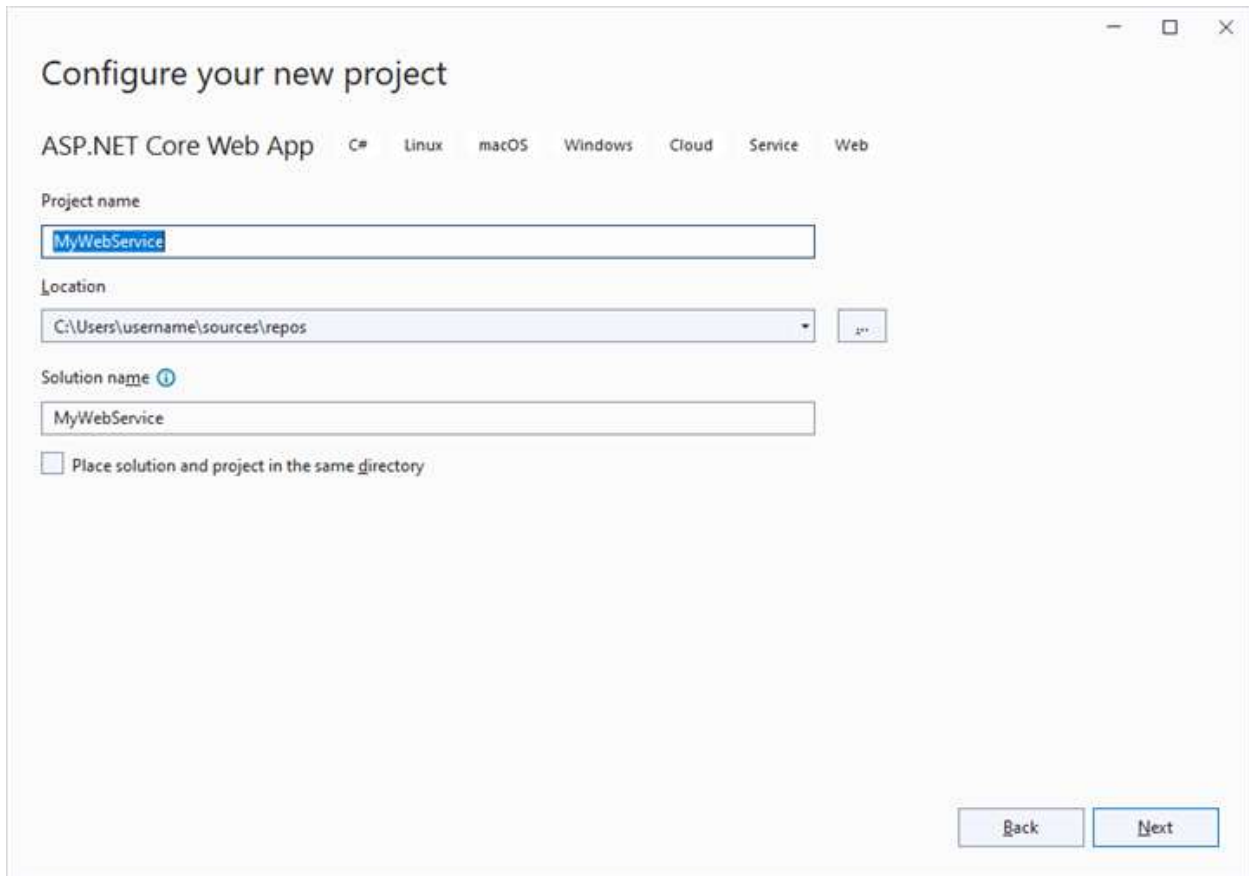

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a Oracle database and bind to the Pivot Table in [this](#) GitHub repository.

#### MongoDB in EJ2 ASP.NET MVC Pivotview Component

This section describes how to consume data from MongoDB database using [MongoDB Driver](#) and [MongoDB Bson](#) libraries and bind it to the Pivot Table via a Web API controller.

*Create a Web API service to fetch MongoDB data*

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

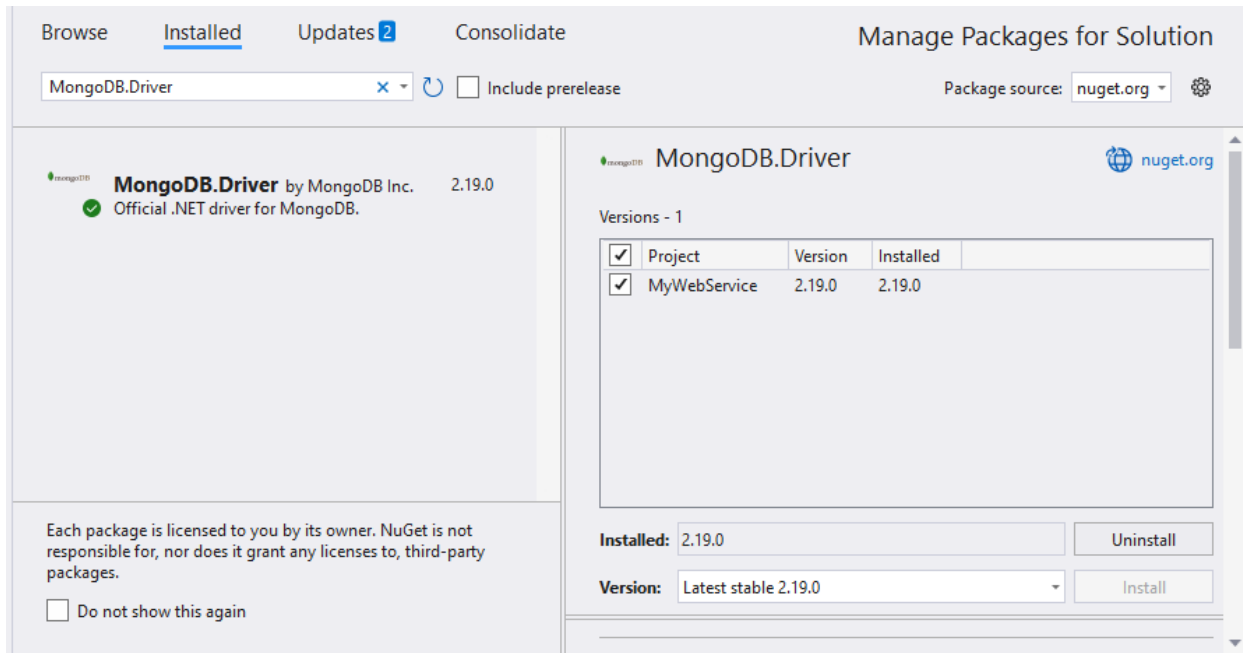

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a MongoDB Server using the **MongoDB.Driver** and **MongoDB.Bson** in our application, we need to install the [MongoDB.Driver](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MongoDB.Driver** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MongoClient** helps to connect the MongoDB database. Next, using the **GetDatabase** and **GetCollection** methods, you can retrieve data from the database. The **Find** method of the **IMongoDatabase** is used to populate the retrieved data into a **List**, as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Driver;
using MongoDB.Bson;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 private static List<ProductDetails> FetchMongoDbResult()
 {
 // Replace with your own connection string.
 string connectionString = "<Enter your valid connection string here>";
```

```

MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}

public class ProductDetails
{
 public ObjectId Id { get; set; }
 public int Sold { get; set; }
 public double Amount { get; set; }
 public string? Country { get; set; }
 public string? Products { get; set; }
 public string? Year { get; set; }
 public string? Quarter { get; set; }
}
}
}
`

```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchMongoDbResult()** method is used to retrieve the MongoDB data as a **List**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Bson;
using MongoDB.Driver;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetMongoDbResult")]
 public object Get()

```

```

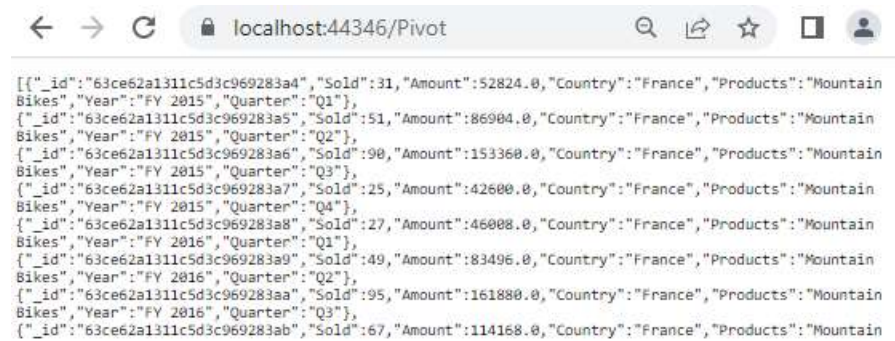

{
return JsonConvert.SerializeObject(FetchMongoDbResult());
}
private static List<ProductDetails> FetchMongoDbResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}
public class ProductDetails
{
public ObjectId Id { get; set; }
public int Sold { get; set; }
public double Amount { get; set; }
public string? Country { get; set; }
public string? Products { get; set; }
public string? Year { get; set; }
public string? Quarter { get; set; }
}
}
}
`

```

6. Run the web application and it will be hosted within the URL <https://localhost:44346/>.

7. Finally, the retrieved data from MongoDB database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

```
[{"_id": "63ce62a1311c5d3c969283a4", "Sold": 31, "Amount": 52824.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2015", "Quarter": "Q1"}, {"_id": "63ce62a1311c5d3c969283a5", "Sold": 51, "Amount": 86904.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2015", "Quarter": "Q2"}, {"_id": "63ce62a1311c5d3c969283a6", "Sold": 90, "Amount": 153360.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2015", "Quarter": "Q3"}, {"_id": "63ce62a1311c5d3c969283a7", "Sold": 25, "Amount": 42600.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2015", "Quarter": "Q4"}, {"_id": "63ce62a1311c5d3c969283a8", "Sold": 27, "Amount": 46008.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2016", "Quarter": "Q1"}, {"_id": "63ce62a1311c5d3c969283a9", "Sold": 49, "Amount": 83496.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2016", "Quarter": "Q2"}, {"_id": "63ce62a1311c5d3c969283aa", "Sold": 95, "Amount": 161880.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2016", "Quarter": "Q3"}, {"_id": "63ce62a1311c5d3c969283ab", "Sold": 67, "Amount": 114168.0, "Country": "France", "Products": "Mountain Bikes", "Year": "FY 2016", "Quarter": "Q4"}]
```

*Connecting the Pivot Table to a MongoDB database using the Web API service*

1. Create a simple ASP.NET MVC Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44346/Pivot` to the Pivot Table component in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:44346/pivot")
)
//Other codes here...
).Render()
`
```

3. Frame and set the report based on the data retrieved from the MongoDB database.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:44346/Pivot")
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add(); values.Name("Amount").Caption("Sold Amount").Add();
}).ShowFieldList(true).Render()
`
```

When you run the sample, the resulting pivot table will look like this:

|                  | FY 2015    |             | FY 2016    |             | F |
|------------------|------------|-------------|------------|-------------|---|
|                  | Units Sold | Sold Amount | Units Sold | Sold Amount |   |
| > France         | 729        | 1160099.5   | 609        | 983317      |   |
| > Germany        | 528        | 845472      | 667        | 1067220     |   |
| > United Kingdom | 782        | 1263109.5   | 640        | 1031630.5   |   |
| > United States  | 682        | 1085398.5   | 480        | 770362      |   |
| Grand Total      | 2721       | 4354079.5   | 2396       | 3852529.5   |   |

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a MongoDB database and bind to the Pivot Table in [this](#) GitHub repository.

### Elasticsearch in EJ2 ASP.NET MVC Pivotview Component

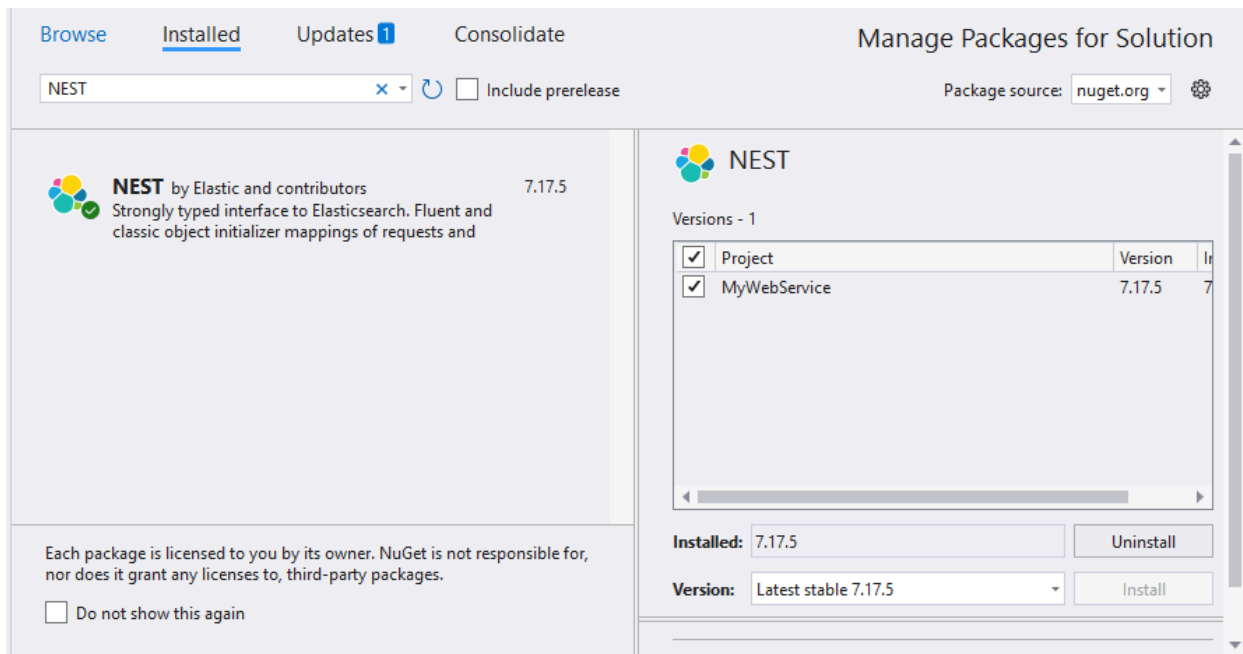

This section describes how to retrieve data from Elasticsearch database using [Nest](#) library and bind it to the Pivot Table via a Web API controller.

#### Create a Web API service to fetch Elasticsearch data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

The screenshot shows the 'Configure your new project' dialog in Visual Studio. The 'ASP.NET Core Web App' template is selected. The project name is 'MyWebService', the location is 'C:\Users\username\sources\repos', and the solution name is 'MyWebService'. The checkbox 'Place solution and project in the same directory' is unchecked. 'Back' and 'Next' buttons are at the bottom right.

2. To connect a Elasticsearch Server using the **NEST** in our application, we need to install the [NEST](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **NEST** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **ElasticClient** helps to connect the Elasticsearch database. Next, using **Search** method you can query your Elasticsearch index and retrieve results from the database.

5. In the **Get()** method of the **PivotController.cs** file, the **FetchElasticsearchData** method is used to retrieve the Elasticsearch data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Nest;
using Newtonsoft.Json;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetElasticSearchData")]
 public object Get()
```

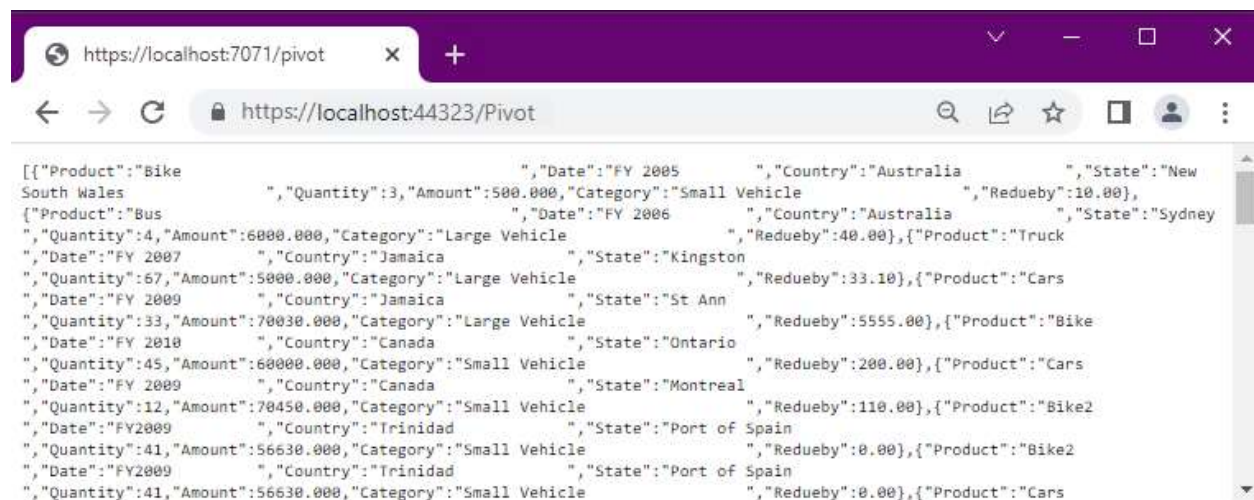

```

{
return JsonConvert.SerializeObject(FetchElasticsearchData());
}
private static object FetchElasticsearchData()
{
// Replace with your own connection string.
var connectionString = "<Enter your valid connection string here>";
var uri = new Uri(connectionString);
var connectionSettings = new ConnectionSettings(uri);
var client = new ElasticClient(connectionSettings);
var searchResponse = client.Search<object>(s => s
.Index("product")
.Size(1000)
);
return searchResponse.Documents;
}
}
}
,

```

6. Run the web application and it will be hosted within the URL <https://localhost:44323>.

7. Finally, the retrieved data from Elasticsearch database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44323/Pivot>, as shown in the browser page below.

*Connecting the Pivot Table to a Elasticsearch database using the Web API service*

1. Create a simple ASP.NET MVC Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44323/Pivot` to the Pivot Table component in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:44323/pivot"
)
//Other codes here...
).Render()
`
```

3. Frame and set the report based on the data retrieved from the Elasticsearch database.

```
`csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
 dataSource => dataSource.Url("https://localhost:44323/Pivot"
).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("State").Add();
}).Columns(columns =>
{
 columns.Name("Product").Add();
}).Values(values =>
{
 values.Name("Quantity").Add(); values.Name("Amount").Caption("Sold Amount").Add();
}).ShowFieldList(true).Render()
`
```

When you run the sample, the resulting pivot table will look like this:

|             | Large Vehicle |        | Small Vehicle |         | Grand Total |        |
|-------------|---------------|--------|---------------|---------|-------------|--------|
|             | Quantity      | Amount | Quantity      | Amount  | Quantity    | Amount |
| ▶ Australia | 16            | 24000  | 12            | 2000    | 28          |        |
| ▶ Canada    |               |        | 420           | 1649000 | 420         |        |
| ▶ Jamaica   | 400           | 300120 |               |         | 400         |        |
| ▶ Trinidad  |               |        | 328           | 453040  | 328         |        |
| Grand Total | 416           | 324120 | 760           | 2104040 | 1176        |        |

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a Elasticsearch database and bind to the Pivot Table in [this](#) GitHub repository.

### Snowflake in EJ2 ASP.NET MVC Pivotview Component

This section describes how to retrieve data from a Snowflake database using [Snowflake Data](#) and bind it to the Pivot Table via a Web API controller.

#### Create a Web API service to fetch Snowflake data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App   C#   Linux   macOS   Windows   Cloud   Service   Web

Project name  
MyWebService

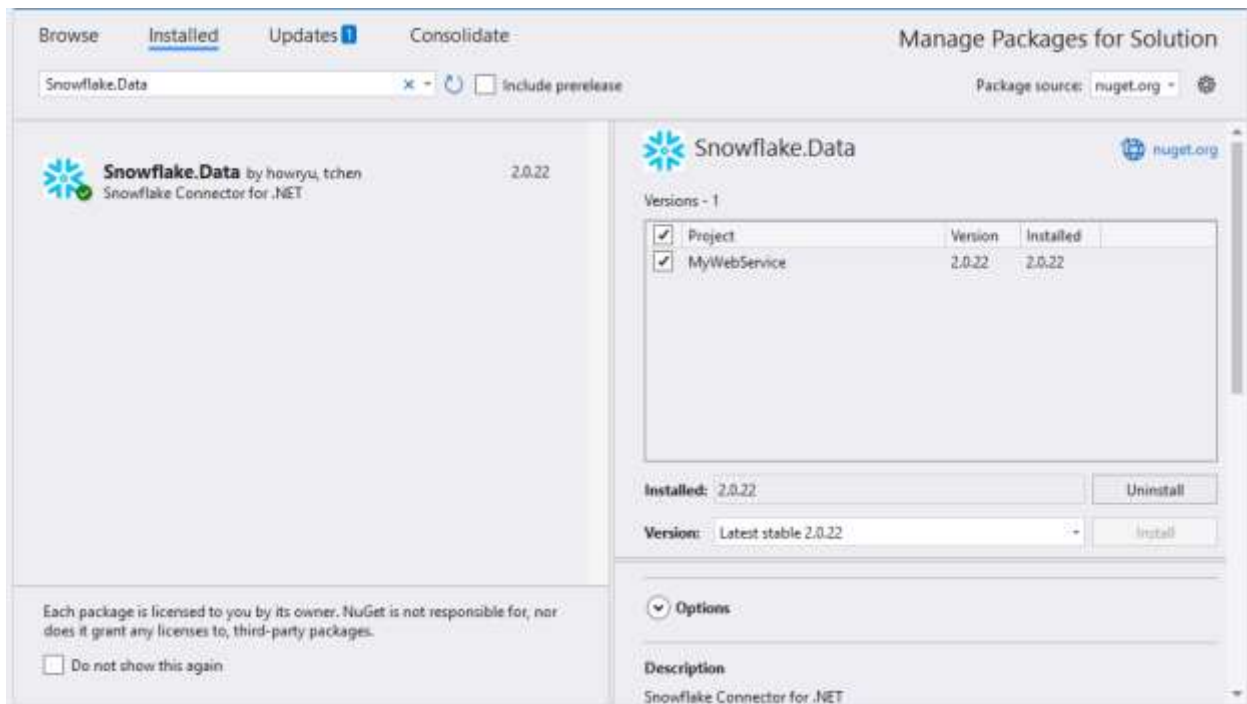

Location  
C:\Users\username\source\repos

Solution name ⓘ  
MyWebService

☐ Place solution and project in the same directory

Back   Next

2. To connect a Snowflake Server using the **Snowflake.Data.Client** in our application, we need to install the [Snowflake.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Snowflake.Data** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **SnowflakeDbConnection** helps to connect the Snowflake database. Next, using **SnowflakeDbDataAdapter** you can process the desired Snowflake query string and retrieve data from the database. The **Fill** method of the **SnowflakeDbDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpGet(Name = "GetSnowflakeResult")]
```

```

public object Get()
{
 return JsonConvert.SerializeObject(FetchSnowflakeResult());
}

public static DataTable FetchSnowflakeResult()
{
 using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
 {
 // Replace with your own connection string.
 snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
 snowflakeConnection.Open();

 SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",
 snowflakeConnection);

 DataTable dataTable = new DataTable();
 adapter.Fill(dataTable);
 snowflakeConnection.Close();
 return dataTable;
 }
}

```

**5.** In the **Get()** method of the **PivotController.cs** file, the **FetchSnowflakeResult** method is used to retrieve the Snowflake data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]

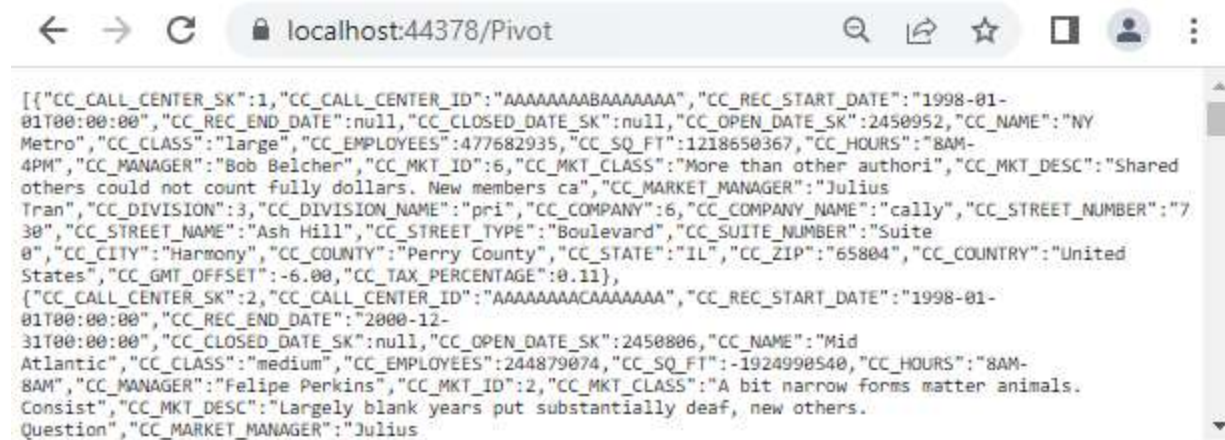

```

```
public class PivotController : ControllerBase
{
 [HttpGet(Name = "GetSnowflakeResult")]
 public object Get()
 {
 return JsonConvert.SerializeObject(FetchSnowflakeResult());
 }
 public static DataTable FetchSnowflakeResult()
 {
 using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
 {
 // Replace with your own connection string.
 snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
 snowflakeConnection.Open();
 SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",
 snowflakeConnection);
 DataTable dataTable = new DataTable();
 adapter.Fill(dataTable);
 snowflakeConnection.Close();
 return dataTable;
 }
 }
}
```

6. Run the application and it will be hosted within the URL <https://localhost:44378/>.

7. Finally, the retrieved data from Snowflake database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

*Connecting the Pivot Table to a Snowflake database using the Web API service*

1. Create a simple ASP.NET MVC Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44378/Pivot` to the Pivot Table component in `~/Views/Home/Index.cshtml` by using the [Url](#) under [PivotViewDataSourceSettings](#) property.

```
'csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44378/pivot"
)
//Other codes here...
).Render()
`
```

3. Frame and set the report based on the data retrieved from the Snowflake database.

```
'csharp
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(
dataSource => dataSource.Url("https://localhost:44378/Pivot"
).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
rows.Name("CCSTATE").Caption("State").Add(); rows.Name("CCCITY").Caption("City").Add();
}).Columns(columns =>
{
columns.Name("CC_COUNTRY").Caption("Country").Add();
}).Values(values =>
{

```

```

values.Name("CCCOMPANY").Caption("Company").Add();
values.Name("CCEMPLOYEES").Caption("Employees").Add();
values.Name("CCTAXPERCENTAGE").Caption("Percentage").Add();
}).ShowFieldList(true).Render()

```

When you run the sample, the resulting pivot table will look like this:

|      | United States |            |                 | Grand Total |            |             |
|------|---------------|------------|-----------------|-------------|------------|-------------|
|      | Company       | Employees  | Percentage      | Company     | Employees  | Percentage  |
| ▶ CA | 16            | 413279139  | 0.4800000000... | 16          | 413279139  | 0.480000... |
| ▶ CO | 5             | 1160903623 | 0.18            | 5           | 1160903623 |             |
| ▶ FL | 15            | 1162362540 | 0.33            | 15          | 1162362540 |             |

| ▶ LA | 6             | 528468075  | 0.16            | 6           | 528468075  |             |

Explore our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to extract data from a Snowflake database and bind to the Pivot Table in [this](#) GitHub repository.

## OLAP

### Getting Started with ASP.NET MVC

**Note:** Starting with v16.2.0.x, if you reference Syncfusion assemblies from trial setup or from the NuGet feed, you also have to include a license key in your projects. Refer to this [link](#) to know about registering Syncfusion license key in your ASP.NET MVC application to use our components.

### Prerequisites

To get start with ASP.NET MVC application, need to ensure the following software to be installed on the machine.

1. .NET Framework 4.5 and above.
2. ASP.NET MVC 4 or ASP.NET MVC 5
3. Visual Studio

### Preparing ASP.NET MVC application

Follow below steps to create ASP.NET MVC Application.

**Step 1:** Choose **File > New > Project...** in the Visual Studio menu bar.

**Step 2:** Select **Installed > Visual C# > Web** and choose the required **.NET Framework** in the drop-down.

**Step 3:** Select **ASP.NET Web Application (.NET Framework)** and change the application name, and then click **OK**.

**Note:** The Essential JS 2 supports 4.5+ .NET Framework in the ASP.NET MVC application. i.e. The minimum target framework is 4.5 for Syncfusion ASP.NET MVC (Essential JS 2).

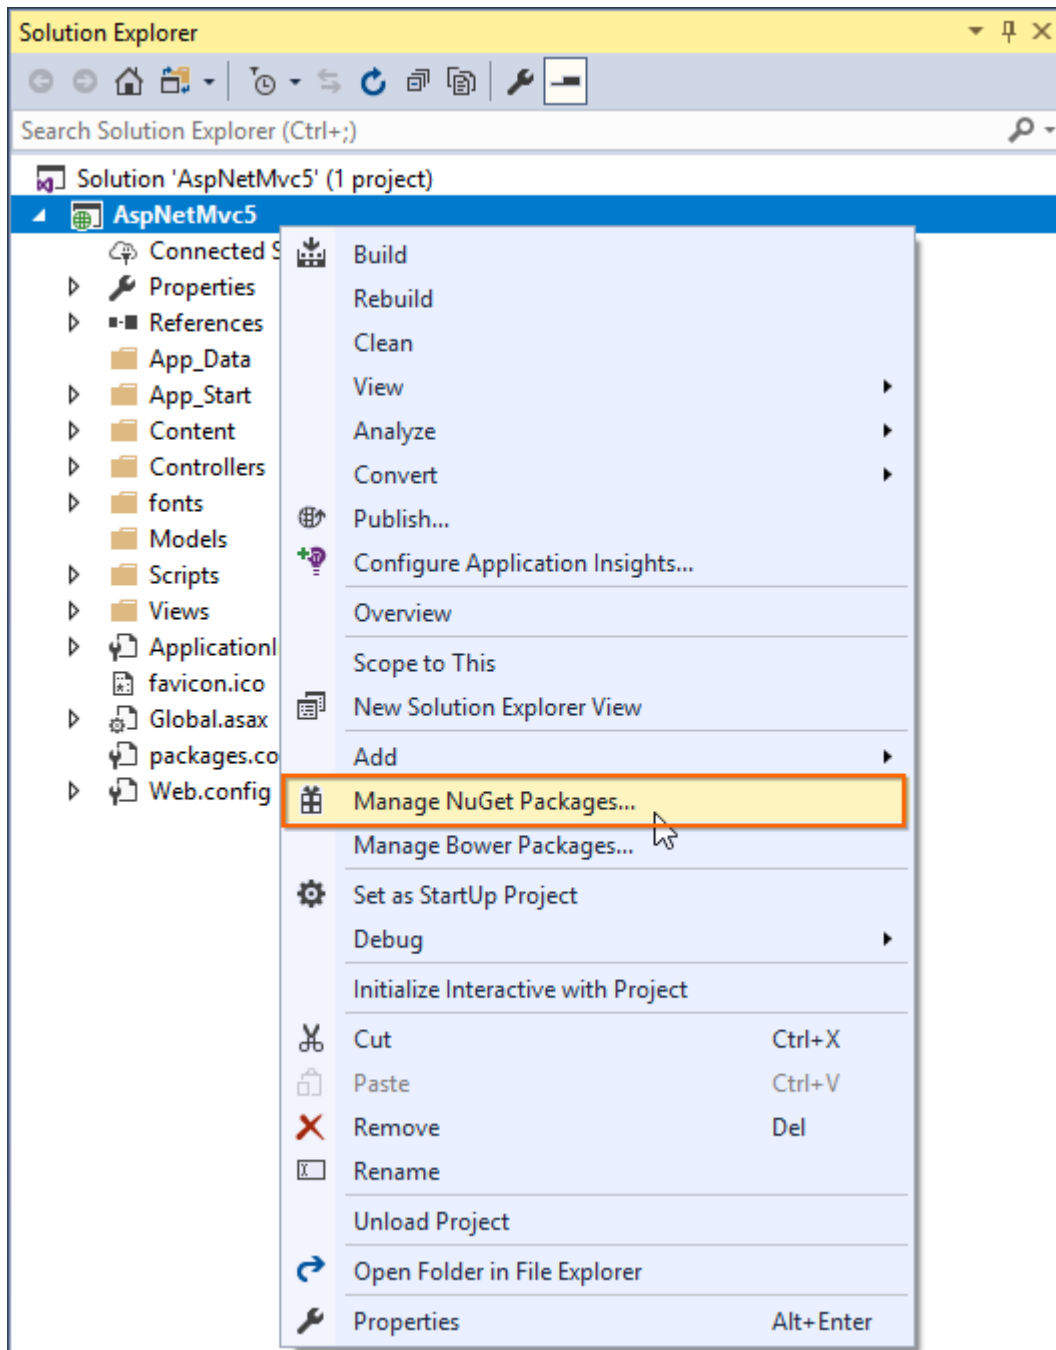

**Step 4:** Choose **MVC** and then click **OK**. Now, the MVC web application project is created with default ASP.NET MVC template.

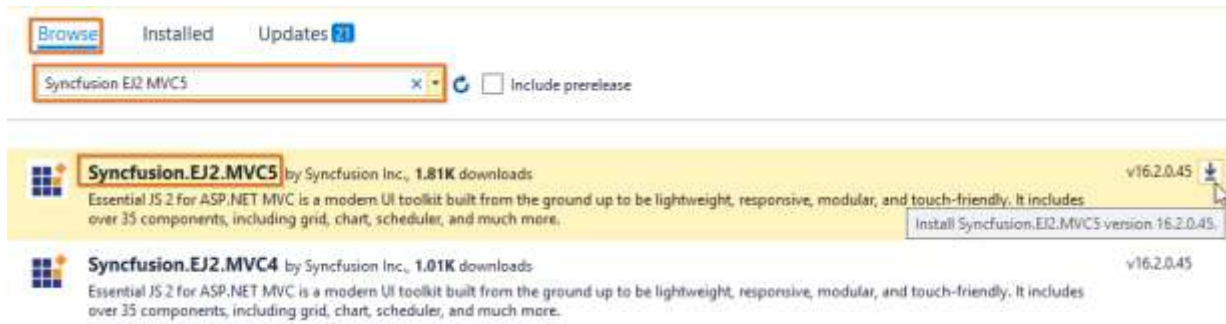

*Configure Essential JS 2 in the application*

**Step 1:** Add the [SynCFusion.EJ2.MVC5](#) NuGet package to the new application by using the Nuget Package Manager. Right-click the project and select **Manage NuGet Packages...**

**Note:** Refer to [this article](#) to learn more details about installing Essential JS 2 NuGet packages in various OS environment.

**Step 2:** Search the Syncfusion EJ2 MVC5 keyword in the **Browse** tab and install **Syncfusion.EJ2.MVC5** NuGet package in the application.

The Essential JS 2 MVC5 NuGet package will be included in the project, after the installation process is completed.

**Note:** The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Step 3:** Open `~/Views/Web.config` file and add the `Syncfusion.EJ2` namespace reference to the `<system.web.webPages.razor>` element and `Syncfusion.EJ2` assembly reference to `<system.web>` element.

```
`html
<configuration>
...
<system.web.webPages.razor>
...
<pages pageBaseType="System.Web.Mvc.WebViewPage">
<namespaces>
...
...
<add namespace="Syncfusion.EJ2"/>
</namespaces>
</pages>
</system.web.webPages.razor>
...
<system.web>
<compilation>
<assemblies>
...
...
<add assembly="Syncfusion.EJ2, Culture=neutral" />
</assemblies>
```

```

</compilation>
</system.web>
</configuration>
`

```

**Step 4:** Add the client-side resources through [CDN](#) in the `<head>` element of `~/Views/Shared/_Layout.cshtml` layout page.

```

`html
<head>
...
<!-- Syncfusion Essential JS 2 Styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/material.css" />
<!-- Syncfusion Essential JS 2 Scripts -->
<script src="https://cdn.syncfusion.com/ej2/dist/ej2.min.js"></script>
</head>
`

```

**Step 5:** Add the Essential JS 2 Script Manager at the end of `<body>` element in the `~/Views/Shared/_Layout.cshtml` layout page.

```

`html
<body>
...
<!-- Syncfusion Essential JS 2 ScriptManager -->
@Html.EJS().ScriptManager()
</body>
`

```

### Adding component to the application

Add the below code to your `Index.cshtml` view page which is present under `Views/Home` folder, to initialize the pivot table component with sample OLAP data source.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").DataSourceSettings(
dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure
Works").ProviderType(ProviderType.SSAS)).Render()

```

### PIVOTTABLE.CS

```
public ActionResult Index()
{
 return View();
}
```

#### *Adding OLAP cube elements to row, column, value and filter axes*

Now that pivot table is initialized and assigned with sample OLAP data source, will further move to showcase the component by organizing appropriate [OLAP cube elements](#) in [Rows](#), [Columns](#), [Values](#) and [Filters](#) axes.

In [DataSourceSettings](#) property, four major axes [Rows](#), [Columns](#), [Values](#) and [Filters](#) plays a vital role in defining and organizing [OLAP cube elements](#) from the bound data source, to render the entire pivot table component in a desired format.

**Rows** – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in row axis of the pivot table.

**Columns** – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in column axis of the pivot table.

**Values** – Collection of [OLAP cube elements](#) (such as Measures, Calculated Measures) that needs to be displayed as aggregated numeric values in the pivot table.

**Filters** - Collection of [OLAP cube elements](#) (such as Hierarchies and Calculated Members) that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each [OLAP cube element](#) in the respective axis, the following basic properties should be set.

- **Name**: It allows to set the unique name of the hierarchies, named set, measures, calculated members etc., from the bound OLAP data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will be rendered as empty.
- **Caption**: It allows to set the caption, which is the alias name of the unique name that needs to be displayed in the pivot table. If not provided, unique name will be displayed.

In this sample, "Product Categories" is added in column, "Customer Geography" in row, and "Customer Count" and "Internet Sales Amount" in value axes respectively.

#### **CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("400").DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product Categories]").Caption("Product Categories").Add(); columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet Sales Amount]").Caption("Internet Sales Amount").Add(); })
```

```
.Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date Fiscal").Add(); })).Render()
```

### FIELDS.CS

```
public ActionResult Index()
{
 return View();
}
```

#### *Applying formatting to measures*

Formatting defines a way in which values should be displayed in pivot table. For example, format “C0” denotes the values should be displayed in currency pattern without decimal points. To do so, define the [PivotViewFormatSetting](#) with its [Name](#) and [Format](#) properties. In this sample, the [Name](#) property is set as “[Measures].[Internet Sales Amount]”, a measure from value axis and its [Format](#) is set as “C0”. Likewise, we can set format for other measures as well.

**Note:** Only measures from [Values](#) axis, which is in the form of numeric data values are applicable for formatting.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product Categories]").Caption("Product Categories").Add(); columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date Fiscal").Add(); })
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("[Measures].[Internet Sales Amount]").Format("C0").Add();
 })
 .Render()
```

### FORMATTING.CS

```
public ActionResult Index()
{
 return View();
}
```

*Enable grouping bar*

The Grouping Bar feature automatically populates [OLAP cube elements](#) from the bound data source and allows end users to drag [OLAP cube elements](#) between different axes such as [Rows](#), [Columns](#), [Values](#) and [Filters](#), and change pivot view at runtime. Sorting, filtering and removing of elements is also possible. It can be enabled by setting the [ShowGroupingBar](#) property to **true** as follows.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowGroupingBar(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })).Render()
<style>
 #pivotview {
 display: block;
 }
</style>
```

**GROUPING-BAR.CS**

```
public ActionResult Index()
{
 return View();
}
```

*Enable pivot field list*

The component provides a built-in Field List similar to Microsoft Excel. It allows you to add or remove [OLAP cube elements](#) and also rearrange the [OLAP cube elements](#) between different axes, including [Rows](#), [Columns](#), [Values](#) and [Filters](#) along with filter and sort options dynamically at runtime. It can be enabled by setting the [ShowFieldList](#) property to **true** as follows.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("400").ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
```

```

 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })).Render()

```

### FIELD-LIST.CS

```

public ActionResult Index()
{
 return View();
}

```

#### Exploring filter axis

The filter axis contains collection of [OLAP cube elements](#) such as hierarchies and calculated members that would act as master filter over the data bound in [Rows](#), [Columns](#) and [Values](#) axes of the pivot table. The [OLAP cube elements](#) along with filter members could be set to filter axis either through report via code behind or by dragging and dropping [OLAP cube elements](#) from other axes to filter axis via grouping bar or field list at runtime.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowFieldList
(true).ShowGroupingBar(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
 .FilterSettings(filterSettings =>
 {
filterSettings.Name("[Date].[Fiscal]").Items(ViewBag.filterMembers).LevelCou
nt(3).Add();
 })).Render()
<style>
 #pivotview {
 display: block;
 }
</style>

```

**EXPLORE-FILTER.CS**

```
public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}
```

*Calculated field*

The calculated field allows user to insert or add a new calculated field based on the available [OLAP cube elements](#) from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

It can be customized using the [PivotViewCalculatedFieldSetting](#) property through code behind. The setting required for calculate field feature at code behind are:

- [Name](#): It allows to set the unique name for new calculated field.
- [Formula](#): It allows to set the user-defined expression.
- [HierarchyUniqueName](#): It allows to specify dimension unique name whose hierarchies alone should be used in the expression. This will be applicable only for calculated dimension.
- [FormatString](#): It allows to set the format string for the resultant calculated field.

You need to set [IsCalculatedField](#) property to true, while adding calculated fields to respective axis through code behind.

Also calculated fields can be added at run time through the built-in dialog. The dialog can be enabled by setting the [AllowCalculatedField](#) property to **true** as follows. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation.

**Note:** Calculated measure can be added only in value axis.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowFieldList
(true).ShowGroupingBar(true).AllowCalculatedField(true).DataSourceSettings(d
ataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
```

```

Sales Amount]").Caption("Internet Sales Amount").Add(); values.Name("Order
on Discount").IsCalculatedField(true).Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
 .FilterSettings(filterSettings =>
 {

filterSettings.Name("[Date].[Fiscal]").Items(ViewBag.filterMembers).LevelCou
nt(3).Add();
 }).CalculatedFieldSettings(calculatedFieldSettings =>
 {

calculatedFieldSettings.Name("BikeAndComponents").Formula("([Product].[Produ
ct Categories].[Category].[Bikes] + [Product].[Product
Categories].[Category].[Components])").HierarchyUniqueName("[Product].[Produ
ct Categories]").FormatString("Standard").Add();
 calculatedFieldSettings.Name("Order on
Discount").Formula("[Measures].[Order Quantity] + ([Measures].[Order
Quantity] * 0.10)").FormatString("Currency").Add();
 })).Render()
<style>
 #pivotview {
 display: block;
 }
</style>

```

### **CALCULATED-FIELD.CS**

```

public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal
Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}

```

Users can add a calculated field at runtime through the built-in dialog by using the following steps.

**Step 1:** Click the "CALCULATED FIELD" button in the field list dialog positioned at the top right corner. The calculated field dialog will be opened now. Enter the name of the calculated field to be created.

<br/>

<br/>

#### Format String

Allows you to specify the required format string while creating new calculated field. Supported format strings are:

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "###0.##0#". This shows the value "9584.3" as "9584.300."

By default, **Standard** will be selected from the drop down list.

#### [Modifying the existing format string](#)

Existing calculated field's format string can be modified only through the UI at runtime. To do so, open the calculated field dialog and click the target calculated field. User can now see the format string for the existing calculated field getting displayed in a drop-down list. Change the format string based on the requirement and finally click "OK".

### Virtual Scrolling

Allows large amounts of data to be loaded without any performance degradation by rendering rows and columns in relation to the current viewport. Rest of the data will be brought into the viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the [EnableVirtualization](#) property in [PivotView](#) class to **true**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
.Rows(rows => {
rows.Name("[Customer].[Customer]").Caption("Customer").Add(); })
```

```

.Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
.Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
.Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
.FormatSettings(formatSettings =>
{
 formatSettings.Name("[Measures].[Internet Sales
Amount]").Format("C0").Add();
})) .EnableVirtualization(true).Render()

```

## VIRTUAL.CS

```

public ActionResult Index()
{
 return View();
}

```

|                   | Bikes          |               |             |               | Clothing      |               |             |               |

| James Coleman     |                |               |             |               |               |               |             |               |

### Limitations for virtual scrolling

- The [ColumnWidth](#) property in [GridSettings](#) should be in pixels. The percentage value is not accepted.
- Resizing columns and setting the width of individual columns will affect scrolling and is therefore not recommended.
- The grand totals option is not supported by virtual scrolling.

### Data Binding

To bind OLAP datasource to the pivot table, you need to specify following properties under [DataSourceSettings](#) option.

| Properties | Description |

|-----|-----|

| [Cube](#) | Points the respective cube name from OLAP database. |

| [ProviderType](#) | Points the provider type for pivot table to identify the type of data source. |

| [Url](#) | Contains the cube URL for establishing the connection (online).|

| [Catalog](#) | Contains the database name (catalog name) to fetch the data. |

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product Categories]").Caption("Product Categories").Add(); columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date Fiscal").Add(); })).Render()
```

### DATA-BINDING.CS

```
public ActionResult Index()
{
 return View();
}
```

### *Fields*

#### *Measures in row axis*

By default, the measures are plotted in column axis. You can place measures in row axis either thorough code behind or UI. To plot those measures in row axis, place the **Measures** field in the row axis as follows.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("600").ShowFieldList(true).ShowGroupingBar(true).DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer Geography]").Caption("Customer Geography").Add(); rows.Name("[Measures]").Caption("Measures").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product Categories]").Caption("Product Categories").Add(); })
 .Values(values => { values.Name("[Measures].[Customer Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date Fiscal").Add(); })
 .FilterSettings(filterSettings =>
```

```

{
filterSettings.Name("[Date].[Fiscal]").Items(ViewBag.filterMembers).LevelCount(3).Add();
))) .Render()
<style>
 #pivotview {
 display: block;
 }
</style>

```

### MEASURES-IN-ROW.CS

```

public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}

```

#### Measures in different position

You can place measures in different position in row or column axis either thorough code behind or UI. In this sample, **Measures** placed before the dimension in the column axis.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product Categories]").Caption("Product Categories").Add(); columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date Fiscal").Add(); })
 .FormatSettings(formatSettings =>
 {
formatSettings.Name("[Date].[Fiscal]").Name("[Measures].[Internet Sales Amount]").Format("C0").Add();
 }
))) .Render()

```

### MEASURES-POSITION.CS

```

public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
}

```

```
return View();
}
```

### Named set

Named set is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining the cube data, arithmetic operators, numbers, and functions.

You can bind the named sets in the pivot table by setting its unique name in the [Name](#) property either in row or column axis and [IsNamedSet](#) boolean property to **true**. In this sample, we have added "Core Product Group" named set in the column axis.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowFieldList
(true).ShowGroupingBar(true).AllowCalculatedField(true).DataSourceSettings(d
ataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
.Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
.Columns(columns => { columns.Name("[Core Product
Group]").Caption("Core Product Group").IsNamedSet(true).Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
.Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
.Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
.FilterSettings(filterSettings =>
{

filterSettings.Name("[Date].[Fiscal]").Items(ViewBag.filterMembers).LevelCou
nt(3).Add();
})) .Render()
<style>
 #pivotview {
 display: block;
 }
</style>
```

### NAMED-SET.CS

```
public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal
Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}
```

### Configuring authentication

Users can configure basic authentication information to access the OLAP cube using the [Authentication](#) property. The settings required to configure are as follows:

- **UserName:** It allows the user to set a username that recognizes the basic authentication of the IIS.
- **Password:** It allows to set the appropriate password.

**Note:** If the user does not configure the authentication, a default popup will appear in the browser to get the authentication information.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings.EnableSorting(true)
 .Authentication(new PivotViewAuthentication {
 UserName = "UserName",
 Password = "Password" })

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })).Render()
```

### AUTHENTICATION.CS

```
public ActionResult Index()
{
 return View();
}
```

### *Roles*

SQL Server Analysis Services uses [Roles](#) to limit data access within a cube. Each role defines a set of permissions that can be granted to a single user or groups of users. It is used to manage security by limiting access to sensitive data and determining who has access to and can change the cube. It can be configured using the [Roles](#) property in [DataSourceSettings](#).

The [Roles](#) property can be used to specify one or more roles to the OLAP cube, separated by commas.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").DataSourceSettings(dataSourceSettings => dataSourceSettings
 .Roles("Role1")

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
```

```

 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); })
 .Render()

```

## ROLES.CS

```

public ActionResult Index()
{
 return View();
}

```

## OLAP Cube: Elements

### Field list

The field list, aka cube dimension browser, is a tree view like structure that organizes the cube elements such as dimensions, hierarchies, measures, etc., from the selected cube into independent logical groups.

### Types of node in field list

- **Display folder:** A folder that contains a set of similar elements.
- **Measure:** Quantity available for analysis.
- **Dimension:** A name given to the parts of the cube that categorizes data.
- **Attribute Hierarchy:** Level of attributes down the hierarchy.
- **User-defined Hierarchy:** Members of a dimension in a hierarchical structure.
- **Level:** Denotes a specific level in the category.
- **Named Set:** A collection of tuples and members, that can be defined and saved as a part of cube definition for later use.

### Measure

In a cube, a measure is a set of values that are based on a column in the cube's fact table and are usually numeric. The measures are the central values of a cube that are analyzed. That is, measures are the numeric data of primary interest to users browsing a cube. You can select measures depend on the types of users request. Some common measures are sales, costs, expenditures, and production count.

### Dimension

A simple dimension object is composed of basic information such as name, hierarchy, level, and members. You can create a dimension element by specifying its name and providing the hierarchy and level name. The dimension element contains the hierarchical details and information about each included level elements in that hierarchy. A hierarchy can have any number of level elements and the level elements can have any number of members and the member elements can have any number of child members.

### Hierarchy

Each element of a dimension can be summarized using a hierarchy. The hierarchy is a series of parent-child relationship, where a parent member represents the consolidation of members which are its children. Parent members can be further aggregated as the children of another parent. For example,

May 2005 can be summarized into Second Quarter 2005 which in turn would be summarized in the year 2005.

#### Level

Level element is the child of hierarchy element which contains a set of members, each of which has the same rank within a hierarchy.

#### Attribute hierarchy

Attribute hierarchy contains the following levels:

- A leaf level contains distinct attribute member, and each member of the leaf level is known as a leaf member.
- Intermediate levels if the attribute hierarchy is a parent-child hierarchy.
- An optional (all) level contains the aggregated value of the attribute hierarchy's leaf members, with the member of the (all) level also known as the (all) member.

#### User-defined hierarchy

User-defined hierarchy organizes the members of a dimension into hierarchical structure and provides navigation paths in a cube. For example, take a dimension table that supports three attributes such as year, quarter, and month. The year, quarter, and month attributes are used to construct a user-defined hierarchy, named Calendar, in the time dimension that relates to all levels.

#### Differentiating user-defined hierarchy and attribute hierarchy

- User-defined hierarchy contains more than one level whereas attribute hierarchy contains only one level.
- User-defined hierarchy provides the navigation path between the levels taken from attribute hierarchies of the same dimension.
- The attribute hierarchy and the user-defined hierarchy are represented in different ways as shown in the following table.

#### Named set

A named set is a collection of tuples and members, which can be defined and saved as a part of the cube definition. Named set records reside inside the sets folder, which is under a dimension element. These elements can be dragged to [Rows](#) or [Columns](#) axis via grouping bar or field list at runtime. To work with a lengthy, complex, or commonly used expression easier, Multidimensional Expressions (MDX) allows you to define a named set.

#### Calculated field

The calculated field allows user to insert or add a new calculated field based on the available OLAP cube elements from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

#### Symbolic representation of the nodes inside field list

| Icon | Name | Node type | Is Draggable |

|  |                                                                                   |                                                                                       |                                                                                       |                                        |
|--|-----------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------|----------------------------------------|
|  | -----                                                                             | -----                                                                                 | -----                                                                                 | -----                                  |
|  |  | Display Folder                                                                        | Display Folder                                                                        | False                                  |
|  |  | Measure                                                                               | Measure                                                                               | False                                  |
|  |  | Dimension                                                                             | Dimension                                                                             | False                                  |
|  |  | User Defined Hierarchy                                                                | Hierarchy                                                                             | True                                   |
|  |  | Attribute Hierarchy                                                                   | Hierarchy                                                                             | True                                   |
|  |  | <br> | <br> | Levels (in order)  Level Element  True |
|  |  | Named Set                                                                             | Named Set                                                                             | True                                   |

**Note:** In general, the Pivot Table is created using the built-in engine for given data source. This is an optional feature that allows you to create the Pivot Table with a server-side pivot engine and external data binding. And this option is applicable only for relational data source.

### Getting Started with Syncfusion Server-side Pivot Engine

This section briefs the Syncfusion assembly [Syncfusion.Pivot.Engine](#), which is used in a server-side application to perform all Pivot calculations such as aggregation, filtering, sorting, grouping, and so on, and only the information to be displayed in the Pivot Table's viewport is passed to the client-side (browser) via web service (Web API) rather than the entire data source. It reduces network traffic and improves the rendering performance of the Pivot Table, especially when dealing with large amounts of data. It also works best with virtual scrolling enabled and supports all the Pivot Table's existing features.

#### Quick steps to render the Pivot Table by using the server-side Pivot Engine

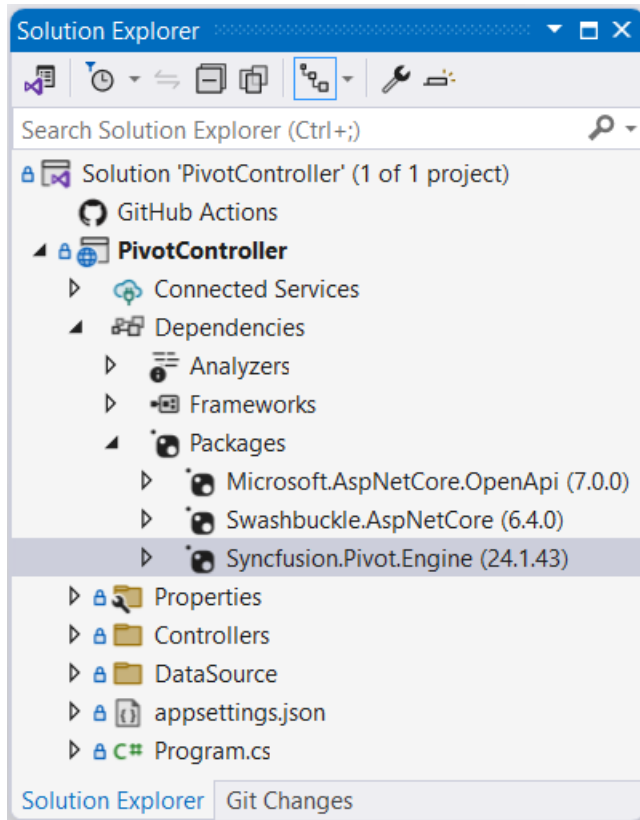

##### *Download and installing Server-side Pivot Engine*

1. Download the ASP.NET Core-based stand-alone Pivot Table [application](#) from the GitHub repository.

2. The **PivotController** (Server-side) application that is downloaded includes the following files.

- **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
- **DataSource.cs** file under **DataSource** folder – This file has model classes to define the structure of the data sources.
- The sample data source files **sales.csv** and **sales-analysis.json** under **DataSource** folder.

3. Open the **PivotController** application in Visual Studio where the Syncfusion library [Syncfusion.Pivot.Engine](#) will be downloaded automatically from the nuget.org site.

#### Connecting Pivot Table to Server-side Pivot Engine

1. Run the **PivotController** (Server-side) application which will be hosted in IIS shortly.
2. Then in the Pivot Table sample, set the [mode](#) property under [e-datasourcesettings](#) as **Server** and map the URL of the hosted Server-side application in [URL](#) property of `dataSourceSettings`.

```
`html
```

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
```

```
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
```

```
).Render()
```

```
`
```

3. Frame and set the report based on the data source available in the **PivotController** application.

```
`html
```

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
```

```
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
```

```
.FormatSettings(formatsettings =>
```

```
{
```

```
formatsettings.Name("Price").Format("C").Add();
```

```

}).Rows(rows =>
{
rows.Name("ProductID").Add();
}).Columns(columns =>
{
columns.Name("Year").Add();
}).Values(values =>
{
values.Name("Sold").Add();
values.Name("Amount").Add();
})
).Render()
`

```

4. Run the sample to get the following result.

|        | FY 2015    |                | FY 2016    |                | FY 2017    |
|--------|------------|----------------|------------|----------------|------------|
|        | Units Sold | Sold Amount    | Units Sold | Sold Amount    | Units Sold |
| PRO-10 | 7901220    | \$1,841,712.00 | 7561880    | \$1,762,804.00 | 7591220    |
| PRO-11 | 7174625    | \$1,673,533.00 | 7338175    | \$1,711,599.80 | 7164625    |
| PRO-12 | 9168140    | \$2,135,848.80 | 7689400    | \$1,792,704.00 | 7375140    |
| PRO-13 | 6674280    | \$1,560,619.20 | 8585260    | \$2,001,738.40 | 6574280    |
| PRO-14 | 7489240    | \$1,745,841.20 | 7167840    | \$1,675,479.20 | 7390240    |
| PRO-15 | 8149185    | \$1,902,397.00 | 7450585    | \$1,734,093.00 | 7249185    |
| PRO-16 | 7070150    | \$1,652,838.40 | 8037500    | \$1,873,597.60 | 7880150    |

## Available configurations in Server-side application

### Supportive Data Sources

The server-side Pivot Engine supports the following data sources,

- Collection
- JSON
- CSV
- DataTable
- Dynamic

### Collection

The collection data sources such as List, IEnumerable, and so on are supported. This can be bound using the **GetData** controller method. Also, in the Pivot Table sample, set the [type](#) property under [e-datasourcesettings](#) to **JSON**, which is also the default enumeration value.

In the server-side application (**PivotController**), a collection type data source is framed in the **DataSource.cs** file as shown in the following.

```
`csharp
public class PivotViewData
{
 public string ProductID { get; set; }
 public string Country { get; set; }
 public string Product { get; set; }
 public double Sold { get; set; }
 public double Price { get; set; }
 public string Year { get; set; }
 public List<PivotViewData> GetVirtualData()
 {
 List<PivotViewData> VirtualData = new List<PivotViewData>();
 for (int i = 1; i <= 10000; i++)
 {
 PivotViewData p = new PivotViewData
 {
 ProductID = "PRO-" + ((100 + i)%20),
 Year = (new string[] { "FY 2015", "FY 2016", "FY 2017", "FY 2018", "FY 2019" })[new Random().Next(5)],
 Country = (new string[] { "Canada", "France", "Australia", "Germany", "France" })[new
 Random().Next(5)],
 Product = (new string[] { "Car", "Van", "Bike", "Flight", "Bus" })[new Random().Next(5)],
 Price = (3.4 * i) + 500,
 Sold = (i * 15) + 10
 };
 VirtualData.Add(p);
 }
 return VirtualData;
 }
}
```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```
`csharp
```

```
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
`
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here bind the collection type data source.
 return new DataSource.PivotViewData().GetVirtualData();
 });
}
`
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Price").Format("C").Add();
}).Rows(rows =>
{
 rows.Name("ProductID").Add();
}).Columns(columns =>
{
 columns.Name("Year").Add();
}).Values(values =>
{
 values.Name("Sold").Add();
}
```

```

values.Name("Amount").Add();
})
).Render()
`

```

|        | FY 2015    |                | FY 2016    |                | FY 2017    |
|--------|------------|----------------|------------|----------------|------------|
|        | Units Sold | Sold Amount    | Units Sold | Sold Amount    | Units Sold |
| PRO-10 | 7901220    | \$1,841,712.00 | 7561880    | \$1,762,804.00 | 7591220    |
| PRO-11 | 7174625    | \$1,673,533.00 | 7338175    | \$1,711,599.80 | 7164625    |
| PRO-12 | 9168140    | \$2,135,848.80 | 7689400    | \$1,792,704.00 | 7378140    |
| PRO-13 | 6674280    | \$1,560,619.20 | 8585260    | \$2,001,738.40 | 6574280    |
| PRO-14 | 7489240    | \$1,745,841.20 | 7167840    | \$1,675,479.20 | 7392400    |
| PRO-15 | 8149185    | \$1,902,397.00 | 7450585    | \$1,734,093.00 | 7249185    |
| PRO-16 | 7070150    | \$1,652,838.40 | 8037500    | \$1,873,597.60 | 7880150    |

### JSON

The JSON data from a local \*.json file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the Server-side pivot engine.

In the Server-side application, **sales-analysis.json** file is available under **DataSource** folder and its model type is defined in **DataSource.cs** file.

```

`csharp
public class PivotJSONData
{
 public string Date { get; set; }
 public string Sector { get; set; }
 public string EnerType { get; set; }
 public string EneSource { get; set; }
 public int PowUnits { get; set; }
 public int ProCost { get; set; }
 public List<PivotJSONData> ReadJSONData(string url)
 {
 WebClient myWebClient = new WebClient();
 Stream myStream = myWebClient.OpenRead(url);
 StreamReader stream = new StreamReader(myStream);
 string result = stream.ReadToEnd();
 stream.Close();
 return Newtonsoft.Json.JsonConvert.DeserializeObject<List<PivotJSONData>>(result);
 }
}

```

```

}
}
`

```

To bind the data source, set its model type **PivotJSONData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotJSONData> PivotEngine = new PivotEngine<DataSource.
PivotJSONData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here bind JSON type data source from the sales-analysis.json file.
 return new DataSource.PivotJSONData().ReadJSONData(_hostingEnvironment.ContentRootPath +
 "\\DataSource\\sales-analysis.json");
 });
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.Type(Syncfusion.EJ2.PivotView.DataSourceType.CSV)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("ProCost").Format("C").Add();
}).Rows(rows =>
{

```

```

rows.Name("EneSource").Add();
}).Columns(columns =>
{
columns.Name("EnerType").Add();
}).Values(values =>
{
values.Name("PowUnits").Add();
values.Name("ProCost").Add();
})
).Render()
,

```

|                | Biomass    |             | Free Energy |             | Grand Total |
|----------------|------------|-------------|-------------|-------------|-------------|
|                | Units Sold | Sold Amount | Units Sold  | Sold Amount | Units Sold  |
| Bio-diesel     | 1042       | \$1,439.00  |             |             | 1042        |
| Ethanol Fuel   | 595        | \$1,031.00  |             |             | 595         |
| Geo-thermal    |            |             | 1528        | \$2,115.00  | 1528        |
| Hydro-electric |            |             | 3378        | \$3,244.00  | 3378        |
| Solar          |            |             | 7929        | \$6,210.00  | 7929        |
| Wastage        | 712        | \$1,043.00  |             |             | 712         |
| Wind           |            |             | 15571       | \$7,666.00  | 15571       |

JSON data from any remote server, like a local JSON file, can also be supported. It accepts both directly downloadable files (*.json*) and *web service URLs*. To bind this, the URL of the *.json* file of a remote server has to be mapped under the **GetData** method. The rest of the configurations are the same as described above.

In the server-side application, the CDN link is used to connect the same **sales-analysis.json** file which is already hosted in the Syncfusion server.

```

`csharp
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind JSON type data source from remote server.

```

```
return new DataSource.PivotJSONData().ReadJSONData("http://cdn.syncfusion.com/data/sales-
analysis.json");
});
}
`
```

### CSV

The CSV data from a local \*.csv file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the server-side pivot engine. Also, in the Pivot Table sample, set the [type](#) property under [e-datasourcesettings](#) as **CSV**.

In the server application, the **sales.csv** file is available under the **DataSource** folder, and its model type is defined in the **DataSource.cs** file.

```
`csharp
public class PivotCSVData
{
 public string Region { get; set; }
 public string Country { get; set; }
 public string ItemType { get; set; }
 public string SalesChannel { get; set; }
 public string OrderPriority { get; set; }
 public string OrderDate { get; set; }
 public int OrderID { get; set; }
 public string ShipDate { get; set; }
 public int UnitsSold { get; set; }
 public double UnitPrice { get; set; }
 public double UnitCost { get; set; }
 public double TotalRevenue { get; set; }
 public double TotalCost { get; set; }
 public double TotalProfit { get; set; }
 public List<string[]> ReadCSVDData(string url)
 {
 List<string[]> data = new List<string[]>();
 using (StreamReader reader = new StreamReader(new WebClient().OpenRead(url)))
 {
 string line;
```

```

while ((line = reader.ReadLine()) != null)
{
 line = line.Trim();
 if (!string.IsNullOrEmpty(line))
 {
 data.Add(line.Split(','));
 }
}
return data;
}
}
}
`

```

To bind the data source, set its model type **PivotCSVData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotCSVData> PivotEngine = new PivotEngine<DataSource.
PivotCSVData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here bind CSV type data source from sales.csv file.
 return new DataSource.PivotCSVData().ReadCSVData(_hostingEnvironment.ContentRootPath +
 "\\DataSource\\sales.csv");
 });
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.Type(Syncfusion.EJ2.PivotView.DataSourceType.CSV)
.FormatSettings(formatsettings =>
{
formatsettings.Name("UnitPrice").Format("C").Add();
}).Rows(rows =>
{
rows.Name("ItemType").Add();
}).Columns(columns =>
{
columns.Name("Region").Add();
}).Values(values =>
{
values.Name("UnitsSold").Add();
values.Name("UnitPrice").Add();
})
).Render()
,

```

|           | Asia       |             | Australia and Oceania |             | Central Ar |
|-----------|------------|-------------|-----------------------|-------------|------------|
|           | Units Sold | Sold Amount | Units Sold            | Sold Amount | Units Sold |
| Baby Food | 55810      | \$3,318.64  | 21548                 | \$765.84    |            |
| Beverages | 84400      | \$806.65    | 34486                 | \$332.15    |            |
| Cereal    | 32668      | \$1,439.90  | 43195                 | \$1,645.60  |            |
| Clothes   | 24290      | \$764.96    | 17020                 | \$655.68    |            |
| Cosmetics | 84630      | \$7,432.40  | 35220                 | \$3,060.40  |            |
| Fruits    | 35679      | \$74.64     | 29951                 | \$46.65     |            |
| Household | 28166      | \$4,009.62  | 55444                 | \$6,014.43  |            |

CSV data from any remote server, like a local CSV file, can also be supported. It accepts both directly downloadable files (.csv) and web service URLs. To bind this, the URL of the .csv file of a remote server has to be mapped under **GetData** method. The rest of the configurations are the same as described above.

In the server application, the CDN link is used to connect the same **sales.csv** file which is already hosted in the Syncfusion server.

```
`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here bind CSV type data source from remote server.
 return new DataSource.PivotCSVData().ReadCSVData("http://cdn.syncfusion.com/data/sales-
analysis.csv");
 });
}
```

#### [DataTable](#)

In the server-side application, there is a manually created DataTable **BusinessObjectsDataView** by mapping the model type **PivotViewData** in **DataSource.cs** file.

```
`csharp
public class BusinessObjectsDataView
{
 public DataTable GetDataTable()
 {
 DataTable dt = new DataTable("BusinessObjectsDataTable");
 PropertyDescriptorCollection pdc = TypeDescriptor.GetProperties(typeof(PivotViewData));
 foreach (PropertyDescriptor pd in pdc)
 {
 dt.Columns.Add(new DataColumn(pd.Name, pd.PropertyType));
 }
 List<PivotViewData> list = new PivotViewData().GetVirtualData();
 foreach (PivotViewData bo in list)
 {
 DataRow dr = dt.NewRow();
 foreach (PropertyDescriptor pd in pdc)
 {
```

```

dr[pd.Name] = pd.GetValue(bo);
}
dt.Rows.Add(dr);
}
return dt;
}
}
`

```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the DataTable.
return new DataSource.BusinessObjectsDataView().GetDataTable();
});
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.FormatSettings(formatsettings =>
{

```

```

formatsettings.Name("Price").Format("C").Add();
}).Rows(rows =>
{
rows.Name("ProductID").Add();
}).Columns(columns =>
{
columns.Name("Year").Add();
}).Values(values =>
{
values.Name("Sold").Add();
values.Name("Price").Add();
})
).Render()
,

```

|        | FY 2015    |                | FY 2016    |                | FY 2017    |
|--------|------------|----------------|------------|----------------|------------|
|        | Units Sold | Sold Amount    | Units Sold | Sold Amount    | Units Sold |
| PRO-10 | 7901220    | \$1,841,712.00 | 7561880    | \$1,762,804.00 | 7591       |
| PRO-11 | 7174625    | \$1,673,533.00 | 7338175    | \$1,711,599.80 | 7164       |

### Dynamic

The model type has to be defined in the aforementioned data sources. However, there is no need to define a model type for the following data sources, which are also supported by the server-side pivot engine.

### ExpandoObject

In the server-side application, an **ExpandoObject** type data source is available under the class **PivotExpandoData** in **DataSource.cs** file.

```

`csharp
public class PivotExpandoData
{
public List<ExpandoObject> Orders { get; set; } = new List<ExpandoObject>();
public List<ExpandoObject> GetExpandoData()
{

```

```

Orders = Enumerable.Range(1, 75).Select((x) =>
{
 dynamic d = new ExpandoObject();
 d.OrderID = 1000 + (x % 100);
 d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new
Random().Next(5)];
 d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
 d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new
DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
 d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
 d.Verified = (new bool[] { true, false })[new Random().Next(2)];
 return d;
}).Cast<ExpandoObject>().ToList<ExpandoObject>();
return Orders;
}
}
`

```

To bind the data source, set its model type as **ExpandoObject** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<ExpandoObject> PivotEngine = new PivotEngine<ExpandoObject>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here returns ExpandoObject type data source.
 return new DataSource.PivotExpandoData().GetExpandoData();
 });
}

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.Rows(rows =>
{
rows.Name("CustomerID").Add();
}).Columns(columns =>
{
columns.Name("ShipCountry").Add();
}).Values(values =>
{
values.Name("Freight").Add();
})
).Render()
`,`
```

|             | UK         | USA        | Grand Total |
|-------------|------------|------------|-------------|
|             | Units Sold | Units Sold | Units Sold  |
| ALFKI       | 1187       | 738        | 1925        |
| ANANTR      | 1011       | 814        | 1825        |
| ANTON       | 1046       | 632        | 1678        |
| BLONP       | 1080       | 749        | 1829        |
| BOLID       | 492        | 929        | 1421        |
| Grand Total | 4816       | 3862       | 8678        |

### Dynamic Objects

In the server-side application, a data source is framed by dynamic objects which is available under the class **PivotDynamicData** in the **DataSource.cs** file.

```
`csharp
public class PivotDynamicData
{
public List<DynamicDictionary> Orders = new List<DynamicDictionary>() { };
public List<DynamicDictionary> GetDynamicData()
{
Orders = Enumerable.Range(1, 100).Select((x) =>
```

```

{
dynamic d = new DynamicDictionary();
d.OrderID = 100 + x;
d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new
Random().Next(5)];
d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new
DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
d.Verified = (new bool[] { true, false })[new Random().Next(2)];
return d;
}).Cast<DynamicDictionary>().ToList<DynamicDictionary>();
return Orders;
}

public class DynamicDictionary : System.Dynamic.DynamicObject
{
Dictionary<string, object> dictionary = new Dictionary<string, object>();
public override bool TryGetMember(GetMemberBinder binder, out object result)
{
string name = binder.Name;
return dictionary.TryGetValue(name, out result);
}
public override bool TrySetMember(SetMemberBinder binder, object value)
{
dictionary[binder.Name] = value;
return true;
}
//The "GetDynamicMemberNames" method of the "DynamicDictionary" class must be overridden and
return the property names to perform data operation and editing while using dynamic objects.
public override System.Collections.Generic.IEnumerable<string> GetDynamicMemberNames()
{
return this.dictionary?.Keys;
}
}

```

```
}
,
```

To bind the data source, set its class **PivotDynamicData** to **TValue** of the **PivotEngine** class.

```
`csharp
private PivotEngine<DataSource.PivotDynamicData> PivotEngine = new
PivotEngine<DataSource.PivotDynamicData>();
,
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
`csharp
public async Task<object> GetData(FetchData param)
{
 return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
 async (cacheEntry) =>
 {
 cacheEntry.SetSize(1);
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 // Here bind data source with dynamic objects.
 return new DataSource.PivotDynamicData().GetDynamicData();
 });
}
,
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`html
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.Url("https://localhost:44350/api/pivot/post")
.Mode(Syncfusion.EJ2.PivotView.RenderMode.Server)
.Rows(rows =>
{
 rows.Name("CustomerID").Add();
}).Columns(columns =>
{
 columns.Name("ShipCountry").Add();
}).Values(values =>
{
```

```

values.Name("Freight").Add();
})
).Render()
,

```

|             | UK         | USA        | Grand Total |
|-------------|------------|------------|-------------|
|             | Units Sold | Units Sold | Units Sold  |
| ALFKI       | 1030       | 742        | 1772        |
| ANANTR      | 1352       | 1018       | 2370        |
| ANTON       | 2525       | 1782       | 4307        |
| BLONP       | 1786       | 1002       | 2788        |
| BOLID       | 1409       | 2012       | 3421        |
| Grand Total | 8102       | 6556       | 14658       |

### Controller Configuration

#### Memory Cache

In the server-side application, the [Memory Cache](#) option is used to store the data source and engine properties in RAM, which will be used for UI operations. To improve performance, this limits the execution of all initial rendering code to regenerate the aggregated values during each UI operation. The codes below show how we use the memory cache option in the **GetEngine** method to store engine properties.

```

`csharp
public async Task<EngineProperties> GetEngine(FetchData param)
{
 isRendered = false;
 // Engine properties are stored in memory cache with GUID "param.Hash".
 return await _cache.GetOrCreateAsync("engine" + param.Hash,
 async (cacheEntry) =>
 {
 isRendered = true;
 cacheEntry.SetSize(1);
 // Memory cache expiration time can be set here.
 cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
 PivotEngine.Data = await GetData(param);
 return await PivotEngine.GetEngine(param);
 });
}
,

```

The engine properties are stored in RAM as a cache with a unique ID (GUID) that is transferred from the client-side source code. The GUID is generated at random and will be changed if the page containing the Pivot Table is refreshed or opened in a new tab/window. As a result, each GUID's memory cache contains unique information, and the component operates independently.

Meanwhile, the memory cache is set to expire after 60 minutes from RAM to free its memory. If the component is still running, the data will be generated and stored for another 60 minutes.

#### Methods and its needs

- **Post:** Allows to get the information from the client-side source and calls appropriate controller methods.
- **GetEngine:** Allows to store the engine properties in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetData:** Allows to store data source in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetMembers:** Allows to get the members of a field. This fires when the member editor is opened to do a filtering operation.
- **GetRawData:** Allows to get raw data of an aggregated value cell. This fires when the drill-through or editing dialog is opened.
- **GetPivotValues:** Allows to update the stored engine properties in-memory cache and returns the aggregated values to browser to render the Pivot Table. Here, the return value can be modified. The Pivot Table will be rendered browser-based on this.

#### Pivot Chart in ASP.NET MVC Pivot Table Component

In pivot table component, pivot chart would act as an additional visualization component with its basic and important characteristic like drill down and drill up, 15+ chart types, series customization, axis customization, legend customization, export, print and tooltip. Its main purpose is to show the pivot data in graphical format.

If user prefers, the pivot chart component can also be displayed individually with pivot values and can change the report dynamically with the help of field list and grouping bar. Using the [PivotViewDisplayOption](#) property in [PivotView](#) class, user can set the visibility of grid and chart in pivot table component. It holds below properties,

- [View](#): Specifies the pivot table component to display grid alone or chart alone or both.
- [Primary](#): Specifies the pivot table to display either grid or chart as primary component during initial loading. It is applicable only when setting the property [View](#) to [View.Both](#).

The below sample displays the pivot chart component based on the pivot report bound on it.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
```

```

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()

```

### DISPLAYVIEW.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Data Binding

End user can bind both local and remote data binding options available in the component to feed the data. The [DataSource](#) property can be assigned either with an instance of `DataManager` or list of object.

For more information [refer](#) here.

### Chart Types

Supports 21 different types of charts as follows,

- Line
- Column
- Area
- Bar
- StepArea
- StackingLine
- StackingColumn
- StackingArea
- StackingBar
- StepLine
- Pareto
- Bubble
- Scatter
- Spline
- SplineArea

- StackingLine100
- StackingColumn100
- StackingBar100
- StackingArea100
- Polar
- Radar

[ChartSeriesType.Line](#) is the default pivot chart type. User can change the pivot chart type by using the property [Type](#) in [PivotChartSeries](#) class.

In the below code sample, the pivot chart type is set as [ChartSeriesType.Bar](#).

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Bar))).Render()
```

#### CHARTTYPE.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### Accumulation Charts

Supports 4 different types of accumulation charts as follows,

- Pie
- Doughnut
- Funnel
- Pyramid

As like other chart types it can be changed using the property [Type](#) in [PivotChartSeries](#) class.

In the below code sample, the **Pie** chart is rendered, and the other accumulation charts can be switched using the drop-down list.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
<div class="control-section" style="overflow:auto">
 <div id="dropdown-control" style="margin-bottom:5px;">
 <table style="width: 350px;">
 <tbody>
 <tr style="height: 50px">
 <td>
 <div>
 Chart Type:
 </div>
 </td>
 <td>
 <div>
 <select id="charttypes" name="ddl-view-mode">
 <option value='Pie' selected>Pie</option>
 <option value='Doughnut'>DoughNut</option>
 <option value='Pyramid'>Pyramid</option>
 <option value='Funnel'>Funnel</option>
 </select>
 </div>
 </td>
 </tr>
 </tbody>
 </table>
 </div>
</div>
```

```

 </tbody>
 </table>
</div>
<div class="content-wrapper">
 @Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(f
alse)
 .EnableSorting(true).Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
 })
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ChartSettings(chartSettings =>
 chartSettings.ChartSeries(chartseries
=>chartseries.Type(ChartSeriesType.Pie)))
 .Render();
 </div>
</div>
<script>
 var chartTypesDropDown = new ej.dropdowns.DropDownList({
 floatLabelType: "Auto",
 change: function (args) {
 var pivotObj =
document.getElementById('PivotView').ej2_instances[0];
 pivotObj.chartSettings.chartSeries.type = args.value;
 }
 });
 chartTypesDropDown.appendTo("#charttypes");
</script>

```

### ACCUMULATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

```
}

```

### Drill Down/Up

In the accumulation charts, drill down and drill up operations can be performed using the built-in context menu option. It will be shown while clicking on the chart series. The context menu has the following options:

**Expand** - It is to drill down the corresponding series until the last level.

**Collapse** - It is to drill up the corresponding series until the first level.

**Exit** - It is to close the context menu.

**Note:** The drill operation in accumulation charts can be performed only for row headers.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.Data).ExpandAll(f
alse)
.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Year").Add();
 rows.Name("Quarter").Add();
})
.Columns(columns =>
{
 columns.Name("Products").Add();
})
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C").Add();
})
)
```

```
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
})) .ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries
=> chartSeries.Type(ChartSeriesType.Pie))).Render();
```

### DRILL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Column Headers and Delimiters

Unlike other chart types, the accumulation charts consider the values of a single column from the pivot table to be drawn. Preferably the first column of the pivot table is considered by default. But it can be changed by defining the column headers using the `ColumnHeader` property in `ChartSettings` class.

If the column has more than one header, then need to mention all the headers separated by the delimiter -, for example, **FY 2016-Q2**. Using the property `ColumnDelimiter` in `ChartSettings` class, one can set the desired delimiter to separate the column headers.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
).EnableSorting(true).DrilledMembers(drilledmembers =>
{
 drilledmembers.Name("Year").Items(new string[] { "FY 2016" }).Add();
})
).Rows(rows =>
{
```

```

 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
 })
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product Categories").Add();
 })
).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
 {
 chartSeries.Type(ChartSeriesType.Doughnut);
 })
).ColumnHeader("FY 2016-Q2").ColumnDelimiter("-").Render();

```

### COLUMN.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Label Customization

The data labels are visible by default showing header name. Its visibility can be modified using the **Visible** boolean property in **DataLabel**. With regard to the label arrangement, the **Smart Labels** options help to arrange labels efficiently without overlapping. It can be disabled by setting the **EnableSmartLabels** property in **ChartSettings** class as **false**.

The **Position** property in **DataLabel** allows to specify the position of the data label. The available options are,

- **Outside**: Positions the label outside the point. It is the default option.
- **Inside**: Positions the label inside the point.

In the following code sample, the data labels are placed inside.

#### **C#HTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(f
alse)
.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries
=>chartSeries.Type(ChartSeriesType.Pyramid).DataLabel(datalabel=>
datalabel.Position("Inside")))).Render();
```

#### **DATALABEL.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.position = Position;
 return View();
}
public PivotViewPivotChartDataLabel Position = new
PivotViewPivotChartDataLabel { Position = "Inside" };
```

The **Connector Line** will be visible when the data label is placed outside the chart. It can be customized using the **ConnectorStyle** property in **DataLabel** for its color, length, width etc. In the following code sample, the connector line is customized.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(f
alse)
.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries
=>chartSeries.Type(ChartSeriesType.Funnel).DataLabel(datalabel=>
{
 datalabel.Position("OutSide");

 datalabel.ConnectorStyle(connector=>connector.Color("#f4429e").DashArray("5,
3").Length("50px").Width(2));
})))).Render();
```

**CONNECTOR.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.position = Position;
 return View();
}
public PivotViewPivotChartDataLabel Position = new
PivotViewPivotChartDataLabel { Position = "OutSide" };

```

*Pie and Doughnut Customization*

User can draw pie and doughnut charts within the specified range using the **StartAngle** and **EndAngle** properties in [PivotChartSeries](#) class. The default value of the **StartAngle** property is **0**, and the **EndAngle** property is **360**. By customizing these properties, user can draw semi pie and semi doughnut charts.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
.Values(values =>

```

```

{
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
{
 chartSeries.Type(ChartSeriesType.Doughnut);
 chartSeries.StartAngle(270);
 chartSeries.EndAngle(90);
})
})
.Render();

```

### ANGLE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

Users can get doughnut chart from pie chart and vice-versa using the `InnerRadius` property in [PivotChartSeries](#) class. If the property is greater than **0** percent, the doughnut chart will appear from the pie chart.

**Note:** It takes the value only in percentage.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(f
alse)

```

```

.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add();values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
{
 chartSeries.Type(ChartSeriesType.Pie);
 chartSeries.InnerRadius("140");
}
)
).Render();

```

### **RADIUS.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### *Exploding Series Points*

Exploding can be enabled by setting the **Explode** property in [PivotChartSeries](#) class to **true**. The series points will be exploded either on mouse click or touch.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.Data).ExpandAll(f
alse)
.EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add(); values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
{
 chartSeries.Type(ChartSeriesType.Pie);
 chartSeries.Explode(true);
})
).Render();
```

**EXPLODE.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Field List

User can enable the field list by setting the property [ShowFieldList](#) in [PivotView](#) class as **true**.

By using this, user can customize the report dynamically and view the result in pivot chart. For more information regarding the field list, refer the [field list](#) topic.

In the following sample, the **Popup** mode of field list is enabled in the pivot chart integration.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column)).ShowFieldList(true).Render()
```

### CHARTFIELDLIST.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

```
}

```

### Grouping Bar

User can enable the grouping bar by setting the property [ShowGroupingBar](#) in [PivotView](#) class as **true**. The grouping bar in pivot chart shows a dropdown list in value axis instead of buttons. The dropdown list holds list of value fields bounded in the [PivotViewDataSourceSettings](#) and it can be switched to draw the pivot chart with the selected value field. This has been defined as the default behavior in the pivot chart component. For more information regarding the grouping bar, refer the [grouping bar](#) topic.

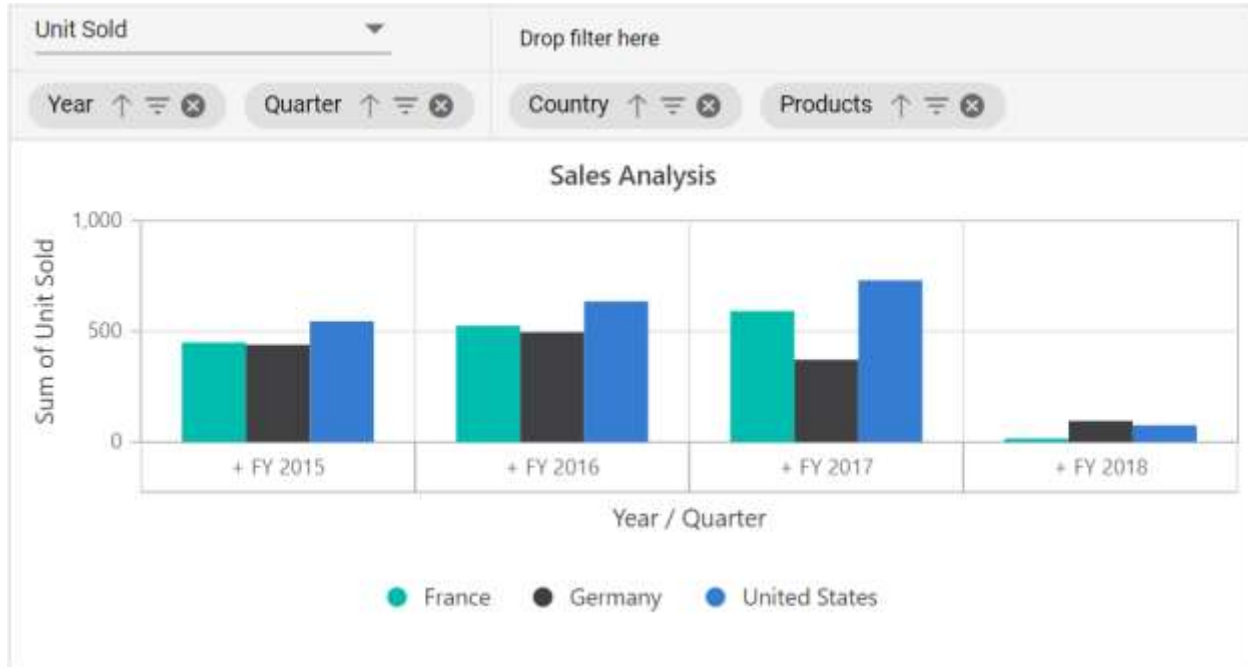

**Note:** For multiple axis support, buttons will be placed in value axis instead of dropdown list.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column)).ShowGroupingBar(true).Render()
```

**CHARTGROUPINGBAR.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

For accumulation charts alone, a drop-down list will be placed in the column axis instead of the buttons. The drop-down list shows the column headers available in the pivot table. Users can dynamically switch column headers with the help of the drop-down list, and the accumulation chart will be updated accordingly.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Chart
}).ShowFieldList(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
).EnableSorting(true).Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
).Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
})
```

```
.Values(values =>
{
 values.Name("Amount").Caption("Sales
Amount").Add();values.Name("Sold").Caption("Units Sold").Add();
})
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C").Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries
=>chartSeries.Type(ChartSeriesType.Pie)
)).ShowGroupingBar(true).Render();
```

### GROUP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Single Axis

By default, the pivot chart will be drawn with the value field (measure) which is set first in the report under value axis. But, user can change to specific value field using the property [Value](#) in [ChartSettings](#) class.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
```

```

 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings => chartSettings.Value("Amount").Title("Sales
 Analysis").ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column))).Render()

```

### CHARTSINGLE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Multiple Axis

User can draw the pivot chart with multiple value fields by setting the property [EnableMultipleAxis](#) in [ChartSettings](#) class as **true**. In the below code sample, the pivot chart will be drawn with both value fields "Sold" and "Amount" available in the [PivotViewDataSourceSettings](#).

**Note:** The multiple axis support is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings =>
 chartSettings.EnableMultipleAxis(true).ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column))).Render()
```

### CHARTMULTIVALUE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

If the user binds more value fields, the result will be multiple pivot charts, and each chart will shrink within the parent container height. To avoid this, set the [EnableScrollOnMultiAxis](#) property in [ChartSettings](#) to **true**. By doing so, each pivot chart will only shrink to a minimal "160px" – "180px" height showing a vertical scrollbar for a clear view.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 values.Name("Products").Type("Count").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings =>
```

```
chartSettings.EnableMultipleAxis(true).enableScrollOnMultiAxis(true).ChartSeries(chartSeries => chartSeries.Type(ChartSeriesType.Column)).Render()
```

### CHARTSCROLLBAR.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

Meanwhile, there is another way to display multiple values in a chart. In this approach, the series drawn from multiple values are grouped and displayed in a single chart. And, based on the values, multiple Y axis scales will be framed with different ranges. This can be achieved by setting the properties [EnableMultipleAxis](#) as **true** and [MultipleAxisMode](#) as **Single** in [ChartSettings](#).

In the following code sample, the pivot chart can be seen as a single chart with multiple value fields such as **Sold** and **Amount** that are drawn as multiple Y axis.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}
```

```

 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings =>
 chartSettings.EnableMultipleAxis(true).MultipleAxisMode('Single').ChartSeries
 (chartSeries => chartSeries.Type(ChartSeriesType.Column))).Render()

```

### **CHARTMULTIPLEAXISMODE.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

Additionally, to display chart series for multiple values within a single y-axis, set the properties [EnableMultipleAxis](#) to **true** and the [MultipleAxisMode](#) to **Combined**, in the [ChartSettings](#).

The y-axis range values will be formatted using the first value field on the value axis. For example, if the first value field is in currency format and the remaining value fields are in different number formats or no format, the y-axis range values will be displayed in the currency format of the first value field.

The pivot chart in the following code sample can be seen as a single chart with multiple value fields such as **Sold** and **Amount** drawn as a single y-axis.

### **CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("450").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Production Year").Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
}

```

```

))) .DisplayOption(new PivotViewDisplayOption { View = View.Chart
}) .ChartSettings(chartSettings =>
chartSettings.EnableMultipleAxis(true) .MultipleAxisMode(MultipleAxisMode.Com
bined) .ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column)) .Render()

```

### COMBINEDYAXIS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Show point color based on members

When multiple axes are enabled, you can display the same color for each member in the column axis by setting the [ShowPointColorByMembers](#) property to **true** in the [ChartSettings](#). As a result, the end user can easily identify each member across different measures in the entire chart.

Furthermore, end user can see or hide specific members across different measures in the entire chart with a single click on the legend item.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}

```

```

 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Production Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings =>
 chartSettings.Value("Amount").EnableMultipleAxis(true).MultipleAxisMode(MultipleAxisMode.Stacked).ShowPointColorByMembers(true).ChartSeries(chartSeries => chartSeries.Type(ChartSeriesType.Column)).primaryYAxis(py => py.Border(Width("0")))).Render()

```

### SHOWMEMBERSERIES.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Series Customization

User can customize series of the pivot chart using [ChartSeries](#) in [ChartSettings](#) class. The changes handled in the property will be reflected commonly in all chart series.

In the following sample, the pivot chart type and border has been changed for all the series.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
```

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column).EnableTooltip(false).Border(border
=> border.Color("#000").Width(2))))).Render()
```

### CHARTSERIES.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

User can also customize the pivot chart series individually using the **ChartSeriesCreated** event, which occurs after the pivot chart series has been created. You can customize each series individually by iterating them.

In the following sample, the even series are hidden in the pivot chart.

### CSSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ChartSeriesCreated("chartSeriesCreated").DisplayOption(new
PivotViewDisplayOption { View = View.Chart }).ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()
<script>
function chartSeriesCreated(args) {
 for (var pos = 0; pos < args.series.length; pos++) {
 if (pos % 2 == 0) {
 args.series[pos].visible = false;
 }
 }
}
</script>
```

### CHARTSERIESEVENT.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Axis Customization

User can customize axis of the pivot chart using [PrimaryXAxis](#) and [PrimaryYAxis](#) properties in [ChartSettings](#) class.

**Note:** Axis customization is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, title of y-axis and x-axis are customized.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column)).PrimaryXAxis(primaryXAxis =>
primaryXAxis.Title("X axis title")).PrimaryYAxis(primaryYAxis =>
primaryYAxis.Title("Y axis title"))).Render()
```

### CHARTAXIS.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

```
}

```

One can also customize multi-level labels of primary x-axis by using the `MultiLevelLabelRender` event in the [ChartSettings](#), which fires on rendering each multi-level label in the pivot chart. It has the following parameters:

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}
```

```

 }).MultiLevelLabelRender("multiLevelLabelRender").DisplayOption(new
 PivotViewDisplayOption { View = View.Chart }).ChartSettings(chartSettings =>
 chartSettings.ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column)).Render()
<script>
 function multiLevelLabelRender(args) {
 args.alignment = 'Far';
 args.textStyle = { fontFamily: 'Bold', fontWeight: '400', size:
 '16px', color: 'red' };
 if (args.text === ' + United States') {
 args.text = 'Text Changed';
 args.alignment = 'Near';
 args.textStyle = { fontFamily: 'Bold', fontWeight: '800', size:
 '16px', color: 'Blue' };
 }
 }
</script>

```

### CHART-MULTILEVELLABELRENDER.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Legend Customization

User can customize legend using [LegendSettings](#) in [ChartSettings](#) class. By default, legend will be visible and it can be hidden by setting the property [Visible](#) in [LegendSettings](#) class as **false**.

The pivot chart support different types of legend shapes as follows,

- Circle
- Rectangle
- VerticalLine
- Pentagon
- InvertedTriangle
- SeriesType
- Triangle
- Diamond

- Cross
- HorizontalLine

Here **SeriesType** would act as the default shape and it can be changed using the property [LegendShape](#) in [ChartSeries](#) class.

Also user can set the position of the legend in pivot chart using the property [Position](#) in [LegendSettings](#) class. The available options to set the legend position are as follows,

- Auto: Places the legend based on area type. This is the default.
- Top: Displays the legend at the top of the pivot chart.
- Left: Displays the legend at the left of the pivot chart.
- Bottom: Displays the legend at the bottom of the pivot chart.
- Right: Displays the legend at the right of the pivot chart.
- Custom: Displays the legend based on the given x and y values.

**Note:** By default, the legend is not visible for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, the legend shape and its position can be customized.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column).LegendShape("Pentagon")).LegendSettings(legendSettings => legendSettings.Position("Right"))).Render()
```

#### LEGEND.CS

```
public ActionResult Index()
{
var data = GetPivotData();
```

```

 ViewBag.DataSource = data;
 return View();
}

```

### User Interaction

#### Marker and CrossHair

User can enable and customize the marker and crosshair using [MarkerSettings](#) and [CrosshairSettings](#) properties in [ChartSettings](#) class respectively.

Also user can enable and customize the crosshair tooltip for axes using [PrimaryXAxis](#) and [PrimaryYAxis](#) classes.

**Note:** Marker and crosshair is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{

```

```

 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Line).Marker(marker =>
 marker.Fill("#EEE").Height(10).Width(10).Shape("Pentagon").Visible(true)).Crosshair(crosshair => crosshair.Enable(true)).PrimaryXAxis(primaryXAxis =>
 primaryXAxis.CrosshairTooltip(crosshairTooltip =>
 crosshairTooltip.Enable(true).Fill("#ff0000")).PrimaryYAxis(primaryYAxis =>
 primaryYAxis.CrosshairTooltip(crosshairTooltip =>
 crosshairTooltip.Enable(true).Fill("#0000FF")))).Render()

```

### MARKER.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Zooming and Panning

User can customize zooming and panning option using the property [ChartZoomSettings](#) in [ChartSettings](#) class.

The pivot chart support four types of zooming which can be set as follows,

- [EnablePinchZooming](#)
- [EnableSelectionZooming](#)

- [EnableDeferredZooming](#)
- [EnableMouseWheelZooming](#)

and three modes of zooming direction that specifies whether to zoom vertically or horizontally or in both ways which are,

- x: Pivot chart can be zoomed horizontally.
- y: Pivot chart can be zoomed vertically.
- x,y: Pivot chart can be zoomed both vertically and horizontally.

This can be set using the property [Mode](#) in [ZoomSettings](#) class. By default, if the pivot chart is zoomed, a toolbar would display with the options - Zoom, ZoomIn, ZoomOut, Pan, Reset. User can also customize its option using the property [ToolbarItems](#) in [ZoomSettings](#) class.

**Note:** Zooming and panning is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column)).ZoomSettings(zoomSettings =>
zoomSettings.EnableDeferredZooming(true).EnableMouseWheelZooming(true).EnablePinchZooming(true).EnableSelectionZooming(true))).Render()
```

### ZOOMING.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### Tooltip

By default, tooltip for the pivot chart is enabled. User can customize it by using the property [TooltipSettings](#) in [ChartSettings](#) class.

**Note:** The tooltip can be disabled by setting the property [Enable](#) in [TooltipSettings](#) class as **false**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}
```

```

 }).DisplayOption(new PivotViewDisplayOption { View = View.Chart
 }).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
 chartSeries.Type(ChartSeriesType.Column)).Tooltip(tooltip =>
 tooltip.EnableMarker(true).Fill("#FFF").Opacity(1).TextStyle(textStyle =>
 textStyle.Color("#000")).Border(border => border.Color("#000")))).Render()

```

### CHARTTOOLTIP.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Export

The pivot chart can be exported using the `chartExport` method which holds parameters like export type, file name, PDF orientation, width, and height in the same order. The mandatory parameters for this method are export type and file name whereas other parameters are optional.

The following are the four export types:

- PNG
- JPEG
- SVG
- PDF

In the following code sample, exporting can be done using an external button named as "Chart Export".

### CHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("chartexport").Content("Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()
<script>
var pivotObj;
document.getElementById("chartexport").onclick = function () {
pivotObj = document.getElementById("PivotView").ej2_instances[0];
pivotObj.chartExport("PNG", "result");
}
</script>
```

### EXPORT.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### Print

The rendered pivot chart can be printed directly from the browser by calling `printChart` method.

In the following code sample, printing can be done using an external button named as "Print".

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("chartprint").Content("Print").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()
<script>
var pivotObj;
document.getElementById("chartprint").onclick = function () {
pivotObj = document.getElementById("PivotView").ej2_instances[0];
pivotObj.printChart();
}
</script>
```

**PRINT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**Drill Down in ASP.NET MVC Pivot Table Control****Drill down and drill up**

The drill down and drill up action helps to view the bound data in detailed and abstract view respectively. By default, if member(s) has children, then expand and collapse icon will be displayed in the respective row/column header. On clicking the icon, expand or collapse action will be performed automatically through built-in source code. Meanwhile, leaf member(s) does not contain expand and collapse icon.

|                 | ► FY 2015  |             | ► FY 2016  |             | ► FY 2017  |
|-----------------|------------|-------------|------------|-------------|------------|
|                 | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| ▼ France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Mountain Bikes  | 197        | \$335,688   | 238        | \$405,552   |            |
| Road Bikes      | 253        | \$379,267   | 288        | \$1,136,552 |            |
| ► Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |

| Grand Total     | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

**Drill position**

Allows to drill only the current position of the selected member and exclude the drilled data of selected member in other positions. For example, if "FY 2015" and "FY 2016" have "Q1" member as child in next level, and when end user attempts to drill "Q1" under "FY 2016", only it will be expanded and not "Q1" under "FY 2015".

**Note:** This feature is built-in and occurs every time when expand or collapse action is done for better performance.

|               | FY 2015 |                | FY 2016        |            |          |

### Expand all

**Note:** This property is applicable only for the relational data source.

Allows to either expand or collapse all headers that are displayed in row and column axes. To display all headers in expanded state, set the property [ExpandAll](#) to **true** and to collapse all headers, set the property [ExpandAll](#) to **false**. By default, [ExpandAll](#) property is set to **false**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### EXPANDALL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

Expand all headers for specific fields

**Note:** This property is applicable only for the relational data source.

Allows to expand or collapse all headers for specific fields (only) in row and column axes. To expand headers for a specific field in row or column axis, set the property [ExpandAll](#) in [Rows](#) or [Columns](#) to **true**. By default, [ExpandAll](#) property in [Rows](#) or [Columns](#) is set to **false**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").ExpandAll(true).Add();
 rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").ExpandAll(true).Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### EXPANDALL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                 | ▼ FY 2015  |             |            |             |            |

Expand all except specific member(s)

**Note:** This option is applicable only for the relational data source.

In addition to the previous topic, there is an enhancement to expand all headers except specific header(s) and similarly to collapse all headers except specific header(s). To achieve this, [PivotViewDrilledMember](#) class is used. The required properties of the [PivotViewDrilledMember](#) class are explained below:

- [Name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [Items](#): It allows to set the exact member(s) which needs to be drilled.

**Note:** The [PivotViewDrilledMember](#) option always works in vice-versa with respect to the property [ExpandAll](#) in pivot table. For example, if [ExpandAll](#) is set to **true**, then the member(s) added in [Items](#) collection alone will be in collapsed state.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
.DrilledMembers(drilledmembers =>
{
 drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).Render()

```

### DRILLED MEMBERS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.drilledMembers = new string[] { "France", "Germany" };
 return View();
}

```

|                 | FY 2015    |             |            |             |            |
|-----------------|------------|-------------|------------|-------------|------------|
|                 | Q1         |             | Q2         |             | Q3         |
|                 | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| ▶ France        | 114        | \$177,246   | 108        | \$172,352   | 1          |
| ▶ Germany       | 74         | \$117,246   | 128        | \$152,352   | 1          |
| ▼ United States | 144        | \$162,246   | 171        | \$145,352   |            |
| Mountain Bikes  | 91         | \$67,824    | 81         | \$99,904    |            |
| Road Bikes      | 53         | \$94,422    | 90         | \$45,448    |            |
| Grand Total     | 332        | \$456,738   | 407        | \$470,056   | 3          |

### Expand specific member(s)

End user can also manually expand or collapse specific member(s) in each fields under row and column axes using the [DrilledMembers](#) class from code behind. The required properties of the [DrilledMembers](#) class are explained below:

- [Name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [Items](#): It allows to set the exact member(s) which needs to be drilled.
- [Delimiter](#): It allows to separate next level of member from its parent member.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .DrilledMembers(drilledmembers =>
 {
 drilledmembers.Name("Quarter").Delimiter("~").Items(ViewBag.drilledMem).Add();
 drilledmembers.Name("Year").Items(ViewBag.drilledMembers).Add();
 })
 .Rows(rows =>
 {

```

```

 rows.Name("Year").Caption("Year").Add(); rows.Name("Quarter").Add();
 rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Country").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()

```

### DRILLED MEMBERS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.drilledMembers = new string[] { "FY 2015", "FY 2016" };
 ViewBag.drilledMem = new string[] { "FY 2015~~Q1" };
 return View();
}

```

### Event

#### Drill

The event **Drill** triggers every time when a field is expanded or collapsed. For instance using this event user can alter delimiter and drill action for the respective item. It has the following parameters:

- **drillInfo** - It holds the current drilled item information.
- **pivotview** - It holds pivot table instance.

**CSHTML**

```
@Html.EJS().PivotView("pivotview").Width("100%").Height("400").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>
) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
 rows.Name("Country").Add();
 rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
})
.Filters(filters =>
{
 filters.Name("Product_Categories").Caption("Product Categories").Add();
})).Drill("onDrill").Render()
<script>
function onDrill(args) {
 // triggers whenever a cell is expanded or collapsed
}
</script>
```

**DRILLEVENT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.drilledMembers = new string[] { "France", "Germany" };
 return View();
}
```

*ActionBegin*

The event [actionBegin](#) triggers when the UI actions such as drill down and drill up begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.

- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| [Expand](#) | Drill down |

| [Collapse](#) | Drill up |

- **cancel**: It allows user to restrict the current action.

In the below sample, drill down and drill up action can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
 args.cancel = true;
 }
 }
</script>
```

### ACTIONBEGIN-DRILL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionComplete

The event [actionComplete](#) triggers when a UI action such as drill down or drill up, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action                   | Action Name |
|--------------------------|-------------|
| <a href="#">Expand</a>   | Drill down  |
| <a href="#">Collapse</a> | Drill up    |

- **actionInfo**: It holds the unique information about the current UI action. For example, if drill down action is completed, the event argument contains information such as field name and the drill information.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
 // Triggers when the drill operations are completed.
 }
 }
</script>
```

### ACTIONCOMPLETE-DRILL.CS

```
public ActionResult Index()
{
```

```

var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

| Action                   | Action Name |
|--------------------------|-------------|
| -----                    | -----       |
| <a href="#">Expand</a>   | Drill down  |
| <a href="#">Collapse</a> | Drill up    |

- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
}
</script>

```

### ACTIONFAILURE-DRILL.CS

```

public ActionResult Index()

```

```
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

## Data Shaping

### Aggregation

**Note:** This feature is applicable only for relational data source.

End user can perform calculations over a group of values (exclusively for value fields bound in value axis) using the aggregation option. By default, values are added (summed) together. The other aggregation types are explained below.

**Note:** The fields with data type such as number support all aggregation types mentioned below except for **“CalculatedField”**. The fields with data type such as string, date, datetime, boolean, etc., support **“Count”** and **“DistinctCount”** aggregation types alone.

| Operator                   | Description                                                                                                   |
|----------------------------|---------------------------------------------------------------------------------------------------------------|
| ----- -----                |                                                                                                               |
| Sum                        | Displays the pivot table values with sum.                                                                     |
| Product                    | Displays the pivot table values with product.                                                                 |
| Count                      | Displays the pivot table values with count.                                                                   |
| DistinctCount              | Displays the pivot table values with distinct count.                                                          |
| Min                        | Displays the pivot table with minimum value.                                                                  |
| Max                        | Displays the pivot table with maximum value.                                                                  |
| Avg                        | Displays the pivot table values with average.                                                                 |
| Median                     | Displays the pivot table values with median.                                                                  |
| Index                      | Displays the pivot table values with index.                                                                   |
| PopulationStDev            | Displays the pivot table values with standard deviation of population.                                        |
| SampleStDev                | Displays the pivot table values with sample standard deviation.                                               |
| PopulationVar              | Displays the pivot table values with variance of population.                                                  |
| SampleVar                  | Displays the pivot table values with sample variance.                                                         |
| RunningTotals              | Displays the pivot table values with running totals.                                                          |
| DifferenceFrom             | Displays the pivot table values with difference from the value of the base item in the base field.            |
| PercentageOfDifferenceFrom | Displays the pivot table values with percentage difference from the value of the base item in the base field. |
| PercentageOfGrandTotal     | Displays the pivot table values with percentage of grand total of all values.                                 |
| PercentageOfColumnTotal    | Displays the pivot table values in each column with percentage of total values for the column.                |

| [PercentageOfRowTotal](#) | Displays the pivot table values in each row with percentage of total values for the row. |

| [PercentageOfParentTotal](#) | Displays the pivot table values with percentage of total of all values based on selected field. |

| [PercentageOfParentColumnTotal](#) | Displays the pivot table values with percentage of its parent total in each column. |

| [PercentageOfParentRowTotal](#) | Displays the pivot table values with percentage of its parent total in each row. |

| [CalculatedField](#) | Displays the pivot table with calculated field values. It allows user to create a new calculated field alone. |

#### *Assigning aggregation type for value fields through API*

For each value field, the aggregation type can be set using the property [Type](#) in [Value](#) class. Meanwhile, aggregation types like [SummaryTypes.DifferenceFrom](#) and [SummaryTypes.PercentageOfDifferenceFrom](#) can check for specific field of specific item using [BaseField](#) and [BaseItem](#) properties. Likewise, [SummaryTypes.PercentageOfParentTotal](#) type can for specific field using [BaseField](#) property. For instance, the aggregation type [SummaryTypes.DifferenceFrom](#) would intake the specified field and its corresponding member as input and its value is compared across other members in the same field and also across different fields to formulate an appropriate output value.

- [Type](#): It allows to set the aggregate type of the field.
- [BaseField](#): It allows to set the specific field to aggregate the values.
- [BaseItem](#): It allows to set the specific member to aggregate the values.

### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Type(Syncfusion.EJ2.PivotView.SummaryTypes.DifferenceFrom).BaseField("Country").BaseItem("France").Add();
 values.Name("Amount").Caption("Sold Amount").Type(Syncfusion.EJ2.PivotView.SummaryTypes.Min).Add();
 })).Render()
```

### **AGGREGATION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

}

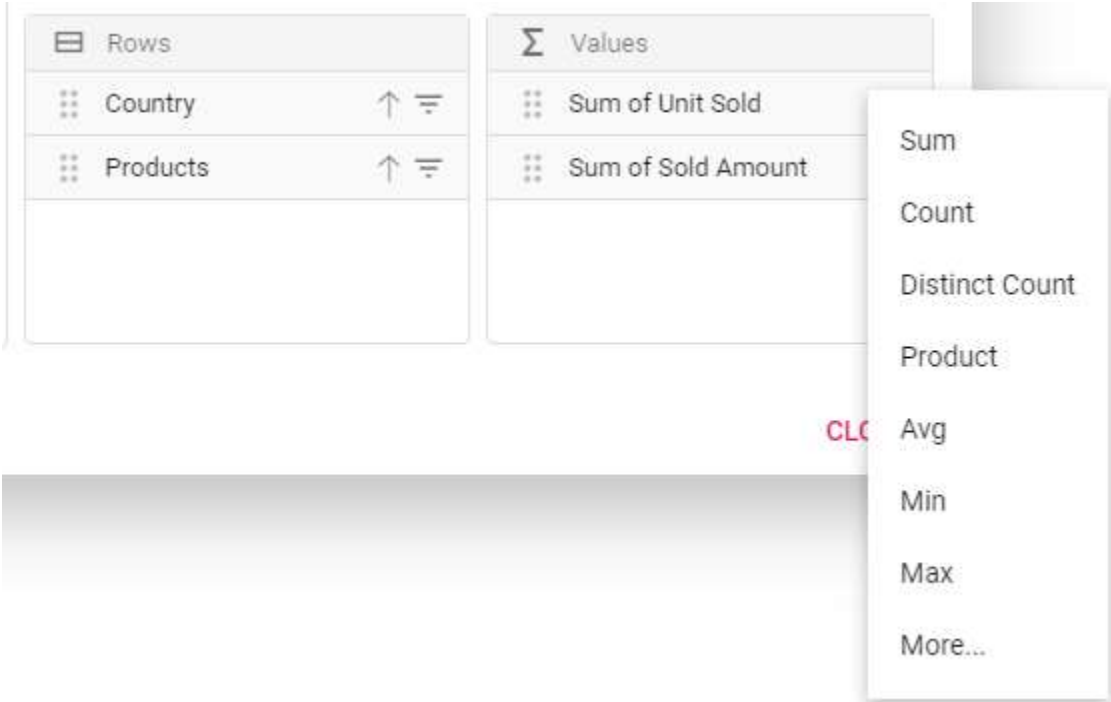

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        |            | \$29,985    |            | \$46,008    |            |
| Germany       | -10        | \$24,422    | -30        | \$86,008    |            |
| United States | 96         | \$45,448    | 110        | \$90,008    |            |
| Grand Total   |            | \$24,422    |            | \$46,008    |            |

**Note:** By default, the aggregation will be considered as [SummaryTypes.Sum](#) to the value fields which had number type and for the value fields which had non-number type values such as string, date, datetime, boolean, etc., the aggregation type will be considered as [SummaryTypes.Count](#).

*Modifying aggregation type for value fields at runtime*

Aggregation types can be changed easily through UI at runtime. The value fields bound to grouping bar and field list appears with a dropdown icon which helps to select an appropriate aggregation type for the respective value field. On selection, the values in the pivot table will be changed dynamically.

<!-- markdownlint-disable MD012 -->

<br/>

<br/>

| Drop filter here |  | FY 2015    |             | FY 2016    |
|------------------|--|------------|-------------|------------|
|                  |  | Units Sold | Sold Amount | Units Sold |
| France           |  | 450        | \$714,955   | 526        |
| Germany          |  | 440        | \$563,515   | 496        |
| United States    |  | 546        | \$754,515   | 636        |
| Grand Total      |  | 1436       | \$2,032,985 | 1658       |

*Show desired aggregation types in its dropdown menu*

By default, all the aggregation types are displayed in the dropdown menu available in buttons. However, based on the request for an application, we may need to show selective aggregation types on our own. This can be achieved using the [AggregateTypes](#) property.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Type(Syncfusion.EJ2.PivotView.SummaryTypes.DifferenceFrom).BaseField("Country").BaseItem("France").Add();
 values.Name("Amount").Caption("Sold Amount").Type(Syncfusion.EJ2.PivotView.SummaryTypes.Min).Add();
 }).AggregateTypes(new List<string>()
 { "DistinctCount", "Avg", "Product" }).ShowGroupingBar(true).Render()
```

### AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

| Drop filter here |          | FY 2015    |             | FY 2016    |
|------------------|----------|------------|-------------|------------|
| Country          | Products | Units Sold | Sold Amount | Units Sold |
| France           |          | 450        | \$714,955   | 526        |
| Germany          |          | 440        | \$563,515   | 496        |
| United States    |          | 546        | \$754,515   | 636        |
| Grand Total      |          | 1436       | \$2,032,985 | 1658       |

#### *Hiding aggregation type from button text*

By default, in value axis each field would be displayed by its name and aggregation type together. To hide aggregation type and display field name alone, set the property [ShowAggregationOnValueField](#) in [PivotViewDataSourceSettings](#) class to **false**.

#### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ShowAggregationOnValueField(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Type(Syncfusion.EJ2.PivotView.SummaryTypes.Sum).Add();
})).Render()
```

#### **AGGREGATION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|     |               |
|-----|---------------|
|     |               |
|     | Σ Values      |
| ↑ ≡ | Unit Sold ▼   |
| ↑ ≡ | Sold Amount ▼ |
|     |               |

| Units Sold ▼ ×  | Drop filter here |
| Sold Amount ▼ × | Year ↑ ≡ ×       |
| Country ↑ ≡ ×   | ► FY 2015        |

*Hiding aggregation type icon from UI*

By default, the icon to set aggregation type is enabled in the grouping bar. To disable this icon, set the property [ShowValueTypeIcon](#) in [PivotViewGroupingBarSettings](#) class to **false**.

**Note:** Icon to change the aggregation type can be hidden only in Grouping Bar but not in Field List at the moment.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).GroupingBarSettings(new
Syncfusion.EJ2.PivotView.PivotViewGroupingBarSettings { ShowValueTypeIcon =
false }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ShowGroupingB
ar(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold
Amount").Type(Syncfusion.EJ2.PivotView.SummaryTypes.Sum).Add();
})).Render()
```

**AGGREGATION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
```

```
return View();
}
```

|                      |                  |
|----------------------|------------------|
| Sum of Units Sold ✕  | Drop filter here |
| Sum of Sold Amount ✕ | Year ↑ = ✕       |
| Country ↑ = ✕        | ► FY 2015        |

### Event

#### AggregateCellInfo

The event `AggregateCellInfo` triggers every time while rendering each value cell. This allows user to change the cell value and skip formatting if applied. It has following parameters:

- `fieldName` - It holds current cell's field name.
- `row` - It holds current cell's row value.
- `column` - It holds current cell's row value.
- `value` - It holds value of current cell.
- `cellSets` - It holds raw data for the aggregated value cell.
- `rowCellType` - It holds row cell type value.
- `columnCellType` - It holds column cell type value.
- `aggregateType` - It holds aggregate type of the cell.
- `skipFormatting` - boolean property, it allows to skip formatting if applied.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).GroupingBarSettings(new
Syncfusion.EJ2.PivotView.PivotViewGroupingBarSettings { ShowValueTypeIcon =
false }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ShowGroupingB
ar(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold
Amount").Type(Syncfusion.EJ2.PivotView.SummaryTypes.Sum).Add();
})).Render()
```

### AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
```

```

ViewBag.DataSource = data;
return View();
}

```

### ActionBegin

The event [actionBegin](#) triggers when clicking and selecting the aggregate type via the dropdown icon in the value field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. For example, while performing aggregation, the action name will be shown as **Aggregate field**.
- **fieldInfo**: It holds the selected value field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the following example, action taken during aggregation type selection via dropdown icon can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Aggregate field') {
 args.cancel = true;
 }
 }
</script>

```

### ACTIONBEGIN-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionComplete

The event [actionComplete](#) triggers when a UI action, such as applying aggregation using the dropdown icon via the value field button, which is present in both the grouping bar and the field list UI, is completed. This allows user to identify the current UI action being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. For example, after completing the aggregation, the action name will be shown as **Field aggregated**.
- **fieldInfo**: It holds the selected value field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'Field aggregated') {
 // Triggers when the aggregation type is applied.
 }
 }
</script>
```

### ACTIONCOMPLETE-AGGREGATION.CS

```
public ActionResult Index()
{
```

```

var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. For example, if the action fails while performing the aggregation, then the action name will be shown as **Aggregate field**.
- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .ShowGroupingBar(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Aggregate field') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
}
</script>

```

### ACTIONFAILURE-AGGREGATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Calculated Field in ASP.NET MVC Pivot Table Component

Allows end user to create a new calculated field in the pivot table, based on available fields from the bound data source or using simple formula with basic arithmetic operators. It can be added at runtime through the built-in dialog, invoked from Field List UI. To do so, set the [AllowCalculatedField](#) property in [PivotView](#) class to **true** in the pivot table. End user can now see a "CALCULATED FIELD" button enabled in Field List UI automatically, which on clicking will invoke the calculated field dialog and perform necessary operation.

Calculated field can also be included in the pivot table through code behind using the [PivotViewCalculatedFieldsSettings](#) class. The required properties to create a new calculate field are:

- [Name](#): It allows to indicate the calculated field with a unique name.
- [Formula](#): It allows to set the formula.
- [Format](#): It helps to set the number format for the resultant value.

**Note:** The calculated field is applicable only for value fields. Also, calculated field created through code behind will be automatically listed in the UI dialog as well.

### CSHTML

```
@{var amount = "\" + "Sum(Amount)" + "\"; }
@{var sold = "\" + "Sum(Sold)" + "\"; }
@{ var totalPrice = amount + "+" + sold; }
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
formatsettings.Name("Total").Format("C0").Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
values.Name("Total").Type(Syncfusion.EJ2.PivotView.SummaryTypes.CalculatedField).Add();
}).CalculatedFieldSettings(calculatedfieldsettings =>
{
calculatedfieldsettings.Name("Total").Formula(totalPrice).Add();
}).AllowCalculatedField(true).ShowFieldList(true).Render()
```

### CALCULATEDFIELD.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             |              | FY 2016    |         |
|---------------|------------|-------------|--------------|------------|---------|
|               | Units Sold | Sold Amount | Total Amount | Units Sold | Sold Am |
| France        | 450        | \$714,955   | \$715,405    | 526        | \$1,    |
| Germany       | 440        | \$563,515   | \$563,955    | 496        | \$1,    |
| United States | 546        | \$754,515   | \$755,061    | 636        | \$2,    |
| Grand Total   | 1436       | \$2,032,985 | \$2,034,421  | 1658       | \$5,    |

Meanwhile, user can also view calculated field dialog in UI by invoking `CreateCalculatedFieldDialog` method on an external button click which is shown in the below code sample.

### CSHTML

```
@{var amount = "\" + "Sum(Amount)" + "\"; }
@{var sold = "\" + "Sum(Sold)" + "\"; }
@{ var totalPrice = amount + "+" + sold; }
@Html.EJS().Button("calculated-field-btn").Content("Calculated
Field").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
formatsettings.Name("Total").Format("C0").Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
values.Name("Total").Type(Syncfusion.EJ2.PivotView.SummaryTypes.CalculatedField).Add();
}).CalculatedFieldSettings(calculatedfieldsettings =>
{
calculatedfieldsettings.Name("Total").Formula(totalPrice).Add();
```

```

 })).AllowCalculatedField(true).ShowFieldList(true).Render()
<script>
 document.getElementById("calculated-field-
btn").addEventListener('click', function () {
 var pivotObj =
document.getElementById("PivotView").ej2_instances[0];
 pivotObj.createCalculatedFieldDialog();
 });
</script>

```

### Create Calculated Field

×

Enter the field name

Drag and drop fields to formula

Country (Count)

Products (Count)

Quarter (Count)

Formula

Example: ("Sum(Order\_Count)" + "Sum(In\_Stock)") \* 250

Format

None

Enter custom format string

OK CANCEL

#### *Editing through the field list and the grouping bar*

User can also modify the existing calculated field using the built-in edit option available directly in the field list (or) grouping bar. To do so, click the "Edit" icon available in the calculated field button. Now the calculated field dialog is opened and the current calculated field name, formula and format can be changed at runtime.

<br/>

<br/>

*Renaming the existing calculated field*

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing name getting

displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

<!-- markdownlint-disable MD012 -->

#### *Apply the format to the calculated field values*

Values in a new or existing calculated field can be formatted via the calculated field UI or code behind. The [FormatSettings](#) property in code-behind can be used to specify the desired format. For more information about the supported formats refer [refer here](#).

To apply format to calculated field values at runtime via UI, a built-in dropdown under the "Format" label is available, from which the user can select the pre-defined format options listed below.

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "C2". This shows the value "9584.3" as "\$9584.30."
- **None** - Denotes that no format will be applied.

**Note:** By default, **None** will be selected from the dropdown.

The screenshot shows the 'Create Calculated Field' dialog box. At the top, the title is 'Create Calculated Field' with a close button (X). Below the title, the text 'Total Amount' is displayed. A section labeled 'Drag and drop fields to formula' contains a list of fields: 'Sold Amount (Sum)', 'Total Amount (Calculated Field)' (highlighted in red), and 'Units Sold (Sum)'. Below this, the 'Formula' section shows the formula: `"Sum(Amount)"+"Sum(Sold)"`. The 'Format' section is expanded, showing a dropdown menu with options: 'Standard' (selected and highlighted in red), 'Currency', 'Percent', 'Custom', and 'None'.

In addition, you can specify the desired custom formats by selecting the **Custom** option from the "Format" dropdown.

*Supported operators and functions for the calculated field formula*

Below is a list of operators and functions that can be used in the formula to create the calculated fields.

- **+** – addition operator.

`typescript

Syntax:  $X + Y$

,

- **-** – subtraction operator.

`typescript

Syntax:  $X - Y$

,

- **\*** – multiplication operator.

`typescript

Syntax:  $X * Y$

- `/` – division operator.

`typescript`

Syntax: X / Y

- `^` – power operator.

### Grouping in ASP.NET MVC Pivot Table Component

**Note:** This feature is applicable only for relational data source.

Grouping is the most-useful feature in pivot table and the component automatically groups date, time, number and string. For example, the date type can be formatted and displayed based on year, quarter, month, and more. Likewise, the number type can be grouped range-wise, such as 1-5, 6-10, etc. These group fields will act as individual fields and allows users to drag them between different axes such as columns, rows, values, and filters and create pivot table at runtime.

The grouping can be enabled by setting the [AllowGrouping](#) property in [PivotView](#) class to **true**.

To perform the grouping action via UI, right click on the pivot table's row or column header, select "**Group**", a dialog will appear in which fill the appropriate options to group the data. To ungroup, right click on the pivot table's row or column header, select "**Ungroup**".

The following are the three different types of grouping:

- Number Grouping
- Date Grouping
- Custom Grouping

**Note:** Similar to Excel, only one type of grouping can be applied for a field.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
 formatsettings.Name("Product_ID").Format("N0").Add();
 formatsettings.Name("Date").Type("date").Format("dd/MM/yyyy-hh:mm
a").Add();
 })
 .Rows(rows => { rows.Name("Date").Add(); })
 .Columns(columns => { columns.Name("Product_ID").Caption("Product
ID").Add(); })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 })
 })
```

```
values.Name("Amount").Caption("Sold Amount").Add(); })).Render()
```

### **GROUPING.CS**

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

#### *Number Grouping*

Number grouping allows users to organize data, which is in number format into different ranges, such as 1-5, 6-10, etc. Number grouping can be configured via UI, by right-clicking on the number based header in the pivot table.

### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
 formatsettings.Name("Product_ID").Format("N0").Add();
 })
 .Rows(rows => { rows.Name("Product_ID").Caption("Product ID").Add(); })
 .Columns(columns => { columns.Name("Products").Add(); })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add(); })).Render()
```

### **GROUPING.CS**

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

| Product ID | Bottles and Cages |             |
|------------|-------------------|-------------|
|            | Units Sold        | Sold Amount |
| 1001       | 162               | \$344.00    |
| 1002       |                   |             |
| 1003       |                   |             |
| 1004       |                   |             |
| 1005       |                   |             |
| 1006       |                   |             |

#### Range selection

The "**Starting at**" and "**Ending at**" options are used to set the number range depending on which the headers will be grouped. For example, if the "Product\_ID" field holds the number from "1001" to "1010" and the user chooses to group the number range by setting "**1004**" to "**Starting at**" and "**1008**" to "**Ending at**" options on their own. Then the specified number range will be used for number grouping and the rest will be grouped as "**Out of Range**".

Grouping

☒ Starting at

1004

☒ Ending at

1008

Interval by

Enter value

OK

CANCEL

#### Range interval

The "**Interval by**" option is used to separate the selected number data type field into range-wise such as 1-5, 6-10, etc.

For example, if the user wants to display the "ProductID" data field with a group interval of "2" by setting the "Interval by" option on their own. The "ProductID" field will then be grouped by the specified range of intervals, such as "**1004-1005**", "**1006-1007**", etc.

| 1006-1007              |                   |             |           |             |     |
| 1008                   |                   |             |           |             |     |
| Out of Range           | 162               | \$344.00    | 297       | \$939.00    |     |
| Grand Total            | 162               | \$344.00    | 297       | \$939.00    |     |

Number grouping can also be configured using the [PivotViewGroupSettings](#) class through code-behind. The properties required are:

- [Name](#): Allows user to set the field name.
- [RangeInterval](#): Allows user to set the interval between two numbers.
- [StartingAt](#): Allows user to set the starting number.
- [EndingAt](#): Allows user to set the ending number.
- [Type](#): Allows user to set the group type. For number grouping, [Number](#) is set.

**Note:** If starting and ending numbers specified in [StartingAt](#) and [EndingAt](#) properties are in-between the number range, then rest of the numbers will be grouped and placed in “Out of Range” section introduced specific to this feature.

| Out of Range           | 162               | \$344.00    | 297       | \$939.00    |     |
| Grand Total            | 162               | \$344.00    | 297       | \$939.00    |     |

### Ungrouping the existing number groups

By right-clicking the appropriate header and selecting **"Ungroup"** from the context menu in the pivot table component, users can ungroup the applied number grouping.

| Product ID <span>↑ ≡ ×</span> | Bottles and Cages |             |
|-------------------------------|-------------------|-------------|
|                               | Unit Sold         | Sold Amount |
| 1004-1005                     |                   |             |
| 1006-1007                     |                   |             |
| 1008                          |                   |             |
| Out of Range                  | 162               | \$344.00    |
| Grand Total                   | 162               | \$344.00    |

### Date Grouping

Date grouping allows users to organize data, which is in date format into different sections such as years, quarters, months, days, hours, minutes, and seconds. Date grouping can be configured via UI, by right-clicking on the date and time based header in the pivot table.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
formatsettings.Name("Date").Type("date").Format("dd/MM/yyyy-hh:mm a").Add();
}))
.Rows(rows => { rows.Name("Date").Add(); })
.Columns(columns => {
columns.Name("Product_Categories").Caption("Product Categories").Add(); })
.Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add(); })}).Render()
```

### GROUPING.CS

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

| Date                | 1001      |             |
|---------------------|-----------|-------------|
|                     | Unit Sold | Sold Amount |
| 01/01/2015-08:18 PM | 6         | \$12.00     |
| 05/01/2015-08:19 PM |           |             |
| 02/02/2015-10:22 AM |           |             |
| 10/02/2015-10:23 AM |           |             |
| 20/02/2015-11:25 AM |           |             |
| 07/03/2015-05:11 AM | 12        | \$24.00     |

#### Range selection

The "**Starting at**" and "**Ending at**" options are used to set the date range depending on which the headers will be grouped. For example, if the "Date" field holds the date from "01/01/2015" to "02/12/2018" and the user chooses to group the date range by setting "**01/07/2015**" to "**Starting at**" and "**31/07/2017**" to "**Ending at**" options on their own. Then the specified date range will be used for date grouping and the rest will be considered as "**Out of Range**".

☒ Ending at

31/07/2017 12:00:00 AM

Interval by

Select groups

OK

CANCEL

#### Group interval

The "**Interval by**" option is used to separate the selected date fields into years, quarters, months, days, hours, minutes and seconds. For example, if the user wants to display the "Date" field with group intervals as "**Years**" and "**Months**" by selecting the "**Interval by**" option on their own. The "Date" field will then be separated by the specified group intervals and created as two new fields, namely "**Years**"

**(Date)**" which holds the date years and **"Months (Date)"** which holds the date months. Such fields can be used for report manipulations in the pivot table at runtime.

**Note:** When none of the **Interval by** options are chosen, the **OK** button in the dialog will be disabled, meaning that at least one interval option should be selected in order to apply the date grouping.

| 2017               | 60                 | \$248.00         |
| Out of Range       | 327                | \$1,363.00       |
| Out of Range       | 327                | \$1,363.00       |
| Grand Total        | 585                | \$2,339.00       |

Date grouping can also be configured using the [PivotViewGroupSettings](#) class through code-behind. The properties required are:

- [Name](#): Allows user to set the field name.
- [Type](#): Allows user to set the group type. For date grouping, [Date](#) is set.

- [StartingAt](#): Allows user to set starting date.
- [EndingAt](#): Allows user to set ending date.
- [GroupInterval](#): Allows user to set interval in year, quarter, month, day, hour, minute, or second pattern.

**Note:** From the date format "YYYY-DD-MM HH:MM:SS", if user wants to display only year and month, then the [GroupInterval](#) property should be set with **Years** and **Months** alone. Also, user can shuffle the order of year, quarter, month, day, hour, minute, or second based on their requirement and display the same in the pivot table.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
 formatsettings.Name("Date").Type("date").Format("dd/MM/yyyy-hh:mm
a").Add();
 })
 .Rows(rows => { rows.Name("Date").Add(); })
 .Columns(columns => {
columns.Name("Product_Categories").Caption("Product Categories").Add(); })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add(); })
 .Filters(filters =>
 {
 filters.Name("Products").Add();
 filters.Name("Product_ID").Caption("Product ID").Add(); })
 .GroupSettings(groupsettings => {
groupsettings.Name("Date").Type("Date").GroupInterval("@(new List<string>()
{ "Years", "Months" })").StartingAt("2015-07-01").EndingAt("2017-07-
31").Add();
 })).Render()
```

### GROUPING.CS

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

Furthermore, in the field list UI, these date group fields **Years (Date)**, **Quarters (Date)**, **Months (Date)**, etc... will be automatically grouped and displayed under the **Date** folder name.

Ungrouping the existing date groups

By right-clicking the appropriate header and selecting **"Ungroup"** from the context menu in the pivot table component, users can ungroup the applied date grouping.

| Years (Date) ↑ = ×  | 1010      |             |
|---------------------|-----------|-------------|
| Months (Date) ↑ = × | Unit Sold | Sold Amount |
| ▼ 2015              | 6         | \$12.00     |
| Sep                 | 6         | \$12.00     |
| Oct                 |           |             |
| ▼ 2016              | 40        | \$80.00     |
| Jan                 |           |             |
| Feb                 | 12        | \$24.00     |

Custom Grouping

Custom grouping can group any data type, such as date, time, number and string, into a custom field based on the user's needs. It can be configured via the UI by right-clicking on any header in the pivot table.

CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)).EnableSorting(true)
 .FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
 formatsettings.Name("Product_ID").Format("N0").Add();
 })
 .Rows(rows => { rows.Name("Products").Add(); })
 .Columns(columns => { columns.Name("Product_ID").Caption("Product
ID").Add(); })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add(); })
).Render()
```

### GROUPING.CS

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

In order to create custom grouping in the pivot table, a minimum of two headers belonging to a specific field should be chosen. To select more than one header, press and hold the CTRL key or hold the SHIFT key and click the appropriate row or column headers. Once selection is done, right-click and select "Group".

| Products <span>↑</span> <span>≡</span> <span>×</span> | 1001      |             |
|-------------------------------------------------------|-----------|-------------|
|                                                       | Unit Sold | Sold Amount |
| Bottles and Cages                                     | 162       | \$344.00    |
| Cleaners                                              |           |             |
| Fenders                                               |           |             |
| Gloves                                                |           |             |
| Jerseys                                               |           |             |
| Mountain Bikes                                        |           |             |
| Road Bikes                                            |           |             |
| Shorts                                                |           |             |
| Touring Bikes                                         |           |             |

In the dialog, the "**Field caption**" is the alias name of the new custom field that will be used to shown up in the pivot table component.

Grouping

Field caption

Product category

Group name

Enter the caption to display in header

OKCANCEL

The "**Group Name**" option helps to set the name of the header to hold the other selected headers. For example, if the user wants to group headers such as "**Gloves**", "**Jerseys**" and "**Shorts**" in the "Products" field by setting the top level name as "**Clothings**" to "**Group Name**" on their own. The selected headers are then grouped under the name "**Clothings**" in the pivot table.

| Products           | Unit Sold        | Sold Amount | Unit Sold | Sold Amount | Unit Sold |
| Bottles and Cages  | 162              | \$344.00    |           |             |           |
| Bottles and Cages  | 162              | \$344.00    |           |             |           |
| Cleaners           |                  |             | 297       | \$939.00    |           |
| Cleaners           |                  |             | 297       | \$939.00    |           |
| Clothings          |                  |             |           |             |           |
| Gloves             |                  |             |           |             |           |
| Jerseys            |                  |             |           |             |           |
| Shorts             |                  |             |           |             |           |
| Fenders            |                  |             |           |             |           |

User can also apply new custom grouping options to an existing custom field by right-clicking on the custom group header in the pivot table. For example, if the user wants to create a new custom group for the current custom group headers such as "Bottles and Cages", "Cleaners" and "Fenders" by setting the top level name as "Accessories" to "Group Name" on their own. The selected headers will then be grouped in the pivot table under the name "Accessories" with a new custom field called "Product category 1".

| Cleaners                  |                  |             | 297       | \$939.00    |           |
| ▼ Fenders                 |                  |             |           |             |           |
| Fenders                   |                  |             |           |             |           |
| ▼ Clothings               |                  |             |           |             |           |

Custom grouping can also be configured using the [PivotViewGroupSettings](#) class through code-behind. The properties required are:

- [Name](#): Allows user to set the field name.
- [Caption](#): Allows user to set the caption name for custom grouping field.
- [CustomGroups](#): Allows user to set the custom groups.
- [Type](#): Allows user to set the group type. For custom grouping, [Custom](#) is set.

The available custom group properties in [CustomGroups](#) property are:

- [GroupName](#): Allows user to set the group name (or title) for selected headers.
- [Items](#): It allows to set the headers which needs to be grouped from display.

**Note:** When the [GroupName](#) with the headers listed in [Items](#) in the [CustomGroups](#) class is grouped by the defined [GroupName](#) and the rest is grouped by its own name in the pivot table.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("350").ShowGroupingBar(true).AllowGrouping(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C").Add();
 formatsettings.Name("Product_ID").Format("N0").Add();
 })
 .Rows(rows => { rows.Name("Products").Add(); })
 .Columns(columns => { columns.Name("Product_ID").Caption("Product
ID").Add(); })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add(); })
 .GroupSettings(groupsettings => {
groupsettings.Name("Products").Type("Custom").Caption("Product
category").CustomGroups(customgroup => {
customgroup.GroupName("Clothings").Items("@(new string[] { "Gloves",
"Jerseys", "Shorts" })").Add(); }).Add();
 })).Render()
```

### GROUPING.CS

```
public ActionResult Index()
{
 var data = GetGroupData();
 ViewBag.DataSource = data;
 return View();
}
```

### Ungrouping the existing custom groups

By right-clicking the appropriate header and selecting "**Ungroup**" from the context menu in the pivot table component, users can ungroup the applied custom grouping.

**Note:** When a specific field is removed from the report after ungrouping, its custom group fields will also be removed from the pivot table.

Ungroup

### Filtering

Filtering allows to view the pivot table with selective records based on members that can be either included or excluded through UI and code-behind.

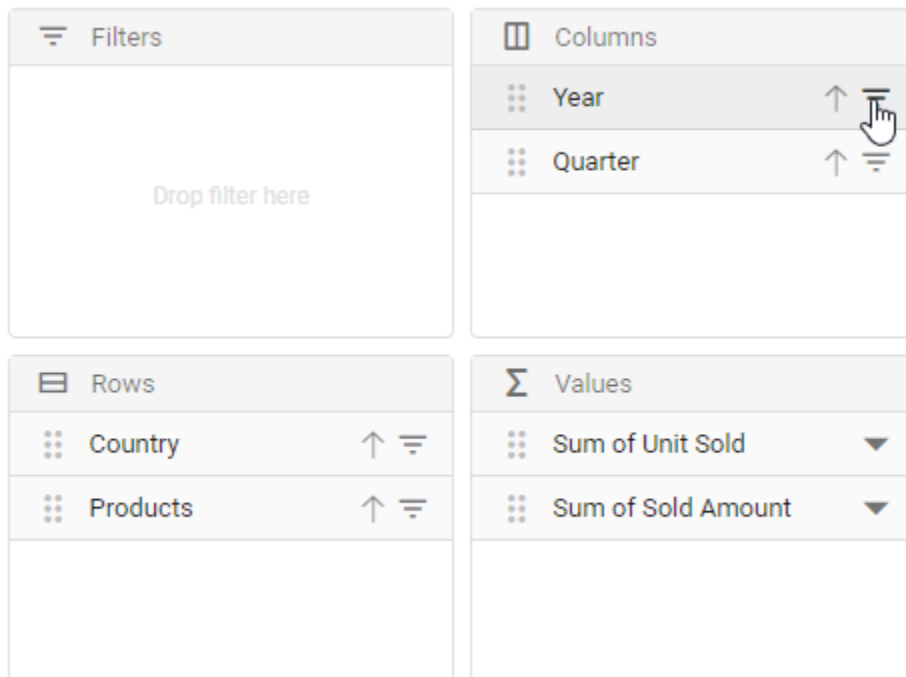

The following are the three different types of filtering:

- Member filtering
- Label filtering
- Value filtering

**Note:** When all the above filtering options are disabled via code-behind, then the filter icon would be disabled in the field list or grouping bar UI.

#### Member filtering

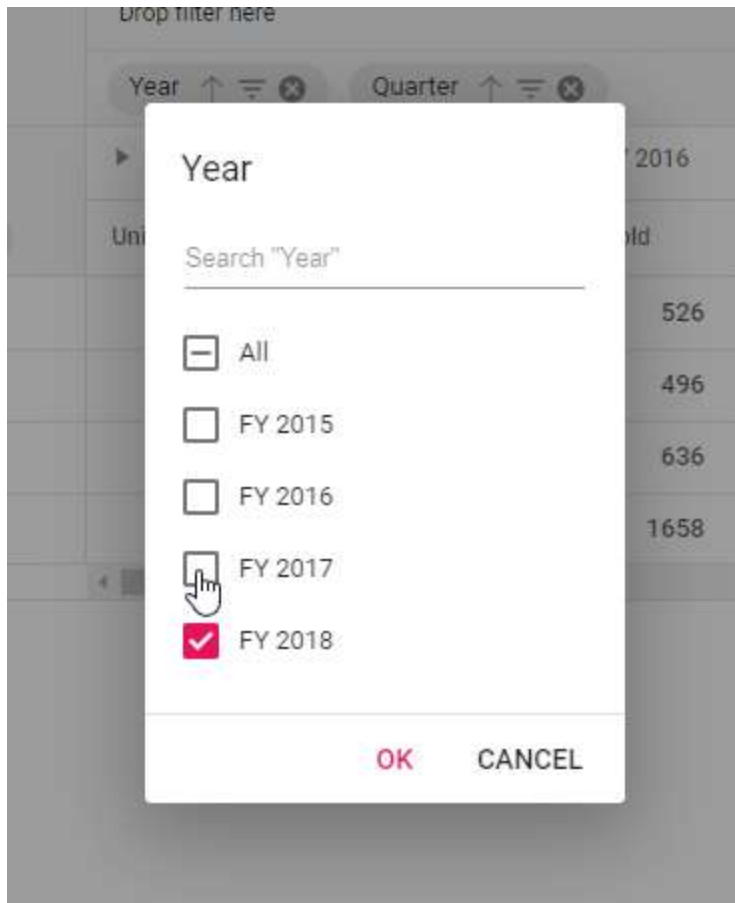

Allows to view the pivot table with selective records based on included and excluded members in each field. By default, member filter option is enabled by the [AllowMemberFilter](#) boolean property in [PivotViewDataSourceSettings](#) class. This UI option helps end user to filter members by clicking the filter icon besides any field in the row, column and filter axes available in the field list or grouping bar UI at runtime.

<br/>

|                    |                  |             |           |             |           |  |

| Germany            | 440              | \$563,515   | 496       | \$1,772,104 |           |  |
| United States      | 546              | \$754,515   | 636       | \$2,263,104 |           |  |
| Grand Total        | 1436             | \$2,032,985 | 1658      | \$5,577,312 |           |  |

<br/>

<br/>

| Sum of Unit Sold   |  | Drop filter here         |             |                       |
|--------------------|--|--------------------------|-------------|-----------------------|
| Sum of Sold Amount |  | Year ↑ ⇅ × Quarter ↑ ⇅ × |             |                       |
| Country ↑ ⇅ ×      |  | FY 2018                  |             | Grand Total           |
| Products ↑ ⇅ ×     |  | Unit Sold                | Sold Amount | Unit Sold Sold Amount |
| ▶ France           |  | 16                       | \$27,264    | 16 \$27,264           |
| ▶ Germany          |  | 96                       | \$77,264    | 96 \$77,264           |
| ▶ United States    |  | 76                       | \$97,264    | 76 \$97,264           |
| Grand Total        |  | 188                      | \$201,792   | 188 \$201,792         |

Meanwhile filtering can also be configured at code behind using the [PivotViewFilterSettings](#) class while initial rendering of the component. The basic settings required to add filter criteria are:

- [Name](#): It allows to set the appropriate field name.
- [Type](#): It allows to set the filter type as [FilterType.Include](#) or [FilterType.Exclude](#) to include or exclude field members respectively.
- [Items](#): It allows to set the members which needs to be either included or excluded from display.

- [LevelCount](#): It allows to set level count of the field to fetch data from the cube. **This property applicable only for OLAP data source.**

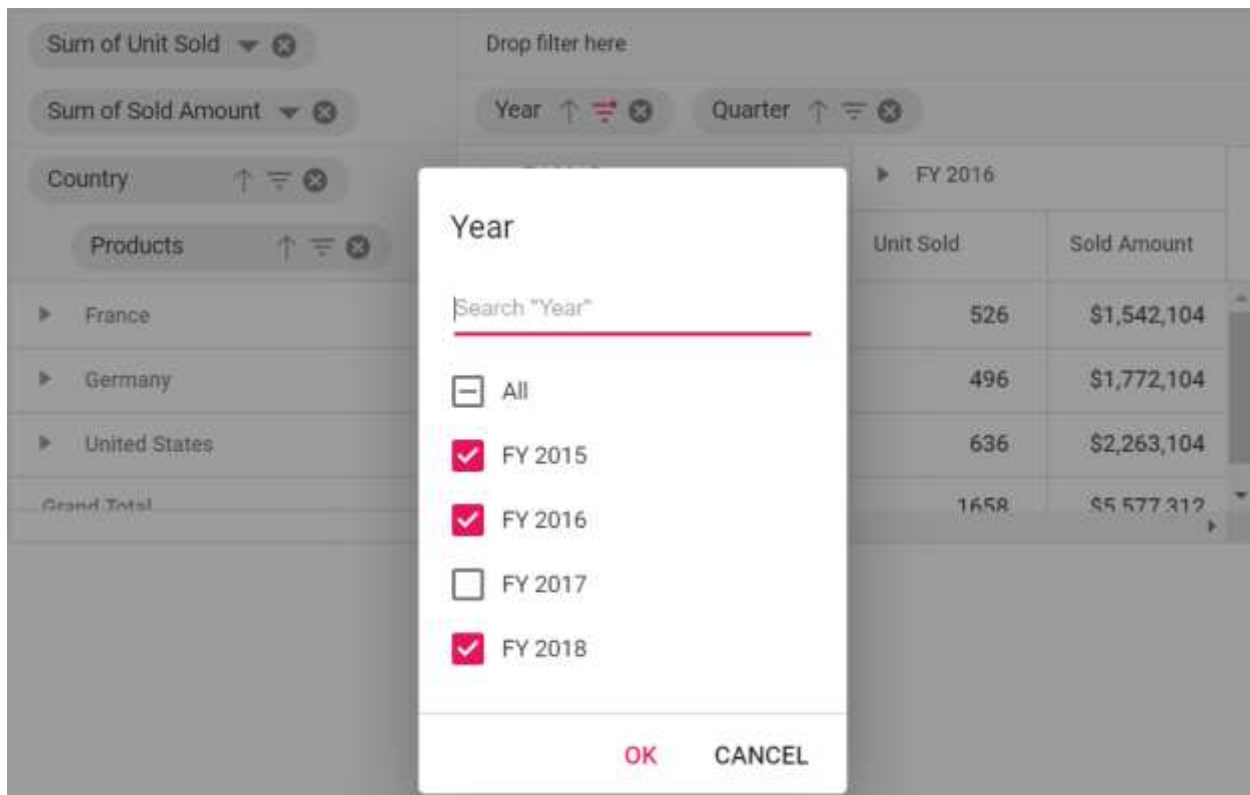

**Note:** When specifying unavailable or inappropriate members to include or exclude filter items collection, they will be ignored.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FilterSettings(filterSettings =>
{
filterSettings.Name("Year").Type(Syncfusion.EJ2.PivotView.FilterType.Exclude)
.Items(ViewBag.filterMembers).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

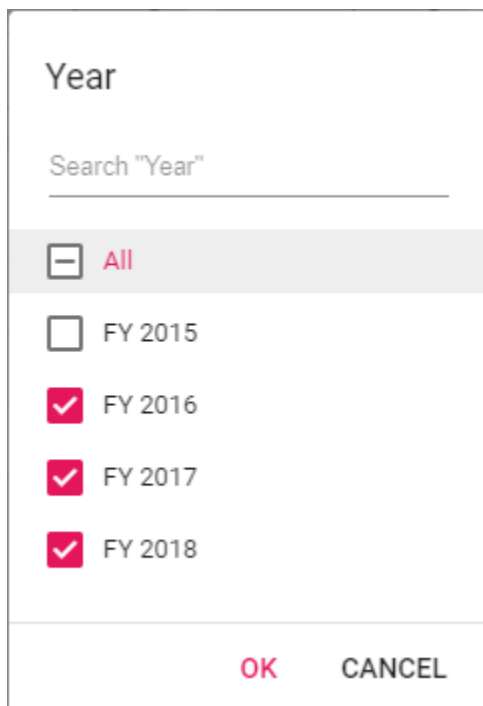

### FILTERING.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
ViewBag.filterMembers = new string[] { "FY 2017" };
return View();
}
```

#### [Option to select and unselect all members](#)

The member filter dialog comes with an option "All", which on checked selects all members and on unchecked deselects all members. The option "All" would appear in intermediate state mentioning that both selected and unselected child members are available.

When all members are deselected, the "Ok" button in member filter dialog would be disabled, meaning, at least one member should be selected and bound to the pivot table component.

A member filter dialog box titled "Year". It features a search bar with the placeholder text "Search 'Year'". Below the search bar, there is a list of members: "All", "FY 2015", "FY 2016", "FY 2017", and "FY 2018". Each member has an unchecked checkbox to its left. The "All" member is highlighted with a light gray background. At the bottom of the dialog, there are two buttons: "OK" and "CANCEL". The "OK" button is disabled (grayed out).

[Provision to search specific member\(s\)](#)

By default, search option is available to quickly navigate to the desired members. It can be done by entering the starting character(s) of the actual members.

A member filter dialog box titled "Year". It features a search bar containing the text "FY 2015" with a clear button (X) to its right. Below the search bar, there is a list of members: "All" and "FY 2015". Each member has a checked checkbox (red square with a white checkmark) to its left. At the bottom of the dialog, there are two buttons: "OK" and "CANCEL". The "OK" button is highlighted in red.

### Option to sort members

User can sort members within the member editor either to ascending (or) descending using the built-in sort icons. When both ascending and descending options are not chosen, then members will be shown in the default order (retrieved as such from data source).

### Performance Tips

In member filter dialog, end user can set the limit to display members while loading large data. Based on this limit, initial loading will get completed quickly without any performance constraint. Also, a message with remaining member count, which are not part of the UI, will be displayed in the member editor.

The data limit can be set using the [MaxNodeLimitInMemberEditor](#) property in [PivotView](#) class. By default, the property holds the numeric value **1000**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(false).AllowMemberFilter(true)
 }, rows =>
 {
 rows.Name("ProductID").Add();
 }, columns =>
 {
 columns.Name("DeliveryDate").Add();
 }, values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .MaxNodeLimitInMemberEditor(500).ShowGroupingBar(true).Render()
```

### FILTERING.CS

```

public ActionResult Index()
{
 var data = GetProductData();
 ViewBag.DataSource = data;
 ViewBag.filterMembers = new string[] { "United States" };
 return View();
}

public class ProductDetails
{
 public string ProductID { get; set; }
 public int Sold { get; set; }
 public DateTime DeliveryDate { get; set; }
}

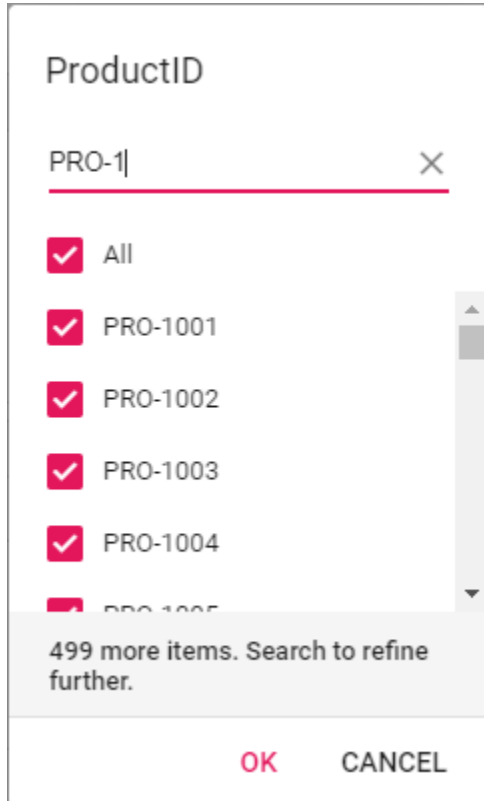

public static List<ProductDetails> GetProductData()
{
 List<ProductDetails> productData = new List<ProductDetails>();
 for (int i = 0; i < 5000; i++)
 {
 int RandomNumber = new Random().Next(1, 10);
 productData.Add(new ProductDetails { Sold = RandomNumber, ProductID
= "PRO-" + (i + 1001), DeliveryDate = new DateTime(2019, 1,
1).AddDays(RandomNumber) });
 }
 return productData;
}

```

Meanwhile, end user can utilize the search option to refine the members from the exceeded limit. For example, consider that there are 5000 members in the name "Node 1", "Node 2", "Node 3", and so on...

and user has set the property [MaxNodeLimitInMemberEditor](#) to **500**. In this case, only the initial 500 members will be displayed by default leaving a message "4500 more items. Search to refine further.". To get the member(s) between 501 to 5000, enter the starting character(s) in search option to bring the desired member(s) from the exceeded limit to the UI. Now, end user can either check or uncheck to continue with the filtering process.

#### [Loading members on-demand](#)

**Note:** This property is applicable only for OLAP data sources.

Allows to load members inside the filter dialog on-demand by setting the [LoadOnDemandInMemberEditor](#) property to **true**. By default, first level is loaded in the member editor from the OLAP cube. So, the member editor will be opened quickly, without any performance constraints. By default, this property is set to **true** and the search will only be applied to the level members that are loaded. In the meantime, the next level members can be added using either of the following methods.

- By clicking on the expander button of the respective member, only its child members will be loaded.
- Select a level from the drop-down list that will load all members up to the chosen level from the cube.

This will help to avoid performance lags when opening a member editor whose hierarchy has a large number of members. Once level members are queried and added one after the other, they will be maintained internally (for all operations like dialog re-opening, drag and drop, etc...) and will not be removed until the web page is refreshed.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowFieldList
(true).ShowGroupingBar(true).LoadOnDemandInMemberEditor(true).AllowCalculate
dField(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
 .Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
 .Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
 .Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); values.Name("Order
on Discount").IsCalculatedField(true).Add(); })
 .Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
 .CalculatedFieldSettings(calculatedFieldSettings =>
{

calculatedFieldSettings.Name("BikeAndComponents").Formula("([Product].[Produ
ct Categories].[Category].[Bikes] + [Product].[Product
Categories].[Category].[Components])").HierarchyUniqueName("[Product].[Produ
ct Categories]").FormatString("Standard").Add();
 calculatedFieldSettings.Name("Order on
Discount").Formula("[Measures].[Order Quantity] + ([Measures].[Order
Quantity] * 0.10)").FormatString("Currency").Add();
 })).Render()
<style>
 #pivotview {
 display: block;
 }
</style>

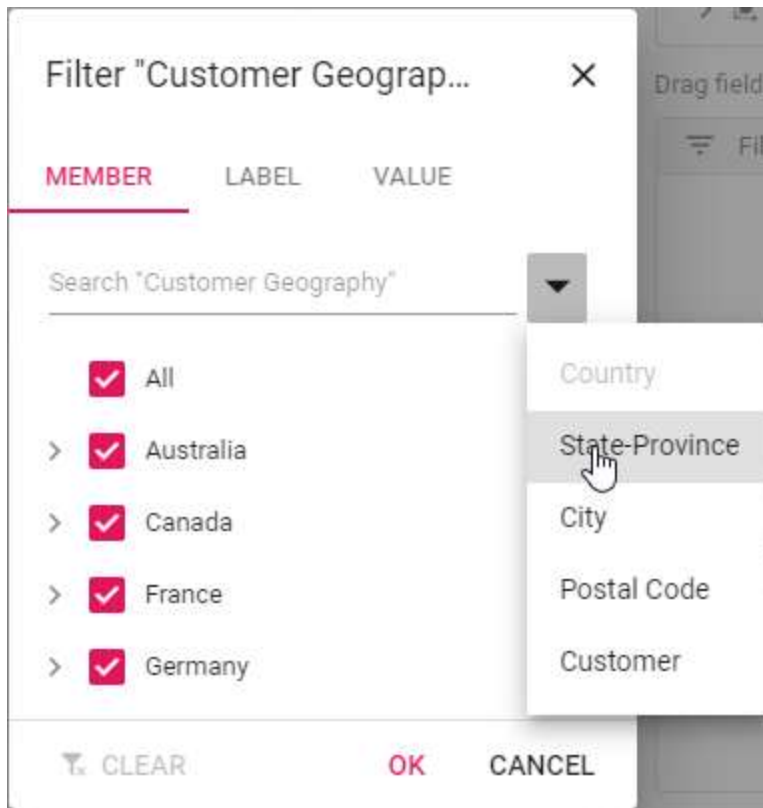

```

**FILTERING.CS**

```

public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal
Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}

```

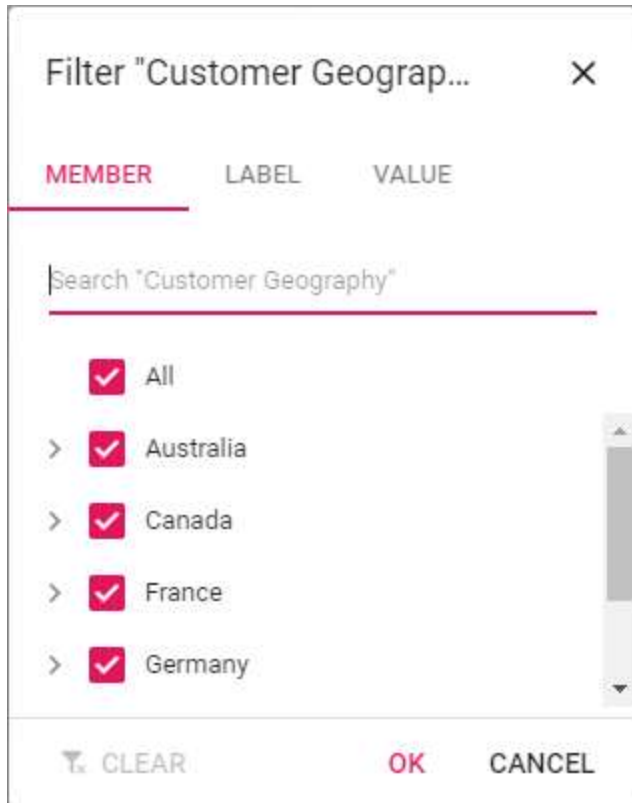

In the example above, "Customer Geography" dimension is loaded with first level (Country) during initial loading. The search will therefore be applied on the members of the "Country" level alone. After that, you can load members to the next level (State-Province) on-demand by expanding the "Australia" node (or) by selecting the "State-Province" level from the drop down list.

- When you expand "Australia", the "State-Province" members will be loaded to "Australia" alone.
- If you load the members by selecting the "State-Province" level from the drop-down list means, the "State-Province" members will be loaded across all countries like Australia, Canada, France, etc.

Once members are loaded, they are maintained internally and will not be removed until the page is refreshed.

If the property is set to **false**, all members of all levels will be queried and added during initial loading itself. Only one query is executed here to retrieve all members from all levels. Since it fetches large number of members, you can feel the performance difference while opening the member editor. But still, expand and search operation is quick here because the members have already been retrieved and populated.

Loading members based on level number

**Note:** This property is applicable only for OLAP data sources.

Allows user to load the members on the basis of the level number set in the [LevelCount](#) property in the [PivotViewFilterSettings](#). By default, this property is set to **1** and the search will only take place within the members of the first level.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("600").ShowFieldList
(true).ShowGroupingBar(true).AllowCalculatedField(true).DataSourceSettings(d
ataSourceSettings => dataSourceSettings.EnableSorting(true)

.Url("https://bi.syncfusion.com/olap/msmdpump.dll").Catalog("Adventure Works
DW 2008 SE").Cube("Adventure Works").ProviderType(ProviderType.SSAS)
.Rows(rows => { rows.Name("[Customer].[Customer
Geography]").Caption("Customer Geography").Add(); })
.Columns(columns => { columns.Name("[Product].[Product
Categories]").Caption("Product Categories").Add();
columns.Name("[Measures]").Caption("Measures").Add(); })
.Values(values => { values.Name("[Measures].[Customer
Count]").Caption("Customer Count").Add(); values.Name("[Measures].[Internet
Sales Amount]").Caption("Internet Sales Amount").Add(); values.Name("Order
on Discount").IsCalculatedField(true).Add(); })
.Filters(filters => { filters.Name("[Date].[Fiscal]").Caption("Date
Fiscal").Add(); })
.FilterSettings(filterSettings =>
{
```

```

 filterSettings.Name("[Customer].[Customer Geography]").Items(ViewBag.filterMembers).LevelCount(2).Add();
 }).CalculatedFieldSettings(calculatedFieldSettings =>
 {

 calculatedFieldSettings.Name("BikeAndComponents").Formula("([Product].[Product Categories].[Category].[Bikes] + [Product].[Product Categories].[Category].[Components])").HierarchyUniqueName("[Product].[Product Categories]").FormatString("Standard").Add();
 calculatedFieldSettings.Name("Order on Discount").Formula("[Measures].[Order Quantity] + ([Measures].[Order Quantity] * 0.10)").FormatString("Currency").Add();
 }).Render()
<style>
 #pivotview {
 display: block;
 }
</style>

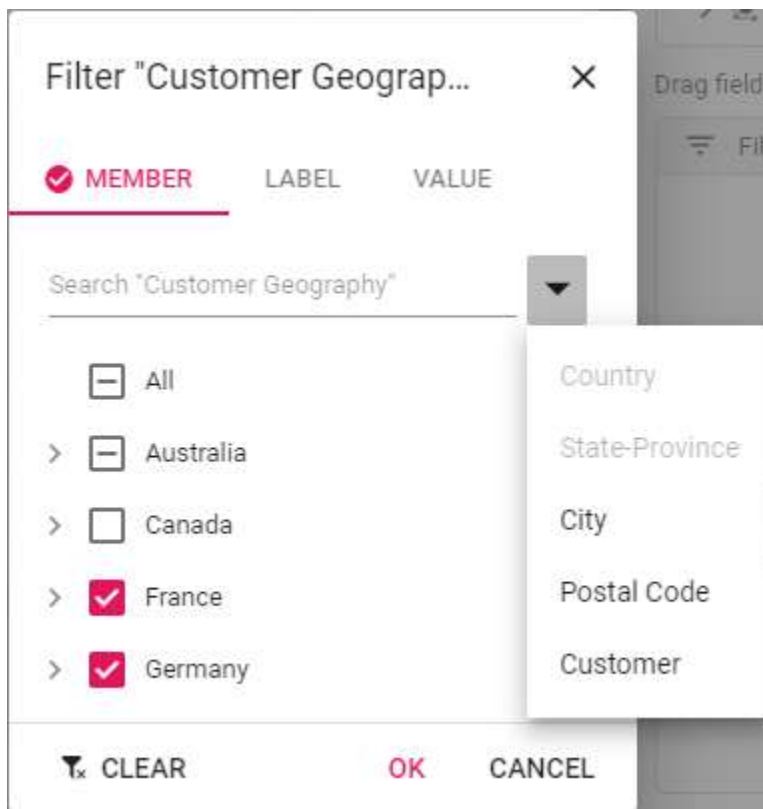

```

**FILTERING.CS**

```

public ActionResult Index()
{
 ViewBag.filterMembers = new string[] { "[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]", "[Date].[Fiscal].[Fiscal Year].&[2005]" };
 return View();
}

```

In the example above, we set [LevelCount](#) as **2** for the "Customer Geography" dimension in [PivotViewFilterSettings](#). So, the "Customer Geography" dimension is loaded with the "Country" and "State-Province" levels during initial loading itself. The search will therefore be applied only to the members of the "Country" and "State-Province" levels. After that, you can load members to the next level on-demand by expanding the respective "State-Province" node (or) by selecting the "City" level from the drop-down list.

### Label filtering

The label filtering helps to view the pivot table with selective header text in fields across row and column axes based on the applied filter criteria. The following are the three different types of label filtering available:

- Filtering string data type
- Filtering number data type
- Filtering date data type

The label filtering dialog can be enabled by setting the [AllowLabelFilter](#) property in [PivotViewDataSourceSettings](#) class to **true**. After enabling this API, click the filter icon besides any field in row or column axis available in field list or grouping bar UI. Now a filtering dialog will appear and navigate to "Label" tab to perform label filtering operations.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### FILTERING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**Note:** In label filtering UI, based on the field chosen, it's member data type is automatically recognized and filtering operation will be carried out. Whereas in code behind, user need to define the data type through a property and it has been explained in the immediate section below.

#### Filtering string data type through code

This type of filtering is exclusively applicable for fields with members in string data type. The filtering can be configured using the [PivotViewFilterSettings](#) class through code-behind. The properties required for label filter are:

- [Name](#): Sets the field name.
- [Type](#): Sets the filter type as [FilterType.Label](#) to the field.

- **Condition:** Sets the operator type such as [Operators.Equals](#), [Operators.GreaterThan](#), [Operators.LessThan](#), etc.
- **Value1:** Sets the start value.
- **Value2:** Sets the end value. It is applicable only for the operator such as [Operators.Between](#) and [Operators.NotBetween](#).
- **SelectedField:** Sets level name of a dimension, where the filter settings are to be applied. **This property applicable only for OLAP data source.**

For example, in a "Country" field, to show countries names that contains "United" text alone, set [Value1](#) to "United" and [Condition](#) to [Operators.Contains](#) for desired output in pivot table.

[Operators](#) that can be used in label filtering are:

| Operator             | Description                                                                   |
|----------------------|-------------------------------------------------------------------------------|
| ----- -----          |                                                                               |
| Equals               | Displays the pivot table that matches with the text.                          |
| DoesNotEquals        | Displays the pivot table that does not match with the given text.             |
| BeginWith            | Displays the pivot table that begins with text.                               |
| DoesNotBeginWith     | Displays the pivot table that does not begins with text.                      |
| EndsWith             | Displays the pivot table that ends with text.                                 |
| DoesNotEndsWith      | Displays the pivot table that does not ends with text.                        |
| Contains             | Displays the pivot table that contains text.                                  |
| DoesNotContains      | Displays the pivot table that does not contain text.                          |
| GreaterThan          | Displays the pivot table when the text is greater.                            |
| GreaterThanOrEqualTo | Displays the pivot table when the text is greater than or equal.              |
| LessThan             | Displays the pivot table when the text is lesser.                             |
| LessThanOrEqualTo    | Displays the pivot table when the text is lesser than or equal.               |
| Between              | Displays the pivot table that records between the start and end text.         |
| NotBetween           | Displays the pivot table that does not record between the start and end text. |

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true)
.FilterSettings(filtersettings =>
{
filtersettings.Name("Country").Type(Syncfusion.EJ2.PivotView.FilterType.Label).Condition(Syncfusion.EJ2.PivotView.Operators.Contains)
.Value1("United").Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}
```

```

 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()

```

### **FILTERING.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |

| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 546        | \$754,515   | 636        | \$2,263,104 |            |

#### Filtering number data type through code

This type of filtering is exclusively applicable for fields with members in number data type. The filtering can be configured in a similar way explained in the previous section - "Filtering string data type through code", except the [Type](#) property setting. For number data type, set the [Type](#) property to [FilterType.Number](#) enumeration.

For example, in a "Sold" field, to show the values between "90" to "100", set [Value1](#) to "90", [Value2](#) to "100" and [Condition](#) to [Operators.Between](#) for desired output in pivot table.

**Note:** Operators like [Operators.Equals](#), [Operators.DoesNotEquals](#), [Operators.GreaterThan](#), [Operators.GreaterThanOrEqualTo](#), [Operators.LessThan](#), [Operators.LessThanOrEqualTo](#), [Operators.Between](#), and [Operators.NotBetween](#) are alone applicable for number data type.

### **CSHTML**

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true)
 .FilterSettings(filtersettings =>
 {
 filtersettings.Name("Sold").Type(Syncfusion.EJ2.PivotView.FilterType.Number)
 .Condition(Syncfusion.EJ2.PivotView.Operators.Between).Value1("90").Value2(100).Add();
 }).Rows(rows =>
 {
 rows.Name("Sold").Caption("Units Sold").Add();
 }

```

```

 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Amount").Caption("Sold Amount").Add();
 }).Filters(filters =>
 {
 filters.Name("Country").Add(); filters.Name("Products").Add();
 }).Render()

```

### FILTERING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|             | ► FY 2015 | ► FY 20...  | ► FY 20...  | ► FY 20... | Grand To |
|-------------|-----------|-------------|-------------|------------|----------|
| 90          | \$198,808 |             | \$192,220   |            | \$391    |
| 91          | \$67,824  |             |             |            | \$67     |
| 93          | \$139,412 |             |             |            | \$139    |
| 95          |           | \$663,760   | \$837,800   |            | \$1,501  |
| 96          |           |             |             | \$77,264   | \$77     |
| 97          |           | \$1,184,352 |             |            | \$1,184  |
| 99          |           |             | \$2,005,012 |            | \$2,005  |
| Grand Total | \$406,044 | \$1,848,112 | \$3,035,032 | \$77,264   | \$5,366  |

#### [Filtering date data type through code](#)

This type of filtering is exclusively applicable for fields with members in date data type. The filtering can be configured in a similar way explained in the prior section - "Filtering string data type through code", except the [Type](#) property setting. For date data type, set the [Type](#) property to [FilterType.Date](#) enumeration.

For example, in a "Delivery Date" field, to show the records of the the year after 2015, then set [Value1](#) to "2015-01-01" and [Condition](#) to [Operators.After](#) for desired output in pivot table.

**Note:** Operators like [Operators.Equals](#), [Operators.DoesNotEquals](#), [Operators.Before](#), [Operators.BeforeOrEqualTo](#), [Operators.After](#), [Operators.AfterOrEqualTo](#), [Operators.Between](#), and [Operators.NotBetween](#) are alone applicable for date data type.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).Load("onLoad").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true)
 .FilterSettings(filterSettings =>
 {
 filterSettings.Name("Year").Type(Syncfusion.EJ2.PivotView.FilterType.Date).Condition(
 Syncfusion.EJ2.PivotView.Operators.After).Add();
 }).FormatSettings(formatSettings =>
 {
 formatSettings.Name("Year").Format("dd/MM/yyyy-hh:mm").Type("date").Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()
 }
</script>
 function onLoad(args) {
 args.dataSourceSettings.filterSettings[0].value1 = new Date("2015,
1, 1");
 }
</script>
```

### **FILTERING.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                  | Mountain Bikes |             | Road Bikes |             | Grand Total |              |
|------------------|----------------|-------------|------------|-------------|-------------|--------------|
|                  | Units Sold     | Sold Amount | Units Sold | Sold Amount | Units Sold  | Sold Amount  |
| 01/01/2016-12:00 | 794            | \$2,767,656 | 864        | \$2,809,656 | 1658        | \$5,577,312  |

| Grand Total      | 1765           | \$5,417,160 | 1677       | \$7,941,508 | 3442        | \$13,358,668 |

#### Clearing the existing label filter

End user can clear the applied label filter by simply click the "Clear" option at the bottom of the filter dialog under "Label" tab.

### Value filtering

The value filtering helps to perform filter operation based only on value fields and its resultant aggregated values over other fields defined in row and column axes.

The value filtering dialog can be enabled by setting the [AllowValueFilter](#) property in [PivotViewDataSourceSettings](#) class to **true**. After enabling this API, click the filter icon besides any field in row or column axis available in field list or grouping bar UI. Now a filtering dialog will appear and navigate to "Value" tab to perform value filtering operations.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowValueFilter(true)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### FILTERING.CS

```

|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 996        | \$1,469,470 | 1162       | \$3,805,208 | 1          |

The value filtering can also be configured using the [PivotViewFilterSettings](#) class through code-behind. The properties required for value filter are:

- [Name](#): Sets the normal field name.
- [Type](#): Sets the filter type as [FilterType.Value](#) to the field.
- [Measure](#): Sets the value field name.
- [Condition](#): Sets the operator type such as [Operators.Equals](#), [Operators.GreaterThan](#), [Operators.LessThan](#) etc.
- [Value1](#): Sets the start value.
- [Value2](#): Sets the end value. It is applicable only for the operator such as [Operators.Between](#) and [Operators.NotBetween](#).

For example, to show the data where total sum of units sold for each country exceeding 1500, set [Value1](#) to "1500" and [Condition](#) to [Operators.GreaterThan](#) in the "Country" field.

[Operators](#) that can be used in value filtering are:

| Operator             | Description                                                                 |
|----------------------|-----------------------------------------------------------------------------|
| ----- -----          |                                                                             |
| Equals               | Displays the pivot table that matches with the value.                       |
| DoesNotEquals        | Displays the pivot table that does not match with the given value.          |
| GreaterThan          | Displays the pivot table when the value is greater.                         |
| GreaterThanOrEqualTo | Displays the pivot table when the value is greater than or equal.           |
| LessThan             | Displays the pivot table when the value is lesser.                          |
| LessThanOrEqualTo    | Displays the pivot table when the value is lesser than or equal.            |
| Between              | Displays the pivot table that records between start and end values.         |
| NotBetween           | Displays the pivot table that does not record between start and end values. |

### C#HTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).AllowValueFilter(true)
.FilterSettings(filtersettings =>
{
filtersettings.Name("Country").Measure("Sold").Type(Syncfusion.EJ2.PivotView
.FilterType.Value).Condition(Syncfusion.EJ2.PivotView.Operators.GreaterThan)
.Value1("1500").Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### FILTERING.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).MemberFiltering("memberFiltering").Render()
<script>
 function memberFiltering(args) {
 args.cancel = true;
 }
</script>
```

### FILTERING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.filterMembers = new string[] { "FY 2017" };
 return View();
}
```

### MemberEditorOpen

The event [MemberEditorOpen](#) fires while opening member editor dialog. It allows to customize the field members to be displayed in the dialog. It has the following parameters

- **fieldName**: It holds the name of the appropriate field.
- **fieldMembers**: It holds the members of a field.
- **cancel**: It is a boolean property and by setting this to true, dialog won't be created.

In the below sample, the member editor of field "Country" shows only the selected Item.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
```

```

 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).MemberEditorOpen("memberEditorOpen").Render()
<script>
 function memberEditorOpen(args) {
 if (args.fieldName == 'Country') {
 args.fieldMembers = args.fieldMembers.filter((key) => {
 return (key.actualText == 'France' || key.actualText ==
'Germany')
 });
 }
 }
</script>

```

### **FILTERING.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.filterMembers = new string[] { "FY 2017" };
 return View();
}

```

### ActionBegin

The event [actionBegin](#) triggers when clicking the filter icon in the field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. For example, while filtering, the action name will be shown as **Filter field**.
- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the below sample, filter action can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### **CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {

```

```

AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Filter field') {
 args.cancel = true;
 }
 }
</script>

```

### ACTIONBEGIN-AGGREGATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### ActionComplete

The event [actionComplete](#) triggers when the filtering action via the field button, which is present in both grouping bar and field list UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. For example, after filtering, the action name will be shown as **Field filtered**.
- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **actionInfo**: It holds the unique information about the current UI action. For example, if the filter action is completed, the event argument contains information such as filter members, field name, and so on.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
```

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource) .ExpandAll (fal
se) .EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'Field filtered') {
 // Triggers when the filter action is completed.
 }
 }
</script>
```

### ACTIONCOMPLETE-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. For example, if the action fails while filtering, the action name will be shown as **Filter field**.
- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource) .ExpandAll (fal
se) .EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
```

```

columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).ShowGroupingBar(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Filter field') {
 // Triggers when the current UI action fails to achieve the
 desired result.
 }
 }
</script>

```

### **ACTIONFAILURE-AGGREGATION.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

## Sorting in ASP.NET MVC Pivot Table Component

### *Member Sorting*

Allows to order field members in rows and columns either in ascending or descending order. By default, field members in rows and columns are in ascending order.

Member sorting can be enabled by setting the [EnableSorting](#) property in [PivotViewDataSourceSettings](#) class to **true**. After enabling this API, click the sort icon besides each field in row or column axis, available in field list or grouping bar UI for re-arranging members either in ascending or descending order.

**Note:** By default the [EnableSorting](#) property in [PivotViewDataSourceSettings](#) class set as **true**. If we set it as **false**, then the field members arrange in pivot table as its data source order. And, the sort icons in grouping bar and field list buttons will be removed.

| Grand Total   | 1436      | \$2,032,985 | 1658      | \$5,577,312 | 1         |

Member sorting can also be configured using the [PivotViewSortSettings](#) class through code behind, during initial rendering. The settings required to sort are:

- [Name](#): It allows to set the field name.
- [Order](#): It allows to set the sort direction either to ascending or descending of the respective field.

**Note:** By default the [Order](#) property in the [PivotViewSortSettings](#) class set as [Sorting.Ascending](#). Meanwhile, we can arrange the field members as its order in data source by setting it as [Sorting.None](#) where the sort icons in grouping bar and field list buttons for the corresponding field will be removed.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.SortSettings(sortsettings =>
{
 sortsettings.Name("Country").Order(Sorting.Descending).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### SORTING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Alphanumeric Sorting

Usually string sorting is applied to field members even if it starts with numbers. But this kind of field members can also be sorted on the basis of numbers that are placed at the beginning of the member name. This can be achieved by setting the [dataType](#) property as **number** to the desired field.

### CSHTML

```
@Html.EJS().PivotView("PivotGrid").Width("100%").Height("300").DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)
 ViewBag.Data)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Country").Add();
 })
 .Rows(rows =>
 {
 rows.Name("ProductID").DataType("Number").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
 .ShowGroupingBar(true).Render()
 })
```

### ALPHAHEADER.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

public List<PivotData> GetPivotData()
{

### Custom Sorting

Allows to sort field headers (aka, members) in rows and columns based on user-defined order. This can be configured mainly using the [MembersOrder](#) in the [PivotViewSortSettings](#) through code behind, during initial rendering. The other settings required to sort are:

- [Name](#) : It allows to set the field name.
- [MembersOrder](#) : It holds an array of headers in the order specified by the user.
- [Order](#) : It allows to specify whether the array of headers should be sorted ascending or descending.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.SortSettings(sortsettings =>
{
sortsettings.Name("Country").Order(Sorting.Ascending).MembersOrder(ViewBag.membersOrder).Add();
sortsettings.Name("Year").Order(Sorting.Descending).MembersOrder(ViewBag.membersOrder_1).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Production Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).Render()
```

### CUSTOM-SORTING.CS

```
public ActionResult Index()
{
var data = GetPivotData();
```

```

ViewBag.DataSource = data;
ViewBag.membersOrder = new string[] { "United Kingdom", "France" };
ViewBag.membersOrder_1 = new string[] { "FY 2015", "FY 2017" };
return View();
}

```

![output](images/Custom sorting.png "Custom Sorting")

### Value Sorting

**Note:** This property is applicable only for relational data source.

Allows to sort individual value field and its aggregated values either in row or column axis in both ascending and descending order. It can be enabled by setting the [EnableValueSorting](#) property in [PivotView](#) class to **true**. On enabling, end user can sort the values by directly clicking the value field header positioned either in row or column axis of the pivot table component.

The value sorting can also be configured using the [PivotViewValueSortSettings](#) option through code behind. The settings required to sort value fields are:

- [HeaderText](#): It allows to set the header names with delimiters, that is used for value sorting. The header names are arranged from Level 1 to Level N, down the hierarchy with a delimiter for better specification.
- [HeaderDelimiter](#): It allows to set the delimiters string to separate the header text between levels.
- [SortOrder](#): It allows to set the sort direction of the value field.

**Note:** Value fields are set to the column axis by default. In such cases, the value sorting applied will have an effect on the column alone. You need to place the value fields in the row axis to do so in row wise. For more information, [refer here](#).

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.ValueSortSettings(new PivotViewValueSortSettings {
 HeaderText = "FY 2015##Sold Amount",
 HeaderDelimiter = "##",
 SortOrder = Sorting.Descending })
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.EnableValueSorting(true).Render()

```

**VALUESORTING.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |               | FY 2016    |             | FY 2017    |
|---------------|------------|---------------|------------|-------------|------------|
|               | Units Sold | Sold Amount ↓ | Units Sold | Sold Amount | Units Sold |
| United States | 546        | \$754,515     | 636        | \$2,263,104 |            |
| France        | 450        | \$714,955     | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515     | 496        | \$1,772,104 |            |
| Grand Total   | 1436       | \$2,032,985   | 1658       | \$5,577,312 | 1          |

*Event**OnHeadersSort*

The event [OnHeadersSort](#) triggers when clicking the value sort icon or the sort icon in the field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **fieldName**: It holds the field name where the sort settings applied.
- **sortOrder**: It holds the current sort order of the field.
- **members**: It holds the sorted headers according to the specified sort order.
- **levelName**: It holds the specific field's unique level name. **Note**: This option is applicable only for OLAP data.
- **isOrderChanged**: By setting this boolean property to true, it allows to display the modified members order.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Production Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
)
```

```

 }).ShowGroupingBar(true).OnHeadersSort("onHeadersSort").Render()
<script>
 function onHeadersSort(args) {
 if (args.fieldName == 'Country') {
 args.members = ['United Kingdom', 'Germany'];
 args.IsOrderChanged = true;
 }
 if (args.fieldName == 'Year') {
 args.members = ['FY 2017', 'FY 2015'];
 args.IsOrderChanged = true;
 }
 }
</script>

```

### ONHEADERSORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

![output](images/Custom sorting\_event.png "Custom Sorting Event")

#### ActionBegin

The event [actionBegin](#) triggers when clicking the value sort icon or the sort icon in the field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

| Action                          | Action Name |
|---------------------------------|-------------|
| -----                           | -----       |
| <a href="#">Sort field</a>      | Sort field  |
| <a href="#">Value sort icon</a> | Sort value  |

- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the below sample, sort action can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Sort field' || args.actionName == 'Sort
value') {
 args.cancel = true;
 }
 }
</script>

```

**ACTIONBEGIN-AGGREGATION.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

**ActionComplete**

The event [actionComplete](#) triggers when the UI actions such as value sorting or sorting via the field button, which is present in both grouping bar and field list UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action                          | Action Name  |
|---------------------------------|--------------|
|                                 |              |
| <a href="#">Sort field</a>      | Field sorted |
| <a href="#">Value sort icon</a> | Value sorted |

- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **actionInfo**: It holds the unique information about the current UI action. For example, if sorting is completed, the event argument contains information such as sort order and the field name.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'Field sorted' || args.actionName == 'Value
sorted') {
 // Triggers when the sort action is completed.
 }
 }
</script>
```

### ACTIONCOMPLETE-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| [Sort field](#) | Sort field |

| [Value sort icon](#) | Sort value |

- **errorInfo**: It holds the error information of the current UI action.

## CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Sort field' || args.actionName == 'Sort
value') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
}</script>
```

## ACTIONFAILURE-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

<!-- markdownlint-disable MD012 -->

### Drill Through

Allows to view the underlying raw data of a summarized cell in the pivot table. It can be enabled by setting the [AllowDrillThrough](#) property to **true**. By double-clicking on any value cell, user can view the detailed raw data in a data grid inside a new window. In the new window, row header, column header

and measure name of the clicked cell will be shown at the top. Also, user can include or exclude fields available in the data grid using column chooser option.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").ShowTooltip(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowDrillThrough(true).Render()
```

### DRILLTHROUGH.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

Users can also view the underlying raw data though the pivot chart. By clicking on any data point, user can view the detailed raw data in a data grid inside a new window.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").ShowTooltip(false).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true))
```

```

.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowDrillThrough(true).DisplayOption(new PivotViewDisplayOption { View = View.Chart }).ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()

```

### DRILLTHROUGHCHART.CS

```

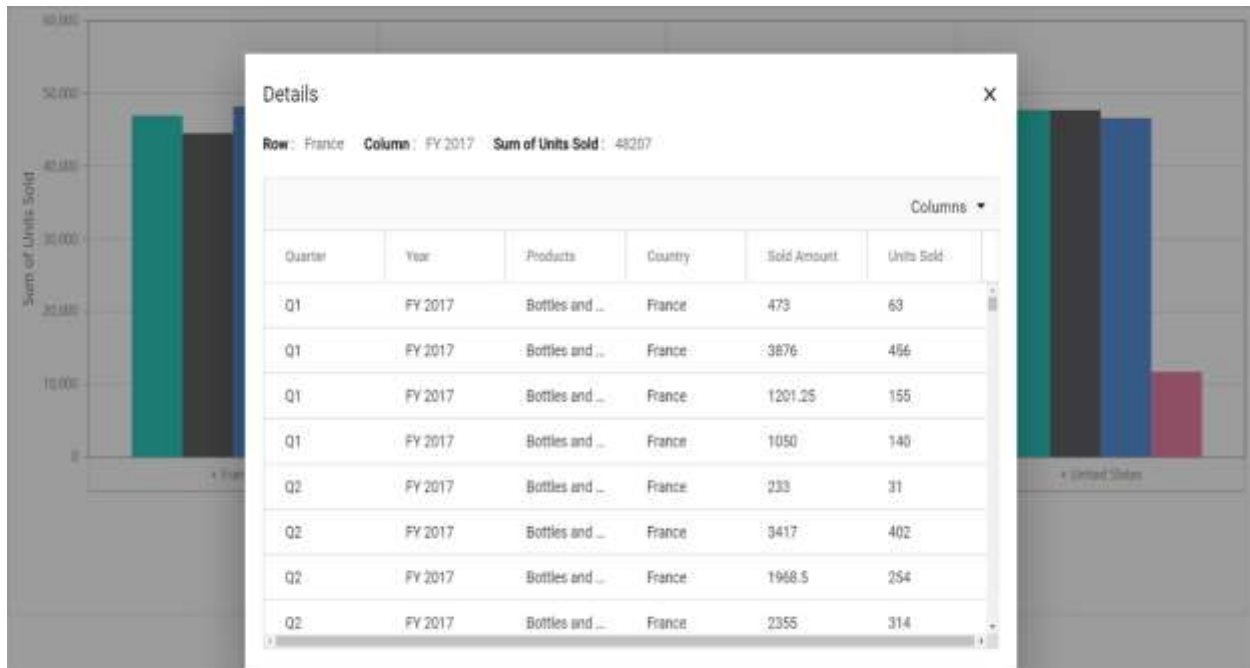

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

&lt;br/&gt;

&lt;br/&gt;

*Maximum rows to retrieve*

**Note:** This property is applicable only for OLAP data sources.

The [MaxRowsInDrillThrough](#) property allows to specify the maximum number of raw data to be returned during the drill through process. By default, this property is set to **"10000"** meaning that if you do not specify this property, you will get 10,000 or less raw data.

### Events

#### DrillThrough

The event `DrillThrough` triggers every time before a value cell is double clicked. This event allows user to customize the data grid columns in drill through popup. Exclusively the event helps to view and process the raw data information behind a aggregated value inside value cell. It has the following parameters:

- `columnHeaders` - It holds column header of the current cell.
- `currentCell` - It holds the current cell's information.

- `currentTarget` - It holds current cell's html element.
- `gridColumns` - It holds data grid columns to be rendered in drill through popup.
- `rowData` - It holds current cell's raw data.
- `rowHeaders` - It holds row header of current cell.
- `value` - It holds value of current cell.
- `cancel` - It is a boolean property and by setting this to true, dialog won't be created.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").ShowTooltip(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).AllowDrillThrough(true).DrillThrough("drillThrough").Render()
<script>
function drillThrough(args) {
//triggers on value cell double click
}
</script>
```

### DRILLTHROUGHEVENT.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### BeginDrillThrough

The event `BeginDrillThrough` occurs for each and every value cell with a double click, and the event argument provides the data grid information before the drill-through popup is shown. User can access the data grid (which holds the raw data underneath the aggregated value cell) options such as sort, group, filter and customize those in the data grid. It has the following parameters:

- `gridObj` - It holds the data grid instance to be rendered inside the drill-through popup.

- **cellInfo** - It holds current cell information like raw data, row header, column header and value.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").ShowTooltip(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Normal)).BeginDrillThrough("beginDrillThrough").Render()
<script>
function beginDrillThrough(args) {
 if (args.gridObj) {
 var gridObj = args.gridObj;
 gridObj.allowGrouping = true;
 gridObj.allowSorting = true;
 gridObj.allowFiltering = true;
 gridObj.filterSettings = { type: 'CheckBox' };
 }
}
</script>
```

### CUSTOMEDITING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Editing

**Note:** This feature is applicable only for relational data source.

Cell edit allows to add, delete, or update the raw items of any value cell from the pivot table. The raw items can be viewed in a data grid inside a new window on double-clicking the appropriate value cell. In

the data grid, CRUD operations can be performed by double-clicking the cells or using toolbar options. Once user finishes editing raw items, aggregation will be performed for the updated values in pivot table component immediately. This support can be enabled by setting the [AllowEditing](#) property in [PivotViewCellEditSettings](#) class to **true**.

The CRUD operations available in the data grid toolbar and command column are:

```
| Toolbar Button | Actions |
|-----|-----|
| Add | Add a new row. |
| Edit | Edit the current row or cell. |
| Delete | Delete the current row. |
| Update | Update the edited row or cell. |
| Cancel | Cancel the edited state. |
```

The following are the supported edit types in the data grid:

- Normal
- Dialog
- Batch
- Command Columns

#### *Normal*

In normal edit mode, when user starts editing, the state of the currently selected row alone will be completely changed to edit state. User can change the cell values and save it to the data source by clicking "Update" toolbar button. To enable the normal edit, set the [Mode](#) property in [PivotViewCellEditSettings](#) class to [EditMode.Normal](#).

**Note:** The normal edit mode is the default mode of editing..

#### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
 }).Values(values =>
 {
```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();

 })).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Normal)).Render()

```

### NORMAL.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Dialog

In dialog edit mode, when you start editing, the currently selected row data will be shown in a dialog.

You can change the cell values and save it to the data source by clicking **Save**.

To enable the dialog edit, set the [Mode](#) property in [PivotViewCellEditSettings](#) class to [EditMode.Dialog](#).

### CSHTML

```

@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }
)
)

```

```

 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Dialog)).Render()

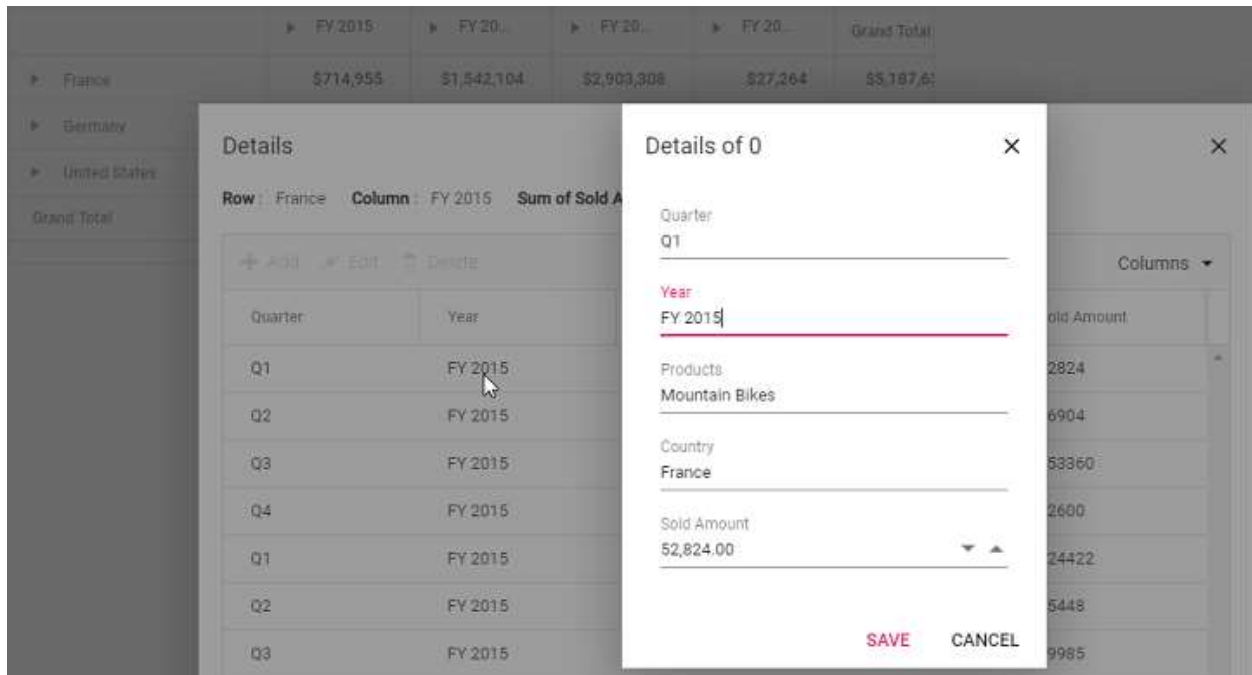

```

### DIALOG.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Batch

In batch edit mode, when you double-click the table cell, the state of target cell is changed to edit state.

You can perform bulk save (added, changed, and deleted data in the single request) to the data source by clicking the toolbar's **Update** button.

To enable the batch edit, set the [Mode](#) property in [PivotViewCellEditSettings](#) class to [EditMode.Batch](#).

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Batch)).Render()
```

**BATCH.CS**

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### Command column

An additional column appended in the grid layout holds the command buttons to perform the CRUD operation.

To enable the command columns, set the [AllowCommandColumns](#) property in [PivotViewCellEditSettings](#) class to **true**.

The available built-in command buttons are:

|                |                          |
|----------------|--------------------------|
| Command Button | Actions                  |

### Inline Editing

Allows editing of a value cell directly without the use of an external edit dialog. It is applicable if and only if a single raw data is used for the value of the cell. It is applicable to all editing modes, such as normal, batch, dialog and column commands. It can be enabled by setting the [allowInlineEditing](#) property in [editSettings](#) to **true**.

## CSHTML

```

@Html.EJS().PivotView("PivotGrid").Width("100%).Height("300").DataSourceSet
tings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>
)ViewBag.Data)
 .FormatSettings(formatsettings =>

```

```

{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Columns(columns =>
{
columns.Name("Date").Add(); columns.Name("Product").Add();
}).Rows(rows =>
{
rows.Name("Country").Add();
}).Values(values =>
{
values.Name("Quantity").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}
)).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowEditing(true).AllowInlineEditing(true)).Render()

```

### INLINE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

| United States  | 47         | \$3,200     | 49         | \$3,320     | 45         | \$6,300     | 53         | \$4,680     |
| Grand Total    | 185        | \$21,690    | 211        | \$15,960    | 241        | \$25,200    | 221        | \$17,720    |

### Editing using the pivot chart

Users can also add, delete, or update the underlying raw items of any data point via pivot chart. The raw items will be shown in the data grid in the new window by clicking the appropriate data point. Then you can edit the raw items as mentioned above by any of the edit types (normal, dialog, batch and command column).

### CSHTML

```

@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{

```

```

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).AllowCommandColumns(true)).DisplayOption(new PivotViewDisplayOption { View = View.Chart }).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries => chartSeries.Type(ChartSeriesType.Column))).Render()

```

### CHART.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

<br/>

<br/>

### Events

#### EditCompleted

The event [editCompleted](#) triggers when values cells are edited completely. The event provides edited cell(s) information along with its previous cell value. It also helps to do the CRUD operation by manually updating the database which is connected to the component. It has the following parameters.

- **currentData** - It holds the current raw data of the edited cells.
- **previousData** - It holds the previous raw data of the edited cells.
- **previousPosition** - It holds the index of the raw data whose values are edited.
- **cancel** - It is a boolean property and if it is set as **true**, the editing won't be reflected in the pivot table.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
```

```

{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
}))).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowA
dding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.Pivot
View.EditMode.Normal)).EditCompleted("editCompleted").Render()
<script>
 function editCompleted(args) {
 //triggers when a value cell is edited.
 }
</script>

```

### EDITCOMPLETED.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### DrillThrough

For more information [refer](#) here.

### BeginDrillThrough

For more information [refer](#) here.

### ActionBegin

The event [actionBegin](#) triggers when the UI actions such as CRUD operations (via dialog) and inline editing begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

| Action  | Action Name         |
|---------|---------------------|
| -----   | -----               |
| Editing | Edit record         |
| Save    | Save edited records |
| Add     | Add new record      |
| Delete  | Remove record       |

- **cancel**: It allows user to restrict the current action.

In the below sample, editing actions such as add and save can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
 })
).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Dialog)).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Add new record' || args.actionName == 'Save edited records') {
 args.cancel = true;
 }
 }
</script>
```

### ACTIONBEGIN-EDITING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionComplete

The event [actionComplete](#) triggers when the UI action such as CRUD operations (via dialog) or inline editing, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name          |
|--------|----------------------|
| Save   | Edited records saved |
| Add    | New record added     |
| Delete | Record removed       |
| Update | Records updated      |

- **actionInfo**: It holds the unique information about the current UI action. For example, if save action is completed, the event argument contains information such as mode of editing and saved records.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
 })
).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowAdding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.PivotView.EditMode.Dialog)).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'New record added' || args.actionName == 'Edited records saved') {
 // Triggers when the editing UI actions such as add and edit are completed.
 }
 }
}
```

```
</script>
```

### ACTIONCOMPLETE-EDITING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

| Action      | Action Name         |
|-------------|---------------------|
| ----- ----- |                     |
| Editing     | Edit record         |
| Save        | Save edited records |
| Add         | Add new record      |
| Delete      | Remove record       |

- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1)
.UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}
```

```

 })).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowA
dding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.Pivot
View.EditMode.Dialog)).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Add new record' || args.actionName == 'Edit
record') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
</script>

```

### ACTIONFAILURE-EDITING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

## Data Formatting

### Number Formatting

Allows you to specify the required display format that should be used in values of the pivot table. Supported display formats are:

- Number
- Currency
- Percentage
- Custom

You can apply format for the numeric values using the following properties in the [FormatSettings](#).

- [Name](#): It allows to specify the field name.
- [Format](#): It allows to specify the format of the respective field.

Possible formatting values are:

1. N - denotes numeric type.
2. C - denotes currency type.
3. P - denotes percentage type.

**Note:** If no format is specified it takes number as default format type.

Other properties include:

- [UseGrouping](#): It allows to enable or disable the separator, for example, \$100,000,000 or \$100000000 respectively. By default, it will be set as **true**.

- **Currency:** It allows to set the currency code which needs to be considered for the currency formatting.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C2").Currency("EUR").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(false).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .ShowFieldList(true).Render()
```

### FORMATTING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             |              | FY 2016    |             |
|---------------|------------|-------------|--------------|------------|-------------|
|               | Units Sold | Sold Amount | Total Amount | Units Sold | Sold Amount |
| France        | 450        | €714955.00  | 450          | 526        | €1542104    |
| Germany       | 440        | €563515.00  | 440          | 496        | €1772104    |
| United States | 546        | €754515.00  | 546          | 636        | €2263104    |
| Grand Total   | 1436       | €2032985.00 | 1436         | 1658       | €5577312    |

You can also format the values at runtime using the formatting dialog. This option can be enabled by setting the [AllowNumberFormatting](#) property to **true**. The same has been discussed in some of the upcoming topics.

### Custom format

You can add any custom format directly to the [Format](#) property in the [FormatSettings](#). Custom format can be achieved by using one or more format specifiers listed in the below table.

| Specifier                | Description                                                                                                                   | Input                            | Format Output |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------------|----------------------------------|---------------|
| 0                        | Replaces the zero with the corresponding digit if it is present. Otherwise, zero will appear in the result string.            | { format: '0000' }               | '0123'        |
| #                        | Replaces the '#' symbol with the corresponding digit if it is present. Otherwise, no digits will appear in the result string. | { format: '####' }               | '1234'        |
| .                        | Denotes the number of digits permitted after the decimal point.                                                               | { format: '###0.##0#' }          | '546321.000'  |
| %                        | Percent specifier denotes the percentage type format.                                                                         | { format: '0000 %' }             | '0100 %'      |
| \$                       | Denotes the currency type format that is based on the global currency code specified.                                         | { format: '\$###.00' }           | '\$ 13.00'    |
| ;                        | Denotes separate formats for positive, negative and zero values.                                                              | { format: '###.##;(###.00);-0' } | '(120.00)'    |
| 'String' (single Quotes) | Denotes the characters that are enclosed in the single quote (') to be replaced in the resulting string.                      | { format: '####.00 '@' ' }       | '123.00 @'    |

**Note:** If custom format is defined, certain properties such as [UseGrouping](#) and [Currency](#) will not be considered.

### CSHTML

```
@{var amount = "\" + "Sum(Amount)" + "\"";}
@{var sold = "\" + "Sum(Sold)" + "\"";}
@{ var totalPrice = amount + "+" + sold;}
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{

#### Invoking formatting dialog through external button

You can invoke the formatting dialog by clicking an external button using the `showNumberFormattingDialog` method.

#### CSHTML

```
@{var amount = "\" + "Sum(Amount)" + "\"; }
@{var sold = "\" + "Sum(Sold)" + "\"; }
@{ var totalPrice = amount + "+" + sold; }
@Html.EJS().Button("calculated-field-btn").Content("Calculated
Field").IsPrimary(true).Render()

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).CalculatedFieldSettings(calculatedfieldsettings =>
{
calculatedfieldsettings.Name("Total").Formula(totalPrice).Add();
```

```
 })).AllowCalculatedField(true).Render()
 <script>
 document.getElementById("calculated-field-
btn").addEventListener('click', function () {
 var pivotObj =
document.getElementById("PivotView").ej2_instances[0];
 pivotObj.calculatedFieldModule.createCalculatedFieldDialog();
 });
 </script>
```

### Events

#### NumberFormatting

The event [NumberFormatting](#) fires while closing the number formatting dialog on "OK" button click. It allows the user to restrict the customization settings done by the user. It has the following parameters

- **formatName**: It holds the name of the field.
- **formatSettings**: It holds the [formatSettings](#) property of the pivot report.
- **cancel**: It is a boolean property and by setting this to true , the customization done in number formatting dialog won't be applied.

In the below sample, the customization done in number formatting dialog for the field "Amount" won't be applied.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolBar(true).AllowNumberFormatting(true).NumberFormatting("numberFormatting").ShowToolBar(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).DisplayOption(new PivotViewDisplayOption { View = View.Both
}).ToolBar(new List<string>
() { "NumberFormatting" }).Render()
<style>
#pivotview {
width: 100%;
height: 100%;
}
.e-tool-expand::before {
content: '\e702';
}
</style>
<script>
function numberFormatting(args) {
if (args.formatName === 'Amount') {
args.cancel = true;
}
}
</script>
```

### FORMATTING.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

*See Also*

- [Customize number, date, and time values](#)
- [NumberFormatOptions](#)
- [Toolbar](#)

### Conditional Formatting

Allows end user to change the appearance of the pivot table value cells with its background color, font color, font family, and font size based on specific conditions.

The conditional formatting can be applied at runtime through the built-in dialog, invoked from the toolbar. To do so, set [AllowConditionalFormatting](#) and [ShowToolbar](#) properties in [PivotView](#) class to **true**. Also, include the item **ConditionalFormatting** within the [Toolbar](#) property in [PivotView](#) class. End user can now see the "Conditional Formatting" icon in toolbar UI automatically, which on clicking will invoke the formatting dialog to perform necessary operations.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").DataSourceSettings(
dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).
 EnableSorting(true)
 .DrilledMembers(drilledmembers =>
 {

drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {

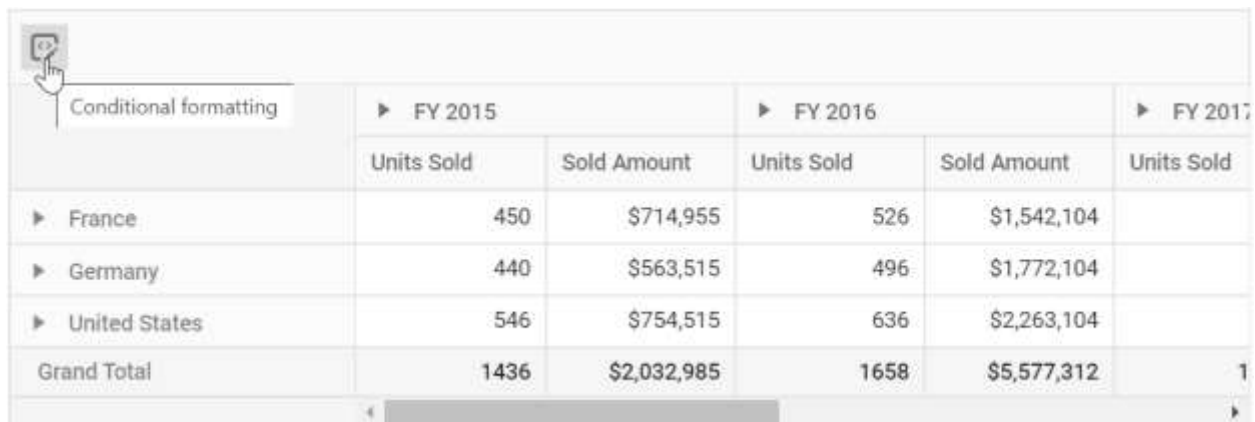

format.Conditions(Syncfusion.EJ2.PivotView.Condition.LessThan).Measure("In_Stock").Value1(1000).Style(style => {
style.BackgroundColor("#80cbc4").Color("black").FontFamily("Tahoma").FontSize("12px"); }).Add();
```

```
format.Conditions(Syncfusion.EJ2.PivotView.Condition.Between).Measure("Sold")
).Value1(500).Value2(40000).Style(style => {
style.BackgroundColor("#f48fb1").Color("black").FontFamily("Tahoma").FontSiz
e("12px"); }).Add();
})
).AllowConditionalFormatting(true).ShowToolbar(true).Toolbar(new
List<string>() { "ConditionalFormatting" }).Render()
```

### FORMATTING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.drilledMembers = new string[] { "France" };
 return View();
}
```

Conditional formatting can also be included in the pivot table through code-behind using the [PivotViewConditionalFormatSetting](#) class. The required properties to apply a new conditional formatting are,

- [Measure](#): Specifies the value field name for which style will be applied.
- [Conditions](#): Specifies the operator type such as equals, greater than, less than, etc.
- [Value1](#): Specifies the start value.
- [Value2](#): Specifies the end value.
- [PivotViewStyle](#): Specifies the style for the cell.

The available style properties in [PivotViewStyle](#) class, to set in value cells are:

- [BackgroundColor](#): Specifies the background color.
- [Color](#): Specifies the font color.

- [FontFamily](#): Specifies the font family.
- [FontSize](#): Specifies the font size.

Meanwhile, user can also view conditional formatting dialog in UI by invoking `ShowConditionalFormattingDialog` method on an external button click which is shown in the below code sample.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("conditional-formatting-btn").Content("Conditional
Formatting").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSet
tings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .DrilledMembers(drilledmembers =>
 {
drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {
format.Conditions(Condition.LessThan).Measure("In_Stock").Value1(1000).Style
(style => {
style.BackgroundColor("#80cbc4").Color("black").FontFamily("Tahoma").FontSiz
e("12px"); }).Add();

format.Conditions(Condition.Between).Measure("Sold").Value1(500).Value2(4000
0).Style(style => {
style.BackgroundColor("#f48fb1").Color("black").FontFamily("Tahoma").FontSiz
e("12px"); }).Add();
 })
).AllowConditionalFormatting(true).Render()
<script>
```

```

document.getElementById("conditional-formatting-
btn").addEventListener('click', function () {
 var pivotObj =
document.getElementById("PivotView").ej2_instances[0];

pivotObj.conditionalFormattingModule.showConditionalFormattingDialog();
});
</script>

```

### FORMATTING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

**CONDITIONAL FORMATTING**

#### *Conditional formatting for all fields*

Allows end user to apply conditional formatting commonly for all value fields just by ignoring the [Measure](#) property and setting rest of the properties in [PivotViewConditionalFormatSettings](#) class.

#### **CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .DrilledMembers(drilledmembers =>
 {
drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
```

```

 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {
 format.Conditions(Syncfusion.EJ2.PivotView.Condition.GreaterThan).Value1(500)
).Style(style => {
 style.BackgroundColor("#80cbc4").Color("black").FontFamily("Tahoma").FontSiz
e("12px"); }).Add();
 })
).AllowConditionalFormatting(true).Render()

```

### FORMATTING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.drilledMembers = new string[] { "France" };
 return View();
}

```

#### Conditional formatting for specific value field

Allows end user to apply conditional formatting to a specific value field by setting the [Measure](#) property with specific value field name in [PivotViewConditionalFormatSettings](#) class.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").DataSourceSet
tings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
 .DrilledMembers(drilledmembers =>
 {
 drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();

```

```

 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {
 format.Conditions(Condition.LessThan).Measure("In_Stock").Value1(500).Style(
style => {
style.BackgroundColor("#80cbc4").Color("black").FontFamily("Tahoma").FontSiz
e("12px"); }).Add();
 })
).AllowConditionalFormatting(true).Render()

```

## FORMATTING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |            |

### Conditional formatting for specific row or column

You can apply conditional formatting for specific row or column using [Label](#) option in the pivot table. It can be configured using the [PivotViewConditionalFormatSettings](#) tag through code behind, during initial rendering. The required settings are:

- [Label](#): Specifies the header name to apply conditions for row or column.
- [Conditions](#): Specifies the operator type such as equals, greater than, less than, etc.
- [Value1](#): Specifies the start value.
- [Value2](#): Specifies the end value.
- [PivotViewStyle](#): Specifies the style for the cell.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {
 format.Conditions(Syncfusion.EJ2.PivotView.Condition.Between).Label("Germany")
 .Value1(500).Value2(50000).Style(style => {
 style.BackgroundColor("#f48fb1").Color("black").FontFamily("Tahoma").FontSize("12px");
 }).Add();
 })
).AllowConditionalFormatting(true).Render()
```

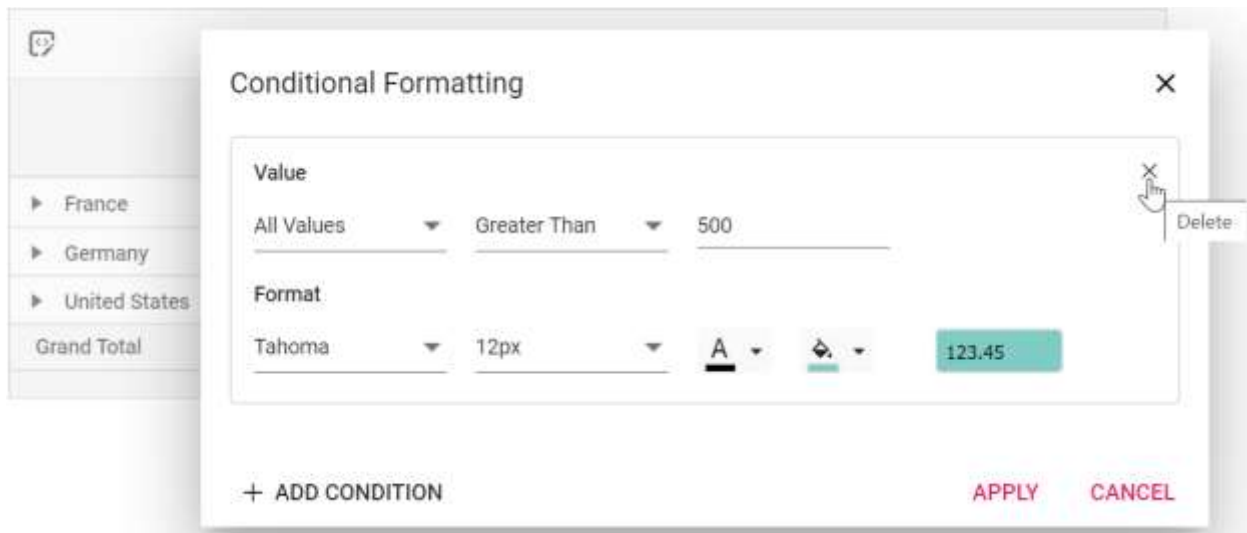

### LABELFORMATTING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
```

```
return View();
}
```

### Editing and removing existing conditional format

Editing and removing existing conditional format can be done through the UI at runtime. To do so, open the conditional formatting dialog and edit the "Value", "Condition" and "Format" options based on user requirement and click "OK". To remove a conditional format, click the "Delete" icon besides the respective condition.

### Event

#### ConditionalFormatting

The event **ConditionalFormatting** is triggered initially while clicking the "ADD CONDITION" button inside the conditional formatting dialog in-order to fill user specific condition instead of default condition at runtime. To use this event, **AllowConditionalFormatting** property in **PivotView** must be set to **true**. It has following parameters -

- **applyGrandTotals** - boolean property, by setting this to true user can enable formatting to grand totals.
- **conditions** - condition to be filled in conditional formatting dialog.
- **label** - Label value for conditional formatting dialog.
- **measure** - measure value for the conditional formatting dialog.
- **style** - style property of the conditional formatting dialog.
- **value1** - value 1 for conditional formatting dialog.
- **value2** - value 2 for conditional formatting dialog, this is applicable only for selected conditions like **Between** and **NotBetween**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("conditional-formatting-btn").Content("Conditional
Formatting").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSet
tings(dataSource =>
```

```

dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .DrilledMembers(drilledmembers =>
 {
drilledmembers.Name("Country").Items(ViewBag.drilledMembers).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("In_Stock").Caption("In Stock").Add();
 values.Name("Sold").Caption("Units Sold").Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product
Categories").Add();
 })
 .ConditionalFormatSettings(format =>
 {
format.Conditions(Condition.LessThan).Measure("In_Stock").Value1(1000).Style
(style => {
style.BackgroundColor("#80cbc4").Color("black").FontFamily("Tahoma").FontSize("12px");
}).Add();
 })

).AllowConditionalFormatting(true).ConditionalFormatting("conditionalFormatting").Render()
<script>
 document.getElementById("conditional-formatting-
btn").addEventListener('click', function () {
 var pivotObj =
document.getElementById("PivotView").ej2_instances[0];

pivotObj.conditionalFormattingModule.showConditionalFormattingDialog();
 });
 function conditionalFormatting(args) {
 args.style.backgroundColor = "Blue";
 args.value1 = 23459;
 }
</script>

```

**FORMATTING.CS**

```

public ActionResult Index()
{

```

```

var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

## Report Manipulation

### Grouping Bar

The Grouping Bar option in pivot table automatically populates fields from the bound data source and allows end users to drag fields between different axes such as columns, rows, values, and filters, and create pivot table at runtime. It can be enabled by setting the [showGroupingBar](#) property in [ejs-pivotview](#) tag to **true**.

Similar to Field List, Grouping Bar UI also comes with basic interactions like,

- Re-arranging fields through drag-and-drop operation between row, column, value and filter axes.
- Remove fields from the existing report using remove icon.
- Add fields to the report using fields panel option.
- Filtering members of specific fields using filter icon.
- Sorting members of specific fields using sort icon.

**Note:** The grouping bar provides some additional options to customize it's UI using [ejs-groupingBarSettings](#) property.

### CSHTML

```

@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)Model).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).Render()

```

### GROUPINGBAR.CS

```

public ActionResult Index()
{

```

```

var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
public List<PivotData> GetPivotData()
{

### Show or hide fields panel

The fields panel, which is positioned above the grouping bar, displays the fields that are available in the data source but are not bound in the report. The fields can be dragged and dropped into the appropriate axis. In addition, any field removed from any axes will be automatically added to the fields panel. The fields panel can be displayed by setting the [showFieldsPanel](#) property in the [e-groupingBarSettings](#) to **true**.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
new PivotViewGroupingBarSettings {
ShowFieldsPanel = false }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}
)
)

```

```

 }).Rows(rows =>
 {
 rows.Name("Country").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 })).ShowGroupingBar(true).Render()

```

### SHOWFIELDSPANEL.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Show or hide all filter icon

The Grouping Bar has an option to filter members of particular fields at runtime in pivot table. In-order to filter members in a field, click the filter icon and check/uncheck members that needs to be displayed. By default, filter icon besides each field is enabled in the grouping bar. To disable the filter icon, set the property [showFilterIcon](#) in [e-groupingBarSettings](#) tag to **false**.

**Note:** By default, the filter icon is enabled in the grouping bar.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 ShowFilterIcon = false
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>

```

```
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).Render()
```

### SHOWFILTER.CS

```

*Show or hide specific filter icon*

To disable the filter icon for a specific field, set the property [showFilterIcon](#) to **false** to the corresponding field in [e-datasourcesettings](#).

In the below sample, the filter icon of "Quarter" and "Products" fields have been hidden.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").DataSourceSettings(
dataSource =>
{
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add();
rows.Name("Products").ShowFilterIcon(false).Add();
}).Columns(columns =>
{

```

```

columns.Name("Year").Add();
columns.Name("Quarter").ShowFilterIcon(false).Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).ShowGroupingBar(true).Render()

```

### SHOWFILTER.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Show or hide all sort icon

The Grouping Bar has an option to order members of a particular fields either in ascending or descending at runtime. In order to sort a field, click the sort icon and to reverse its sort direction, once again click the same sort icon. By default, the sort icon besides each field is enabled in the grouping bar and members will be arranged in ascending order. To disable the sort option, set the property [showSortIcon](#) in [e-groupingBarSettings](#) tag to **false**.

**Note:** By default, the sort icon is enabled in the grouping bar.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 ShowSortIcon = false
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>

```

```
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).ShowGroupingBar(true).Render()
```

### SHOWSORT.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                    |                  |             |            |             |       |

| Grand Total        | 1436             | \$2,032,985 | 1658       | \$5,577,312 |            |

*Show or hide all remove icon*

The Grouping Bar has an option to remove any field at runtime. To remove a field, just click the remove icon. By default, the remove icon besides each field is enabled in the grouping bar. To disable the remove icon, set the property [showRemoveIcon](#) in [e-groupingBarSettings](#) tag to **false**.

**Note:** By default, the remove icon is enabled in the grouping bar.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 ShowRemoveIcon = false
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10)
 .MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {

```

```
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .ShowGroupingBar(true).Render()
```

### SHOWREMOVE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                      |                      |             |            |             |            |

*Show or hide specific remove icon*

To disable the remove icon for a specific button, set the property [showRemoveIcon](#) to **false** to the corresponding field in [e-datasourcesettings](#).

In the below sample, the remove icon of fields "Year", "Sold" and "Products" have been hidden.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
dataSource =>
{
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).
EnableSorting(true).FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).
MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add();
rows.Name("Products").ShowRemoveIcon(false).Add();
}
```

```

 }).Columns(columns =>
 {
 columns.Name("Year").ShowRemoveIcon(false).Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").ShowRemoveIcon(false).Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).Render()

```

### SHOWREMOVE.CS

```

#### Disable all fields from dragging

The Grouping Bar has an option to drag-and-drop fields between row, column, value and filter axes in order to change report at runtime. By default, all fields are available for drag-and-drop operation in the grouping bar. To disable these fields, set the property [allowDragAndDrop](#) in [e-groupingBarSettings](#) tag to **false**. This will prevent end user from changing the current report.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
 AllowDragAndDrop =false }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{

```

```
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .ShowGroupingBar(true).Render()
```

**DRAG.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             |            |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |            |

*Disable specific field from dragging*

To disable dragging for a specific button, set the property [allowDragAndDrop](#) to **false** to the corresponding field in [e-datasourcesettings](#).

In the below sample, the drag and drop of the fields "Year" and "Products" have been restricted.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).FormatSettings(
 formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").AllowDragAndDrop(false).Add();
 })
```

```

 }).Columns(columns =>
 {
 columns.Name("Year").AllowDragAndDrop(false).Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).Render()

```

### **DRAG.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### *Remove specific field(s) from displaying*

When a report is bound to the pivot table, fields will be automatically populated within the Grouping Bar. In this case, you can also prevent specific fields from being displayed. To do so, set the appropriate field name(s) in the [excludeFields](#) property of [dataSourceSettings](#).

**Note:** The `excludeFields` property setting will be reflected in the field list UI as well, and for more information, see this [link](#).

### **CSHTML**

```

@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ExcludeFields(ViewBag.Excludefields)).ShowGroupingBar(true).Render()

```

### **REMOVESPECIFIC.CS**

```

public ActionResult Index()
{

```

```

var data = GetPivotData();
ViewBag.DataSource = data;
ViewBag.Excludefields = new string[] { "Amount" };
return View();
}

```

| Sum of Units Sold | Drop filter here |         |         |         |
|-------------------|------------------|---------|---------|---------|
|                   | Year             | Quarter |         |         |
| Country           | FY 2015          | FY 2016 | FY 2017 | FY 2018 |
| Products          |                  |         |         |         |
| France            | 450              | 526     | 592     |         |
| Germany           | 440              | 496     | 372     |         |
| United States     | 546              | 636     | 632     |         |
| Grand Total       | 1436             | 1658    | 1596    |         |

#### Changing aggregation type of value fields at runtime

End user can perform calculations over a group of values using the aggregation option. The value fields bound to the field list, appears with a dropdown icon, helps to select an appropriate aggregation type at runtime. On selection, the values in the Pivot Table will be changed dynamically. By default, the icon to set aggregation type is enabled in the grouping bar. To disable this icon, set the property [showValueTypeIcon](#) in [e-groupingBarSettings](#) tag to **false**. To know more about aggregation, [refer](#) here.

#### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = false
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).Render()

```

**AGGREGATION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

<!-- markdownlint-disable MD012 -->

|                    |            |             |
|--------------------|------------|-------------|
| Sum of Units Sold  | Year       | Quarter     |
| Sum of Sold Amount | FY 2015    | FY 2016     |
| Country            | Units Sold | Sold Amount |
| Products           | Units Sold | Sold Amount |

<br/>

<br/>

<br/>

|                    |                  |
|--------------------|------------------|
| Sum of Units Sold  | Drop filter here |
| Sum of Sold Amount | Year             |
| Country            | Quarter          |
| Products           | FY 2015          |
| France             | Units Sold       |
| Germany            | Sold Amount      |
| United States      | Units Sold       |
| Grand Total        | 1436             |

*Show or hide specific dropdown icon*

To disable the dropdown icon for a specific button, set the property [showValueTypeIcon](#) to **false** to the corresponding field in [e-datasourcesettings](#).

In the below sample, the dropdown icon of field "Sold" is hidden.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
```

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true).FormatSettings(
 formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").ShowValueTypeIcon(false).Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).ShowGroupingBar(true).Render()
```

### AGGREGATION-SPECIFIC.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                        |                          |             |            |             |            |
|------------------------|--------------------------|-------------|------------|-------------|------------|
| Sum of Units Sold ✕    | Drop filter here         |             |            |             |            |
| Sum of Sold Amount ▼ ✕ | Year ↑ = ✕ Quarter ↑ = ✕ |             |            |             |            |
| Country ↑ = ✕          | FY 2015                  |             | FY 2016    |             |            |
| Products ↑ = ✕         | Units Sold               | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France                 | 450                      | \$714,955   | 526        | \$1,542,104 |            |
| Germany                | 440                      | \$563,515   | 496        | \$1,772,104 |            |
| United States          | 546                      | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total            | 1436                     | \$2,032,985 | 1658       | \$5,577,312 |            |

**Note:** The property [showFilterIcon](#), [showSortIcon](#), [showValueTypeIcon](#) and [allowDragAndDrop](#) in fields of [e-datasourcesettings](#) are applicable for both grouping bar and field list.

#### Show values button

During runtime, the **Values** button in the grouping bar can be moved to a different position (i.e., different index) among other fields in the column or row axis. To enable the **Values** button, set the [showValuesButton](#) property to **true**.

**Note:** This support is only available for relational data sources.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").ShowGroupingBar(true).ShowValuesButton(true).Height("350").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Add();
 })
).Render()
```

**GROUPINGBAR-VALUESBUTTON.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                    |                  |             |            |             |

| Germany            | 74               | 117246      | 128        |             |

*Event*[OnFieldDropped](#)

The event [onFieldDropped](#) fires on whenever a field is dropped over an axis.

It has following parameters - `droppedAxis`, `droppedField` and `dataSourceSettings`. In this sample we have modified the `droppedField` caption based on the `droppedAxis`.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).OnFieldDropped("onFieldDropped").Render()
<script>
 function onFieldDropped(args) {
 args.droppedField.caption = args.droppedField.name + " --> " +
args.droppedAxis;
 }
</script>
```

### FIELD-DROPPED.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### FieldDragStart

The event [fieldDragStart](#) fires whenever a field drag starts from its axis. It allows the user to restrict the drag operation based on its parameters. It has the following parameters

- `fieldName`: It holds the name of the appropriate field.
- `fieldItem`: It holds the complete definition of the appropriate field mentioned in data source settings.
- `axis`: It holds the axis name where the draggable field lies.
- `cancel`: It is a boolean property and by setting this to true, user can restrict the field from dragging.

In the below sample, the drag operation for the fields in row axis alone is restricted.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).FieldDragStart("fieldDragStart").Render()
<script>
 function fieldDragStart(args) {
 if(args.axis === 'rows') {
 args.cancel = true;
 }
 }
</script>
```

**FIELD-DRAG-START.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**FieldDrop**

The event [fieldDrop](#) fires whenever a field is dropped into an axis. It allows the user to restrict the drop operation based on its parameters. It has the following parameters

- **fieldName**: It holds the name of the appropriate field.
- **dropField**: It holds the complete definition of the appropriate field mentioned in data source settings.
- **draggedAxis**: It holds the axis name from where dragging was started.
- **dropAxis**: It holds the axis name where the field is dropped.
- **dropPosition**: It holds the dropped index among other existing fields in the axis.
- [dataSourceSettings](#): It holds complete pivot report.
- **cancel**: It is a boolean property and by setting this to true, user can restrict the field from being dropped.

In the below sample, dropping of any fields in value axis alone is restricted.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).FieldDrop("fieldDrop").Render()
<script>
 function fieldDrop(args) {
 if(args.dropAxis === 'values') {
 args.cancel = true;
 }
 }
</script>
```

### FIELD-DROP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### FieldRemove

The event [fieldRemove](#) fires when removing any field from their axis. It helps the user to limit the elimination of a field based on its parameters. It has the following parameters

- **fieldName**: It holds the name of the field to be removed.
- **fieldItem**: It holds the complete definition of the appropriate field mentioned in data source settings.
- **axis**: It holds the name of the axis from where it is to remove the field.
- **dataSourceSettings**: It holds complete pivot report.
- **cancel**: It is a boolean property and by setting this to true, user can restrict the field from removing.

In the below sample, the field "Country" could not be removed from report by any UI operations.

### **CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).FieldRemove("fieldRemove").Render()
<script>
 function fieldRemove(args) {
 if(args.fieldName === 'Country') {
 args.cancel = true;
 }
 }
</script>
```

### **FIELD-REMOVE.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### [AggregateMenuOpen](#)

The event [aggregateMenuOpen](#) fires while clicking dropdown icon of the value field button UI. It allows to customize the aggregate types to be displayed in the dropdown menu. It has the following parameters

- **fieldName**: It holds the name of the field that opens the aggregate menu.
- **aggregateTypes**: It holds the aggregation types set for a field.
- **displayMenuCount**: It allows to set the menu count to be displayed initially. By default, its count is 7.
- **cancel**: It is a boolean property and by setting this to true, dropdown menu won't be displayed.

In the below sample, the aggregate types of the field "Amount" has been customized in it's dropdown menu.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%).Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).AggregateMenuOpen("aggregateMenuOpen").Render()
<script>
 function aggregateMenuOpen(args) {
 args.displayMenuCount = 4;
 if(args.fieldName === 'Amount') {
 args.aggregateTypes = ['Sum', 'Avg', 'Max'];
 }
 }
</script>
```

### AGGREGATION-MENU-OPEN.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

| Drop filter here   |                | Year |             | Quarter |             |
|--------------------|----------------|------|-------------|---------|-------------|
|                    |                |      |             |         |             |
| Sum of Units Sold  | Sum            |      |             |         |             |

| Products           | Product        |      |             |         |             |
|                    | More...        |      |             |         |             |
| France             |                | 450  | \$714,955   | 526     | \$1,542,104 |
| Germany            |                | 440  | \$563,515   | 496     | \$1,772,104 |
| United States      |                | 546  | \$754,515   | 636     | \$2,263,104 |
| Grand Total        |                | 1436 | \$2,032,985 | 1658    | \$5,577,312 |

**Note:** The events [aggregateMenuOpen](#), [fieldRemove](#), [fieldDrop](#), [fieldDragStart](#) and [onFieldDropped](#) are applicable for both grouping bar and field list.

#### ActionBegin

The event [actionBegin](#) triggers when the UI action such as sorting, filtering, aggregation or edit calculated field, that are present in the grouping bar UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings:** It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName:** It holds the name of the current action began. The following are the UI actions and their names:

| Action                                      | Action Name           |
|---------------------------------------------|-----------------------|
| Sort icon                                   | Sort field            |
| Filter icon                                 | Filter field          |
| Aggregation (Value type drop down and menu) | Aggregate field       |
| Remove icon                                 | Remove field          |
| Edit icon                                   | Edit calculated field |

- **fieldInfo:** It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel:** It allows user to restrict the current action.

In the below sample, grouping bar UI actions such as sorting and filtering can be restricted by setting the **args.cancel** option to **true** in the [actionBegin](#) event.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 AllowDragAndDrop = true
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
```

```

values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
))).ShowGroupingBar(true).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Sort field' || args.actionName == 'Filter
field') {
 args.cancel = true;
 }
 }
</script>

```

### ACTIONBEGIN-AGGREGATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### ActionComplete

The event [actionComplete](#) triggers when the UI action such as as sorting, filtering, aggregation or edit calculated field, that are present in the grouping bar UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action                                      | Action Name             |
|---------------------------------------------|-------------------------|
| -----                                       | -----                   |
| Sort icon                                   | Field sorted            |
| Filter icon                                 | Field filtered          |
| Aggregation (Value type drop down and menu) | Field aggregated        |
| Remove icon                                 | Field removed           |
| Edit icon                                   | Calculated field edited |

- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **actionInfo**: It holds the unique information about the current UI action. For example, if sorting is completed, the event argument contains information such as sort order and the field name.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(new PivotViewGroupingBarSettings {
 AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'Field sorted' || args.actionName == 'Field
 filtered') {
 // Triggers when the grouping bar UI actions such as sorting and
 filtering are completed.
 }
 }
</script>
```

**ACTIONCOMPLETE-AGGREGATION.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**ActionFailure**

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName:** It holds the name of the current action failed. The following are the UI actions and their names:

| Action | Action Name|

|-----|-----|

| Sort icon| Sort field|

| Filter icon| Filter field|

| Aggregation (Value type drop down and menu)| Aggregate field|

| Remove icon| Remove field|  
| Edit icon| Edit calculated field|

- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
AllowDragAndDrop =true }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowGroupingBar(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Sort field' || args.actionName == 'Filter
field') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
}
</script>
```

### ACTIONFAILURE-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Pivot Field List in ASP.NET MVC Pivot Table Component

The pivot table provides a built-in Field List similar to Microsoft Excel. It allows to add or remove fields and also rearrange them between different axes, including column, row, value, and filter along with sort and filter options dynamically at runtime.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup):** To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed):** To display the field list in a static position within a web page.

#### *In-built Field List (Popup)*

To enable the field list in pivot table UI, set the [ShowFieldList](#) property in [PivotView](#) class to **true**. A small icon will appear on the top left corner of the pivot table and clicking on this icon, field list dialog will appear.

**Note:** The field list icon will be displayed at the top right corner of the pivot table, when grouping bar is enabled.

#### CSHTML

```
@model List<PivotTableSample.Controllers.PivotData>
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Render()
```

#### FIELDLIST.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
public List<PivotData> GetPivotData()
{

*Stand-alone Field List (Fixed)*

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set [RenderMode](#) property to [Mode.Fixed](#) in [PivotFieldList](#).

**Note:** To make field list interact with pivot table, you need to use the **UpdateView** and **Update** methods for data source update in both field list and pivot table simultaneously.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("Static_FieldList").RenderMode(Mode.Fixed).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).EnginePopulated("onFieldListEnginePopulate").Render()
<style>
 #Static_FieldList {
 width: 400px;
 }
</style>
<script>
 var pivotObj; var fieldlistObj;
 function onGridEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 if (fieldlistObj) {
 fieldlistObj.update(pivotObj);
 }
 }
 function onFieldListEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 fieldlistObj.updateView(pivotObj);
 }
</script>
```

**STATIC.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*Invoking dynamic Field List (Customized)*

Also, you can display the field list dialog independently through other means. For example, you can invoke the field list dialog on an external button click. To do so, set [RenderMode](#) property to [Mode.Popup](#) and since on button click, field list dialog will be invoked.

**Note:** \* Meanwhile, you can display the field list dialog at specific target element within a webpage using [target](#) property. By default, the [target](#) value is null, which refers the [document.body](#) element.

\* Moreover, to make field list interact with pivot table, you need to use the **updateView** and **update** methods for data source update in both field list and pivot table simultaneously.

The below sample code illustrates the field list dialog invoked on an external button click.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("fieldlistbtn").Content("Field
List").IsPrimary(true).Render()
<div id="Popup_FieldList"></div>
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEngi
nePopulate").Render()
```

```

@Html.EJS().PivotFieldList("PivotFieldList").RenderMode(Syncfusion.EJ2.Pivot
View.Mode.Popup).Target("#Popup_FieldList").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).EnginePopulated("onFieldListEnginePopulate").Render()
<style>
.e-toggle-field-list {
display: none !important;
}
</style>
<script>
var pivotObj; var fieldlistObj;
function onGridEnginePopulate(args) {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
if (fieldlistObj) {
fieldlistObj.update(pivotObj);
}
}
function onFieldListEnginePopulate(args) {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
fieldlistObj.updateView(pivotObj);
}
document.getElementById('fieldlistbtn').onclick = function () {
fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
fieldlistObj.dialogRenderer.fieldListDialog.show();
};
</script>

```

### POPUP.CS

```

public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

### Search desired field

End user can search for desired field in the field list UI by typing the field name into the search box at runtime. It can be enabled by setting the [enableFieldSearching](#) property to **true** via code-behind.

**Note:** By default, field search option is disabled in the field list UI.

To enable search box in the static field list UI, set the [enableFieldSearching](#) property to **true** in [PivotFieldList](#).

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("Static_FieldList").RenderMode(Mode.Fixed).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).EnginePopulated("onFieldListEnginePopulate").EnableFieldSearching(true).Render()

<style>
 #Static_FieldList {
 width: 400px;
 }
</style>
<script>
 var pivotObj; var fieldlistObj;
```

```

function onGridEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 if (fieldlistObj) {
 fieldlistObj.update(pivotObj);
 }
}
function onFieldListEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 fieldlistObj.updateView(pivotObj);
}
</script>

```

### SEARCH.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

![output](images/Search desired field in static field list.png "Searching Static FieldList")

To enable search box in the pivot table's built-in popup field list UI, set the [enableFieldSearching](#) property to **true** in [PivotView](#).

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("fieldlistbtn").Content("Field
List").IsPrimary(true).Render()
<div id="Popup_FieldList"></div>
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEngi
nePopulate").EnableFieldSearching(true).Render()
@Html.EJS().PivotFieldList("PivotFieldList").RenderMode(Syncfusion.EJ2.Pivot
View.Mode.Popup).Target("#Popup_FieldList").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true).EnableFieldSearch(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{

```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).EnginePopulated("onFieldListEnginePopulate").Render()
<style>
 .e-toggle-field-list {
 display: none !important;
 }
</style>
<script>
 var pivotObj; var fieldlistObj;
 function onGridEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 if (fieldlistObj) {
 fieldlistObj.update(pivotObj);
 }
 }
 function onFieldListEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 fieldlistObj.updateView(pivotObj);
 }
 document.getElementById('fieldlistbtn').onclick = function () {
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 fieldlistObj.dialogRenderer.fieldListDialog.show();
 };
</script>

```

### SEARCH.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

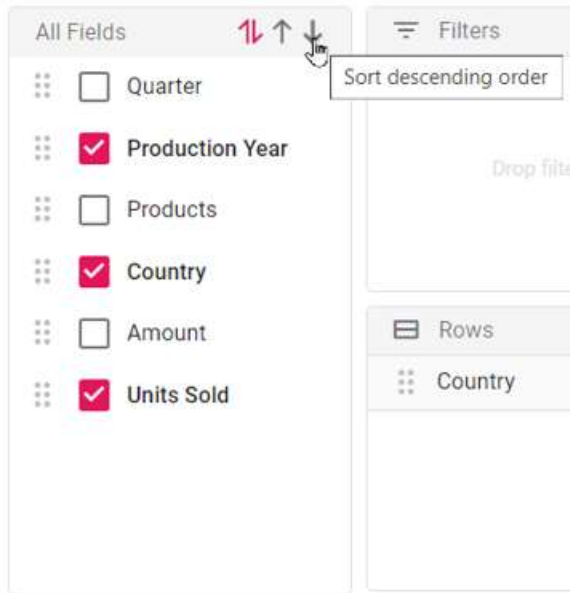

![output](images/Search desired field in popup field list.png "Searching Popup FieldList")

#### Option to sort fields

End user can sort fields in the field list UI to ascending (or) descending (or) default order (as obtained from the data source) using the built-in sort icons.

By default, fields are displayed in the default order.

## Field List

## Sort fields in a desired order

To display the fields in descending order by default, set the `DefaultFieldListOrder` property to **Descending** in the [Load](#) event.

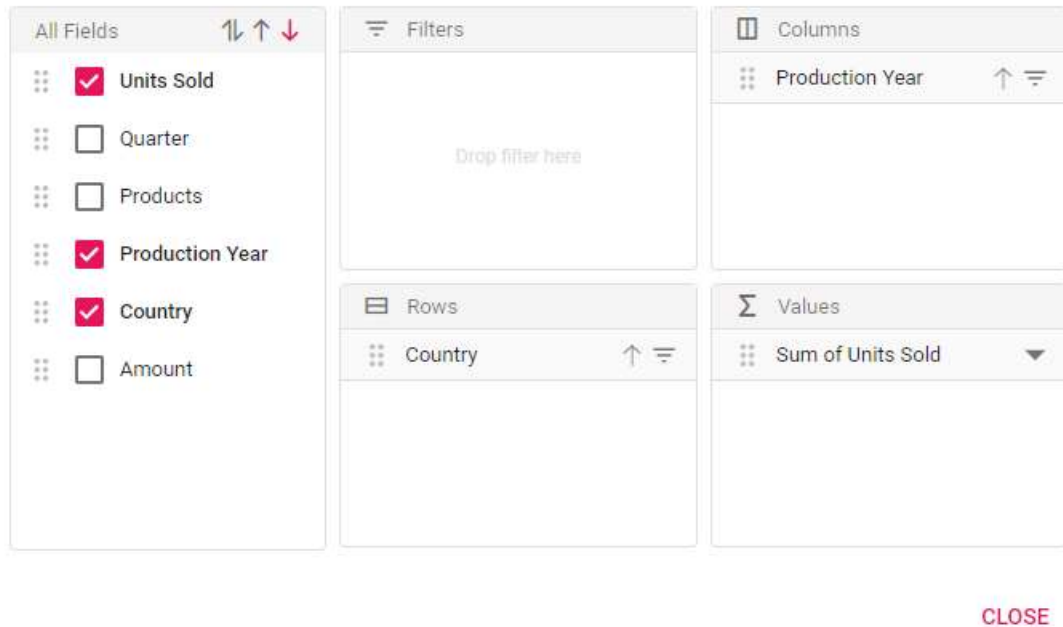

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(350).Load("onLoad").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true)
.AllowValueFilter(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Production Year").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
})).ShowFieldList(true).ShowGroupingBar(true).Render()
<script>
 function onLoad(args) {
 args.defaultFieldListOrder = 'Descending';
 }
</script>
```

**FIELD SORT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Field List

### Group fields under desired folder name

In the field list UI, you can display fields by grouping them under the desired folder name. It can only be configured via code-behind by setting the [GroupName](#) property in [FieldMapping](#).

**Note:** You can only group fields to one level using the [GroupName](#) property.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(340).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add();
}).Columns(columns =>
{
 }
```

```

 columns.Name("Year").Caption("Production Year").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 }).FieldMapping(fields=>
 {
 fields.Name("Quarter").GroupName("Product category").Add();
 fields.Name("Products").GroupName("Product category").Add();
 fields.Name("Amount").GroupName("Product category").Caption("Sold
Amount").Add();
 }).ShowGroupingBar(true).ShowFieldList(true).Render()

```

### GROUPNAME.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Field List

The screenshot displays a 'Field List' interface with four main panels:

- All Fields:** A list of fields with checkboxes for selection. Under 'Product category', there are 'Quarter', 'Products', and 'Sold Amount' (all unchecked). Below this, 'Production Year', 'Country', and 'Units Sold' are checked with red checkmarks.
- Filters:** A panel with a 'Drop filter here' instruction and a filter icon.
- Columns:** A panel showing 'Production Year' as the column field, with an upward arrow and a filter icon.
- Rows:** A panel showing 'Country' as the row field, with an upward arrow and a filter icon.
- Values:** A panel showing 'Sum of Units Sold' as the value field, with a dropdown arrow.

CLOSE

### Add or remove fields

Using check box besides each field, end user can select or unselect to add or remove fields respectively from the report at runtime.

## Field List

### *Remove specific field(s) from displaying*

When a data source is bound to the component, fields will be automatically populated inside the Field List. In such case, user can also restrict specific field(s) from displaying. To do so, set the appropriate field name(s) in [ExcludeFields](#) property belonging to [PivotViewDataSourceSettings](#) class.

### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ExcludeFields(ViewBag.Excludefields).ShowFieldList(true).Render()
```

### **FIELDLIST.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
```

```
ViewBag.DataSource = data;
ViewBag.Excludefields = new string[] { "Products", "Amount" };
return View();
}
```

Sorting members

Using the sort icon besides each field in row and column axes, members can be arranged either in ascending or descending order at runtime. To know more about member sorting, [refer](#) here.

### Calculated fields

The calculated field support allows end user to add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. To enable this support in Field List UI, set the [AllowCalculatedField](#) property in [PivotView](#) class to **true** in pivot table. Now a button will be seen automatically inside the field list UI which will invoke the calculated field dialog on click. To know more about calculated field, [refer](#) here.

#### Changing aggregation type of value fields at runtime

End user can perform calculations over a group of values using the aggregation option. The value fields bound to the field list, appears with a dropdown icon, helps to select an appropriate aggregation type at runtime. On selection, the values in the Pivot Table will be changed dynamically. To know more about aggregation, [refer](#) here.

### Defer layout update

Defer layout update support to update the pivot table only on demand and not during every user action. To enable this support in Field List UI, set the [AllowDeferLayoutUpdate](#) property in [PivotView](#) class to **true** in pivot table. Now a check box inside Field List UI will be seen in checked state, allowing pivot table to update only on demand. To know more about defer layout, [refer](#) here.

### Show built-in Field List (Popup) over specific target

By passing the target element to the built-in field list dialog module in the [dataBound](#) event, the field list dialog will be displayed over the appropriate target element on a web page. By default, the Pivot Table's parent element is used as the target element to display the built-in field list dialog.

The sample code below shows the built-in field list dialog using `document.body` as the target element.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
dataSourceSettings =>
{
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false);
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
```

```

{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})).DataBound("ondataBound").ShowFieldList(true).Render()
<script>
 function ondataBound(args) {
 var pivotTableObj =
 document.getElementById('PivotView').ej2_instances[0];

 pivotTableObj.pivotFieldListModule.dialogRenderer.fieldListDialog.target =
 document.body;
 }
</script>

```

### FIELDLIST-ON-SPECIFICTARGET.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             |
|---------------|------------|-------------|------------|-------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |

#### Show field list using toolbar

It can also be viewed in toolbar by setting [ShowFieldList](#) and [ShowToolbar](#) properties in [PivotView](#) class to **true**. Also, include the item **FieldList** within the [Toolbar](#) property in [PivotView](#) class. When toolbar is enabled, field list icon will be automatically added into the toolbar and the icon won't appear on top left corner in the pivot table component.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("300").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolbar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>

```

```

dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
})
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).Toolbar(new List<string>() { "FieldList" }).Render()

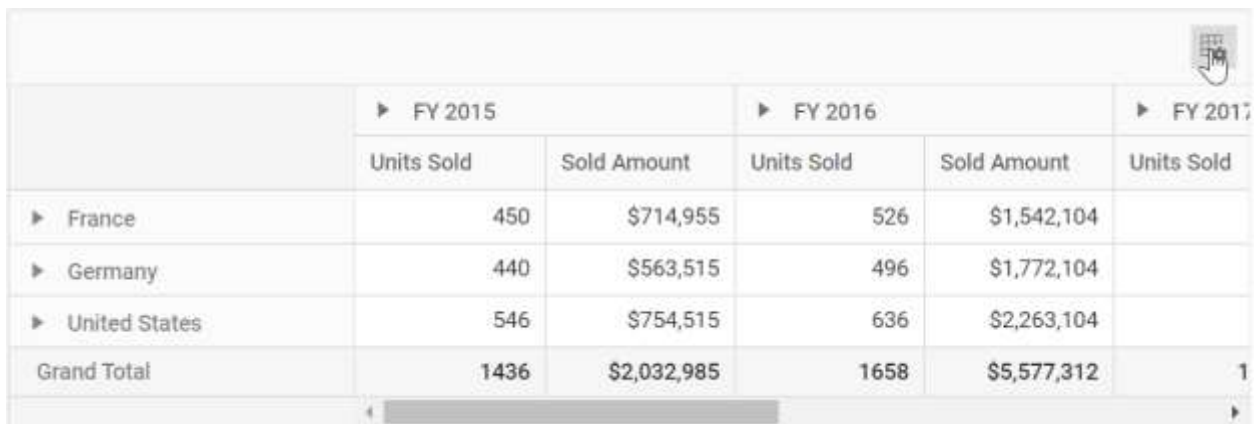

```

### FIELDLIST.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

*Set caption to fields which isn't bound to the report*

One can set the caption to all fields from the data source even if it is not bound to the actual report. It can be achieved using the [EnginePopulated](#) event. On doing so, caption of the respective field will be displayed in both grouping bar and field list.

In the sample, we have set caption to the fields **Year** and **Quarter** dynamically.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEnginePopulate").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .FormatSettings(formatsettings =>
 {

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }) .Rows(rows =>
 {
 rows.Name("Country").Add();
 }) .Columns(columns =>
 {
 columns.Name("Products").Add();
 }) .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }) .ShowFieldList(true).Render()
<script>
var pivotObj;
function onGridEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 Object.keys(pivotObj.engineModule.fieldList).forEach((key, index)
=> {
 if (key === 'Quarter') {
 pivotObj.engineModule.fieldList[key].caption =
'Production Quarter Year';
 }
 else if (key === 'Year') {
 pivotObj.engineModule.fieldList[key].caption =
'Production Year';
 }
 });
}
</script>

```

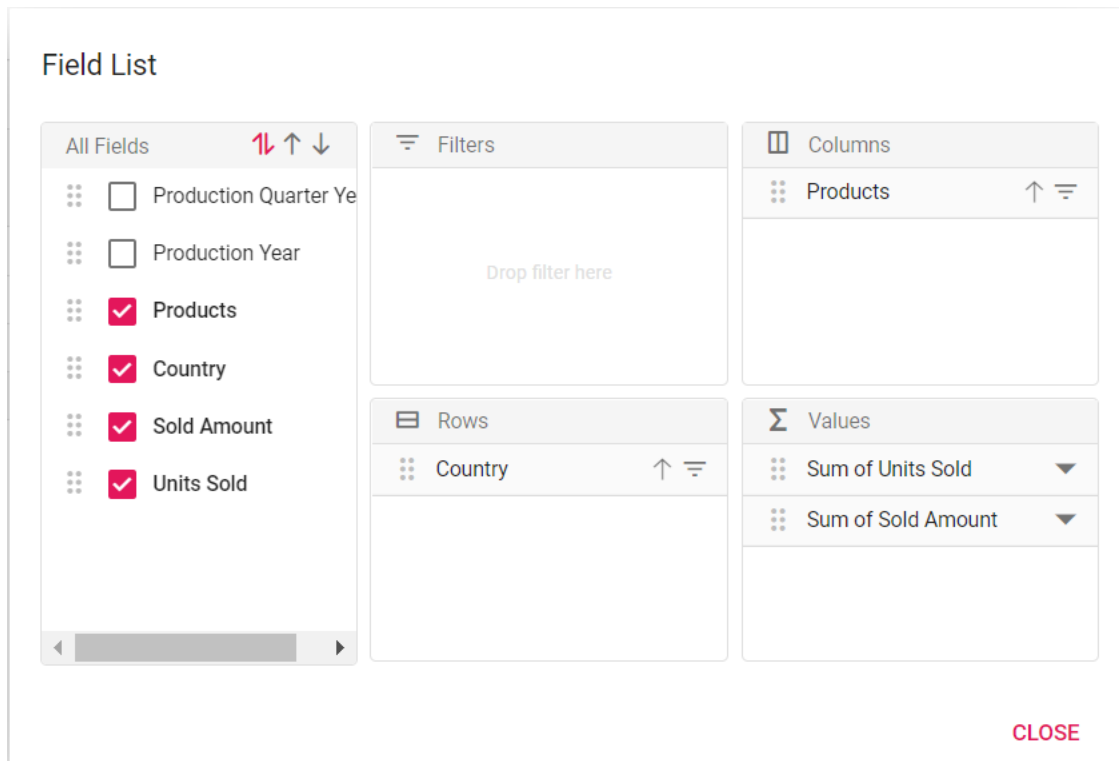

### FIELDLIST.CS

```

public IActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

During runtime, the **Values** button in the field list can be moved to a different position (i.e., different index) among other fields in the column or row axis. To enable the **Values** button, set the [showValuesButton](#) property to **true**.

**Note:** This support is only available for relational data sources.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("PivotFieldList").RenderMode(Mode.Fixed).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();

 })).EnginePopulated("onFieldListEnginePopulate").ShowValuesButton(true).Render()
</style>
 #Static_FieldList {
 width: 400px;
 }
</style>
<script>
 var pivotObj; var fieldlistObj;
 function onGridEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 if (fieldlistObj) {
 fieldlistObj.update(pivotObj);
 }
 }
 function onFieldListEnginePopulate(args) {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
 fieldlistObj.updateView(pivotObj);
 }
</script>

```

#### **FIELDLIST-VALUESBUTTON.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Events

##### EnginePopulated

The [EnginePopulated](#) event is available in both Pivot Table and Field List.

- The event [EnginePopulated](#) is triggered in field list whenever the report gets modified. The updated report is passed to the pivot table via `UpdateView` method written within this event to refresh the same.
- Likewise, [EnginePopulated](#) event is triggered in pivot table whenever the report gets modified. The updated report is passed to the field list via `Update` method written within this event to refresh the same.

The event [EnginePopulated](#) is triggered after engine is populated. It has following parameters - `DataSourceSettings`, `PivotFieldList` and `PivotValues`.

**Note:** This event is not required for Popup field list since it is a in built one.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("Static_FieldList").RenderMode(Mode.Fixed).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).EnginePopulated("onFieldListEnginePopulate").Render()
<style>
#Static_FieldList {
width: 400px;
}
</style>
<script>
var pivotObj; var fieldlistObj;
function onGridEnginePopulate(args) {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
if (fieldlistObj) {
fieldlistObj.update(pivotObj);
}
}
function onFieldListEnginePopulate(args) {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
fieldlistObj =
document.getElementById('PivotFieldList').ej2_instances[0];
fieldlistObj.updateView(pivotObj);
}
</script>
```

### STATIC.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### FieldListRefreshed

The event [FieldListRefreshed](#) is triggered whenever there is any change done in the field list UI. It has following parameter - [DataSourceSettings](#) and [PivotValues](#). It allows user to identify each field list update. This event is applicable only for static field list.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotGrid").Height("300").DataSource(dataSource =>
dataSource.Data((IEnumerable<object>)ViewBag.Data).FieldListRefreshed("field
ListRefreshed").ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).
AllowValueFilter(true)
 .FormatSettings(formatsettings =>
 {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowFieldList(true).Render()
<script>
 function fieldListRefreshed(args) {
 //Triggers, whenever field list get refreshed.
 }
</script>
```

### POPUP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### FieldDropped

The event [OnFieldDropped](#) fires whenever a field is dropped in an axis. It has following parameters - **DroppedAxis**, **DroppedField** and **DataSourceSettings**. In this illustration, we have modified the **DroppedField** caption through this event at runtime.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource
ce =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
).ShowFieldList(true).OnFieldDropped("onFieldDropped").Render()
<script>
var pivotGridObj;
function onFieldDropped(args) {
args.droppedField.caption = args.droppedField.name + " --> " +
args.droppedAxis;
}
</script>
```

### DROPPED.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.data = data;
return View();
}
```

### ActionBegin

The event [actionBegin](#) triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

|                                             |                                                   |
|---------------------------------------------|---------------------------------------------------|
| Action                                      | Action Name                                       |
| -----                                       | -----                                             |
| <a href="#">Sort icon</a>                   | Sort field                                        |
| <a href="#">Filter icon</a>                 | Filter field                                      |
| <a href="#">Aggregation</a>                 | (Value type drop down and menu)   Aggregate field |
| <a href="#">Edit icon</a>                   | Edit calculated field                             |
| <a href="#">Calculated field button</a>     | Open calculated field dialog                      |
| <a href="#">Field list</a>                  | Open field list                                   |
| <a href="#">Field list tree – Sort icon</a> | Sort field tree                                   |

- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the below sample, opening pop-up field list can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
).ShowFieldList(true).ActionBegin("actionBegin").Render()
<script>
function actionBegin(args) {
 if (args.actionName == 'Open field list') {
 args.cancel = true;
 }
}
</script>

```

### ACTIONBEGIN-FIELDLIST.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### ActionComplete

The event [actionComplete](#) triggers when the UI actions such as sorting, filtering, aggregation or edit calculated field, that are present in the field list UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name |
|--------|-------------|
| -----  | -----       |

- | [Sort icon](#) | Field sorted |
- | [Filter icon](#) | Field filtered |
- | [Aggregation](#) (Value type drop down and menu) | Field aggregated |
- | [Edit icon](#) | Calculated field edited |
- | [Calculated field button](#) | Calculated field applied |
- | [Field list](#) | Field list closed |
- | [Field list tree – Sort icon](#) | Field tree sorted |

- **fieldInfo**: It holds the selected field information.

**Note:** This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **actionInfo**: It holds the unique information about the current UI action. For example, if sorting is completed, the event argument contains information such as sort order and the field name.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
).ShowFieldList(true).ActionComplete("actionComplete").Render()
<script>
function actionComplete(args) {
 if (args.actionName == 'Field list closed') {
 // Triggers when the field list dialog is closed.
 }
}
</script>
```

**ACTIONCOMPLETE-FIELDLIST.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**ActionFailure**

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| [Sort icon](#) | Sort field |

| [Filter icon](#) | Filter field |

| [Aggregation](#) (Value type drop down and menu) | Aggregate field |

| [Edit icon](#) | Edit calculated field |

| [Calculated field button](#) | Open calculated field dialog |

| [Field list](#) | Open field list |

| [Field list tree – Sort icon](#) | Sort field tree |

- **errorInfo**: It holds the error information of the current UI action.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
```

```

{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).ShowFieldList(true).ActionFailure("actionFailure").Render()
<script>
 function actionFailure(args) {
 if (args.actionName == 'Open field list') {
 // Triggers when the current UI action fails to achieve the
 desired result.
 }
 }
}
</script>

```

### ACTIONFAILURE-FIELDLIST.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### See Also

- [Change load limited data in member editor](#)

#### Defer Layout Update

Defer layout update support allows to update the pivot table component only on demand. On enabling this feature, end user can drag-and-drop fields between row, column, value and filter axes, apply sorting and filtering inside the Field List, resulting in change of pivot report alone but not the pivot table values. Once all operations are performed and on clicking the "Apply" button in the Field List, pivot table will start to update with the last modified report. This also helps in bringing better performance in pivot table component rendering.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup):** To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed):** To display the field list in a static position within a web page.

#### *In-built Field List (Popup)*

To enable deferred updates in the pivot table, set the property [AllowDeferLayoutUpdate](#) in [PivotView](#) as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>

```

```

dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).AllowDeferLayoutUpdate(true).Render()

```

### DEFERUPDATE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                                                                                           |                                                            |                                                                                   |

☒ Defer Layout Update

APPLY

CANCEL

### Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set [RenderMode](#) property to [Mode.Fixed](#) in [PivotFieldList](#).

To enable deferred updates in the static fieldlist, set the property [AllowDeferLayoutUpdate](#) in [PivotFieldList](#) as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

**Note:** To make field list interact with pivot table, you need to use the **UpdateView** and **Update** methods for data source update in both field list and pivot table simultaneously.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").AllowDeferLayoutUpdate(true)
.EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("Static_FieldList").RenderMode(Mode.Fixed).DataSourceSettings(
dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1)
.UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.EnginePopulated("onFieldListEnginePopulate").AllowDeferLayoutUpdate(true)
.Render()

## Performance

<!-- markdownlint-disable MD036 -->

### Virtual Scrolling

#### Virtual Scrolling

The virtual scrolling option allows you to load the large amounts of data without performance degradation by rendering rows and columns only in the content viewport. The data will refresh dynamically on vertical or horizontal scroll. This feature can be enabled by setting the [EnableVirtualization](#) property in [PivotView](#) class to **true**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).Width(800).DataSourceSettings
(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(true)
).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
```

```

columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
}))).EnableVirtualization(true).Render()

```

### VIRTUALSCROLLING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                | ▼ FY 2015  |             |            |             |           |
|----------------|------------|-------------|------------|-------------|-----------|
|                | Q1         |             | Q2         |             | Q3        |
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sol |
| ▼ France       | 114        | \$177,246   | 108        | \$172,352   |           |
| Mountain Bikes | 31         | \$52,824    | 51         | \$86,904    |           |
| Road Bikes     | 83         | \$124,422   | 57         | \$85,448    |           |
| ▼ Germany      | 74         | \$117,246   | 128        | \$152,352   |           |
| Mountain Bikes | 51         | \$92,824    | 61         | \$76,904    |           |

### Limitations for virtual scrolling

- In virtual scrolling, the [ColumnWidth](#) property in [GridSettings](#) should be in pixel and percentage values are not accepted.
- Resizing columns, setting width to individual columns which affects the calculation used to pick the correct page on scrolling.
- Grouping, which takes additional time to splitting the raw items into the provided format.
- Date Formatting, which takes additional time to convert date format.
- Date Formatting with sorting, here additionally full date time format should be framed to perform sorting along with the provided date format which lags the performance.
- When using OLAP data, subtotals and grandtotals are only displayed when measures are bound at the last position in the [Row](#) or [Column](#) axis. Otherwise, the data from the pivot table will be shown without summary totals.
- Even if virtual scrolling is enabled, not only is the current view port data retrieved, but also the data for the immediate previous page and the immediate next page. As a result, when the end user scrolls slightly ahead or behind, the next or previous page data is displayed immediately without requiring a refresh. **Note:** If the pivot table's width and height are large, the loading data count in the current, previous, and next view ports (pages) will also increase, affecting performance.

### Data Compression

**Note:** This property is applicable only for relational data source.

When we bind one million raw data, the pivot table will process all raw data to generate aggregated data during initial rendering and report manipulation. But in data compression, the data will be compressed based on the uniqueness of the raw data, and unique records will be provided as input for the Pivot Table. The compressed data will be used for further operations at all times, reducing the looping complexity and improving the performance of the pivot table. For example, if the pivot table is connected to one million raw data aggregated to 1,000 unique data means, it will be rendered within 3 seconds rather than 10 seconds. You can enable this option by using the [AllowDataCompression](#) property along with [EnableVirtualization](#) property.

**Note:** This options will only function when the virtual scrolling is enabled.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).Width(800).DataSourceSettings
(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.EnableVirtualization(true).AllowDataCompression(true).Render()

```

### VIRTUALSCROLLING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Limitations during data compression

- The following aggregation types will not be supported.
- Average
- Populationstdev
- Samplestdev
- Populationvar
- Samplevar
- If you use any of the aggregations above, it will result in an aggregation type “Sum”.
- Distinctcount will act as “Count” aggregation type.

- In the calculated field, an existing field can be inserted without altering its default aggregation type. Even if we change it, it would use the default aggregation type back for calculation.

#### *Virtual scrolling for static field list*

Virtual scrolling automatically works with "Popup" field list on setting the [EnableVirtualization](#) property in the Pivot Table to **true**. In case of static field list, which act as a separate component, user need to enable [EnableVirtualization](#) property in the Pivot Table and also pass the report information to pivot table instance via the [load](#) event of the field list.

#### **CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
EnginePopulated("onGridEnginePopulate").Render()

@Html.EJS().PivotFieldList("PivotFieldList").RenderMode(Mode.Fixed).DataSourceSettings(dataSource =>
dataSource.DataSource(data(1000)).ExpandAll(false).EnableSorting(true)
.Rows(rows =>
{
 rows.Name("ProductID").Add();
}).Columns(columns =>
{
 columns => { columns.Name("Year").Add();
}).Values(values =>
{
 values.Name("Price").Caption("Unit Price").Add();
 values.Name("Sold").Caption("Unit Sold").Add();
}).Load("onLoad").EnginePopulated("onFieldListEnginePopulate").Render()
<style>

<!-- markdownlint-disable MD036 -->

**Paging in ASP.NET MVC Pivot Table Component**

Paging allows you to load large amounts of data that can be divided and displayed page by page in the pivot table. It can be enabled by setting the [EnablePaging](#) property to **true**. It can be configured at code-behind by using the [PageSettings](#) property, during initial rendering of the component. The properties required are:

- [CurrentRowPage](#): Allows user to set the current row page number to be displayed in the pivot table.
- [CurrentColumnPage](#): Allows user to set the current column page number to be displayed in the pivot table.
- [RowPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's row axis.
- [ColumnPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's column axis.

***Pager UI***

When paging is enabled, a built-in pager UI appears at the bottom of the pivot table, allowing you to change the current page in the row and column axes by navigating to a desired page using the navigation buttons or an input text box, as well as change the page size via dropdown at runtime.

You can also change the position, visibility, compact view, and template of the row and column pagers by using the [PagerSettings](#).

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("ProductName").Caption("Product Name").Add();
}).Values(values =>
{
```

```

 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
 })
).PageSettings(pageSettings =>
 pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings =>
 pagerSettings.Position(PagerPosition.Bottom).EnableCompactView(false).IsInversed(false).ShowColumnPager(true)

 .ShowRowPager(true).ShowRowPageSize(true).ShowColumnPageSize(true).RowPageSizes(ViewBag.RowPageSizes).ColumnPageSizes(ViewBag.ColumnPageSizes)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()

```

## PAGING.CS

```

public ActionResult Index()
{
 ViewBag.ColumnPageSizes = new double[] { 5, 10, 20, 50, 100 };
 ViewBag.RowPageSizes = new double[] { 10, 50, 100, 200 };
 return View();
}

```

[Inverse pager](#)

Toggles and displays row and column pager. To show the column pager on the left side of the pager UI, set the [IsInversed](#) property in [PagerSettings](#) to **true**.

**Note:** By default, the row pager is displayed on the left side of the pager UI, while the column pager is displayed on the right side.

**C#HTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("ProductName").Caption("Product Name").Add();
}).Values(values =>
{
 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
})
).PageSettings(pageSettings =>
pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings => pagerSettings.IsInversed(true)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()
```

**PAGING.CS**

Column pager

Columns per page

Row pager

Rows per page

|< < > >| 1 of 4
5

|< < > >| 1 of 9
10

### Compact view

By hiding all except the previous and next navigation buttons, the pager UI can be displayed with the absolute minimum of paging options. The compact view can be enabled by setting the [EnableCompactView](#) property in [PagerSettings](#) to **true**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("ProductName").Caption("Product Name").Add();
}).Values(values =>
{
 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
})
).PageSettings(pageSettings =>
pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings => pagerSettings.EnableCompactView(true)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()
```

**PAGING.CS**

```
public ActionResult Index()
{
 return View();
}
```

Show or hide paging option

By using the [ShowRowPager](#) and [ShowColumnPager](#) properties in [PagerSettings](#), you can show or hide row and column pager separately in the pager UI.

In the following example, row pager has been disabled by setting the [ShowRowPager](#) property in [PagerSettings](#) to **false**.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("ProductName").Caption("Product Name").Add();
}).Values(values =>
{
```

```

 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
 })
).PageSettings(pageSettings =>
pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings => pagerSettings.ShowRowPager(false)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()

```

## PAGING.CS

```

public ActionResult Index()
{
 return View();
}

```

|                                                                                                                           | Boston Crab Meat |            | Camembert Pierrot |            | Guaraná Fantástica |            |

### Show or hide page size

By using the [ShowRowPageSize](#) and [ShowColumnPageSize](#) properties in [PagerSettings](#), you can show or hide "Rows per page" and "Columns per page" dropdown menu. The dropdown menu contains a list of pre-defined or user-defined page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

## CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}

```

```

 }).Rows(rows =>
 {
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
 }).Columns(columns =>
 {
 columns.Name("ProductName").Caption("Product Name").Add();
 }).Values(values =>
 {
 values.Name("Quantity").Caption("Quantity").Add();
 values.Name("UnitPrice").Caption("Unit Price").Add();
 })
).PageSettings(pageSettings =>
 pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings =>
 pagerSettings.ShowRowPageSize(false).ShowColumnPageSize(false)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()

```

### PAGING.CS

```

public ActionResult Index()
{
 return View();
}

```

| Bruxelles       | 10               | \$18       |                   |            |                    |            |
| Charleroi       | 5                | \$18       | 40                | \$27       | 12                 | \$5        |
| ▼ Brazil        | 36               | \$66       | 212               | \$224      | 145                | \$26       |
| Campinas        |                  |            | 10                | \$34       |                    |            |
| Row pager       |                  |            | Column pager      |            |                    |            |
| < < > >  1 of 9 |                  |            | < < > >  1 of 4   |            |                    |            |

#### Customize page size

By using the [RowPageSizes](#) and [ColumnPageSizes](#) properties in [PagerSettings](#), you can specify a set of desired page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

**Note:** By default, the "Rows per page" dropdown have pre-defined page sizes of **10, 50, 100, and 200**, while the "Columns per page" dropdown have pre-defined page sizes of **5, 10, 20, 50, and 100**.

In the following example, the "Rows per page" dropdown is set with user-defined page sizes of **10, 20, 30, 40, and 50** and the "Columns per page" dropdown is set with user-defined page sizes of **5, 10, 15, 20, and 30**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("350").EnablePaging(true).DataSourceSettings(dataSource => dataSource.DataSource(dataManger =>
{
 dataManger.Url("https://bi.syncfusion.com/northwindservice/api/orders").CrossDomain(true).Adaptor("WebApiAdaptor");
}).ExpandAll(true).ShowAggregationOnValueField(false).EnableSorting(true).FormatSettings(formatsettings =>
{
 formatsettings.Name("UnitPrice").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("ShipCountry").Add(); rows.Name("ShipCity").Add();
}).Columns(columns =>
{
 columns.Name("ProductName").Caption("Product Name").Add();
}).Values(values =>
{
 values.Name("Quantity").Caption("Quantity").Add();
values.Name("UnitPrice").Caption("Unit Price").Add();
})
).PageSettings(pageSettings =>
pageSettings.ColumnPageSize(5).RowPageSize(10).CurrentColumnPage(1).CurrentRowPage(1)
).PagerSettings(pagerSettings =>
pagerSettings.RowPageSizes(ViewBag.RowPageSizes).ColumnPageSizes(ViewBag.ColumnPageSizes)
).GridSettings(gridSettings => gridSettings.ColumnWidth(120)).Render()
```

### PAGING.CS

```

State Persistence

State persistence allows user to maintain the current state of the component along with its report bounded in the browser local storage (cookie). Even if the browser is refreshed or if you move to the

next page within the browser, components state will be persisted. State persistence stores the Pivot Table object in the local storage when [EnablePersistence](#) property in [PivotView](#) class is set to **true**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).EnablePersistence(true).ShowGroupingBar(true).Render()
```

### PERSISTENCE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Save and Load Pivot Layout

You can save the current layout of the pivot table by using `getPersistData` in string format. The saved layout can be loaded to pivot table any time by passing the saved data as a parameter to `loadPersistData` method in the [PivotView](#).

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("save").Content("Save Layout").IsPrimary(true).Render()
@Html.EJS().Button("load").Content("Load Layout").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).EnablePersistence(true).ShowGroupingBar(true).Render()
```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowGroupingBar(true).ShowFieldList(true).Render()
<script>
 var pivotObj;
 var pivotLayout;
 document.getElementById('save').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotLayout = pivotObj.getPersistData();
 }
 document.getElementById('load').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.loadPersistData(pivotLayout);
 }
</script>

```

### SAVE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

<!-- markdownlint-disable MD012 -->

## Row and Column in ASP.NET MVC Pivot Table Component

### Width and Height

Allows end user to set the pivot table's height and width by using [Height](#) and [Width](#) properties in [PivotView](#) class respectively. The supported formats to set [Height](#) and [Width](#) properties are,

- Pixel: For example - 100, 200, "100px", "200px".
- Percentage: For example - "100%", "200%".
- Auto: It is applicable for [Height](#) property alone in-order to render the pivot table beyond its parent container height without vertical scrollbar. The parent container here would show its vertical scrollbar as soon as the component reaches beyond its dimension.

**Note:** The pivot table will not be displayed less than **400px**, since it's the minimum width of the component.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Width("550").Height("315px").DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 }).Rows(rows =>

```

```
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).Render()
```

### SIZE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Row Height

Allows end user to set the height of each pivot table rows commonly using the [RowHeight](#) property in [PivotViewGridSettings](#) class.

**Note:** By default, the [RowHeight](#) property is set as **36** pixels for desktop layout and **48** pixels for mobile layout.

<br/> The height of the column headers alone may vary when grouping bar feature is enabled.

In the below code sample, the [RowHeight](#) property is set as **60** pixels.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new PivotViewGridSettings { RowHeight = 60 }).Render()

```

### ROWHEIGHT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                    | FY 2015     |                    | FY 2016     |                    | FY 2017    |
|--------------------|-------------|--------------------|-------------|--------------------|------------|
|                    | Units Sold  | Sold Amount        | Units Sold  | Sold Amount        | Units Sold |
| France             | 450         | \$714,955          | 526         | \$1,542,104        |            |

| United States      | 546         | \$754,515          | 636         | \$2,263,104        |            |
| <b>Grand Total</b> | <b>1436</b> | <b>\$2,032,585</b> | <b>1658</b> | <b>\$5,577,312</b> |            |

### Column Width

Allows end user to set the width of each pivot table columns commonly using the [ColumnWidth](#) property in [PivotViewGridSettings](#) class.

**Note:** By default, the [ColumnWidth](#) property is set as **110** pixels to each columns except the first column. For first column, **250** pixels and **200** pixels are set respectively with and without grouping bar.

In the below example, the [ColumnWidth](#) property is set as **200** pixels.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).GridSettings(new PivotViewGridSettings { ColumnWidth=120 })).Render()
```

### COLUMNWIDTH.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             |       |
|---------------|------------|-------------|------------|-------------|-------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |       |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |       |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |       |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 |       |

*Adjust width based on columns*

By default, if the component width set in code-behind is more than the width of the total columns, then the columns will be stretched to make it fit. To avoid the stretching, set the [AllowAutoResizing](#) property in the [PivotViewGridSettings](#) to **false**. By doing so, the component will be adjusted (shrunk) based on the width of total columns.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FilterSettings(filterSettings =>
{
filterSettings.Name("Year").Type(Syncfusion.EJ2.PivotView.FilterType.Exclude)
.Items(ViewBag.filterMembers).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
})).GridSettings(new PivotViewGridSettings { AllowAutoResizing=true
}).Render()
```

**ALLOWAUTORESIZING.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.filterMembers = new string[] { "FY 2017", "FY 2015" };
 return View();
}
```

|                 | ► FY 2016 | ► FY 2018 | Grand Total |
|-----------------|-----------|-----------|-------------|
| ► France        | 526       | 16        | 542         |
| ► Germany       | 496       | 96        | 592         |
| ► United States | 636       | 76        | 712         |
| Grand Total     | 1658      | 188       | 1846        |

## Reorder

Allows end user to reorder a particular column header from one index to another index within the pivot table through drag-and-drop option. It can be enabled by setting the [AllowReordering](#) property in [PivotViewGridSettings](#) class to **true**.

## CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new PivotViewGridSettings { AllowReordering=true
}).Render()
```

## REORDER.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                 | ► FY 2015  | FY 2016     |            | ► FY 2017   |            |
|-----------------|------------|-------------|------------|-------------|------------|
|                 | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| ► France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| ► Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| ► United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total     | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

### Column Resizing

Allows end user to resize the columns by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. To enable column resizing option, set the [AllowResizing](#) property in [PivotViewGridSettings](#) class to **true**.

**Note:** By default, the column resizing option is enabled.

<br/> In RTL mode, user can click and drag the left edge of the header cell to resize the column.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).GridSettings(new PivotViewGridSettings { AllowResizing=true }).Render()
```

### COLUMNRESIZING.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 | 5          |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 | 3          |
| United States | 546        | \$754,515   | 636        | \$2,263,104 | 7          |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 16         |

### Text Wrap

Allows end user to wrap the cell content to the next line when it exceeds the boundary of the cell width. To enable text wrap, set the [AllowTextWrap](#) property in [PivotViewGridSettings](#) class to **true**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).GridSettings(new PivotViewGridSettings { AllowTextWrap=true }).Render()
```

### TEXTWRAP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |             |
|---------------|------------|-------------|------------|-------------|------------|-------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold | Sold Amount |
| France        | 450        | \$714,955   | 526        | \$1,542,104 | 592        | \$2,903,308 |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 | 372        | \$1,634,808 |
| United States | 546        | \$754,515   | 636        | \$2,263,104 | 731        | \$3,387,308 |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1695       | \$7,925,424 |

### Text Align

Allows end user to align the content of the pivot table's row and column headers and value cells by using the [TextAlign](#) and [HeaderTextAlign](#) properties in the [ColumnRender](#) event under [GridSettings](#). The following alignments are:

- **Left** - It allows the content to be positioned on the left.
- **Right** - It allows the content to be positioned on the right.
- **Center** - It allows the content to be positioned in the middle.
- **Justify** - It allows the content to be as flexible as possible, when the cell does not occupy the entire available area.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).GridSettings(gridSettings =>
gridSettings.ColumnRender("columnRender")).Render()
<script>
function columnRender(args) {
 if(args.stackedColumns[0]){
 // Content for the row headers is right-aligned here.
 args.stackedColumns[0].textAlign="Right";
 }
 if(args.stackedColumns[1]){
 // Content for the column header "FY 2015" is center-aligned
 here.
 args.stackedColumns[1].textAlign = 'Center';
 }
 if(args.stackedColumns[1] && args.stackedColumns[1].columns[0]){
 // Content for the column header "Q1" is right-aligned here.
 args.stackedColumns[1].columns[0].textAlign = 'Right';
 }
 if(args.stackedColumns[1] && args.stackedColumns[1].columns[0] &&
args.stackedColumns[1].columns[0].columns[0]){
 // Content for the value header "Units Sold" is right-aligned
 here.
 args.stackedColumns[1].columns[0].columns[0].headerTextAlign =
'Right';
 }
 if(args.stackedColumns[1] && args.stackedColumns[1].columns[0] &&
args.stackedColumns[1].columns[0].columns[0]){
```

```
// Content for the values are left-aligned here.
args.stackedColumns[1].columns[0].columns[0].textAlign = 'Left';
 }
}
</script>
```

### TEXTWRAP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

| Mountain Bikes   | 77         | \$131,208   | 92         | \$156,768   | 51         | \$86,904    | 91         |

### AutoFit

Allows the user to fit the Pivot Table columns as wide as the content of the cell without wrapping. It auto fits all of the Pivot Table columns by invoking the [autoFitColumns](#) method from the grid instance.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false);
 dataSourceSettings.FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 });
 });
```

```

 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DataBound("ondataBound").Render()
<script>
 function ondataBound(args) {
 var pivotTableObj =
 document.getElementById('PivotView').ej2_instances[0];
 pivotTableObj.grid.autoFitColumns();
 }
</script>

```

### AUTOFITMETHOD.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 | 59         |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 | 37         |
| United Sta... | 546        | \$754,515   | 636        | \$2,263,104 | 63         |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 159        |

**Note:** The minimum width of 250 pixels is set by default with the grouping bar UI for the first column and cannot be reduced further. So, when the grouping bar is enabled, one can auto fit the Pivot Table columns by calling the [autoFitColumns](#) method from the grid instance with the parameter contained pivot table columns field name excluding first column.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 }).Rows(rows =>
 {

```

```

 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {

### Autofit specific columns

During initial rendering, the parameter `autoFit` in the [ColumnRender](#) event under [PivotViewGridSettings](#) can be set to **true** to auto fit specific columns.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.ColumnRender("columnRender")).Render()
<script>
function columnRender(args) {
 for (var i = 0; i < args.columns.length; i++) {
 args.columns[i].autoFit = true;
 }
}
</script>

```

### AUTOFIT-EVENT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Grid Lines

Allows end user to display cell border for each cells using [GridLines](#) property in [PivotViewGridSettings](#) class.

Available mode of grid lines are:

- | Modes | Actions |
- |-----|-----|
- | Both | Displays both the horizontal and vertical grid lines.|
- | None | No grid lines are displayed.|
- | Horizontal | Displays the horizontal grid lines only.|
- | Vertical | Displays the vertical grid lines only.|
- | Default | Displays grid lines based on the theme.|

**Note:** By default, pivot table renders grid lines in **Both** mode.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new PivotViewGridSettings { GridLines= "Vertical"
}).Render()
```

### GRIDLINES.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |

### Selection

Selection provides an option to highlight a row or a column or a cell. It can be done through simple mouse down or arrow keys. To enable selection in the pivot table, set the [AllowSelection](#) property in [PivotViewGridSettings](#) class to **true**.

The pivot table supports two types of selection that can be set using [Type](#) property in [PivotViewSelectionSettings](#) class. The selection types are:

- **Single:** It is set by default, and it only allows selection of a single row or a column or a cell.
- **Multiple:** Allows you to select multiple rows or columns or cells.

To perform multi-selection, press and hold "CTRL" key and click the desired rows or cells. To select range of rows or cells, press and hold the "SHIFT" key and click the rows or columns or cells.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.AllowSelection(true).SelectionSettings(selectionSettings =>
selectionSettings.Type("Multiple"))).Render()
```

### SELECTION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

### Selection Mode

The pivot table supports four types of selection mode that can be set using [Mode](#) property in [PivotViewSelectionSettings](#) class.. The selection modes are:

- [SelectionMode.Row](#): It is set by default, and allows user to select only rows.
- [SelectionMode.Column](#): Allows user to select only columns.
- [SelectionMode.Cell](#): Allows user to select only cells.
- [SelectionMode.Both](#): Allows user to select rows and columns at the same time.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).GridSettings(gridSettings =>
 gridSettings.AllowSelection(true).SelectionSettings(selectionSettings =>
 selectionSettings.Mode(SelectionMode.Both)).Render()
```

**SELECTIONMODE.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

*Cell Selection Mode*

The pivot table supports two types of cell selection mode that can be set using [CellSelectionMode](#) in [PivotViewSelectionSettings](#) class. The cell selection modes are:

- **[PivotCellSelectionMode.Flow](#)**: It is set by default. The range of cells are selected between the start index and end index that includes in-between cells of rows.
- **[PivotCellSelectionMode.Box](#)**: Range of cells are selected from the start and end column indexes that includes in-between cells of rows within the range.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
{
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
})
```

```

))) .GridSettings(gridSettings =>
gridSettings.AllowSelection(true) .SelectionSettings(selectionSettings =>
selectionSettings.CellSelectionMode("Box") .Type("Multiple") .Mode(SelectionMode.Both)) .Render()

```

### CELLSELECTION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

**Note:** Cell selection requires [Mode](#) property in [PivotViewSelectionSettings](#) class to be [SelectionMode.Cell](#) or [SelectionMode.Both](#), and [Type](#) property should be [Multiple](#).

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

#### Changing background color of the selected cell

The background-color of the selected cell can be changed using built-in CSS names. To do so, refer to the code sample below, which shows that the selected cells are changed to a **green yellow** color.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{

```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).GridSettings(gridSettings =>
 gridSettings.AllowSelection(true).SelectionSettings(selectionSettings =>
 selectionSettings.CellSelectionMode("Box").Type("Multiple").Mode(SelectionMode.Both))).Render()
<style>
 .e-pivotview .e-cellselectionbackground,
 .e-pivotview .e-selectionbackground,
 .e-pivotview .e-grid .e-rowsheader.e-selectionbackground,
 .e-pivotview .e-grid .e-columnsheader.e-selectionbackground {
 background-color: greenYellow !important;
 }
</style>

```

### CELLSELECTION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                  | ► FY 2015  |             | ► FY 2016  |             |

| ► United States  | 682        | \$1,085,399 | 480        |             |

### Event

#### CellSelected

The event **CellSelected** is triggered when cell selection gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters -

`selectedCellsInfo`, `currentCell` and `target`. This event allows user to view selected cells information and user can pass those selected cells information to any external component for data binding.

### CSHTML

```
<div>
<div class="column-8">
 @using Syncfusion.EJ2.PivotView

 @Html.EJS().PivotView("pivotview").Width("100%").Height("400").DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)
 ViewBag.DataSource).ExpandAll(true).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product Categories").Add();
 })
).GridSettings(gridSettings =>
 {
 gridSettings.AllowSelection(true).SelectionSettings(selectionSettings =>
 {

### CellSelecting

The event **CellSelecting** triggers before cell gets selected gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters - **currentCell**, **data** and **cancel**.

### CSHTML

```
<div>
<div class="column-8">
 @using Syncfusion.EJ2.PivotView

 @Html.EJS().PivotView("pivotview").Width("100%").Height("400").DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)
 ViewBag.DataSource).ExpandAll(true).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 columns.Name("Order_Source").Caption("Order Source").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 })
 .Filters(filters =>
 {
 filters.Name("Product_Categories").Caption("Product Categories").Add();
 })
).GridSettings(gridSettings =>
 {
 gridSettings.AllowSelection(true).SelectionSettings(selectionSettings =>
 {
 selectionSettings.CellSelectionMode(PivotCellSelectionMode.Box).Type("Multiple").Mode(SelectionMode.Cell)
 }).CellSelecting("cellSelecting").Render()
 })
 })
 </div>
</script>
```

```
function cellSelecting(args) {
 }
</script>
```

### CELLSELECTION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Clip Mode

The clip mode provides options to display its overflow cell content in the pivot table. It can be configured using the [ClipMode](#) property in [PivotViewGridSettings](#) class. The pivot table supports three types of clip modes which are:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

**Note:** By default, [ClipMode](#) value is set to **Ellipsis**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings => gridSettings.ClipMode("Clip")).Render()
```

### CLIPMODE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015 |          | FY 2016    |             | FY 2017    |             |
|---------------|---------|----------|------------|-------------|------------|-------------|
|               | Units   | Sold     | Units Sold | Sold Amount | Units Sold | Sold Amount |
| France        | 450     | \$714,95 | 526        | \$1,542,104 | 592        | \$2,903,    |

### Cell Template

User can customize the pivot table cell element by using the `CellTemplate` property in `PivotViewTemplates` class. The `CellTemplate` property accepts either an HTML string or the element's ID, which can be used to append additional HTML elements to showcase each cell with custom format.

In this demo, the revenue cost for each year is represented with trend icons.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").DataBound("trend").DataSourceSettings(dataSourceSettings =>
{
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(true).EnableSorting(true)
 .DrilledMembers(drilledmembers =>{
 drilledmembers.Name("Year").Items(ViewBag.drilledMembers).Add();
 })
 .FormatSettings(formatsettings => {
 formatsettings.Name("ProCost").Format("C0").Add();
 })
 .Rows(rows => {
 rows.Name("Year").Caption("Year").Add();
 rows.Name("HalfYear").Caption("Half Year").Add();
 })
 .Columns(columns => {
 columns.Name("EnerType").Caption("Energy Type").Add();
 columns.Name("EneSource").Caption("Energy Source").Add();
 })
 .Values(values => {
 values.Name("ProCost").Caption("Revenue Growth").Add();
 })
}).GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).CellTemplate("${getCellContent(data)}").Render()

<script>

## Events

### QueryCellInfo

The event `queryCellInfo` triggers while rendering each row and value cells in the pivot table. It allows the user to customize the current cell like adding or removing styles, editing value, etc. It has the following parameters:

- `cell` - It holds the current cell information.
- `data` - It holds the entire row data besides the current cell.
- `column` - It holds the entire column data besides the current cell.
- `pivotview` - It holds pivot table instance.

## CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
{
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
})
```

```

 })).GridSettings(gridSettings =>
 gridSettings.QueryCellInfo("querycell").Render()
<script>
 function queryCell(args) {
 }
</script>

```

### QUERYCELL.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### HeaderCellInfo

The event `headerCellInfo` triggers while rendering each column header cell in the pivot table. It allows the user to customize the element of the current header cell like adding or removing styles, editing value, etc. It has the following parameters:

- `node` - It holds the current header cell information.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.HeaderCellInfo("headerCellInfo").Render()
<script>
 function headerCellInfo(args) {
 }
</script>

```

**HEADERCELL.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*ColumnRender*

The event [ColumnRender](#) triggers while framing each columns for rendering in the pivot table. It allows the user to customize the text alignment, column visibility, autofit, re-ordering, minimum and maximum width for a specific column. It has the following parameters:

- **columns** - It holds the leaf level columns (i.e., value headers) information.
- **dataSourceSettings** - It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **name** - It holds the name of the event.
- **stackedColumns** - It holds the drilled columns (i.e., including column and value headers) information.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.ColumnRender("columnRender")).Render()
<script>
 function columnRender(args) {
 for (var i = 0; i < args.columns.length; i++) {
 args.columns[i].autoFit = true;
 args.columns[i].textAlign="Right";
 }
 }
</script>
```

**TEXTWRAP.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*CellClick*

The event **CellClick** triggers while clicking a cell in the pivot table. For instance, using this event end-user can either add or remove styles, edit value and also perform any other DOM manipulations. It has the following parameters:

- **currentCell** - It holds the current cell information.
- **data** - It holds the clicked cell's data like axis, formatted text, actual text, row header, column header and value informations.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingbar(true).CellClick("cellClick").Render()
<script>
 function cellClick(args){
 args.currentCell.setAttribute("style", "background-color: red;");
 }
</script>
```

**CELLCLICK.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

## Show or hide totals in ASP.NET MVC Syncfusion Pivot Table Control

### Show or hide grand totals

Allows to show or hide grand totals in rows and columns using the [ShowGrandTotals](#) property. To hide the grand totals in rows and columns, set the property [ShowGrandTotals](#) in [PivotViewDataSourceSettings](#) class to **false**.

End user can also hide grand totals for row or columns separately by setting the property [ShowRowGrandTotals](#) or [ShowColumnGrandTotals](#) in [DataSourceSettings](#) class to **false** respectively.

By default, [ShowGrandTotals](#), [ShowRowGrandTotals](#) and [ShowColumnGrandTotals](#) properties in [PivotViewDataSourceSettings](#) class are set as **true**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSe
ttings(new PivotViewGroupingBarSettings {
ShowRemoveIcon =false }).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).ShowGrandTotals(false)).Render()
```

### GRANDTOTAL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |

Show grand totals at top or bottom

Allows to show grand totals either at top or bottom in rows and columns using the [GrandTotalsPosition](#) property. To show the grand totals at top in rows and columns, set the [GrandTotalsPosition](#) property in [DataSourceSettings](#) to **Top**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
{
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
 .GrandTotalsPosition(GrandTotalsPosition.Top).Render()
```

### GRANDTOTAL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                  | Grand Total |             | FY 2005    |

| Germany        |            |             |            |             |       |
| Mountain Bikes | 51         | \$92,824    | 61         | \$76,904    |       |

#### Show sub-totals at top or bottom

Allows to show sub-totals either at top or bottom of the header group in rows and columns by using the [SubTotalsPosition](#) property. By default, [SubTotalsPosition](#) property is set to **Auto**, which means that column sub-totals are displayed at the bottom and row sub-totals are displayed at the top of the header group in the pivot table.

To show sub-totals at top of the header group in rows and columns, set the [SubTotalsPosition](#) property in [DataSourceSettings](#) to **Top**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").GroupingBarSettings(
 new PivotViewGroupingBarSettings {
 ShowRemoveIcon = false
 }).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10)
 .MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
```

```
columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).SubTotalsPosition(SubTotalsPosition.Top).Render()
```

### GRANDTOTAL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

|                   | FY 2015       |      |      | FY 2016 |
|-------------------|---------------|------|------|---------|
|                   | FY 2015 Total | Q1   | Q2   |         |
| ▼ France          | 5854          | 2766 | 3088 |         |

| ► United States   | 3068    | 3500 | 6568          |        |

### Show or hide totals using toolbar

It can also be achieved using built-in toolbar options by setting the [ShowToolbar](#) property in [PivotView](#) class to **true**. Also, include the items **GrandTotal** and **SubTotal** within the [Toolbar](#) property in [PivotView](#) class. End user can now see "Show/Hide Grand totals" and "Show/Hide Sub totals" icons in toolbar UI automatically.

The grand totals and sub-totals can be dynamically displayed at the top or bottom of the pivot table's row and column axes by using the built-in options "Grand totals position" and "Subtotals position" available in the grand totals and sub-totals drop down menus, respectively.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolbar(true).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 })
 .Columns(columns =>
```

```

{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).Toolbar(new List<string>() { "SubTotal", "GrandTotal" }).Render()

```

### TOOLBAR.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|                |  | FY 2016     |            | FY 2017     |

## Hyperlink

The pivot table supports to show hyperlink option to link data for individual cells that are displayed in the component. Also, the hyperlink can be enabled separately for row headers, column headers, value cells, and summary cells using the [HyperlinkSettings](#) class. It can be configured through code behind, during initial rendering and the settings available to show hyperlink are:

- [ShowHyperlink](#): It allows to set the visibility of hyperlink in all cells.
- [ShowRowHeaderHyperlink](#): It allows to set the visibility of hyperlink in row headers.
- [ShowColumnHeaderHyperlink](#): It allows to set the visibility of hyperlink in column headers.
- [ShowValueCellHyperlink](#): It allows to set the visibility of hyperlink in value cells.
- [ShowSummaryCellHyperlink](#): It allows to set the visibility of hyperlink in summary cells.
- [HeaderText](#): It allows to set the visibility of hyperlink based on header text.
- [ConditionalSettings](#): It allows to set the visibility of hyperlink based on specific condition.

<!-- markdownlint-disable MD028 -->

**Note:** By default, the hyperlink options are disabled for all cells in the pivot table.

**Note:** User defined style can be applied to hyperlink using [CssClass](#) property in [HyperlinkSettings](#) class.

### Hyperlink for all cells

The pivot table has an option to show hyperlink option for all cells that are currently in display. To do so, user need to set [ShowHyperlink](#) to **true**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowHyperlink(true)).Render()
```

### ALLCELLS.CS

```
public ActionResult Index()
{
var data = GetPivotData();
```

```

 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

### Hyperlink for row headers

The pivot table has an option to show hyperlink option for row header cells alone that are currently in display. To do so, user need to set [ShowRowHeaderHyperlink](#) to **true**.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowRowHeaderHyperlink(true)).Render()

```

### ROWHEADER.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |

### Hyperlink for column headers

The pivot table has an option to show hyperlink option for column header cells alone that are currently in display. To do so, user need to set [ShowColumnHeaderHyperlink](#) to **true**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowColumnHeaderHyperlink(true)).Render()
```

### COLUMNHEADER.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

### Hyperlink for value cells

The pivot table has an option to show hyperlink option for value cells alone that are currently in display. To do so, user need to set [ShowValueCellHyperlink](#) to **true**.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.DrilledMembers(drilledmembers =>
{
 drilledmembers.Name("Country").Items(ViewBag.countryMembers).Add();
 drilledmembers.Name("Year").Items(ViewBag.yearMembers).Add();
}).FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
}).HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowValueCellHyperlink(true)).Render()
```

### VALUECELLS.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.yearMembers = new string[] { "FY 2015" };
 ViewBag.countryMembers = new string[] { "France" };
 return View();
}
```

### Hyperlink for summary cells

The pivot table has an option to show hyperlink option for summary cells alone that are currently in display. To do so, user need to set [ShowSummaryCellHyperlink](#) to true.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.DrilledMembers(drilledmembers =>
{
 drilledmembers.Name("Country").Items(ViewBag.countryMembers).Add();
 drilledmembers.Name("Year").Items(ViewBag.yearMembers).Add();
}).FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
}).HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowSummaryCellHyperlink(true)).Render()
```

### SUMMARYCELLS.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.yearMembers = new string[] { "FY 2015" };
 ViewBag.countryMembers = new string[] { "France" };
```

```
return View();
}
```

|                | FY 2015    |             |            |             |            |
|----------------|------------|-------------|------------|-------------|------------|
|                | Q1         |             | Q2         |             | Q3         |
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 114        | \$177,246   | 108        | \$172,352   |            |
| Mountain Bikes | 31         | \$52,824    | 51         | \$86,904    |            |
| Road Bikes     | 83         | \$124,422   | 57         | \$85,448    |            |
| Germany        | 74         | \$117,246   | 128        | \$152,352   |            |
| Mountain Bikes | 51         | \$92,824    | 61         | \$76,904    |            |

### Condition based hyperlink

The pivot table has an option to show hyperlink in the cells based on specific conditions. It can be configured using the [ConditionalSettings](#) class through code behind, during initial rendering. The settings required are:

- [Measure](#): Specifies the value field name, in-order to set the visibility of hyperlink for the same when condition is met.
- [Conditions](#): Specifies the operator type such as [Condition.Equals](#), [Condition.GreaterThan](#), [Condition.LessThan](#), etc.
- [Value1](#): Specifies the start value.
- [Value2](#): Specifies the end value.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.DrilledMembers(drilledmembers =>
{
drilledmembers.Name("Country").Items(ViewBag.countryMembers).Add();
drilledmembers.Name("Year").Items(ViewBag.yearMembers).Add();
}).FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
```

```
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).HyperlinkSettings(hyperlinksettings => hyperlinksettings
 .ConditionalSettings(format =>
 {
 format.Conditions(Syncfusion.EJ2.PivotView.Condition.Between).Measure("Sold")
).Value1(100).Value2(200).Add();
 })).Render();
}
```

## CONDITIONS.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.yearMembers = new string[] { "FY 2015" };
 ViewBag.countryMembers = new string[] { "France" };
 return View();
}
```

|                | FY 2015    |             |            |             |            |
|----------------|------------|-------------|------------|-------------|------------|
|                | Q1         |             | Q2         |             | Q3         |
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 114        | \$177,246   | 108        | \$172,352   |            |
| Mountain Bikes | 31         | \$52,824    | 51         | \$86,904    |            |
| Road Bikes     | 83         | \$124,422   | 57         | \$85,448    |            |
| Germany        | 74         | \$117,246   | 128        | \$152,352   |            |
| Mountain Bikes | 51         | \$92,824    | 61         | \$76,904    |            |

### Condition based hyperlink for specific row or column

You can apply conditions for specific row or column using [Label](#) option to show hyperlink option in the pivot table. It can be configured using the [ConditionalSettings](#) option through code behind, during initial rendering. The required settings are:

- [Label](#): Specifies the header name to get visibility of hyperlink option for row or column.
- [Conditions](#): Specifies the operator type such as [Condition.Equals](#), [Condition.GreaterThan](#), [Condition.LessThan](#), etc.
- [Value1](#): Specifies the start value.
- [Value2](#): Specifies the end value.

## CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
```

```

dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .DrilledMembers(drilledmembers =>
 {
 drilledmembers.Name("Country").Items(ViewBag.countryMembers).Add();
 drilledmembers.Name("Year").Items(ViewBag.yearMembers).Add();
 }).FormatSettings(formatsettings =>
 {

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).HyperlinkSettings(hyperlinksettings => hyperlinksettings
 .ConditionalSettings(format =>
 {

format.Conditions(Syncfusion.EJ2.PivotView.Condition.LessThan).Label("France")
 .Value1(1000).Add();
 })).Render()

```

### LABELCONDITIONS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.yearMembers = new string[] { "FY 2015" };
 ViewBag.countryMembers = new string[] { "France" };
 return View();
}

```

### Header based hyperlink

The pivot table has an option to show hyperlink in the cells based on specific row or column header. It can be configured using the [HeaderText](#) option through code behind, during initial rendering.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .DrilledMembers(drilledmembers =>
 {
 drilledmembers.Name("Country").Items(ViewBag.countryMembers).Add();
 drilledmembers.Name("Year").Items(ViewBag.yearMembers).Add();
 }

```

```

 }).FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).HyperlinkSettings(hyperlinksettings => hyperlinksettings.HeaderText("FY 2015.Q1.Units Sold")).Render()

```

## HEADERS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 ViewBag.yearMembers = new string[] { "FY 2015" };
 ViewBag.countryMembers = new string[] { "France" };
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |
|---------------|------------|-------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 526        | \$1,542,104 |            |
| Germany       | 440        | \$563,515   | 496        | \$1,772,104 |            |
| United States | 546        | \$754,515   | 636        | \$2,263,104 |            |
| Grand Total   | 1436       | \$2,032,985 | 1658       | \$5,577,312 | 1          |

## Event

The event [HyperlinkCellClick](#) fires on every hyperlink cell click.

It has following parameters - `cancel` and `currentCell`. The parameter `currentCell` is used to customize the host cell element by any means. Meanwhile, when the parameter `cancel` is set to `true`, applied customization will not be updated to the host cell element.

## CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)

```

```

.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).HyperLinkCellClick("hyperlink").HyperlinkSettings(hyperlinksettings =>
hyperlinksettings.ShowRowHeaderHyperlink(true)).Render()
<script>
function hyperlink(args) {
 args.cancel = false;
 args.currentCell.setAttribute("data-url",
"https://ej2.syncfusion.com/");//here we have redirected to EJ2 Syncfusion
on hyperlinkcell click
}
</script>

```

### EVENT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Toolbar in ASP.NET MVC Syncfusion Pivot Table Control

Toolbar option allows to access the frequently used features like switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc... with ease at runtime. This option can be enabled by setting the [ShowToolbar](#) property in [PivotView](#) class to **true**. The [Toolbar](#) property in [PivotView](#) class accepts the collection of built-in toolbar options.

#### Built-in Toolbar Options

The following table shows built-in toolbar options and its actions.

| Built-in Toolbar Options | Actions                    |
|--------------------------|----------------------------|
| ----- -----              |                            |
| New                      | Creates a new report       |
| Save                     | Saves the current report   |
| Save As                  | Save as current report     |
| Rename                   | Renames the current report |

- | Delete | Deletes the current report |
- | Load | Loads any report from the report list |
- | Grid | Shows pivot table |
- | Chart | Shows a chart in any type from the built-in list and option to enable/disable multiple axes |
- | Exporting | Exports the pivot table as PDF/Excel/CSV and the pivot chart as PDF and image |
- | Sub-total | Shows or hides sub totals |
- | Grand Total | Shows or hides grand totals |
- | Conditional Formatting | Shows the conditional formatting pop-up to apply formatting |
- | Number Formatting | Shows the number formatting pop-up to apply number formatting |
- | Field List | Shows the fieldlist pop-up |
- | MDX | Shows the MDX query that was run to retrieve data from the OLAP data source. **This applies only to the OLAP data source.** |

**Note:** The order of toolbar options can be changed by simply moving the position of items in the **ToolbarItems** collection. Also if end user wants to remove any toolbar option from getting displayed, it can be simply ignored from adding into the **ToolbarItems** collection.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("300").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolbar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
})
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();

### Show desired chart types in the dropdown menu

By default, all chart types are displayed in the dropdown menu included in the toolbar. However, based on the request for an application, we may need to show selective chart types on our own. This can be achieved using the [ChartTypes](#) property. To know more about supporting chart types, [click here](#).

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolbar(true).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).GridSettings(new Syncfusion.EJ2.PivotView.PivotViewGridSettings {
 ColumnWidth = 140 }).DisplayOption(new PivotViewDisplayOption { View =
 Syncfusion.EJ2.PivotView.View.Both }).Toolbar(new List<string>() { "Grid", "Chart" }).ChartTypes(new List<string>() { "Column", "Bar",
 "Line", "Area" }).Render()
<style>
 #pivotview {
 width: 100%;
```

```

 height: 100%;
 }
 .e-tool-expand::before {
 content: '\e702';
 }
</style>

```

### TOOLBAR.CS

```

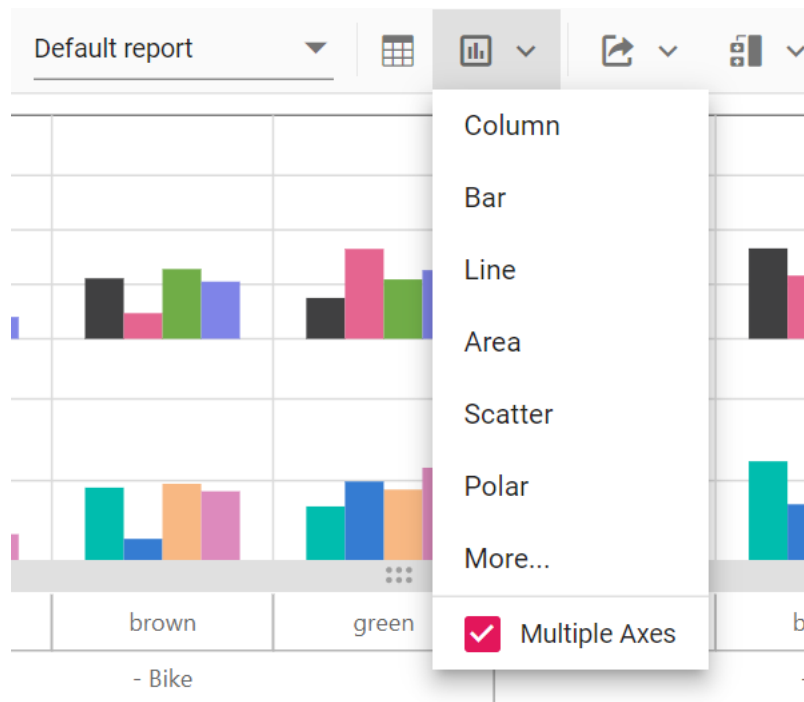

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

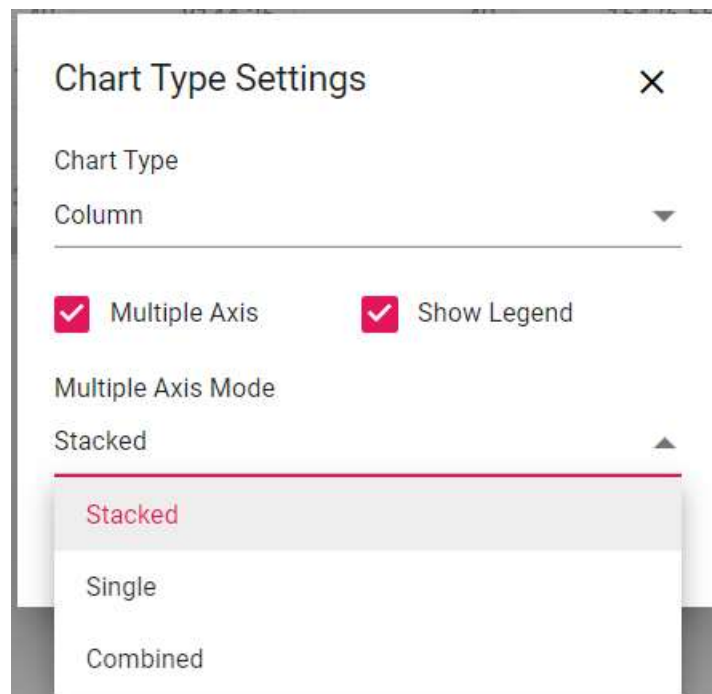

#### Switch the chart to multiple axes

In the chart, the user can switch from single axis to multiple axes with the help of the built-in checkbox available inside the chart type dropdown menu in the toolbar. For more information [refer here](#).

<!-- markdownlint-disable MD009 -->

There are three modes available in **Multiple Axis** option: **Stacked**, **Single** and **Combined**. The modes can be changed using “Multiple Axis Mode” drop-down list which appears while clicking the **More...** option.

#### Show or hide legend

In the chart, legend can be shown or hidden dynamically with the help of the built-in option available in the chart type drop-down menu.

**Note:** By default, the legend is not be visible for the accumulation chart types like pie, doughnut, pyramid, and funnel. Users can enable or disable using the built-in checkbox option.

#### Adding custom option to the toolbar

In addition to the existing built-in toolbar items, new toolbar item(s) may also be included. This can be achieved by using the [ToolbarRender](#) event. The action of the new toolbar item(s) can also be defined within this event.

**Note:** The new toolbar item(s) can be added to the desired position in the toolbar using the `splice` option.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("300").ShowToolbar(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).EnableSorting(true)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
```

```

 })).GridSettings(new PivotViewGridSettings { ColumnWidth = 140
 }).DisplayOption(new PivotViewDisplayOption { View = View.Both
 }).Toolbar(new List<string>
 () { "Expand/Collapse" }).ToolbarRender("beforeToolbarRender").Render()
<style>
 #pivotview {
 width: 100%;
 height: 100%;
 }
 .e-tool-expand::before {
 content: '\e702';
 }
</style>
<script>
 function beforeToolbarRender(args) {
 args.customToolbar.splice(12, 0, {
 prefixIcon: 'e-tool-expand e-icons', tooltipText:
'Expand/Collapse',
 click: function (args) {
 var pivotTableObj =
document.getElementById('pivotview').ej2_instances[0];
 pivotTableObj.dataSourceSettings.expandAll =
!pivotTableObj.dataSourceSettings.expandAll;
 },
 });
 }
</script>

```

### TOOLBARCUSTOMIZE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |
|---------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 5          |
| Germany       | 440        | \$563,515   | 4          |
| United States | 546        | \$754,515   | 6          |
| Grand Total   | 1436       | \$2,032,985 | 16         |

In the above topic, we have seen how to add an icon as one of the toolbar item in toolbar panel. In the next topic, we are going to see how to frame the entire toolbar panel and how to add a custom control in it.

### Toolbar Template

It allows to customize the toolbar panel by using template option. It allows any custom control to be used as one of the toolbar item inside the toolbar panel. It can be achieved by two ways.

Here, the entire toolbar panel can be framed in HTML elements that are appended at the top of the pivot table. The **id** of the HTML element needs to be set in the [toolbarTemplate](#) property in-order to map it to the pivot table.

### CSHTML

```
<div id="template">
 <div>
 @Html.EJS().Button("expandbtn").Content("Expand
All").CssClass("e-flat").IsPrimary(true).Render()
 @Html.EJS().Button("collapsebtn").Content("Collapse
ALL").CssClass("e-flat").IsPrimary(true).Render()
 </div>
</div>

@Html.EJS().PivotView("PivotGrid").Width("100%").Height("300").ShowToolbar(t
rue).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>
) ViewBag.Data)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Columns(columns =>
{
columns.Name("Year").Add(); columns.Name("Quarter").Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new
Syncfusion.EJ2.PivotView.PivotViewGridSettings { ColumnWidth = 140
}).ToolbarTemplate("#template").Render()
<script>
 document.getElementById("expandbtn").addEventListener('click', function
() {
 var pivotObj =
document.getElementById("PivotGrid").ej2_instances[0];
 pivotObj.dataSourceSettings.expandAll = true;
 });
 document.getElementById("collapsebtn").addEventListener('click',
function () {
 var pivotObj =
document.getElementById("PivotGrid").ej2_instances[0];
 pivotObj.dataSourceSettings.expandAll = false;
```

```
});
</script>
```

### TOOLBARCUSTOMIZE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

| EXPAND ALL    COLLAPSE ALL |            |               |            |               |            |             |
|----------------------------|------------|---------------|------------|---------------|------------|-------------|
|                            | FY 2015    |               | FY 2016    |               | FY 2017    |             |
|                            | Units Sold | Sold Amount   | Units Sold | Sold Amount   | Units Sold | Sold Amount |
| France                     | 729        | \$1,160,099.5 | 609        | \$983,317     | 703        | \$1,14      |
| Germany                    | 528        | \$845,472     | 667        | \$1,067,220   | 579        | \$94        |
| United Kingdom             | 782        | \$1,263,109.5 | 640        | \$1,031,630.5 | 657        | \$1,041     |
| United States              | 682        | \$1,085,398.5 | 480        | \$770,362     | 644        | \$1,022     |
| Grand Total                | 2721       | \$4,354,079.5 | 2396       | \$3,852,529.5 | 2583       | \$4,11      |

Another option allows to frame a custom toolbar item using HTML elements and include in the toolbar panel at the desired position. The custom toolbar items can be declared as control **instance** or element **id** in the [toolbar](#) property in pivot table.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@{
 List<object> toolbarItems = new List<object>();
 toolbarItems.Add(new { template = "#enablertl" });
 toolbarItems.Add(new { template = "#disablertl" });
}
@Html.EJS().Button("enablertl").Content("Enable Rtl").CssClass("e-flat").IsPrimary(true).Render()
@Html.EJS().Button("disablertl").Content("Disable Rtl").CssClass("e-flat").IsPrimary(true).Render()

@Html.EJS().PivotView("PivotGrid").Width("100%).Height("300").ShowToolbar(true).ShowToolbar(true).DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>
)ViewBag.Data)
 .FormatSettings(formatsettings =>

**Note:** For both options, the actions for the toolbar template items can be defined in the event [toolbarClick](#). Also, if the toolbar item is a custom control then its built-in events can also be accessed.

<!-- markdownlint-disable MD009 -->

### Save and load report as a JSON file

The current pivot report can be saved as a JSON file in the desired path and loaded back to the pivot table at any time.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView
Save<div class="fileUpload btn btn-
primary">Load<input id="files" type="file" class="upload"
/></div>
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").DataSourceSet
tings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).EnableSorting
(true)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).DataBound("ondataBound").Render()
<style>
#pivotview {
width: 100%;
height: 100%;
}
.fileUpload {
position: relative;
overflow: hidden;
margin: 10px;
}
.fileUpload input.upload {
position: absolute;
top: 0;
right: 0;
margin: 0;
padding: 0;
font-size: 20px;
cursor: pointer;
opacity: 0;
filter: alpha(opacity=0);
}
</style>
<script>
function ondataBound(args) {
var pivotTableObj =
document.getElementById('pivotview').ej2_instances[0];
var dataSource =
JSON.parse(pivotTableObj.getPersistData()).dataSourceSettings.dataSource;
var a = document.getElementById('save');

```

```

 var mime_type = 'application/octet-stream'; // text/html, image/png,
et c
 a.setAttribute('download', 'pivot.JSON');
 a.href = 'data:' + mime_type + ';base64,' +
 btoa(JSON.stringify(dataSource) || '');
 document.getElementById('files').addEventListener('change',
 readBlob, false);
 }
 function readBlob(args) {
 var files = document.getElementById('load').files;
 var file = files[0];
 var start = 0;
 var stop = file.size - 1;
 var reader = new FileReader();
 reader.onloadend = function(evt) {
 if (evt.target.readyState == FileReader.DONE) {
 var pivotTableObj =
document.getElementById('pivotview').ej2_instances[0];
 pivotTableObj.dataSource = JSON.parse(evt.target.result);
 }
 };
 var blob = file.slice(start, stop + 1);
 reader.readAsBinaryString(blob);
 }
}
</script>

```

### SAVE-LOAD-JSON.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Save and load reports to a SQL database

SQL Server is a relational database management system (RDBMS) that can be used to store and manage large amounts of data. In this topic, we will see how to save, save as, rename, load, delete, and add reports between a SQL Server database and an ASP.NET MVC Pivot Table at runtime.

#### Create a Web API service to connect to a SQL Server database

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

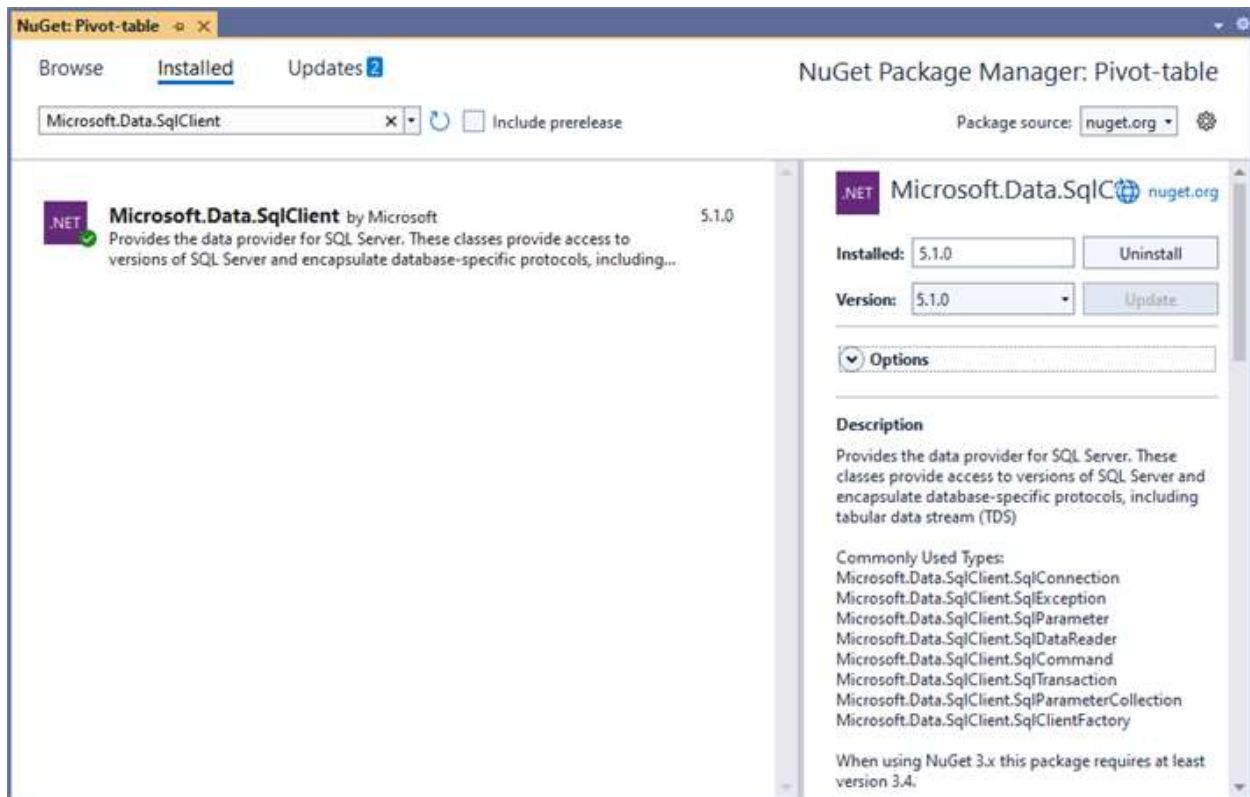

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a SQL Server database using the Microsoft SqlClient in our application, we need to install the [Microsoft.Data.SqlClient](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Microsoft.Data.SqlClient** and install it.

3. Under the **Controllers** folder, create a Web API controller (aka, PivotController.cs) file that aids in data communication with the Pivot Table.

4. In the Web API Controller (aka, PivotController), the **OpenConnection** method is used to connect to the SQL database. The **GetDataTable** method then processes the specified SQL query string, retrieves data from the database, and converts it into a **DataTable** using **SqlCommand** and **SqlDataAdapter**. This **DataTable** can be used to retrieve saved reports and modify them further as shown in the code block below.

[PivotController.cs]

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Microsoft.Data.SqlClient;
using System.Data;
namespace MyWebService.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpPost]
```

```
[Route("Pivot/SaveReport")]
public void SaveReport([FromBody] Dictionary<string, string> reportArgs)
{
 SaveReportToDB(reportArgs["reportName"], reportArgs["report"]);
}

[HttpPost]
[Route("Pivot/FetchReport")]
public IActionResult FetchReport()
{
 return Ok((FetchReportListFromDB()));
}

[HttpPost]
[Route("Pivot/LoadReport")]
public IActionResult LoadReport([FromBody] Dictionary<string, string> reportArgs)
{
 return Ok((LoadReportFromDB(reportArgs["reportName"])));
}

[HttpPost]
[Route("Pivot/RemoveReport")]
public void RemoveReport([FromBody] Dictionary<string, string> reportArgs)
{
 RemoveReportFromDB(reportArgs["reportName"]);
}

[HttpPost]
[Route("Pivot/RenameReport")]
public void RenameReport([FromBody] RenameReportDB reportArgs)
{
 RenameReportInDB(reportArgs.ReportName, reportArgs.RenameReport, reportArgs.isReportExists);
}

public class RenameReportDB
{
 public string ReportName { get; set; }
 public string RenameReport { get; set; }
}
```

```
public bool isReportExists { get; set; }
}

private void SaveReportToDB(string reportName, string report)
{
 SqlConnection sqlConn = OpenConnection();
 bool isDuplicate = true;
 SqlCommand cmd1 = null;
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
 isDuplicate = false;
 cmd1 = new SqlCommand("update ReportTable set Report=@Report where ReportName like @ReportName", sqlConn);
 }
 }
 if (isDuplicate)
 {
 cmd1 = new SqlCommand("insert into ReportTable (ReportName,Report) Values(@ReportName,@Report)", sqlConn);
 }
 cmd1.Parameters.AddWithValue("@ReportName", reportName);
 cmd1.Parameters.AddWithValue("@Report", report.ToString());
 cmd1.ExecuteNonQuery();
 sqlConn.Close();
}

private string LoadReportFromDB(string reportName)
{
 SqlConnection sqlConn = OpenConnection();
 string report = string.Empty;
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
```

```
report = (string)row["Report"];
break;
}
}
sqlConn.Close();
return report;
}
private List<string> FetchReportListFromDB()
{
 SqlConnection sqlConn = OpenConnection();
 List<string> reportNames = new List<string>();
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if (!string.IsNullOrEmpty(row["ReportName"] as string))
 {
 reportNames.Add(row["ReportName"].ToString());
 }
 }
 sqlConn.Close();
 return reportNames;
}
private void RenameReportInDB(string reportName, string renameReport, bool isReportExists)
{
 SqlConnection sqlConn = OpenConnection();
 SqlCommand cmd1 = null;
 if (isReportExists)
 {
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
 cmd1 = new SqlCommand("delete from ReportTable where ReportName like '%" + reportName + "%'",
 sqlConn);
 }
 }
 }
}
```

```
break;
}
}
cmd1.ExecuteNonQuery();
}
foreach (DataRow row in GetDataTable(sqlConn).Rows)
{
 if ((row["ReportName"] as string).Equals(reportName))
 {
 cmd1 = new SqlCommand("update ReportTable set ReportName=@RenameReport where ReportName
like '%" + reportName + "%'", sqlConn);
 break;
 }
}
cmd1.Parameters.AddWithValue("@RenameReport", renameReport);
cmd1.ExecuteNonQuery();
sqlConn.Close();
}
private void RemoveReportFromDB(string reportName)
{
 SqlConnection sqlConn = OpenConnection();
 SqlCommand cmd1 = null;
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
 cmd1 = new SqlCommand("delete from ReportTable where ReportName like '%" + reportName + "%'",
sqlConn);
 break;
 }
 }
 cmd1.ExecuteNonQuery();
 sqlConn.Close();
}
```

```

private SqlConnection OpenConnection()
{
 // Replace with your own connection string.
 string connectionString = @"<Enter your valid connection string here>";
 SqlConnection sqlConn = new SqlConnection(connectionString);
 sqlConn.Open();
 return sqlConn;
}

private DataTable GetDataTable(SqlConnection sqlConn)
{
 string xquery = "select * from ReportTable";
 SqlCommand cmd = new SqlCommand(xquery, sqlConn);
 SqlDataAdapter da = new SqlDataAdapter(cmd);
 DataTable dt = new DataTable();
 da.Fill(dt);
 return dt;
}
}

```

5. When you run the app, it will be hosted at <https://localhost:44313>. You can use the hosted URL to save and load reports in the SQL database from the Pivot Table.

Further, let us explore more on how to save, load, rename, delete, and add reports using the built-in toolbar options via Web API controller (aka, PivotController) one-by-one.

#### [Saving a report](#)

When you select the **“Save a report”** option from the toolbar, the [saveReport](#) event is triggered. In this event, an AJAX request is made to the Web API controller's **SaveReport** method, passing the name of the current report and the current report, which you can use to check and save in the SQL database.

For example, the report shown in the following code snippet will be passed to the **SaveReport** method along with the report name **“Sample Report”** and saved in the SQL database.

[Index.cshtml]

```
`csharp
```

```
@using Syncfusion.EJ2.PivotView;
```

```
@Html.EJS().PivotView("pivotview").Width("700").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowConditionalFormatting(true).AllowPdfExport(true).AllowCalculatedField(true).DataSource
```

```

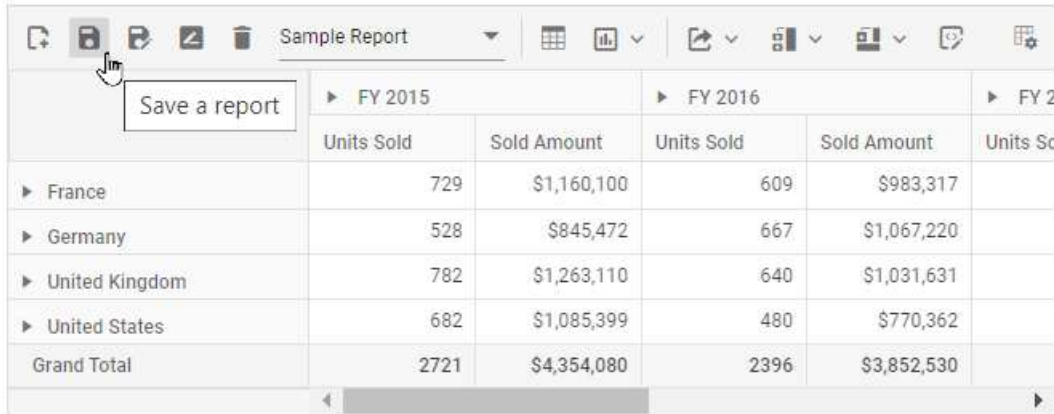

Settings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
.FormatSettings(formatSettings => { formatSettings.Name("Amount").Format("C0").Add(); })
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Production Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add(); values.Name("Amount").Caption("Sold
Amount").Add();
}).DisplayOption(new PivotViewDisplayOption { View = View.Both }).ChartSettings(new
PivotViewChartSettings { Value = "Amount", EnableExport = true, EnableMultipleAxis = false
}).Toolbar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load",
"Grid", "Chart", "Export", "SubTotal", "GrandTotal", "Formatting",
"FieldList"}).SaveReport("saveReport").LoadReport("loadReport").FetchReport("fetchReport").RenameR
eport("renameReport").RemoveReport("removeReport").NewReport("newReport").ToolbarRender("bef
oreToolbarRender").Render()
<script>
function saveReport(args) {
var report = JSON.parse(args.report);
report.dataSourceSettings.dataSource = [];
fetch('https://localhost:44313/Pivot/SaveReport', {
method: 'POST',
headers: {
'Accept': 'application/json',
'Content-Type': 'application/json',
},
body: JSON.stringify({ reportName: args.reportName, report: JSON.stringify(report) })
}).then(response => {
fetchReport(args);
});

```

```
}
</script>
`

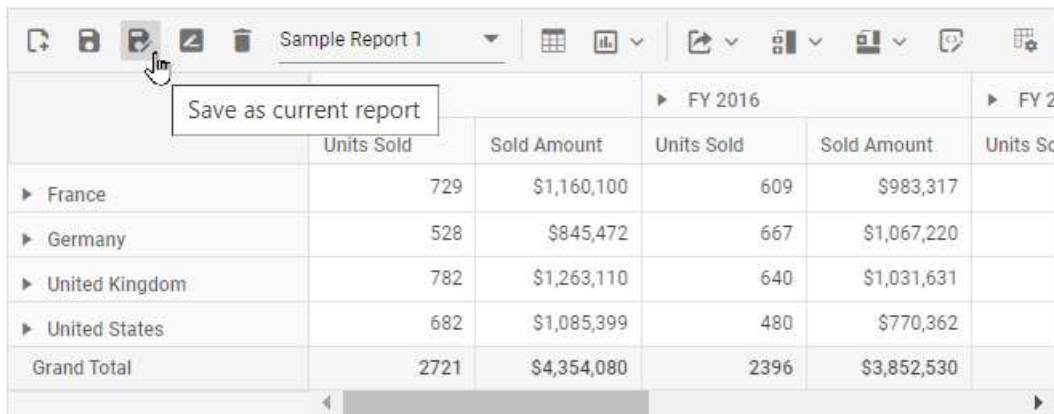

[PivotController.cs]
`csharp
namespace MyWebApp.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpPost]
 [Route("Pivot/SaveReport")]
 public void SaveReport([FromBody] Dictionary<string, string> reportArgs)
 {
 SaveReportToDB(reportArgs["reportName"], reportArgs["report"]);
 }
 private void SaveReportToDB(string reportName, string report)
 {
 SqlConnection sqlConn = OpenConnection();
 bool isDuplicate = true;
 SqlCommand cmd1 = null;
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
 isDuplicate = false;
 cmd1 = new SqlCommand("update ReportTable set Report=@Report where ReportName like @ReportName", sqlConn);
 }
 }
 if (isDuplicate)
 {
```

```
cmd1 = new SqlCommand("insert into ReportTable (ReportName,Report)
Values(@ReportName,@Report)", sqlConn);
}
cmd1.Parameters.AddWithValue("@ReportName", reportName);
cmd1.Parameters.AddWithValue("@Report", report.ToString());
cmd1.ExecuteNonQuery();
sqlConn.Close();
}
private SqlConnection OpenConnection()
{
// Replace with your own connection string.
string connectionString = @"<Enter your valid connection string here>";
SqlConnection sqlConn = new SqlConnection(connectionString);
sqlConn.Open();
return sqlConn;
}
private DataTable GetDataTable(SqlConnection sqlConn)
{
string xquery = "select * from ReportTable";
SqlCommand cmd = new SqlCommand(xquery, sqlConn);
SqlDataAdapter da = new SqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
return dt;
}
}
}
```

|                | FY 2015    |             | FY 2016    |             | FY 2017    |
|----------------|------------|-------------|------------|-------------|------------|
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 729        | \$1,160,100 | 609        | \$983,317   |            |
| Germany        | 528        | \$845,472   | 667        | \$1,067,220 |            |
| United Kingdom | 782        | \$1,263,110 | 640        | \$1,031,631 |            |
| United States  | 682        | \$1,085,399 | 480        | \$770,362   |            |
| Grand Total    | 2721       | \$4,354,080 | 2396       | \$3,852,530 |            |

In the meantime, you can save a duplicate of the current report to the SQL Server database with a different name by selecting **“Save as current report”** from the toolbar. The [saveReport](#) event will then be triggered with the new report name **“Sample Report 1”** and the current report. You can save them to the SQL Server database after passing them to the Web API service, as mentioned above.

|                | FY 2015    |             | FY 2016    |             | FY 2017    |
|----------------|------------|-------------|------------|-------------|------------|
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 729        | \$1,160,100 | 609        | \$983,317   |            |
| Germany        | 528        | \$845,472   | 667        | \$1,067,220 |            |
| United Kingdom | 782        | \$1,263,110 | 640        | \$1,031,631 |            |
| United States  | 682        | \$1,085,399 | 480        | \$770,362   |            |
| Grand Total    | 2721       | \$4,354,080 | 2396       | \$3,852,530 |            |

#### Loading a report

When you select the dropdown menu item from the toolbar, the [loadReport](#) event is triggered. In this event, an AJAX request is made to the **LoadReport** method of the Web API controller, passing the name of the selected report. The method uses this information to search for the report in the SQL database, fetch it, and load it into the pivot table.

For example, if the report name **“Sample Report 1”** is selected from a dropdown menu and passed, the **LoadReport** method will use that name to search for the report in the SQL database, retrieve it, and then load it into the pivot table.

[Index.cshtml]

```
`csharp
```

```
@using Syncfusion.EJ2.PivotView;
```

```
@Html.EJS().PivotView("pivotview").Width("700").ShowToolBar(true).ShowFieldList(true).AllowExcelExport(true).AllowConditionalFormatting(true).AllowPdfExport(true).AllowCalculatedField(true).DataSourceSettings(dataSourceSettings =>
```

```
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
```

```
.FormatSettings(formatsettings => { formatsettings.Name("Amount").Format("C0").Add(); })
```

```

.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Production Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add(); values.Name("Amount").Caption("Sold
Amount").Add();
}).DisplayOption(new PivotViewDisplayOption { View = View.Both }).ChartSettings(new
PivotViewChartSettings { Value = "Amount", EnableExport = true, EnableMultipleAxis = false
}).Toolbar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load",
"Grid", "Chart", "Export", "SubTotal", "GrandTotal", "Formatting",
"FieldList"}).SaveReport("saveReport").LoadReport("loadReport").FetchReport("fetchReport").RenameR
eport("renameReport").RemoveReport("removeReport").NewReport("newReport").ToolbarRender("bef
oreToolbarRender").Render()
<script>
function loadReport(args) {
fetch('https://localhost:44313/Pivot/LoadReport', {
method: 'POST',
headers: {
'Accept': 'application/json',
'Content-Type': 'application/json',
},
body: JSON.stringify({ reportName: args.reportName })
}).then(res => res.json())
.then(response => {
if (response) {
var report = JSON.parse(response);
var pivotTableObj = document.getElementById('pivotview').ej2_instances[0];
report.dataSourceSettings.dataSource = pivotTableObj.dataSourceSettings.dataSource;
pivotTableObj.dataSourceSettings = report.dataSourceSettings;
}
}

```

```
});
}
</script>
,
```

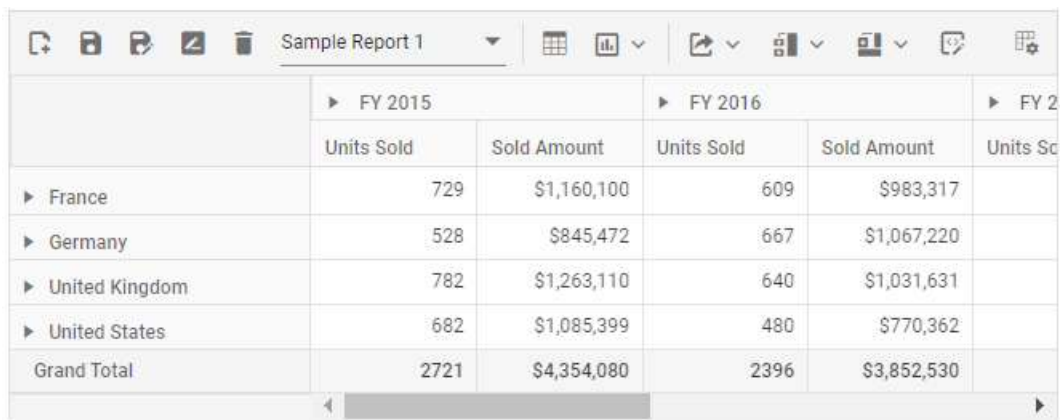

```
[PivotController.cs]
```

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Microsoft.Data.SqlClient;
using System.Data;
namespace MyWebApp.Controllers
{
 [ApiController]
 [Route("[controller]")]
 public class PivotController : ControllerBase
 {
 [HttpPost]
 [Route("Pivot/LoadReport")]
 public IActionResult LoadReport([FromBody] Dictionary<string, string> reportArgs)
 {
 return Ok((LoadReportFromDB(reportArgs["reportName"])));
 }
 private string LoadReportFromDB(string reportName)
 {
 SqlConnection sqlConn = OpenConnection();
 string report = string.Empty;
 foreach (DataRow row in GetDataTable(sqlConn).Rows)
 {
 if ((row["ReportName"] as string).Equals(reportName))
 {
 report = (string)row["Report"];
 break;
 }
 }
 }
 }
}
```

```

sqlConn.Close();
return report;
}
private SqlConnection OpenConnection()
{
// Replace with your own connection string.
string connectionString = @"<Enter your valid connection string here>";
SqlConnection sqlConn = new SqlConnection(connectionString);
sqlConn.Open();
return sqlConn;
}
private DataTable GetDataTable(SqlConnection sqlConn)
{
string xquery = "select * from ReportTable";
SqlCommand cmd = new SqlCommand(xquery, sqlConn);
SqlDataAdapter da = new SqlDataAdapter(cmd);
DataTable dt = new DataTable();
da.Fill(dt);
return dt;
}
}
}

```

The screenshot shows the Syncfusion Pivot Table Control interface. At the top is a toolbar with various icons for actions like refresh, save, print, zoom, and pivot table manipulation. Below the toolbar is a table titled 'Sample Report 1'. The table has a hierarchical structure with expandable rows and columns. The columns are organized into three main sections: FY 2015, FY 2016, and FY 2017. Each section contains 'Units Sold' and 'Sold Amount' columns. The rows include 'France', 'Germany', 'United Kingdom', 'United States', and a 'Grand Total' row. The data is displayed in a grid with alternating row colors for readability.

|                | FY 2015    |             | FY 2016    |             | FY 2017    |
|----------------|------------|-------------|------------|-------------|------------|
|                | Units Sold | Sold Amount | Units Sold | Sold Amount | Units Sold |
| France         | 729        | \$1,160,100 | 609        | \$983,317   |            |
| Germany        | 528        | \$845,472   | 667        | \$1,067,220 |            |
| United Kingdom | 782        | \$1,263,110 | 640        | \$1,031,631 |            |
| United States  | 682        | \$1,085,399 | 480        | \$770,362   |            |

### Renaming a report

When you select the **“Rename a current report”** option from the toolbar, the [renameReport](#) event is triggered. In this event, an AJAX request is made to the **RenameReport** method of the Web API controller, passing the current and new report names, where you can use the current report name to identify the report and resave it with the new report name in the SQL database.

For example, if we rename the current report from **“Sample Report 1”** to **“Sample Report 2”**, both **“Sample Report 1”** and **“Sample Report 2”** will be passed to the **RenameReport** method, which will rename the current report with the new report name **“Sample Report 2”** in the SQL database.

[Index.cshtml]

```
`csharp
@using Syncfusion.EJ2.PivotView;

@Html.EJS().PivotView("pivotview").Width("700").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowConditionalFormatting(true).AllowPdfExport(true).AllowCalculatedField(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.Data).ExpandAll(false)
.FormatSettings(formatsettings => { formatsettings.Name("Amount").Format("C0").Add(); })
.Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Production Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add(); values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Both }).ChartSettings(new PivotViewChartSettings { Value = "Amount", EnableExport = true, EnableMultipleAxis = false
}).Toolbar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load",
"Grid", "Chart", "Export", "SubTotal", "GrandTotal", "Formatting",
"FieldList"}).SaveReport("saveReport").LoadReport("loadReport").FetchReport("fetchReport").RenameReport("renameReport").RemoveReport("removeReport").NewReport("newReport").ToolbarRender("beforeToolbarRender").Render()

| Grand Total    | 2721       | \$4,354,080 | 2396       | \$3,852,530 |            |

#### Deleting a report

When you select the **“Delete a current report”** option from the toolbar, the [removeReport](#) event is triggered. In this event, an AJAX request is made to the **RemoveReport** method of the Web API controller, passing the current report name to identify and delete the appropriate report from the SQL database.

**Note:** \* If the current report **n** from the pivot table is deleted, the pivot table will automatically load the last report from the report list.

\* When a report is removed from a pivot table with only one report, the SQL database refreshes; however, the pivot table will continue to show the removed report until a new report is added to the pivot table.

For example, if we delete the current report **“Sample Report 2”** from the pivot table, the current report name **“Sample Report 2”** is passed to the **RemoveReport** method, which allows you to identify and delete the report from the SQL database.

[Index.cshtml]

```
`csharp
```

```
@using Syncfusion.EJ2.PivotView;
```

```
@Html.EJS().PivotView("pivotview").Width("700").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowConditionalFormatting(true).AllowPdfExport(true).AllowCalculatedField(true).DataSourceSettings(dataSourceSettings =>

| Grand Total      | 2721       | \$4,354,080 | 2396       | \$3,852,530 |            |

### Adding a report

When you select the **“Create a new report”** option from the toolbar, the [newReport](#) event is triggered, followed by the [saveReport](#) event. To save this new report to the SQL database, use the [saveReport](#) event triggered later, and then follow the save report briefing in the preceding [topic](#).

|             | Grand Total           |
|-------------|-----------------------|
| Grand Total | No records to display |

### Limitations with respect to report manipulation

Below points need to be considered when saving the report to SQL Server database.

- **Data source:** Both raw data and aggregated data won't be saved and loaded from the database.
- **Hyperlinks:** Option to link external facts via pivot table cells won't be saved and loaded from the database.
- The pivot table should always load reports from the SQL database based on the data source that is currently bound to it.

In [this](#) GitHub repository, you can find our ASP.NET MVC Pivot Table sample and ASP.NET Core Web Application to save and load reports from SQL Server database.

### Events

#### FetchReport

The event [FetchReport](#) is triggered when dropdown list is clicked in the toolbar in-order to retrieve and populate saved reports. It has following parameter - **ReportName**. This event allows user to fetch the report names from local storage and populate the dropdown list.

#### LoadReport

The event [LoadReport](#) is triggered when a report is selected from the dropdown list in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to load the selected report to the pivot table.

#### NewReport

The event [NewReport](#) is triggered when the new report icon is clicked in the toolbar. It has following parameter - **Report**. This event allows user to create new report and add to the report list.

*RenameReport*

The event [RenameReport](#) is triggered when rename report icon is clicked in the toolbar. It has following parameters - **Rename**, **Report** and **ReportName**. This event allows user to rename the selected report from the report list.

*RemoveReport*

The event [RemoveReport](#) is triggered when remove report icon is clicked in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to remove the selected report from the report list.

*SaveReport*

The event [SaveReport](#) is triggered when save report icon is clicked in the toolbar. It has following parameters - **Report** and **ReportName**. This event allows user to save the altered report to the report list.

### ToolbarRender

The [ToolbarRender](#) event is triggered when the toolbar is rendered. It has the `customToolbar` parameter. This event helps to customize the built-in toolbar items and to [include new toolbar item\(s\)](#).

### CSSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%).Height("300").ShowToolbar(t
true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).EnableSorting
(true)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).DisplayOption(new PivotViewDisplayOption { View = View.Both
}).Toolbar(new List<string>
() { "Save", "Export", "FieldList"
}).SaveReport("saveReport").ToolbarRender("beforeToolbarRender").Render()
<style>
#pivotview {
width: 100%;
height: 100%;
}
.e-tool-expand::before {
content: '\e702';
}
</style>
<script>
function saveReport(args) {
```

```

 var reports = [];
 var isSaved = false;
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
 !== "") {
 reports = JSON.parse(localStorage.pivotviewReports);
 }
 if (args.report && args.reportName && args.reportName !== '') {
 reports.map(function (item) {
 if (args.reportName === item.reportName) {
 item.report = args.report;
 isSaved = true;
 }
 });
 if (!isSaved) {
 reports.push(args);
 }
 localStorage.pivotviewReports = JSON.stringify(reports);
 }
 function beforeToolbarRender(args) {
 args.customToolbar.splice(2, 0, {
 prefixIcon: 'e-rename-report e-icons', tooltipText: 'Custom
Button',
 click: function (args) {
 // Here you can customize the click event for custom button
 },
 });
 args.customToolbar.splice(3, 0, {
 prefixIcon: 'e-tool-expand e-icons', tooltipText:
'Expand/Collapse',
 click: function (args) {
 var pivotTableObj =
document.getElementById('pivotview').ej2_instances[0];
 pivotTableObj.dataSourceSettings.expandAll =
!pivotTableObj.dataSourceSettings.expandAll;
 },
 });
 args.customToolbar[0].align = "Left";
 args.customToolbar[1].align = "Center";
 args.customToolbar[2].align = "Right";
 }
 }
</script>

```

#### TOOLBARCUSTOMIZE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |
|---------------|------------|-------------|------------|
|               | Units Sold | Sold Amount | Units Sold |
| France        | 450        | \$714,955   | 5          |
| Germany       | 440        | \$563,515   | 4          |
| United States | 546        | \$754,515   | 6          |
| Grand Total   | 1436       | \$2,032,985 | 16         |

### Before Export

The pivot table (or) pivot chart can be exported as a pdf, excel, csv etc., document using the toolbar options. And, you can customize the export settings for exporting document by using the [BeforeExport](#) event in the toolbar.

For example, you can add the header and footer for the pdf document by setting the **header** and **footer** properties for the **pdfExportProperties** in the [BeforeExport](#) event.

### CSHTML

### ActionBegin

The event [actionBegin](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| New report | Add new report |

| Save report | Save current report |

| Save as report | Save as current report |

| Rename report | Rename current report |

| Remove report | Remove current report |

| Report change | Report change |

| Conditional Formatting | Open conditional formatting dialog |

| Number Formatting | Open number formatting dialog |

| Export menu | PDF export, Excel export, CSV export |

| Show Fieldlist | Open field list |

| Show Table | Show table view |

| Chart menu | Show chart view |

| Sub-totals menu | Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals |

| Grand totals menu | Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals |

- **cancel**: It allows user to restrict the current action.

In the below sample, toolbar UI actions such as add new report and save current report can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolBar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolBar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
})
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).GridSettings(new Syncfusion.EJ2.PivotView.PivotViewGridSettings {
ColumnWidth = 140 }).DisplayOption(new PivotViewDisplayOption { View =
Syncfusion.EJ2.PivotView.View.Both }).ToolBar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load", "Grid", "Chart",
"Export", "SubTotal", "GrandTotal", "ConditionalFormatting",
"NumberFormatting", "FieldList" }).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 if (args.actionName == 'Add new report' || args.actionName == 'Save
current report') {
 args.cancel = true;
 }
 }
</script>
```

### ACTIONBEGIN-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ActionComplete

The event [actionComplete](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

| Action                 | Action Name                                                                                |
|------------------------|--------------------------------------------------------------------------------------------|
| -----                  | -----                                                                                      |
| New report             | New report added                                                                           |
| Save report            | Report saved                                                                               |
| Save as report         | Report re-saved                                                                            |
| Rename report          | Report renamed                                                                             |
| Remove report          | Report removed                                                                             |
| Report change          | Report changed                                                                             |
| Conditional Formatting | Conditionally formatted                                                                    |
| Number Formatting      | Number formatted                                                                           |
| Export menu            | PDF exported, Excel exported, CSV exported                                                 |
| Show Fieldlist         | Field list closed                                                                          |
| Show Table             | Table view shown                                                                           |
| Sub-totals menu        | Sub-totals hidden, Row sub-totals shown, Column sub-totals shown, Sub-totals shown         |
| Grand totals menu      | Grand totals hidden, Row grand totals shown, Column grand totals shown, Grand totals shown |

- **actionInfo**: It holds the unique information about the current UI action. For example, while adding new report, the event argument contains information such as report name and the action name.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolbar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
```

```

{
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
})
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).GridSettings(new Syncfusion.EJ2.PivotView.PivotViewGridSettings {
ColumnWidth = 140 }).DisplayOption(new PivotViewDisplayOption { View =
Syncfusion.EJ2.PivotView.View.Both }).Toolbar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load", "Grid", "Chart",
"Export", "SubTotal", "GrandTotal", "ConditionalFormatting",
"NumberFormatting", "FieldList" }).ActionComplete("actionComplete").Render()
<script>
 function actionComplete(args) {
 if (args.actionName == 'New report added' || args.actionName ==
'Report saved') {
 // Triggers when the toolbar UI actions such as add new report
 and save current report icon are completed.
 }
 }
}
</script>

```

### ACTIONCOMPLETE-AGGREGATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName:** It holds the name of the current action failed. The following are the UI actions and their names:

| Action      | Action Name         |
|-------------|---------------------|
| New report  | Add new report      |
| Save report | Save current report |

| Save as report | Save as current report |

| Rename report | Rename current report |

| Remove report | Remove current report |

| Report change | Report change |

| Conditional Formatting | Open conditional formatting dialog |

| Number Formatting | Open number formatting dialog |

| Export menu | PDF export, Excel export, CSV export |

| Show Fieldlist | Open field list |

| Show Table | Show table view |

| Chart menu | Show chart view |

| Sub-totals menu | Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals |

| Grand totals menu | Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals |

- **errorInfo**: It holds the error information of the current UI action.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolbar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolbar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
})
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
})
.Columns(columns =>
{
 columns.Name("Year").Add(); columns.Name("Quarter").Add();
})
.Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})
).GridSettings(new Syncfusion.EJ2.PivotView.PivotViewGridSettings {
ColumnWidth = 140 }).DisplayOption(new PivotViewDisplayOption { View =
Syncfusion.EJ2.PivotView.View.Both }).Toolbar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load", "Grid", "Chart",
"Export", "SubTotal", "GrandTotal", "ConditionalFormatting",
"NumberFormatting", "FieldList" }).ActionFailure("actionFailure").Render()
```

```
<script>
 function actionFailure(args) {
 if (args.actionName == 'Add new report' || args.actionName == 'Save
current report') {
 // Triggers when the current UI action fails to achieve the
desired result.
 }
 }
}
</script>
```

### ACTIONFAILURE-AGGREGATION.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Tooltip

The tooltip can be enabled or disabled by setting the [showTooltip](#) property to **true**. By default, tooltip is enabled in the pivot table.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowTooltip(false).Render()
```

### TOOLTIP.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

```
}
```

### Tooltip Template

User can design their own tooltip by setting the property [TooltipTemplate](#) with own HTML elements. The property accepts both HTML string and ID attribute. The following place holders are available to display its dynamic values inside the HTML elements.

`${rowHeaders}` – Row headers of the selected value cell.

`${columnHeaders}` – Column headers of the selected value cell.

`${rowFields}` – Row fields of the selected value cell.

`${columnFields}` – Column fields of the selected value cell.

`${valueField}` – Field name of the selected value cell.

`${aggregateType}` – Aggregate type of the selected value cell.

`${value}` - Formatted value of the selected value cell.

The tooltip customization is common for both pivot table and pivot chart or it can be done individually as well. To customize the pivot table tooltip, the above procedure needs to be followed. To customize the pivot chart tooltip alone use `Template` property of tooltip under [ChartSettings](#).

In the below sample, the pivot table and pivot chart shows customized tooltip layouts.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").TooltipTemplate("#Template").ShowToolBar(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).DisplayOption(new PivotViewDisplayOption { View = View.Both
}).ToolBar(new List<string>
() { "Grid", "Chart" }).ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column).Tooltip(tooltip =>
tooltip.Template("${aggregateType} of ${valueField}:
${value}"))).Render()
```

```

<style>
 #pivotview {
 width: 100%;
 height: 100%;
 }
 .e-tool-expand::before {
 content: '\e702';
 }
 .wrap {
 border: 3px solid #27b1f0;

## Style and Appearance

### Hiding Axis

The visibility of row, column, value and filter axis in Field List and Grouping Bar can be changed using custom CSS setting. To do so, refer the code sample below:

#### CSHTML

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).ShowFieldList(true).Render()
<style>
 #PivotTable .e-group-columns {
 display: none;
 }
 #PivotTable .e-group-filters {
 height: 71px !important;
 }
 #PivotTable_PivotFieldList_Wrapper .e-field-list-columns{
 display: none;
 }
 #PivotTable_PivotFieldList_Wrapper .e-field-list-values{
 margin-top: 0px;
 height: 338px;
 }
 .e-pivotfieldlist-wrapper .e-values {
 height: 310px !important;
 }
 /* Hiding row axis in grouping bar */
 /* #PivotView .e-group-rows {
 display: none;
 } */
 /* Hiding row axis in field list */
 /* .e-pivotfieldlist-wrapper .e-field-list-rows {
 display: none;
 } */
 /* Hiding value axis in grouping bar */
 /* #PivotView .e-group-values {
 display: none;
 } */
 /* Hiding value axis in field list */
 /* .e-pivotfieldlist-wrapper .e-field-list-values {
 display: none;
 } */
 /* Hiding filter axis in grouping bar */
 /* #PivotView .e-group-filters {
```

```

 display: none;
 } */
 /* Hiding filter axis in field list */
 /* .e-pivotfieldlist-wrapper .e-field-list-filters {
 display: none;
 } */
</style>

```

### AXIS.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Text Alignment

The alignment of text inside row headers, column headers, value cells and summary cells can be changed using custom CSS setting. To do so, refer the code sample below:

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource => dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()
<style>
 .e-pivotview .e-valuescontent {
 text-align: center !important;
 }

 /* Column headers */
 /*.e-pivotview .e-columnsheader {
 text-align: center !important;
 }
 //Rows Headers
 .e-pivotview .e-rowsheader {
 text-align: center !important;
 }*/
 /* Summary Cells */
 /* .e-pivotview .e-summary {
 text-align: center !important;
 }*/
</style>

```

**TEXT-ALIGN.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**Customize header, value and summary cell style**

The elements in pivot table like header cell, value cell and summary cell style can be customized using built-in CSS names. To do so, refer the code sample below:

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).ShowGroupingBar(true).ShowFieldList(true).Render()
<style>
 .e-pivotview .e-headercell {
 background-color: thistle !important;
 }
 .e-pivotview .e-rowsheader {
 background-color: skyblue !important;
 }
 .e-pivotview .e-summary:not(.e-gtot) {
 background-color: pink !important;
 }

## Printing and Exporting

### Print in ASP.NET MVC Pivot Table Component

The rendered pivot table can be printed directly from the browser by invoking the `print` method from the grid's instance. The below sample code illustrates the print option being invoked by an external button click.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("print").Content("Print").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).Render()
<script>
 var pivotObj;
 document.getElementById('print').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.grid.print();
 }
</script>
```

#### PRINTTABLE.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

Similarly, to print the pivot chart, use the `print` method from the chart's instance. The below sample code illustrates the print option being invoked by an external button click.

To display the pivot chart, set the [PivotViewDisplayOption](#) property to either **Chart** or **Both**.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().Button("print").Content("Print").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DisplayOption(new PivotViewDisplayOption { View = View.Chart
}).ChartSettings(chartSettings => chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()
<script>
 var pivotObj;
 document.getElementById('print').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.chart.print();
 }
</script>
```

### PRINTCHART.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Excel Export in ASP.NET MVC Pivot Table Component

The Excel export allows Pivot Table data to be exported as Excel document. To enable Excel export in the pivot table, set the [AllowExcelExport](#) property in [PivotView](#) class to **true**. Once the API is set, user needs to call the `excelExport` method for exporting on external button click.

**Note:** The pivot table component can be exported to Excel format using options available in the toolbar. For more details [refer](#) here.

**CSHTML**

```
@Html.EJS().Button("excel").Content("Export To
Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})) .AllowExcelExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.excelExport();
 }
</script>
```

**EXPORT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*Multiple pivot table exporting*

The Excel export provides an option to export multiple pivot table data in the same Excel file.

*Same WorkSheet*

The Excel export provides support to export multiple pivot tables in same sheet. To export in same sheet, define `multipleExport.type` as `AppendToSheet` in `excelExportProperties`. It has an option to provide blank rows between pivot tables and these blank row(s) count can be defined using the `multipleExport.blankRows` property.

**Note:** By default, `multipleExport.blankRows` value is 5 between pivot table's within the same sheet.

**CSHTML**

```
@Html.EJS().Button("excel").Content("Export To
Excel").IsPrimary(true).Render()
```

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()

@Html.EJS().PivotView("PivotGrid2").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Columns(columns =>
{
columns.Name("Country").Add(); columns.Name("Products").Add();
}).Rows(rows =>
{
rows.Name("Year").Caption("Year").Add(); rows.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()
<script>
var pivotObj; var pivotObj2;
document.getElementById('excel').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
pivotObj2 = document.getElementById('PivotGrid2').ej2_instances[0];
var excelExportProperties = {
multipleExport: { type: 'AppendToSheet', blankRows: 2 }
};
var firstGridExport =
pivotObj.grid.excelExport(excelExportProperties, true);
firstGridExport.then(function (fData) {
pivotObj2.excelExport(excelExportProperties, false, fData);
});
}
</script>

```

**SAMESHEETEXPORT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**New WorkSheet**

Excel export provides support to export multiple pivot tables into new sheets. To export in new sheets, define `multipleExport.type` as `NewSheet` in `excelExportProperties`.

**CSHTML**

```
@Html.EJS().Button("excel").Content("Export To
Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()

@Html.EJS().PivotView("PivotGrid2").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Columns(columns =>
{
 columns.Name("Country").Add(); columns.Name("Products").Add();
}).Rows(rows =>
{
 rows.Name("Year").Caption("Year").Add(); rows.Name("Quarter").Add();
```

```

 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj2 = document.getElementById('PivotGrid2').ej2_instances[0];
 var excelExportProperties = {
 multipleExport: { type: 'NewSheet' }
 };
 var firstGridExport =
 pivotObj.grid.excelExport(excelExportProperties, true);
 firstGridExport.then(function (fData) {
 pivotObj2.excelExport(excelExportProperties, false, fData);
 });
 }
</script>

```

### NEWSHEETEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### *Changing the pivot table style while exporting*

The Excel export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **excelExportProperties** object and pass it as a parameter to the **excelExport** method.

**Note:** By default, material theme is applied to exported Excel document.

### CSHTML

```

@Html.EJS().Button("excel").Content("Export To Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{

```

```

 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var excelExportProperties = {
 theme: {
 header: { fontName: 'Segoe UI', fontColor: '#666666' },
 record: { fontName: 'Segoe UI', fontColor: '#666666' },
 caption: { fontName: 'Segoe UI', fontColor: '#666666' }
 }
 };
 pivotObj.excelExport(excelExportProperties);
 }
</script>

```

### THEMEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Add header and footer while exporting

The Excel export provides an option to include header and footer content for the excel document before exporting. In-order to add header and footer, define **header** and **footer** properties in **excelExportProperties** object and pass it as a parameter to the **excelExport** method.

### CSHTML

```

@Html.EJS().Button("excel").Content("Export To Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{

```

```

 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var excelExportProperties = {
 header: {
 headerRows: 2,
 rows: [
 { cells: [{ colSpan: 4, value: "Pivot Grid", style: {
fontColor: '#C67878', fontSize: 20, hAlign: 'Center', bold: true, underline:
true } }] }
],
 },
 footer: {
 footerRows: 4,
 rows: [
 { cells: [{ colSpan: 4, value: "Thank you for your
business!", style: { hAlign: 'Center', bold: true } }] },
 { cells: [{ colSpan: 4, value: "!Visit Again!", style: {
hAlign: 'Center', bold: true } }] }
],
 },
 };
 pivotObj.excelExport(excelExportProperties);
 }
</script>

```

### THEMEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Changing the file name while exporting

The Excel export provides an option to change file name of the document before exporting. In-order to change the file name, define **fileName** property in **excelExportProperties** object and pass it as a parameter to the **excelExport** method.

### CSHTML

```

@Html.EJS().Button("excel").Content("Export To
Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>

```

```

dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var excelExportProperties = {
 fileName: 'sample.xlsx'
 };
 pivotObj.excelExport(excelExportProperties);
 }
</script>

```

### FILENAME.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### CSV Export

Also, the Excel export allows pivot table data to be exported in **CSV** file format. To export pivot table in **CSV** file format, you need to use the **csvExport** method.

### CSHTML

```

@Html.EJS().Button("excel").Content("Export To Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{

```

```

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.csvExport();
 }
</script>

```

### CSVEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Virtual Scroll Data

You can export the pivot table virtual scroll data as Excel/CSV document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the [AllowExcelExport](#) as true. You need to use the `exportToExcel` method for PivotEngine export.

**Note:** PivotEngine export will be performed while enabling virtual scrolling by default.

### Virtual Scroll Data Excel Export

#### CSHTML

```

@Html.EJS().Button("excel").Content("Export To Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}

```

```

 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowExcelExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.excelExportModule.exportToExcel('Excel');
 }
</script>

```

**EXPORT.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

## Virtual Scroll Data CSV Export

**CSHTML**

```

@Html.EJS().Button("excel").Content("Export To Excel").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()
<script>
 var pivotObj; var pivotObj2;
 document.getElementById('excel').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];

```

```

 var excelExportProperties = {
 fileName: 'csvexport.csv',
 };
 pivotObj.csvExport(excelExportProperties);
 }
</script>

```

### CSVEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as an Excel/CSV document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the [ExcelExport](#) module into the pivot table.

**Note:** By default, the pivot engine export will be performed while virtual scrolling is enabled.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
ExportAllPages(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(true)
e)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Sold").Add(); rows.Name("Amount").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Country").Caption("Units Sold").Add();
values.Name("Products").Caption("Sold Amount").Add();
})).AllowExcelExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.excelExport();
 }
</script>

```

**EXPORTALLPAGES.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*Events**ExcelQueryCellInfo*

The event **ExcelQueryCellInfo** triggers while framing each row and value cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **value** - It holds the cell value.
- **column** - It holds column information for the current cell.
- **data** - It holds the entire row data across the current cell.
- **style** - It holds the style properties for the cell.

**CSHTML**

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.ExcelQueryCellInfo("excelQueryCell").Render()
<script>
 function excelQueryCell(args) {
 }
</script>
```

**EXCELQUERYCELL.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ExcelHeaderQueryCellInfo

The event **ExcelHeaderQueryCellInfo** triggers on framing each header cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **cell** - It holds the current cell information.
- **style** - It holds the style properties for the cell.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.ExcelHeaderCellInfo("excelHeaderCell").Render()
<script>
 function excelHeaderCell(args) {
 }
</script>
```

### EXCELHEADER.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### ExportComplete

The event [ExportComplete](#) is triggered after the pivot table data has been exported to an Excel/CSV document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the `isBlob` parameter as **true** when using the `excelExport` method. It has the following parameters:

- `type` - It holds the current export type such as PDF, Excel, and CSV.
- `promise` - It holds the promise object for blob data.

### CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
e)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Sold").Add(); rows.Name("Amount").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Country").Caption("Units Sold").Add();
values.Name("Products").Caption("Sold Amount").Add();
})).AllowExcelExport(true).ExportComplete("exportComplete").Render()
<script>
var pivotObj;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
pivotObj.excelExport({}, false, null, true);
}
function exportComplete(args) {
if (args.promise !== null) {
args.promise.then((e: { blobData: Blob }) => {
console.log(e.blobData);
});
}
}
}
</script>
```

### BLOB-EXPORT.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
}
```

```
return View();
}
```

- [PDF Exporting](#)

### PDF Export in ASP.NET MVC Pivot Table Component

PDF export allows exporting pivot table data as PDF document. To enable PDF export in the pivot table, set the [AllowPdfExport](#) as true. You need to use the `pdfExport` method for PDF exporting.

#### CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
var pivotObj;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
pivotObj.pdfExport();
}
</script>
```

#### EXPORT.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

*Multiple pivot table exporting*

PDF export provides an option for exporting multiple pivot tables to same file. In this exported document, each pivot table will be exported to new page of document in same file.

**CSHTML**

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()

@Html.EJS().PivotView("PivotGrid2").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Columns(columns =>
{
columns.Name("Country").Add(); columns.Name("Products").Add();
}).Rows(rows =>
{
rows.Name("Year").Caption("Year").Add(); rows.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
var pivotObj; var pivotObj2;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
pivotObj2 = document.getElementById('PivotGrid2').ej2_instances[0];
var firstGridPdfExport = pivotObj.grid.pdfExport({}, true);
firstGridPdfExport.then(function (pdfData) {
pivotObj2.pdfExport({}, false, pdfData);
```

```

 });
}
</script>

```

### MULTIPLEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### *Export table and chart into the same document*

When the [PivotViewDisplayOption](#) is set to **Both**, you can export both the table and the chart into the same PDF document. To achieve this, use the `pdfExport` method and set the `exportBothTableAndChart` parameter to **true**.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DisplayOption(new
PivotViewDisplayOption { View = View.Both }).DataSourceSettings(dataSource
=>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render().ChartSettings(chartSettings =>
chartSettings.ChartSeries(chartSeries =>
chartSeries.Type(ChartSeriesType.Column))).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport(null, false, null, false, true);
 }
</script>

```

### EXPORTTABLEANDCHART.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

#### *Customization during PDF export*

PDF export provides option to customize mapping of pivot table to the exported PDF document.

#### *To add header and footer while exporting*

You can customize text, page number, line, page size and changing orientation in header and footer of the exported document.

#### *To add a text in header/footer*

You can add text either in header or footer of the exported PDF document like in the below code example.

```
`javascript
var pdfExportProperties = {
 header: {
 fromTop: 0,
 height: 130,
 contents: [
 {
 type: 'Text',
 value: "Northwind Traders",
 position: { x: 0, y: 50 },
 style: { textBrushColor: '#000000', fontSize: 13 }
 },
]
 }
},
```

#### *To draw a line in header/footer*

You can add line either in header or footer of the exported PDF document like in the below code example.

Supported line styles:

- dash
- dot
- dashdot

- dashdotdot
- solid

```
`javascript
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Line',
style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
}
```

#### [Add page number in header/footer](#)

You can add page number either in header or footer of exported PDF document like in the below code example.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`javascript
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'PageNumber',
```

```

pageNumberType: 'Arabic',
format: 'Page { $current } of { $total }', //optional
position: { x: 0, y: 25 },
style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
}
]
}
}
,

```

The below code illustrates the PDF export customization options.

### **CSSHTML**

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
var pivotObj;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Text',
value: "Pivot Table",
position: { x: 0, y: 50 },
style: { textBrushColor: '#000000', fontSize: 13,
dashStyle: 'Solid', hAlign: 'Center' }
}
}
}
}

```

```

],
 footer: {
 fromBottom: 160,
 height: 150,
 contents: [
 {
 type: 'PageNumber',
 pageNumberType: 'Arabic',
 format: 'Page {$current} of {$total}',
 position: { x: 0, y: 25 },
 style: { textBrushColor: '#02007a', fontSize: 15 }
 }
]
 }
};
pivotObj.pdfExport(pdfExportProperties);
}
</script>

```

### THEMEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Add an image in header/footer

You can add image (Base64 string) either in header or footer of the exported PDF document like in the below code example.

```

`javascript
var pdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Image',
src: image,
position: { x: 20, y: 10 },
size: { height: 100, width: 100 },
}
]
}

```

$$\left. \begin{array}{l} \} \\ \} \\ , \end{array} \right\}$$

The below code illustrates the PDF export customization options.

CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowPdfExport(true).Render()
```

<script>

```
var pivotObj;
```

```
var image =
```

 }
]
 }
 };
 pivotObj.pdfExport(pdfExportProperties);
 }
</script>

```

### THEMEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Changing the file name while exporting

The PDF export provides an option to change file name of the document before exporting. In-order to change the file name, define **fileName** property in **pdfExportProperties** object and pass it as a parameter to the **pdfExport** method.

### CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
```

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
var pivotObj;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
var pdfExportProperties = {
fileName: 'sample.pdf'
};
pivotObj.pdfExport(pdfExportProperties);
}
</script>
```

### FILENAME.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### Changing page orientation while exporting

The PDF export provides an option to change page orientation of the document before exporting. In order to change the page orientation, define **pageOrientation** property in **pdfExportProperties** object and pass it as a parameter to the **pdfExport** method. By default, the page orientation will be in **Portrait** and it can be changed to **Landscape** based on user requirement.

### CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
```

```

{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var pdfExportProperties = {
 pageOrientation: 'Landscape'
 };
 pivotObj.pdfExport(pdfExportProperties);
 }
</script>

```

### PAGELAYOUT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Changing page size while exporting

The PDF export provides an option to change page size of the document before exporting. In-order to change the page size, define **pageSize** property in **pdfExportProperties** object and pass it as a parameter to the **pdfExport** method.

**Supported page sizes are:** Letter, Note, Legal, A0, A1, A2, A3, A5, A6, A7, A8, A9, B0, B1, B2, B3, B4, B5, ArchA, ArchB, ArchC, ArchD, Arche, Flsa, HalfLetter, Letter11x17, Ledger.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{

```

```

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var pdfExportProperties = {
 pageSize: 'Letter'
 };
 pivotObj.pdfExport(pdfExportProperties);
 }
</script>

```

### PAGESIZE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Changing document width and height while exporting

Before exporting, you can change the height and width of the PDF document. To achieve this, use the **height** and **width** properties in the [BeforeExport](#) event.

This option is only available if [EnableVirtualization](#) is set to **true**. In addition, the **VirtualScroll** and **PDFExport** modules must be injected into the pivot table.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>

```

```

{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).AllowPdfExport(true).Render().BeforeExport("beforeExport").Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport();
 }
 function beforeExport(args: BeforeExportEventArgs) {
 args.width = pivotObj.element.offsetWidth;
 args.height = pivotObj.element.offsetHeight;
 }
</script>

```

### EXPORTING-CUSTOMIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Customize the table column count while exporting

Before exporting, you can split and export the pivot table columns on each page of the PDF document by using the **columnSize** property in the [BeforeExport](#) event.

This option is only available if [EnableVirtualization](#) is set to **true**. In addition, the [VirtualScroll](#) and [PDFExport](#) modules must be injected into the pivot table.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>

```

```

{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render().BeforeExport("beforeExport").Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport();
 }
 function beforeExport(args: BeforeExportEventArgs) {
 args.columnSize = 6;
 }
</script>

```

### EXPORTING-COLUMNCUSTOMIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

#### Changing the table's column width and row height while exporting

You can change the column width and row height in the PDF document during the pivot table export by using the [OnPdfCellRender](#) event. Within this event, the `args.column.width` property allows you to change the width of specific columns.

As shown in the code example below, the “Unit Sold” column under “FY 2015” is changed to a width of 60 pixels.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}

```

```

 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).AllowPdfExport(true).OnPdfCellRender("onPdfCellRender").Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport();
 }
 function onPdfCellRender(args) {
 if (args.pivotCell && args.pivotCell.valueSort &&
 args.pivotCell.valueSort.levelName === 'FY 2015.Units Sold') {
 args.column.width = 60
 }
 }
</script>

```

### EXPORTING-COLUMNWIDTHCUSTOMIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

Similarly, you can change the height of specific rows in the PDF document by using the `args.cell.height` property in the [OnPdfCellRender](#) event.

As shown in the code example below, the “Mountain Bikes” row under “France” is changed to a height of 30 pixels.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).DrilledMembers(drilledmembers =>
{
 drilledmembers.Name("Country").Items(new string[] { "France" }).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
}

```

```

 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).AllowPdfExport(true).Render().OnPdfCellRender("onPdfCellRender").Render(
)
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport();
 }
 function onPdfCellRender(args) {
 if (args.pivotCell && args.pivotCell.valueSort &&
 args.pivotCell.valueSort.levelName === 'France.Mountain Bikes') {
 args.cell.height = 30
 }
 }
</script>

```

### EXPORTING-ROWHEIGHTCUSTOMIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

This option is only available if [EnableVirtualization](#) is set to **true**.

#### *Changing the pivot table style while exporting*

The PDF export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **pdfExportProperties** object and pass it as a parameter to the **pdfExport** method.

**Note:** By default, material theme is applied to exported PDF document.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{

```

```

 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var pdfExportProperties = {
 theme: {
 header: {
 fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true, borders: { color: '#64FA50', lineStyle: 'Thin' }
 },
 record: {
 fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
 },
 caption: {
 fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
 }
 }
 };
 pivotObj.pdfExport(pdfExportProperties);
 }
</script>

```

### THEMEEXPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

<!-- markdownlint-disable MD009 -->

#### Changing default font while exporting

By default, the pivot table uses "Helvetica" font in the exported document. But it can be changed using the **theme** property in **pdfExportProperties**.

The available built-in fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

```
`javascript
var pdfExportProperties = {
 theme: {
 header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold) },
 caption: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 9) },
 record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }
 }
}
```

#### Adding custom font while exporting

In addition to existing built-in fonts, custom fonts can also be used. The custom font should be in **Base64** format and mention it in **PdfTrueTypeFont** class. In the following example, we have used **Advent Pro** font family that supports **Hungarian** language

#### CSHTML

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 var pdfExportProperties = {
 theme: {
 header: {font: new PdfTrueTypeFont(base64AlgeriaFont, 11)
 },
 caption: { font: new PdfTrueTypeFont(base64AlgeriaFont, 9)
 },
 record: { font: new PdfTrueTypeFont(base64AlgeriaFont, 10) }
 }
 }
```

```

 };
 pivotObj.pdfExport (pdfExportProperties);
}
</script>

```

### **NON-ENGLISH-EXPORT.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

**Note:** The non-English alphabets can also be exported properly by setting its appropriate font.

#### *Virtual Scroll Data*

You can export the pivot table virtual scroll data as PDF document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the `allowPdfExport` as true. You need to use the `exportToPDF` method for PivotEngine export.

**Note:** PivotEngine export will be performed while enabling virtual scrolling by default

### **CSHTML**

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExportModule.exportToPDF();
 }
</script>

```

**EXPORT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**Repeat row headers**

Repeat row headers on each page can be achieved using PivotEngine export option. To disable repeat row headers, you need to set **allowRepeatHeader** to **false** in beforeExport event. You need to use the **exportToPDF** method for PivotEngine export.

**Note:** By default, repeat row headers is enabled in the PivotEngine export.

**CSHTML**

```
@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).AllowPdfExport(true).BeforeExport("beforeExport").Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExportModule.exportToPDF();
 }
 function beforeExport(args: BeforeExportEventArgs) {
 args.allowRepeatHeader = false;
 }
</script>
```

**EXPORT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
```

```

 ViewBag.DataSource = data;
 return View();
}

```

### Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as a PDF document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the **PDFExport** module into the pivot table.

**Note:** By default, the pivot engine export will be performed while virtual scrolling is enabled.

### CSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
ExportAllPages(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(true)
)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Sold").Add(); rows.Name("Amount").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Country").Caption("Units Sold").Add();
values.Name("Products").Caption("Sold Amount").Add();
})).AllowPdfExport(true).Render()
<script>
 var pivotObj;
 document.getElementById('pdf').onclick = function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 pivotObj.pdfExport();
 }
</script>

```

### EXPORTALLPAGES.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Events

#### PdfQueryCellInfo

The event **PdfQueryCellInfo** triggers on framing each row and value cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **value** - It holds the cell value.
- **column** - It holds column information for the current cell.
- **data** - It holds the entire row data across the current cell.
- **style** - It holds the style properties for the cell.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.PdfQueryCellInfo("pdfqueryCell").Render()
<script>
function pdfqueryCell(args) {
}
</script>
```

### PDFQUERYCELL.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

#### PdfHeaderQueryCellInfo

The event **PdfHeaderQueryCellInfo** triggers on framing each column header cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **cell** - It holds the current rendering cell information.
- **style** - It holds the style properties for the cell.

### CSSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.PdfHeaderCellInfo("pdfHeaderCell")).Render()
<script>
function pdfHeaderCell(args) {
}
</script>
```

### PDFHEADER.CS

```
public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}
```

### ExportComplete

The event [ExportComplete](#) is triggered after the pivot table data has been exported to an PDF document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the **isBlob** parameter as **true** when using the **pdfExport** method. It has the following parameters:

- **type** - It holds the current export type such as PDF, Excel, and CSV.
- **promise** - It holds the promise object for blob data.

### CSSHTML

```

@Html.EJS().Button("pdf").Content("Pdf Export").IsPrimary(true).Render()
@Html.EJS().PivotView("PivotView").Height("300").EnableVirtualization(true).
DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(true)
e)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Sold").Add(); rows.Name("Amount").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Country").Caption("Units Sold").Add();
values.Name("Products").Caption("Sold Amount").Add();
})).AllowPdfExport(true).ExportComplete("exportComplete").Render()
<script>
var pivotObj;
document.getElementById('pdf').onclick = function () {
pivotObj = document.getElementById('PivotView').ej2_instances[0];
pivotObj.pdfExport({}, false, null, true);
}
function exportComplete(args) {
if (args.promise !== null) {
args.promise.then((e: { blobData: Blob }) => {
console.log(e.blobData);
});
}
}
}
</script>

```

### BLOB-EXPORT.CS

```

public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

### Globalization

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number ([Internationalization](#)) & adding culture specific customization and translation to the text ([Localization](#)).

### Internationalization

Internationalization library provides support for formatting and parsing the number, date, and time by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, all the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

,

```
npm install cldr-data --save
```

,

Once the package installed, you can find the culture specific JSON data under the location `/scripts/cldr-data`.

- Now use the [loadCultureFiles](#) method to load the culture specific CLDR JSON data.

In ASP.NET MVC refer the culture files directly from `/scripts/cldr-data` location. In ASP.NET Core refer the culture files directly from `/wwwroot/scripts/cldr-data` location as like the below code examples for both ASP.NET Core and MVC

```
`sh
```

```
function loadCultureFiles(de) {
```

```
var files = ['ca-gregorian.json', 'numbers.json', 'timeZoneNames.json'];
```

```
var loader = ej.base.loadCldr;
```

```
var loadCulture = function (prop) {
```

```
var val, ajax;
```

```
<!--For ASP.NET MVC -->
```

```
ajax = new ej.base.Ajax(location.origin + '/../scripts/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
```

```
<!--For ASP.NET Core-->
```

```
ajax = new ej.base.Ajax(location.origin + '/../wwwroot/scripts/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
```

```
ajax.onSuccess = function (value) {
```

```
val = value;
```

```
};
```

```
ajax.send();
```

```
loader(JSON.parse(val));
```

```
};
for (var prop = 0; prop < files.length; prop++) {
loadCulture(prop);
}
}
,
```

- Before changing to a culture other than English, ensure that locale text for the concerned culture is loaded through load method of L10n class.

```
`sh
var L10n = ej.base.L10n;
L10n.load({
"de": {
'pivotview': {
'grandTotal': 'Gesamtsumme',
'total': 'Insgesamt',
'value': 'Wert',
'noValue': 'Kein Wert',
'row': 'Zeile',
'column': 'Spalte',
'collapse': 'Zusammenbruch',
'expand': 'Erweitern',
},
}
});
,
```

- Set the culture by using the locale property.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
```

```

formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{

```

### INTERNATIONALIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

**Note:** \* By default, locale value is en-US. If you want to change the en-US culture to a different culture, you have to change the locale accordingly.

<!-- markdownlint-disable MD009 -->

*Decimal separators*

The decimal separators of pivot table values varies based on the culture applied to the component. The culture can be set by calling the method [setCulture](#) with appropriate culture string as its parameter.

The following example demonstrates the decimal separators in **Deutsch** culture.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C2").Currency("EUR").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Locale("de-DE").Render()
<script>
var pivotObj;
var L10n = ej.base.L10n;
L10n.load({
 'de-DE': {
 'pivotview': {
 'grandTotal': 'Gesamtsumme',
 'total': 'Insgesamt',
 'value': 'Wert',
 'noValue': 'Kein Wert',
 'row': 'Zeile',
 'column': 'Spalte',
 'collapse': 'Zusammenbruch',
 'expand': 'Erweitern'
 },
 'pivotfieldlist': {

Localization

The [Localization](#) library allows you to localize default text content of the Pivot Table. The pivot Table component has static text on some features (like drop area text, pivot field list title, etc...) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the `locale` value and translation object.

The following list of properties and its values are used in the pivot table.

- Locale keywords |Text
- staticFieldList | Pivot Field List
- fieldList | Field List
- dropFilterPrompt | Drop filter here
- dropColPrompt | Drop column here
- dropRowPrompt | Drop row here
- dropValPrompt | Drop value here
- addPrompt | Add field here
- adaptiveFieldHeader | Choose field
- centerHeader | Drag fields between axes below:
- add | add
- drag | Drag
- filter | Filter
- filtered | Filtered
- sort | Sort

remove | Remove

filters | Filters

rows | Rows

columns | Columns

values | Values

calculatedField | Calculated Field

createCalculatedField | Create Calculated Field

fieldName | Enter the field name

error | Error

invalidFormula | Invalid formula.

dropText | Example: ("Sum(*OrderCount*)" + "Sum(*InStock*)") \* 250

dropTextMobile | Add fields and edit formula here.

dropAction | Calculated field cannot be place in any other region except value axis.

search | Search

close | Close

cancel | Cancel

delete | Delete

alert | Alert

warning | Warning

ok | OK

sum | Sum

average | Average

count | Count

min | Min

max | Max

allFields | All Fields

formula | Formula

fieldExist | A field already exists in this name. Enter a different name.

confirmText | A calculation field already exists in this name. Do you want to replace it?

noMatches | No matches

format | Summaries values by

edit | Edit

clear | Clear

formulaField | Drag and drop fields to formula

dragField | Drag field to formula

### Loading Translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Pivot Table in **Deutsch** culture.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Locale("fr-CH").Render()
<script>
var L10n = ej.base.L10n;
L10n.load({
 "fr-CH": {
 "pivotview": {
 "grandTotal": "Grand Total",
 "total": "Total",
 "value": "Valeur",
 "noValue": "Pas de valeur",
 "row": "Rangée",
 "column": "La colonne",
 "collapse": "Effondrement",
 "expand": "L'expansion"
 },
 "pivotfieldlist": {
 "fieldList": "Field List",
 "dropRowPrompt": "Drop row ici",
 "dropColPrompt": "Drop column here",
 "dropValPrompt": "Valeur liste déroulante ici",
 "dropFilterPrompt": "Filtre goutte ici",
 "addPrompt": "Ajouter un champ ici",
 "centerHeader": "Faire glisser les champs entre les zones
ci-dessous :",
 "add": "Ajouter",
 "drag": "Faites glisser",
 "filter": "Filter",
```

```

 "filtered": "Filtered",
 "sort": "Trier",
 "remove": "Déposer",
 "filters": "Filters",
 "rows": "Lignes",
 "columns": "Colonnes",
 "values": "Valeurs",
 "error": "Error",
 "dropAction": "Champ calculé ne peut pas être place dans
toute autre région, à l'exception de l'axe des valeurs.",
 "search": "Recherchez",
 "close": "Fermer",
 "cancel": "Annuler",
 "delete": "Supprimer",
 "alert": "Alert",
 "warning": "Attention",
 "ok": "OK",
 "allFields": "Tous les domaines",
 "noMatches": "Pas de correspondance"
 }
}
});
</script>

```

### LOCALIZATION.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Right-to-left (RTL)

RTL provides an option to switch the text direction and layout of the Pivot Table component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Pivot Table, set the `enableRtl` property to **true**.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSet
tings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(fal
se)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).Mini
mumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{

```

```

 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).ShowFieldList(true).Locale("ar").EnableRtl(true).Render()
<script>
 var L10n = ej.base.L10n;
 L10n.load({
 "ar": {
 "pivotview": {
 "grandTotal": "المجموع الكلي",
 "total": "المجموع",
 "value": "القيمة",
 "noValue": "لا قيمة لها",
 "row": "صف",
 "column": "العمود",
 "collapse": "الانهيار",
 "expand": "توسيع"
 },
 "pivotfieldlist": {
 "fieldList": "قائمة الحقول",
 "dropRowPrompt": "تراجع الخلاف هنا",
 "dropColPrompt": "انخفاض العمود هنا",
 "dropValPrompt": "انخفاض قيمة هنا",
 "dropFilterPrompt": "انخفاض هنا عامل التصفية",
 "addPrompt": "إضافة حقل هنا",
 "centerHeader": "اسحب المجالات بين المناطق الموضحة أدناه",
 "add": "إضافة",
 "drag": "اسحب",
 "filter": "الفلتر",
 "filtered": "تصفية",
 "sort": "النوع",
 "remove": "قم بإزالة",
 "filters": "عوامل التصفية",
 "rows": "الصفوف",
 "columns": "الاعمدة",
 "values": "قيم",
 "error": "خطأ",
 "search": "البحث",
 "close": "قريب",
 "cancel": "الغاء",
 "delete": "احذف",
 "alert": "حالة تاهب قصوى",
 "warning": "تحذير",
 "ok": "موافق",
 "allFields": "جميع الحقول",
 "noMatches": "لا مباريات"
 }
 }
 });
 document.addEventListener('DOMContentLoaded', function () {
 pivotObj = document.getElementById('PivotView').ej2_instances[0];
 ej.base.setStyleAttribute(pivotObj.fieldlistModule.element, {
 width: ej.base.formatUnit(pivotObj.width)
 });
 });

```

```
});
</script>
```

## RTL.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

## Accessibility in Pivotview component

The pivot table component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the pivot table component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

[WAI-ARIA](#) (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the pivot table component:

| Attributes | Purpose |

| --- | --- |

| **role=grid** | Attribute added to identify the grid component element within the pivot table element. |

| **role=region** | Attribute added to identify the chart component element within the pivot table element. |

| **role=button** | This attribute is added to the pager navigation buttons as well as the buttons in the dialog popup such as field list, calculated field, member editor, conditional formatting of pivot table component to indicate that it is a clickable element. |

| **role=table** | This attribute is added to each conditional formatting style container element to denote it as a table. |

| **role=tableitems** | This attribute is added to the container element that appears inside the number formatting popup to indicate it as a table. |

| **aria-disabled** | The buttons within the dialog popups, such as field list, calculated field and member editor, will be disabled based on their usability. To indicate its disabled state, we will add this attribute with the values **true**. By default, the attribute value is set to **false**. |

| **aria-label** | This attribute is added to label elements that are placed inside the pager, member editor popup, and calculated field popup to identify them as label elements. |

| **aria-selected** | This attribute is added to the selected treeview item in the calculated field popup with the value as **true** to denote that it is a selected element. |

| **aria-colspan** | This attribute is added to the **th** elements in the **e-table**, which represent the column span value. |

| **aria-rowspan** | This attribute is added to the **th** elements in the **e-table**, which represent the row span value. |

| **data-type** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the aggregate type for the specified field. |

| **data-caption** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the caption for the specified field. |

| **data-basefield** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base field for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-baseitem** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base item for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-field** | This attribute is added to the treeview item in the calculated field popup. It denotes the name of the specified field. |

| **data-membertype** | This attribute is added to the treeview item in the calculated field popup. It denotes the member type of the selected OLAP calculated field. |

| **data-hierarchy** | This attribute is added to the treeview item in the calculated field popup. It denotes the parent hierarchy unique name of the selected OLAP calculated field. |

| **data-formula** | This attribute is added to the treeview item in the calculated field popup. It denotes the formula used for the specified calculated field. |

| **data-formatString** | This attribute is added to the treeview item in the calculated field popup. It denotes the format string used for the specified calculated field. |

| **data-customformatstring** | This attribute is added to the treeview item in the calculated field popup. It denotes the custom format string used for the specified calculated field. |

### Keyboard interaction

The pivot table component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press** | **To do this** |

| --- | --- |

| **Tab / Shift + Tab** | **To focus the close icon in the message.** |

| **Enter / Space** | **Closes the focused close icon's message.** |

### Pivot Table

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Moves the cell focus right side. If no cells are focused, it moves to the next active element in the browser page.** |

| **Shift + Tab** | **Moves the cell focus left side. If no cells are focused, it moves to the previous active element in the browser page.** |

| DownArrow | Moves the cell focus downwards. If the selection is enabled in the pivot table, then it will move downwards to select next row or column or individual cell. |

| UpArrow | Moves the cell focus upwards. If the selection is enabled in the pivot table, then it will move upwards to select previous row or column or individual cell. |

| LeftArrow | Moves the cell focus left side. If the selection is enabled in the pivot table, then it will move left side to select previous row or column or individual cell. |

| RightArrow | Moves the cell focus right side. If the selection is enabled in the pivot table, then it will move right side to select next row or column or individual cell. |

| Shift + DownArrow | Extends the cell selection downwards. |

| Shift + UpArrow | Extends the cell selection selection upwards. |

| Shift + LeftArrow | Extends the cell selection to the left side. |

| Shift + RightArrow | Extends the cell selection to the right side. |

| Ctrl + A | Selects all cells. |

| Esc | Deselects all cells. If the current active element is a context menu, then the context menu popup will be closed. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | If the current cell is an expand/collapse cell, it performs expand/collapse operation (drill operation). If the current row/column header is in value sort state, it performs value sorting. If the current cell is in selection state, it moves to the next row, column or individual cell. If drill-through or editing is enabled in the pivot table, the drill-through dialog will be opened based on the selected value cell. If the current active element is a context menu popup, menu selection will be performed. |

| Shift + Enter | If value sorting is enabled in the pivot table and the current cell is a header with respect to its value axis, it performs value sorting to either ascending or descending order. If the current cell is in selection state, it moves to the previous row, column or individual cell. |

| Ctrl + Enter | If hyperlink is enabled in the current cell, it performs hyperlink selection. |

| Shift + F10 or Menu | If context menu is enabled in the pivot table, the context menu popup will be opened in the current cell. |

#### Field List

| Press | To do this |

| --- | --- |

| Shift + Ctrl + F | If the popup field list is enabled in either the pivot table or the pivot chart, the field list dialog will be opened. |

| Tab | Moves to the next active element in the field list. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the field list. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will open to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and it has a dropdown icon, the aggregation menu will open to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Esc or Escape | Closes the popup field list dialog. |

#### Grouping Bar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element (field's button) in the grouping bar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element (field's button) in the grouping bar. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will be opened to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and if it has a dropdown icon, the aggregation menu will be opened to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a dropdown list, the next item will be selected. |

| UpArrow | If the current active element is a dropdown list, the previous item will be selected. |

| Home | If the current active element is a dropdown list, the first item will be selected. |

| End | If the current active element is a dropdown list, the last item will be selected. |

| Alt + Down | If the current active element is a dropdown list, the popup will be opened. |

| Alt + Down | If the current active element is a dropdown list, the popup will be closed. |

| Esc or Escape | Closes the dropdown list.

#### *Filter Dialog*

| Press | To do this |

| --- | --- |

| Shift + F | If the current active element is a field's button and if it has a filter icon in either the field list or grouping bar UI, the filter dialog will be opened to perform filtering. |

| Tab | Moves to the next active element in the filter dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the filter dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. If the current active element is a tab, it moves focus to the previous tab element. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tab, it moves focus to the next tab element. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Alt + Down | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be opened. |

| Alt + Up | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tab, the current tab element will be selected. If the current active element is a tree node, the current node will be either checked or unchecked. If the current active element is DropDownList, the focus item will be selected, and the popup list will close when it is open. Otherwise, toggles the popup list. |

| Esc or Escape | Closes the filter dialog. |

#### *Calculated Field Dialog*

| Press | To do this |

| --- | --- |

| Shift + E | If the current active element is a field's button and if it has an edit icon in either the field list or grouping bar UI, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Tab | Moves to the next active element in the calculated field dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the calculated field dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tree node and has a menu icon, the aggregation menu will be opened to select appropriate aggregation type to the selected field. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tree node, it copies the selected field name/formula to the formula text area to perform calculations. |

| Esc or Escape | Closes the calculated field dialog. |

#### *Formatting Dialog*

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the formatting dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the formatting dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a DropDownList, the next item will be selected. |

| UpArrow | If the current active element is a DropDownList, the previous item will be selected. |

| Home | If the current active element is a DropDownList, the first item will be selected. |

| End | If the current active element is a DropDownList, the last item will be selected. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be opened. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | Closes the formatting dialog. |

#### Toolbar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active option in the toolbar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active option in the toolbar. If no active elements present, it moves to the previous active element in the browser page. |

| Enter | Performs the selection operation of the current active element. |

#### Drill-Through Dialog

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to right side. If no active elements present, then it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to left side, If no active elements present, then it moves to the previous active element in the browser page. |

| DownArrow | Moves the row/cell focus downwards. |

| UpArrow | Moves the row/cell focus upwards. |

| LeftArrow | Moves the cell focus left side. |

- | **RightArrow** | Moves the cell focus right side. |
- | **Home** | Goes to the first cell in the current row. |
- | **End** | Goes to the last cell in the current row. |
- | **Ctrl + Home** | Goes to the first cell in the table. |
- | **Ctrl + End** | Goes to the last cell in the table. |
- | **Enter** | Performs the selection operation of the current active element. |
- | **Esc or Escape** | If the cell is in selected state, the it deselects all rows/cells. If the row/cell is in edit state, it cancels the current entries in the row/cell. If the current active element is not a row/cell, it closes the drill-through dialog. |
- | **F2** | Initiate editing a row/cell in the data grid. |
- | **Insert** | Adds a new row/cell in the data grid. |
- | **Delete** | Removes the selected row in the data grid. |

Some commonly used applicable key combinations and their relative functionalities in all dialogs are listed below.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves to the next active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the next active element in the browser page. |

| **Shift + Tab** | Moves to the previous active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the previous active element in the browser page. |

| **Space** | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| **Enter** | When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will be triggered. The Enter key will not be worked, when the dialog content contains any text area with initial focus. |

| **Esc or Escape** | Closes the dialog. |

### Ensuring accessibility

The pivot table component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the pivot table component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the pivot table component with accessibility tools.

### CSHTML

```

## Migration from Essential JS 1

This article describes the API migration process of Pivot Grid component from Essential JS 1 to Essential JS 2.

### Data Binding

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Data source | **property:**

```
dataSource

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Data((IEnumerable<object>)ViewBag.Data))| property:
dataSourceSettings

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
e => dataSource.DataSource((IEnumerable<object>)ViewBag.Data)).Render()|
```

| Rows | **property:**

```
rows

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("Country").FieldCaption("Country").Add(); })))|
property: rows

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.Rows(rows =>{ rows.Name("Country").Caption("Country").Add(); })).Render()|
```

| Columns | **property:**

```
columns

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Columns(columns => {
columns.FieldName("Country").FieldCaption("Country").Add(); })))| property:
columns

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.Columns(columns =>{ columns.Name("Country").Caption("Country").Add();
})).Render()|
```

| Values | **property:**

```
values

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Values(values => { values.FieldName("balance").FieldCaption("Balance($)").Add();
})))| property:
values

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.Values(values =>{ values.Name("balance").Caption("Balance($)").Add();
})).Render()|
```

| Filters | **property:**

```
filters

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Filters(filters => { filters.FieldName("Country").FieldCaption("Country").Add();
})))| property:
filters

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.Filters(filters =>{ filters.Name("Country").Caption("Country").Add(); })).Render()|
```

| Value axis position | Not Applicable | **property:**

```
valueAxis

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.ValueAxis("row")).Render()|
```

## Aggregation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Summary Type | **property:**

```
summaryType

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Values(values => {
values.FieldName("balance").FieldCaption("Balance($)").SummaryType("Count").Add();
})))| property: type

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
```

```
=> dataSource.Values(values =>{ values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold
Amount").Type(SummaryType.Count).Add();}).Render() |
```

### Number Format

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Format settings | **property:**

```
format

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Values(values => {
values.FieldName("balance").FieldCaption("Balance($)").Format("currency").Add(); })| property:
formatSettings

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource =>
dataSource.FormatSettings(formatsettings => {
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignific
antDigits(1).UseGrouping(true).Add(); formatsettings.Name("Year").Format("dd/MM/yyyy-
hh:mm").Type("date").Add(); })).Render() |
```

### Summary Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide grand totals | **property:**

```
enableGrandTotal

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.EnableGrandTotal(false)) | property:
showGrandTotals

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
=> dataSource.ShowGrandTotals(false)).Render() |
```

| Show/hide row grand totals | **property:**

```
enableRowGrandTotal

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource
=> dataSource.EnableRowGrandTotal(false)) | property:
showRowGrandTotals

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
=> dataSource.ShowRowGrandTotals(false)).Render() |
```

| Show/hide column grand totals | **property:**

```
enableColumnGrandTotal

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource
=> dataSource.EnableColumnGrandTotal(false)) | property:
showColumnGrandTotals

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
=> dataSource.ShowColumnGrandTotals(false)).Render() |
```

| Show/hide sub-totals | Not Applicable | **property:**

```
showSubTotals

@Html.EJS().PivotView("PivotView").DataSource(dataSource =>
dataSource.ShowSubTotals(false)).Render() |
```

| Show/hide row sub-totals | Not Applicable | **property:**

```
showRowSubTotals

@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource
=> dataSource.ShowRowSubTotals(false)).Render() |
```

| Show/hide column sub-totals | Not Applicable | **property:**

showColumnSubTotals<br/><br/>@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource => dataSource.ShowColumnSubTotals(false)).Render() |

| Show/hide sub-totals for specific field | **property:**

showSubTotal<br/><br/>@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource => dataSource.Rows(rows => { rows.FieldName("Country").ShowSubTotal(false).Add(); } ) |

**property:**

showSubTotals<br/><br/>@Html.EJS().PivotView("PivotView").DataSourceSettings(dataSource => dataSource.Rows(rows => { rows.Name("Country").ShowSubTotals(false).Add(); } )).Render() |

### Drill operation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Expand All | **property:**

### Field List

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide field list pop-up button on pivot grid | Not Applicable | **property:**

showFieldList<br/><br/>@Html.EJS().PivotView("PivotView").ShowFieldList(true).Render() |

| Defer update | **property:**

enableDeferUpdate<br/><br/>@Html.EJ().Pivot().PivotGrid("PivotGrid").EnableDeferUpdate(true) | Not Applicable |

| Control initialization | **component:**

PivotSchemaDesigner<br/><br/>@Html.EJ().Pivot().PivotSchemaDesigner("PivotSchemaDesigner") | **component:**

PivotFieldListComponent<br/><br/>@Html.EJS().PivotFieldList("PivotFieldList").Render() |

| Render mode | Not Applicable | **property:**

renderMode<br/><br/>@Html.EJS().PivotFieldList("PivotFieldList").RenderMode("Fixed").Render() |

| Show/hide calculated field button | Not Applicable | **property:**

allowCalculatedField<br/><br/>@Html.EJS().PivotFieldList("PivotFieldList").AllowCalculatedField(true).Render() |

| Show/hide value group button | Not Applicable | **property:**

```
showValuesButton

@Html.EJS().PivotFieldList("PivotFieldList").ShowValuesButton(true)
.Render()|
```

### Grouping Bar

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show/hide Grouping bar | **property:**

```
enableGroupingBar

@Html.EJ().Pivot().PivotGrid("PivotGrid").EnableGroupingBar(true)
```

| **property:**

```
showGroupingBar

@Html.EJS().PivotView("PivotView").ShowGroupingBar(true).Render()|
```

| Grouping Bar Settings | Not Applicable | **property:**

```
groupingBarSettings

@Html.EJS().PivotView("PivotView").GroupingBarSettings(new
PivotViewGroupingBarSettings { ShowFilterIcon =false ShowSortIcon=true
ShowRemovelcon=false}).Render()|
```

| Show/hide value group button | Not Applicable | **property:**

```
showValuesButton

@Html.EJS().PivotView("PivotView").ShowValuesButton(true).Render()|
```

### Filtering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Filter settings | **property:**

```
filterItems

@Html.EJ().Pivot().PivotGrid("PivotGrid").DataSource(dataSource =>
dataSource.Rows(rows => { rows.FieldName("Country").FieldCaption("Country").Add();
})).ClientSideEvents(clientSideEvents => clientSideEvents.Load("onLoad"))

function
onLoad(args) {
args.model.dataSource.rows[0].filterItems = {
filterType:
ej.PivotAnalysis.FilterType.Exclude,
 values: ["Canada", "France"] };

>function onCellClick() { }|
```

## How To

```
<!-- markdownlint-disable MD009 -->
```

### Switching to older themes style

From Volume 1, 2020 onwards Syncfusion has revised the theming and layout of the Pivot Table. So, to inherit the older theme style and layout do the necessary changes in CSS and pivot table height.

### CSS Selectors

In current theme, the cells can be differentiated by their background colors. To avoid it, you need to override its background colors via simple CSS coding within your application. The below CSS selectors allow to achieve the same for material, fabric, bootstrap and bootstrap v4 themes.

```
`html
```

```

<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#fff !important;
}
</style>
`

```

Meanwhile for high contrast theme, we need to set the following CSS.

```

`html
<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#000 !important;
}
</style>
`

```

### *Adjusting Row Height*

In current theme, to make the component compact we have reduced the height of each pivot table rows. But user can reset the height of the pivot table using the [RowHeight](#) property in [PivotViewGridSettings](#). In older theme, the property was set to 36 pixels for desktop layout and 48 pixels for mobile layout. So reset the [RowHeight](#) accordingly to visualize the older theme style.

In the below code sample, we replicate the older theme style.

### **CSHTML**

```
@using Syncfusion.EJ2.PivotView
```

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new PivotViewGridSettings { RowHeight = 36 }).Render()
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#fff !important;
}
</style>

```

### SWITCHTHEME.CS

```

public ActionResult Index()
{
var data = GetPivotData();
ViewBag.DataSource = data;
return View();
}

```

| <b>Grand Total</b> | <b>1436</b> | <b>\$2,032,585</b> | <b>1658</b> | <b>\$5,577,312</b> |            |

### Customize number, date, and time values

You can format the number, date, and time values for each field using [FormatSettings](#) option under [PivotViewDataSourceSettings](#). It can be configured through code behind, during initial rendering.

#### Number formatting

For numbers, the formatting settings required to apply through code behind are:

- **name**: It allows to set the field name.
- **format**: It allows to set the format of the respective field.

**Note:** Also, you can customize the applied number format by setting the [NumberFormatOptions](#) options in [FormatSettings](#) itself.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(dataSource =>
 dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource)
 .ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Amount").Format("C2").MaximumSignificantDigits(3).MinimumSignificantDigits(1).UseGrouping(false).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).Render()
```

**NUMBER.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

*Date and time formatting*

**Note:** This property is applicable only for relational data source.

For date and time, the formatting settings required to apply through code behind are:

- **name:** It allows to set the field name.
- **format:** It allows to set the format of the respective field.
- **type:** It allows to set the type of format to be used for the respective field.

**Note:** Also, you can customize the applied date format by setting [DateFormatOptions](#) options in [FormatSettings](#) itself.

**CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").DataSourceSettings(
 dataSource =>
 {
 dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource)
 .ExpandAll(false).EnableSorting(true)
 .FormatSettings(formatsettings =>
 {
 formatsettings.Name("Year").Format("dd/MM/yyyy-hh:mm").Type("date").Add();
 })
 .Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add(); columns.Name("Quarter").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
 })
.Render()
```

**DATE.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

**Limitations of date formatting**

As per Firefox and Edge browsers standards, most of the date and time formats used in data source aren't supported. For example: Apr-2000, Apr-01-2000, 01-03-2000, 2000-Apr-01 etc... are not supported. Meanwhile [ISO formats](#) will be supported across all browsers.

### Customize the icons for pivot table

You can customize the pivot button icons in the pivot table by overriding the class **.pivot-button** with a custom property content as mentioned below.

```
`html
<style>
PivotView_PivotFieldList .e-icons.e-toggle-field-list::before {
content: '\e337';
}
</style>
`
```

In the below sample, pivot table is rendered with a customized pivot button icons.

### CSHTML

```
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).ShowGroupingBar(true).Render()
<style>
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-dropdown-icon::before,
#PivotView .e-pivot-button .e-icons.e-dropdown-icon::before {
content: "\ec25";
}
#PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-pv-filtered::before,
#PivotView .e-pivot-button .e-icons.e-pv-filtered::before {
content: "\e611";
}
```

```

 #PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-pv-
filter::before,
 #PivotView .e-pivot-button .e-icons.e-pv-filter::before {
 content: '\e611';
 }
 #PivotView_PivotFieldList .e-icons.e-toggle-field-list::before {
 content: '\e342';
 }
 #PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-
sort::before,
 #PivotView .e-pivot-button .e-icons.e-sort::before {
 content: '\e523';
 }
 #PivotView_PivotFieldList_Wrapper .e-pivot-button .e-icons.e-
remove::before,
 #PivotView .e-pivot-button .e-icons.e-remove::before {
 content: '\e94a';
 }
 #PivotView_PivotFieldList_Wrapper .e-icons.e-drag::before,
 #PivotView .e-pivot-button .e-icons.e-drag::before {
 content: '\e571';
 }
 #PivotView .e-icons.e-expand::before {
 content: '\e22c';
 }
 #PivotView .e-icons.e-collapse::before {
 content: '\e22b';
 }
 }
</style>

```

### ICONCUSTOMIZE.CS

```

public IActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Customize empty value cells

You can show the custom string in the empty value cells using the [EmptyCellsTextContent](#) string type property in [PivotViewDataSourceSettings](#) object of the pivot table. It can be configured through code behind during initial rendering.

### CSHTML

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{

```

```
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).EmptyCellsTextContent("*").Render()
```

### **CUSTOMTEXT.CS**

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Configure data grid options on editing mode

You can access the data grid options such as sort, group, filter on editing mode using the [BeginDrillThrough](#) event in the pivot table. The event occurs in every value cell on double click and provides the data grid information before display the drill through grid pop-up.

### **CSHTML**

```
@Html.EJS().PivotView("PivotView").Width("100%").Height("300").ShowTooltip(false).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })
).EditSettings(pivotViewCellEditSettings=>pivotViewCellEditSettings.AllowA
```

```

dding(true).AllowDeleting(true).AllowEditing(true).Mode(Syncfusion.EJ2.Pivot
View.EditMode.Normal)).BeginDrillThrough("beginDrillThrough").Render()
<script>
 function beginDrillThrough(args) {
 if (args.gridObj) {
 var gridObj = args.gridObj;
 gridObj.allowGrouping = true;
 gridObj.allowSorting = true;
 gridObj.allowFiltering = true;
 gridObj.filterSettings = { type: 'CheckBox' };
 }
 }
</script>

```

### CUSTOMEDITING.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

Refresh the field list while change the data source

You can refresh pivot table and field list with new data source dynamically.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotGrid").Height("300").DataSource(dataSource =>
dataSource.Data((IEnumerable<object>)ViewBag.Data).ExpandAll(false).EnableSo
rting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").UseGrouping(true).Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).ShowFieldList(true).Render()
<script>
 var pivotGridObj;
 document.getElementById('Refresh').addEventListener('click', () => {
 pivotGridObj =
document.getElementById('PivotGrid').ej2_instances[0];
 pivotGridObj.engineModule.fieldList = {};
 pivotGridObj.dataSourceSettings.dataSource = [
 { 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Year': 'FY
2015' },

```

```

2015' },
 { 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Year': 'FY
2015' },
 { 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Year': 'FY
2015' },
 { 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Year': 'FY
2016' }]];
});
</script>

```

## REFRESH.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.data = data;
 return View();
}

```

## Customizing loading indicator

You can customize the appearance of the loading indicator in the pivot table by using the [SpinnerTemplate](#) property. This property accepts an HTML string which can be used for appearance customization.

**Note:** You can also disable the loading indicator by setting [SpinnerTemplate](#) to empty string.

## CSHTML

```

@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false).EnableSorting(true).AllowLabelFilter(true).AllowValueFilter(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}).ShowFieldList(true).SpinnerTemplate("<i class='fa fa-cog fa-spin fa-3x fa-fw'></i>").Render()

```

## FIELDLIST.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Changing the Pivot Table component's minimum height

The `minHeight` property allows you to change the minimum height for the pivot table control. For the pivot table control, the default minimum height is **300px**.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("200").Width(650).DataSourceSettings(
dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
.Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DataBound("ondataBound").Render()
<script>
 function ondataBound(args) {
 var pivotTableObj =
document.getElementById('PivotView').ej2_instances[0];
 pivotTableObj.minHeight = 200;
 }
</script>
```

#### MINHEIGHT.CS

```
public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}
```

### Render chart control based on cell selection

The cell selection support is enabled using the [AllowSelection](#) property and its type and mode are configured using the [PivotViewSelectionSettings](#) property. The [cellSelected](#) event gets fired on every selection operation performed in the pivot table. This event returns the selected cell informations, like row header name, column header name, measure name, and value. Based on this information, the [chart](#) control will be plotted.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView;
<div class="control-section" style="overflow:auto">
<div class="content-wrapper">

@Html.EJS().PivotView("pivotview").Width("100%").ShowTooltip(false).Height("
300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>
)ViewBag.Data).ExpandAll(true).EnableSorting(true)
 .Rows(rows =>
 {
 rows.Name("Country").Add();
 rows.Name("Products").Add();
 })
 .Columns(columns =>
 {
 columns.Name("Year").Add();
 })
 .Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 })).GridSettings(new PivotViewGridSettings { ColumnWidth = 140,
AllowSelection = true
}).DataBound("onDataBound").Load("onLoad").CellSelected("onCellSelected").Re
nder()
</div>

<div id="Chart" style="height: 450px;"></div>
</div>
<script>
 var onInit = true;
 var measureList = {};
 var chart;
 var selectedCells;
 var chartSeries;
 function dataBound() {
 var pivotObj =
document.getElementById('pivotview').ej2_instances[0];
 if (onInit) {
 for (var i = 0; i <
pivotObj.dataSourceSettings.values.length; i++) {
 var value = pivotObj.dataSourceSettings.values[i];
 measureList[value.name] = value.caption || value.name;
 }
 pivotObj.grid.selectionModule.selectCellsByRange({
cellIndex: 1, rowIndex: 1 }, { cellIndex: 3, rowIndex: 3 });
 }
 }
 function cellSelected(args) {
 selectedCells = args.selectedCellsInfo;
 if (selectedCells && selectedCells.length > 0) {
 chartSeries = frameChartSeries();
 chartUpdate();
 }
 }

```

```

function frameChartSeries() {
 var pivotObj =
document.getElementById('pivotview').ej2_instances[0];
 var columnGroupObject = {};
 for (var b = 0; b < selectedCells.length; b++) {
 var cell = selectedCells[b];

### Drill-through grid's cell edit type

Using the [DrillThrough](#) event in the pivot table, you can define the edit type of a particular column in the grid present inside the drill-through dialog. To do so, check the column name in the [DrillThrough](#) event and then specify the edit type of that column using the [GridColumn.EditType](#) event argument.

**Note:** The [GridColumn.EditType](#) property must be set based on the column's data type. For example, the string data type will not be applicable for the numeric text box edit type.

- `NumericTextBox` control for integer, double, and decimal data types.
- `TextBox` control for string data type.
- `DropDownList` control to show all unique values related to that field.
- `CheckBox` control for boolean data type.
- `DatePicker` control for date data type.
- `DateTimePicker` control for date time data type.

In the below example, the data type of the `Country` column is set to `DropDownList`.

### CSHTML

```
@Html.EJS().PivotView("PivotGrid").Width("100%").Height("300").DataSource(dataSource =>
dataSource.Data((IEnumerable<object>) ViewBag.Data).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
```

```

 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Production Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).DrillThrough("drillThrough").EditSettings(new
PivotViewCellEditSettings{AllowAdding=true;AllowDeleting=true;AllowEditing=true;AllowCommandColumns=true}).Render()
<script>
function drillThrough(args) {
 for (var i = 0; i < args.gridColumns.length; i++) {
 if (args.gridColumns[i].field === 'Country') {
 args.gridColumns[i].editType = 'dropdownedit';
 //args.gridColumns[i].editType = 'numericedit';
 //args.gridColumns[i].editType = 'textedit';
 //args.gridColumns[i].editType = 'booleanedit';
 //args.gridColumns[i].editType = 'datepickeredit';
 //args.gridColumns[i].editType = 'datetimepickeredit';
 }
 }
}
</script>

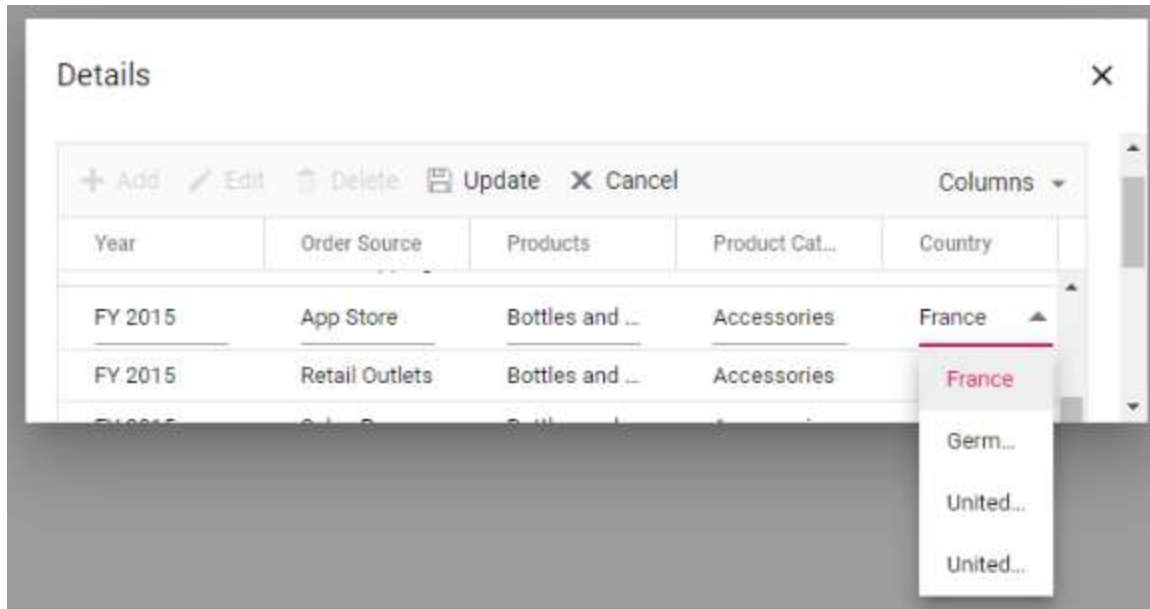

```

### EDITTYPE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Show field list when pivot table is empty

When there are no fields in a pivot table's row, column, value, and filter axes, a field list can still be displayed. To do so, use the [DataBound](#) event and call the `onShowFieldList` method as shown below.

### CSHTML

```
@Html.EJS().PivotView("PivotGrid").Width("100%).Height("300").DataSource(dataSource =>
dataSource.Data((IEnumerable<object>) ViewBag.Data).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatsettings =>
{
formatsettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
}).Rows(rows =>
{
rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
columns.Name("Year").Caption("Production Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).DrillThrough("drillThrough").EditSettings(new
PivotViewCellEditSettings{AllowAdding=true;AllowDeleting=true;AllowEditing=true;AllowCommandColumns=true}).Render()
<script>
function drillThrough(args) {
for (var i = 0; i < args.gridColumns.length; i++) {
if (args.gridColumns[i].field === 'Country') {
args.gridColumns[i].editType = 'dropdownedit';
//args.gridColumns[i].editType = 'numericedit';
```

```

 //args.gridColumns[i].editType = 'textedit';
 //args.gridColumns[i].editType = 'booleanedit';
 //args.gridColumns[i].editType = 'datepickeredit';
 //args.gridColumns[i].editType = 'datetimepickeredit';
 }
}
}
</script>

```

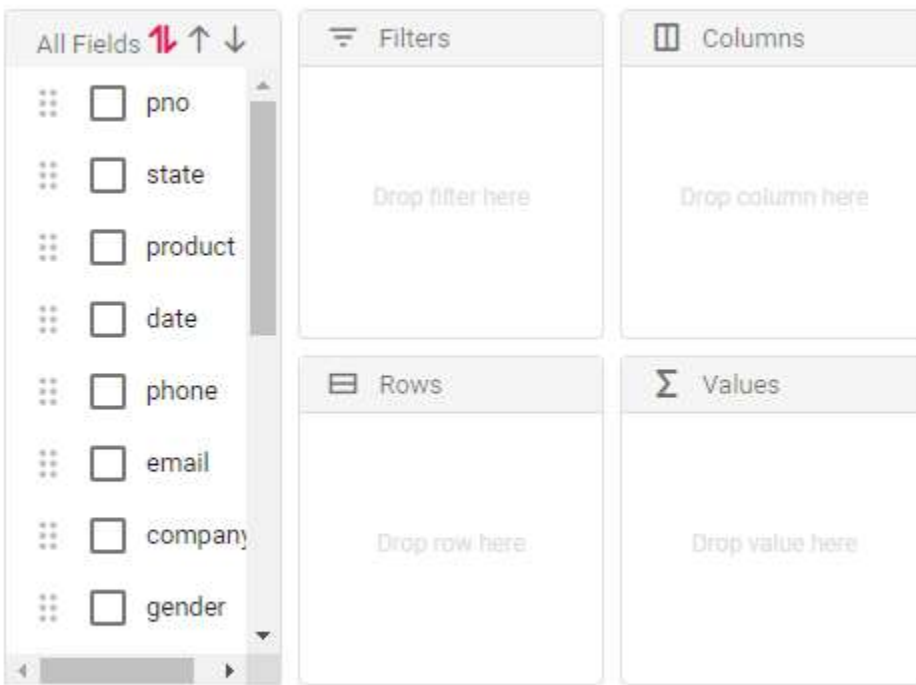

### EDITTYPE.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

### Field List

CLOSE

Apply custom style to pivot cells in ASP.NET MVC Pivot Table Component

The [QueryCellInfo](#) event in [PivotViewGridSettings](#) can be used to apply custom style to row and value cells, and the [HeaderCellInfo](#) event in [PivotViewGridSettings](#) can be used to apply custom styles to column cells.

In the following example, a custom style has been applied to the column header **“Sold Amount”** under **“FY 2016”** via the [HeaderCellInfo](#) event and to the row header **“Germany”** and its aggregated value via the [QueryCellInfo](#) event by adding the **“e-custom”** class to the cell element.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(gridSettings =>
gridSettings.QueryCellInfo("querycell").HeaderCellInfo("headerCellInfo")).Render()
<style>
 .e-custom {
 font-family: 'Courier New', Courier, monospace;
 font-size: 12px !important;
 background-color: pink !important;
 }
</style>
<script>
 function queryCell(args) {
 var colIndex = Number(args.cell.getAttribute('data-colindex'));
 var cells = args.data[colIndex] ? args.data[colIndex] : {};
 // Here by using 'actualText' option, a custom class can be added
 to the specific row header and its value to apply custom style.
 if (cells.actualText === 'Germany') {
 args.cell.classList.add('e-custom');
 } else if (cells.actualText === 'Amount' &&
 cells.columnHeaders === 'FY 2016' && cells.rowHeaders ===
'Germany') {
 args.cell.classList.add('e-custom');
 }
 }
 function headerCellInfo(args) {
 var customAttributes = args.cell.column.customAttributes;
 // Here custom class can be added to the specific column header
 by using unique level name, to apply custom style.
 if (args.node.classList.contains('e-columnsheader') &&
 customAttributes &&
 customAttributes.cell.valueSort.levelName === 'FY 2016.Sold
Amount') {
```

```

 args.node.classList.add('e-custom');
 }
}
</script>

```

### CUSTOMSTYLES.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016    |             | FY 2017    |             | FY 2018    |             | Grand Total |

**Note:** The **dot(.)** character in **FY 2016.Sold Amount** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the [HeaderDelimiter](#) in the [PivotViewValueSortSettings](#) property to any other delimiter instead of the default separator.

Show tooltip for row and column headers in ASP.NET MVC Pivot Table Component

You can create and display the tooltip for each row and column header(s) in the pivot table by using an external tooltip component via the [DataBound](#) event.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>

### Hide specific columns in ASP.NET MVC Pivot Table Component

By using the [ColumnRender](#) event in the [PivotViewGridSettings](#), you can hide specific column(s) in the pivot table. In the example below, the “Units Sold” column under “FY 2016” is hidden by setting its **visible** property to **false** via the [ColumnRender](#) event.

**Note:** The **dot(.)** character in **FY 2016.Units Sold** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the [HeaderDelimiter](#) in the [PivotViewValueSortSettings](#) property to any other delimiter instead of the default separator.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height("300").Width(650).DataSourceSettings(
 dataSourceSettings =>
 {
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false);
 dataSourceSettings.FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {
 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 }).GridSettings(gridSettings =>
 {
 gridSettings.ColumnRender("columnRender").Render()
 })
)
<script>
 function columnRender(args) {
 for (var i = 1; i < args.columns.length; i++) {
```

```

 if (args.stackedColumns[i].customAttributes &&
args.stackedColumns[i].customAttributes.cell.valueSort.levelName === 'FY
2016.Units Sold') {
 args.stackedColumns[i].visible = false;
 }
 }
}
</script>

```

### HIDESPECIFICCOLUMN.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|               | FY 2015    |             | FY 2016     | FY 2017    | FY 2018     |            | Grand Total |              |

Export table and chart into the same document using toolbar

Even if the [PivotViewDisplayOption.View](#) property is set to **Both** in the pivot table, you can only export either the table or the chart to the PDF document based on the current value set in the [PivotViewDisplayOption.Primary](#) property. But, to export both the table and the chart to the same PDF document, use the `pdfExport` method during the [ActionBegin](#) event invoke.

In the following example, the built-in export action can be restricted by setting the `args.cancel` option to **true** in the [ActionBegin](#) event, and both the table and the chart can be exported by calling the `pdfExport` method and setting the `exportBothTableAndChart` argument to **true**.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Height("300").ShowToolbar(true).ShowField
List(true).AllowPdfExport(true).DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).Expan
dAll(false)
.FormatSettings(formatsettings =>
{
 formatsettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{

```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).GridSettings(new Syncfusion.EJ2.PivotView.PivotViewGridSettings {
 ColumnWidth = 140 }).DisplayOption(new PivotViewDisplayOption { View =
 Syncfusion.EJ2.PivotView.View.Both }).Toolbar(new List<string>
 () { "Grid", "Chart", "Export", "FieldList"
 }).ActionBegin("actionBegin").Render()
<script>
 function actionBegin(args) {
 var pivotTableObj =
 document.getElementById('pivotview').ej2_instances[0];
 if (args.actionName == 'PDF export') {
 args.cancel = true;
 pivotTableObj.pdfExport({}, false, null, false, true);
 }
 }
</script>

```

### EXPORTTABLEANDCHART.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

<!-- markdownlint-disable MD009 -->

#### Add custom aggregation type to the menu in ASP.NET MVC Pivot Table Component

By using the [DataBound](#) event, you can add your own custom aggregate type(s) to the pivot table's aggregate menu.

In the following example, we have added the aggregation types **CustomAggregateType 1** and **CustomAggregateType 2** to the aggregate menu. The calculation for those aggregated types can be done using the [AggregateCellInfo](#) event.

### CSHTML

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Height("300").DataSourceSettings(dataSourceSettings =>
 dataSourceSettings.DataSource((IEnumerable<object>)ViewBag.DataSource).ExpandAll(false)
 .FormatSettings(formatSettings =>
 {
 formatSettings.Name("Amount").Format("C0").Add();
 }).Rows(rows =>
 {
 rows.Name("Country").Add(); rows.Name("Products").Add();
 }).Columns(columns =>
 {
 columns.Name("Year").Caption("Year").Add();
 columns.Name("Quarter").Add();
 }).Values(values =>
 {

```

```

 values.Name("Sold").Caption("Units Sold").Add();
 values.Name("Amount").Caption("Sold Amount").Add();
 })).GridSettings(new PivotViewGridSettings { ColumnWidth = 140
 }).AggregateCellInfo("aggregateCell").DataBound("dataBound").Render()
<script>
 var SummaryType = [
 'Sum',
 'Count',
 'DistinctCount',
 'Avg',
 'CustomAggregateType1',
 'CustomAggregateType2'
];
 var L10n = ej.base.L10n;
 L10n.load({
 'en-US': {
 pivotview: {
 CustomAggregateType1: 'Custom Aggregate Type 1',
 CustomAggregateType2: 'Custom Aggregate Type 2',
 },
 pivotfieldlist: {
 CustomAggregateType1: 'Custom Aggregate Type 1',
 CustomAggregateType2: 'Custom Aggregate Type 2',
 }
 }
 });
 function dataBound() {
 var pivotObj =
 document.getElementById('pivotview').ej2_instances[0];
 pivotObj.getAllSummaryType = function () {
 return SummaryType;
 };
 pivotObj.pivotFieldListModule.aggregateTypes = SummaryType;
 pivotObj.pivotFieldListModule.getAllSummaryType = function () {
 return SummaryType;
 };
 }
 function aggregateCell(args) {
 if (args.aggregateType === 'CustomAggregateType1') {
 args.value = args.value * 100;
 }
 if (args.aggregateType === 'CustomAggregateType2') {
 args.value = args.value / 100;
 }
 }
}
</script>

```

### CUSTOMAGGREGATION.CS

### Convert complex JSON to flat JSON and assign it to the pivot table

By default, flat JSON can only bind to the pivot table. However, you can connect complex JSON to the pivot table by converting it to flat JSON via code-behind and binding it to the pivot table using the [DataSource](#) property in the [Load](#) event.

In the following example, the **complexToFlatJson()** method is used to convert complex JSON to flat JSON and bind it to the pivot table using the [DataSource](#) property, then modifying the field names in the [Rows](#) and [Columns](#) based on the converted flat JSON under [PivotViewDataSourceSettings](#) in the [Load](#) event.

### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("PivotView").Height(300).DataSourceSettings(dataSource =>
 dataSource.DataSource(data()).ExpandAll(false)
 .ValueSortSettings(new PivotViewValueSortSettings {
 HeaderDelimiter = "-",
 }).Rows(rows =>
 {
 rows.Name("ShipDetails").Add();
 }).Columns(columns =>
 {
 columns.Name("OrderDetails").Add();
 }).Values(values =>
 {
 values.Name("Freight").Caption("Units Sold").Add();
 })).Load("load").Render()
<script>
 function load(args) {
 dataSource =
 JSON.parse(JSON.stringify(args.dataSourceSettings.dataSource));
 args.dataSourceSettings.dataSource = complexToFlatJson(dataSource);
 var rows = [];
 for (var i = 0; i < args.dataSourceSettings.rows.length; i++) {
 if (args.dataSourceSettings.rows[i].name in parentProp) {
 rows =
 rows.concat(parentProp[args.dataSourceSettings.rows[i].name]);
 }
 else {
 rows.push(args.dataSourceSettings.rows[i]);
 }
 }
 args.dataSourceSettings.rows = rows;
 var columns = [];
 for (var i = 0; i < args.dataSourceSettings.columns.length; i++) {
 if (args.dataSourceSettings.columns[i].name in parentProp) {
 columns =
 columns.concat(parentProp[args.dataSourceSettings.columns[i].name]);
 }
 }
 }
}
```

```

 else {
 columns.push(args.dataSourceSettings.columns[i]);
 }
 }
 args.dataSourceSettings.columns = columns;

### Load desired report from the report list as default in ASP.NET MVC Pivot Table Component

By default, the pivot table is displayed with the report bound at the code-behind. To load a desired report from the previously saved report collection during initial rendering, set the desired report name in the [DataBound](#) event, along with the additional report-based customization code shown below.

#### CSHTML

```
@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Width("100%").Height("300").ShowToolBar(true).ShowFieldList(true).AllowExcelExport(true).AllowNumberFormatting(true).AllowConditionalFormatting(true).AllowPdfExport(true).ShowToolBar(true).AllowCalculatedField(true).DataSourceSettings(dataSource =>
dataSource.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false).EnableSorting(true)
.FormatSettings(formatSettings => {
formatSettings.Name("Amount").Format("C0").MaximumSignificantDigits(10).MinimumSignificantDigits(1).UseGrouping(true).Add(); })
.Rows(rows => { rows.Name("Country").Add(); rows.Name("Products").Add(); })
.Columns(columns => { columns.Name("Year").Add();
columns.Name("Order_Source").Caption("Order Source").Add(); })
.Values(values =>
{
values.Name("In_Stock").Caption("In Stock").Add();
values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
}))
.Filters(filters =>
{
filters.Name("Product_Categories").Caption("Product Categories").Add();
}))
.GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).DisplayOption(new PivotViewDisplayOption { View = View.Both
}).ToolBar(new List<string>
() { "New", "Save", "SaveAs", "Rename", "Remove", "Load", "Grid", "Chart",
"Export", "SubTotal", "GrandTotal", "ConditionalFormatting",
"NumberFormatting" "FieldList"
}).SaveReport("saveReport").LoadReport("loadReport").FetchReport("fetchReport").RenameReport("renameReport").RemoveReport("removeReport").NewReport("newReport").DataBound("dataBound").Render()
<script>
var isInitial = true;
function saveReport(args) {
var reports = [];
var isSaved = false;
if (localStorage.pivotviewReports && localStorage.pivotviewReports !== "") {
reports = JSON.parse(localStorage.pivotviewReports);
}
if (args.report && args.reportName && args.reportName !== '') {
reports.map(function (item) {
if (args.reportName === item.reportName) {
item.report = args.report;
isSaved = true;
}
});
if (!isSaved) {
reports.push(args);
}
}
```

```

 localStorage.pivotviewReports = JSON.stringify(reports);
 }
}
function fetchReport(args) {
 var reportCollection = [];
 var reeportList = [];
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
!= "") {
 reportCollection = JSON.parse(localStorage.pivotviewReports);
 }
 reportCollection.map(function (item) {
 reeportList.push(item.reportName);
 });
 args.reportName = reeportList;
}
function removeReport(args) {
 var reportCollection = [];
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
!= "") {
 reportCollection = JSON.parse(localStorage.pivotviewReports);
 }
 for (var i = 0; i < reportCollection.length; i++) {
 if (reportCollection[i].reportName === args.reportName) {
 reportCollection.splice(i, 1);
 }
 }
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
!= "") {
 localStorage.pivotviewReports =
JSON.stringify(reportCollection);
 }
}
function renameReport(args) {
 var reportCollection = [];
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
!= "") {
 reportCollection = JSON.parse(localStorage.pivotviewReports);
 }
 reportCollection.map(function (item) {
 if (args.reportName === item.reportName) {
 item.reportName = args.rename;
 }
 });
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
!= "") {
 localStorage.pivotviewReports =
JSON.stringify(reportCollection);
 }
}
function newReport() {
 var pivotObj =
document.getElementById('pivotview').ej2_instances[0];
 pivotObj.setProperties({
 dataSourceSettings: {
 columns: [],
 rows: [],
 values: [],

```

```

 filters: []
 }
}, false);
}
function dataBound() {
 var pivotObj = document.getElementById('pivotview').ej2_instances[0]
 if (pivotObj && isInitial) {
 isInitial = false;
 pivotObj.toolbarModule.action = 'Load';
 pivotObj.toolbarModule.reportList.value = 'Default report';
 loadReport({ reportName: 'Default report' });
 }
}
function loadReport(args) {
 var pivotObj = document.getElementById('pivotview').ej2_instances[0]
 var reportCollection = [];
 if (localStorage.pivotviewReports && localStorage.pivotviewReports
 !== "") {
 reportCollection = JSON.parse(localStorage.pivotviewReports);
 }
 reportCollection.map(function (item) {
 if (args.reportName === item.reportName) {
 args.report = item.report;
 }
 });
 if (args.report) {
 pivotObj.dataSourceSettings =
 JSON.parse(args.report).dataSourceSettings;
 }
}
</script>

```

### LOADPREDEFINEDREPORT.CS

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

|             | Mountain Bikes |              | Road Bikes |             | Grand Total |              |

### Display string value to pivot table values

End user can display string value to the pivot table's value cell by using the [AggregateCellInfo](#) event.

In the following example, each cell value of the **Sold** field's actual value has been assigned from its combination data sets obtained from the `args.cellSets` in the [AggregateCellInfo](#) event.

**CSHTML**

```

@using Syncfusion.EJ2.PivotView
@Html.EJS().PivotView("pivotview").Height("300").DataSourceSettings(dataSourceSettings =>
dataSourceSettings.DataSource((IEnumerable<object>) ViewBag.DataSource).ExpandAll(false)
.FormatSettings(formatSettings =>
{
 formatSettings.Name("Amount").Format("C0").Add();
}).Rows(rows =>
{
 rows.Name("Country").Add(); rows.Name("Products").Add();
}).Columns(columns =>
{
 columns.Name("Year").Caption("Year").Add();
columns.Name("Quarter").Add();
}).Values(values =>
{
 values.Name("Sold").Caption("Units Sold").Add();
values.Name("Amount").Caption("Sold Amount").Add();
})).GridSettings(new PivotViewGridSettings { ColumnWidth = 140
}).AggregateCellInfo("aggregateCell").Render()
<script>
 function aggregateCell(args){
 if (args.fieldName === 'Sold') {
 args.value = secondsToHms(args.value);
 }
 }
 function secondsToHms(d) {
 d = Number(d);
 var h = Math.floor(d / 3600);
 var m = Math.floor((d % 3600) / 60);
 var s = Math.floor((d % 3600) % 60);
 return (
 ('0' + h).slice(-2) + ':' + ('0' + m).slice(-2) + ':' + ('0' +
s).slice(-2)
);
 }
</script>

```

**DISPLAYSTRINGVALUE.CS**

```

public ActionResult Index()
{
 var data = GetPivotData();
 ViewBag.DataSource = data;
 return View();
}

```

## Predefined Dialogs

### Getting Started with ASP.NET Core Predefined Dialogs

This section briefly explains about how to include ASP.NET MVC Predefined Dialogs in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

## Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Open ASP.NET MVC Predefined Dialogs

Now, add the Syncfusion ASP.NET MVC Predefined Dialogs in `~/Views/Home/Index.cshtml` page.

Once you completed the setup, you can open predefined dialogs from any where in application using `Alert`, `Confirm` or `Prompt` methods in `DialogUtility`.

*Show alert dialog*

An alert dialog box used to display an errors, warnings, and information alerts that needs user awareness. This can be achieved by using the `DialogUtility.alert` method. The alert dialog is displayed along with the `OK` button. When user clicks on `OK` button, alert dialog will get closed.

In the below code example, alert dialog displayed on button click action.

CSHTML

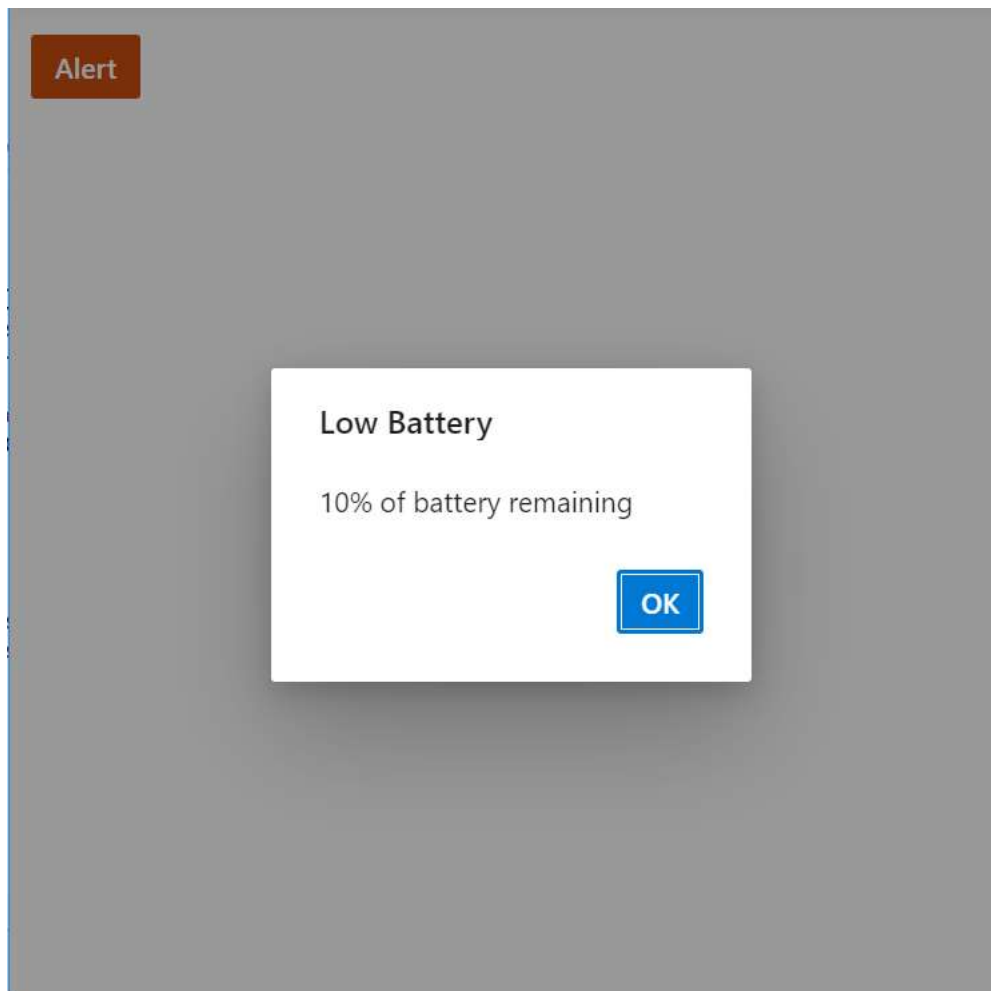

```
<div style="height:400px;">
 <div id="predefinedDialogDefault" class="col-lg-12 control-section">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()

 </div>
</div>
<script>
 var dialogObj;
 document.getElementById('alertBtn').onclick = function () {
 document.getElementById("statusText").style.display = "none";
```

```
dialogObj = ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 okButton: { click: alertBtnClick.bind(this) },
 position: { X: "center", Y: "center" }
});
};
function alertBtnClick() {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = "The user closed
the Alert dialog.";
 document.getElementById("statusText").style.display = "block";
}
</script>
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC predefined dialogs will be rendered in the default web browser.

#### [Show confirm dialog](#)

A confirm dialog box used to displays a specified message along with the **OK** and **Cancel** buttons. This can be achieved by using the `DialogUtility.confirm` method. It is used to get approval from the user,

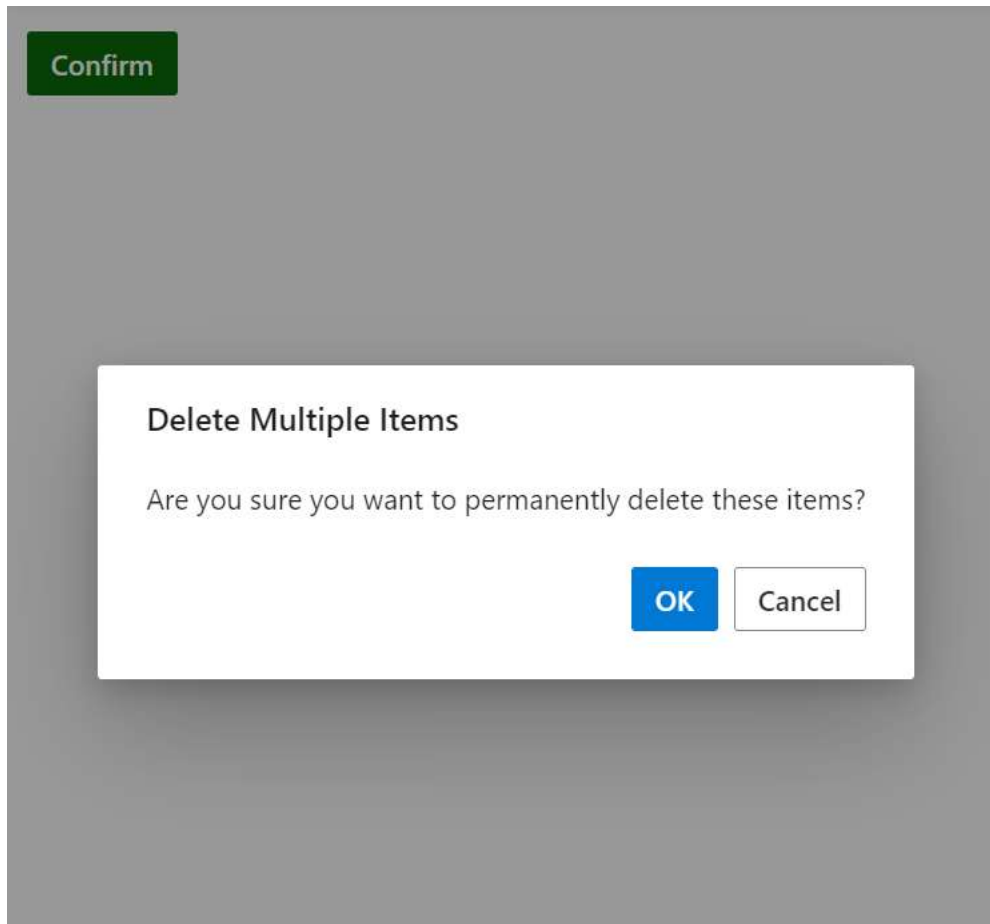

and it appears before any critical action. After get approval from the user the dialog will disappear automatically.

In the below code example, the confirm dialog displayed on **OK** and **Cancel** button click action.

### CSHTML

```
<div style="height:400px;">
 <div id="predefinedDialogDefault" class="col-lg-12 control-section">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()

 </div>
</div>
<script>
 var dialogObj;
 document.getElementById('confirmBtn').onclick = function () {
 document.getElementById("statusText").style.display = "none";
 dialogObj = ej.popups.DialogUtility.confirm({
 title: "Delete multiple items",
 content: "Are you sure you want to permanently delete these
items?",
 okButton: { click: confirmOkAction.bind(this) },
 cancelButton: { click: confirmCancelAction.bind(this) },
 position: { X: "center", Y: "center" }
 });
 };
 var confirmOkAction = function () {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = " The user
confirmed the dialog box";
 document.getElementById("statusText").style.display = "block";
 };
 var confirmCancelAction = function () {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = "The user canceled
the dialog box.";
 document.getElementById("statusText").style.display = "block";
 };
</script>
```

#### Show Prompt dialog

A prompt dialog is used to get the input from the user. When the user clicks the **OK** button the input value from the dialog is returned. If the user clicks the **Cancel** button the null value is returned. After getting the input from the user the dialog will disappear automatically.

In the below code example, the confirm dialog displayed on **OK** and **Cancel** button click action.

#### CSHTML

```
<div style="height:400px;">
 <div id="predefinedDialogDefault" class="col-lg-12 control-section">

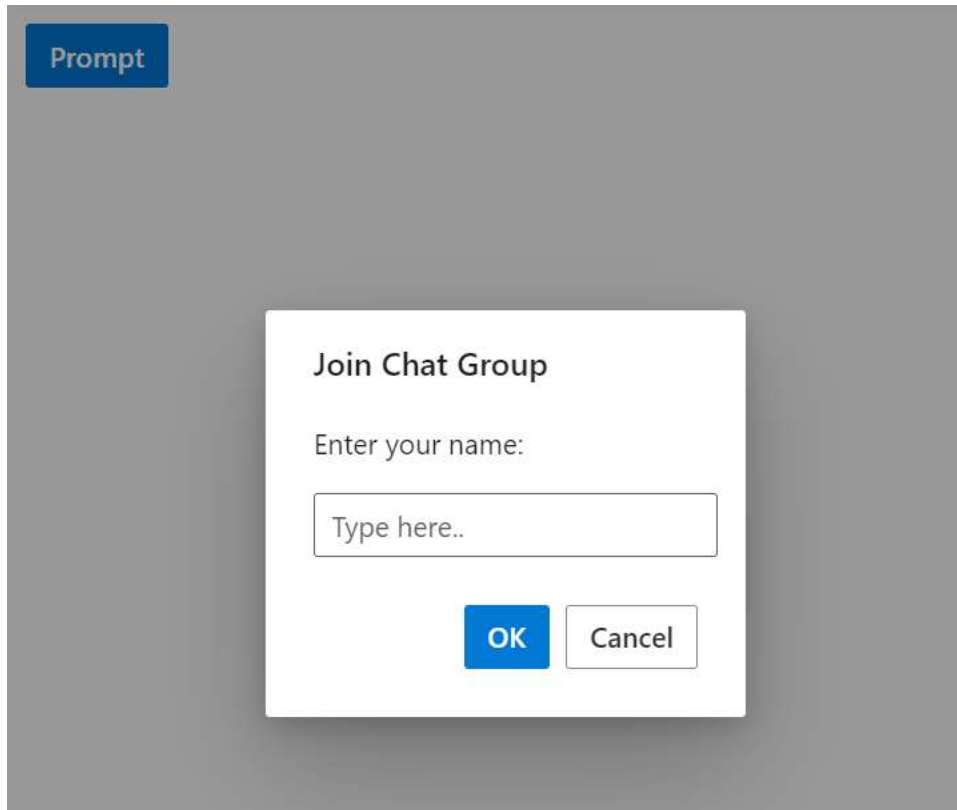

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()

 </div>
</div>
<script>
 var dialogObj;
 document.getElementById('promptBtn').onclick = function () {
 document.getElementById("statusText").style.display = "none";
 dialogObj = ej.popups.DialogUtility.confirm({
 title: "Join chat group",
 content: "<p>Enter your name: </p><input id= inputEle type=text
name=Required class=e-input placeholder=Type here.. />",
 okButton: { click: promptOkAction.bind(this) },
 cancelButton: { click: promptCancelAction.bind(this) },
 });
 };
</script>
```

```
 position: { X: "center", Y: "center" }
 });
};
function promptOkAction() {
 var value;
 value = document.getElementById("inputEle").value;
 if (value == "") {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = "The user's
input is returned as \" \" ";
 document.getElementById("statusText").style.display = "block";
 }
 else {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = "The user's
input is returned as" + " " + value;
 document.getElementById("statusText").style.display = "block";
 }
}
function promptCancelAction() {
 dialogObj.hide();
 document.getElementById("statusText").innerHTML = "The user canceled
the prompt dialog";
 document.getElementById("statusText").style.display = "block";
}
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}
```

- [Close dialog while click on outside of dialog](#)
- [How to make a reusable alert and confirm dialog](#)

### Draggable in Predefined Dialogs

The predefined dialogs supports dragging within its target container by grabbing the dialog header, which allows the user to reposition the dialog dynamically by using the `isDraggable` property.

#### Alert

##### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 isDraggable: true
 });
 };
</script>
```

```
};
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

### Confirm

#### CONFIRM.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.confirm({
 title: "Delete multiple items",
 content: "Are you sure you want to permanently delete these
items?",
 isDraggable: true
 });
 };
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}
```

### Prompt

#### PROMPT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.confirm({
 title: "Join chat group",

```

```

 content: "<p>Enter your name: </p> <input id= inputEle type=text
name=Required class=e-input placeholder=Type here.. />",
 isDraggable: true
 });
};
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}

```

### Animation in Predefined Dialogs

The predefined dialogs can be animated during the open and close actions. You can customize the Delay, Duration, and Effect of animation by using the animationSettings property.

In the following sample, the zoom effect is enabled. So, the dialog will open with the zoom in and close with the zoom out effect.

#### Alert

### ALERT.CSHTML

```

<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 animationSettings: { effect: 'Zoom', duration: 400 }
 });
 };
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}

```

#### Confirm

**CONFIRM.CSHTML**

```
<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Delete multiple items",
 content: "Are you sure you want to permanently delete these
items?",
 animationSettings: { effect: 'Zoom', duration: 400 }
 });
 };
</script>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}
```

**Prompt****PROMPT.CSHTML**

```
<div style="height:400px;">

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Join Wi-Fi network",
 content: "<p>Enter your name: </p><input id=inputEle type=text
name=Required class=e-input placeholder=Type here.. />",
 animationSettings: { effect: 'Zoom', duration: 400 }
 });
 };
</script>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}
```

## Positioning in Predefined Dialogs in Blazor

Customize the dialog position by using the `position` property. The position can be represented with specific `X` and `Y` values.

- The `Position.X` can be configured with a left, center, right or offset value. By default, the value is set as `center`.
- The `Position.Y` can be configured with a top, center, bottom or offset value. By default, the value is set as `center`.

Use the following code snippet for `alert.cshtml`, `confirm.cshtml` and `prompt.cshtml` to customize the position. Here, customized the dialog position as `X= "top"` and `Y= "center"`.

### Alert

#### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 position: { X: "top", Y: "center" }
 });
 };
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

### Confirm

#### CONFIRM.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Delete multiple items",
```

```

 content: "Are you sure you want to permanently delete these
items?",
 position: { X: "top", Y: "center" }
 });
};
</script>

```

**CONTROLLER.CS**

```

public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}

```

**Prompt****PROMPT.CSHTML**

```

<div style="height:400px;">

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Join chat group",
 content: "<p>Enter your name: </p> <input id=inputEle type=text
name=Required class=e-input placeholder=Type here.. />",
 position: { X: "top", Y: "center" }
 });
 };
</script>

```

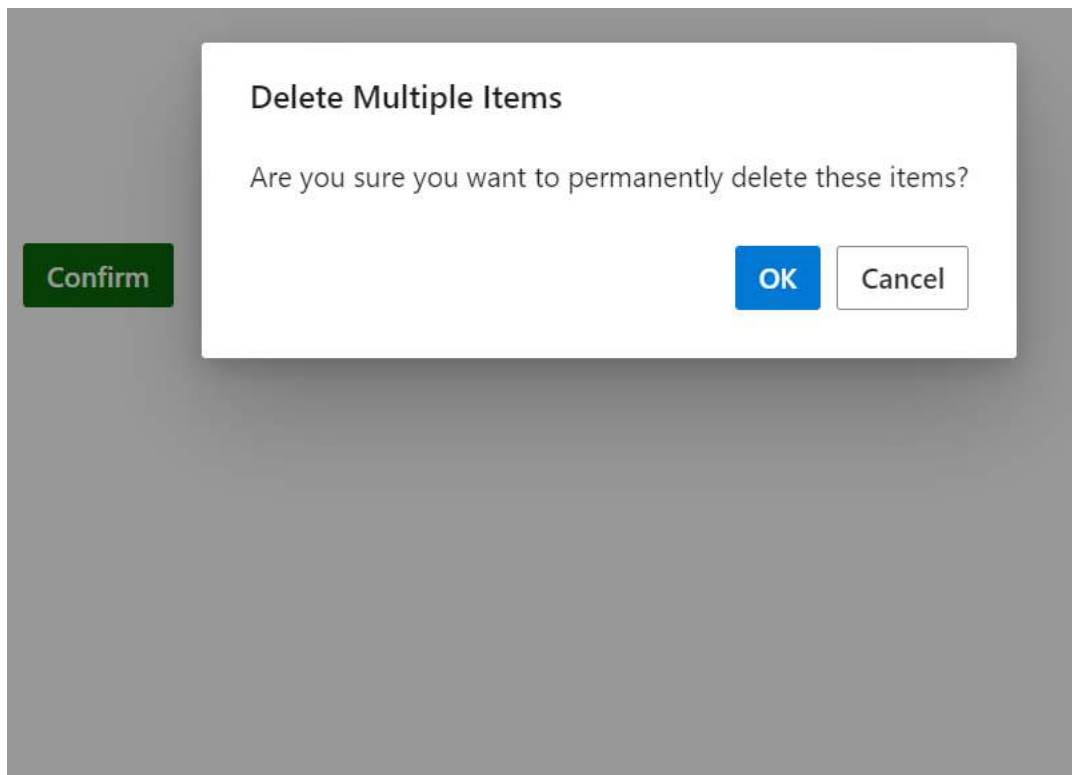

**CONTROLLER.CS**

```

public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}

```

**Results from the code snippet****Alert**

**Confirm****Prompt**

### Dimension in Predefined Dialogs

Customize the predefined dialogs dimensions using the `height` and `width` properties.

By default, the predefined dialogs `width` and `height` property value is set as `auto`. Depends on the dialog content the width and height values are automatically adjust. You can specify the dimension values in both pixels and percentage format to change the default dialog width and height values.

Use the following code snippet for **Alert.cshtml**, **Confirm.cshtml** and **Prompt.cshtml** to customize the dialog dimensions.

#### Alert

##### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Not enough space",
 content: "Delete certain files to free up space to store more
items.",
 width : "300px",
 height : "200px"
 });
 };
</script>
```

##### CONTROLLER.CS

```
public class HomeController : Controller
```

```
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

## Confirm

### CONFIRM.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Delete multiple items",
 content: "Are you sure you want to permanently delete these
items?",
 width : "400px",
 height : "200px"
 });
 };
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}
```

## Prompt

### PROMPT.CSHTML

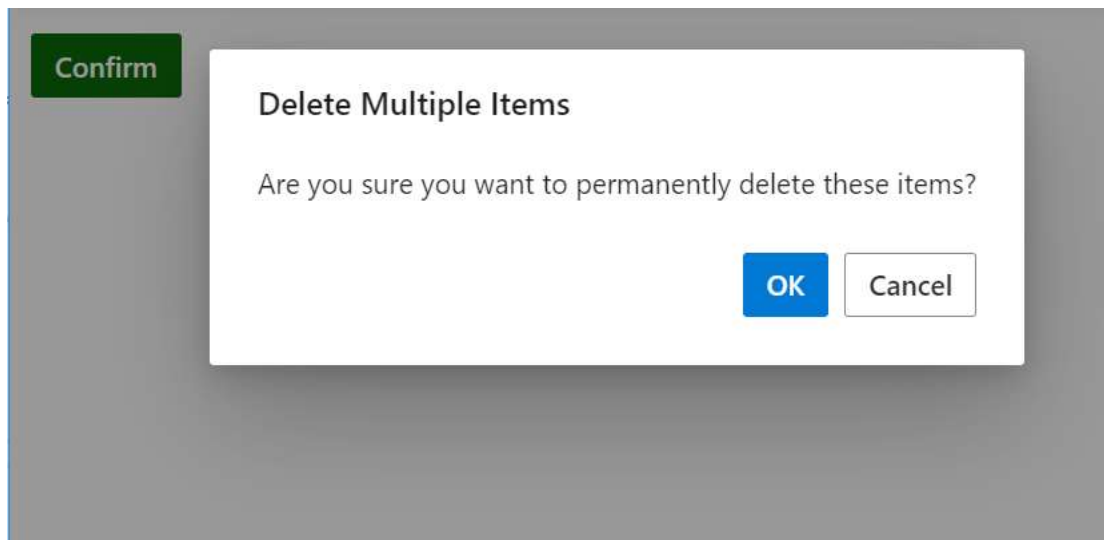

```
<div style="height:400px;">

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Join chat group",
 content: "<p>Enter your name: </p> <input id= inputEle type=text
name=Required class=e-input placeholder=Type here.. />",
 width : "350px",
 height : "210px"
 });
 };
</script>
```

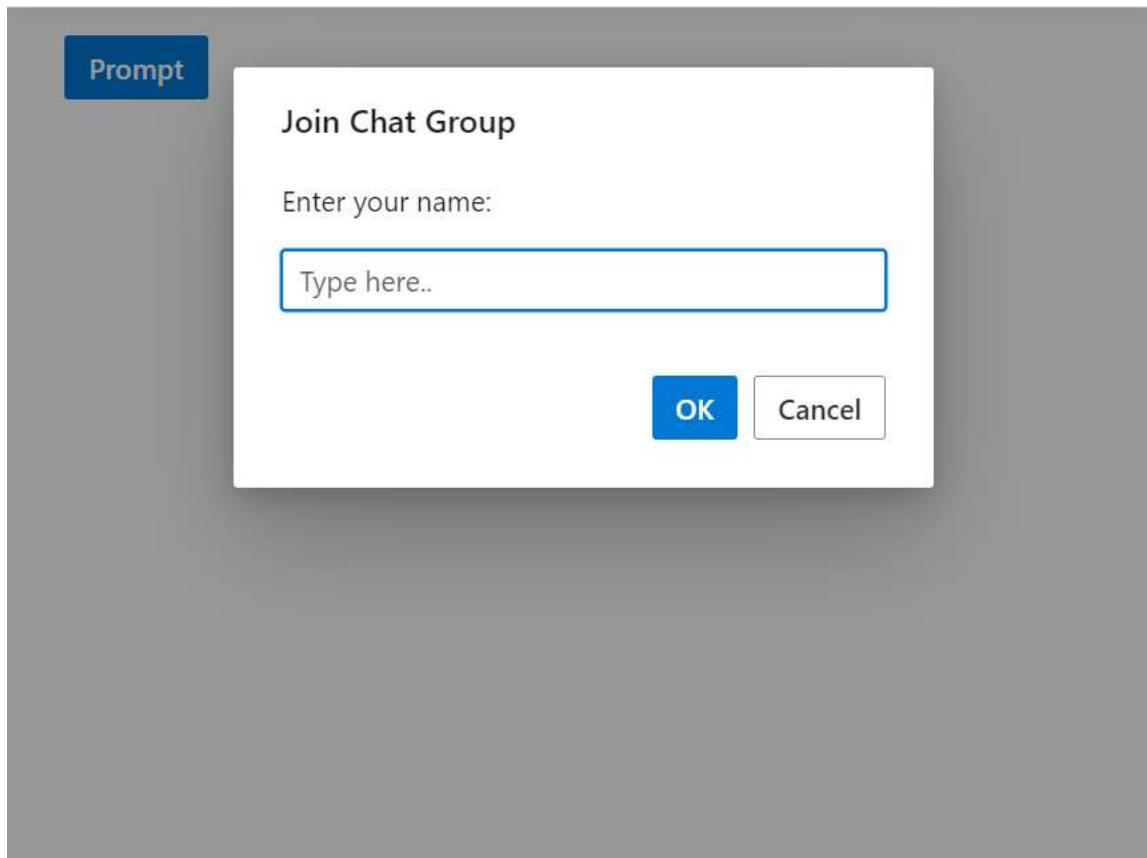

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}
```

**Results from the code snippet****Alert****Confirm**

### Prompt

### Max-width and max-height

To have a restricted max-width and max-height dialog dimension, you need to specify the max-width, max-height CSS properties for the component's container element by using the `cssClass` property. The max-height value is calculated in source level and set to the dialog. so, need to override the max-height property.

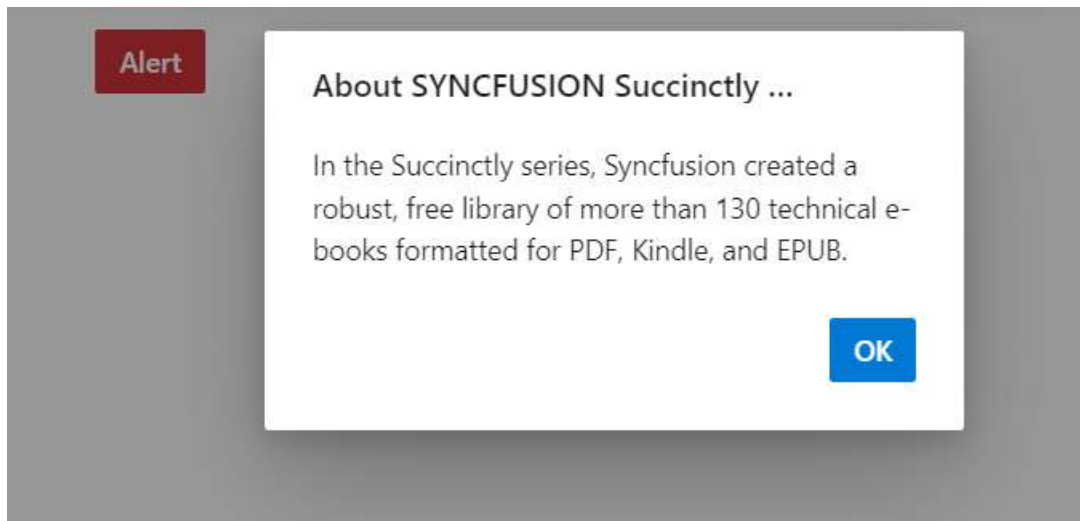

Use the following code to customize the max-width and max-height for alert dialog:

**ALERT.CSHTML**

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<style>
 .e-alert-dialog.customClass {
 max-width: 350px;
 max-height: 250px !important;
 }
</style>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "About syncfusion succinctly series",
 content: "In the succinctly series, syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.",
 cssClass: "customClass"
 });
 };
</script>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

**Min-width and min-height**

To have a restricted min-width and min-height dialog dimension, you need to specify the min-width, min-height CSS properties for the component's container element by using the `cssClass` property.

Use the following code to customize the min-width and min-height for alert dialog:

#### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 isDraggable: true
 });
 };
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}
```

## Customization of Predefined Dialogs

### Customize action buttons

You can customize the predefined dialogs buttons by using below properties.

- **okButton** - Use this property to customize **OK** button text and appearance.
- **cancelButton** - Use this property to customize **Cancel** button text and appearance.

Use the following code snippet for **Alert.cshtml**, **Confirm.cshtml** and **Prompt.cshtml** to customize the predefined dialog action buttons.

For alert dialog , customized the default dialog button content as **Done** by using the **okButton.text** property.

For confirm dialog, customized the default dialog buttons content as **Yes** and **No** by using the **okButton.text** and **cancelButton.text** property and also customized the dialog button icons by using **okButton.icon** property.

For prompt dialog , customized the default dialog buttons content as **Connect** and **Close** by using **okButton.text** and **cancelButton.text** property.

### Alert

#### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Good job!",
 content: "You clicked the alert button!",
 okButton: { text: 'Done' }
 });
 };
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

### Confirm

#### CONFIRM.CSHTML

```
<div style="height:400px;">
```

```

 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
 success").Render()
</div>
<style>
 .e-btn-icon.e-icons.e-check icon.e-icon-left:before {
 content: '\e7ff';
 }
 .e-btn-icon.e-icons.e-close icon.e-icon-left:before {
 content: '\e7fc';
 }
</style>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.confirm({
 title: "Delete file",
 content: "Are you sure you want to permanently delete these
file?",
 okButton: { text: "Yes", icon: "e-icons e-check" },
 cancelButton: { text: "No", icon: "e-icons e-close" }
 });
 };
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}

```

### Prompt

#### PROMPT.CSHTML

```

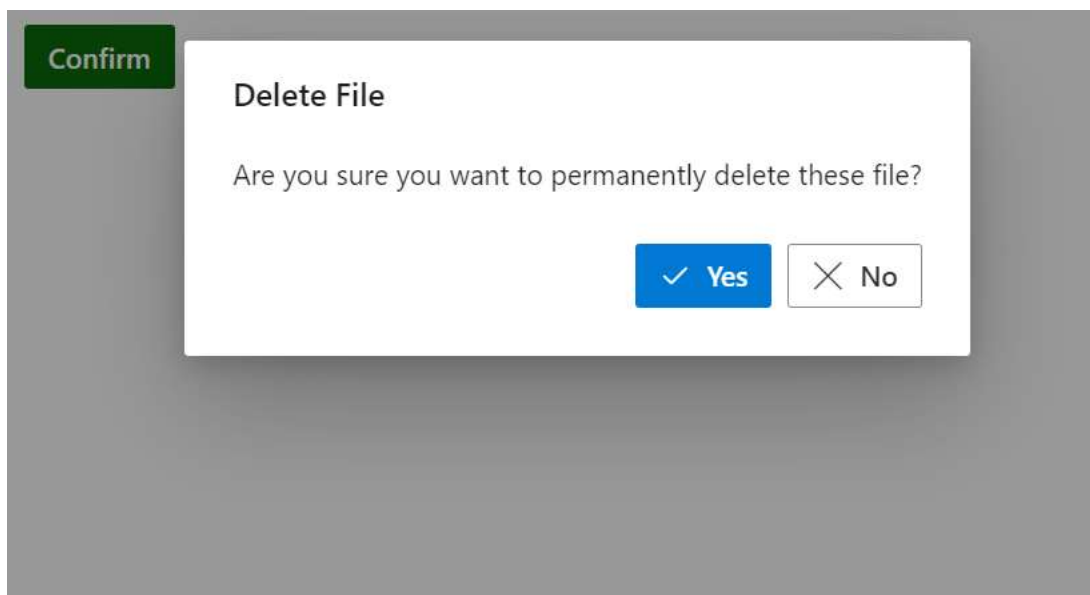

<div style="height:400px;">

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.confirm({
 title: "Join Wi-Fi network",
 content: "<table class=Table><tbody><tr><td>SSID:
AndroidAP</td></tr><tr> <td>Password:</td> </tr> <tr> <td> <input type=password id=password name=Required
class=e - input> </td> </tr> </tbody> </table>",
 okButton: { text: "Connect" },
 cancelButton: { text: "Close" }
 });
 };
</script>

```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}
```

**Results from the code snippet****Alert****Confirm****Prompt**

### Show or hide dialog close button

When rendering the predefined dialogs through utility methods, You can close the dialog using the following ways. The default values of `closeOnEscape` and `showCloseIcon` is `false`.

- By pressing the escape key if the [closeOnEscape](#) property is enabled.
- By clicking the close button if the [showCloseIcon](#) property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the [hide](#) method.

Use the following code for **alert**, **confirm** and **prompt** to demonstrates the different ways of hiding the utility dialog.

### Alert

#### ALERT.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("alertBtn").Content("Alert").CssClass("e-
danger").Render()
</div>
<script>
 document.getElementById('alertBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Low battery",
 content: "10% of battery remaining",
 showCloseIcon: true,
 closeOnEscape : true
 });
 };
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Alert()
 {
 return View();
 }
}
```

## Confirm

### CONFIRM.CSHTML

```
<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("Confirm").CssClass("e-
success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Delete multiple items",
 content: "Are you sure you want to permanently delete these
items?",
 showCloseIcon: true,
 closeOnEscape : true
 });
 };
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}
```

## Prompt

### PROMPT.CSHTML

```
<div style="height:400px;">

@Html.EJS().Button("promptBtn").Content("Prompt").IsPrimary(true).Render()
</div>
<script>
 document.getElementById('promptBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Join Wi-Fi network",
 content: "<table class=Table><tbody><tr><td>SSID:
AndroidAP</td></tr><tr> <td>Password:</td> </tr> <tr> <td> <input type=password id=password name=Required
class=e - input> </td> </tr> </tbody> </table>",
 showCloseIcon: true,
 closeOnEscape : true
 });
 };
</script>
```

```

 });
};
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Prompt()
 {
 return View();
 }
}

```

### Results from the code snippet

#### Alert

![ASP.NET MVC Predefined Dialogs alert close icon](../images/alert-show-hide-btn.png)

#### Confirm

![ASP.NET MVC Predefined Dialogs confirm close icon](../images/confirm-show-hide-btn.png)

#### Prompt

![ASP.NET MVC Predefined Dialogs prompt close icon](../images/prompt-show-hide-btn.png)

#### Customize dialog content

You can load custom content in predefined dialogs using the `content` property.

Use the following code to customize the dialog content to render the custom TextBox component inside the prompt dialog to get the username from the user.

### ALERT.CSHTML

```

<div style="height:400px;">
 @Html.EJS().Button("confirmBtn").Content("confirm").CssClass("e-
 success").Render()
</div>
<script>
 document.getElementById('confirmBtn').onclick = function () {
 ej.popups.DialogUtility.alert({
 title: "Join chat group",
 content: "<p>Enter your name: </p><input class=e-input />",
 width: "350px"
 });
 };
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Confirm()
 {
 return View();
 }
}

```

```
}
}
```

### Results from the code snippet

## Progress Bar

### Getting Started with ASP.NET MVC Progress Bar Control

This section briefly explains about how to include [ASP.NET MVC Progress Bar](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5

NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

`

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

`

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

##### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

#### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

##### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

#### Add ASP.NET MVC Progress Bar control

Now, add the Syncfusion ASP.NET MVC Progress Bar control in **~/Views/Home/Index.cshtml** page.

##### CSHTML

```
@(Html.EJS().ProgressBar("container").Render())
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Progress Bar control will be rendered in the default web browser.

### Progress Type

You can change the type of progress bar by using [Type](#) property. By default **Linear** type of progress bar will render.

#### CSHTML

```
@(Html.EJS().ProgressBar("container")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(40)
 .Height("60")
 .Minimum(0).Maximum(100)
 .Render())
```

**Note:** [View Sample in GitHub.](#)

### Types

Visualize progress in different shapes (rectangle, circle, and semi-circle) to give a unique appearance to your app design.

#### Linear

<!-- markdownlint-disable MD033 -->

Set **Type** to Linear to get the linear progress bar. It also support secondary progress and different mode of progress.

#### CSHTML

```
@(Html.EJS().ProgressBar("lineardeterminate")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(100)
 .Height("60")
 .Minimum(0).Maximum(100)
 .Render())
@ (Html.EJS().ProgressBar("linearindeterminate")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(20)
 .Height("60").IsIndeterminate(true)
 .Minimum(0).Maximum(100)
 .Render())
@ (Html.EJS().ProgressBar("linearbuffer")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(40)
 .Height("60").SecondaryProgress(60)
 .Minimum(0).Maximum(100)
 .Render())
@ (Html.EJS().ProgressBar("linearsegment")
```

```
.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(100)
 .Height("60").SegmentCount(8)
 .Minimum(0).Maximum(100)
 .Render()
```

**LINEAR.CS****Circular**

Set **Type** to Circular to get the circular progress bar. It also support secondary progress and different mode of progress.

**CSHTML**

```
@(Html.EJS().ProgressBar("Circulareterminate")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(100)
 .Height("60")
 .Minimum(0).Maximum(100)
 .Render())
@(Html.EJS().ProgressBar("Circularindeterminate")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(20)
 .Height("60").IsIndeterminate(true)
 .Minimum(0).Maximum(100)
 .Render())
@(Html.EJS().ProgressBar("Circularbuffer")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(40)
 .Height("60").SecondaryProgress(60)
 .Minimum(0).Maximum(100)
 .Render())
@(Html.EJS().ProgressBar("Circularsegment")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(100)
 .Height("60").SegmentCount(8)
 .Minimum(0).Maximum(100)
 .Render())
```

**CIRCULAR.CS****Tooltip in ASP.NET MVC ProgressBar Component****Tooltip**

The tooltip for the progress bar is used to represent the progress value. During the initial load, it can be enabled by using the [Enable](#) property. The [ShowTooltipOnHover](#) property can show the tooltip on mouseover.

**CSHTML**

```
@(Html.EJS().ProgressBar("lineardeterminate")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(90)
 .Height("90")
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Tooltip(tp => tp.Enable(true))
 .Render())
```

### **TOOLTIP.CS**

### Format

By default, the tooltip shows information about progress. In addition to that, show more information in the tooltip using the [Format](#) property.

### **CSHTML**

```
@(Html.EJS().ProgressBar("lineardeterminate")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(90)
 .Height("90")
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Tooltip(tp => tp.Enable(true).Format("Progress:
${value}"))
 .Render())
```

### **FORMAT.CS**

### Customization

The [Fill](#) and [Border](#) properties are used to customize the background color and border of the tooltip respectively. The [TextStyle](#) property in the tooltip is used to customize the font of the tooltip text.

### **CSHTML**

```
@(Html.EJS().ProgressBar("lineardeterminate")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(90)
 .Height("90")
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Tooltip(tp => tp.Enable(true).Format("Progress:
${value}").TextStyle(ts =>
ts.FontWeight("900").Size("15px").Color("red").FontFamily("Roboto").FontStyle("Italic")))
 .Render())
```

### **CUSTOMIZATION.CS**

## States

Visualize progress in different states.

### Determinate

<!-- markdownlint-disable MD033 -->

This is the default state. You can use it when the progress estimation is known.

#### CSHTML

```
@ (Html.EJS () .ProgressBar ("container")

.Type (Syncfusion.EJ2.ProgressBar.ProgressType.Linear) .Value (100)
 .Height ("60")
 .Minimum (0) .Maximum (100)
 .Render ())
```

#### DETERMINE.CS

### Indeterminate

By enabling the **IsIndeterminate** property, the state of the progress bar can be changed to indeterminate when the progress cannot be estimated or is not being calculated. It can be combined with determinate mode to know that the application is estimating progress before the actual progress starts.

#### CSHTML

```
@ (Html.EJS () .ProgressBar ("container")

.Type (Syncfusion.EJ2.ProgressBar.ProgressType.Linear) .Value (20)
 .Height ("60") .IsIndeterminate (true)
 .Minimum (0) .Maximum (100)
 .Render ())
```

#### INDETERMINATE.CS

### Buffer

<!-- markdownlint-disable MD033 -->

You can use a secondary progress indicator when the primary progress depends on the secondary progress. This will allow users to visualize both primary and secondary progress simultaneously.

#### CSHTML

```
@ (Html.EJS () .ProgressBar ("container")
```

```
.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(40)
 .Height("60").SecondaryProgress(60)
 .Minimum(0).Maximum(100)
 .Render()
```

**BUFFER.CS****Range**

<!-- markdownlint-disable MD033 -->

Range represents the entire span of the progress bar and can be defined using the **Minimum** and **Maximum** properties. The default value of the range is 0 to 100.

**CSHTML**

```
@(Html.EJS().ProgressBar("container")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(40)
 .Height("60")
 .Minimum(0).Maximum(100)
 .Render())
```

**RANGE.CS****Customization****Segments**

<!-- markdownlint-disable MD033 -->

We can divide a progress bar into multiple segments using a **SegmentCount** to visualize the progress of multiple sequential tasks.

**CSHTML**

```
@(Html.EJS().ProgressBar("container")
 .Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(100)
 .Height("60").SegmentCount(8)
 .Minimum(0).Maximum(100)
 .Render())
```

**SEGMENTS.CS**

### Thickness

Customize the thickness of the track using [TrackThickness](#), progress using [ProgressThickness](#) and secondary progress using [SecondaryProgressThickness](#) to render the progress bar with different appearances.

#### CSHTML

```
@(Html.EJS().ProgressBar("container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear)
 .Value(100).ShowProgressValue(true)

.Width("90%).Height("60").TrackThickness(24).ProgressThickness(24).Minimum(
0).Maximum(100).SecondaryProgressThickness(20)
 .LabelStyle(ls => ls.Color("#FFFFFF"))
 .Animation(an => an.Enable(true).Delay(0).Duration(2000))
 .Render())
```

#### THICKNESS.CS

### Radius

<!-- markdownlint-disable MD033 -->

The radius of the progress bar can be customized using **Radius** property and corner can be customized by **CornerRadius** property.

#### CSHTML

```
@(Html.EJS().ProgressBar("container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(60)
 .TrackThickness(80).ProgressThickness(10).Radius("100%")

.ProgressColor("white").CornerRadius(Syncfusion.EJ2.ProgressBar.CornerType.Round)
 .Minimum(0).Maximum(100)
 .Render())
```

#### RADIUS.CS

### InnerRadius

<!-- markdownlint-disable MD033 -->

The inner radius of the progress bar can be customized using **InnerRadius** property.

#### CSHTML

```
@(Html.EJS().ProgressBar("container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(60)
 .Width("160px").Height("160px").EnableRtl(false)
```

```
.TrackThickness(80).ProgressThickness(10).Radius("100%").InnerRadius("190%")
.ProgressColor("white").CornerRadius(Syncfusion.EJ2.ProgressBar.CornerType.Round)
.Minimum(0).Maximum(100)
.Render()
```

### **INNER-RADIUS.CS**

#### Progress color and track color

<!-- markdownlint-disable MD033 -->

Customize the color of progress, secondary progress, and track by using the [ProgressColor](#), [SecondaryProgressColor](#) and [TrackColor](#) properties.

### **CSHTML**

```
@(Html.EJS().ProgressBar("percentage").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear)
 .Value(100).ShowProgressValue(true).TrackColor("#F8C7D8")
 .Width("90%").Height("60").CornerRadius(Syncfusion.EJ2.ProgressBar.CornerType.Round)
 .ProgressColor("#E3165B").TrackThickness(24).ProgressThickness(24).Minimum(0)
 .Maximum(100).SecondaryProgress(60).SecondaryProgressColor("green")
 .Animation(an => an.Enable(true).Delay(0).Duration(2000))
 .LabelStyle(ls => ls.Color("#FFFFFF"))
 .TextRender("textRender")
 .Render())
var textRender = function (args) {
 args.text = '50';
}
```

### **TRACK-THICKNESS.CS**

#### Annotation and Label

##### Annotation

In the circular progress bar, you can add any view to the center using the **Content** property in annotation.

For example, you can include add, start, or pause button to control the progress. You can also add an image that indicates the actual task in progress or add custom text that conveys how far the task is completed.

### **CSHTML**

```
@(Html.EJS().ProgressBar("container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(60)

.TrackThickness(80).InnerRadius("190%").CornerRadius(Syncfusion.EJ2.ProgressBar.CornerType.Round)
 .Minimum(0).Maximum(100).Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Annotations(an => { an.Content("<div style='font-size:20px; font-weight:bold; color:#ffffff;fill:#ffffff'>60%</div>").Add();
}).Render())
```

### ANNOTATION.CS

### Label

You can show the progress value in both linear and circular progress bar using **ShowProgressValue** property.

### CSHTML

```
@(Html.EJS().ProgressBar("container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(50)

.ShowProgressValue(true).TrackThickness(24).ProgressThickness(24)
 .Minimum(0).Maximum(100)
 .Render())
```

### LABEL.CS

### Animation

<!-- markdownlint-disable MD033 -->

Progress Bar support to animate the progress by using **Animation** property. Enable the animation by setting **Enable** property and also you can control the speed by using **Duration** property.

### CSHTML

```
@(Html.EJS().ProgressBar("container")

.Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(40)
 .Height("60")
 .Minimum(0).Maximum(100)
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Render())
```

### ANIMATION.CS

## Events

### ValueChanged

<!-- markdownlint-disable MD033 -->

This event is triggered when the progress value is changed. This event contains the following event argument.

#### CSHTML

```
@(Html.EJS().ProgressBar("lineardeterminate").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Linear).Value(100)
 .Height("60").Load("Load")

.Minimum(0).Maximum(100).ValueChanged("progressValue")
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000))
 .Render())
```

#### VALUE-CHANGED.CS

### ProgressCompleted

This event is triggered when the progress attains the Maximum value. This event contains the following argument.

#### CSHTML

```
<div id="pause-container">
 @(Html.EJS().ProgressBar("pause-
container").Type(Syncfusion.EJ2.ProgressBar.ProgressType.Circular).Value(100)
)
 .Width("160px").Height("160px")
 .Minimum(0).Maximum(100).Load("progressLoad")
 .Animation(an =>
an.Enable(true).Delay(0).Duration(2000)).ProgressCompleted("progressComplete
d")
 .Annotations(an =>
 {
 an.Content("<div style='font-size:20px; font-weight:bold;
color:#ffffff;fill:#ffffff'>60%</div>").Add();
 }).Render())
</div>
<script>
var clearTimeout1;
var clearTimeout2;
var progressCompleted = function (args) {
 clearTimeout(clearTimeout2);
 clearTimeout2 = setTimeout(function () {
 var pausePlay = document.getElementById("pause-
container").ej2_instances[0];
```

```

 pausePlay.annotations[0].content = "<div id='point1'
style='font-size:20px;font-
weight:bold;color:#ffffff;fill:#ffffff'>60%</div>";
 pausePlay.dataBind();
 }, 2000);
}
</script>

```

### **PROGRESS-COMPLETED.CS**

### Accessibility in ASP.NET MVC Progress bar component

The Progress bar component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress bar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

```

}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Progress bar component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Progress bar component:

- progressbar (role)
- aria-valuemin (attribute)
- aria-valuemax (attribute)
- aria-valuenow (attribute)
- aria-label (attribute)

### Keyboard interaction

The Progress bar component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress bar component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the Progress bar element. |

| **Ctrl + P** | Prints the Progress bar. |

### Ensuring accessibility

The Progress bar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Progress bar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Progress bar component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

## Progress Button

### Getting Started with ASP.NET MVC Progress Button Control

This section briefly explains about how to include [ASP.NET MVC Progress Button](#) control in your ASP.NET MVC application using Visual Studio.

## Prerequisites

### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

## Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

## Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

## Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Progress Button control

Now, add the Syncfusion ASP.NET MVC Progress Button control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().ProgressButton("element").Content("Spin Left").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Progress Button control will be rendered in the default web browser.

**Note:** Progress Button supports different styles, types and sizes like [Button](#). In addition, it also support `top` and `bottom` position of the icon.

Enabling progress in button

You can enable the background filler UI by setting the [EnableProgress](#) property to `true`.

#### CSHTML

```
@Html.EJS().ProgressButton("spinleft").Content("Spin
Left").EnableProgress(true).Render()
```

**Note:** [View Sample in GitHub](#).

See also

- [Spinner and Progress options](#)

<!-- markdownlint-disable MD002 MD022 -->

## Spinner

### *Change spinner position*

Spinner position can be changed by modifying the [Position](#) property of [SpinSettings](#). By default, the spinner is positioned at the left of the ProgressButton. You can position it at the **left**, **right**, **top**, **bottom**, or **center** of the text content.

### *Change spinner size*

Spinner size can be changed by modifying the [Width](#) property of [SpinSettings](#). In this demo, the **Width** is set to **20** to change the spinner size.

### *Spinner template*

You can use custom spinner by specifying the [Template](#) property of [SpinSettings](#) with custom styles.

The following sample demonstrates the above functionalities of the spinner.

## **CSHTML**

```
@Html.EJS().ProgressButton("submit").Content("Submit").SpinSettings(ViewBag.spinSettings).Render()
<style>
@@keyframes custom-rolling {
 0% {
 -webkit-transform: rotate(0deg);
 transform: rotate(0deg);
 }
 100% {
 -webkit-transform: rotate(360deg);
 transform: rotate(360deg);
 }
}
.template {
 border: 2px solid green;
 border-style: dotted;
 border-radius: 50%;
 border-top-color: transparent;
 border-bottom-color: transparent;
 height: 16px;
 width: 16px;
}
.template {
 -webkit-animation: custom-rolling 1.3s linear infinite;
 animation: custom-rolling 1.3s linear infinite;
}
</style>
```

## **DEFAULT.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ProgressButtonSpinSettings spinSettings = new
 ProgressButtonSpinSettings()
 {
 Position = SpinPosition.Right,
 Width = "20",
 }
 }
}
```

```

 Template = "<div class='template'></div>"
 };
 ViewBag.spinSettings = spinSettings;
 return View();
}

```

<!-- markdownlint-disable MD025 MD022 -->

## Progress

### Content animation

The [Content](#) of the ProgressButton can be animated during progress using the [Effect](#) property of [AnimationSettings](#). You can also set custom duration and timing function using the [duration](#) and [easing](#) properties. The possible [effect](#) values are [None](#), [SlideLeft](#), [SlideRight](#), [SlideUp](#), [SlideDown](#), [ZoomIn](#), and [ZoomOut](#).

### CSHTML

```

@Html.EJS().ProgressButton("slideleft").Content("Slide
Left").EnableProgress(true).AnimationSettings(ViewBag.animationSettings).SpinSettings(ViewBag.spinSettings).Render()

```

### DEFAULT.CS

```

using Syncfusion.EJ2.SplitButtons;
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ProgressButtonSpinSettings spinSettings = new
ProgressButtonSpinSettings()
 {
 Position = SpinPosition.Left
 };
 ViewBag.spinSettings = spinSettings;
 ProgressButtonAnimationSettings animationSettings = new
ProgressButtonAnimationSettings()
 {
 Effect = AnimationEffect.SlideRight,
 Duration = 500,
 Easing = "linear",
 };
 ViewBag.animationSettings = animationSettings;
 return View();
 }
}

```

### Change step of the ProgressButton

The progress state can be visualized to the specified interval by changing the [Step](#) property in the [begin](#) event of the ProgressButton. In this demo, the [Step](#) property is set to [20](#) to show progress at every 20% increment.

### CSHTML

```
@Html.EJS().ProgressButton("progress").Content("Progress
Step").EnableProgress(true).Begin("begin").CssClass("e-hide-
spinner").Render()
<script>
 function begin(args) {
 args.step = 20;
 }
</script>
```

**DEFAULT.CS**

```
public ActionResult Default()
{
 return View();
}
```

**Note:** The class `e-hide-spinner` hides the spinner in the ProgressButton, For more information, see [hide spinner](#) section

*Changing progress state dynamically*

The progress state can be changed dynamically by modifying the `Percent` property in the progress events. In this demo, on 40% completion of progress, the `Percent` property is set to `90` to show dynamic change of the progress state.

**CSHTML**

```
@Html.EJS().ProgressButton("progress").Content("Progress").EnableProgress(tr
ue).Duration(15000).Begin("begin").Progress("progress").End("end").CssClass(
"e-hide-spinner").Render()
<script>
 function begin(args) {
 this.content = 'Progress ' + args.percent + '%';
 this.dataBind();
 }
 function progress(args) {
 this.content = 'Progress ' + args.percent + '%';
 this.dataBind();
 if (args.percent === 40) {
 args.percent = 90
 }
 }
 function end(args) {
 this.content = 'Progress ' + args.percent + '%';
 this.dataBind();
 }
</script>
```

**DEFAULT.CS**

```
public ActionResult Default()
{
 return View();
}
```

**Note:** The method `dataBind` applies the property changes immediately to the component.

## Start and stop methods

You can pause and resume the progress using the `stop` and `start` methods, respectively. In this demo, clicking the `ProgressButton` will pause and resume the progress.

**CSHTML**

```
@Html.EJS().ProgressButton("download").Content("Download").EnableProgress(true).IconCss("e-btn-sb-icon e-download").Duration(4000).Created("created").End("end").CssClass("e-hide-spinner").Render()
<script>
 function end() {
 var progressBtn =
ej.base.getComponent(document.querySelector("#download"), "progress-btn");
 progressBtn.content = 'Download';
 progressBtn.iconCss = 'e-btn-sb-icon e-download';
 progressBtn.dataBind();
 }
 function created() {
 var progressBtn =
ej.base.getComponent(document.querySelector("#download"), "progress-btn");
 progressBtn.element.addEventListener('click', clickHandler);
 }
 function clickHandler() {
 var progressBtn =
ej.base.getComponent(document.querySelector("#download"), "progress-btn");
 if (progressBtn.content === 'Download') {
 progressBtn.content = 'Pause';
 progressBtn.iconCss = 'e-btn-sb-icon e-pause';
 progressBtn.dataBind();
 }
 // clicking on ProgressButton will stop the progress when the text
 content is 'Pause'
 else if (progressBtn.content === 'Pause') {
 progressBtn.content = 'Resume';
 progressBtn.iconCss = 'e-btn-sb-icon e-play';
 progressBtn.dataBind();
 progressBtn.stop();
 }
 // clicking on ProgressButton will start the progress when the text
 content is 'Resume'
 else if (progressBtn.content === 'Resume') {
 progressBtn.content = 'Pause';
 progressBtn.iconCss = 'e-btn-sb-icon e-pause';
 progressBtn.dataBind();
 progressBtn.start();
 }
 }
}
</script>
<style>

### Accessibility in Progress Button Component

The Progress button component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

```

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Progress button component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Progress button component:

| Attributes | Purpose |

| --- | --- |

| **aria-label** | Provides an accessible name for the icon only Progress button. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Progress button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress button component.

| **Press** | **To do this** |

| --- | --- |

| **Enter / Space** | Starts the progress. |

### Ensuring accessibility

The Progress button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Progress button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Progress button component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET Core controls](#)

## Styles and Appearances

To modify the ProgressButton appearance, you need to override the default CSS of ProgressButton component. Find the list of CSS classes and its corresponding section in ProgressButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

### CSS Class | Purpose of Class

- |.e-progress-btn|To customize the progress button
- |.e-progress-btn: hover|To customize the progress button on hover
- |.e-progress-btn: focus|To customize the progress button on focus
- |.e-progress-btn .e-spinner-pane .e-spinner-inner svg .e-path-circle|To customize the progress button spinner

## How To

### Change the text content and styles of the ProgressButton during progress

You can change the text content and styles of the ProgressButton during progress state by changing the text content and the [cssClass](#) property at the [begin](#) and [end](#) events.

### CSHTML

```
@Html.EJS().ProgressButton("upload").Content("Upload").EnableProgress(true).
CssClass("e-hide-spinner").Duration(4000).Begin("begin").End("end").Render()
<script>
 function begin() {
 this.content = 'Uploading...';
 this.cssClass = 'e-hide-spinner e-info';
 this.dataBind();
 }
 function end() {
 this.content = 'Success';
 this.cssClass = 'e-hide-spinner e-success';
 this.dataBind();
 setTimeout(() => {
 this.content = 'Upload';
 this.cssClass = 'e-hide-spinner';
 this.dataBind();
 }, 500)
 }
</script>
```

### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

### Customize progress using cssClass

You can customize the background filler UI using the [cssClass](#) property.

- Adding `e-vertical` to `cssClass` shows vertical progress.

- Adding `e-progress-top` to `cssClass` shows progress at the top.

You can also show reverse progress by adding custom class to the [cssClass](#) property.

#### CSHTML

```
@Html.EJS().ProgressButton("vprogress").Content("Vertical
Progress").EnableProgress(true).CssClass("e-hide-spinner e-
vertical").Duration(4000).Render()
@Html.EJS().ProgressButton("tprogress").Content("Progress
Top").EnableProgress(true).CssClass("e-hide-spinner e-progress-
top").Duration(4000).Render()
@Html.EJS().ProgressButton("rprogress").Content("Reverse
Progress").EnableProgress(true).CssClass("e-hide-spinner e-reverse-
progress").Duration(4000).Render()
<style>
 .e-reverse-progress .e-progress {
 right: 0;
 left: auto;
 }
 button {
 margin: 25px;
 }
</style>
```

#### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

#### Hide spinner

You can hide spinner in the ProgressButton by setting the `e-hide-spinner` property to [cssClass](#).

#### CSHTML

```
@Html.EJS().ProgressButton("progress").Content("Progress").EnableProgress(tr
ue).CssClass("e-hide-spinner").Render()
```

#### DEFAULT.CS

```
public ActionResult Default()
{
 return View();
}
```

## QueryBuilder

### Getting Started with ASP.NET MVC Query Builder Control

This section briefly explains about how to include [ASP.NET MVC Query Builder](#) control in your ASP.NET MVC application using Visual Studio.

## Prerequisites

### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

## Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

## Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

## Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### **~/ \_LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Query Builder control

Now, add the Syncfusion ASP.NET MVC Query Builder control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@model List<QueryBuilderSample.Controllers.EmployeeView>
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(Model).Render()
```

#### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View(EmployeeView.GetAllRecords());
 }
}

public class EmployeeView
{
 public EmployeeView()
 {
 }

 public EmployeeView(int EmployeeID, string FirstName, string LastName,
string Title, DateTime BirthDate, DateTime HireDate, int ReportsTo, string
Address, string PostalCode, string Phone, string City, string Country)
 {
 this.EmployeeID = EmployeeID;
 }
}
```

```

this.FirstName = FirstName;
this.LastName = LastName;
this.Title = Title;
this.BirthDate = BirthDate;
this.HireDate = HireDate;
this.ReportsTo = ReportsTo;
this.Address = Address;
this.PostalCode = PostalCode;
this.Phone = Phone;
this.City = City;
this.Country = Country;
}

public int EmployeeID { get; set; }
public string FirstName { get; set; }
public string LastName { get; set; }
public string Title { get; set; }
public DateTime BirthDate { get; set; }
public DateTime HireDate { get; set; }
public int ReportsTo { get; set; }
public string Address { get; set; }
public string PostalCode { get; set; }
public string Phone { get; set; }
public string City { get; set; }
public string Country { get; set; }
public static List<EmployeeView> GetAllRecords()
{
 List<EmployeeView> Emp = new List<EmployeeView>();
 Emp.Add(new EmployeeView(1, "Nancy", "Davolio", "Sales Representative", new
 DateTime(1948, 12, 08), new DateTime(1992, 05, 01), 2, "507 - 20th Ave.
 E.Apt. 2A ", " 98122", "(206) 555-9857 ", "Seattle ", "USA"));
 Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President, Sales", new
 DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W. Capital Way",
 "98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
 Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales Representative",
 new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3, " 4110 Old
 Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
 Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales Representative",
 new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6, "14 Garrett Hill
 ", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales Manager", new
 DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8, "Coventry House Miner
 Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", "USA"));
 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales Representative", new
 DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2, " 7 Houndstooth Rd.",
 " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales Representative", new
 DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7, "Edgeham
 Hollow Winchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "UK"));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales Coordinator",
 new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9, "722 Moss Bay
 Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales Representative", new
 DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5, "4726 - 11th Ave.
 N.E. ", "98105 ", "(71) 555-5598 ", "London", "UK "));
 return Emp;
}
}

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Query Builder control will be rendered in the default web browser.

### Render with rule

The following example shows a basic Query Builder component with rule.

#### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(Model).Rule(ViewBag.rule).Render()
```

#### HOMECONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title", Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return View(EmployeeView.GetAllRecords());
 }
}

public class EmployeeView
{
 public EmployeeView()
 {

```

```

}
public EmployeeView(int EmployeeID, string FirstName, string LastName,
string Title, DateTime BirthDate, DateTime HireDate, int ReportsTo, string
Address, string PostalCode, string Phone, string City, string Country)
{
this.EmployeeID = EmployeeID;
this.FirstName = FirstName;
this.LastName = LastName;
this.Title = Title;
this.BirthDate = BirthDate;
this.HireDate = HireDate;
this.ReportsTo = ReportsTo;
this.Address = Address;
this.PostalCode = PostalCode;
this.Phone = Phone;
this.City = City;
this.Country = Country;
}
public int EmployeeID { get; set; }
public string FirstName { get; set; }
public string LastName { get; set; }
public string Title { get; set; }
public DateTime BirthDate { get; set; }
public DateTime HireDate { get; set; }
public int ReportsTo { get; set; }
public string Address { get; set; }
public string PostalCode { get; set; }
public string Phone { get; set; }
public string City { get; set; }
public string Country { get; set; }
public static List<EmployeeView> GetAllRecords()
{
List<EmployeeView> Emp = new List<EmployeeView>();
Emp.Add(new EmployeeView(1, "Nancy", "Davolio", "Sales Representative", new
DateTime(1948, 12, 08), new DateTime(1992, 05, 01), 2, "507 - 20th Ave.
E.Apt. 2A ", " 98122", "(206) 555-9857 ", "Seattle ", "USA"));
Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President, Sales", new
DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W. Capital Way",
"98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales Representative",
new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3, " 4110 Old
Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales Representative",
new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6, "14 Garrett Hill
", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales Manager", new
DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8, "Coventry House Miner
Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", " USA"));
Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales Representative", new
DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2, " 7 Houndstooth Rd.",
" WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
Emp.Add(new EmployeeView(7, "Robert", "King", "Sales Representative", new
DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7, "Edgeham
Hollow Winchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", " UK"));
Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales Coordinator",
new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9, "722 Moss Bay
Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
}

```

```
Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales Representative", new
DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5, "4726 - 11th Ave.
N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
return Emp;
}
}
```

The screenshot shows a web-based Query Builder interface. At the top, there are buttons for 'AND', 'OR', and a '+' icon to add more conditions. Below these, there are two filter rules displayed in a list. The first rule has the column 'Employee ID', the operator 'Equal', and the value '1'. The second rule has the column 'Title', the operator 'Equal', and the value 'Sales Manager'. Each rule has a close button (X) to its right. On the left side of the filter rules, there is a vertical list of column names: Employee ID, Title, Hire Date, Salary, Commission Pct, Manager, Department Name, Location, and Country.

**Note:** [View Sample in GitHub.](#)

### Column Binding

The column definitions are used as the [DataSource](#) schema in the Query Builder. This plays a vital role in rendering column values. The query builder operations such as create or delete conditions and create or delete groups are performed based on the column definitions. The [Field](#) property of the [Columns](#) is necessary to map the data source values in the query builder columns.

**Note:** If the column field is not specified in the data source, the column values will be empty.

### Auto generation

The [Columns](#) are automatically generated when the [Columns](#) declaration is empty or undefined while initializing the query builder. All the columns in the [DataSource](#) are bound as the query builder columns.

### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("100%").DataSource(ViewBag.da
taSource).Render()
```

### DEFAULT.CS

```
public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",
Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule{ Label="Title", Field="Title", Type="string",
Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
}
```

```

public class EmployeeView
{

"507 - 20th Ave. E.Apt. 2A ", " 98122", "(206) 555-9857 ", "Seattle ",
"USA"));
 Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President,
Sales", new DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W.
Capital Way", "98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
 Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales
Representative", new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3,
" 4110 Old Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
 Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales
Representative", new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6,
"14 Garrett Hill ", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales
Manager", new DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8,
"Coventry HouseMiner Rd. ", "EC2 7JR ", " (206) 555-8122", "Tacoma ", "
USA"));
 }
}

```

```

 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales
Representative", new DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2,
" 7 Houndstooth Rd.", " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales
Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7,
"Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "
UK"));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales
Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9,
"722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales
Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5,
"4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
 return Emp;
 }
}

```

**Note:** When columns are auto-generated, the column type will be determined from the first record of the data source.

### Labels

By default, the column label is displayed from the column [Field](#) value. To override the default label, you have to define the [Label](#) value.

**Note:** If both the field and headerText are not defined in the column, the column renders with “empty” header text.

### Operators

The operator for a column can be defined in the columns property.

The available operators and its supported data types are:

| Operators          | Description                                                             | Supported Types              |
|--------------------|-------------------------------------------------------------------------|------------------------------|
| -----              | -----                                                                   | -----                        |
| startswith         | Checks whether the value begins with the specified value.               | String                       |
| endswith           | Checks whether the value ends with the specified value.                 | String                       |
| contains           | Checks whether the value contains the specified value.                  | String                       |
| equal              | Checks whether the value is equal to the specified value.               | String Number/Date/Boolean   |
| notequal           | Checks for values not equal to the specified value.                     | String/Number  Date  Boolean |
| greaterthan        | Checks whether the value is greater than the specified value.           | Date/Number                  |
| greaterthanorequal | Checks whether a value is greater than or equal to the specified value. | Date/Number                  |
| lessthan           | Checks whether the value is less than the specified value.              | Date/Number                  |
| lessthanorequal    | Checks whether the value is less than or equal to the specified value.  | Date/Number                  |
| between            | Checks whether the value is between the two-specific value.             | Date/Number                  |
| notbetween         | Checks whether the value is not between the two-specific value.         | Date/Number                  |

| in | Checks whether the value is one of the specific values. | String/Number |

| notin | Checks whether the value is not in the specific values. | String/Number |

### Step

The Query Builder allows you to set the step values to the number fields. So that, you can easily access the numeric textbox. Use the [Step](#) property, to set the step value for number values.

### Format

The Query Builder formats date and number values. Use the [Format](#) property, to format date and number values.

### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee
ID").Type("number").Step(10).Add();
 col.Field("FirstName").Label("First
Name").Type("string").Operators(ViewBag.Operator).Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("MM/dd/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).DataSource(ViewBag.dataSource).Render()
```

### DEFAULT.CS

```

}

```

```

 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7, "Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "UK"));

 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9, "722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));

 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5, "4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", "London", "UK "));

 return Emp;
 }
}

```

## Validations

Validation allows you to validate the conditions and it display errors for invalid fields while using the `validateFields` method. To enable validation in the query builder, set [AllowValidation](#) to true. Column fields are validated after setting [AllowValidation](#) to true. So, you should manually configure the validation for Operator and Value fields through [Validation](#).

**Note:** Set `isRequired` validation for Operator and Value fields.

Set `min`, `max` values for number values.

## CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}) .DataSource(ViewBag.dataSource).AllowValidation(true).Render()
@Html.EJS().Button("validate").CssClass("e-primary").Content("Validate Fields").Render()

<script>
 document.getElementById('validate').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.validateFields();
 }
</script>

```

## DEFAULT.CS

```

public ActionResult Index()
{
 ViewBag.dataSource = EmployeeView.GetAllRecords();
}

```

```

 return View();
 }
}

 return Emp;
 }
}

```

## Template

Template allows you to define your own input widgets for columns. To implement the template, you can define the following functions.

- **create**: Creates the custom component.
- **write**: Wire events for the custom component.
- **destroy**: Destroy the custom component.

In the following sample, dropdown is used as the custom component in Payment Mode column.

## CSHTML

```

<div class="col-lg-8 control-section">
 @Html.EJS().QueryBuilder("querybuilder").Columns(col =>
 {
 col.Field("Category").Label("Category").Type("string").Add();
 col.Field("PaymentMode").Label("Payment
Mode").Type("string").Template(ViewBag.template).Operators(ViewBag.paymentOp
erator).Add();
 col.Field("TransactionType").Label("Transaction
Type").Type("boolean").Operators(ViewBag.transactionOperator).Add();

 col.Field("Description").Label("Description").Type("string").Add();
 col.Field("Date").Label("Date").Type("date").Add();

 col.Field("Amount").Label("Amount").Type("number").Operators(ViewBag.amountO
perator).Add();

 }).DataSource(ViewBag.dataSource).Rule(ViewBag.rule).Width("100%").Render()
 </div>
<script>
 function paymentCreate() {
 var elem = document.createElement('input');
 elem.setAttribute('type', 'text');
 return elem;
 }
 function paymentDestroy(args) {

```

```

 var selectObj =
ej.base.getComponent(document.getElementById(args.elementId),
'multiselect');
 if (selectObj) {
 selectObj.destroy();
 }
 var dropdown =
ej.base.getComponent(document.getElementById(args.elementId),
'dropdownlist');
 if (dropdown) {
 dropdown.destroy();
 }
 }
 function paymentWrite(args) {
 var ds = ['Cash', 'Debit Card', 'Credit Card', 'Net Banking',
'Wallet'];
 var inOperators = ['in', 'notin'];
 var qryBldrObj =
ej.base.getComponent(document.getElementById("querybuilder"), 'query-
builder');
 if (inOperators.indexOf(args.operator) > -1) {
 var multiSelectObj = new ej.dropdowns.MultiSelect({
 dataSource: ds,
 value: args.values,
 mode: 'CheckBox',
 placeholder: 'Select Transaction',
 change: function (e) {
 qryBldrObj.notifyChange(e.value, e.element);
 }
 });
 multiSelectObj.appendTo('#' + args.elements.id);
 }
 else {
 var dropDownObj = new ej.dropdowns.DropDownList({
 dataSource: ds,
 value: args.values ? args.values : ds[0],
 change: function (e) {
 qryBldrObj.notifyChange(e.itemData.value, e.element);
 }
 });
 dropDownObj.appendTo('#' + args.elements.id);
 }
 }
</script>
<style>
.e-control-wrapper.e-slider-container.e-horizontal {
 height: 0;
}
.e-querybuilder {
 margin: 3% auto;
}
#ruleContent {
 border: 1px solid #d3d3d3;
 width: 100%;
 height: 500px;
 overflow: auto;
}

```

```
.highcontrast textarea#ruleContent {
 background-color: #000;
}
</style>
```

**DEFAULT.CS**

```
public ActionResult Template()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Category",
Field="Category", Type="string", Operator="equal", Value = new string[] {
"Clothing" } },
 new QueryBuilderRule { Condition="or", Rules = new
List<QueryBuilderRule>() {
 new QueryBuilderRule { Label="Transaction Type",
Field="TransactionType", Type="boolean", Operator="equal", Value = "Income"
},
 new QueryBuilderRule { Label="Payment Mode",
Field="PaymentMode", Type="string", Operator="equal", Value = "Cash" }
 } },
 new QueryBuilderRule { Label="Amount", Field="Amount",
Type="number", Operator="equal", Value = 10 }
 }
 };
 Temp template = new Temp()
 {
 create = "paymentCreate",
 destroy = "paymentDestroy",
 write = "paymentWrite"
 };

"greaterthanorequal" },
 new { key = "Not equal", value = "notequal" }
 };
 ViewBag.rule = rule;
```

```

 ViewBag.paymentOperator = paymentOperator;
 ViewBag.transactionOperator = transactionOperator;
 ViewBag.amountOperator = amountOperator;
 ViewBag.template = template;
 return View();
 }
 public class Temp
 {
 public string create { get; set; }
 public string destroy { get; set; }
 public string write { get; set; }
 }

```

## Data binding

The Query Builder uses **DataManager** to bind the data source, which supports both RESTful JSON data services binding and local JavaScript object array binding. The [DataSource](#) property can be assigned either with the instance of **DataManager** or JavaScript object array collection. It supports two kinds of data binding method.

- Local data
- Remote data

### Local Data

To bind local data to the query builder, you can assign the [DataSource](#) property with a JavaScript object array. The local data source can also be provided as an instance of the **DataManager**.

### CSHTML

```

@model List<QueryBuilderSample.Controllers.EmployeeView>
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(Model).Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },

```

```

 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 };
 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
}
public class EmployeeView
{
 public EmployeeView()
 {
 }

 public EmployeeView(int EmployeeID, string FirstName, string
LastName, string Title, DateTime BirthDate, DateTime HireDate, int
ReportsTo, string Address, string PostalCode, string Phone, string City,
string Country)
 {
 this.EmployeeID = EmployeeID;
 this.FirstName = FirstName;
 this.LastName = LastName;
 this.Title = Title;
 this.BirthDate = BirthDate;
 this.HireDate = HireDate;
 this.ReportsTo = ReportsTo;
 this.Address = Address;
 this.PostalCode = PostalCode;
 this.Phone = Phone;
 this.City = City;
 this.Country = Country;
 }

 public int EmployeeID { get; set; }
 public string FirstName { get; set; }
 public string LastName { get; set; }
 public string Title { get; set; }
 public DateTime BirthDate { get; set; }
 public DateTime HireDate { get; set; }
 public int ReportsTo { get; set; }
 public string Address { get; set; }
 public string PostalCode { get; set; }
 public string Phone { get; set; }
 public string City { get; set; }
 public string Country { get; set; }
 public static List<EmployeeView> GetAllRecords()
 {
 List<EmployeeView> Emp = new List<EmployeeView>();
 Emp.Add(new EmployeeView(1, "Nancy", "Davolio", "Sales
Representative", new DateTime(1948, 12, 08), new DateTime(1992, 05, 01), 2,
"507 - 20th Ave. E.Apt. 2A ", " 98122", "(206) 555-9857 ", "Seattle ",
"USA"));
 Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President,
Sales", new DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W.
Capital Way", "98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
 Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales
Representative", new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3,
" 4110 Old Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
 }
}

```

```

 Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales Representative", new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6, "14 Garrett Hill ", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales Manager", new DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8, "Coventry HouseMiner Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", "USA"));
 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales Representative", new DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2, " 7 Houndstooth Rd.", " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7, "Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "UK "));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9, "722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5, "4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
 return Emp;
 }
}

```

**Note:** By default, DataManager uses JsonAdaptor for local data-binding.

### Remote data

To bind remote data to the query builder, assign service data as an instance of **DataManager** to the [DataSource](#) property. To interact with remote data source, provide the endpoint url.

### CSHTML

```

@Html.EJS().QueryBuilder("RemoteData").DataSource(dataManager =>
{
 dataManger.Url("https://services.syncfusion.com/aspnet/production/api/orders")
 .CrossDomain(true).Adaptor("ODataV4Adaptor");
 }).Columns(col =>
 {
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
 }).Rule(ViewBag.rule).Width("72%").MaxGroupCount(5).Render()

```

### REMOTEDATA.CS

```

public IActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()

```

```

 {
 Condition = "and",
 Rules = new List<QueryBuilderRules>()
 {
 new QueryBuilderRules { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRules { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return view();
 }
}

```

**Note:** By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

#### *Binding with OData services*

**OData** is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManager**. Refer to the following code example for remote Data binding using OData service.

#### **CSHTML**

```

@Html.EJS().QueryBuilder("OData").DataSource(dataManger =>
{
 dataManger.Url("https://services.syncfusion.com/aspnet/production/api/orders")
 .CrossDomain(true).Adaptor("ODataAdaptor");
 }).Columns(col =>
 {
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
 }).Rule(ViewBag.rule).Width("72%").MaxGroupCount(5).Render()
}

```

#### **ODATA.CS**

```

public IActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRules>()
 {
 new QueryBuilderRules { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRules { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 }
}

```

```
};
ViewBag.rule = rule;
return view();
}
```

### Binding with ODataV4 services

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume ODataV4 services. For more details on ODataV4 services, refer to the [odata documentation](#). To bind ODataV4 service, use the **ODataV4Adaptor**.

### CSHTML

```
@Html.EJS().QueryBuilder("OdataV4").DataSource(dataManger =>
{
dataManger.Url("https://services.syncfusion.com/aspnet/production/api/orders")
.CrossDomain(true).Adaptor("ODataV4Adaptor");
}).Columns(col =>
{
col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
col.Field("FirstName").Label("First Name").Type("string").Add();
col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
col.Field("Title").Label("Title").Type("string").Add();
col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
col.Field("Country").Label("Country").Type("string").Add();
col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).Width("72%").MaxGroupCount(5).Render()
```

### ODATAV4.CS

```
public IActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRules>()
 {
 new QueryBuilderRules { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRules { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return view();
}
```

### Web API

You can use **WebApiAdaptor** to bind query builder with Web API created using OData endpoint.

### CSHTML

```
@Html.EJS().QueryBuilder("WebApi").DataSource(dataManger =>
```

```
{
dataManger.Url("api/OrderAPI").CrossDomain(true).Adaptor("WebApiAdaptor");
}).Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).Width("72%")..MaxGroupCount(5).Render()
```

### WEBAPI.CS

```
public IActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRules>()
 {
 new QueryBuilderRules { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRules { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return view();
}
```

### Url adaptor

You can use the UrlAdaptor of DataManager when binding data source from remote data. In the initial load of querybuilder, data are fetched from remote data and bound to the querybuilder using url property of DataManager.

### CSHTML

```
@Html.EJS().QueryBuilder("UrlAdaptor").DataSource(dataManger =>
{
dataManger.Url("Home/QBDataSource").CrossDomain(true).Adaptor("UrlAdaptor");
}).Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
```

```
col.Field("Country").Label("Country").Type("string").Add();
col.Field("City").Label("City").Type("string").Add();
}).Width("72%").MaxGroupCount(5).Render()
```

### URL-DATA.CS

```
public IActionResult QBDataSource([FromBody]DataManagerRequest dm)
{
 IEnumerable DataSource = employeeData;
 DataOperations operation = new DataOperations();
 if (dm.Where != null && dm.Where.Count > 0) //Filtering
 {
 DataSource = operation.PerformFiltering(DataSource,
dm.Where, dm.Where[0].Operator);
 }
 int count = DataSource.Cast<OrdersDetails>().Count();
 if (dm.Skip != 0)
 {
 DataSource = operation.PerformSkip(DataSource, dm.Skip);
//Paging
 }
 if (dm.Take != 0)
 {
 DataSource = operation.PerformTake(DataSource, dm.Take);
 }
 return dm.RequiresCounts ? Json(new { result = DataSource, count
= count }) : Json(DataSource);
}
```

### Support with Data Manager

You can use the created conditions in DataManager through the `GetPredicate` method, which results the filtered records.

### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("850px").Columns(col =>
{
 col.Field("TaskID").Label("Task ID").Type("number").Add();
 col.Field("Name").Label("Name").Type("string").Add();

col.Field("Category").Label("Category").Type("string").Add();
 col.Field("SerialNo").Label("Serial
No").Type("string").Add();
 col.Field("InvoiceNo").Label("Invoice
No").Type("string").Add();
 col.Field("Status").Label("Status").Type("string").Add();
}).Rule(ViewBag.importRules).Render()
@Html.EJS().Button("getpredicate").CssClass("e-primary").Content("Get
Predicate").Render()

<script>
 document.getElementById('getpredicate').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
```

```

 var template =
 '<tr><td>${TaskID}</td><td>${Name}</td><td>${Category}</td></tr>';
 var compileFunction = ej.base.compile(template);
 var table = (document.getElementById('datatable'));
 table.className = 'e-table';
 var predicate =
 querybuilderObj.getPredicate(querybuilderObj.getValidRules(querybuilderObj.rule));
 dataManagerQuery = new ej.data.Query().select(['TaskID', 'Name',
 'Category', 'SerialNo', 'InvoiceNo', 'Status']).where(predicate);
 new
 ej.data.DataManager(@Html.Raw(JsonConvert.SerializeObject(@ViewBag.DataSource)))
 .executeQuery(dataManagerQuery)
 .then(function (e) {
 e.result.forEach(function (data) {
 table.appendChild(compileFunction(data)[0]);
 });
 });
 }
</script>
<style type="text/css">
 .e-hide {
 display: none;
 }
</style>
<body>
 <div id="container">
 <div id="Grid"></div>
 <table id="datatable" class="e-table e-hide">
 <thead>
 <tr><th>Task ID</th><th>Category</th><th>Name</th></tr>
 </thead>
 <tbody>
 </tbody>
 </table>
 </div>
<script>
var ele = document.getElementById('container');
if(ele) {
 ele.style.visibility = "visible";
}
</script>
</body>

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Category",
 Field="Category", Type="string", Operator="equal", Value = "Laptop" }
 }
 }
}

```

```

 }
 };
 ViewBag.rule = rule;
 // hardwareData is referred from MVC sample browser.
 ViewBag.DataSource = QueryBuilderData.hardwareData;
 return View();
}

```

### Grid Integration with QueryBuilder

This section explains how to integrate Grid with QueryBuilder. We have used **UrlAdaptor** to load dataSource to Grid, and the dataSource property is optional for QueryBuilder. So, you can create QueryBuilder with only columns. QueryBuilder interacts with Grid through the **Query** property of a Grid. You can get the query from QueryBuilder and update the Grid Query property in the **ruleChange** event of QueryBuilder. The **UrlAdaptor** works based on the on-demand concept, it will load only current page records from the server and request the next page records when navigating to the next page. Also, we have sent the request to the server for every action performed in the Grid.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("73%").Columns(col =>
{
 col.Field("CustomerID").Label("Customer ID").Type("number").Add();
 col.Field("CompanyName").Label("Company Name").Type("string").Add();
 col.Field("ContactName").Label("Contact Name").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).RuleChange("updateRule").Render()
@Html.EJS().Grid("Grid").DataSource(dataManager => {
dataManager.Url("/Home/UrlDataSource").Adaptor("UrlAdaptor"); }).Columns(col
=>
{
 col.Field("CustomerID").HeaderText("Customer ID").Width("120").Add();
 col.Field("CompanyName").HeaderText("Company Name").Width("120").Add();
 col.Field("ContactName").HeaderText("Contact Name").Width("120").Add();
 col.Field("City").HeaderText("City").Width("120").Add();
}).AllowPaging().Render()
<script>
 function updateRule(args) {
 var dataManagerQuery;
 var qryBldrObj =
ej.base.getComponent(document.getElementById("querybuilder"), 'query-
builder');
 var grid = ej.base.getComponent(document.getElementById("grid"),
'grid');
 var predicate = qryBldrObj.getPredicate(args.rule);
 if (ej.base.isNullOrUndefined(predicate)) {
 dataManagerQuery = new ej.data.Query().select(['CustomerID',
'CompanyName', 'ContactName', 'City']);
 } else {
 dataManagerQuery = new ej.data.Query().select(['CustomerID',
'CompanyName', 'ContactName', 'City']).where(predicate);
 }
 grid.query = dataManagerQuery;
 grid.refresh();
 }
</script>

```

**HOMECONTROLLER.CS**

```

public class HomeController : Controller
{
 private NORTHWNDContext _context;
 public HomeController(NORTHWNDContext context)
 {
 _context = context;
 }
 public IActionResult Index()
 {
 return View();
 }
 private IQueryable<Records> GetDataSource()
 {
 IQueryable<Records> transactions = _context.Records;
 return transactions;
 }
 public IActionResult UrlDatasource([FromBody] DataManagerRequest dm)
 {
 IQueryable<Records> DataSource = GetDataSource();
 QueryableOperation operation = new QueryableOperation();
 if (dm.Where != null && dm.Where.Count > 0) //Filtering
 {
 DataSource = operation.PerformFiltering(DataSource, dm.Where,
dm.Where[0].Condition); //filtering
 }
 if (dm.Search != null && dm.Search.Count > 0)
 {
 DataSource = operation.PerformSearching(DataSource, dm.Search);
//Search
 }
 int count = DataSource.Cast<Records>().Count();
 if (dm.Skip != 0)
 {
 DataSource = operation.PerformSkip(DataSource, dm.Skip);
 }
 if (dm.Take != 0)
 {
 DataSource = operation.PerformTake(DataSource, dm.Take);
 }
 return dm.RequiresCounts ? Json(new { result = DataSource, count =
count }) : Json(DataSource);
 }
}

```

**Model Binding Support**

Model binding allows to bind properties for the components used in field, operator, and value columns. To implement model binding, assign [FieldModel](#), [OperatorModel](#), and [ValueModel](#) properties in QueryBuilder.

**CSHTML**

```
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
```

```

{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
})
).FieldModel(ViewBag.fieldModel).OperatorModel(ViewBag.operatorModel).Value
Model(ViewBag.valueModel).Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 List<string> values = new List<string> { "Mr.", "Mrs." };
 ViewBag.values = values;
 var fieldModel = new { allowFiltering = true, popupHeight =
"380px" };
 var operatorModel = new { allowFiltering = true, popupHeight =
"380px" };
 var valueModel = new { numericTextBoxModel = new { cssClass =
"e-custom" } };
 ViewBag.fieldModel = fieldModel;
 ViewBag.operatorModel = operatorModel;
 ViewBag.valueModel = valueModel;
 return View();
}

```

### Filtering

Query Builder allows you to create or delete conditions and groups. You can use **ShowButtons** to enable/disable these buttons.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).ShowButtons(new
Syncfusion.EJ2.QueryBuilder.QueryBuilderShowButtons { GroupDelete = true,
GroupInsert = true, RuleDelete = true }).Render()
@Html.EJS().Button("addgroup").CssClass("e-primary").Content("Add
Group").Render()

```

```

@Html.EJS().Button("addrule").CssClass("e-primary").Content("Add
Rule").Render()
@Html.EJS().Button("deletegroup").CssClass("e-primary").Content("Delete
Group").Render()

<script>
 document.getElementById('addgroup').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.addGroups([{ 'condition': 'and', 'rules': [{
'label': 'First Name', 'field': 'FirstName', 'type': 'string', 'operator':
'startswith', 'value': 'v' }] }], 'group0');
 }
 document.getElementById('addrule').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.addRules([{ 'label': 'City', 'field': 'City',
'type': 'string', 'operator': 'equal', 'value': 'US' }], 'group0');
 }
 document.getElementById('deletegroup').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.deleteGroups(['group0']);
 }
</script>

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",

 return Emp;
 }
}

```

You can create or delete conditions by interacting through the user interface and methods.

- Use the `addRules` and `deleteRules` methods to create/delete conditions.
- Use the `addGroups` and `deleteGroups` methods to create/delete groups.

## Importing

Importing allows you to view or edit the predefined conditions. You can import the conditions by using methods and initial rendering.

### Initial Rendering

To apply conditions initially, you can define the `Rule`. Here, you can import structured JSON object by defining the `Rule` property.

### CSHTML

```

@model List<QueryBuilderSample.Controllers.EmployeeView>
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(Model).Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
}

```

```

 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
 }
}

public class EmployeeView
{
 public EmployeeView()
 {
 }

 public EmployeeView(int EmployeeID, string FirstName, string
LastName, string Title, DateTime BirthDate, DateTime HireDate, int
ReportsTo, string Address, string PostalCode, string Phone, string City,
string Country)
 {
 this.EmployeeID = EmployeeID;
 this.FirstName = FirstName;
 this.LastName = LastName;
 this.Title = Title;
 this.BirthDate = BirthDate;
 this.HireDate = HireDate;
 this.ReportsTo = ReportsTo;
 this.Address = Address;
 this.PostalCode = PostalCode;
 this.Phone = Phone;
 this.City = City;
 this.Country = Country;
 }

 public int EmployeeID { get; set; }
 public string FirstName { get; set; }
 public string LastName { get; set; }
 public string Title { get; set; }
 public DateTime BirthDate { get; set; }
 public DateTime HireDate { get; set; }
 public int ReportsTo { get; set; }
 public string Address { get; set; }
 public string PostalCode { get; set; }
 public string Phone { get; set; }
 public string City { get; set; }
 public string Country { get; set; }
 public static List<EmployeeView> GetAllRecords()
 {
 List<EmployeeView> Emp = new List<EmployeeView>();

Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7,
"Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "
UK"));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales
Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9,
"722 Moss Bay Blvd. ", "98033 ", " (206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales
Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5,
"4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
 return Emp;
}
}

```

## Post Rendering

### Import from JSON

You can set the conditions from structured JSON object through the `setRules` method.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Render()
@Html.EJS().Button("importrules").CssClass("e-primary").Content("Import
Rule").Render()

<script>
 document.getElementById('importrules').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.setRules({ 'condition': 'or', 'rules': [{ 'label':
'Employee ID', 'field': 'EmployeeID', 'type': 'number', 'operator': 'equal',
'value': '1001' }] });
 }
</script>

```

### DEFAULT.CS

```

public ActionResult Index()
{

```

```

 return View();
}

```

### Import From SQL

You can set the conditions from SQL query through the `setRulesFromSql` method.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("EmployeeID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}) .Render()
@Html.EJS().Button("importrules").CssClass("e-primary").Content("Import
Rule").Render()
<script>
 document.getElementById('importrules').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 querybuilderObj.setRulesFromSql("EmployeeID = 1");
 }
</script>

```

### DEFAULT.CS

```

public ActionResult Index()
{
 return View();
}

```

### Exporting

Exporting allows you to save or maintain the created conditions through the Query Builder. You can export the defined conditions by the following ways.

#### JSON Export

You can export the defined conditions to structured JSON object through the `getRules` method.

#### SQL Support

You can export the defined conditions to SQL query through the `getRulesFromSQL` method.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
}

```

```

 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
 }).Render()

@Html.EJS().Dialog("defaultdialog").Target(".e-query-
builder").Width("50%").Header("Query
builder").Visible(false).ShowCloseIcon(true).Render()
@Html.EJS().Button("getsql").CssClass("e-primary").Content("Get
Sql").Render()
@Html.EJS().Button("getrule").CssClass("e-primary").Content("Get
Rule").Render()
<script>
 document.getElementById('getsql').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 var dialogObj =
ej.base.getInstance(document.getElementById("defaultdialog"),
ej.popups.Dialog);
 dialogObj.content =
querybuilderObj.getSqlFromRules(querybuilderObj.getRules());
 dialogObj.show();
 }
 document.getElementById('getrule').onclick = function () {
 var querybuilderObj =
ej.base.getInstance(document.getElementById("querybuilder"),
ej.querybuilder.QueryBuilder);
 var dialogObj =
ej.base.getInstance(document.getElementById("defaultdialog"),
ej.popups.Dialog);
 dialogObj.content = '<pre>' +
JSON.stringify(querybuilderObj.getValidRules(querybuilderObj.rule), null, 4)
+ '</pre>';
 dialogObj.show();
 }
</script>

```

## DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",
Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 }
}

```

```
};
ViewBag.rule = rule;
return View();
}
```

## Localization

The **Localization** library allows you to localize the default text content of the Query Builder. The Query Builder has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the **Locale** value and translation object.

The following list of properties and its values are used in the Query Builder.

|                    |                        |
|--------------------|------------------------|
| Locale key words   | Text                   |
| -----              | -----                  |
| AddGroup           | Add Group              |
| AddCondition       | Add Condition          |
| DeleteRule         | Remove this condition  |
| DeleteGroup        | Delete group           |
| Edit               | EDIT                   |

## Styles and Appearances

To modify the QueryBuilder appearance, you need to override the default CSS of QueryBuilder component. Find the list of CSS classes and its corresponding section in QueryBuilder component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

### CSS Class | Purpose of Class

|.e-group-header .e-btn|To customize the condition button in querybuilder

|.e-group-body .e-rule-container|To customize the querybuilder rule container

|.e-group-container .e-group-header .e-dropdown-btn|To customize the querybuilder Add group/condition button

`|.e-query-builder .e-group-header .e-deletegroup|` To customize the querybuilder Delete group button

`|.e-query-builder .e-rule-field .e-rule-value-delete .e-rule-delete|` To customize the querybuilder Delete condition button

`|.e-query-builder .e-rule-list > ::after, .e-query-builder .e-rule-list > ::before|` To customize the querybuilder group joining line

`|.e-query-builder .e-rule-container.e-joined-rule|` To customize the querybuilder condition joining line

## Templates

### Header Template

Header Template allows to define your own user interface for Header, which includes creating or deleting rules and groups and to customize the AND/OR condition and NOT condition options. To implement header template in querybuilder, you can create the user interface using `x-template` and assign the values when `requestType` is `header-template-create` in `actionBegin` event.

### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("850px").HeaderTemplate("#headerTemplate").ActionBegin("actionBegin").EnableNotCondition(true).Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("LastName").Label("LastName").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.importRules).MaxGroupCount(5).Render()
</div>
</div>
</div>
<style>
.e-query-builder .e-add-btn {
 margin-left: 10px;
 margin-right: 10px;
}
.e-query-builder .cndtnbtn.e-control.e-dropdownlist.e-lib.e-input {
 padding-left: 10px;
}
.e-query-builder span.e-custom-group-btn {
 max-width: 100px;
 border-radius: 5px !important;
 border-width: 1px !important;
 margin-top: 3px;
}
.e-query-builder .e-custom-group-btn.e-input-focus::before, .e-custom-group-btn.e-input-focus::after {
 background: transparent !important;
}
```

```

 }
 .e-query-builder .e-group-header .e-addrulegroup, .e-group-header .e-
delete-btn {
 border: 1px solid grey !important;
 }
 .e-query-builder .e-group-header .e-addrulegroup:hover, .e-group-header
.e-delete-btn:hover {
 border: 1px solid grey !important;
 }
 .e-query-builder .e-toggle {
 background: #317ab9;
 border-color: #317ab9;
 color: #fff;
 }

```

### Accessibility in Query builder control

The Query Builder component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Query Builder component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

```

| Keyboard Navigation Support | |
| Accessibility Checker Validation | |
| Axe-core Accessibility Validation | |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

The following list of ARIA attributes is used in Query Builder.

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the query builder component. |

### Keyboard interaction

The Query Builder component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Query Builder component.

| **Press** | **To do this** |

| --- | --- |

| **Tab / Shift + Tab** | **To focus the next item in the rule.** |

### Ensuring accessibility

The Query Builder component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Query Builder component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Query Builder component with accessibility tools.

## How To

### Display Options

Display options allow you to view the Query Builder Vertically or Horizontally. For this, you should use the `DisplayMode` property.

### CSHTML

```
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(ViewBag.dataSource).Rule(ViewBag.rule).DisplayMode(Syncfusion.
EJ2.QueryBuilder.DisplayMode.Vertical).Render()
```

### DEFAULT.CS

```
public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
}

public class EmployeeView
{
 public EmployeeView()
 {
 }
}
```

```

 public EmployeeView(int EmployeeID, string FirstName, string

 return Emp;
 }
}

```

**Note:** The default view in the desktop mode is Horizontal.

<br/> The default view in the mobile mode is Vertical.

### Sort the columns

SortDirection allows you to sort the columns bounded to the Query Builder to view the columns by ascending or descending order. You should set the **SortDirection** property to sort the fields.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
})
.DataSource(ViewBag.dataSource).Rule(ViewBag.rule).SortDirection(Syncfusio
n.EJ2.QueryBuilder.SortDirection.Ascending).Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",

"USA"));
 Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President,
Sales", new DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W.
Capital Way", "98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
 Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales
Representative", new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3,
" 4110 Old Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
 Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales
Representative", new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6,
"14 Garrett Hill ", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales Manager",
new DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8, "Coventry
HouseMiner Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", " USA"));
 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales
Representative", new DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2,
" 7 Houndstooth Rd.", " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales
Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7,

```

```

"Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "
UK")));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales
Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9,
"722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales
Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5,
"4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
 return Emp;
}
}

```

### Restrict the groups

You can restrict the groups by defining the `MaxGroupCount` property. By default, the value is 5. In the below demo, the `MaxGroupCount` is set to 2 .

### CSHTML

```

@model List<QueryBuilderSample.Controllers.EmployeeView>
@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(Model).Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID",
Field="EmployeeID", Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
}

public class EmployeeView
{
 public EmployeeView()
 {

```

```

 }
 public EmployeeView(int EmployeeID, string FirstName, string

 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales
Manager", new DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8,
"Coventry House Miner Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", "
USA"));
 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales
Representative", new DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2,
" 7 Houndstooth Rd.", " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales
Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7,

```

```

"Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "
UK")));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales
Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9,
"722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales
Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5,
"4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", " London", "UK "));
 return Emp;
}
}

```

**Note:** You can use this property in the mobile mode to restrict the nested group creation.

### State Persistence

State persistence allows you to maintain the current state in the browser's `localStorage` even if the browser is refreshed or if you move to the next page within the browser. State persistence stores the Query Builder's `Rule` object in the local storage when the `EnablePersistence` is defined to true.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).DataSource(ViewBag.dataSource).Rule(ViewBag.rule).EnablePersistence(true)
.Render()

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",
Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 ViewBag.dataSource = EmployeeView.GetAllRecords();
 return View();
}

```

```

public class EmployeeView
{
 public EmployeeView()
 {
 }
 public EmployeeView(int EmployeeID, string FirstName, string LastName,
string Title, DateTime BirthDate, DateTime HireDate, int ReportsTo, string
Address, string PostalCode, string Phone, string City, string Country)
 {
 this.EmployeeID = EmployeeID;
 this.FirstName = FirstName;
 this.LastName = LastName;
 this.Title = Title;

 public string Address { get; set; }
 public string PostalCode { get; set; }
 public string Phone { get; set; }
 public string City { get; set; }
 public string Country { get; set; }
 public static List<EmployeeView> GetAllRecords()
 {
 List<EmployeeView> Emp = new List<EmployeeView>();
 Emp.Add(new EmployeeView(1, "Nancy", "Davolio", "Sales
Representative", new DateTime(1948, 12, 08), new DateTime(1992, 05, 01), 2,
"507 - 20th Ave. E.Apt. 2A ", " 98122", "(206) 555-9857 ", "Seattle ",
"USA"));
 Emp.Add(new EmployeeView(2, "Andrew", "Fuller", "Vice President,
Sales", new DateTime(1952, 02, 19), new DateTime(1992, 08, 14), 4, "908 W.
Capital Way", "98401 ", "(206) 555-9482 ", "Kirkland ", "USA"));
 Emp.Add(new EmployeeView(3, "Janet", "Leverling", "Sales
Representative", new DateTime(1963, 08, 30), new DateTime(1992, 04, 01), 3,
" 4110 Old Redmond Rd.", "98052 ", "(206) 555-8122", "Redmond ", "USA "));
 Emp.Add(new EmployeeView(4, "Margaret", "Peacock", "Sales
Representative", new DateTime(1937, 09, 19), new DateTime(1993, 05, 03), 6,
"14 Garrett Hill ", "SW1 8JR ", "(71) 555-4848 ", "London ", "UK "));
 Emp.Add(new EmployeeView(5, "Steven", "Buchanan", "Sales Manager",
new DateTime(1955, 03, 04), new DateTime(1993, 10, 17), 8, "Coventry
HouseMiner Rd. ", "EC2 7JR ", "(206) 555-8122", "Tacoma ", " USA"));
 Emp.Add(new EmployeeView(6, "Michael", "Suyama", "Sales
Representative", new DateTime(1963, 07, 02), new DateTime(1993, 10, 17), 2,
" 7 Houndstooth Rd.", " WG2 7LT", "(71) 555-4444 ", "London ", "UK "));
 }
}

```

```

 Emp.Add(new EmployeeView(7, "Robert", "King", "Sales Representative", new DateTime(1960, 05, 29), new DateTime(1994, 01, 02), 7, "Edgeham HollowWinchester Way ", "RG1 9SP ", "(71) 555-5598 ", "London ", "UK"));
 Emp.Add(new EmployeeView(8, "Laura", "Callahan", "Inside Sales Coordinator", new DateTime(1958, 01, 09), new DateTime(1994, 03, 05), 9, "722 Moss Bay Blvd. ", "98033 ", "(206) 555-3412", "Seattle ", "USA "));
 Emp.Add(new EmployeeView(9, "Anne", "Dodsworth", "Sales Representative", new DateTime(1966, 01, 27), new DateTime(1994, 11, 15), 5, "4726 - 11th Ave. N.E. ", "98105 ", "(71) 555-5598 ", "London", "UK"));
 return Emp;
}
}

```

### Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Query Builder component from right-to-left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL, set the `EnableRtl` to true.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).EnableRtl(true).Locale("ar-AE").Render()
<script type="text/javascript">
var qbObj = document.getElementById('querybuilder1').ej2_instances[0];
ej.base.L10n.load({
 'ar-AE': {
 'querybuilder': {
 'AddGroup': 'إضافة مجموعة',
 'AddCondition': 'إضافة الشرط',
 'DeleteRule': 'أزل هذا الشرط',
 'DeleteGroup': 'حذف المجموعة',
 'Edit': 'تصحيح',
 'SelectField': 'اختر مجال',
 'DeleteRule': 'أزل هذا الشرط',
 'DeleteGroup': 'حذف المجموعة',
 'SelectOperator': 'حدد المشغل',
 'StartsWith': 'أبدأ بـ',
 'EndsWith': 'ينتهي مع',
 'Contains': 'يحتوي على',
 'Equal': 'متساو',
 'NotEqual': 'ليس متساوي',
 'LessThan': 'أقل من',
 'LessThanOrEqual': 'أصغر من أو يساوي',
 'GreaterThan': 'أكبر من',
 'GreaterThanOrEqual': 'أكبر من أو يساوي',

```

```

 'Between': 'ما بين',
 'NotBetween': 'ليس بينهما',
 'In': 'في',
 'NotIn': 'ليس في',
 'Remove': 'إزالة',
 'ValidationMessage': 'هذه الخانة مطلوبة'
 }
}
});
</script>

```

### DEFAULT.CS

```

public ActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {
 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",
Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return View();
}

```

### Summary View

Summary view allows you to show or hide the filtered query. By default, the value is false. You can enable by setting the `summaryView` property to true.

### CSHTML

```

@Html.EJS().QueryBuilder("querybuilder").Width("72%").Columns(col =>
{
 col.Field("EmployeeID").Label("Employee ID").Type("number").Add();
 col.Field("FirstName").Label("First Name").Type("string").Add();
 col.Field("TitleOfCourtesy").Label("Title Of
Courtesy").Type("boolean").Values(new List<string> { "Mr.", "Mrs." }).Add();
 col.Field("Title").Label("Title").Type("string").Add();
 col.Field("HireDate").Label("Hire
Date").Type("date").Format("dd/MM/yyyy").Add();
 col.Field("Country").Label("Country").Type("string").Add();
 col.Field("City").Label("City").Type("string").Add();
}).Rule(ViewBag.rule).SummaryView(true).Render()

```

### DEFAULT.CS

```

public IActionResult Index()
{
 QueryBuilderRule rule = new QueryBuilderRule()
 {

```

```

 Condition = "and",
 Rules = new List<QueryBuilderRule>()
 {
 new QueryBuilderRule { Label="Employee ID", Field="EmployeeID",
Type="number", Operator="equal", Value = 1 },
 new QueryBuilderRule { Label="Title", Field="Title",
Type="string", Operator="equal", Value = "Sales Manager" }
 }
 };
 ViewBag.rule = rule;
 return View();
}

```

## RadioButton

### Getting Started with ASP.NET MVC Radio Button Control

This section briefly explains about how to include [ASP.NET MVC Radio Button](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

<add namespace="Syncfusion.EJ2"/>

```
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Radio Button control

Now, add the Syncfusion ASP.NET MVC Radio Button control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Option 1").Name("default").Render()
@Html.EJS().RadioButton("radio2").Label("Option 2").Name("default").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Radio Button control will be rendered in the default web browser.

☐ Option 1 ☒ Option 2 .

### Change the Radio Button state

The Radio Button contains 2 states visually, they are as follows:

- Checked
- Unchecked

The Radio Button [Checked](#) property is used to handle the checked and unchecked state. In the checked state an inner circle will be added to the visualization of Radio Button.

#### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Option
1").Name("state").Checked(true).Render()
@Html.EJS().RadioButton("radio2").Label("Option 2").Name("state").Render()
```

**Note:** [View Sample in GitHub.](#)

**Note:** You can also explore our [ASP.NET MVC Radio Button Example](#) that shows you how to render the Radio Button in ASP.NET MVC.

### Label and Size in Radio Button Component

This section explains the different sizes and labels.

#### Label

RadioButton caption can be defined by using the [label](#) property.

This reduces the manual addition of label for RadioButton. You can customize the label position before or after the RadioButton through the [labelPosition](#) property.

#### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Option
1").Name("state").Checked(true).Render()
@Html.EJS().RadioButton("radio2").Label("Option 2").Name("state").Render()
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
li {
 list-style: none;
}
</style>
```

#### LABEL.CS

```
public ActionResult Label()
{
 return View();
}
```

Left Side Label ☒

☐ Right Side Label

### Size

The different RadioButton sizes available are default and small. To reduce the size of the default RadioButton to small, set the [cssClass](#) property to `e-small`.

### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Small").Name("size").CssClass("e-small").Checked(true).Render()
@Html.EJS().RadioButton("radio2").Label("Default").Name("size").Render()
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
li {
 list-style: none;
}
</style>
```

### SIZE.CS

```
public ActionResult Size()
{
 return View();
}
```

☒ Small

☐ Default

### See Also

- [How to customize the RadioButton appearance](#)

### Styles and Appearances

To modify the RadioButton appearance, you need to override the default CSS of RadioButton component. Find the list of CSS classes and its corresponding section in RadioButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

#### CSS Class | Purpose of Class

`|.e-radio-wrapper|` To customize the radio button wrapper

`|.e-radio + label:hover::before|` To customize the radiobutton on hover

`|.e-radio:checked + label::after, e-radio:checked + label::before |` To customize the checked radiobutton

`|.e-radio:checked:focus + label::before, .e-radio:checked + label:hover::before |` To customize the checked radiobutton on hover

 Warning

 Danger

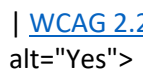

### Accessibility in Radio Button Component

The Radio button component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Radio button component is outlined below.

| Accessibility Criteria | Compatibility |

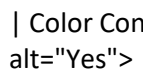

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes"> |

| [Section 508](#) Support |  alt="Yes"> |

| Screen Reader Support |  alt="Yes"> |

| Right-To-Left Support |  alt="Yes"> |

| Color Contrast |  alt="Yes"> |

| Mobile Device Support |  alt="Yes"> |

| Keyboard Navigation Support |  alt="Yes"> |

| [Accessibility Checker](#) Validation |  alt="Yes"> |

| [Axe-core](#) Accessibility Validation |  alt="Yes"> |

<style>

.post .post-content img {

```
display: inline-block;
margin: 0.5em 0;
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Radio button component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Radio button component:

| Attributes | Purpose |
|------------|---------|
|------------|---------|

|     |     |
|-----|-----|
| --- | --- |
|-----|-----|

|               |                                                                                                      |
|---------------|------------------------------------------------------------------------------------------------------|
| aria-disabled | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |
|---------------|------------------------------------------------------------------------------------------------------|

### Keyboard interaction

The Radio button component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Radio button component.

| Press | To do this |
|-------|------------|
|-------|------------|

|     |     |
|-----|-----|
| --- | --- |
|-----|-----|

|               |                                       |
|---------------|---------------------------------------|
| UP/Left arrow | Move and select the previous options. |
|---------------|---------------------------------------|

|                  |                                   |
|------------------|-----------------------------------|
| Down/Right arrow | Move and select the next options. |
|------------------|-----------------------------------|

### Ensuring accessibility

The Radio button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Radio button component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Radio button.html) in a new window to evaluate the accessibility of the Radio button component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET Core controls](#)

### How To

#### Customize RadioButton Appearance

You can customize the appearance of the RadioButton component by using the CSS rules.

Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the RadioButton is customized through the custom classes to create the primary, success, info, warning, and danger type of RadioButton.

### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Primary").Name("custom").CssClass("e-primary").Render()
@Html.EJS().RadioButton("radio2").Label("Success").Name("custom").CssClass("e-success").Render()
@Html.EJS().RadioButton("radio3").Label("Info").Name("custom").CssClass("e-info").Checked(true).Render()
@Html.EJS().RadioButton("radio4").Label("Warning").Name("custom").CssClass("e-warning").Render()
@Html.EJS().RadioButton("radio5").Label("Danger").Name("custom").CssClass("e-danger").Render()
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
li {
 list-style: none;
}
.e-success .e-radio:checked + label::after { /* csslint allow: adjoining-classes */
 background-color: #689f38;
 border-color: #689f38;
}
.e-success .e-radio:checked:focus + label::after, .e-success .e-radio:checked + label:hover::after { /* csslint allow: adjoining-classes */
 background-color: #449d44;
 border-color: #449d44;
}
.e-success .e-radio:checked + label::before {
 border-color: #689f38;
}
.e-success .e-radio:checked:focus + label::before, .e-success .e-radio:checked + label:hover::before { /* csslint allow: adjoining-classes */
 border-color: #449d44;
}
.e-success .e-radio + label:hover::before {
 border-color: #blafaf
}
.e-info .e-radio:checked + label::after { /* csslint allow: adjoining-classes */
 background-color: #2196f3;
 border-color: #2196f3;
}
.e-info .e-radio:checked:focus + label::after, .e-info .e-radio:checked + label:hover::after { /* csslint allow: adjoining-classes */
 background-color: #0b7dda;
 border-color: #0b7dda;
}
.e-info .e-radio:checked + label::before {
 border-color: #2196f3;
}
```

```

.e-info .e-radio:checked:focus + label::before, .e-info .e-radio:checked +
label:hover::before {
 border-color: #0b7dda;
}
.e-info .e-radio + label:hover::before {
 border-color: #b1afaf
}
.e-warning .e-radio:checked + label::after { /* csslint allow: adjoining-
classes */
 background-color: #ef6c00;
 border-color: #ef6c00;
}
.e-warning .e-radio:checked:focus + label::after, .e-warning .e-
radio:checked + label:hover::after { /* csslint allow: adjoining-classes */
 background-color: #cc5c00;
}
.e-radio:checked + .e-warning::before {
 border-color: #ef6c00;
}
.e-warning .e-radio:checked:focus + label::before, .e-warning .e-
radio:checked + label:hover::before {
 border-color: #cc5c00;
}
.e-warning .e-radio + label:hover::before {
 border-color: #b1afaf
}
.e-danger .e-radio:checked + label::after { /* csslint allow: adjoining-
classes */
 background-color: #d84315;
 border-color: #d84315;
}
.e-danger .e-radio:checked:focus + label::after, .e-danger .e-radio:checked
+ label:hover::after { /* csslint allow: adjoining-classes */
 background-color: #ba330a;
 border-color: #ba330a;
}
.e-danger .e-radio:checked + label::before {
 border-color: #d84315;
}
.e-danger .e-radio:checked:focus + label::before, .e-danger .e-radio:checked
+ label:hover::before {
 border-color: #ba330a;
}
.e-danger .e-radio + label:hover::before {
 border-color: #b1afaf
}
</style>

```

### CUSTOM.CS

```

public ActionResult Custom()
{
 return View();
}

```

### Name and Value in form submit

The name attribute of the RadioButton is used to group RadioButton. When the RadioButton are grouped in form, the checked items value attribute will be post to server on form submit that can be retrieved through the name. The disabled RadioButton value will not be sent to the server on form submit.

In the following code snippet, Credit and Debit card is in checked state. Now, the value that is in checked state will be sent on form submit.

#### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Credit/Debit
Card").Name("payment").Checked(true).Render()
@Html.EJS().RadioButton("radio2").Label("Net
Banking").Name("payment").Render()
@Html.EJS().RadioButton("radio3").Label("Cash on
Delivery").Name("payment").Render()
@Html.EJS().RadioButton("radio4").Label("Others").Name("payment").Render()
@Html.EJS().Button("primarybtn").Content("Submit").IsPrimary(true).Render()
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
button {
 margin: 20px 0 0 5px;
}
li {
 list-style: none;
}
</style>
```

#### FORM.CS

```
public ActionResult Form()
{
 return View();
}
```

### Right-To-Left

RadioButton component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in RadioButton component.

#### CSHTML

```
@section ControlsSection{

@Html.EJS().RadioButton("radio1").Label("Default").Name("default").EnableRtl
(true).Render()
}
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
li {
 list-style: none;
}
```

```
}
</style>
```

### RTL.CS

```
public ActionResult Rtl()
{
 return View();
}
```

### Set the disabled state

RadioButton component can be enabled/disabled by giving [disabled](#) property. To disable RadioButton component, the `disabled` property can be set as `true`.

### CSHTML

```
@Html.EJS().RadioButton("radio1").Label("Option
1").Name("default").Checked(true).Render()
@Html.EJS().RadioButton("radio2").Label("Option
2").Name("default").Disabled(true).Render()
@Html.EJS().RadioButton("radio3").Label("Option 3").Name("default").Render()
<style>
.e-radio-wrapper {
 margin-top: 18px;
}
button {
 margin: 20px 0 0 5px;
}
li {
 list-style: none;
}
</style>
```

### DISABLED.CS

```
public ActionResult Disabled()
{
 return View();
}
```

## Migration from Essential JS 1

This article describes the API migration process of RadioButton component from Essential JS 1 to Essential JS 2.

### Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Label | **Property:** `text` <br/><br/> `@Html.EJ().RadioButton("radio").Text("RadioButton")` |

**Property:** `label` <br/><br/> `@Html.EJS().RadioButton("radio").Label("RadioButton").Render()` |

| Checked state | **Property:** *checked* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").Checked(true) | **Property:** *checked*  
 <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").Checked(true).Render() |

| Adding custom css class | **Property:** *cssClass* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").CssClass("custom-class") | **Property:**  
*cssClass* <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").CssClass("custom-  
 class").Render() |

| Disabled state | **Property:** *enabled* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").Enabled(false) | **Property:** *disabled*  
 <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").Disabled(true).Render() |

| State persistence | **Property:** *enablePersistence* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").EnablePersistence(true) | **Property:**  
*enablePersistence* <br/><br/>  
 @Html.EJS().RadioButton("radio").Label("RadioButton").EnablePersistence(true).Render() |

| RTL | **Property:** *enableRTL* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").EnableRTL(true) | **Property:** *enableRtl*  
 <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").EnableRtl(true).Render() |

| HTML Attributes | **Property:** *htmlAttributes* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").HtmlAttributes("") | Not applicable |

| Id property | **Property:** *id* <br/><br/> @Html.EJ().RadioButton("radio").Id("sync") | Not applicable  
 |

| Prefix value of Id | **Property:** *idPrefix* <br/><br/> @Html.EJ().RadioButton("radio").IdPrefix("ej") |  
 Not applicable |

| Name attribute | **Property:** *name* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("Male").Name("gender") | **Property:** *name* <br/><br/>  
 @Html.EJS().RadioButton("radio").Label("Male").Name("gender").Render() |

| Value attribute | **Property:** *value* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("Male").Name("gender").Value("male") | **Property:** *value*  
 <br/><br/>  
 @Html.EJS().RadioButton("radio").Label("Male").Name("gender").Value("male").Render() |

| Size | **Property:** *size* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("Small").Size(RadioButtonSize.Small) | **Property:** *size*  
 <br/><br/> @Html.EJS().RadioButton("radio").Label("Small").CssClass("e-small").Render() |

| Validation rules | **Property:** *validationRules* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").ValidationRules(ViewBag.rules) | Not  
 applicable |

| Validation message | **Property:** *validationMessage* <br/><br/>  
 @Html.EJ().RadioButton("radio").Text("RadioButton").ValidationRules(ViewBag.rules).Validatio  
 nMessage(ViewBag.message) | Not applicable |

## Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy | **Method:** *destroy* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton") <br/> var radiobutton = \$("#radio").data("ejRadioButton");<br/>radiobutton.destroy(); | **Method:** *destroy* <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").Render() <br/> var radiobutton = document.getElementById('radio').ej2\_instances[0]; <br/>radiobutton.destroy(); |

| Disable the RadioButton | **Method:** *disable* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton") <br/> var radiobutton = \$("#radio").data("ejRadioButton");<br/>radiobutton.disable(); | Not applicable |

| Enable the RadioButton | **Method:** *enable* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton") <br/> var radiobutton = \$("#radio").data("ejRadioButton");<br/>radiobutton.enable(); | Not applicable |

## Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeChange Event | **Event:** *beforeChange* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton").BeforeChange("beforeChange") <br/><br/>function beforeChange(args) {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} | Not applicable |

| Change Event | **Event:** *change* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton").Change("change") <br/><br/>function change(args) {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} | Event: *change* <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").Change("change").Render() <br/><br/>function change(args) {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} |

| Create Event | **Event:** *create* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton").Create("create") <br/><br/>function create(args) {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} | Event: *created* <br/><br/> @Html.EJS().RadioButton("radio").Label("RadioButton").Created("created").Render() <br/><br/>function created() {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} |

| Destroy Event | **Event:** *destroy* <br/><br/> @Html.EJ().RadioButton("radio").Text("RadioButton").Destroy("destroy") <br/><br/>function destroy(args) {<br/> &#160;&#160;&#160;&#160;/ code block / <br/>} | Not applicable |

## Range Navigator

### Getting Started with ASP.NET MVC Range Navigator Control

This section briefly explains about how to include [ASP.NET MVC Range Navigator](#) control in your ASP.NET MVC application using Visual Studio.

### Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](https://nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add script resources

Here, the script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

#### **~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

## Add ASP.NET MVC Range Navigator control

Now, add the Syncfusion ASP.NET MVC Range Navigator control in `~/Views/Home/Index.cshtml` page.

**CSHTML**

```
@(Html.EJS().RangeNavigator("container").Render())
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Range Navigator control will be rendered in the default web browser.

## Populate range navigator with data

Now, we are going to provide data to the range navigator. Add a series object to the range navigator by using series property. Now map the field names x and y in the JSON data to the [xName](#) and [yName](#) properties of the [series](#), then set the JSON data to dataSource property. Since the JSON contains Datetime data, set the [valueType](#) as `DateTime`. By default, the axis valueType is Numeric.

**CSHTML**

```
@model List<RangeNavigatorSample.Controllers.data>
@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(Model).Add();
 }).Render()
)
```

**HOMECONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 }
 }
}
```

```

new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
};
return View(dataSource);
}
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

**Note:** [View Sample in GitHub.](#)

### Selecting Range

The Range Selector's left and right thumbs are used to indicate the selected range in the large collection of data. A range can be selected in the following ways:

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and the end through the `value` property.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Value(ViewBag.range)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### RANGE.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 }
 }
}

```

```

 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48
 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50
 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66
 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78
 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Lightweight range navigator

By default, when the `dataSource` for `series` is empty, a lightweight Range Selector will be shown without Chart.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Value(ViewBag.range)
.XName("x").YName("y").DataSource(ViewBag.dataSource)
.Render()
)

```

### LIGHT-WEIGHT.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28
 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44
 },
 },
}

```

```

 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48
 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50
 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66
 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78
 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

## See Also

- [Period Selector](#)

## Series Types

To render the data, the Range Selector supports three types of series.

<!-- markdownlint-disable MD036 -->

### Line

<!-- markdownlint-disable MD036 -->

To render a line series, use series **type** as **Line**. By default, the line series is rendered in the Range Selector.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")

.Tooltip(tl=>tl.Enable(true).Format("yyyy/MM/dd").DisplayMode(Syncfusion.EJ2.Charts.TooltipDisplayMode.Always))

 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Type(Syncfusion.EJ2.Charts.RangeNavigatorType.Line).Add();
 }
)

```

```

 }).Render()
)

```

### LINE.CS

```

public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Area

To render an area series, use series **type** as **Area**.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")

.Tooltip(tl=>tl.Enable(true).Format("yyyy/MM/dd").DisplayMode(Syncfusion.EJ2.Charts.TooltipDisplayMode.Always))

```

```

 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Type(Syncfusion.EJ2.Charts.RangeNavigatorType.Area).Add();
 }).Render()
)

```

### AREA.CS

```

public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### StepLine

To render a Step line series, use series **type** as **Step Line**

### CSHTML

```
@(Html.EJS().RangeNavigator("container"))
```

```

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy").

.Tooltip(tl=>tl.Enable(true).Format("yyyy/MM/dd").DisplayMode(Syncfusion.EJ2.Charts.TooltipDisplayMode.Always))

 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Type(Syncfusion.EJ2.Charts.RangeNavigatorType.StepLine).Add();
 }).Render()
)

```

**STEP.CS**

```

public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

<!-- markdownlint-disable MD036 -->

## Types of data

### Numeric

The numeric scale is used to represent the numeric values of data in a Range Selector. By default, the **valueType** of a Range Selector is **Double**.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

### DOUBLE.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

### Range

The minimum and the maximum of the scale will be calculated automatically based on the provided data. It can be customized by using the `minimum`, `maximum`, and `interval` properties.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .Minimum(10)
 .Maximum(400)
 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

### RANGE.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

### Label Format

The numeric labels can be formatted using the `labelFormat` property and it supports all the globalized formats.

**CSHTML**

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

**FORMAT.CS**

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

| Label Value | Label Format property value | Result  | Description                              |
|-------------|-----------------------------|---------|------------------------------------------|
| 1000        | n1                          | 1000.0  | The Number is rounded to 1 decimal place |
| 1000        | n2                          | 1000.00 | The Number is rounded to 2 decimal place |

|      |    |            |                                                                                    |
|------|----|------------|------------------------------------------------------------------------------------|
| 1000 | n3 | 1000.000   | The Number is rounded to 3 decimal place                                           |
| 0.01 | p1 | 1.0%       | The Number is converted to percentage with 1 decimal place                         |
| 0.01 | p2 | 1.00%      | The Number is converted to percentage with 2 decimal place                         |
| 0.01 | p3 | 1.000%     | The Number is converted to percentage with 3 decimal place                         |
| 1000 | c1 | \$1,000.0  | The Currency symbol is appended to number and number is rounded to 1 decimal place |
| 1000 | c2 | \$1,000.00 | The Currency symbol is appended to number and number is rounded to 2 decimal place |

### Custom Label Format

The Range Selector also supports the Custom Label formats using the placeholders such as **{value}\$**, in which the value represents the axis label, e.g. 20\$.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {

sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

### FORMAT.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
```

```

 public double y1;
 }

```

### Logarithmic Axis

<!-- markdownlint-disable MD033 -->

The Logarithmic supports the logarithmic scale, and it is used to visualize the data when the Range Selector has numerical values in both the lower (e.g.: 10-6) and the higher (e.g.: 106) orders of the magnitude.

### CSHTML

```

@ (Html.EJS() .RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.Logarithmic)
 .Series(sr =>
 {
sr.XName("y").YName("y1").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### LOG.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 100, y1 = 44 },
 new data { y = 500, y1 = 48 },
 new data { y = 1000, y1 = 50 },
 new data { y = 5000, y1 = 66 },
 new data { y = 7000, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}

```

### Range

The minimum and the maximum of the Range Selector will be calculated automatically based on the provided data. It can be customized by using the `minimum`, `maximum`, and `interval` properties.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.Logarithmic)
 .Minimum(10)
 .Maximum(1000)
 .Series(sr =>
 {
sr.XName("y").YName("y1").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

### LOG-RANGE.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 100, y1 = 44 },
 new data { y = 500, y1 = 48 },
 new data { y = 1000, y1 = 50 },
 new data { y = 5000, y1 = 66 },
 new data { y = 7000, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

### Logarithmic Base

The Logarithmic Base can be customized using the `logBase` property. The default value of this property is **10**.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.Logarithmic)
 .LogBase(10)
 .Series(sr =>
 {
sr.XName("y").YName("y1").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

### LOG-BASE.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 100, y1 = 44 },
 new data { y = 500, y1 = 48 },
 new data { y = 1000, y1 = 50 },
 new data { y = 5000, y1 = 66 },
 new data { y = 7000, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

### Date-time

The Range Selector supports the DateTime scale and displays the DateTime values as labels in the specified format.

#### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

#### DATE-TIME.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}
```

**Note:** Date-time Range navigator supports date-time scale and displays date-time values as a labels in the specified format.

#### Interval Customization

The DateTime intervals can be customized using the `interval` and the `intervalType` properties of the Range Selector. For example, if the `interval` is set to 2 and the `intervalType` is set to years, the interval will be considered to be 2 years.

DateTime supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes

#### CSHTML

```
@(Html.EJS().RangeNavigator("container")
.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.IntervalType("Months")
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

#### DATE-TIME-INTERVAL.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
}
```

```

 ViewBag.dataSource = dataSource;
 return View();
 }
 public class data
 {
 public DateTime x;
 public double y;
 public double y1;
 }

```

### Label Format

The `labelFormat` property is used to format and parse the date to all globalize format.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("'y/M/d'")
 .Series(sr =>
 {
 sr.XName("x").YName("y").Type(Syncfusion.EJ2.Charts.RangeNavigatorType.Area)
 .DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### DATE-TIME-FORMAT.CS

```

public ActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

```

```

 }
 public class data
 {
 public DateTime x;
 public double y;
 public double y1;
 }

```

The following table shows the results of applying some common DateTime formats to the `labelFormat` property.

<!-- markdownlint-disable MD033 -->

| Label Value            | Label Format Property Value | Result      | Description                                            |
|------------------------|-----------------------------|-------------|--------------------------------------------------------|
| new Date(2000, 03, 10) | EEEE                        | Monday      | The Date is displayed in day format                    |
| new Date(2000, 03, 10) | yMd                         | 04/10/2000  | The Date is displayed in month/date/year format        |
| new Date(2000, 03, 10) | MMM                         | Apr         | The Shorthand month for the date is displayed          |
| new Date(2000, 03, 10) | hm                          | 12:00 AM    | Time of the date value is displayed as label           |
| new Date(2000, 03, 10) | hms                         | 12:00:00 AM | The Label is displayed in hours:minutes:seconds format |

## Period selector

The period selector allows to select a range with specified periods.

### Periods

An array of objects that allows the users to specify pre-defined time intervals. The `interval` property specifies the count value of the button, and the `text` property specifies the text to be displayed on the button. The `intervaltype` property allows the users to customize the interval type, and it supports the following types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

### CSHTML

```
@(Html.EJS().RangeNavigator("container"))
```

```

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .PeriodSelectorSettings(ps =>
ps.Position(Syncfusion.EJ2.Charts.PeriodSelectorPosition.Top).Periods(ViewBag.periods))
 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### PERIODS.CS

```

public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;

 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

## Positioning period selector

The `position` property allows the users to position the period selector at the **Top** or **Bottom**.

**CSHTML**

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.PeriodSelectorSettings(ps =>
ps.Position(Syncfusion.EJ2.Charts.PeriodSelectorPosition.Top).Periods(ViewBag.periods).Position("Bottom"))
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

**POSITION.CS**

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 }
 };
 ViewBag.dataSource = dataSource;

 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}
```

## Height

The **height** property allows the users to specify the height of the period selector. The default value of the height property is **43px**.

## C#HTML

```
@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .PeriodSelectorSettings(ps =>
ps.Position(Syncfusion.EJ2.Charts.PeriodSelectorPosition.Top).Periods(ViewBag.periods).Height("45")
).Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

## HEIGHT.CS

```
public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;

 return View();
}
public class data
{
}
```

```

public DateTime x;
public double y;
public double y1;
}

```

### Visibility of range navigator

The `disableRangeSelector` property allows the users to display only the period selector and not the Range Selector.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .DisableRangeSelector("true")
 .PeriodSelectorSettings(ps =>
ps.Position(Syncfusion.EJ2.Charts.PeriodSelectorPosition.Top).Periods(ViewBag.periods))
 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### VISIBLE.CS

```

public IActionResult Index()
{
 List<data>dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 }
 },
}

```

```

 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;

 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### See Also

- [LightWeight](#)

## Labels

### Multilevel labels

The multi-level labels for the Range Selector can be enabled by setting the `enableGrouping` property to **true**. This is restricted to the DateTime axis alone.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .EnableGrouping(true)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### MULTI.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28
 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44
 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48
 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50
 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66
 },
 };
}

```

```

 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78
 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Grouping

The multi-level labels can be grouped using the `groupBy` property with the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy").RangeIntervalType.Months")
 .EnableGrouping(True)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### GROUP.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>

```

```

 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28
 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44
 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48
 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50
 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66
 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78
 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Smart labels

The `labelIntersectAction` property is used to avoid overlapping of labels. The following code sample shows the setting of `labelIntersectAction` property to **Hide**.

#### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .EdgeLabelPlacement(Syncfusion.EJ2.Chart.EdgeLabelPlacement.Shift)
 .LabelIntersectAction(Syncfusion.EJ2.Chart.LabelIntersectAction.Hide)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

#### SMART.CS

```

public IActionResult Index()

```

```

{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Label positioning

By default, the labels can be placed outside the Range Selector. It can also be placed inside the Range Selector using the `labelPosition` property.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### POSITION.CS

```

public IActionResult Index()

```

```

 {
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
 }
 public class data
 {
 public DateTime x;
 public double y;
 public double y1;
 }

```

### Labels customization

The font size, color, family, etc. can be customized using the `labelStyle` setting.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### CUSTOM.CS

```

public IActionResult Index()
{

```

```

List<data> dataSource = new List<data>
{
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
};
ViewBag.dataSource = dataSource;
return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

## Grid and Tick Lines

### Grid line customization

The gridlines indicate axis divisions by drawing the chart plot. Gridlines include helpful cues to the user, particularly for large or complicated charts. The **width**, **color**, and **dashArray** of the major gridlines can be customized by using the **majorGridLines** setting.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .MajorGridLines(ViewBag.lineWidth)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### GRID.CS

```

public IActionResult Index()

```

```

{
 List < data>dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public double y;
 public double y1;
}

```

### Tick line customization

Ticklines are the small lines which is drawn on the axis line representing the axis labels. Ticklines will be drawn outside the axis by default. The **width**, **color**, and **dashArray** of the major ticklines can be customized by using the **majorTickLines** setting.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .MajorTickLines(ViewBag.lineWidth)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### TICK.CS

```

public IActionResult Index()
{
 List < data>dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 };
}

```

```

 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public double y;
 public double y1;
}

```

## Customization

### Navigator appearance

The Range Selector can be customized by using the `navigatorStyleSettings`. The `selectedRegionColor` property is used to specify the color for the selected region, whereas the `unselectedRegionColor` property is used to specify the color for the unselected region.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .NavigatorStyleSettings(style => {
style.unselectedRegionColor("Skyblue").selectedRegionColor("black")
 })
 .Series(sr =>
 {
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### APPEARANCE.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 }
}

```

```

 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public double y;
 public double y1;
}

```

### Thumb

The thumb property allows to customize the border, fill color, size, and type of thumb. Thumbs can be of two shapes: **Circle** and **Rectangle**.

### CSHTML

```

@ (Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("{value}K")
.NavigatorStyleSettings(style => {

style.unselectedRegionColor("Skyblue").selectedRegionColor("black").Thumb("V
iewBag.thumb)

})
.Series(sr =>
{

sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)

```

### THUMB.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 }
}

```

```

 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public double y;
 public double y1;
}

```

### Border customization

Using the `navigatorBorder`, the `width` and `color` of the Range Selector border can be customized.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .NavigatorBorder("ViewBag.border")
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### BORDER.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public double y;
}

```

```

 public double y1;
 }

```

### Deferred update

If the `enableDeferredUpdate` property is set to **true**, then the changed event will be triggered after dragging the slider. If the `enableDeferredUpdate` is **false**, then the changed event will be triggered when dragging the slider. By default, the `enableDeferredUpdate` is set to **false**.

### CSHTML

```

@ (Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .EnableDeferredUpdate(true)
)
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)

```

### SNAP.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}

```

### Allow snapping

The `allowSnapping` property toggles the placement of the slider exactly to the left or on the nearest interval.

#### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .AllowSnapping(true)
)
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

#### SNAP.CS

```
public IActionResult Data()
{
 List dataSource = new List
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = chartData;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

### Animation

The speed of the animation can be controlled using the `animationDuration` property. The default value of the `animationDuration` property is **500** milliseconds.

#### CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("{value}K")
 .AnimationDuration("2000")
)
.Series(sr =>
{
```

```
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
}
```

## ANIMATION.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { y = 12, y1 = 28 },
 new data { y = 34, y1 = 44 },
 new data { y = 45, y1 = 48 },
 new data { y = 56, y1 = 50 },
 new data { y = 67, y1 = 66 },
 new data { y = 78, y1 = 78 },
 new data { y = 89, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public double y;
 public double y1;
}
```

## Tooltip

<!-- markdownlint-disable MD036 -->

The tooltip for sliders are supported by the Range Selector. Sliders are used in the Range Selector to select data from a specific range. The tooltip displays the selected start and end values.

<!-- markdownlint-disable MD013 -->

### Enable Tooltip

The tooltip can be used to display information about the selected data and it is enabled by setting the `enable` property to **true**.

## CSHTML

```
@(Html.EJS().RangeNavigator("container")

.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
```

```

.Tooltip(tl=>tl.Enable(true).DisplayMode(Syncfusion.EJ2.Charts.TooltipDisplayMode.Always))
 .Series(sr =>
 {
sr.XName("x").YName("y").Type(Syncfusion.EJ2.Charts.RangeNavigatorType.Area)
.DataSource(ViewBag.dataSource).Add();
 }).Render()
)

```

### TOOLTIP.CS

```

public ActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Customization

Tooltip can be customized using the following properties:

- enable - Customizes the visibility of the tooltip.
- fill - Customizes the background color of the tooltip.

- opacity - Customizes the opacity of the tooltip.
- textStyle - Customizes the font size, color, family, style, weight, alignment, and overflow of the tooltip.

### C#HTML

```
@(Html.EJS().RangeNavigator("container")
.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Tooltip(tl=>tl.Enable(true).Format("yyyy/MM/dd"))
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

### TOOLTIP.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}
```

### Label Format

The `labelFormat` property in the tooltip is used to format and parse the date to all globalize formats.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")
.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Tooltip(tl=>tl.Enable(true).Format("yyyy/MM/dd").DisplayMode(Syncfusion.EJ2
.Charts.TooltipDisplayMode.Always))
.Series(sr =>
{
sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
}).Render()
)
```

### TOOLTIP.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}

public class data
{
 public DateTime x;
 public double y;
 public double y1;
}
```

The following table shows the results of applying some common date and time formats to the `labelFormat` property.

<!-- markdownlint-disable MD033 -->

| Label Value                         | Label Format Property Value | Result      | Description                                            |
|-------------------------------------|-----------------------------|-------------|--------------------------------------------------------|
| <code>new Date(2000, 03, 10)</code> | <code>EEEE</code>           | Monday      | The Date is displayed in day format                    |
| <code>new Date(2000, 03, 10)</code> | <code>yMd</code>            | 04/10/2000  | The Date is displayed in month/date/year format        |
| <code>new Date(2000, 03, 10)</code> | <code>MMM</code>            | Apr         | The Shorthand month for the date is displayed          |
| <code>new Date(2000, 03, 10)</code> | <code>hm</code>             | 12:00 AM    | Time of the date value is displayed as label           |
| <code>new Date(2000, 03, 10)</code> | <code>hms</code>            | 12:00:00 AM | The Label is displayed in hours:minutes:seconds format |

## RTL

The Range Selector supports right-to-left (RTL), which can be enabled with the `enableRtl` property.

### CSHTML

```
@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .EnableRtl(true)
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
```

### RTL.CS

```
public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
```

```

 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28
 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44
 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48
 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50
 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66
 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78
 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84
 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

## Export and print

### Export

The rendered Range Selector can be exported to **JPEG**, **PNG**, **SVG**, or **PDF** format by using the **export** method in the Range Selector. This method contains the following parameters:

- **Type** - To specify the export type. The component can be exported to **JPEG**, **PNG**, **SVG**, or **PDF** format.
- **File name** - To specify the file name to export.
- **Orientation** - To specify the orientation type. This is applicable only for PDF export type.

### CSHTML

```

@(Html.EJS().RangeNavigator("container")
 .ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
 .LabelFormat("MMM-yy")
 .Series(sr =>
 {
 sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }
)

```

```

 }).Render()
)
 @Html.EJS().Button("export").Content("Primary").IsPrimary(true).Render();
<script>
document.getElementById('export').onclick = function () {
 var control =
document.getElementById('export').ej2_instances[0];
 control.export("PNG", "range");
};
</script>

```

### EXPORT.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },
 new data { x = new DateTime(2010, 01, 01), y = 57, y1 = 78 },
 new data { x = new DateTime(2011, 01, 01), y = 70, y1 = 84 },
 };
 ViewBag.dataSource = dataSource;
 return View();
}
public class data
{
 public DateTime x;
 public double y;
 public double y1;
}

```

### Print

The rendered Range Selector can be printed directly from the browser by calling the public method `print`.

### CSHTML

```

@ (Html.EJS().RangeNavigator("container")
.ValueType(Syncfusion.EJ2.Charts.RangeValueType.DateTime)
.LabelFormat("MMM-yy")
.Series(sr =>
{

```

```

sr.XName("x").YName("y").DataSource(ViewBag.dataSource).Add();
 }).Render()
)
@Html.EJS().Button("print").Content("Primary").IsPrimary(true).Render();
<script>
document.getElementById('print').onclick = function () {
 var chart = document.getElementById('print-
container').ej2_instances[0];
 chart.print();
};
</script>

```

## PRINT.CS

```

public IActionResult Index()
{
 List<data> dataSource = new List<data>
 {
 new data { x = new DateTime(2005, 01, 01), y = 21, y1 = 28 },
 new data { x = new DateTime(2006, 01, 01), y = 24, y1 = 44 },
 new data { x = new DateTime(2007, 01, 01), y = 36, y1 = 48 },
 new data { x = new DateTime(2008, 01, 01), y = 38, y1 = 50 },
 new data { x = new DateTime(2009, 01, 01), y = 54, y1 = 66 },

## Accessibility in ASP.NET MVC Range navigator component

The Range navigator component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range navigator component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Range navigator component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range navigator component:

- region (role)
- aria-label (attribute)

### Keyboard interaction

The Range navigator component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range navigator component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Moves the focus to the Range navigator element.** |

| **Ctrl + P** | **Prints the Range navigator.** |

### Ensuring accessibility

The Range navigator component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range navigator component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range navigator component with accessibility tools.

## Range Slider

### Getting Started with ASP.NET MVC Range Slider Control

This section briefly explains about how to include [ASP.NET MVC Range Slider](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

**~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Range Slider control

Now, add the Syncfusion ASP.NET MVC Range Slider control in `~/Views/Home/Index.cshtml` page.

#### CSHTML

```
@Html.EJS().Slider("slider").Type(Syncfusion.EJ2.Inputs.SliderType.MinRange)
.Value(40).Render()
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Range Slider control will be rendered in the default web browser.

**Note:** [View Sample in GitHub](#)

- [Slider Types](#)
- [Slider Formatting](#)
- [Orientation Slider](#)
- [Ticks in Slider](#)
- [Tooltip in Slider](#)

## Types in RangeSlider Control

The types of Slider are as follows:

### | Types | Usage |

| --- | --- |

| Default | Shows a default Slider to select a single value. |

| MinRange | Displays the shadow from the start value to the current selected value. |

| Range | Selects a range of values. It also displays the shadow in-between the selection range. |

**Note:** Both the Default Slider and Min-Range Slider have same behavior that is used to select a single value. In Min-Range Slider, a shadow is considered from the start value to current handle position. But the Range Slider contains two handles that is used to select a range of values and a shadow is considered in between the two handles.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
@Html.EJS().Slider("default").Value("30").Render()

@Html.EJS().Slider("minrange").Type(SliderType.MinRange).Value("30").Render()

@Html.EJS().Slider("range").Value(ViewBag.range).Type(SliderType.Range).Render()
```

### HOMECONTROLLER.CS

```
public IActionResult Index()
{
 ViewBag.range = new int[] { 30, 70 };
 return View();
}
```

Default

MinRange

Range

## Tooltip

The Slider displays the tooltip to indicate the current value by clicking the Slider bar or drag the Slider handle. The Tooltip position can be customized by using the `placement` property. Also decides the tooltip display mode on a page, i.e., on hovering, focusing, or clicking on the Slider handle and it always remains/displays on the page.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Type(SliderType.MinRange).Value("30").Tooltip(
new SliderTooltipData { IsVisible = true, ShowOn = TooltipShowOn.Always,
Placement = TooltipPlacement.After }).Render()
```

### HOMECONTROLLER.CS

```
public IActionResult Index()
{
 return View();
}
```

## Buttons

The Slider value can be changed by using the Increase and Decrease buttons. In Range Slider, by default the first handle value will be changed while clicking the button. Change the handle focus and press the button to change the last focused handle value.

**Note:** After enabling the slider buttons if the 'Tab' key is pressed, the focus goes to the handle and not to the button.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").ShowButtons(true).Type(SliderType.MinRange).Value("30").Tooltip(new SliderTooltipData { IsVisible = true, ShowOn =
TooltipShowOn.Always, Placement = TooltipPlacement.After }).Render()
```

### HOMECONTROLLER.CS

```
public IActionResult Index()
{
 return View();
}
```

## Orientation

The Slider can be displayed, either in horizontal or vertical orientation. By default, the Slider renders in horizontal orientation.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Value("30").Orientation(SliderOrientation.Vertical).Render()
<style>
 #default {
 height: 300px;
 }
</style>
```

### HOMECONTROLLER.CS

```
public IActionResult Index()
{
 return View();
}
```

## Ticks

The Ticks in Slider supports you to easily identify the current value/values of the Slider. It contains `smallStep` and `largeStep`. The value of the major ticks alone will be displayed in the slider. In order to enable/disable the small ticks, use the `showSmallTicks` property.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
@Html.EJS().Slider("default").Value("30").Ticks(new SliderTicksData {
Placement = Placement.After, LargeStep = 20, SmallStep = 10, ShowSmallTicks
= true }).Tooltip(new SliderTooltipData { IsVisible = true, Placement =
TooltipPlacement.Before, ShowOn = TooltipShowOn.Always }).Render()
```

### TICKS.CS

```
public ActionResult Ticks()
{
 return View();
}
```

### Step

When the Slider is moved, it increases/decreases the value based on the step value. By default, the value is increased/decreased by 1. Use the `step` property to change the increment step value.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
@Html.EJS().Slider("default").Value("30").Step(10).Ticks(new
SliderTicksData { Placement = Placement.After, LargeStep = 20, SmallStep =
10, ShowSmallTicks = true }).Tooltip(new SliderTooltipData { IsVisible =
true, Placement = TooltipPlacement.Before, ShowOn = TooltipShowOn.Always
}).Render()
```

### STEP.CS

```
public ActionResult Step()
{
 return View();
}
```

### Min and Max

Enables the minimum/starting and maximum/ending value of the Slider, by using the `min` and `max` property. By default, the minimum value is 1 and maximum value is 100. In the following sample the slider is rendered with the min value as 100 and max value as 1000.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(100).Max(1100).Value("300").Tooltip(new
SliderTooltipData { isVisible = true, ShowOn = TooltipShowOn.Always,
Placement = TooltipPlacement.Before }).Ticks(new SliderTicksData { Placement
= Placement.After, LargeStep = 200, SmallStep = 100, ShowSmallTicks = true
}).Render()
```

#### MIN-MAX.CS

```
public ActionResult MiniMax()
{
 return View();
}
```

### Formatting in Range Slider Control

The `format` feature used to customize the units of Slider values to desired format. The formatted values will also be applied to the ARIA attributes of the slider. There are two ways of achieving formatting in slider.

- Use the `format` API of slider which utilizes our [Internationalization](#) to format values.
- Customize using the events namely `renderingTicks` and `tooltipChange`.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(100).Value("30").Step(1).Tooltip(new
SliderTooltipData { IsVisible = true, Format = "C2" }).Ticks(new
SliderTicksData { Placement = Placement.After, LargeStep = 20, SmallStep =
10, ShowSmallTicks = true, Format = "C2" }).Render()
```

### FORMAT.CS

```
public ActionResult Format()
{
 return View();
}
```

### Using format API

In this method, we have different predefined formatting styles like Numeric (N), Percentage (P), Currency (C) and # specifiers. In this below example we have formatted the ticks and tooltip values into percentage.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(1).Value("0.3").Step(0.01).Tooltip(
new SliderTooltipData { IsVisible = true, ShowOn = TooltipShowOn.Always,
Format = "P0" , Placement=TooltipPlacement.Before}).Ticks(new SliderTicksData
{ Placement = Placement.After, LargeStep = 0.2, SmallStep = 0.1,
ShowSmallTicks = true, Format = "P0" }).Render()
```

### FORMAT-API.CS

```
public ActionResult FormatAPI()
{
 return View();
}
```

### Using Events

In this method, we will be retrieving the values from the slider events then process them to desired formatted the values. In this sample we have customized the ticks values into weekdays as one formatting and tooltip values into day of the week as another formatting.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(6).Value("0").Step(1).Tooltip(new
SliderTooltipData { IsVisible = true, Placement = TooltipPlacement.Before
}).Ticks(new SliderTicksData { Placement = Placement.After, LargeStep = 1
}).TooltipChange("tooltipChangeHandler").RenderingTicks("renderingTicksHandl
er").Render()
<script>
function renderingTicksHandler(args) {
 // Weekdays Array
 var daysArr =
 ['Sunday', 'Monday', 'Tuesday', 'Wednesday', 'Thursday', 'Friday', 'Saturday'];
 // Customizing each ticks text into weekdays
 args.text = daysArr[parseFloat(args.value)];
}
function tooltipChangeHandler(args) {
 // Customizing tooltip to display the Day (in numeric) of the week
 args.text = 'Day ' + (Number(args.value) + 1).toString();
}
</script>
```

#### EVENTS.CS

```
public ActionResult Events()
{
 return View();
}
```

### Movement Limits and Drag Interval

The slider limits restrict the slider thumb between a particular range. This is used if higher or lower value affects the process or product where the slider is being used.

The following are the six options in the slider's limits object. Each API in the limits object is optional.

- enabled: Enables the limits in the Slider.
- minStart: Sets the minimum limit for the first handle.
- minEnd: Sets the maximum limit for the first handle.
- maxStart: Sets the minimum limit for the second handle.
- maxEnd: Sets the maximum limit for the second handle.

- startHandleFixed: Locks the first handle.
- endHandleFixed: Locks the second handle.

### Default and MinRange Slider limits

There is only one handle in the Default and MinRange Slider, so minStart, minEnd, and startHandleFixed options can be used. When the limits are enabled in the Slider, the limited area becomes darkened. So you can differentiate the allowed and restricted area. Refer to the following snippet to enable the limits in the Slider.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(100).Value(25).Type(SliderType.Default).Enabled(true).Tooltip(new SliderTooltipData { IsVisible = true })
.Limits(new SliderLimitData { Enabled = true, MinStart = 10, MinEnd = 40 }).Render()
```

#### DEFAULT-LIMITS.CS

```
public IActionResult Index()
{
 return View();
}
```

### Range Slider limits

In the range slider, both handles can be restricted and locked from the limit's object. In this sample, the first handle is limited between 10 and 40, and the second handle is limited between 60 and 90.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(100).Value(ViewBag.range).Type(SliderType.Range).Enabled(true).Tooltip(new SliderTooltipData { IsVisible = true })
.Limits(new SliderLimitData { Enabled = true, MinStart = 10, MinEnd = 40, MaxStart = 60, MaxEnd = 90 }).Render()
```

#### RANGE-LIMITS.CS

```
public IActionResult Index()
{
 ViewBag.range = new int[] { 25, 75 };
}
```

```
 return View();
 }
```

### Handle lock

The movement of slider handles can be locked by enabling the `startHandleFixed` and `endHandleFixed` properties in the limit's object.

In this sample, the movement of both slider handles has been locked.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(0).Max(100).Value(ViewBag.range).Type(SliderType.Range).Enabled(true).Tooltip(new SliderTooltipData { IsVisible = true }).Limits(new SliderLimitData { Enabled = true, StartHandleFixed = true, EndHandleFixed = true, MinStart = 10, MaxEnd = 90 }).Render()
```

### HANDLE-LOCK.CS

```
public IActionResult Index()
{
 ViewBag.range = new int[] { 25, 75 };
 return View();
}
```

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the slider track

Use the following CSS to customize the slider track.

```
`css
```

```
.e-control-wrapper.e-slider-container.e-horizontal .e-slider-track {
```

```
background: #007bff;
height: 3px;
}
,
```

#### Customizing the slider handle

Use the following CSS to customize the slider handle properties.

```
`css
.e-control-wrapper.e-slider-container .e-slider .e-handle {
background-color: #f9920b;
border-radius: 50%;
border: 0;
}
,
```

#### Customizing the slider limits

Use the following CSS to customize the slider limits.

```
`css
.e-control-wrapper.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}
,
```

#### Customizing the slider ticks

Use the following CSS to customize the slider ticks.

```
`css
.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
,
```

#### Customizing the slider buttons

Use the following CSS to customize the slider buttons.

```
`css
.e-control-wrapper.e-slider-container .e-slider-button {
background: #007bff;
height: 25px;
```

```
width: 25px;
```

```
}
```

```
,
```

### Accessibility in ASP.NET MVC Range Slider component

The Range Slider component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range Slider component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

```
<style>
```

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Range Slider component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range Slider component:

| Attributes                    | Purpose                                                                                                                                  |
|-------------------------------|------------------------------------------------------------------------------------------------------------------------------------------|
| ---                           | ---                                                                                                                                      |
| <code>role=slider</code>      | Used to convey a significant and contextual message to the user.                                                                         |
| <code>aria-valuemin</code>    | Indicates the Minimum value of the slider.                                                                                               |
| <code>aria-valuemax</code>    | Indicates the Maximum value of the slider.                                                                                               |
| <code>aria-valuenow</code>    | Indicates the current value of the slider.                                                                                               |
| <code>aria-valuetext</code>   | Returns the current text of the slider.                                                                                                  |
| <code>aria-orientation</code> | Indicates whether the Slider is oriented horizontally or vertically.                                                                     |
| <code>aria-label</code>       | Provides an accessible name for the Slider, serving as label text for the Slider's left and right buttons (for increment and decrement). |

### Keyboard interaction

The Range Slider component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range Slider component.

| Press                 | To do this                                                                                                                                   |
|-----------------------|----------------------------------------------------------------------------------------------------------------------------------------------|
| ---                   | ---                                                                                                                                          |
| Right Arrow/Up Arrow  | Increase the Slider value.                                                                                                                   |
| Left Arrow/Down Arrow | Decrease the Slider value.                                                                                                                   |
| Home                  | Moves to the start value (for Range Slider when the second thumb is focused and the Home key is pressed, it moves to the first thumb value). |
| <kbd>End              | Moves to the end value (for Range Slider when the first thumb is focused and the End key is pressed, it moves to the second thumb value).    |
| Page Up               | Increases the Slider by <code>largeStep</code> value.                                                                                        |
| Page Down             | Decreases the Slider by <code>largeStep</code> value.                                                                                        |

### Ensuring accessibility

The Range Slider component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range Slider component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range Slider component with accessibility tools.

## Migration from Essential JS 1

This article describes the API migration process of Slider component from Essential JS 1 to Essential JS 2.

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Max value | **Property:** *MaxValue* <br/><br/> `Html.EJ().Slider("slider").MaxValue(50)` | **Property:** *Max* <br/><br/> `@Html.EJS().Slider("slider").Max(50)` |

| Min value | **Property:** *MinValue* <br/><br/> `Html.EJ().Slider("slider").MinValue(50)` | **Property:** *Min* <br/><br/> `@Html.EJS().Slider("slider").Min(50)` |

| Step | **Property:** *IncrementStep, LargeStep, SmallStep, ShowSmallTicks* <br/><br/> `Html.EJ().Slider("slider").IncrementStep(20).LargeStep(20)<br/>.SmallStep(10).ShowSmallTicks(true).ShowScale(true)` | **Property:** *Ticks* <br/><br/> `@Html.EJS().Slider("slider").Ticks(new SliderTicksData { ShowSmallTicks = true, LargeStep = 20, SmallStep = 5, Placement = Placement.After })` |

| Type | **Property:** *SliderType* <br/><br/> `Html.EJ().Slider("slider").SliderType(SlideType.Range)` | **Property:** *Type* <br/><br/> `@Html.EJS().Slider("slider").Type(SliderType.Range)` |

| Tooltip | **Property:** *ShowTooltip* <br/><br/> `Html.EJ().Slider("slider").ShowTooltip(true)` | **Property:** *Tooltip* <br/><br/> `@Html.EJS().Slider("slider").Tooltip(new SliderTooltipData { Placement = TooltipPlacement.After, IsVisible = true })` |

| RTL | **Property:** *EnableRTL* <br/><br/> `Html.EJ().Slider("slider").EnableRTL(true)` | **Property:** *EnableRtl* <br/><br/> `@Html.EJS().Slider("slider").EnableRtl(true)` |

| Custom values | **Not Applicable** | **Property:** *CustomValues* <br/><br/> `String[] values = { "Mon", "Tue", "Wed" };<br/> ViewBag.customValues = values;<br/> <br/> @Html.EJS().Slider("slider").CustomValues(ViewBag.customValue)` |

| Limit the slider movement | **Not Applicable** | **Property:** *Limits* <br/><br/> `@Html.EJS().Slider("slider").Limits(new SliderLimitData { Enabled = true, MinStart = 20, MinEnd = 40 })` |

| Disable | **Method:** *disable* <br/><br/> `@Html.EJ().Slider("slider") <br/><br/> var sliderObj = $("#slider").ejSlider("instance");<br/> sliderObj.disable();` | **Property:** *Enabled* <br/><br/> `@Html.EJS().Slider("slider") <br/> <br/> var sliderObj = document.getElementById('slider').ej2_instances[0];<br/> sliderObj.enabled = false;` |

| Enable | **Method:** *enable* <br/><br/> `@Html.EJ().Slider("slider") <br/><br/> var sliderObj = $("#slider").ejSlider("instance");<br/> sliderObj.enable();` | **Property:** *Enabled* <br/><br/> `@Html.EJ().Slider("slider").Enabled(false) <br/> <br/> var sliderObj = document.getElementById('slider').ej2_instances[0];<br/> sliderObj.enabled = true;` |

| Set Value | **Method:** `setValue(value,[enableAnimation])` <br/><br/>  
 @Html.EJ().Slider("slider")<br/><br/> var sliderObj = \$("#slider").ejSlider("instance"); <br/>  
 sliderObj.setValue(50); | **Property:** `value` <br/><br/> @Html.EJS().Slider("slider").Enabled(false)  
 <br/> <br/> var sliderObj = document.getElementById('slider').ej2\_instances[0]; <br/>  
 sliderObj.value = 30; |

| Get Value | **Method:** `getValue()` <br/><br/> @Html.EJ().Slider("slider")<br/><br/> var sliderObj =  
 \$("#slider").ejSlider("instance"); <br/> sliderObj.getValue(); | **Property:** `value` <br/><br/>  
 @Html.EJS().Slider("slider").Value(50) <br/><br/> var sliderObj =  
 document.getElementById('slider').ej2\_instances[0]; <br/> var value = sliderObj.value; |

| Destroy | **Not Applicable** | **Method:** `destroy()` <br/><br/>  
 @Html.EJS().Slider("slider").Value(50)<br/><br/> var sliderObj =  
 document.getElementById('slider').ej2\_instances[0]; <br/> sliderObj.destroy(); |

| Change | **Event:** `Change` <br/><br/> @Html.EJ().Slider("slider").ClientSideEvents(e =>  
 e.Change("onChange")) <br/><br/> function onChange(args) { } | **Event:** `Changed` <br/><br/>  
 @Html.EJS().Slider("slider").Changed("onChanged") <br/><br/> function onChanged(args) { } |

| Create | **Event:** `Create` <br/><br/> @Html.EJ().Slider("slider").ClientSideEvents(e =>  
 e.Create("onCreate")) <br/><br/> function onCreate(args) { } | **Event:** `Created` <br/><br/>  
 @Html.EJS().Slider("slider").Created("onCreated") <br/><br/> function onCreated(args) { } |

| Slide | **Event:** `Slide` <br/><br/> @Html.EJ().Slider("slider").ClientSideEvents(e =>  
 e.Slide("onSlide")) <br/><br/> function onSlide(args) { } | **Event:** `Change` <br/><br/>  
 @Html.EJS().Slider("slider").Change("onChange") <br/><br/> function onChange(args) { } |

| Start | **Event:** `Start` <br/><br/> @Html.EJ().Slider("slider").ClientSideEvents(e =>  
 e.Start("onStart")) <br/><br/> function onStart(args) { } | **Event:** `Created` <br/><br/>  
 @Html.EJS().Slider("slider").Created("onCreated") <br/><br/> function onCreated(args) { } |

| Stop | **Event:** `Stop` <br/><br/> @Html.EJ().Slider("slider").ClientSideEvents(e =>  
 e.Stop("onStop")) <br/><br/> function onStop(args) { } | **Event:** `Changed` <br/><br/>  
 @Html.EJS().Slider("slider").Changed("onCreated") <br/><br/> function onChanged(args) { } |

| Rendered Ticks | **Not Applicable** | **Event:** `RenderedTicks` <br/><br/>  
 @Html.EJS().Slider("slider").RenderedTicks("onRenderedTicks") <br/><br/> function  
 onRenderedTicks(args) { } |

## How To

### Time Range Slider

The time formatting can be achieved same as the date formatting using `renderingTicks` and `change` events. The process of time formatting is explained in the below sample.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(1373693400000).Max(1373715000000).Step(360
0000).RenderingTicks("renderingTicksHandler").TooltipChange("tooltipChangeHa
ndler").Tooltip(new SliderTooltipData { Placement = TooltipPlacement.Before,
```

```

isVisible = true }).Ticks(new SliderTicksData { Placement = Placement.After,
LargeStep = 7200000 }).ShowButtons(true).Render()
<script type="text/javascript">
 function tooltipChangeHandler(args) {
 var totalMiliSeconds = Number(args.text);
 var custom = { hour: '2-digit', minute: '2-digit' };
 args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
 }
 function renderingTicksHandler(args) {
 var totalMiliSeconds = Number(args.value);
 var custom = { hour: '2-digit', minute: '2-digit' };
 args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
 }
</script>

```

### TIME-FORMAT.CS

```

public ActionResult TimeFormat()
{
 return View();
}

```

### Date Range Slider

The Date formatting can be achieved in ticks and tooltip using `renderingTicks` and `tooltipChange` events respectively. The process of formatting is explained in the below sample.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("default").Min(1371081600000).Max(1371772800000).Step(864
00000).TooltipChange("tooltipChangeHandler").RenderingTicks("renderingTicksH
andler").ShowButtons(true).Tooltip(new SliderTooltipData { Placement =
TooltipPlacement.Before, isVisible = true }).Ticks(new SliderTicksData {
Placement = Placement.After, LargeStep = 172800000, }).Render()
<script>
 function tooltipChangeHandler(args) {
 var totalMiliSeconds = Number(args.text);
 // Converting the current milliseconds to the respective date in
desired format
 var custom = { year: "numeric", month: "short", day: "numeric" };
 args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
custom);
 }

```

```

 }
 function renderingTicksHandler(args) {
 var totalMiliSeconds = Number(args.value);
 // Converting the current milliseconds to the respective date in
 desired format
 var custom = { year: "numeric", month: "short", day: "numeric" };
 args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
 custom);
 }
</script>

```

### DATE-FORMAT.CS

```

public ActionResult DateFormat()
{
 return View();
}

```

### Numeric Range Slider

The numeric values can be formatted into different decimal digits or fixed number of whole numbers or to represent the units. The Numeric processing is demonstrated below.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
<div id='kilometer'>

@Html.EJS().Slider("kilometer").Min(0).Max(100).Step(1).Value("30").Tooltip(
new SliderTooltipData { IsVisible = true, Format = "##.## Km" }).Ticks(new
SliderTicksData { Placement = Placement.After, LargeStep = 20, SmallStep =
10, ShowSmallTicks = true, Format = "##.## Km" }).Render()
</div>
<div id='decimal'>

@Html.EJS().Slider("decimalobj").Min(0.1).Max(0.2).Value("0.15").Step(0.01).
Tooltip(new SliderTooltipData { IsVisible = true, Format = "##.##00"
}).Ticks(new SliderTicksData { Placement = Placement.After, LargeStep =
0.02, SmallStep = 0.01, ShowSmallTicks = true, Format = "##.##00" }).Render()
</div>
<div id='slider'>

@Html.EJS().Slider("sliderobj").Min(0).Max(100).Value("5").Step(1).Tooltip(n
ew SliderTooltipData { IsVisible = true, Format = "##.## Km" }).Ticks(new
SliderTicksData { Placement = Placement.After, LargeStep = 20, SmallStep =
10, ShowSmallTicks = true, Format = "##.## Km" }).Render()
</div>

```

**NUMERIC-VALUE.CS**

```
public ActionResult NumericValue()
{
 return View();
}
```

Slider formatted with unit representation

Slider formatted with three decimal specifiers

Slider formatted with two leading zeros

**Customize Slider Bar**

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the slider bar. The slider bar can be customized with different themes. By default, slider have class name `e-slider-track` for bar. The class can be overridden with our own color values like the following code snippet.

```
`css
```

```
.e-control.e-slider .e-slider-track .e-range {
```

```
background: linear-gradient(left, #e1451d 0, #fdff47 17%, #86f9fe 50%, #2900f8 65%, #6e00f8 74%,
#e33df9 83%, #e14423 100%);
```

```
}
```

```
`
```

You can also apply background color for a certain range depending upon slider values, using change event.

```
`javascript
```

```
function change(args) {
```

```
if (args.value > 0 && args.value <= 25) {
```

```
// Change handle and range bar color to green when
```

```

(slidebarHandle).style.backgroundColor = 'green';
(slidebarTrack).style.backgroundColor = 'green';
} else if (args.value > 25 && args.value <= 50) {
// Change handle and range bar color to royal blue
(slidebarHandle).style.backgroundColor = 'royalblue';
(slidebarTrack).style.backgroundColor = 'royalblue';
} else if (args.value > 50 && args.value <= 75) {
// Change handle and range bar color to dark orange
(slidebarHandle).style.backgroundColor = 'darkorange';
(slidebarTrack).style.backgroundColor = 'darkorange';
} else if (args.value > 75 && args.value <= 100) {
// Change handle and range bar color to red
(slidebarHandle).style.backgroundColor = 'red';
(slidebarTrack).style.backgroundColor = 'red';
}
}
,

```

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
<div id='container'>
 <div class="col-lg-12 control-section">
 <div class="slider-content-wrapper">
 <div class="slider_container">
 <div class="slider-labeltext slider_userselect">Height</div>
 @Html.EJS().Slider("height_slider").Render()
 </div>
 <div class="slider_container">
 <div class="slider-labeltext slider_userselect">Gradient
color</div>
 @Html.EJS().Slider("gradient_slider").Type(SliderType.MinRange).Render()
 </div>
 <div class="slider_container">
 <div class="slider-labeltext slider_userselect">Dynamic
thumb and selection bar color</div>
 @Html.EJS().Slider("dynamic_color_slider").Type(SliderType.MinRange).Change(
"changeHandler").Created("createdHandler").Render()
 </div>
 </div>
 </div>
</div>
<script type="text/javascript">

```

```

var sliderTrack;
var sliderHandle;
function changeHandler(args) {
 if (args.value > 0 && args.value <= 25) {
 // Change handle and range bar color to green when
 (sliderHandle).style.backgroundColor = 'green';
 (sliderTrack).style.backgroundColor = 'green';
 } else if (args.value > 25 && args.value <= 50) {
 // Change handle and range bar color to royal blue
 (sliderHandle).style.backgroundColor = 'royalblue';
 (sliderTrack).style.backgroundColor = 'royalblue';
 } else if (args.value > 50 && args.value <= 75) {
 // Change handle and range bar color to dark orange
 (sliderHandle).style.backgroundColor = 'darkorange';
 (sliderTrack).style.backgroundColor = 'darkorange';
 } else if (args.value > 75 && args.value <= 100) {
 // Change handle and range bar color to red
 (sliderHandle).style.backgroundColor = 'red';
 (sliderTrack).style.backgroundColor = 'red';
 }
}

function createdHandler(args) {
 sliderTrack =
document.getElementById('dynamic_color_slider').querySelector('.e-range');
 sliderHandle =
document.getElementById('dynamic_color_slider').querySelector('.e-handle');
 (sliderHandle).style.backgroundColor = 'green';
 (sliderTrack).style.backgroundColor = 'green';
}
</script>
<style>
.slider-content-wrapper {
 width: 40%;
 margin: 0 auto;
 min-width: 185px;
}
.slider-userselect {
 -webkit-user-select: none;
 /* Safari 3.1+ */
 -moz-user-select: none;
 /* Firefox 2+ */
 -ms-user-select: none;
 /* IE 10+ */
 user-select: none;
 /* Standard syntax */
}
.slider-labeltext {
 text-align: left;
 font-weight: 500;
 font-size: 13px;
 padding-bottom: 10px;
}
#height_slider .e-handle,
#gradient_slider .e-handle {
 height: 20px;
 width: 20px;
 margin-left: -10px;
}

```

```

### CUSTOM-BAR.CS

```
public ActionResult TimeFormat()
{
 return View();
}
```

### Customize Slider Limits

Slider appearance can be customized via CSS. By overriding the slider CSS classes, the slider limit bar can be customized.

Here, the limit bar is customized with different background color. By default, the slider has class `e-limits` for limits bar.

You can override the class with our own color values as given in the following code snippet.

```
`css
.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}
```

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
<div id='container'>
 <div class="col-lg-8 control-section">
 <div class="content-wrapper">
 <div class="sliderwrap">
 <label class="userselect">MinRange Slider With
Limits</label>

@Html.EJS().Slider("minrange").Min(0).Max(100).Value(25).Type(SliderType.Default).Enabled(true).Ticks(new SliderTicksData { Placement =
Placement.Before, LargeStep = 20, SmallStep = 5, ShowSmallTicks = true
}).Tooltip(new SliderTooltipData { IsVisible = true, Placement =
TooltipPlacement.Before, ShowOn = TooltipShowOn.Focus }).Limits(new
SliderLimitData { Enabled = true, MinStart = 10, MinEnd = 40 }).Render()
 </div>
 <div class="sliderwrap">
 <label class="userselect">Range Slider With
Limits</label>
```

```

@Html.EJS().Slider("range").Min(0).Max(100).Value(ViewBag.rangeValue).Type(S
liderType.Range).Enabled(true).Ticks(new SliderTicksData { Placement =
Placement.Before, LargeStep = 20, SmallStep = 5, ShowSmallTicks = true
}).Tooltip(new SliderTooltipData { IsVisible = true, Placement =
TooltipPlacement.Before, ShowOn = TooltipShowOn.Focus }).Limits(new
SliderLimitData { Enabled = true, MinStart = 10, MinEnd = 40, MaxStart = 60,
MaxEnd = 90}).Render()
</div>
</div>
</div>
</div>
<style>
.content-wrapper {
 width: 52%;
 margin: 0 auto;
 min-width: 185px;
}
.sliderwrap {
 margin-top: 45px;
}
.e-bigger .content-wrapper {
 width: 80%;
}
.sliderwrap label {
 padding-bottom: 50px;
 font-size: 13px;
 font-weight: 500;
 margin-top: 15px;
 display: block;
}
.userselect {
 -webkit-user-select: none;
 /* Safari 3.1+ */
 -moz-user-select: none;
 /* Firefox 2+ */

{
 ViewBag.rangeValue = new int[] { 25, 75 };
}

```

```
return View();
}
```

MinRange Slider With Limits

Range Slider With Limits

### Customize Slider Ticks label

Slider view can be customized via CSS. By overriding the slider CSS classes, you can customize the ticks. The ticks in slider allows you to easily identify the current value/values of the slider. It contains [smallStep](#) and [largeStep](#). By default, slider has class `e-tick` for slider ticks. You can override the class as per your requirement. Refer to the following code snippet to render ticks.

```
`css
.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
`
```

Here, the color for rendered ticks has been applied through `nth-child(childnumber)`. *The color is applied to the value of the childnumber in the slider.*

```
`css
ticks_slider .e-scale :nth-child(1)::before {
color: red;
}
`
```

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

Ticks with legends

### Customize Slider Thumb

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the thumb. By default, slider has unique class `e-handle` for slider thumb. You can override the following class as per your requirement. Here, in the sample, the slider thumb has been customized to square, circle, oval shapes, and background image has also been customized.

```
`css
```

```
.e-control.e-slider .e-handle {
background-image: url('https://ej2.syncfusion.com/demos/src/slider/images/thumb.png');
background-color: transparent;
height: 25px;
width: 25px;
}

square_slider.e-control.e-slider .e-handle {
border-radius: 0%;
background-color: #f9920b;
border: 0;
}

circle_slider.e-control.e-slider .e-handle {
border-radius: 50%;
background-color: #f9920b;
border: 0;
}

oval_slider.e-control.e-slider .e-handle {
height: 25px;
width: 8px;
top: 3px;
```

```
border-radius: 15px;
background-color: #f9920b;
}
,
```

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
<div id='container'>

 background-color: #f9920b;
}
</style>
```

### CUSTOM-THUMB.CS

```
public ActionResult TimeFormat()
{
 return View();
}
```

### Form Slider with FormValidator

The Slider control can be validated using our [FormValidator](#). The following steps walk-through slider validation.

- Render slider control inside a form.
- Bind [changed](#) event in the slider control to validate the slider value when the value changes.
- Initialize and render FormValidator for the form using form ID.
- Set the required property in the FormValidator [rules](#) collection. Here, the [min](#) property of slider that sets the minimum value in the slider control is set, and it has hidden input as enable [validateHidden](#) property is set to true.

**Note:** Form validation is done either by ID or name value of the slider control. Above ID of the slider is used to validate it.

Using slider name: Render slider with name attribute. In the following code snippet, name attribute value of slider is used for form validation.

- Validate the form using [validate](#) method, and it validates the slider value with the defined rules collection and returns the result. If user selects the value less than the minimum value, form will not submit.
- Slider validation can be done during value changes in slider. Refer to the following code snippet.

```
`javascript
// change event handler for slider
function onChanged(args) {
 formObj.validate();
}
```

```
}
,
```

The **FormValidator** has following default validation rules, which are used to validate the Slider control.

| Rules | Description                                                                                                 | Example |
|-------|-------------------------------------------------------------------------------------------------------------|---------|
| max   | Slider control must have value less than or equal to max number   if max: 3, 3 is valid and 4 is invalid    |         |
| min   | Slider control must have value greater than or equal to min number   if min: 4, 5 is valid and 2 is invalid |         |
| regex | Slider control must have valid value in regex format   if regex: '/4/', 4 is valid and 1 is invalid         |         |
| range | Slider control must have value between range number   if range: [4,5], 4 is valid and 6 is invalid          |         |

```

```
}
</style>
```

### FORM-VALIDATOR.CS

```
public ActionResult TimeFormat()
{
 return View();
}
```

### Show Slider from Hidden State

This section demonstrates how-to render the Slider component in hidden state and make it visible in button click. We can initialize Slider in hidden state by setting display as none to it.

In the sample, by clicking on the button, we can make the Slider visible from hidden state, and we must also call the `refresh` method of the Slider to render it properly based on its original dimensions.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs
@Html.EJS().Button("element").Content("Button").Render()
<div id='container' style="margin-top:150px;">

 @Html.EJS().Slider("default").Min(1373693400000).Max(1373715000000).
 Step(3600000).RenderingTicks("renderingTicksHandler").TooltipChange("tooltip
 ChangeHandler").Tooltip(new SliderTooltipData { Placement =
 TooltipPlacement.Before, IsVisible = true }).Ticks(new SliderTicksData {
 Placement = Placement.After, LargeStep = 7200000
 }).ShowButtons(true).Render()
</div>
<script type="text/javascript">
 function tooltipChangeHandler(args) {
 var totalMilliseconds = Number(args.text);
 var custom = { hour: '2-digit', minute: '2-digit' };
 args.text = new Date(totalMilliseconds).toLocaleTimeString("en-us",
 custom);
 }
```

```

 }
 function renderingTicksHandler(args) {
 var totalMilliseconds = Number(args.value);
 var custom = { hour: '2-digit', minute: '2-digit' };
 args.text = new Date(totalMilliseconds).toLocaleTimeString("en-us",
custom);
 }
 document.getElementById('element').onclick = function () {
 //slider visible from hidden state
 slider = document.getElementById("container");
 ticks = document.getElementById("default");
 slider.style.display = "block";
 ticks.ej2_instances[0].refresh();
 };
</script>
<style>
/* render slider in hidden state */
#container{
 display: none;
}
</style>

```

### HIDDEN-SLIDER.CS

```

public ActionResult HiddenSlider()
{
 return View();
}

```

### Reversible Range Slider

You can create a Range Slider rendered with values in reverse order by setting the `min` property to the maximum value and the `max` property to the minimum value. An example of how to achieve a reversible Range Slider is shown below

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Inputs

@Html.EJS().Slider("reversible").Min(100).Max(0).Value(ViewBag.range).Enabled(true).Type(SliderType.Range).Orientation(SliderOrientation.Vertical).Ticks(new SliderTicksData { Placement = Placement.Before, LargeStep = 20,

```

```
SmallStep = 5, ShowSmallTicks = true }).Tooltip(new SliderTooltipData {
 IsVisible = true, Placement = TooltipPlacement.Before }).Render()
```

### REVERSIBLE-SLIDER.CS

```
public ActionResult Reverse()
{
 ViewBag.range = new int[] { 30, 70 };
 return View();
}
```

Reversible order can be achieved with **Horizontal** orientation Range Slider by setting **enableRtl** as true.

## Rating

### Getting Started with ASP.NET MVC Rating Control

This section briefly explains about how to include **ASP.NET MVC Rating** control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

### ~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/\_Layout.cshtml** file as follows.

### ~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Rating control

Now, add the Syncfusion ASP.NET MVC Rating control in `~/Home/Index.cshtml` page.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Render()
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Rating control will be rendered in the default web browser.

### Value

You can set the rating value by using the [Value](#) property.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating1").Value(3).Render()
```

### Precision Modes in ASP.NET MVC Rating Control

You can use the [Precision](#) property of the ASP.NET MVC Rating control to provide ratings with varying levels of precision.

The precision types of Rating are as follows:

- Full: The rating is increased in whole number increments. For example, if the current rating is 2, the next possible ratings are 3, 4, and so on.
- Half: The rating is increased in increments of 0.5 (half). For example, if the current rating is 2.5, the next possible ratings are 3, 3.5, 4, and so on.
- Quarter: The rating is increased in increments of 0.25 (quarter). For example, if the current rating is 3.75, the next possible ratings are 4, 4.25, 4.5, and so on.
- Exact: The rating is increased in increments of 0.1. For example, if the current rating is 3.9, the next possible ratings are 4, 4.1, 4.2, and so on.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
```

```

<label>Full Precision</label>

@Html.EJS().Rating("rating").Value(3).Precision(PrecisionType.Full).Render()

<label>Half Precision</label>

@Html.EJS().Rating("rating1").Value(2.5).Precision(PrecisionType.Half).Render()

<label>Quarter Precision</label>

@Html.EJS().Rating("rating2").Value(3.75).Precision(PrecisionType.Quarter).Render()

<label>Exact Precision</label>

@Html.EJS().Rating("rating3").Value(2.3).Precision(PrecisionType.Exact).Render()

```

### PRECISIONMODES.CS

```

public ActionResult PrecisionModes()
{
 return View();
}

```

Full Precision

Half Precision

Quarter Precision

Exact Precision

### Labels in ASP.NET MVC Rating Control

You can use the [ShowLabel](#) property to display a label that shows the current value of the rating. When the `ShowLabel` property is set to `true`, a label will be displayed.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).ShowLabel(true).Render()

```

### SHOWLABEL.CS

```

public ActionResult ShowLabel()
{
 return View();
}

```

### Label position

The Rating control allows you to place the label on the top, bottom, left, or right side of the rating using the [LabelPosition](#) property.

The following label positions are supported:

- Top: The label is placed on the top of the rating.
- Bottom: The label is placed on the bottom of the rating.
- Left: The label is placed on the left side of the rating.
- Right: The label is placed on the right side of the rating.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
<label>Left Label Position</label>

@Html.EJS().Rating("rating1").Value(3).ShowLabel(true).LabelPosition(LabelPosition.Left).Render()

<label>Right Label Position</label>

@Html.EJS().Rating("rating2").Value(3).ShowLabel(true).LabelPosition(LabelPosition.Right).Render()

<label>Top Label Position </label>

@Html.EJS().Rating("rating3").Value(3).ShowLabel(true).LabelPosition(LabelPosition.Top).Render()

<label>Bottom Label Position</label>

@Html.EJS().Rating("rating4").Value(3).ShowLabel(true).LabelPosition(LabelPosition.Bottom).Render()
```

### LABELPOSITION.CS

```
public ActionResult LabelPosition()
{
 return View();
}
```

**Left Label Position**

3 / 5 ★ ★ ★ ☆ ☆

**Right Label Position**

★ ★ ★ ☆ ☆ 3 / 5

**Top Label Position**

3 / 5

★ ★ ★ ☆ ☆

**Bottom Label Position**

★ ★ ★ ☆ ☆

3 / 5

**Label template**

You can use the [LabelTemplate](#) tag directive to specify a custom template for the **Label** of the rating.

The current value of the rating will be passed as the **value** property in the template context when building the content of the label. This allows you to include dynamic information about the rating in the template.

**CSHTML**

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).ShowLabel(true).LabelTemplate("${value} Out Of 5").Render()
```

**LABELTEMPLATE.CS**

```
public ActionResult LabelTemplate()
{
 return View();
}
```

★ ★ ★ ☆ ☆ 3 Out Of 5

**Tooltip in ASP.NET MVC Rating Control**

The ASP.NET MVC rating control supports tooltip to show additional information in rating items by setting the [ShowTooltip](#) property. If enabled, the tooltip appears when the user hovers over a rating item.

**CSHTML**

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).ShowTooltip(true).Render()
```

**SHOWTOOLTIP.CS**

```
public ActionResult ShowTooltip()
{
 return View();
}
```

## Tooltip template

You can use the [TooltipTemplate](#) tag directive to specify a custom template for the **Tooltip** of the rating. The current value of the rating will be passed as the **value** property in the template context when building the content of the tooltip. This allows you to include dynamic information about the rating in the template.

**CSHTML**

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(4).TooltipTemplate("#template").Render()
<script id="template" type="text/x-jsrender">
 ${if(value==1)}
 Angry${else if(value==2)}
 Sad${else if(value==3)}
 Neutral${else if(value==4)}
 Good${else}
 Happy
 ${/if}
</script>
```

**TOOLTIPTEMPLATE.CS**

```
public ActionResult TooltipTemplate()
{
 return View();
}
```

## Tooltip customization

You can customize the appearance of the tooltips using the **CssClass** property of the ASP.NET MVC Rating control and by defining the custom styles for tooltip elements like the below example.

**Note:** You can find more information about customizing the appearance of the tooltip in the [Tooltip Customization](#) documentation.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).CssClass("customtooltip").Render()
<style>
 /* To change the radius of the tooltip corners. */
 .customtooltip.e-tooltip-wrap {
 border-radius: 3px;
 }
 /* To change the size of the tooltip content. */
 .customtooltip.e-tooltip-wrap .e-tip-content {
 font-size:14px;
 }
 /* To change the border color and width for tooltip. */
 .customtooltip.e-tooltip-wrap.e-popup {
 border: 2px solid #969393;
 }
 /* To change the color for arrow of the tooltip. */
 .customtooltip.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
 border: 12px solid #9693
 }
 /* To change the top border color for arrow of the tooltip. */
 .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
 border-top: 12.5px solid #969393;
 }
</style>
```

### CUSTOMTOOLTIP.CS

```
public ActionResult CustomTooltip()
{
 return View();
}
```

### Selection in ASP.NET MVC Rating Control

The ASP.NET MVC Rating control allows users to rate something using a visual scale, and the selection state can be changed by the user clicking or tapping on the stars in the rating scale or through code. The Rating control has a minimum value and a reset button, and provides customization options for the selected rating value and selection behavior.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).Render()
```

### SELECTION.CS

```
public ActionResult Selection()
{
 return View();
}
```

#### Min value

You can use the [Min](#) property of the ASP.NET MVC Rating control to set the minimum possible rating value the user can select. If you set the `Min` property to 2, then you will not be able to select a rating lower than 2.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Min(2).Render()
```

### MIN.CS

```
public ActionResult Min()
{
 return View();
}
```

#### Single selection

You can use the [EnableSingleSelection](#) property of the ASP.NET MVC Rating control to select only one item at a time. When the `EnableSingleSelection` property is set to `true`, only the selected item will be considered to be in the selected state, while all other items will be unselected.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).EnableSingleSelection(true).Render()
```

### SINGLESELECTION.CS

```
public ActionResult SingleSelection()
{
 return View();
}
```

### Show or hide reset button

You can reset the rating value to its default by using the [AllowReset](#) property of the ASP.NET MVC Rating control. When the [AllowReset](#) property is set to `true`, a reset button will be shown that allows the user to reset the rating value to its default.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).AllowReset(true).Render()
```

#### ALLOWRESET.CS

```
public ActionResult AllowReset()
{
 return View();
}
```

### Templates in ASP.NET MVC Rating Control

The ASP.NET MVC Rating control allows you to customize the appearance of the rating items using templates. You can use templates to specify a custom layout for the rating items, which can include any content you want. This allows you to create a more customized and interactive rating experience for the user.

The rating control supports below templates for item customization.

- [EmptyTemplate](#)
- [FullTemplate](#)

#### Empty (unrated) symbol template

To customize the appearance of **unrated** items, you can use the [EmptyTemplate](#) tag directive. It allows you to specify the desired custom content for the unrated items.

The `value` and `index` are available in the template context for accessing information about the un-rated item.

If the [FullTemplate](#) is not defined, the [EmptyTemplate](#) will be used as the default for both rated and unrated items. You can apply custom styles to differentiate between the rated and unrated states of the items.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).EmptyTemplate("<span class='custom-
font sf-rating-heart'>").Render()
<style>
.e-rating-container .custom-font {
```

```

/* To add the background color for the font icon. */
background: linear-gradient(to right, rgb(254,87,133,255) var(--
rating-value), transparent var(--rating-value));
/* To clip the background to the icon (text) alone. */
background-clip: text;
-webkit-background-clip: text;
/* To make the background color visible instead of font color. */
-webkit-text-fill-color: transparent;
/* To provide a border for font icon. */
-webkit-text-stroke: 1px rgb(254,87,133,255);
}

 }
}
</style>

```

### EMPTYTEMPLATE.CS

```

public ActionResult EmptyTemplate()
{
 return View();
}

```

**Note:** The current value of the rating item available in the template context as `value` and in the rating item element as CSS Variable (`--rating-value`) can be used to support precision in templates.

### Full (rated) symbol template

To customize the appearance of **rated** items in the Syncfusion ASP.NET MVC rating control, you can use the `FullTemplate` tag directive. This directive allows you to specify a custom layout for the rated items, which can include any content you desire.

The `value` and `index` are available in the template context for accessing information about the rated item.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).EmptyTemplate("").FullTemplate("").Render()
<style>
 .e-rating-container .custom-font {
 /* To change the icon font color. */

</style>

```

### FULLTEMPLATE.CS

```

public ActionResult FullTemplate()
{
 return View();
}

```

### Using Emoji icon as rating symbol

You can use emojis of your choice as rating symbol by specifying them as template content within the `EmptyTemplate` tag directive.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(4).EnableAnimation(false).EnableSingleSel
ection(true).EmptyTemplate("#template").Render()

```

```
<script id="template" type="text/x-jsrender">
 ${if(index==0)}
 😡${else if(index==1)}
 🙁${else if(index==2)}
 😐${else if(index==3)}
 🙂${else}
 😀
 ${/if}
</script>
<style>
 /* To change the color of an unselected rating item. */
 .e-rating-item-container:not(.e-rating-selected) .emoji {
 filter: grayscale(1);
 }
</style>
```

### EMOJIICON.CS

```
public ActionResult EmojiIcon()
{
 return View();
}
```

### Using SVG icon as rating symbol

You can use SVG icons of your choice as rating symbol by specifying them as template content within the `EmptyTemplate` and `FullTemplate` tag directives.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(4).EnableAnimation(false).EmptyTemplate("#emptyTemplate").FullTemplate("#fullTemplate").Render()
<script type="text/x-jsrender" id="fullTemplate">
 <svg width="35" height="25" class="e-rating-svg-icon">
 <defs>
 <linearGradient id="grad${index}" x1="0%" y1="0%" x2="100%"
y2="0%">
 <stop class="start" offset="0%" />
 <stop class="end" offset="100%" />
 </linearGradient>
 </defs>
 <rect width="35" height="25" fill="url(#grad${index})"
style="stroke-width:2;stroke:rgb(173,181,189)" />
 </svg>
</script>
<script type="text/x-jsrender" id="emptyTemplate">
 <svg width="35" height="25" class="e-rating-svg-icon">
 <rect width="35" height="25" fill="transparent" style="stroke-
width:2;stroke:rgb(173,181,189)" />
 </svg>
</script>
```

```

<style>
/* To change the size between items */
.e-rating-container .e-rating-item-container {
 padding: 0px;
}
/* To set the gradient color */
.e-rating-svg-icon #grad0 .start {
 stop-color: #FF0000;
}
.e-rating-svg-icon #grad0 .end,
.e-rating-svg-icon #grad1 .start {
 stop-color: #ff5101;
}
.e-rating-svg-icon #grad1 .end,
.e-rating-svg-icon #grad2 .start {
 stop-color: #ffc801;
}
.e-rating-svg-icon #grad2 .end,
.e-rating-svg-icon #grad3 .start {
 stop-color: #dbe300;
}
.e-rating-svg-icon #grad3 .end,
.e-rating-svg-icon #grad4 .start {
 stop-color: #8bc301;
}
.e-rating-svg-icon #grad4 .end {
 stop-color: #4eaa01;
}
</style>

```

### SVGTEMPLATE.CS

```

public ActionResult SVGTemplate()
{
 return View();
}

```

### Using PNG image as rating symbol

You can use PNG images of your choice as rating symbol by specifying them as template content within the `EmptyTemplate` and `FullTemplate` tag directives.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@{
 var fulltemplate = ""; //Provide the URL for the image here.
 var emptytemplate = ""; //Provide the URL for the image here.
}
@Html.EJS().Rating("rating").Value(3).EmptyTemplate("#emptytemplate").FullTemplate("#fulltemplate").Render()
<script id="fulltemplate" type="text/x-jsrender">

</script>

```

```

</script>
<script id="emptytemplate" type="text/x-jsrender">

</script>

```

### PNGIMAGE.CS

```

public ActionResult PNGImage()
{
 return View();
}

```

### Events in Rating Control

This section describes the rating events that will be triggered when appropriate actions are performed. The following events are available in the rating control.

#### BeforeItemRender

The rating control triggers the [BeforeItemRender](#) event before rendering each rating item. The `RatingItemEventArgs` passed as an event argument provides the details of the item to be rendered.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").BeforeItemRender("BeforeItemRender").Render()
<script>
 function BeforeItemRender(args) {
 // Here, you can customize your code.
 }
</script>

```

### BEFOREITEMRENDER.CS

```

public ActionResult BeforeItemRender()
{
 return View();
}

```

#### Created

The rating control triggers the [Created](#) event when the rendering of the rating control is completed.

### CSHTML

```

@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Created("Created").Render()
<script>
 function Created(args) {
 // Here, you can customize your code.
 }
</script>

```

**CREATEDEVENT.CS**

```
public ActionResult CreatedEvent()
{
 return View();
}
```

**ValueChanged**

The rating control triggers the [ValueChanged](#) event when the value of the rating is changed. The `RatingChangedEventArgs` passed as an event argument provides the details when value is changed.

**CSHTML**

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").ValueChanged("ValueChanged").Render()
<script>
 function ValueChanged(args) {
 // Here, you can customize your code.
 }
</script>
```

**VALUECHANGED.CS**

```
public ActionResult ValueChanged()
{
 return View();
}
```

**OnItemHover**

The rating control triggers the [OnItemHover](#) event when the rating item is hovered. The `RatingHoverEventArgs` passed as an event argument provides the details of the hovered item.

**CSHTML**

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").OnItemHover("OnItemHover").Render()
<script>
 function OnItemHover(args) {
 // Here, you can customize your code.
 }
</script>
```

**ITEMHOVER.CS**

```
public ActionResult ItemHover()
{
 return View();
}
```

**Appearance in ASP.NET MVC Rating Control**

You can also customize the appearance of rating control.

### Items count

You can specify the number of rating items using the [ItemsCount](#) property.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).ItemsCount(8).Render()
```

#### ITEMSCOUNT.CS

```
public ActionResult ItemsCount()
{
 return View();
}
```

### Disabled

You can disable the Syncfusion ASP.NET MVC Rating control by using the [Disabled](#) property. When the **Disabled** property is set to **true**, the rating control will be disabled and the user will not be able to interact with it and a disabled rating control may have a different visual appearance than an enabled one.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).Disabled(true).Render()
```

#### DISABLED.CS

```
public ActionResult Disabled()
{
 return View();
}
```

### Visible

You can use the [Visible](#) property of the ASP.NET MVC Rating control to control the visibility of the control. When the **Visible** property is set to **true**, the rating control will be visible on the page. When it is set to **false**, the control will be hidden.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).Visible(true).Render()
```

#### VISIBLE.CS

```
public ActionResult Visible()
```

```
{
 return View();
}
```

### Read only

You can use the [ReadOnly](#) property of the ASP.NET MVC Rating control to make the control non-interactive and prevent the user from changing the rating value.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).ReadOnly(true).Render()
```

### READONLY.CS

```
public ActionResult ReadOnly()
{
 return View();
}
```

### CssClass

You can customize the appearance of the rating control, such as by changing its colors, fonts, sizes, or other visual aspects by using the [CssClass](#) property.

#### Changing rating symbol border color

You can change the rating icon border color in ASP.NET MVC Rating control, you can use the [CssClass](#) property and set the [text-stroke](#) CSS property of [.e-rating-icon](#) to your desired border color.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).CssClass("custom-font").Render()
<style>
 .e-rating-container.custom-font .e-rating-item-list:hover .e-rating-
 item-container .e-rating-icon,
 .e-rating-container.custom-font .e-rating-item-container .e-rating-icon
 {
 /* To change rating symbol border color */
 -webkit-text-stroke: 2px #ae9e9d;
 }
</style>
```

### BORDERCOLOR.CS

```
public ActionResult BorderColor()
```

```
{
 return View();
}
```

#### Changing rated/un-rated symbol fill color

You can customize the fill colors of rated and un-rated icons in the Rating control using the `CssClass` property and the `linear-gradient` color-stops in the `background` CSS property of `.e-rating-icon`. The **first** color-stop defines the rated fill color and the **second** defines the un-rated fill color.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).CssClass("custom-font").Render()
<style>
 .e-rating-container.custom-font .e-rating-item-list:hover .e-rating-
 item-container .e-rating-icon,
 .e-rating-container.custom-font .e-rating-item-container .e-rating-icon
 {
 /* To change rated symbol fill color and un-rated symbol fill color
 */
 background: linear-gradient(to right, #ffe814 var(--rating-value),
 #d8d7d4 var(--rating-value));
 background-clip: text;
 -webkit-background-clip: text;
 }
</style>
```

#### FILLCOLOR.CS

```
public ActionResult FillColor()
{
 return View();
}
```

This will customize the rated fill color to `#ffe814` and un-rated fill color to `#d8d7d4`. `--rating-value` in the `linear-gradient` provides the current value of the rating item.

#### Changing the item spacing

You can change the space between the rating items in ASP.NET MVC Rating control, by using the `CssClass` property and setting the `margin` / `padding` CSS property of `.e-rating-item-container` to your desired size.

#### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).CssClass("custom-font").Render()
<style>
```

```
.e-rating-container.custom-font .e-rating-item-container {
 /* To change the size between items */
 margin: 0px 7px;
}
</style>
```

### ITEMSSPACING.CS

```
public ActionResult ItemSpacing()
{
 return View();
}
```

### Changing icon using CssClass

You can change the rating item icon in ASP.NET MVC Rating control, you can use the `CssClass` property and set the `content` CSS property of `.e-icons.e-star-filled:before` to your desired font icon.

### CSHTML

```
@using Syncfusion.EJ2.Inputs
@Html.EJS().Rating("rating").Value(3).CssClass("custom-icon").Render()
<style>
 .custom-icon .e-icons.e-star-filled:before {
 content: "\e702";
 }
 @@font-face {
 font-family: 'custom-icon';

</style>

```

### CHANGEICON.CS

```

public ActionResult ChangeIcon()
{
 return View();
}

```

### Accessibility in ASP.NET MVC Rating Control

Accessibility is achieved in the rating control through **WAI-ARIA** standard and keyboard navigations. The Rating control can be effectively accessed through assistive technologies such as screen readers.

#### Keyboard interaction

The rating control is interactive with below keyboard shortcuts.

| Keyboard shortcuts | Actions |

|-----|-----|

| Space | If a **Reset Button** is focused, resets the value to **Min** value. |

| ArrowUp | Increases the value. |

| ArrowLeft | Decreases the value and in RTL mode, increases the value. |

| ArrowDown | Decreases the value. |

| ArrowRight | Increases the value and in RTL mode, decreases the value. |

#### ARIA attribute

The following ARIA attributes are used in rating control based on its state.

| Properties | Functionality |

| ----- | ----- |

| role | This attribute is added to the div element to describe the actual role. |

| aria-label | Attribute provides the text label with some default description for the Rating and its items.  
|

| aria-valuemin | It defines the minimum value of rating. |

| aria-valuemax | It defines the maximum value of rating. |

| aria-valuenow | It defines the current value of rating. |

## Ribbon

### Getting Started with ASP.NET MVC Ribbon Control

This section briefly explains about how to include **ASP.NET MVC Ribbon** control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

#### Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### **PACKAGE MANAGER**

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

#### ~/ \_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

### Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

#### ~/ \_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

### Add ASP.NET MVC Ribbon control

Now, add the Syncfusion ASP.NET MVC Ribbon control in `~/Home/Index.cshtml` page.

#### INDEX.CSHTML

```
@Html.EJS().Ribbon("ribbon").Render()
```

### Adding Ribbon Tab

In Ribbon, the options are arranged in tabs for easy access. You can use the `Tabs` property of ribbon to define the ribbon tab like below.

#### INDEX.CSHTML

```
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Add();
}).Render()
```

### Adding Ribbon Group

To define a ribbon group under each tab, you can use the **Groups** property of ribbon tab like below. The **Orientation** property of ribbon group defines whether the collection of items will be rendered column-wise or row-wise.

#### INDEX.CSHTML

```
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(groups =>
 {
 groups.Header("Clipboard").Orientation(ItemOrientation.Row).Add();
 }).Add();
}).Render()
```

### Adding Ribbon Items

You can use the **Collections** property of ribbon group to define each ribbon collection that contains one or more items. To define each ribbon item, you can use the **Items** property of ribbon collection and the **Type** property of ribbon item to specify the type of control to be rendered, like a button, a drop-down button, a combo box, and more.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text =
 "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new MenuItem
 { Text = "Keep text only" } };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(groups =
 {
 groups.Header("Clipboard").Orientation(ItemOrientation.Row).Collections(coll
 ection =>
 {
 collection.Id("paste-collection").Items(items =>
 {
 items.Type(RibbonItemType.SplitButton).SplitButtonSettings(splitbutton =>
 {
 splitbutton.IconCss("e-icons e-paste").Items(pasteOptions).Content("Paste");
 }).Add();
 }).Add();
 collection.Id("cutcopy-collection").Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }
 }
}).Add();
```

```

 }).Add();
 }).Add();
 }).Render();

```

The following example illustrates how tabs, groups, collections, and items are used in a ribbon control to form the ribbon layout.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
 List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text
= "Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem {
Text = "Convert Table" }, new MenuItem { Text = "Excel SpreadSheet" } };

 List<string> fontSize = new List<string>() { "8", "9", "10", "11", "12",
"14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96" };
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
 List<MenuItem> fileOptions = new List<MenuItem>()
 {
 new MenuItem { Text = "New", IconCss = "e-icons e-file-new",
Id="new" },
 new MenuItem { Text = "Open", IconCss = "e-icons e-folder-open",
Id="open" },
 new MenuItem { Text = "Rename", IconCss = "e-icons e-rename",
Id="rename" },
 new MenuItem { Text = "Save as", IconCss = "e-icons e-save",
Id="save" }
 };
}
@Html.EJS().Ribbon("ribbon").FileMenu(file =>
{
 file.Text("File").Visible(true).MenuItems(fileOptions);
}).Tabs(tab => {
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").ShowLauncherIcon(true).GroupIconCss("e-
icons e-paste").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.SplitButton).SplitButtonSettings(splitbutton =>
 {
 splitbutton.IconCss("e-icons e-
paste").Items(pasteOptions).Content("Paste");
 }).Add();
 }).Add();
 }).Add();
 }
}

```

```

collection.Items(items =>
{
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
}).Add();

group.Header("Font").EnableGroupOverflow(true).Orientation(ItemOrientation.Row).GroupIconCss("e-icons e-bold").CssClass("font-group").Collections(collections =>
{
 collections.Id("ribbon-collection").Items(items =>
 {
 items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
 {
 comboBox.DataSource(fontStyle).Index(3).AllowFiltering(true).Width("150px");
 }).Add();

 items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
 {
 comboBox.DataSource(fontSize).Index(3).Width("65px");
 }).Add();
 }).Add();
 collections.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).AllowedSizes(RibbonItemSize.Small).DisplayOptions(Syncfusion.EJ2.Ribbon.DisplayMode.Simplified).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456");
 }).Add();

 items.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").IsToggle(true);
 }).Add();

 items.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").IsToggle(true);
 }).Add();
 });
});

```

```

items.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSettings(button =>
{
 button.IconCss("e-icons e-underline").IsToggle(true);
}).Add();

items.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSettings(button =>
{
 button.IconCss("e-icons e-strikethrough").IsToggle(true);
}).Add();

items.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSettings(button =>
{
 button.IconCss("e-icons e-change-case").IsToggle(true);
}).Add();
}).Add();
group.Header("Editor").GroupIconCss("e-icons e-edit").Collections(collections =>
{
 collections.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.Content("Editor").IconCss("e-icons e-edit");
 }).Add();
 }).Add();
}).Add();
tab.Header("Insert").Groups(groups =>
{
 groups.Header("Tables").Collections(collections =>
 {
 collections.Items(items =>

 groups.Header("Views").GroupIconCss("e-icons e-
print").Orientation(ItemOrientation.Row).Collections(collections =>
 {
 collections.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-print-layout").Content("Print
Layout");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-web-layout").Content("Web
Layout");
 }).Add();
 }).Add();
 }).Add();
 groups.Header("Show").Collections(collections =>
 {
 collections.Items(items =>
 {
 items.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
 {
 checkBox.Label("Ruler").Checked(false);
 }).Add();

 items.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
 {
 checkBox.Label("Gridlines").Checked(false);
 }).Add();

 items.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
 {
 checkBox.Label("Navigation Pane").Checked(true);
 }).Add();
 }).Add();
 }).Add();
}).Render()

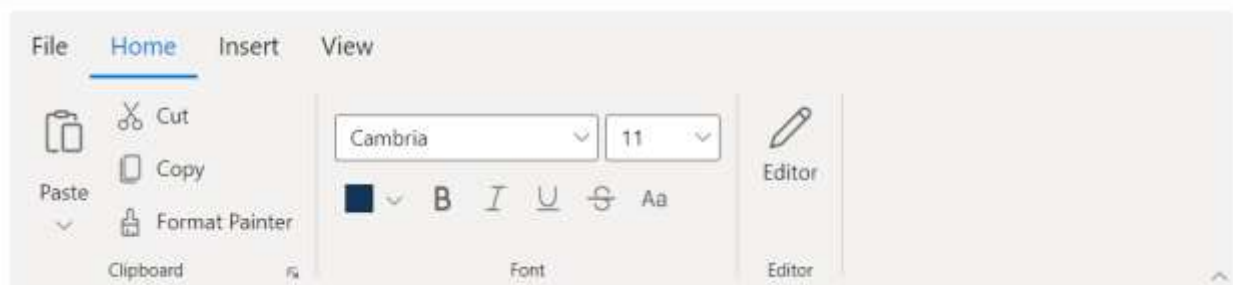

```

```

<style>
 .ribbonTemplate {
 display: flex;
 align-items: center;
 justify-content: center;
 cursor: pointer;
 }
 .ribbonTemplate.Large {
 flex-direction: column;
 }
 .ribbonTemplate.Large .e-icons {
 font-size: 35px;
 }
 .ribbonTemplate.Medium .e-icons,
 .ribbonTemplate.Small .e-icons {
 font-size: 20px;
 margin: 15px 5px;
 }
 .ribbonTemplate.Small .text {
 display: none;
 }
 .font-group .e-ribbon-group-content {
 justify-content: center;
 }
</style>

```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Ribbon control will be rendered in the default web browser.

## Tabs and Groups

The Ribbon control consists of a series of tabs that are organized into groups to enable quick access to specific commands or tools. Each tab contains a set of groups, and each group contains collections of items that are logically related to each other.

### Adding Tabs

You can use the [Tabs](#) property to add tabs to the Ribbon control and define the content of the tab header by using the [Header](#) property.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{

```

```
tab.Header("Home").Add();
}).Render()
```

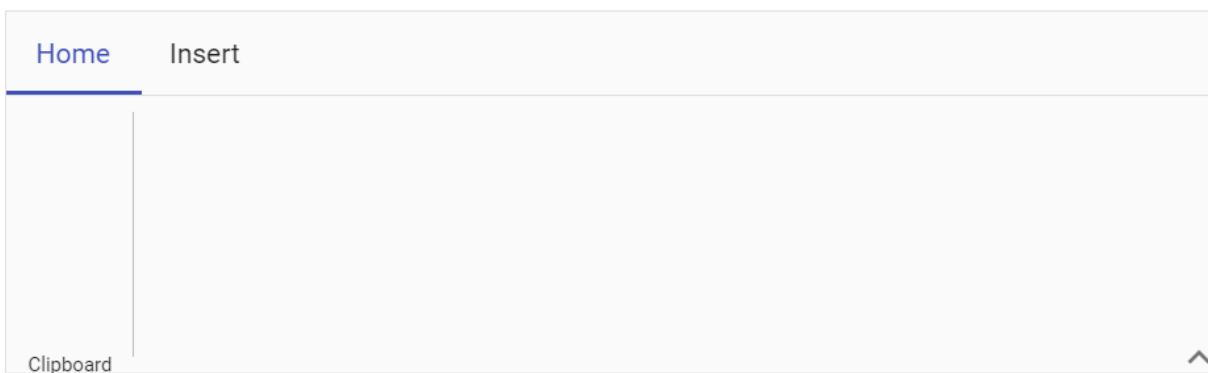

### Adding Groups

You can use the [Groups](#) property to add groups for each tab in the Ribbon and define the name of the group header by using the [Header](#) property.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(groups =>
 {
 groups.Header("Clipboard").Add();
 }).Add();
 tab.Header("Insert").Groups(groups =>
 {
 groups.Header("Tables").Add();
 }).Add();
}).Render()
```

### Adding Items

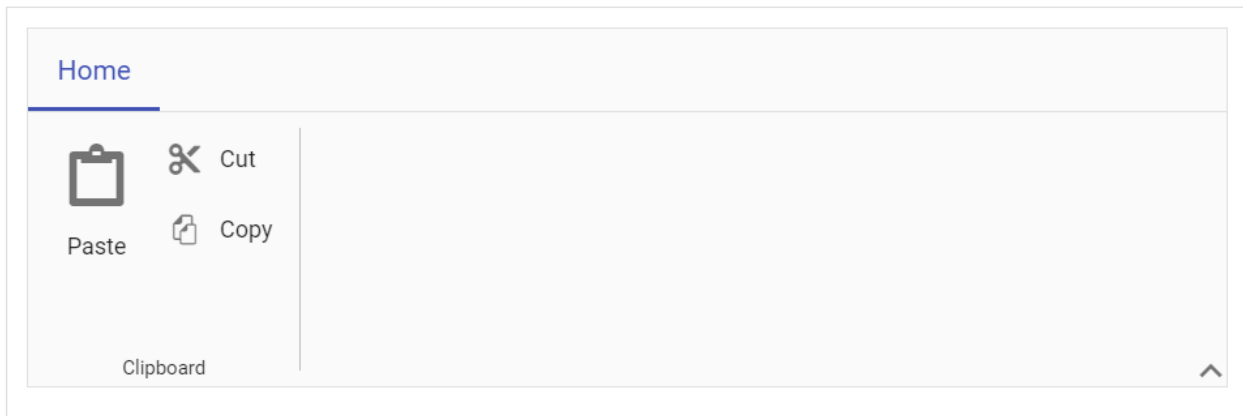

You can add collections of items to each group by using the [Collections](#) and [Items](#) properties.

#### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
```

```
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

For more information on the built-in and how to add custom Ribbon items, you can visit the [items](#) page.

### Ribbon Items

Ribbon renders various built-in items based on the item [Type](#) property. By default, the type property is set as **Button** which renders the Button.

### Built-in items

You can render the built-in Ribbon items by using the [Items](#) property, to specify the [Type](#) property.

The following table explains the built-in items and their actions.

| Built-in Ribbon Items | Actions |
|-----------------------|---------|
| -----                 | -----   |

- | Button | Renders button as ribbon item.
- | CheckBox | Renders checkbox as ribbon item.
- | DropDown | Renders dropdownbutton as ribbon item.
- | SplitButton | Renders splitbutton as ribbon item.
- | ComboBox | Renders combobox as ribbon item.
- | ColorPicker | Renders color picker as ribbon item.
- | GroupButton | Renders groupbutton as ribbon item.

### Button items

You can render the built-in button Ribbon item by setting the [Type](#) property as `Button`. You can also customize the button item using the [RibbonButtonSettings](#), which provides options such as `iconCss`, `content`, `isToggle` and more.

### Toggle button

The [IsToggle](#) property can be used to define whether the button act as a toggle button or not. By default the value is `false`.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut").IsToggle(true);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render();
```

### CheckBox items

You can render the built-in checkBox Ribbon item by setting the [Type](#) property to `CheckBox`. You can also customize the checkBox item using the [RibbonCheckBoxSettings](#), which provides options such as `labelPosition`, `label`, `checked` and more.

### Checkbox state

You can use the [Checked](#) property to handle the checked or unchecked state. By default, the value is `false`.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
```

```
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
 {
 checkBox.Checked(true).Label("Ruler");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

### Defining label

You can use the [Label](#) property to add a caption for the CheckBox. The label position can be set **Before** or **After**, by using the [LabelPosition](#) property. By default, the labelPosition is **After**.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
 {
 checkBox.Checked(true).Label("Ruler").LabelPosition("Before");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

### DropDown button items

You can render the built-in dropDown Ribbon item by setting the [Type](#) property to **DropDown**. You can also customize the dropDown item through [RibbonDropDownSettings](#), which provides options such as **iconCss**, **content**, **target** and more.

### Target

The [Target](#) property specifies the element selector to be displayed in the DropDownButton popup.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
```

```

string[] pictureOptions = new string[] { "This device", "Stock Images",
"Online Images" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Illustrations").Collections(collection =>
{
collection.Items(item =>
{
item.Type(RibbonItemType.DropDown).DropDownSettings(dropdown =>
{
dropdown.IconCss("e-icons e-image").Content("Pictures").Target("#listView");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
@Html.EJS().ListView("listView").ShowHeader(true).HeaderTitle("Insert
Picture From").DataSource(pictureOptions).Render()

```

### Split button items

You can render the built-in splitButton Ribbon item by setting the [Type](#) property to `SplitButton` you can render a splitButton item. You can also customize the SplitButton item through [RibbonSplitButtonSettings](#), which provides options such as `IconCss`, `Items`, `Target` and more.

### Target

The [Target](#) property specifies the element selector to be displayed in the SplitButton popup.

### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
string[] pictureOptions = new string[] { "This device", "Stock Images",
"Online Images" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Illustrations").Collections(collection =>
{
collection.Items(item =>
{
item.Type(RibbonItemType.SplitButton).SplitButtonSettings(splitbutton =>
{
splitbutton.IconCss("e-icons e-
image").Content("Pictures").Target("#listView");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()

```

```
@Html.EJS().ListView("listView").ShowHeader(true).HeaderTitle("Insert
Picture From").DataSource(pictureOptions).Render()
```

### Combobox items

You can render the built-in comboBox Ribbon item by setting the [Type](#) property to `ComboBox` you can render a comboBox item. You can also customize the ComboBox item through [RibbonComboBoxSettings](#), which provides options such as `AllowFiltering`, `AutoFill`, `Index`, `SortOrder` and more.

### Filtering

You can use the [AllowFiltering](#) property to filter the data items. The filtering operation is initiated automatically, as soon as you start typing characters. If no match is found, the value of the `noRecordsTemplate` property will be displayed. By default, the value is `false`.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
 "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(combobox =>
 {
 combobox.DataSource(fontStyle).AllowFiltering(true);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
```

### Index

You can use the [Index](#) property to get or set the selected item in the combobox.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
 "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
```

```
{
collection.Items(item =>
{
item.Type(RibbonItemType.ComboBox).ComboBoxSettings(combobox =>
{
combobox.DataSource(fontStyle).Index(3);
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
```

### SortOrder

You can use the [SortOrder](#) property to specify the order in which the DataSource should be sorted.

|            |                                                |
|------------|------------------------------------------------|
| None       | The data source is not sorted.                 |
| Ascending  | The data source is sorted in ascending order.  |
| Descending | The data source is sorted in descending order. |

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("View").Collections(collection =>
{
collection.Items(item =>
{
item.Type(RibbonItemType.ComboBox).ComboBoxSettings(combobox =>
{
combobox.DataSource(fontStyle).SortOrder("Descending");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
```

### Colorpicker items

You can render the built-in colorPicker Ribbon item by setting the [Type](#) property to **ColorPicker**. You can also customize the colorPicker item through [RibbonColorPickerSettings](#), which provides options such as **Value**, **Columns**, **ShowButtons** and more.

### Value

You can use the [Value](#) property to specify the color value. The value should be specified as Hex code.

**INDEX.CSHTML**

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Inputs
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorpicker =>
 {
 colorpicker.Value("035a");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render();
 }
```

*Groupbutton items*

You can render the built-in groupbutton Ribbon item by setting the [Type](#) property to `GroupButton`. You can also customize the groupbutton item using the [RibbonGroupButtonSettings](#), which provides options such as `Selection` and `Items`.

*Items*

You can render the groupbutton items by using [Items](#) property. You can also customize the groupbutton items through [RibbonGroupButtonItem](#), which provides options such as `Content`, `IconCss`, `Selected` and more.

*Item content*

You can use the [Content](#) property to define the text content for the groupbutton.

**CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> groupButtonContent = new
 List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-left", Content
 = "Align Left" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-center", Content
 = "Align Center" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-right", Content
 = "Align Right" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-justify", Content =
 "Justify" }
 };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
```

```

{
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Medium).GroupButtonSettings(groupButton =>
 {
 groupButton.Items(groupButtonContent);
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

### Icon only

You can use the [IconCss](#) property to customize the groupbutton icon. If the `IconCss` property is not defined, the groupbutton will not be rendered.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> groupButtonIcon = new
 List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-left" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-center" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-right" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-justify" }
 };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Small).GroupButtonSettings(groupButton =>
 {
 groupButton.Items(groupButtonIcon);
 }).Add();
 });
 });
 });
}).Render()

```

```

 }).Add();
 }).Add();
 }).Add();
}).Render();

```

### Selection

You can use the [Selected](#) property to select the groupbutton item initially. When set to `true`, the button will be selected. By default the `Selected` property is false.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> groupButtonSelected = new
 List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-left", Content
= "Align Left" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-center", Content
= "Align Center", Selected = true },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-right", Content
= "Align Right" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-justify", Content =
"Justify" }
 };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Small).Gr
oupButtonSettings(groupButton =>
 {
 groupButton.Items(groupButtonSelected);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

### Single selection

You can set the [Selection](#) property value as `RibbonGroupButtonSelection.Single` to make one selection at a time. It automatically deselects the previous choice when a different item is clicked.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> singleSelection = new
List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-left", Content
= "Align Left" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-center", Content
= "Align Center", Selected = true },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-right", Content
= "Align Right" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-justify", Content =
"Justify" }
 };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {

items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Small).Gr
oupButtonSettings(groupButton =>
 {

groupButton.Selection(RibbonGroupButtonSelection.Single).Items(singleSelecti
on);

 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

### Multiple selection

You can set the [Selection](#) property value as `RibbonGroupButtonSelection.Multiple` to select more than one button at a time. Users can select a button one by one to select multiple buttons.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> multipleSelection = new
List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-bold", Content =
"Bold" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-italic", Content =
"Italic", Selected = true },
 new RibbonGroupButtonItem { IconCss = "e-icons e-underline", Content =
"Underline" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-strikethrough",
Content = "Strikethrough", Selected = true }
 };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {

items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Small).Gr
oupButtonSettings(groupButton =>
 {

groupButton.Selection(RibbonGroupButtonSelection.Multiple).Items(multipleSel
ection);

 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
}
```

### Groupbutton in simplified mode layout

In simplified mode, the groupbutton will be rendered as a dropdownbutton. The dropdownbutton icon will be updated based on the button item selected. The initial button icon will be the set, if none of the buttons are selected.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<RibbonGroupButtonItem> groupButtonSelected = new
List<RibbonGroupButtonItem>() {
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-left", Content
= "Align Left" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-center", Content
= "Align Center", Selected = true },
 new RibbonGroupButtonItem { IconCss = "e-icons e-align-right", Content
= "Align Right" },
 new RibbonGroupButtonItem { IconCss = "e-icons e-justify", Content =
"Justify" }
 };
}
@Html.EJS().Ribbon("ribbon").ActiveLayout(RibbonLayout.Simplified).Tabs(tab
=>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Paragraph").Collections(collection =>
 {
 collection.Items(items =>
 {

items.Type(RibbonItemType.GroupButton).AllowedSizes(RibbonItemSize.Small).Gr
oupButtonSettings(groupButton =>
 {

groupButton.Selection(RibbonGroupButtonSelection.Single).Items(groupButtonSe
lected);

 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 }
}
```

### Custom items

You can customize the ribbon items with non-built-in items or HTML content by setting the [Type](#) property to **Template**. This provides an option to customize the ribbon items with greater flexibility.

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("View").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Template).ItemTemplate("<span class='ribbonTemplate
${activeSize}'>Video").Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
<style>
.ribbonTemplate {
display: flex;
align-items: center;
justify-content: center;
cursor: pointer;
}
.ribbonTemplate.Large {
flex-direction: column;
}
.ribbonTemplate.Large .e-icons {
font-size: 35px;
}
.ribbonTemplate.Medium .e-icons,
.ribbonTemplate.Small .e-icons {
font-size: 20px;
margin: 15px 5px;
}
.ribbonTemplate.Small .text {
display: none;
}
</style >
```

### Items display Mode

You can use the [DisplayOptions](#) property to display the items in the Ribbon.

|            |                                                                              |
|------------|------------------------------------------------------------------------------|
| Auto       | The items are displayed in all layouts based on the ribbon's overflow state. |
| Classic    | The items are displayed only in the classic layout group.                    |
| Simplified | The items are displayed only in the simplified layout group.                 |
| Overflow   | The items are displayed only in the overflow popup.                          |

### Display items in Classic only

To display the items only in the classic layout group, set the mode as `DisplayMode.Classic` in the [DisplayOptions](#) property.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).DisplayOptions(Syncfusion.EJ2.Ribbon.DisplayMode.Classic).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
```

### Display items in Simplified only

To display the items only in the simplified layout group, set the mode as `DisplayMode.Simplified` in the [DisplayOptions](#) property.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).DisplayOptions(Syncfusion.EJ2.Ribbon.DisplayMode.Simplified).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render();
 }
```

#### Display items in Overflow popup only

To display the items only in the overflow, set the mode as `DisplayMode.Overflow` in the [DisplayOptions](#) property.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).DisplayOptions(Syncfusion.EJ2.Ribbon.DisplayMode.Overflow).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render();
 }
```

#### Enable or disable items

You can use the [Disabled](#) property to disable a Ribbon item. It prevents the user interaction when set to `true`. By default, the value is `false`.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
```

```

{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).Disabled(true).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 item.Type(RibbonItemType.CheckBox).Disabled(true).CheckBoxSettings(checkBox =>
 {
 checkBox.Checked(true).Label("Ruler");
 }).Add();
 item.Type(RibbonItemType.DropDown).Disabled(true).DropDownSettings(dropdown =>
 {
 dropdown.IconCss("e-icons e-table").Content("Table");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 }
}

```

## Ribbon Layouts

The Ribbon allows to customize the layout by using the [ActiveLayout](#) property. The Ribbon control supports the following layouts:

### Classic layout

In classic layout, the Ribbon control organizes the items and groups in a traditional form by setting the [ActiveLayout](#) property to [Classic](#). By default, the Ribbon control renders in the [Classic](#) layout.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text = "Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem { Text = "Convert Table" }, new MenuItem { Text = "Excel SpreadSheet" } };
}
@Html.EJS().Ribbon("ribbon").ActiveLayout(RibbonLayout.Classic).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }
 }
)
 }
)
 }
)
}
)

```

```

 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 tab.Header("Insert").Groups(groups =>
 {
 groups.Header("Tables").Collections(collections =>
 {
 collections.Items(items =>
 {
 items.Type(RibbonItemType.DropDown).DropDownSettings(dropDown =>
 {
 dropDown.IconCss("e-icons e-
table").Content("Table").Items(tableOptions);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()

```

### Defining items size

You can use the [AllowedSizes](#) property to set the allowed size for an item. The Ribbon items can be appeared in three different sizes: Large(large icon with text), Medium(small icon with text) and Small(small icon only). On resizing, the items size can be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon

```

```

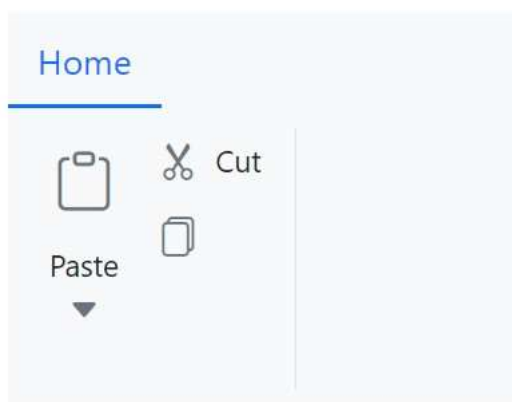

@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Collections(collection =>
 {
 collection.Items(item =>
 {

item.Type(RibbonItemType.SplitButton).AllowedSizes(RibbonItemSize.Large).Spl
itButtonSettings(button =>
 {
 button.IconCss("e-icons e-
paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 collection.Items(item =>
 {

item.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Medium).ButtonS
ettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();

item.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Small).ButtonSe
ttings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

*Defining items orientation*

The Ribbon group [Orientation](#) property allows to manage how the items are aligned either in a **Row** or **Column**. By default, the orientation is set to **Column**, in which the items are arranged vertically.

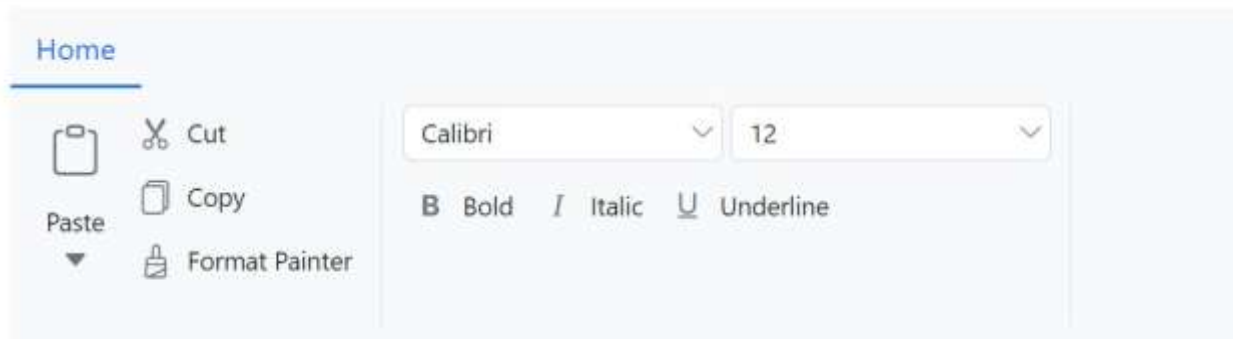

**CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
 List<string> fontSize = new List<string>() { "8", "9", "10", "11", "12",
"14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96" };
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Orientation(ItemOrientation.Column).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-
paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 group.Orientation(ItemOrientation.Row).Collections(collection =>
 {
 collection.Items(item =>
 {
```

```

=> item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
 {
 button.DataSource(fontStyle).Index(2);
 }).Add();
=> item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
 {
 button.DataSource(fontSize).Index(4);
 }).Add();
collection.Items(item =>
{
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").Content("Bold");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").Content("Italic");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-
underline").Content("Underline");
 }).Add();
 }).Add();
}).Add();
}).Add();
}).Render()

```

When the orientation is set to **Row** a group may have a maximum of three collections each of which may contain any number of items. When the orientation is set to **Column** a group may have any number of collections, each of which may contain one large-sized item or three medium/small-sized items. If two large-sized items are specified, it automatically converts into two medium/small-sized items.

#### [Defining group header](#)

You can use the [Header](#) property to set the name for each group header.

#### **CSHTML**

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-
paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 }).Add();
 group.Header("Font").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").Content("Bold");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").Content("Italic");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-
underline").Content("Underline");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
}

```

### Defining group icon

You can use the [GroupIconCss](#) property to customize the icons in the group overflow button. When the ribbon's size is adjusted, the group popup will appear.

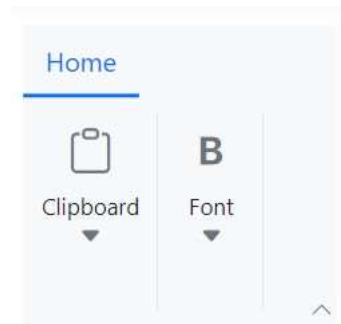

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text = "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new MenuItem { Text = "Keep text only" } };
 List<string> fontSize = new List<string>() { "8", "9", "10", "11", "12", "14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96" };
 List<string> fontStyle = new List<string>() { "Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia", "Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").GroupIconCss("e-icons e-paste").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 });
 });
 });
}
```

```

 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 group.Header("Font").GroupIconCss("e-icons e-
bold").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontStyle).Index(2);
 }).Add();
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontSize).Index(4);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").Content("Bold");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").Content("Italic");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-
underline").Content("Underline");
 }).Add();
 }).Add();
 }).Add();
}).Add();
}).Render()

```

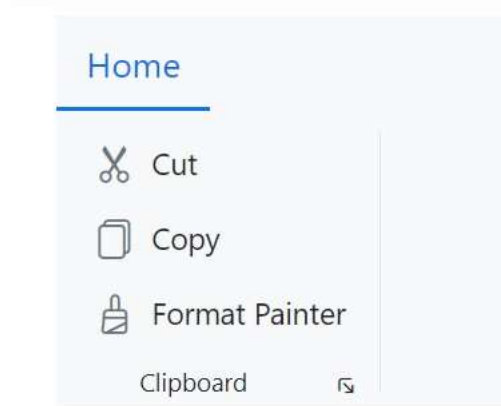

### Enabling group launcher icon

You can use the [ShowLauncherIcon](#) property to enable or disable the launcher icon for each group. By default, the property is set to `false`.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.ShowLauncherIcon(true).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

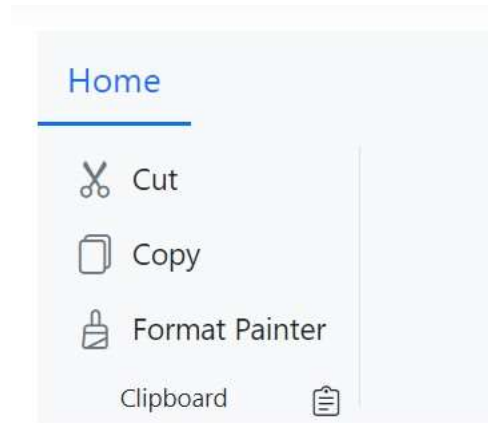

### Customize launcher icon

You can use the [LauncherIconCss](#) property to customize the launcher icon by applying the custom styles.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").LauncherIconCss("e-icons e-
description").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").GroupIconCss("e-icons e-
paste").ShowLauncherIcon(true).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

### Defining group collapsible state

You can use the [IsCollapsible](#) property to determine whether the group is collapsed or not during resize. By default, the property is set to `true`. To prevent the group from being collapsed, set the property to `false`.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
 List<string> fontSize = new List<string>() { "8", "9", "10", "11", "12",
"14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96" };
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").GroupIconCss("e-icons e-
paste").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-
paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
```

```

 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 }).Add();
 group.Header("Font").IsCollapsible(false).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontStyle).Index(2);
 }).Add();
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontSize).Index(4);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").Content("Bold");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").Content("Italic");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-
underline").Content("Underline");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

### Defining priority order for group collapse or expand

You can use the [Priority](#) property to set the priority order for each group which should be collapsed or expanded on resizing. When collapsing, higher priority values are fetched first. When expanding, lower priority values are fetched first.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };
 List<MenuItem> findOptions = new List<MenuItem>() { new MenuItem { Text
= "Find", IconCss = "e-icons e-search" }, new MenuItem { Text = "Advanced
find", IconCss = "e-icons e-search" }, new MenuItem { Text = "Go to",
IconCss = "e-icons e-arrow-right" } };
 List<MenuItem> selectOptions = new List<MenuItem>() { new MenuItem {
Text = "Select All" }, new MenuItem { Text = "Select Objects" } };

 List<string> fontSize = new List<string>() { "8", "9", "10", "11", "12",
"14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96" };
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").GroupIconCss("e-icons e-
paste").Priority(2).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-
paste").Content("Paste").Items(pasteOptions);
 }).Add();
 }).Add();
 }
 }
}
```

```

 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-
painter").Content("Format Painter");
 }).Add();
 }).Add();
 }).Add();
 group.Header("Font").GroupIconCss("e-icons e-
bold").Priority(0).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontStyle).Index(2);
 }).Add();
 item.Type(RibbonItemType.ComboBox).ComboBoxSettings(button
=>
 {
 button.DataSource(fontSize).Index(4);
 }).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-bold").Content("Bold");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-italic").Content("Italic");
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-
underline").Content("Underline");
 }).Add();
 }).Add();
 }).Add();
 group.Header("Editing").GroupIconCss("e-icons e-
bold").Priority(1).Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>

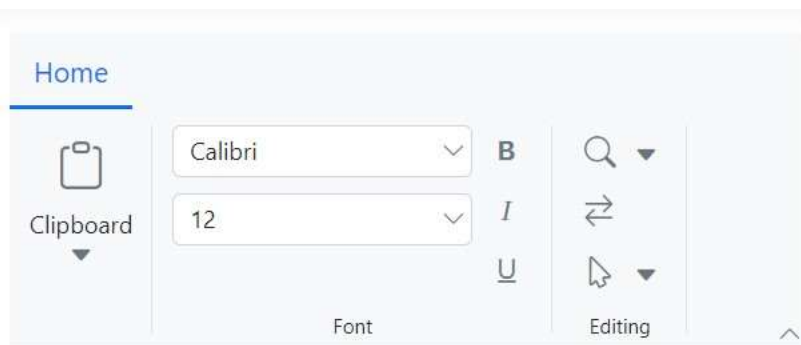

```

```

 {
 button.IconCss("e-icons e-
search").Content("Find").Items(findOptions);
 }).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-replace").Content("Replace");
 }).Add();

 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-mouse-
pointer").Content("Select").Items(selectOptions);
 }).Add();
 }).Add();
}).Add();
}).Add();
}).Render()

```

### Simplified layout

In simplified layout, the Ribbon control organizes the items and groups into a single row by setting the [ActiveLayout](#) property to [Simplified](#).

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text
= "Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem {
Text = "Convert Table" }, new MenuItem { Text = "Excel SpreadSheet" } };
}
@Html.EJS().Ribbon("ribbon").ActiveLayout(RibbonLayout.Simplified).Tabs(tab
=>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {

```

```

 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
}).Add();
collection.Items(items =>
{
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
}).Add();
tab.Header("Insert").Groups(groups =>
{
 groups.Header("Tables").Collections(collections =>
 {
 collections.Items(items =>

items.Type(RibbonItemType.DropDown).DropDownSettings(dropDown =>
 {
 dropDown.IconCss("e-icons e-
table").Content("Table").Items(tableOptions);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

#### Enabling group overflow popup

You can use the [EnableGroupOverflow](#) property to add a separate popup for the overflow items in the group while resizing. The overflow items will appear in the common overflow popup, located at the right end of the tab content if it is set to **false**.

#### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteOptions = new List<MenuItem>() { new MenuItem { Text
= "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
MenuItem { Text = "Keep text only" } };

```

```

List<MenuItem> findOptions = new List<MenuItem>() { new MenuItem { Text
= "Find", IconCss = "e-icons e-search" }, new MenuItem { Text = "Advanced
find", IconCss = "e-icons e-search" }, new MenuItem { Text = "Go to",
IconCss = "e-icons e-arrow-right" } };

List<MenuItem> selectOptions = new List<MenuItem>() { new MenuItem {
Text = "Select All" }, new MenuItem { Text = "Select Objects" } };

 }).Add();

 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-mouse-
pointer").Content("Select").Items(selectOptions);
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()

```

### Minimized state

You can hide the Ribbon contents and display only the tab headers by double-clicking on the tab header. In minimized state, the Ribbon control expands to its normal state when click on the tab header.

You can use the [IsMinimized](#) property to change the Ribbon component to minimized state. By default, the value is `false`.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text = "Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem { Text = "Convert Table" }, new MenuItem { Text = "Excel SpreadSheet" } };
}
@Html.EJS().Ribbon("ribbon").IsMinimized(true).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
```

```

 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
}).Add();
tab.Header("Insert").Groups(groups =>
{
 groups.Header("Tables").Collections(collections =>
 {
 collections.Items(items =>
 {
 items.Type(RibbonItemType.DropDown).DropDownSettings(dropDown =>
 {
 dropDown.IconCss("e-icons e-
table").Content("Table").Items(tableOptions);
 }).Add();
 }).Add();
 }).Add();
}).Add();
}).Add();
}).Render()

```

## File Menu

The Ribbon control provides a built-in file menu that allows you to add menu items for performing specific actions. The file menu can be enabled by setting the [FileMenu](#) property.

### Visibility

You can show the file menu by setting the [Visible](#) property to `true`. By default, the file menu is hidden.

### CSHTML

```

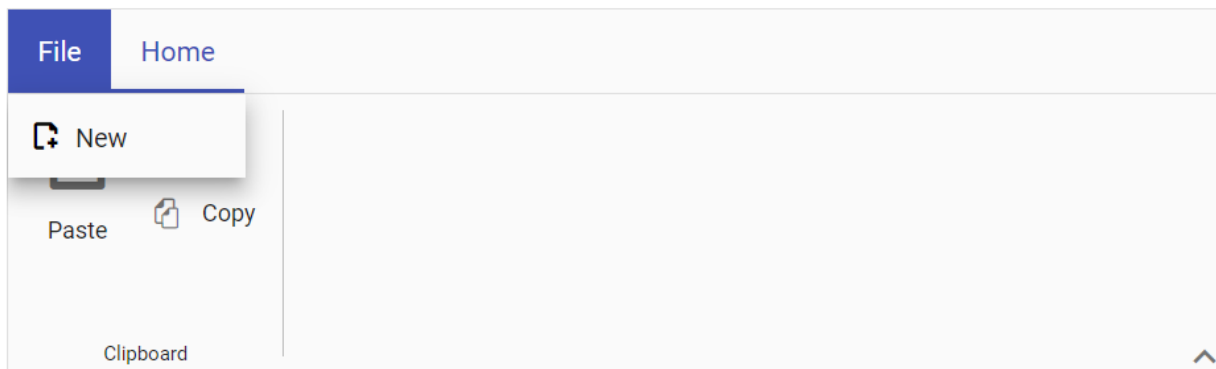

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> fileOptions = new List<MenuItem>()
 {
 new MenuItem { Text = "New", IconCss = "e-icons e-file-new" }
 };
}
@Html.EJS().Ribbon("ribbon").FileMenu(file =>
{
 file.Visible(true).MenuItems(fileOptions);
}).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>

```

```

 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
}).Add();
}).Render()

```

### Adding Menu Items

The menu items can be added to the file menu using the [MenuItems](#) property.

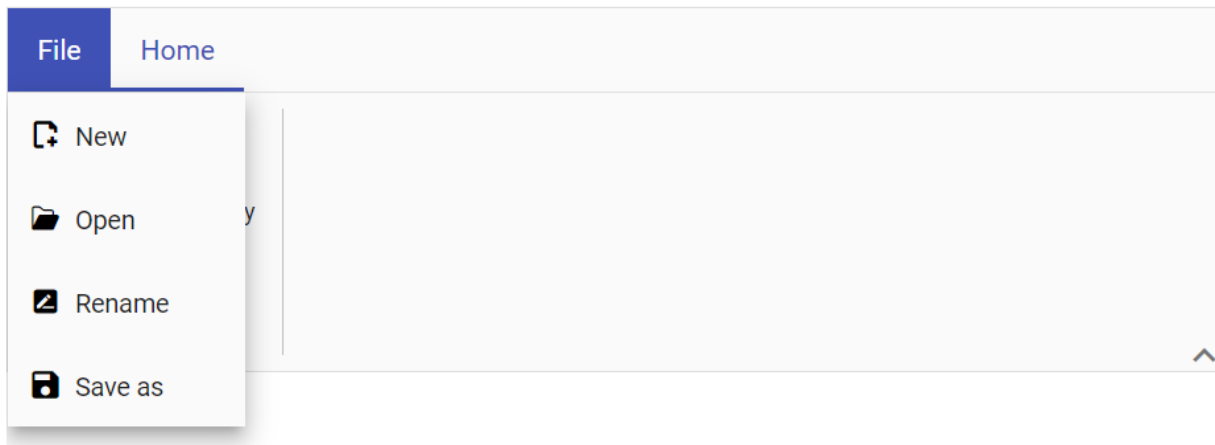

#### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> fileOptions = new List<MenuItem>()
 {
 new MenuItem { Text = "New", IconCss = "e-icons e-file-new" },
 new MenuItem { Text = "Open", IconCss = "e-icons e-folder-open",
Id="open" },
 new MenuItem { Text = "Rename", IconCss = "e-icons e-rename",
Id="rename" },
 new MenuItem { Text = "Save as", IconCss = "e-icons e-save",
Id="save" }
 };
}

```

```
@Html.EJS().Ribbon("ribbon").FileMenu(file =>
{
 file.Visible(true).MenuItems(fileOptions);
}).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
```

### Open Submenu on click

You can open the submenu on menu item click, by setting the [ShowItemOnClick](#) property to `true`. By default, the submenu will open on mouse hover.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
```

```

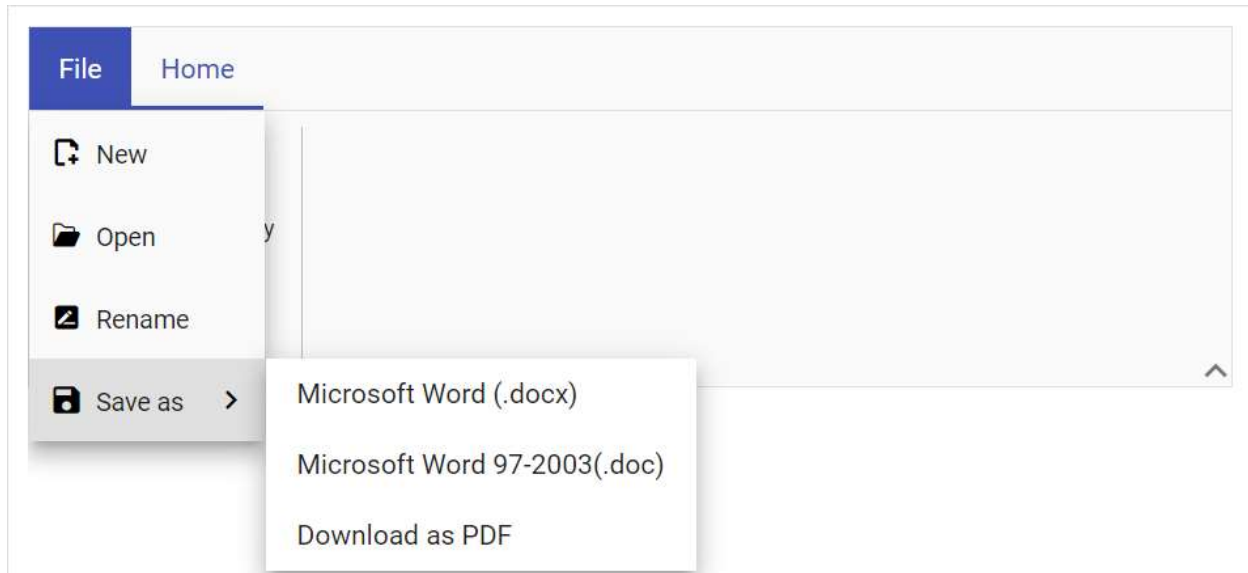

@{
 List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text
= "Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem {
Text = "Convert Table" }, new MenuItem { Text = "Excel SpreadSheet" } };
 List<MenuItem> fileOptions = new List<MenuItem>() {
 new MenuItem { Text = "New", IconCss = "e-icons e-file-new" },
 new MenuItem { Text = "Open", IconCss = "e-icons e-folder-open" },
 new MenuItem { Text = "Rename", IconCss = "e-icons e-rename" },
 new MenuItem { Text = "Save as", IconCss = "e-icons e-save",
 Items= new List<MenuItem>() {
 new MenuItem { Text = "Microsoft Word (.docx)" },
 new MenuItem { Text = "Microsoft Word 97-2003(.doc)" },
 new MenuItem { Text = "Download as PDF" }
 }
 }
 };
}
@Html.EJS().Ribbon("ribbon").FileMenu(file =>
{
 file.Visible(true).ShowItemOnClick(true).MenuItems(fileOptions);
}).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 tab.Header("Insert").Groups(groups =>
 {
 groups.Header("Tables").Collections(collections =>
 {
 collections.Items(items =>
 {
 items.Type(RibbonItemType.DropDown).DropDownSettings(dropDown =>
 {
 dropDown.IconCss("e-icons e-
table").Content("Table").Items(tableOptions);

```

```

 }).Add();
 }).Add();
}).Add();
}).Add();
}).Render();

```

### Custom Header text

You can define the file menu header text content by using the [Text](#) property.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> fileOptions = new List<MenuItem>()
 {
 new MenuItem { Text = "New", IconCss = "e-icons e-file-new" }
 };
}
@Html.EJS().Ribbon("ribbon").FileMenu(file =>
{
 file.Text("App").Visible(true).MenuItems(fileOptions);
}).Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}

```

```

collection.Items(items =>
{
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
}).Add();
}).Render()

```

## Ribbon Backstage

The Ribbon supports backstage view which is an addition to the traditional file menu. It displays information like application settings, user details, etc. The backstage view can be enabled by setting the [backStageMenu](#) property.

The backstage view options are displayed on the left, while the content of each option is shown on the right.

## Adding backstage items

The menu items can be added to the backstage view by using the [items](#) property. You can show the backstage view by setting the [visible](#) property to `true`. By default, the backstage view is hidden.

## CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<BackstageItem> backstageItems = new List<BackstageItem>() {
 new BackstageItem { Id = "home", Text = "Home", IconCss = "e-icons e-home", Content = processBackstageContent("home") },
 new BackstageItem { Id = "new", Text = "New", IconCss = "e-icons e-file-new", Content = processBackstageContent("new") },
 new BackstageItem { Id = "open", Text = "Open", IconCss = "e-icons e-folder-open", Content = processBackstageContent("open") },
 };
}

```

```

BackStageMenu backstageSettings = new BackStageMenu() { Text = "File",
Visible = true, BackButton = new BackstageBackButton { Text = "Close" },
Items = backstageItems };
}
@functions {
 string processBackstageContent(string item)
 {
 string content = "";

### [Adding Backstage events](#)

### Help pane

The help pane is dedicated area where the users can define help contents like controlling document permissions, sharing features, and more which appears on the right side of the Ribbon. You can use the [HelpPaneTemplate](#) property to set the help pane contents.

### **INDEX.CSHTML**

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Ribbon("ribbon").HelpPaneTemplate("#helpPaneTemplate").Tabs(tab
=>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }
 }
 }
}

```

```

 }).Add();
 }).Add();
 }).Add();
 }).Render()
<style>
.action_btn {
margin: 0px 3px;
border: none;
color: #ffffff;
background-color: #0d6efd;
}
#undo, #redo{
padding: 0px 3px ;
}
</style>
<script type="text/x-jsrender" id="helpPaneTemplate">
<button class="action_btn"> <label>
 Undo </label></button>
<button class="action_btn"> <label>
 Redo </label></button>
</script>

```

## Tooltip

The Ribbon component supports tooltip to show additional information in the Ribbon items. The tooltip appears when the user hovers over a Ribbon item.

### Adding Title

You can use the [Title](#) property to set the tooltip title for each Ribbon item.

## CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteMenuOptions = new List<MenuItem>() { new MenuItem { Text
 = "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new
 MenuItem { Text = "Keep text only" } };
 var cutOptions = new RibbonTooltipSettings { Title = "Cut" };
 var copyOptions = new RibbonTooltipSettings { Title = "Copy" };
 var pasteOptions = new RibbonTooltipSettings { Title = "Paste" };
 var formatOptions = new RibbonTooltipSettings { Title = "Format Painter" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>

```

```

{
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Items(pasteMenuOptions).Content("Paste");
 }).RibbonTooltipSettings(pasteOptions).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).RibbonTooltipSettings(cutOptions).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).RibbonTooltipSettings(copyOptions).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-painter").Content("Format Painter");
 }).RibbonTooltipSettings(formatOptions).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
}

```

### Adding Content

You can use the [Content](#) property to set the tooltip content for each Ribbon item.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteMenuOptions = new List<MenuItem>() { new MenuItem { Text = "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new MenuItem { Text = "Keep text only" } };
 var cutOptions = new RibbonTooltipSettings { Title = "Cut", Content = "Places the selected text or object on the clipboard so that you can paste it somewhere else." };
 var copyOptions = new RibbonTooltipSettings { Title = "Copy", Content = "Copies the chosen text or object to the clipboard so that you can reuse it elsewhere." };
 var pasteOptions = new RibbonTooltipSettings { Title = "Paste", Content = "Insert the clipboard content where the cursor is currently placed." };
 var formatOptions = new RibbonTooltipSettings { Title = "Format Painter", Content = "Copies the formatting style of a selected text or object and applies it to other content within the document." };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>

```

```

{
 item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Items(pasteMenuOptions).Content("Paste");
 }).RibbonTooltipSettings(pasteOptions).Add();
 }).Add();
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).RibbonTooltipSettings(cutOptions).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).RibbonTooltipSettings(copyOptions).Add();
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-format-painter").Content("Format Painter");
 }).RibbonTooltipSettings(formatOptions).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
}

```

### Adding Icon

You can use the [IconCss](#) property to specify the icons to be displayed in the tooltip.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
 List<MenuItem> pasteMenuOptions = new List<MenuItem>() { new MenuItem { Text = "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new MenuItem { Text = "Keep text only" } };
 var cutOptions = new RibbonTooltipSettings { Title = "Cut", Content = "Places the selected text or object on the clipboard so that you can paste it somewhere else.", IconCss = "e-icons e-cut" };
 var copyOptions = new RibbonTooltipSettings { Title = "Copy", Content = "Copies the chosen text or object to the clipboard so that you can reuse it elsewhere.", IconCss = "e-icons e-copy" };
 var pasteOptions = new RibbonTooltipSettings { Title = "Paste", Content = "Insert the clipboard content where the cursor is currently placed.", IconCss = "e-icons e-paste" };
 var formatOptions = new RibbonTooltipSettings { Title = "Format Painter", Content = "Copies the formatting style of a selected text or object and applies it to other content within the document.", IconCss = "e-icons e-format-painter" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>

```

```

{
collection.Items(item =>
{
item.Type(RibbonItemType.SplitButton).SplitButtonSettings(button =>
{
button.IconCss("e-icons e-paste").Items(pasteMenuOptions).Content("Paste");
}).RibbonTooltipSettings(pasteOptions).Add();
}).Add();
collection.Items(item =>
{
item.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("Cut");
}).RibbonTooltipSettings(cutOptions).Add();
item.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-copy").Content("Copy");
}).RibbonTooltipSettings(copyOptions).Add();
item.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-format-painter").Content("Format Painter");
}).RibbonTooltipSettings(formatOptions).Add();
}).Add();
}).Add();
}).Add();
}).Render()

```

### Customization

You can use the [CssClass](#) property to customize the appearance of the tooltip with your own custom styles.

### CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
List<MenuItem> pasteMenuOptions = new List<MenuItem>() { new MenuItem { Text = "Keep Source Format" }, new MenuItem { Text = "Merge format" }, new MenuItem { Text = "Keep text only" } };

}
</style>
```

## Ribbon Resizing

The Ribbon effectively resizes the ribbon elements while being resized. It extends when the ribbon size is increased and collapses when the ribbon size is decreased. The resizing can be performed in both the classic and simplified modes. Also, we have an option to resize the ribbon elements in the custom order.

In classic mode on resizing, the items size will be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

In simplified mode on resizing, the items size will be changed based on the available width of the tab content from the order of Medium-> Small and viceversa.

### Defining items allowed size

You can use the [AllowedSizes](#) property to maintain a constant size for an item. If **AllowedSizes** is set, it keeps the size constant even when being resized.

### CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Collections(collection =>
{
collection.Items(item =>
{
item.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Large).ButtonSe
ttings(button =>
{
button.IconCss("e-icons e-cut").Content("Cut");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
```

### Defining items active size

You can use the [ActiveSize](#) property to define the item size initially, before it is being resized. When resized the **ActiveSize** property is updated based on the ribbon's overflow state, which is determined by the **AllowedSizes** property being configured. By default, the value is **Medium**.

## Events

This section describes the ribbon events that will be triggered when appropriate actions are performed. The following events are available in the ribbon control.

### Tab selected

The [TabSelected](#) event is triggered after selecting the tab item.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").TabSelected("function(args) {tabSelectedEvent(ar
gs)}").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 <script>
 function tabSelectedEvent(args) {
 // Here, you can customize your code.
 }
 </script>
```

### Tab selecting

The [TabSelecting](#) event is triggered before selecting the tab item.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").TabSelecting("function(args) {tabSelectingEvent (
args)}").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
```

```

{
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-paste").Content("Paste");
}).Add();
}).Add();
collection.Items(items =>
{
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("Cut");
}).Add();
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-copy").Content("Copy");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function tabSelectingEvent(args) {
// Here, you can customize your code.
}
</script>

```

### Ribbon collapsing

The [RibbonCollapsing](#) event is triggered before collapsing the ribbon.

#### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").RibbonCollapsing("function(args){ribbonCollapsingEvent(args)}").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-paste").Content("Paste");
}).Add();
}).Add();
collection.Items(items =>
{
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("Cut");
}).Add();
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-copy").Content("Copy");
}

```

```

 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
<script>
function ribbonCollapsingEvent(args) {
 // Here, you can customize your code.
}
</script>

```

### Ribbon expanding

The [RibbonExpanding](#) event is triggered before expanding the ribbon.

#### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").RibbonExpanding("function(args){ribbonExpanding
(args)}").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
<script>
function ribbonExpanding(args) {
 // Here, you can customize your code.
}
</script>

```

### Group launcher click

The [LauncherIconClick](#) event is triggered when the launcher icon of the group is clicked.

**INDEX.CSHTML**

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").LauncherIconClick("function(args){launchClick(a
rgs)}").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").ShowLauncherIcon(true).Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-paste").Content("Paste");
 }).Add();
 }).Add();
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("Cut");
 }).Add();
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("Copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 <script>
 function launchClick(args) {
 // Here, you can customize your code.
 }
 </script>

```

## Button item events

*Clicked*

The [Clicked](#) event is triggered when the button is clicked.

**INDEX.CSHTML**

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.Button).ButtonSettings(button =>
 {

```

```
button.IconCss("e-icons e-cut").Content("Cut").Clicked("function() { clickedEvent() }");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function clickedEvent() {
// Here, you can customize your code.
}
</script>
```

### Created

The [Created](#) event is triggered when the button is created.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("Cut").Created("function() { createdEvent() }");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function createdEvent() {
// Here, you can customize your code.
}
</script>
```

### Checkbox item events

#### Change

The [Change](#) event is triggered when the Checkbox state is changed.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
```

```

group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
{
checkBox.Label("Ruler").Checked(false).Change("function(){changeEvent()}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function changeEvent() {
// Here, you can customize your code.
}
</script>

```

### Created

The [Created](#) event is triggered once the Checkbox is created.

### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.CheckBox).CheckBoxSettings(checkBox =>
{
checkBox.Label("Ruler").Checked(false).Created("function(){createdEvent()}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function createdEvent() {
// Here, you can customize your code.
}
</script>

```

### Colorpicker item events

#### Change

The [Change](#) event is triggered while changing the colors.

### INDEX.CSHTML

```

@using Syncfusion.EJ2

```

```
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").Change("function() {changeEvent()}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 <script>
 function changeEvent() {
 // Here, you can customize your code.
 }
 </script>
```

#### Created

The [Created](#) event is triggered once the ColorPicker is created.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").Created("function() {createdEvent()}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 <script>
 function createdEvent() {
 // Here, you can customize your code.
 }
 </script>
```

#### Open

The [Open](#) event is triggered while opening the ColorPicker popup.

**INDEX.CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").Open("function(args) {openEvent(args)}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function openEvent(args) {
 // Here, you can customize your code.
}
</script>
```

*Select*

The [Select](#) event is triggered while selecting the color in picker/palette, when showButtons property is enabled.

**INDEX.CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").Select("function(args) {selectEvent(args)}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function selectEvent(args) {
 // Here, you can customize your code.
}
</script>
```

*Before close*

The [BeforeClose](#) event is triggered before closing the ColorPicker popup.

**INDEX.CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").BeforeClose("function(args){beforeCloseEvent(ar
gs)}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function beforeCloseEvent() {
 // Here, you can customize your code.
}
</script>
```

*Before open*

The [BeforeOpen](#) event is triggered before opening the ColorPicker popup.

**INDEX.CSHTML**

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").BeforeOpen("function(args){beforeOpenEvent(args
)}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function beforeOpenEvent(args) {
 // Here, you can customize your code.
}
```

```
}
</script>
```

### Before tile render

The [BeforeTileRender](#) event is triggered while rendering each palette tile.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorPicker =>
 {
 colorPicker.Value("#123456").BeforeTileRender("function(args) {beforeTileRenderEvent(args)}");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function beforeTileRenderEvent(args) {
 // Here, you can customize your code.
}
</script>
```

### ComboBox item events

#### Change

The [Change](#) event is triggered when an item in a popup is selected or when the model value is changed by the user.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
 "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
 "Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
 Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
```

```
{
items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
{
comboBox.DataSource(fontStyle).Index(2).Change("function(args){changeEvent(a
rgs)}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function changeEvent() {
// Here, you can customize your code.
}
</script>
```

### Close

The [Close](#) event is triggered when the popup is closed.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
{
comboBox.DataSource(fontStyle).Index(2).Close("function(args){closeEvent(arg
s)}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function closeEvent(args) {
// Here, you can customize your code.
}
</script>
```

### Open

The [Open](#) event is triggered when the popup is opened.

**INDEX.CSHTML**

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
 "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
 "Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
 Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
 {
 comboBox.DataSource(fontStyle).Index(2).Open("function(args) {openEvent(args)
 }");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 }
 <script>
 function openEvent(args) {
 // Here, you can customize your code.
 }
 </script>

```

*Created*

The [Created](#) event is triggered once the Combobox is created.

**INDEX.CSHTML**

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
 List<string> fontStyle = new List<string>() { "Algerian", "Arial",
 "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
 "Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
 Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Items(items =>
 {
 items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
 {

```

```

comboBox.DataSource(fontStyle).Index(2).Created("function(args){createdEvent
(args)}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function createdEvent() {
// Here, you can customize your code.
}
</script>

```

### Filtering

The [Filtering](#) event triggers on typing a character in the Combobox.

### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
{
comboBox.DataSource(fontStyle).Index(2).Filtering("function(args){filteringE
vent(args)}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function filteringEvent(args) {
// Here, you can customize your code.
}
</script>

```

### Select

The [Select](#) event is triggered when an item in the popup is selected.

### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon

```

```
@{
List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
{
comboBox.DataSource(fontStyle).Index(2).Select("function(args){selectEvent(a
rgs)}");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function selectEvent(args) {
// Here, you can customize your code.
}
</script>
```

### Before open

The [BeforeOpen](#) event triggers before opening the popup.

### INDEX.CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@{
List<string> fontStyle = new List<string>() { "Algerian", "Arial",
"Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia",
"Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New
Roman", "Verdana", "Windings" };
}
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(items =>
{
items.Type(RibbonItemType.ComboBox).ComboBoxSettings(comboBox =>
{
comboBox.DataSource(fontStyle).Index(2).BeforeOpen("function(args){beforeOpe
nEvent(args)}");
}).Add();
}).Add();
}
```

```

}).Add();
}).Add();
}).Render()
<script>
function beforeOpenEvent(args) {
// Here, you can customize your code.
}
</script>

```

## DropDown item events

### Before close

The [BeforeClose](#) event is triggered before closing the DropDownButton popup.

### INDEX.CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@{
List<MenuItem> tableOptions = new List<MenuItem>() { new MenuItem { Text =
"Insert Table" }, new MenuItem { Text = "This device" }, new MenuItem { Text =
"Convert Table" }, new MenuItem { Text = "Excel Spreadsheet" } };

}).Render()
<script>
function backStageItemClickEvent(args) {
// Here, you can customize your code.
}
</script>
```

## Methods

The following methods are available in the Ribbon control.

### addTab

Using the **addTab** method you can add tab dynamically in the ribbon control. The arguments are as follows.

| Argument name       | Description                                                  |
|---------------------|--------------------------------------------------------------|
| tab                 | Gets the tab data to add.                                    |
| targetId (optional) | Gets the ID of the target tab to add the new tab.            |
| isAfter (optional)  | Defines whether the tab is added before or after the target. |

### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("addTab").Content("AddTab").Click("addTab").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Header("Home").Groups(group =>
{
group.Header("Clipboard").Collections(collection =>
{
collection.Items(item =>
{
item.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("cut");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function addTab() {
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
let newTab = {
header: "Insert",
id: "tab"
```

```

}
ribbonObj.addTab(newTab);
}
</script>

```

### addGroup

Using the **addGroup** method you can add a group dynamically in the ribbon control. The arguments are as follows.

| Argument name       | Description                                                    |
|---------------------|----------------------------------------------------------------|
| tabId               | Gets the ribbon tab ID.                                        |
| group               | Gets the group data to add.                                    |
| targetId (optional) | Gets the ID of the target group to add the new group.          |
| isAfter (optional)  | Defines whether the group is added before or after the target. |

### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon

 ribbonObj.addGroup("home", newGroup);
}
</script>

```

## addCollection

Using the `addCollection` method you can add a collection dynamically in the ribbon control. The arguments are as follows.

| Argument name       | Description                                                         |
|---------------------|---------------------------------------------------------------------|
| -----               | -----                                                               |
| groupId             | Gets the ribbon group ID.                                           |
| collection          | Gets the collection data to add.                                    |
| targetId (optional) | Gets the ID of the target collection to add the new collection.     |
| isAfter (optional)  | Defines whether the collection is added before or after the target. |

## INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("addCollection").Content("AddCollection").Click("addCollection").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Id("fontGroup").Header("Clipboard").Collections(collection =>
 {
 collection.Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
 }
 <script>
 function addCollection() {
 var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
 let newCollection = {
 id: "insertGroup",
 items: [
 {
 type: "Button",
 buttonSettings: {
 content: "Edit",
 iconCss: "e-icons e-edit"
 }
 },
 {
 type: "ColorPicker",
 colorPickerSettings: {
 value: "035a"
 }
 }
]
 }
 }
}
```

```

}
ribbonObj.addCollection("fontGroup", newCollection);
}
</script>

```

### addItem

Using the **addItem** method you can add an item dynamically in the ribbon control. The arguments are as follows.

| Argument name       | Description                                                   |
|---------------------|---------------------------------------------------------------|
| -----               | -----                                                         |
| collectionId        | Gets the ribbon collection ID.                                |
| item                | Gets the item data to add.                                    |
| targetId (optional) | Gets the ID of the target item to add the new item.           |
| isAfter (optional)  | Defines whether the item is added before or after the target. |

### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("addItem").Content("AddItem").Click("addItem").IsPrimary(
true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Type(RibbonItemType.Button).AllowedSizes(RibbonItemSize.Medium).ButtonS
ettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function addItem() {
 var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
 let newItem = {
 id: "insertItem",
 type: "ColorPicker",
 colorPickerSettings: {
 value: "035a"
 }
 }
 ribbonObj.addItem("buttonCollection", newItem);
}
</script>

```

### removeTab

The `removeTab` method is used to remove a tab from the ribbon control. This method takes the `tabId` as a parameter.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("removeTab").Content("RemoveTab").Click("removeTab").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Clipboard").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 tab.Id("insertTab").Header("Insert").Add();
}).Render()
<script>
function removeTab() {
 var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
 ribbonObj.removeTab("insertTab");
}
</script>
```

### removeGroup

The `removeGroup` method is used to remove a group of items from the ribbon control. This method takes the `groupId` as a parameter.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("removeGroup").Content("RemoveGroup").Click("removeGroup").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Font").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Type(RibbonItemType.Button).ButtonSettings(button =>
 {

```

```

button.IconCss("e-icons e-cut").Content("cut");
}).Add();
}).Add();
}).Add();
group.Header("ClipBoard").Id("clipBoard").Add();
}).Add();
}).Render()
<script>
function removeGroup() {
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
ribbonObj.removeGroup("clipBoard");
}
</script>

```

### removeCollection

The `removeCollection` method is used to remove a collection of items from the ribbon control. This method takes the `collectionId` as a parameter.

### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("removeCollection").Content("RemoveCollection").Click("removeCollection").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Id("homeTab").Header("Home").Groups(group =>
{
group.Header("Font").Collections(collection =>
{
collection.Id("buttonCollection").Items(item =>
{
item.Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("cut");
}).Add();
}).Add();
collection.Id("colorPicker").Items(item =>
{
item.Type(RibbonItemType.ColorPicker).ColorPickerSettings(colorpicker =>
{
colorpicker.Value("035a");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function removeCollection() {
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
ribbonObj.removeCollection("colorPicker");
}
</script>

```

### removeItem

The **removeItem** method is used to remove an item from the ribbon control. This method takes the **itemId** as a parameter.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("removeItem").Content("RemoveItem").Click("removeItem").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Font").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Id("cutItem").Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 item.Id("copyItem").Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-copy").Content("copy");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
}).Render()
<script>
function removeItem() {
 var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
 ribbonObj.removeItem("copyItem");
}
</script>
```

### enableItem

The **enableItem** method in a ribbon control is used to enable a specific item in the ribbon control. This method takes the **itemId** as a parameter.

#### INDEX.CSHTML

```
@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("enableItem").Content("EnableItem").Click("enableItem").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Font").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
```

```

item.Id("cutItem").Disabled(true).Type(RibbonItemType.Button).ButtonSettings
(button =>
{
button.IconCss("e-icons e-cut").Content("cut");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function enableItem() {
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
ribbonObj.enableItem("cutItem");
}
</script>

```

### disableItem

The **disableItem** method in a ribbon control is used to disable a specific item in the ribbon control. This method takes the **itemId** as a parameter.

#### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("disableItem").Content("DisableItem").Click("disableItem")
).IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
tab.Id("homeTab").Header("Home").Groups(group =>
{
group.Header("Font").Collections(collection =>
{
collection.Id("buttonCollection").Items(item =>
{
item.Id("cutItem").Type(RibbonItemType.Button).ButtonSettings(button =>
{
button.IconCss("e-icons e-cut").Content("cut");
}).Add();
}).Add();
}).Add();
}).Add();
}).Render()
<script>
function disableItem() {
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
ribbonObj.disableItem("cutItem");
}
</script>

```

### refreshLayout

The **refreshLayout** method can be used to update the layout.

#### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon

```

```

@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("refresh").Content("Refresh").Click("refreshLayout").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Font").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Id("cutItem").Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Render()
<script>
function refreshLayout() {
 var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
 ribbonObj.activeLayout = "Simplified";
 ribbonObj.refreshLayout();
}
</script>

```

### selectTab

The **selectTab** method is used to select a tab from the ribbon control. This method takes the **tabId** as a parameter.

### INDEX.CSHTML

```

@using Syncfusion.EJ2.Ribbon
@using Syncfusion.EJ2.Navigations
@Html.EJS().Button("selectTab").Content("selectTab").Click("selectTab").IsPrimary(true).Render()
@Html.EJS().Ribbon("ribbon").Tabs(tab =>
{
 tab.Id("homeTab").Header("Home").Groups(group =>
 {
 group.Header("Font").Collections(collection =>
 {
 collection.Id("buttonCollection").Items(item =>
 {
 item.Id("cutItem").Type(RibbonItemType.Button).ButtonSettings(button =>
 {
 button.IconCss("e-icons e-cut").Content("cut");
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 }).Add();
 tab.Id("insertTab").Header("Insert").Add();
 }).Render()
<script>
function selectTab() {

```

```
var ribbonObj = document.getElementById("ribbon").ej2_instances[0];
ribbonObj.selectTab("insertTab");
}
</script>
```

## RichTextEditor

### Getting Started with ASP.NET MVC Rich Text Editor Control

This section briefly explains about how to include [ASP.NET MVC Rich Text Editor](#) control in your ASP.NET MVC application using Visual Studio.

#### Prerequisites

##### [System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

#### PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

**Note:** Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

**Note:** If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

#### Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

#### Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/\_Layout.cshtml** file as follows,

**~/ LAYOUT.CSHTML**

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

**Note:** Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

**Register Syncfusion script manager**

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

**~/ LAYOUT.CSHTML**

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

**Add ASP.NET MVC Rich Text Editor control**

Now, add the Syncfusion ASP.NET MVC Rich Text Editor control in `~/Views/Home/Index.cshtml` page.

**CSHTML**

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<div>
 <div>
 <p>The Rich Text Editor is WYSIWYG ('what you see is what you get')
editor useful to create and edit content, and return the valid HTML
markup or markd
own of the content</p>
 <p> Toolbar </p>

 <p> Toolbar contains commands to align the text, insert
link, insert image, insert list, undo / redo operations, HTML view, etc </p>

 <p> Toolbar is fully customizable </p>

 <p> Links </p>

```

```

 <p> You can insert a hyperlink with its corresponding
dialog</p>

 <p> Attach a hyperlink to the displayed text. </p>

 <p> Customize the quick toolbar based on the hyperlink </p>

 <p> Image.</p>

 <p> Allows you to insert images from an online source as
well as the local computer</p>

 <p> You can upload an image</p>

 <p> Provides an option to customize quick toolbar for an
image </p>

</div>
</div>).Render()
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Rich Text Editor control will be rendered in the default web browser.

#### Initialize from iframe element

Initialize the Rich Text Editor on `<div>` element as shown below and set the enable field of [IframeSettings](#) property as true to render the Rich Text Editor content in an `<iframe>` and its isolated from the rest of the page.

#### CSHTML

```
@Html.EJS().RichTextEditor("iframe").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>

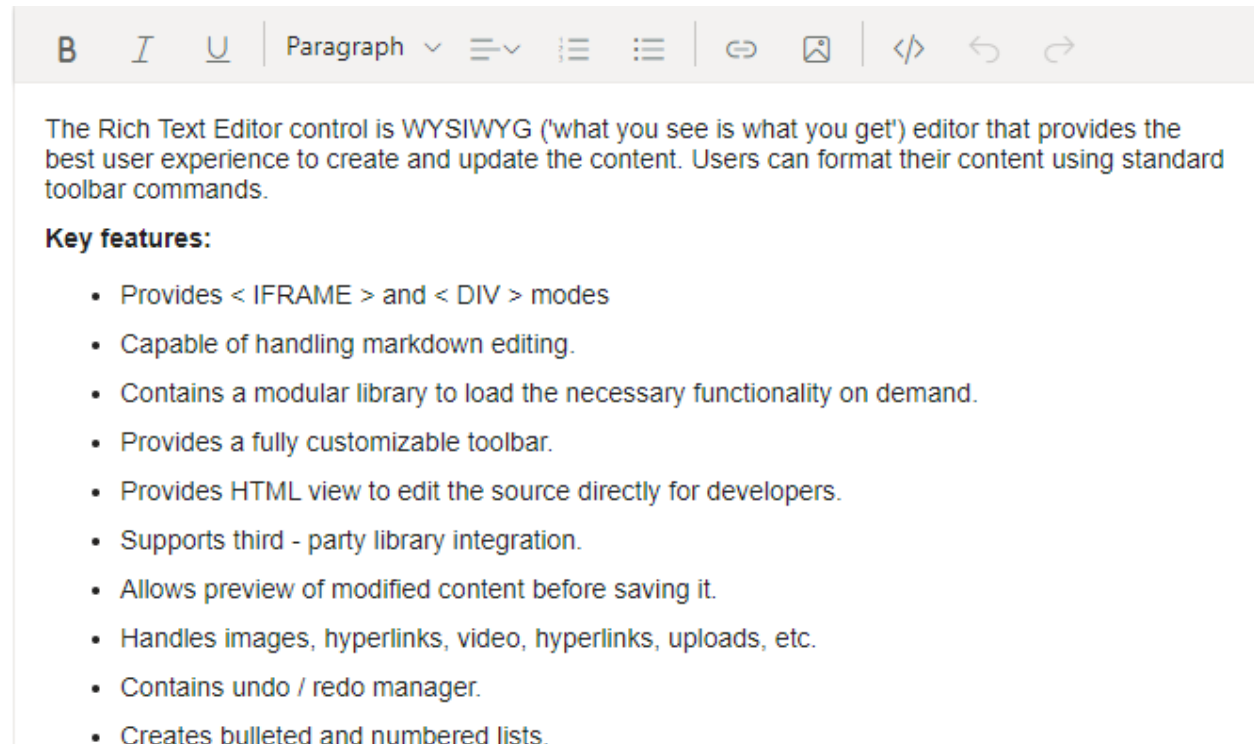

</div>
```

```

<p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).IframeSettings(iframeSettings =>
iframeSettings.Enable(true)).Render()

```

The screenshot shows the Rich Text Editor control. At the top is a toolbar with icons for Bold (B), Italic (I), Underline (U), Paragraph (dropdown), Bulleted List, Numbered List, Link, Image, Source Code, Undo, and Redo. Below the toolbar is the content area, which contains the following text:

The Rich Text Editor control is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.

**Key features:**

- Provides < IFRAME > and < DIV > modes
- Capable of handling markdown editing.
- Contains a modular library to load the necessary functionality on demand.
- Provides a fully customizable toolbar.
- Provides HTML view to edit the source directly for developers.
- Supports third - party library integration.
- Allows preview of modified content before saving it.
- Handles images, hyperlinks, video, hyperlinks, uploads, etc.
- Contains undo / redo manager.
- Creates bulleted and numbered lists.

### Configure the Toolbar

Configure the toolbar with the tools using items field of the [ToolbarSettings](#) property as your application requires.

### CSHTML

```

@model List<string>
@Html.EJS().RichTextEditor("toolbar").ToolbarSettings(e =>
e.Items((object)Model)).ContentTemplate(@<div>
<p>
The Rich Text Editor control is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
Users can format their content using standard toolbar commands.
</p>
<p> Key features:</p>

<p> Provides < IFRAME > and < DIV > modes
</p>
<p> Capable of handling markdown editing.</p>
<p> Contains a modular library to load the necessary
functionality on demand.</p>
<p> Provides a fully customizable toolbar.</p>

```

```

<p> Provides HTML view to edit the source directly for
developers.</p>
<p> Supports third - party library integration.</p>
<p> Allows preview of modified content before saving
it.</p>
<p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).Render()

```

## HOMECONTROLLER.CS

```

public ActionResult Index()
{
 List<string> tools = new List<string>() {
 "Bold", "Italic", "Underline", "StrikeThrough",
 "FontName", "FontSize", "FontColor", "BackgroundColor",
 "LowerCase", "UpperCase", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList",
 "Outdent", "Indent", "|",
 "CreateLink", "Image", "CreateTable", "|", "ClearFormat", "Print",
 "SourceCode", "FullScreen", "|", "Undo", "Redo"
 };
 return View(tools);
}

```

Paragraph
...

The Rich Text Editor control is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.

**Key features:**

- Provides < IFRAME > and < DIV > modes
- Capable of handling markdown editing.
- Contains a modular library to load the necessary functionality on demand.
- Provides a fully customizable toolbar.
- Provides HTML view to edit the source directly for developers.
- Supports third - party library integration.
- Allows preview of modified content before saving it.
- Handles images, hyperlinks, video, hyperlinks, uploads, etc.
- Contains undo / redo manager.
- Creates bulleted and numbered lists.

**Note:** `|` and `-` can insert a vertical and horizontal separator lines in the toolbar.

### Insert Images and Links

The **Image** module inserts an image into Rich Text Editor's content area, and the **Link** module links external resources such as website URLs, to selected text in the Rich Text Editor's content, respectively.

The link inject module adds a link icon to the toolbar and the image inject module adds an image icon to the toolbar.

Specifies the items to be rendered in quick toolbar based on the target element such image, link and text element. The quick toolbar opens to customize the element by clicking the target element.

### CSHTML

```
@model List<string>
@Html.EJS().RichTextEditor("image").ToolbarSettings(e =>
e.Items((object)Model)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).QuickToolbarSettings(e => { e.Image((object)ViewBag.image);
}).Render()
```

### HOMECONTROLLER.CS

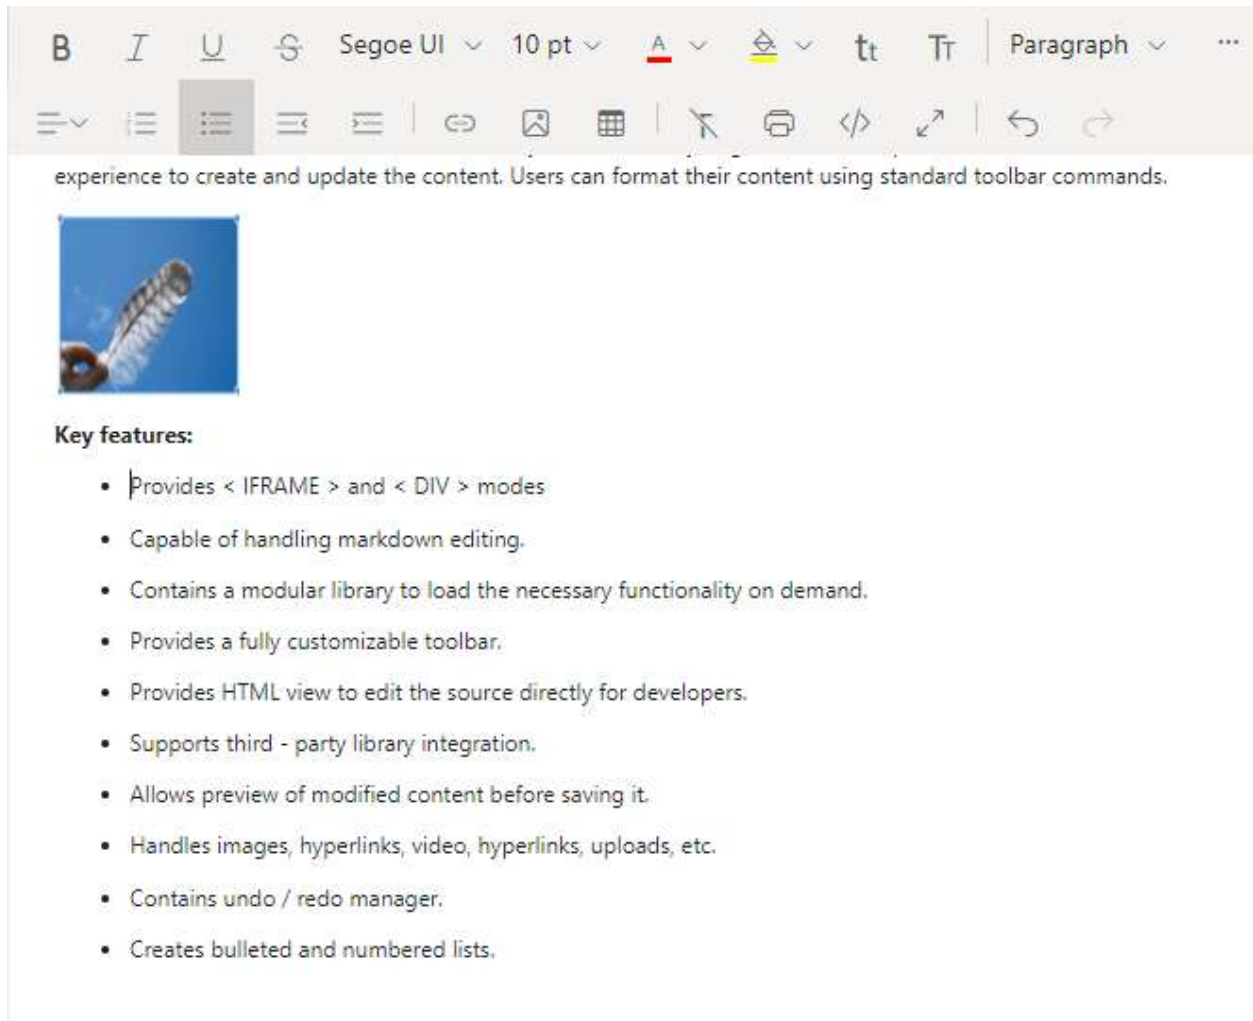

```
public ActionResult Index()
{
 ViewBag.image = new[] {
 "Replace", "Align", "Caption", "Remove", "InsertLink", "OpenImageLink", "-",
 "EditImageLink", "RemoveImageLink", "Display", "AltText", "Dimension"
 };
 List<string> tools = new List<string>() {
 "Bold", "Italic", "Underline", "StrikeThrough",
 "FontName", "FontSize", "FontColor", "BackgroundColor",
 "LowerCase", "UpperCase", "|",

```

```

"Formats", "Alignments", "OrderedList", "UnorderedList",
"Outdent", "Indent", "|",
"CreateLink", "Image", "CreateTable", "|", "ClearFormat", "Print",
"SourceCode", "FullScreen", "|", "Undo", "Redo"
};
return View(tools);
}

```

### Send formatted content using XmlHttpRequest

The Html string of the Rich Text Editor can be passed from View to the Controller through the **XMLHttpRequest Post** action. The HTML value binds to the corresponding mapped controller, and you can access it in the Post action parameter.

### CSHTML

```

@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<div>
 <div>
 <p>The Rich Text Editor is WYSIWYG ('what you see is what you get')
 editor useful to create and edit content, and return the valid HTML
 markup or <a

```

```

href='https://ej2.syncfusion.com/aspnetmvc/RichTextEditor/DefaultMode'>markd
own of the content</p>
 <p> Toolbar </p>

 <p> Toolbar contains commands to align the text, insert
link, insert image, insert list, undo / redo operations, HTML view, etc </p>

 <p> Toolbar is fully customizable </p>

 <p> Links </p>

 <p> You can insert a hyperlink with its corresponding
dialog</p>

 <p> Attach a hyperlink to the displayed text. </p>

 <p> Customize the quick toolbar based on the hyperlink </p>

 <p> Image.</p>

 <p> Allows you to insert images from an online source as
well as the local computer</p>

 <p> You can upload an image</p>

 <p> Provides an option to customize quick toolbar for an
image </p>

</div>
</div>).Render()
<button id="getRTEvalue">Get RichTextEditor Value</button>
<script>
 document.getElementById('getRTEvalue').addEventListener('click',
function () {
 var obj = document.getElementById('defaultRTE').ej2_instances[0];
 var value = JSON.stringify(
 { text: obj.value }
);
 const Http = new XMLHttpRequest();
 const url = '@Url.Action("Save")';
 Http.open("POST", url);
 Http.setRequestHeader('Content-Type', 'application/json');
 Http.send(value);
});
</script>

```

### Retrieve the Formatted Content

To retrieve the editor contents, use [value](#) property of Rich Text Editor.

```
`javascript
var rteValue = this.rteObj.value;
`
```

Or, you can use the public method, `getHtml` to retrieve the Rich Text Editor content.

```
`javascript
var rteValue = this.rteObj.getHtml();
`
```

To fetch the Rich Text Editor's text content, use `getText` method of Rich Text Editor.

```
`javascript
var rteValue = this.rteObj.getText();
`
```

### Retrieve the number of characters

To get the maximum number of characters in the Rich Text Editor's content, use `getCharCount`

```
`typescript
let rteCount = this.rteObj.getCharCount();
`
```

The final output will be displayed as follows

### CSHTML

```
@model List<string>
@Html.EJS().RichTextEditor("link").ToolbarSettings(e =>
e.Items((object)Model)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p> Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>

</div>
```

```

<p> Allows preview of modified content before saving
it.</p>
<p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).Render()

```

## HOMECONTROLLER.CS

```

public ActionResult Index()
{
 List<string> tools = new List<string>() {
 "Bold", "Italic", "Underline", "StrikeThrough",
 "FontName", "FontSize", "FontColor", "BackgroundColor",
 "LowerCase", "UpperCase", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList",
 "Outdent", "Indent", "|",
 "CreateLink", "Image", "CreateTable", "|", "ClearFormat", "Print",
 "SourceCode", "FullScreen", "|", "Undo", "Redo"
 };
 return View(tools);
}

```

## Formation

The Rich Text Editor control used to create and edit the content and return valid HTML markup or markdown (MD) of the content. It supports the following two editing formation.

- HTML Editor
- Markdown Editor

## HTML Editor

Rich Text Editor is a WYSIWYG editing control for formatting the word content as HTML.

The HTML editing mode is the default mode in Rich Text Editor to format the content through the available toolbar items to return the valid HTML markup. Set the [EditorMode](#) property as **HTML**.

**CSHTML**

```
@Html.EJS().RichTextEditor("htmlEditor").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

## Markdown Editor

Set the [EditorMode](#) property as Markdown, to create or edit the content and apply formatting to view markdown formatted content.

- The Supported Tags are h6,h5,h4,h3,h2,h1,blockquote,pre,p,ol,ul.
- The Supported Selection Tags are Bold, Italic, StrikeThrough, InlineCode, SubScript, SuperScript, UpperCase, LowerCase.
- The supported insert commands are Image, Link and Table.

**Note:** The third-party library such as [Marked](#) or any other library is used to convert markdown into HTML content.

**CSHTML**

```
@using Syncfusion.EJ2.RichTextEditor
```

```
@Html.EJS().RichTextEditor("markdown").Value((string)ViewBag.value).EditorMode(EditorMode.Markdown).Render()
```

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.value = @"""**Overview**
 The Rich Text Editor control is WYSIWYG ('what you see is what you get')
 editor used to create and edit the content and return valid HTML markup or
 markdown (MD) of the content. The editor provides a standard toolbar to
 format content using its commands. Modular library features to load the
 necessary functionality on demand. The toolbar contains commands to align
 the text, insert link, insert image, insert list, undo/redo operation, HTML
 view, and more.
 Key features
 - *Mode*: Provides IFRAME and DIV mode.
 - *Module*: Modular library to load the necessary functionality on demand.
 - *Toolbar*: Provide a fully customizable toolbar.
 - *Editing*: HTML view to edit the source directly for developers.
 - *Third-party Integration*: Supports to integrate third-party library.
 - *Preview*: Preview the modified content before saving it.
 - *Tools*: Handling images, hyperlinks, video, uploads and more.
 - *Undo and Redo*: Undo/redo manager.
 - *Lists*:Creates bulleted and numbered list.";
 return View();
 }
}
```

## Toolbar

The Rich Text Editor's toolbar contains a collection of tools such as bold, italic and text alignment buttons that are used to format the content. However, in most integrations, it's desirable to change the toolbar configuration to suit needs. Fortunately, that's quite easy to do too.

To create Rich Text Editor with Markdown editing feature, it can be added by defining the Toolbar as a collection of built-in items.

The Rich Text Editor allows you to configure different types of toolbar using **Type** field in [ToolbarSettings](#) property. The types of toolbar are:

1. Expand
2. MultiRow

### Expand Toolbar

The default mode of [Type](#) is **Expand**, it will hide the overflowing items in the next row. By clicking the expand arrow, view the overflowing toolbar items.

#### CSHTML

```
@using Syncfusion.EJ2.RichTextEditor
<div style="width:500px; margin:0 auto;">
 @Html.EJS().RichTextEditor("toolbar-types").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

 </div>).ToolbarSettings(e => { e.Type(ToolbarType.Expand); }).Render()
</div>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Multi-row Toolbar

Set the type as **MultiRow** in [ToolbarSettings](#) to moves the overflowing items in the next row. All toolbar items are visible.

#### CSHTML

```
@using Syncfusion.EJ2.RichTextEditor
<div style="width:500px; margin:0 auto;">
 @Html.EJS().RichTextEditor("toolbar-types").ContentTemplate(@<div>
```

```

<p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
</p>
<p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
</p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).ToolbarSettings(e => { e.Type(ToolbarType.MultiRow); }).Render()
</div>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Floating Toolbar

By default, toolbar is float at the top of the Rich Text Editor on scrolling. By disabling the [EnableFloating](#), toolbar at the top of the content area of Rich Text Editor. Floating toolbar offset can be customize by specifies the offset of the floating toolbar from documents top position using [FloatingToolbarOffset](#).

Enable or disable the floating toolbar using `EnableFloating` of `ToolbarSettings` property.

## CSHTML

```

@using Syncfusion.EJ2.RichTextEditor
<div class="control-wrapper">
 <div class="control-section">
 @Html.EJS().RichTextEditor("toolbar-
 floating").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is
 what you get') editor that provides the best user experience to create and
 update the content.
 </p>

```

```

 Users can format their content using standard toolbar
 commands.
 </p>
 <p> Key features:</p>

 <p> Provides < IFRAME > and < DIV >
 modes </p>

 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks,
 uploads, etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

 </div>).Created("created").Height("720px").ToolbarSettings(e => {
 e.Type(ToolbarType.Expand).EnableFloating(false); }).Render()
 </div>
 <div class="col-lg-4">
 Enable/Disable Floating:
 @Html.EJS().CheckBox("float").Checked(false).Label("Enable
 Floating").Change("checkchange").Render()
 </div>
</div>
<script type="text/javascript">
 var defaultRTE;
 function created() {
 defaultRTE = this;
 }
 function checkchange(args) {
 defaultRTE.toolbarSettings.enableFloating = args.checked;
 defaultRTE.dataBind();
 }
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Toolbar Items

The following table lists the available tools on the toolbar.

| Name | Icons | Summary | Initialization |
|------|-------|---------|----------------|
|------|-------|---------|----------------|

|                         |                                                                                     |                                                                                                                                                   |
|-------------------------|-------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|
| ----- ----- ----- ----- |                                                                                     |                                                                                                                                                   |
| Undo                    |    | Allows to undo the actions.  toolbarSettings: { items: ['Undo']}                                                                                  |
| Redo                    |    | Allows to redo the actions.  toolbarSettings: { items: ['Redo']}                                                                                  |
| Alignment               |    | Align the content with left, center, and right margin.  toolbarSettings: { items: ['Alignments']}                                                 |
| OrderedList             |    | Create a new list item(numbered).  toolbarSettings: { items: ['OrderedList']}                                                                     |
| UnorderedList           |    | Create a new list item(bulleted).  toolbarSettings: { items: ['UnorderedList']}                                                                   |
| Indent                  |    | Allows to increase the indent level of the content.  toolbarSettings: { items: ['Indent']}                                                        |
| Outdent                 |    | Allows to decrease the indent level of the content.  toolbarSettings: { items: ['Outdent']}                                                       |
| Hyperlink               |    | Creates a hyperlink to a text or image to a specific location in the content.  toolbarSettings: { items: ['CreateLink']}                          |
| Images                  |   | Inserts an image from an online source or local computer.  toolbarSettings: { items: ['Image']}                                                   |
| LowerCase               |  | Change the case of selected text to lower in the content.  toolbarSettings: { items: ['LowerCase']}                                               |
| UpperCase               |  | Change the case of selected text to upper in the content.  toolbarSettings: { items: ['UpperCase']}                                               |
| SubScript               |  | Makes the selected text as subscript (lower).  toolbarSettings: { items: ['SubScript']}                                                           |
| SuperScript             |  | Makes the selected text as superscript (higher).  toolbarSettings: { items: ['SuperScript']}                                                      |
| Print                   |  | Allows to print the editor content.  toolbarSettings: { items: ['Print']}                                                                         |
| FontName                |  | Defines the fonts that appear under the Font Family DropDownList from the Rich Text Editor's toolbar.  toolbarSettings: { items: ['FontName']}    |
| FontSize                |  | Defines the font sizes that appear under the Font Size DropDownList from the Rich Text Editor's toolbar.  toolbarSettings: { items: ['FontSize']} |
| FontColor               |  | Specifies an array of colors can be used in the colors popup for font color.  toolbarSettings: { items: ['FontColor']}                            |

|  | Specifies an array of colors can be used in the colors popup for background color. | toolbarSettings: { items: ['BackgroundColor']} |

|  | An Object with the options that will appear in the Paragraph Format dropdown from the toolbar. | toolbarSettings: { items: ['Formats']} |

|  | Apply double line strike through formatting for the selected text. | toolbarSettings: { items: ['StrikeThrough']} |

|  | The clear format tool is useful to remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. As a result, all the text formatting will be cleared and return to its default formatting styles. | toolbarSettings: { items: ['ClearFormat']} |

|  | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: { items: ['FullScreen']} |

|  | Rich Text Editor includes the ability for users to directly edit HTML code via “Source View”. If you made any modification in Source view directly, synchronize with Design view. | toolbarSettings: { items: ['SourceCode']} |

|  | Allows to create list items with various list style types(numbered). | toolbarSettings: { items: ['NumberFormatList']} |

|  | Allows to create list items with various list style types(bulleted). | toolbarSettings: { items: ['BulletFormatList']} |

|  | Allows each line to begin at the same distance from the editor’s left-hand side. | toolbarSettings: { items: ['JustifyLeft']} |

|  | There is an even space on each side of each line since the text is not aligned to the left or right margins. | toolbarSettings: { items: ['JustifyCenter']} |

|  | Allows each line to end at the same distance from the editor’s right-hand side. | toolbarSettings: { items: ['JustifyRight']} |

|  | The text is aligned with both right and left margins. | toolbarSettings: { items: ['JustifyFull']} |

|  | Text that is thicker and darker than usual. | toolbarSettings: { items: ['Bold']} |

|  | Shows a text that is leaned to the right. | toolbarSettings: { items: ['Italic']} |

|  | The underline is added to the selected text. | toolbarSettings: { items: ['Underline']} |

| ClearAll |  | Removes all styles that have been applied to the selected text. | toolbarSettings: { items: ['ClearAll']} |

| Cut |  | Removes the text from its current location and places it into the clipboard. | toolbarSettings: { items: ['Cut']} |

| Copy |  | The selected item is copied and pasted into the clipboard. | toolbarSettings: { items: ['Copy']} |

| Paste |  | Allows you to insert a clipboard item into a specific location. | toolbarSettings: { items: ['Paste']} |

| OpenLink |  | To open the URL link that is attached to the selected text. | toolbarSettings: { items: ['OpenLink']} |

| EditLink |  | Allows you to change the URL that has been attached to a specific item. | toolbarSettings: { items: ['EditLink']} |

| CreateTable |  | Create a table with defined columns and rows. | toolbarSettings: { items: ['CreateTable']} |

| RemoveTable |  | Removes the selected table and its contents. | toolbarSettings: { items: ['TableRemove']} |

| Replace |  | Replace the selected image with another image. | toolbarSettings: { items: ['Replace']} |

| Align |  | The image can be aligned to the right, left, or center. | toolbarSettings: { items: ['Align']} |

| Remove |  | Allows to remove the selected image from the editor. | toolbarSettings: { items: ['Remove']} |

| OpenImageLink |  | Opens the link that is attached to the selected image. | toolbarSettings: { items: ['OpenImageLink']} |

| EditImageLink |  | Allows to edit the link that is attached to the selected image. | toolbarSettings: { items: ['EditImageLink']} |

| RemoveImageLink |  | Removes the link that is attached to the selected image. | toolbarSettings: { items: ['RemoveImageLink']} |

| InsertLink |  | Allows users to add a link to a particular item. | toolbarSettings: { items: ['InsertLink']} |

| Display |  | Allows you to choose whether an image should be shown inline or as a block. | toolbarSettings: { items: ['Display']} |

| AltText |  | To display image description when an image on a Web page cannot be displayed. | toolbarSettings: { items: ['AltText']} |

| Dimension |  | Allows you to customize the image's height and width. | toolbarSettings: { items: ['Dimension']} |

| Maximize |  | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: { items: ['Maximize']} |

| Minimize |  | Shrinks the editor to the default width and height. | toolbarSettings: { items: ['Minimize']} |

| Preview |  | Allows to see how the editor's content looks in a browser. | toolbarSettings: { items: ['Preview']} |

| InsertCode |  | Represents preformatted text which is to be presented exactly as written in the HTML file. | toolbarSettings: { items: ['InsertCode']} |

| RemoveLink |  | Allows you to remove the applied link from the selected item. | toolbarSettings: { items: ['RemoveLink']} |

| TableHeader |  | Allows you to add a table header. | toolbarSettings: { items: ['TableHeader']} |

| TableColumns |  | Shows the dropdown to insert a column or delete the selected column. | toolbarSettings: { items: ['TableColumns']} |

| TableRows |  | Shows the dropdown to insert a row or delete the selected row. | toolbarSettings: { items: ['TableRows']} |

| TableCellHorizontalAlign |  | Allows the table cell content to be aligned horizontally. | toolbarSettings: { items: ['TableCellHorizontalAlign']} |

| TableCellVerticalAlign |  | Allows the table cell content to be aligned vertically. | toolbarSettings: { items: ['TableCellVerticalAlign']} |

| TableEditProperties |  | Allows you to change the table width, padding, and cell spacing styles. | toolbarSettings: { items: ['TableEditProperties']} |

By default, tool will be arranged in following order.

**Note:** items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments', 'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode', 'Undo', 'Redo']

We can customize the tools order as our application requirement. If you are not specifying any tools order, the editor will create the toolbar with default items.

### Custom Tool

The Rich Text Editor allows you to configure your own commands to its toolbar using [ToolbarSettings](#) property. The command can be plain text, icon, or HTML template. You can also define the order and group where the command should be included. Bind the action to the command by getting its instance.

This sample shows how to add your own commands to toolbar of the Rich Text Editor. The “Ω” command is added to insert special characters in the editor.

The below code snippet, for custom tool with tooltip text which will be included in **Items** field of **ToolbarSettings** property.

```
`csharp
var tools = new {
 tooltipText = "Insert Symbol",

 template = "<button class='e-tbar-btn e-btn' tabindex='-1' id='custom_tbar' style='width:100%'><div
class='e-tbar-btn-text rtecustomtool' style='font-weight: 500;'> Ω</div></button>"

};

ViewBag.items = new object[] { "Bold", "Italic", "Underline", "|", "Formats", "Alignments", "OrderedList",
"UnorderedList", "|", "CreateLink", "Image", "|", "SourceCode", tools
, "|", "Undo", "Redo"
};
`
```

Click the “Ω” command to show the special characters list, and then choose the character to be inserted in the editor.

### CSHTML

```
<div id="rteSection">
 @Html.EJS().RichTextEditor("customtool").ContentTemplate(@<div><p>
 The custom command 'insert special character' is configured as the last
 item of the toolbar.
 Click on the command and choose the special character you want to
 include from the popup.
 </p></div>).Created("created").ToolbarSettings(e =>
 e.Items((object)ViewBag.items)).Render()
 @Html.EJS().Dialog("customTbarDialog").Visible(false).Header("Special
 Characters").Created("onDialogCreate").ZIndex(1000).ShowCloseIcon(false).IsM
 odal(true).cssClass('e-rte-
 elements').OverlayClick("dialogOverlay").Buttons(e =>
 {
 e.ButtonModel(ViewBag.button).Click("onInsert").Add();
 e.ButtonModel(ViewBag.button1).Click("dialogOverlay").Add();
 })
</div>
```

```

 }).ContentTemplate(@<div id="rteSpecial_char">
 <div class="char_block" title="^">^</div>

</style>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 var tools = new
 {
 tooltipText = "Insert Symbol",
 template = "<button class='e-tbar-btn e-btn' tabindex='-1'
id='custom_tbar' style='width:100%'><div class='e-tbar-btn-text
rtcustomtool' style='font-weight: 500;'> Ω</div></button>"
 };
 ViewBag.items = new object[] { "Bold", "Italic", "Underline", "|",
"Formats", "Alignments", "OrderedList",
"UnorderedList", "|", "CreateLink", "Image", "CreateTable", "|",
"SourceCode", tools
, "|", "Undo", "Redo"
 };
 ViewBag.button = new
 {
 content = "Insert",
 isPrimary = true
 };
 ViewBag.button1 = new
 {
 content = "Cancel"
 };
 return View();
 }
}

```

The focus will be lost while rendering the required component for the custom toolbar, causing it to render outside the Rich Text Editor and triggering a blur event. During that time, proper functionality will not be achievable. Therefore, it is recommended to set the `cssClass` property or class as `e-rte-elements` in the dependency component.

### Quick Inline Toolbar

Quick commands are opened as popup on clicking the corresponding element. The commands must be passed as string collection to image, text, and link attributes of the [QuickToolbarSettings](#) property.

| Target Element | Default Quick Toolbar items |

|-----|-----|

| Image | 'Replace', 'Align', 'Caption', 'Remove', 'InsertLink', 'Display', 'AltText', 'Dimension'.|

| Link | 'Open', 'Edit', 'UnLink'.|

| Text | null <br> (Any toolbar [items](#) in the Rich Text Editor can be configured here).|

| Table| 'TableHeader', 'TableRows', 'TableColumns', 'BackgroundColor', '-', 'TableRemove', 'Alignments', 'TableCellVerticalAlign', 'Styles'.|

Custom tool can be added to the corresponding quick toolbar, using [QuickToolbarSettings](#) property.

The below sample demonstrates the option to insert the image to the Rich Text Editor content as well as option to rotate the image through the quick toolbar.

### CSHTML

```
<div class="control-section">

@Html.EJS().RichTextEditor("inline").Created("onCreated").ToolbarClick("onToolbarClick").InlineMode(e =>
e.Enable(true).OnSelection(true)).ToolbarSettings(e =>
e.Items((object)ViewBag.items)).QuickToolbarSettings(e => {
e.Image((object)ViewBag.image); }).ContentTemplate(@<div>
 <p>

## Styling

### Font Name and Font Size

By default, the editor is initialized with **Segoe UI** font name and **10pt** font size. To change it, select a different font name and font size from the drop-down in the editor's toolbar.

To apply different font style for section of the content, select the text that you would like to change, and select a required font style from the drop-down to apply the changes to the selected text.

#### FontName DropDowns

The following table list the default font name and width of the [FontFamily](#) dropdown and available list of font names.

| Default Key | Default Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|-------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| -----       | -----                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| font name   | null                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| width       | 65px                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| items       | { text: 'Segoe UI', value: 'Segoe UI' }, { text: 'Arial', value: 'Arial,Helvetica,sans-serif' }, { text: 'Courier New', value: 'Courier New,Courier,monospace' }, { text: 'Georgia', value: 'Georgia,serif' }, { text: 'Impact', value: 'Impact,Charcoal,sans-serif' }, { text: 'Lucida Console', value: 'Lucida Console,Monaco,monospace' }, { text: 'Tahoma', value: 'Tahoma,Geneva,sans-serif' }, { text: 'Times New Roman', value: 'Times New Roman,Times,serif' }, { text: 'Trebuchet MS', value: 'Trebuchet MS,Helvetica,sans-serif' }, { text: 'Verdana', value: 'Verdana,Geneva,sans-serif' } |

#### FontSize DropDowns

The following table list the default font size and width of the [FontSize](#) dropdown and available list of font size.

| Default Key | Default Value |
|-------------|---------------|
| -----       | -----         |
| font size   | null          |

```
| width | 35px.|
```

```
| items [{ text: '8 pt', value: '8pt' }, { text: '10 pt', value: '10pt' }, { text: '12 pt', value: '12pt' }, { text: '14 pt', value: '14pt' }, { text: '18 pt', value: '18pt' }, { text: '24 pt', value: '24pt' }, { text: '36 pt', value: '36pt' }].|
```

The below sample demonstrate the option to add the font name and font size tools to the toolbar as well as modify the default **width** of the tools.

### CSHTML

```
@Html.EJS().RichTextEditor("font").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).FontFamily(t =>
t.Width("100px")).FontSize(t=>t.Width("40px")).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>

</div>).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "FontName", "FontSize" };
 return View();
 }
}
```

### Custom Fonts and Size

Rich Text Editor supports to provide custom font and size with existing list.

If you want to add additional font names and font sizes to font drop-down, pass the font information as JSON data to the items field of [FontSize](#) and [FontFamily](#) property.

**CSHTML**

```
@Html.EJS().RichTextEditor("custom-font").ToolBarSettings(e =>
e.Items((object)ViewBag.toolbar)).FontFamily(f =>
f.Width("80px").default("Arial").Items((object)ViewBag.fontFamilyItems)).FontSize(f => f.Width("60px").default("10px")).Items((object)ViewBag.fontSizeItems)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary functionality on demand.</p>

 <p>Allows preview of modified content before saving it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).Render()
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 object size1 = new
 {
 text = "8 px",
 value = "8px"
 };
 object size2 = new
 {
 text = "10 px",
 value = "10px"
 };
 object size3 = new
 {
 text = "12 px",
 value = "12px"
 };
 object size4 = new
 {
```

```

 text = "14 px",
 value = "14px"
 };
 object size5 = new
 {
 text = "42 px",
 value = "42px"
 };
 object item1 = new
 {
 text = "Segoe UI",
 value = "Segoe UI"
 };
 object item2 = new
 {
 text = "Arial",
 value = "Arial,Helvetica,sans-serif"
 };
 object item3 = new
 {
 text = "Courier New",
 value = "Courier New,Courier,monospace"
 };
 object item4 = new
 {
 text = "Georgia",
 value = "Georgia,serif"
 };
 object item5 = new
 {
 text = "Impact",
 value = "Impact,Charcoal,sans-serif"
 };
 object item6 = new
 {
 text = "Calibri Light",
 value = "CalibriLight"
 };
 ViewBag.items = new[] { "FontName", "FontSize" };
 ViewBag.fontFamilyItems = new[] { item1, item2, item3, item4, item5,
item6 };
 ViewBag.fontSizeItems = new[] { size1, size2, size3, size4, size5 };
 return View();
}
}

```

### Font and Background Color

If you want to apply font color or background color for a selected content of Rich Text Editor you can use font color and background color tools.

Rich Text Editor support to provide customs font color and background color with existing list through the `colorCode` field of [FontColor](#) and [BackgroundColor](#).

**FontColor** and **BackgroundColor** property has two mode **Picker** and **Palette**. Palette mode has predefined set of **colorCode** and in picker mode, we have provided with more colors. Through **modeSwitcher** we can able to switch between these two options.

### CSHTML

```
@Html.EJS().RichTextEditor("edit-color").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).FontColor(f =>
f.ModeSwitcher(true)).BackgroundColor(b =>
b.ModeSwitcher(true)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>

 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "FontColor", "BackgroundColor" };
 return View();
 }
}
```

### Editor content styles

By default, The content styles of Rich Text Editor are not returned while retrieving HTML value from the editor. So, the styles are not applied when using the HTML value outside of the editor. To get the styles to Rich Text Editor's content for your application, You can copy and use the below styles directly in your application. The styles listed below which used in the UI elements of the Rich Text Editor.

**Note:** Make sure to add a CSS class 'e-rte-content' to the content container.

```
`css
.e-rte-content p {
margin: 0 0 10px;
margin-bottom: 10px;
}
.e-rte-content li {
margin-bottom: 10px;
}
.e-rte-content h1 {
font-size: 2.17em;
font-weight: 400;

### Image

Rich Text Editor allows to insert images from online sources as well as local computer where you want to insert the image in your content. For inserting the image to the Rich Text Editor, the following list of options have been provided in the [InsertImageSettings](#)

| Options | Description |

|-----|-----|

| AllowedTypes | Specifies the extensions of the image types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as .jpg and .png. |

| Display | Sets the default display for an image when it is inserted in to the Rich Text Editor. Possible options are: 'inline' and 'break'. |

- | Width | Sets the default width of the image when it is inserted in the Rich Text Editor.
- | Height | Sets the default height of the image when it is inserted in the Rich Text Editor.
- | SaveUrl | Provides URL to map the action result method to save the image.
- | Path | Specifies the location to store the image.
- | Resize | To enable resizing for image element.
- | MinWidth | Defines the maximum Width of the image.
- | MaxWidth | Defines the maximum Width of the image.
- | MinHeight | Defines the minimum Height of the image.
- | MaxHeight | Defines the maximum Height of the image.
- | ResizeByPercent | Image resizing should be done by percentage calculation.

### Upload Options

Through the **browse** option in the Image dialog, select the image from the local machine and insert into the Rich Text Editor content.

If the path field is not specified in the [InsertImageSettings](#), the image will be converted into blob url for the image will be created and the generated url will be set as src property of `<img>` tag as below.

`typescript

```

```

**Note:** If you want to insert a lot of tiny images in the editor and don't want a specific physical location for saving images, you can opt to save format as Base64.

In the below sample, the image has been load from the local machine and it will be saved in the given location.

### CSHTML

```
@Html.EJS().RichTextEditor("image").ToolBarSettings(e =>
e.Items((object)ViewBag.items)).InsertImageSettings(obj =>
obj.Display("inline")).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>

</div>
```

```

 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Image" };
 return View();
 }
}

```

## Server Side Action

The selected image can be uploaded to the required destination by using the below controller action. Map this method name in saveUrl property of [InsertImageSettings](#) and provide required destination path through path property.

**Note:** The runnable demo application is available in this [Github](#) repository.

## CSHTML

```

@Html.EJS().RichTextEditor("defaultRTE").InsertImageSettings(obj =>
obj.SaveUrl("/Home/SaveImage").Path("../Uploads/")).Render()

```

## SAVEFILE.CS

```

using System.IO;
using System.Web;
using System.Web.Mvc;
namespace ImageUpload.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()
 {
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveImage(HttpPostedFileBase UploadFiles)
 {
 if (UploadFiles != null)
 {
 string path = Server.MapPath("~/Uploads/");
 // Create a new directory, if it does not exists
 if (!Directory.Exists(path))
 {

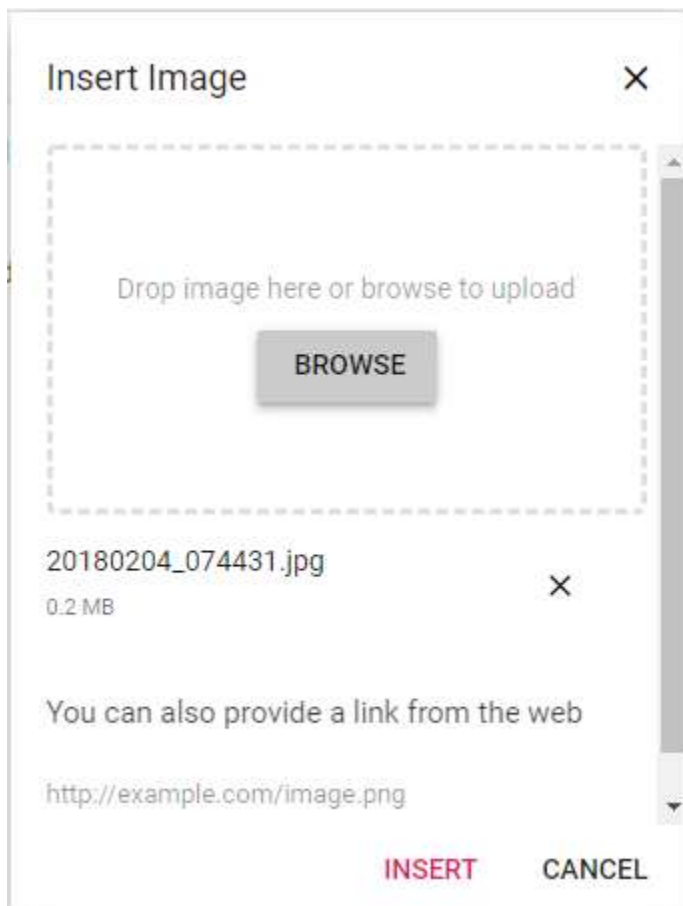

```

```
 Directory.CreateDirectory(path);
 }
 // Save a image file in directory
 UploadFiles.SaveAs(path +
Path.GetFileName(UploadFiles.FileName));
 }
}
}
```

### Image Delete

If you want to remove an image from the Rich Text Editor content, select the image and click “Remove” tool from quick toolbar. It will delete the image from the Rich Text Editor content.

Once you select the image from the local machine, the URL for the image will be generated, from there also you remove the image from the service location through the clicking of cross icon as below in the image.

The following sample explains, how to configure `RemoveUrl` to remove a saved image from the remote service location, when the following image remove actions are performed:

- `delete` key action.
- `backspace` key action.
- Removing uploaded image file from the insert image dialog.

- Deleting image using the quick toolbar **remove** option.

### CSHTML

```
@Html.EJS().RichTextEditor("RteImage").InsertImageSettings(obj =>
obj.SaveUrl("/Home/SaveImage").RemoveUrl("/Home/RemoveImage").Path("../Uploads/")).Render()
```

### HOME-CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveImage(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 string fileName = UploadFiles.FileName;
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileSavePath = Path.Combine(fileSave, fileName);
 // Save the image
 UploadFiles.SaveAs(fileSavePath);
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
 }
 [AcceptVerbs("Post")]
 public void RemoveImage(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 // Do remove action here
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 }
}
```

```
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
 }
```

### Insert from Web

If you want to insert an image from online source like Google, Bing, etc., you need to enable images tool on the editor's toolbar. By default, the images tool is open an image dialog which allows you to insert an image from online source.

### Dimension

Sets the default width and height of the image when it is inserted in the Rich Text Editor using **Width** and **Height** of [InsertImageSettings](#).

Through the **quickToolbar**, also you can change the width and height using **Change Size** option. Once click into the option. The Image Size dialog will open as below. In that specify the width and height of the image in pixel.

### Caption and Alt Text

Image caption and alternative text can be specified for the inserted image in the Rich Text Editor through the [QuickToolbarSettings](#) options such as Image Caption and Alternative Text.

Through the Alternative Text option, set the alternative text for the image, when the image is not upload successfully into the Rich Text Editor.

By clicking the Image Caption, the image will get wrapped in an image element with a caption. Then, you can type caption content inside the Rich Text Editor.

### Display Position

Sets the default display for an image when it is inserted in the Rich Text Editor using **Display** field in [InsertImageSettings](#). It has two possible options: 'inline' and 'break'.

### CSHTML

```
@Html.EJS().RichTextEditor("image").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).InsertImageSettings(obj => obj.Display("break")).Render()
```

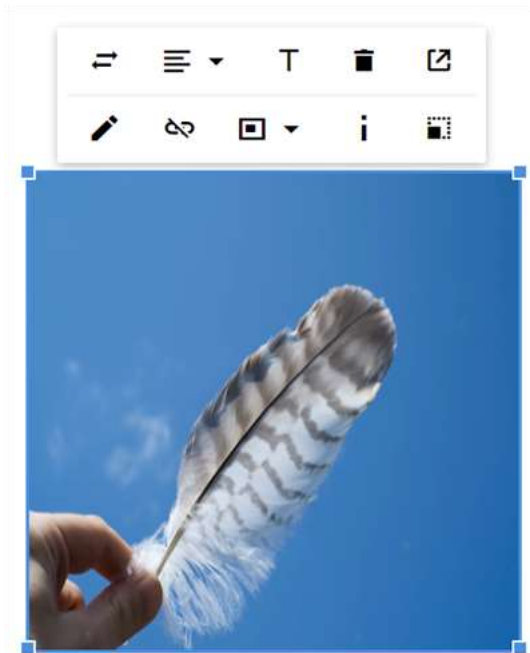

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Image" };
 return View();
 }
}
```

### Image with Link

The hyperlink itself can be an image in Rich Text Editor. If the image given as hyperlink, the remove, edit and open link will be added to the quick toolbar of image as below. For further details about link, see the [link documentation](#).

### Drag and Drop

By default, the Rich Text Editor allows you to insert images by drag-and-drop from the local file system such as Windows Explorer into the content editor area. And, you can upload the images to the server before inserting into the editor by configuring the `saveUrl` property. The images can be repositioned anywhere within the editor area by dragging and dropping the image.

In the following sample, you can see feature demo.

### CSHTML

```
@Html.EJS().RichTextEditor("drag-drop").InsertImageSettings(obj =>
obj.SaveUrl("https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save"))
.ContentTemplate(@<div><p>
 The Rich Text Editor control is WYSIWYG ('what you see is what
 you get') editor that provides the best user experience to create and update
 the content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>

</div>
```

```
<p> Creates bulleted and numbered lists.</p>
</div>).Render()
```

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### *Drag and drop with specific extension images*

You can allow the specific images alone to be uploaded using the the `allowedTypes` property. By default, the Rich Text Editor allows the JPG, JPEG, and PNG formats. You can configure this formats as follows.

```
`typescript
```

```
insertImageSettings: {
 allowedTypes: ['.jpg']
},
```

### *Prevent drag and drop action*

You can prevent drag-and-drop action by setting the `actionBegin` argument cancel value to true. The following code shows how to prevent the drag-and-drop.

```
`typescript
```

```
function actionBegin(args) {
 if(args.type === 'drop' || args.type === 'dragstart') {
 args.cancel =true;
 }
}
```

## Insert Audio

The Rich Text Editor allows inserting audio files from online sources and the local computer where you want to insert the audio in your content. For inserting the audio to the Rich Text Editor, the following list of options have been provided in the [InsertAudioSettings](#).

| Options | Description |

|-----|-----|

| AllowedTypes | Specifies the extensions of the audio types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as `.mp3`, `.wav`, `.m4a` and `.wma` |

| LayoutOption | Sets the default display for audio when it is inserted into the Rich Text Editor. Possible options are: `Inline` and `Break`. |

| SaveFormat | Sets the default save format of the audio element when inserted. Possible options are: `Blob` and `Base64`. |

| SaveUrl | Provides URL to map the action result method to save the audio. |

| RemoveUrl | Provides URL to map the action result method to remove the audio. |

| Path | Specifies the location to store the audio. |

[Configure audio tool in the toolbar](#)

To include the audio tool in the Rich Text Editor, you can add the toolbar item `Audio` to the `ToolbarSettings` [Items](#) property.

To configure `Audio` toolbar item, refer to the below code.

#### **CSHTML**

```
@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
 e.Items((object)ViewBag.items)).Render()
```

#### **CONTROLLER.CS**

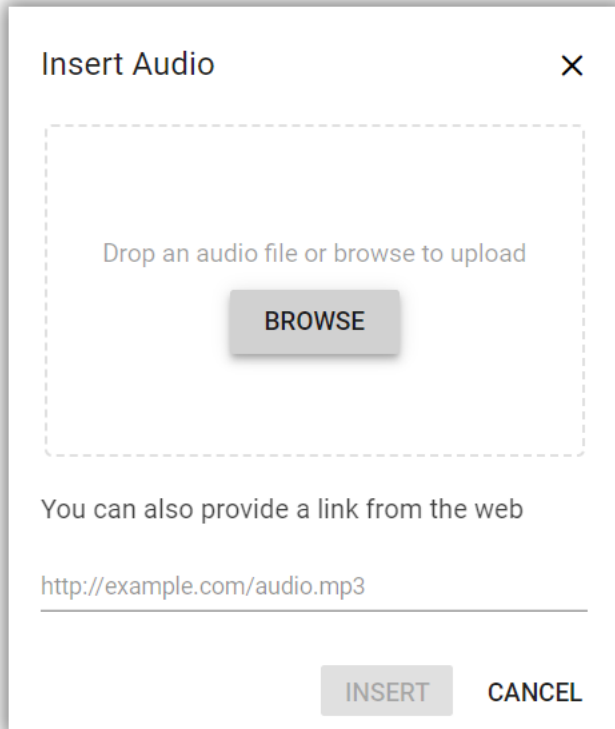

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Audio" };
 return View();
 }
}
```

[Insert audio from web](#)

To insert audio from the hosted link or local machine, you should enable the audio tool on in the editor's toolbar.

[Insert from web URL](#)

By default, the audio tool opens the audio dialog, allowing you to insert audio from an online source. Inserting the URL will be added to the `src` attribute of the `<source>` tag.

### Upload and insert audio

In the audio dialog, using the **browse** option, select the audio from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [InsertAudioSettings](#), the audio will be converted into **Blob** url or **Base64** and inserted inside the Rich Text Editor.

### Restrict audio upload based on size

You can restrict the audio uploaded from the local machine when the uploaded audio file size is greater than the allowed size by using the [FileUploading](#) event.

**Note:** The file size in the argument will be returned in **bytes**.

Using the Rich Text Editor **FileUploading** event, you can restrict the audio to upload when the given audio size is greater than the allowed **fileSize**. Also, the audio size in the argument will be returned in **bytes**.

In the following illustration, the audio size has been validated before uploading, and it is determined whether the audio has been uploaded or not.

### CSHTML

```
@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
e.Items((object) ViewBag.items)).InsertAudioSettings(obj =>
obj.SaveUrl("https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save").
Path("../Files/")).FileUploading("onFileUploading").Render()
<script>
 function onFileUploading(args) {
 var imgSize = 500000;
 var sizeInBytes = args.fileData.size;
```

```

 if (imgSize < sizeInBytes) {
 args.cancel = true;
 }
 }
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Audio" };
 return View();
 }
}

```

#### *Server-side action*

The selected audio can be uploaded to the required destination using the controller action below. Map this method name in [InsertAudioSettings.SaveUrl](#) and provide the required destination path through [InsertAudioSettings.Path](#) properties.

**Note:** If you want to insert lower-sized audio files in the editor and don't want a specific physical location for saving audio, you can opt to save the format as **Base64**.

In the following code blocks, you can insert the audio files which are saved in the specified path.

### CSHTML

```

@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertAudioSettings(obj =>
obj.SaveUrl("/Home/SaveFiles").Path("../Files/")).Render()

```

### SAVEFILE.CS

```

using System.IO;
using System.Web;
using System.Web.Mvc;
namespace FileUpload.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Audio" };
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveFiles(HttpPostedFileBase UploadFiles)
 {
 if (UploadFiles != null)
 {
 string path = Server.MapPath("~/Files/");
 // Create a new directory, if it does not exists
 if (!Directory.Exists(path))

```

```

 {
 Directory.CreateDirectory(path);
 }
 // Save a file in directory
 UploadFiles.SaveAs(path +
Path.GetFileName(UploadFiles.FileName));
 }
}
}
}

```

### Audio save format

The audio files can be saved as **Blob** or **Base64** url by using the [InsertAudioSettings.SaveFormat](#) property, which is of enum type and the generated url will be set to the **src** attribute of the **<source>** tag.

**Note:** The default **SaveFormat** property is set to **Blob** format.

By default, the files are saved in the **Blob** format.

`typescript

<audio>

<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"  
type="audio/mp3" >

</audio>

<audio>

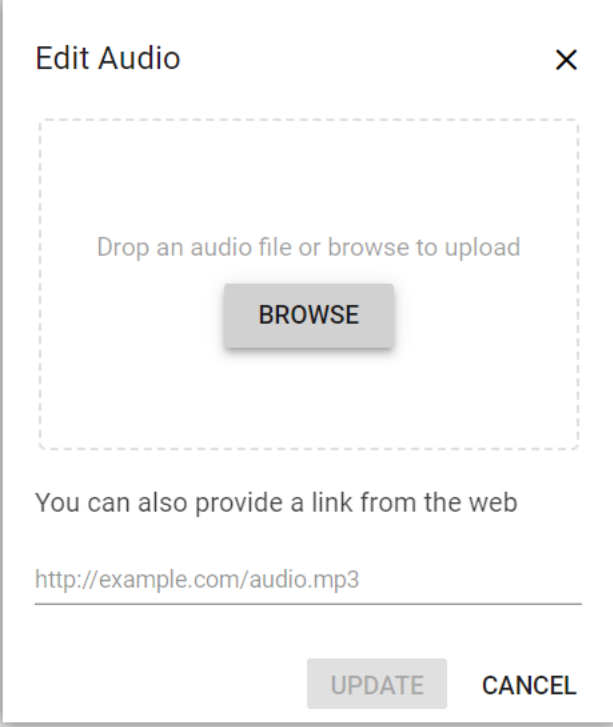

<source src="data:audio/mp3;base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA"  
type="audio/mp3" >

</audio>

,

### Replacing audio

Once an audio file has been inserted, you can change it using the Rich Text Editor [QuickToolbarSettings](#) **audioReplace** option. You can replace the audio file using the web URL or the browse option in the audio dialog.

The image shows a modal dialog box titled "Edit Audio" with a close button (X) in the top right corner. Inside the dialog, there is a dashed rectangular area containing the text "Drop an audio file or browse to upload" and a "BROWSE" button. Below this area, the text "You can also provide a link from the web" is followed by a text input field containing the URL "http://example.com/audio.mp3". At the bottom of the dialog, there are two buttons: "UPDATE" and "CANCEL".

Edit Audio

Drop an audio file or browse to upload

BROWSE

You can also provide a link from the web

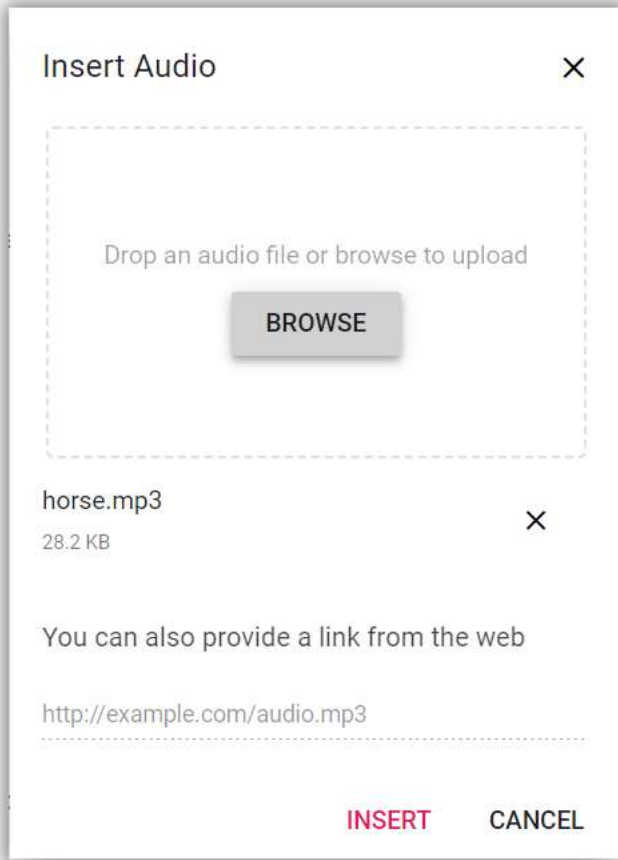

http://example.com/audio.mp3

UPDATE CANCEL

### Delete audio

To remove audio from the Rich Text Editor content, select the audio and click the `audioRemove` tool from the quick toolbar. It will delete the audio from the Rich Text Editor content as well as from the service location if the [InsertAudioSettings.RemoveUrl](#) is given.

Once you select the audio from the local machine, the URL for the audio will be generated. You can remove the audio from the service location by clicking the cross icon.

The following sample explains how to configure `InsertAudioSettings.RemoveUrl` to remove saved audio from the remote service location when the following audio removal actions are performed:

- `delete` key action.
- `backspace` key action.
- Removing uploaded audio file from the insert audio dialog.
- Deleting audio using the quick toolbar `audioRemove` option.

**Note:** The default `LayoutOption` property is set to `Inline`.

#### CSHTML

```
@Html.EJS().RichTextEditor("RteImage").InsertImageSettings(obj =>
obj.SaveUrl("/Home/SaveImage").RemoveUrl("/Home/RemoveImage").Path("../Uploads/")).Render()
```

#### HOME-CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

```

[AcceptVerbs("Post")]
public void SaveImage(HttpPostedFileBase UploadFiles)
{
 try
 {
 if (UploadFiles != null)
 {
 string fileName = UploadFiles.FileName;
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileSavePath = Path.Combine(fileSave, fileName);
 // Save the image
 UploadFiles.SaveAs(fileSavePath);
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
}

[AcceptVerbs("Post")]
public void RemoveImage(HttpPostedFileBase UploadFiles)
{
 try
 {
 if (UploadFiles != null)
 {
 // Do remove action here
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
}
}

```

### Display Position

Sets the default display for an audio when it is inserted in the Rich Text Editor using the `InsertAudioSettings.LayoutOption`. It has two possible options: `Inline` and `Break`. When updating the display positions, it updates the audio elements' layout position.

### CSHTML

```

@Html.EJS().RichTextEditor("audio").ToolBarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>

```

```

<p>

</div>).InsertAudioSettings(obj => obj.LayoutOption("Break")).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Audio" };
 return View();
 }
}

```

### Rename audio before inserting

Using the [InsertAudioSettings](#) property, you can specify the server handler to upload the selected audio. Then by binding the `FileUploadSuccess` event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert audio dialog.

Refer `rename.cs` controller file for configure the server-side.

## CSHTML

```

@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertAudioSettings(obj =>
obj.SaveUrl("/Home/Rename").Path("../Uploads/")).FileUploadSuccess("onFileUp
loadSuccess").Render()
<script>
 function onFileUploadSuccess(args) {
 if (args.e.currentTarget.getResponseHeader('name') != null) {
 args.file.name = args.e.currentTarget.getResponseHeader('name');
 var filename = document.querySelector(".e-file-name")[0];

```

```

 filename.innerHTML =
args.file.name.replace(document.querySelectorAll(".e-file-
type")[0].innerHTML, '');
 filename.title = args.file.name;
 }
}
</script>

```

## RENAME.CS

```

using System;
using System.IO;
using System.Web;
using System.Web.Mvc;
namespace RenameFile.Controllers
{
 public class HomeController : Controller
 {
 int x = 0;
 string filename;
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Audio" };
 return View();
 }
 [AcceptVerbs("Post")]
 public void Rename(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 filename = UploadFiles.FileName;
 if (UploadFiles != null)
 {
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileName =
Path.GetFileName(UploadFiles.FileName);
 var fileSavePath = Path.Combine(fileSave, fileName);
 // Rename a uploaded file name
 while (System.IO.File.Exists(fileSavePath))
 {
 filename = "rteAudio" + x + "-" + fileName;
 fileSavePath = Path.Combine(fileSave, filename);
 x++;
 }
 if (!System.IO.File.Exists(fileSavePath))
 {
 UploadFiles.SaveAs(fileSavePath);

```

```

// Modified file name shared through response
header by adding custom header
 Response.Headers.Add("name", filename);
 Response.StatusCode = 200;
 Response.ContentType = "application/json;
charset=utf-8";
 }
}
}
}
}
catch (Exception)
{
 Response.StatusCode = 204;
}
}
}
}
}

```

### Upload audio with authentication

The Rich Text Editor control allows you to add additional data with the File Upload, which can be received on the server side. By using the `FileUploading` event and its `customFormData` argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

**Note:** By default, it doesn't support the `UseDefaultCredentials` property; we need to manually append the default credentials with the upload request.

By default it doesn't support `UseDefaultCredentials` property, we need to manually append the default credentials with the upload request.

### CSHTML

```

@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object) ViewBag.items)).InsertAudioSettings(obj =>
obj.SaveUrl("/Home/SaveFiles").FileUploading("onFileUploading").Path("../Files/")).Render()
<script>
 function onFileUploading(args) {
 var accessToken = "Authorization_token";
 // adding custom Form Data
 args.customFormData = [{ 'Authorization': accessToken }];
 }
</script>

```

### SAVEFILE.CS

```

using System.IO;
using System.Web;
using System.Web.Mvc;
namespace FileUpload.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()

### Insert Video

The Rich Text Editor allows you to insert videos from online sources and local computers where you want to insert the video in your content. For inserting the video to the Rich Text Editor, the following list of options have been provided in the [InsertVideoSettings](#).

| Options | Description |

|-----|-----|

| AllowedTypes | Specifies the extensions of the video types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as `.mp4`, `.mov`, `.wmv` and `.avi`.|

| LayoutOption | Sets the default display for a video when it is inserted into the Rich Text Editor. Possible options are: `Inline` and `Break`.|

| SaveFormat | Sets the default save format of the video element when inserted. Possible options are: `Blob` and `Base64`.|

| Width | Sets the default width of the video when it is inserted in the Rich Text Editor.|

| MinWidth | Sets the minWidth of the video element when it is inserted in the Rich Text Editor.|

| MaxWidth | Sets the maxWidth of the video element when it is inserted in the Rich Text Editor.|

| Height | Sets the default height of the video when it is inserted in the Rich Text Editor.|

- | MinHeight | Sets the minHeight of the video element when it is inserted in the Rich Text Editor.
- | MaxHeight | Sets the maxHeight of the video element when it is inserted in the Rich Text Editor.
- | SaveUrl | Provides URL to map the action result method to save the video.
- | RemoveUrl | Provides URL to map the action result method to remove the video.
- | Path | Specifies the location to store the video.
- | Resize | Sets the resizing action for the video element.
- | ResizeByPercent | Sets the percentage values for the video element with the resizing action.

#### Configure video tool in the toolbar

To include the video tool in the Rich Text Editor, you can add the toolbar item **Video** to the **ToolbarSettings** [Items](#) property.

To configure **Video** toolbar item, refer to the below code.

#### CSHTML

```
@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).Render()
```

#### CONTROLLER.CS

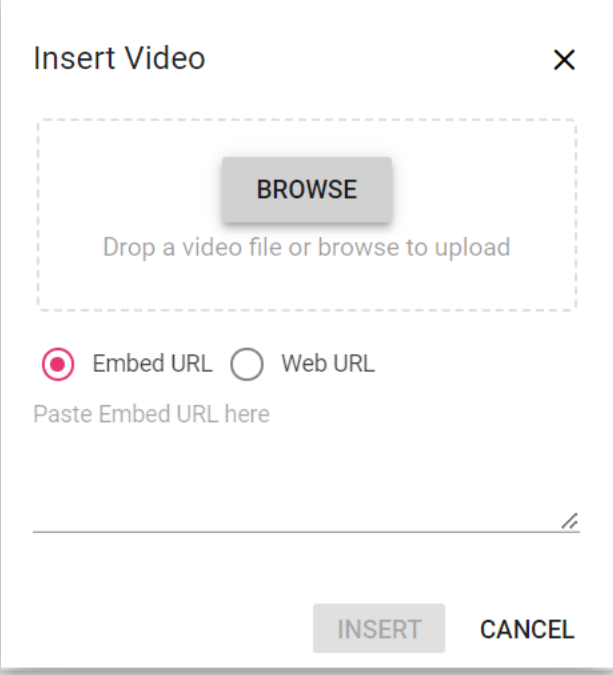

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
}
```

#### Insert video from web

To insert a video from the hosted link or local machine, you should enable the video tool on the editor's toolbar. By default, the video tool opens the dialog, allowing you to insert a video as an embedded URL. You can switch to a web URL to insert the video file from the online source.

#### Insert from web URL

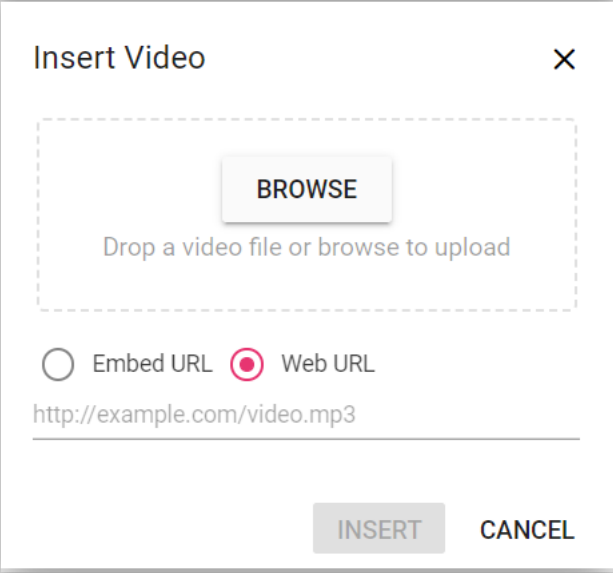

The video tool default opens the video dialog, allowing you to insert an embedded URL.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed rectangular area containing a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" (which is selected with a red dot) and "Web URL". Under the "Embed URL" option, there is a text input field with the placeholder text "Paste Embed URL here". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

#### *Insert from web URL*

Switching the option to the web URL in the video dialog allows you to insert a video from the online source. Inserting the URL will be added to the `src` attribute of the `<source>` tag.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed rectangular area containing a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" and "Web URL" (which is selected with a red dot). Under the "Web URL" option, there is a text input field containing the example URL "http://example.com/video.mp3". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

#### *Upload and insert video*

In the video dialog, by using the `browse` option, select the video from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [InsertVideoSettings](#), the video will be converted into `Blob` url or `Base64` and inserted inside the Rich Text Editor.

*Restrict video upload based on size*

Using the Rich Text Editor `FileUploading` event, you can restrict the video to upload when the given video size is greater than the allowed `fileSize`. Also, the video size in the argument will be returned in `bytes`.

**Note:** The file size in the argument will be returned in `bytes`.

In the following example, the video size has been validated before uploading and determined whether the video has been uploaded or not

In the following example, the video size has been validated before uploading and determined whether the video has been uploaded or not.

**CSHTML**

```
@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertVideoSettings(obj =>
obj.SaveUrl("https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save").
Path("../Files/")).FileUploading("onFileUploading").Render()
<script>
 function onFileUploading(args) {
 var imgSize = 500000;
 var sizeInBytes = args.fileData.size;
 if (imgSize < sizeInBytes) {
 args.cancel = true;
 }
 }
</script>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
}
```

*Server-side action*

The selected video can be uploaded to the required destination using the controller action below. Map this method name in [InsertVideoSettings.SaveUrl](#) and provide required destination path through [InsertVideoSettings.Path](#) properties.

**Note:** If you want to insert lower-sized video files in the editor and don't want a specific physical location for saving the video, you can save the format as `Base64`.

In the following code blocks, you can insert the video files which are saved in the specified path.

**CSHTML**

```
@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertVideoSettings(obj =>
obj.SaveUrl("/Home/SaveFiles").Path("../Files/")).Render()
```

**SAVEFILE.CS**

```

using System.IO;
using System.Web;
using System.Web.Mvc;
namespace FileUpload.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveFiles(HttpPostedFileBase UploadFiles)
 {
 if (UploadFiles != null)
 {
 string path = Server.MapPath("~/Files/");
 // Create a new directory, if it does not exists
 if (!Directory.Exists(path))
 {
 Directory.CreateDirectory(path);
 }
 // Save a file in directory
 UploadFiles.SaveAs(path +
 Path.GetFileName(UploadFiles.FileName));
 }
 }
 }
}

```

*Video save format*

The video files can be saved as **Blob** or **Base64** url by using the [InsertVideoSettings.SaveFormat](#) property, which is of enum type and the generated url will be set to the **src** attribute of the **<source>** tag.

**Note:** The default **SaveFormat** property is set to **Blob** format.

By default, the files are saved in the **Blob** format.

`typescript

<video>

<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"  
type="video/mp4" >

</video>

type="video/mp4" >

&lt;/video&gt;

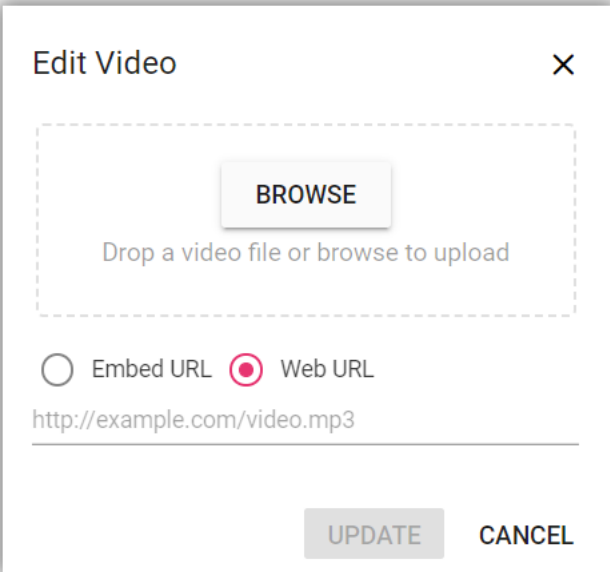

,

### Replacing video

Once a video file has been inserted, you can replace it using the Rich Text Editor [QuickToolbarSettings](#) `videoReplace` option. You can replace the video file either by using the embedded URL or the web URL and the browse option in the video dialog.

The 'Edit Video' dialog box features a close button (X) in the top right corner. It contains a dashed rectangular area with a 'BROWSE' button and the text 'Drop a video file or browse to upload'. Below this, there are two radio buttons: 'Embed URL' (which is selected) and 'Web URL'. A text input field labeled 'Paste Embed URL here' is positioned below the radio buttons. At the bottom, there are 'UPDATE' and 'CANCEL' buttons.

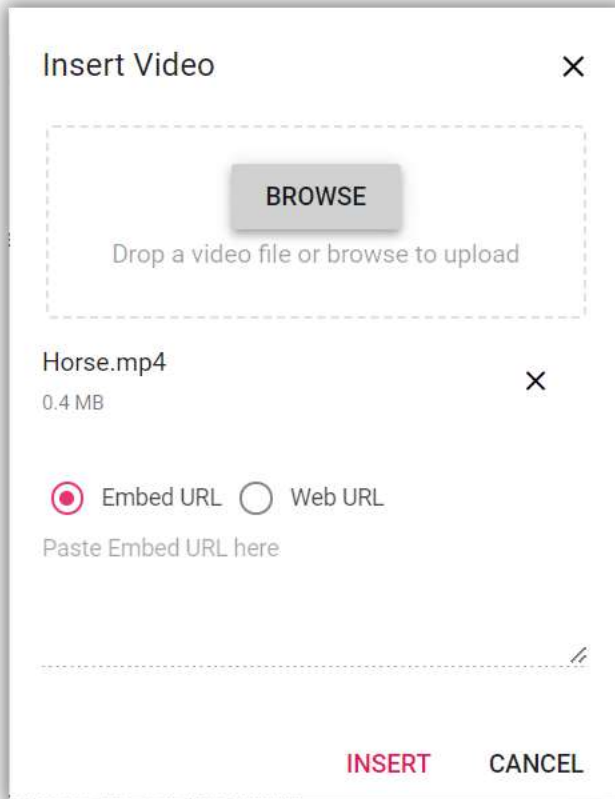

The 'Edit Video' dialog box is identical to the one above, but with the 'Web URL' radio button selected. The text input field now contains the example URL 'http://example.com/video.mp3'. The 'UPDATE' and 'CANCEL' buttons remain at the bottom.

### Delete video

To remove a video from the Rich Text Editor content, select the video and click the `videoRemove` tool from the quick toolbar. It will delete the video from the Rich Text Editor content as well as from the service location if the [InsertVideoSettings.RemoveUrl](#) is given.

Once you select the video from the local machine, the URL for the video will be generated. You can remove the video from the service location by clicking the cross icon.

The following example explains how to configure `InsertVideoSettings.removeUrl` to remove a saved video from the remote service location when the following video remove actions are performed:

- `delete` key action.
- `backspace` key action.
- Removing uploaded video file from the insert video dialog.
- Deleting video using the quick toolbar `videoRemove` option.

### CSHTML

```
@Html.EJS().RichTextEditor("RteImage").InsertImageSettings(obj =>
obj.SaveUrl("/Home/SaveImage").RemoveUrl("/Home/RemoveImage").Path("../Uploads/")).Render()
```

### HOME-CONTROLLER.CS

```
public class HomeController : Controller
```

```

{
 public ActionResult Index()
 {
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveImage(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 string fileName = UploadFiles.FileName;
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileSavePath = Path.Combine(fileSave, fileName);
 // Save the image
 UploadFiles.SaveAs(fileSavePath);
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
 }
 [AcceptVerbs("Post")]
 public void RemoveImage(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 // Do remove action here
 Response.StatusCode = 200;
 Response.ContentType = "application/json; charset=utf-8";
 }
 }
 catch (Exception)
 {
 Response.StatusCode = 204;
 }
 }
}

```

### Dimension

Set the default width, minWidth, height and minHeight of the video element, when it is inserted in the Rich Text Editor using the [Width](#), [MinWidth](#), [Height](#), [MinHeight](#) properties.

Through the [QuickToolbarSettings](#), also you can change the width and height using **Change Size** option. Once you click on the option, the video size dialog will open as below. In that, specify the width and height of the video in pixels

The image shows a 'Video Size' dialog box with a close button (X) in the top right corner. It contains two input fields: 'Width' with the value '321px' and 'Height' with the value '241px'. A red 'UPDATE' button is located at the bottom right of the dialog.

### Display Position

Sets the default display property for the video when it is inserted in the Rich Text Editor using the `InsertVideoSettings.LayoutOption`. It has two possible options: **Inline** and **Break**. When updating the display positions, it updates the video elements' layout position.

**Note:** The default `LayoutOption` property is set to **Inline**.

Sets the default display for an video when it is inserted in the Rich Text Editor using the `InsertVideoSettings.LayoutOption`. It has two possible options: **Inline** and **Break**. When updating the display positions, it updates the video elements' layout position.

### CSHTML

```
@Html.EJS().RichTextEditor("video").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>

</div>
```

```

<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).InsertVideoSettings(obj => obj.LayoutOption("Break")).Render()

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
}

```

### Resize video

The Rich Text Editor has built-in video resizing support, which is enabled for the video elements added. The resize points will appear on each corner of the video when focusing so users can easily resize the video using mouse points or thumb through the resize points. Also, the resize calculation will be done based on the aspect ratio.

You can disable the resize action by configuring `false` for the [InsertVideoSettings.Resize](#) property.

**Note:** If the [MinWidth](#) and [MinHeight](#) properties are configured the video resizing does not shrink below the specified values.

### Rename video before inserting

By using the [InsertVideoSettings](#) property, you can specify the server handler to upload the selected video. Then by binding the `FileUploadSuccess` event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert video dialog.

Refer `rename.cs` controller file for configure the server-side.

### CSHTML

```
@Html.EJS().RichTextEditor("editor").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertVideoSettings(obj =>
obj.SaveUrl("/Home/Rename").Path("../Uploads/")).FileUploadSuccess("onFileUp
loadSuccess").Render()
<script>
 function onFileUploadSuccess(args) {
 if (args.e.currentTarget.getResponseHeader('name') != null) {
 args.file.name = args.e.currentTarget.getResponseHeader('name');
 var filename = document.querySelectorAll(".e-file-name")[0];
 filename.innerHTML =
args.file.name.replace(document.querySelectorAll(".e-file-
type")[0].innerHTML, '');
 filename.title = args.file.name;
 }
 }
</script>
```

**RENAME.CS**

```
using System;
using System.IO;
using System.Web;
using System.Web.Mvc;
namespace RenameFile.Controllers
{
 public class HomeController : Controller
 {
 int x = 0;
 string filename;
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
 [AcceptVerbs("Post")]
 public void Rename(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 filename = UploadFiles.FileName;
 if (UploadFiles != null)
 {
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileName =
Path.GetFileName(UploadFiles.FileName);
 var fileSavePath = Path.Combine(fileSave, fileName);
 // Rename a uploaded file name
 while (System.IO.File.Exists(fileSavePath))
```

```

 {
 filename = "rteVideo" + x + "-" + fileName;
 fileSavePath = Path.Combine(fileSave, filename);
 x++;
 }
 if (!System.IO.File.Exists(fileSavePath))
 {
 UploadFiles.SaveAs(fileSavePath);
 // Modified file name shared through response
 header by adding custom header
 Response.Headers.Add("name", filename);
 Response.StatusCode = 200;
 Response.ContentType = "application/json;
charset=utf-8";
 }
 }
}
catch (Exception)
{
 Response.StatusCode = 204;
}
}
}
}

```

## Upload video with authentication

The Rich Text Editor control allows you to add additional data with the File Upload, which can be received on the server side. By using the `FileUploading` event and its `customFormData` argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

**Note:** By default, it doesn't support the `UseDefaultCredentials` property, you can manually append the default credentials with the upload request.

By default it doesn't support `UseDefaultCredentials` property, we need to manually append the default credentials with the upload request.

## CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).InsertVideoSettings(obj =>
obj.SaveUrl("/Home/SaveFiles").FileUploading("onFileUploading").Path("../Files/")).Render()

<script>
 function onFileUploading(args) {
 var accessToken = "Authorization_token";
 // adding custom Form Data
 args.customFormData = [{ 'Authorization': accessToken }];
 }
</script>
```

**SAVEFILE.CS**

```

using System.IO;
using System.Web;
using System.Web.Mvc;
namespace FileUpload.Controllers
{
 public class HomeController : Controller
 {
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Video" };
 return View();
 }
 [AcceptVerbs("Post")]
 public void SaveFiles(HttpPostedFileBase UploadFiles)
 {
 string currentPath = Request.Form["Authorization"].ToString();
 if (UploadFiles != null)
 {
 string path = Server.MapPath("~/Files/");
 // Create a new directory, if it does not exists
 if (!Directory.Exists(path))
 {
 Directory.CreateDirectory(path);
 }
 // Save a file in directory
 UploadFiles.SaveAs(path +
 Path.GetFileName(UploadFiles.FileName));
 }
 }
 }
}

```

## Link

A hyperlink can be insert into the editor for quick access to the related information. The hyperlink itself can be a text or an image.

### Insert Link

Point the cursor anywhere within the editor where you would like to insert the link. It is also possible to select a text or an image within the editor and can be converted to the hyperlink. Click the Insert HyperLink tool on the toolbar. The Insert Link Dialog will be open. The dialog has the following options.

| Options      | Description                                                               |
|--------------|---------------------------------------------------------------------------|
| ----- -----  |                                                                           |
| Web Address  | Type or paste the destination for the link you are creating               |
| Display Text | Type or edit the required text that you want to display text for the link |

| Tooltip | To display additional helpful information when you place the pointer on the hyperlink, type the required text in the “Tooltip” field. |

| Open Link in New Window | Specify whether, the given link will be open in new window or not |

### CSHTML

```
@Html.EJS().RichTextEditor("link").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>

 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "CreateLink" };
 return View();
 }
}
```

**Note:** The Rich Text Editor link tool validates URLs, as you type them in Web Address. URLs considered invalid will be highlighted with red color by clicking the insert button in the **Insert Link** dialog.

#### Remove Link

If you want to remove a hyperlink from a text or image, select the text or image with the hyperlink and click **Remove Hyperlink** tool from toolbar. It will keep the text or image.

### Auto-link

When you type URL and Enter key to the Rich Text Editor, the typed URL will be automatically changed into the hyperlink.

### Manipulation

It is possible to add custom style on the selected link inside the Rich Text Editor through quick toolbar.

The quick toolbar for the Link has the following options.

| Tools       | Description                                               |
|-------------|-----------------------------------------------------------|
| ----- ----- |                                                           |
| Open        | The given link page, will be open in new window.          |
| Edit Link   | Used to edit the link in the Rich Text Editor content.    |
| Remove Link | Used to remove link from the content of Rich Text Editor. |
| Custom Tool | Used to add the custom options in the quick toolbar.      |

### CSHTML

```

## Table

Rich Text Editor allows to insert table of content in edit panel and provide options to add, edit, and remove the table as well as perform other table related action. For inserting the table to the Rich Text Editor, the following list of options have been provided in the [TableSettings](#)

| Options  | Description                                                                                                                                                                                                                        | Default Value                   |
|----------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------|
| minWidth | Sets the default minWidth of the table.                                                                                                                                                                                            | 0                               |
| maxWidth | Sets the default maxWidth of the table.                                                                                                                                                                                            | null                            |
| resize   | Enable resize feature in table.                                                                                                                                                                                                    | true                            |
| styles   | This is an array of key value pair, on each pair, key should be name of styling and value is class name. this list will be shown on quick toolbar options to change the styles of table on designing like dashed, double bordered. | <a href="#">TableStyleItems</a> |
| width    | Sets the default width of the table.                                                                                                                                                                                               | 100%                            |

## Insert Table

Using the [table](#) toolbar option, select a number of rows and columns to be inserted over the table grid and insert table into Rich Text Editor content using the mouse.

Tables can also be inserted through the [Insert Table](#) option in the pop-up where the number of rows and columns can be provided manually, and this is the default way in devices.

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "CreateTable" };
 return View();
 }
}

```

## Quick Toolbar

Quick toolbar is opened by clicking the table. It has different sets of commands to be performed on the table which increases the feasibility to edit the table easily.

### Table Header

**Table Header** command is available with quick toolbar option through which the header row can be added or removed from the inserted table. The following image illustrates the table header.

### Insert Rows

**Rows** can be inserted above or below the required table cell through the quick toolbar. Also, focused row can be deleted. The following screenshot shows the available options of the row item.

### Insert Columns

**Columns** can be inserted to the left or right side of the required table cell through the quick toolbar. Also, the focused column can be deleted. The following screenshot shows the available options of the column item.

### Set Color

The background color can be set for each table cell through the **background color** command available with quick toolbar.

### Delete Table

Using the delete item in the quick toolbar, users can delete the entire table.

### Vertical Align

Text inside the table can be aligned to top, middle, or bottom using the `tableCellVerticalAlign` tool of the quick toolbar.

### Horizontal Align

Text inside the table can be aligned left, right, or center using the `tableCellHorizontalAlign` tool of the quick toolbar.

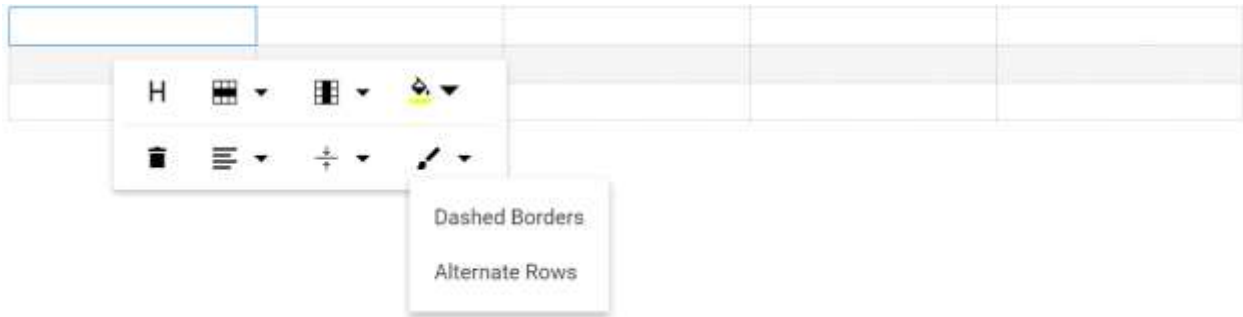

### Table Styles

Table styles provided for class name should be appended to a table element. It helps to design the table in specific CSS styles when inserting in the editor.

By Default, provides Dashed border and Alternate rows.

**Dashed border:** Applies the dashed border to the table.

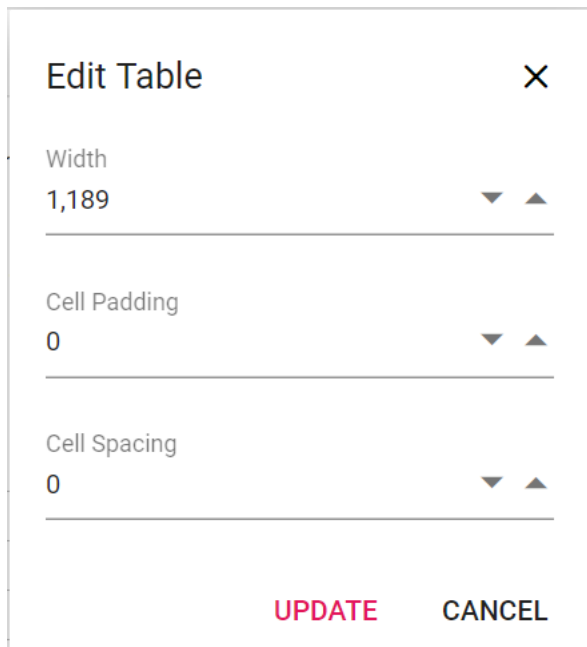

**Alternate border:** Applies the alternative background to the table.

### Table Properties

Sets the default width of the table when it is inserted in the Rich Text Editor using the width of [TableSettings](#).

Using the quick toolbar, users can change the width, cell padding, and cell spacing in the selected table using the properties option.

### Table cell merge and split

The Rich Text Editor allows users to change the appearance of the tables by splitting or merging the table cells.

**TableCell** item should be configured in the Table [quickToolbarSettings](#) Property to show the merge/split icons while selecting the table cells

#### Table cell merge

The table cell merge feature allows you to merge two or more row and column cells into a single cell with its contents.

The following image explains the table merge action.

### Table cell split

The table cell split feature allows you to split the merged cells both horizontally and vertically.

The following image explains the table split action.

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "CreateTable" };
 ViewBag.Table = new[] {
 "TableHeader", "TableRows", "TableColumns", "TableCell", "-",
 "BackgroundColor", "TableRemove", "TableCellVerticalAlign", "Styles"
 };
 return View();
 }
}
```

### Emoji Picker

An emoji picker is a tool that allows users to add emojis or emoticons to their text easily. Typically, it is a small window or panel that displays a variety of emojis arranged in different categories, such as smileys, animals, food, and so on. Users can select the desired emoji by clicking on it or by typing its name in a search bar.

Enabling the toolbar option and custom emojis.

Add the **EmojiPicker** tool to the toolbar of the RichTextEditor by utilizing the **ToolbarSettings** [Items](#) property.

By default, a predefined set of emojis is configured. However, you can customize these icons according to your needs. To achieve this, utilize the [EmojiPickerSettings](#) property.

The following code example shows how to customize icons in the emoji picker.

**CSHTML**

```
<ejs-richtexteditor id="emojiPickerRTE">
 <e-richtexteditor-toolbarsettings items="ViewBag.items"/>
 <e-richtexteditor-emojipickersettings iconsSet= "ViewBag.iconsSet"/>
 <e-content-template>
 <p>An emoji picker in a Rich Text Editor is a tool that allows users
to easily add emojis or emoticons to their text.</p>
 <p>Typically, it is a small window or panel that displays a variety
of emojis, arranged in different categories, such as smileys, animals, food,
and so on. Users can select the desired emoji by clicking on it or by typing
its name in a search bar.</p>
 </e-content-template>
</ejs-richtexteditor>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[]
 {
 "EmojiPicker", "ClearFormat", "Bold", "Italic", "Underline",
 "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList", "|",
 "CreateLink", "Image", "|", "SourceCode", "Undo", "Redo"
 };
 ViewBag.iconsSet = new[]
 {
 new
 {
 name = "Smilies & People",
 code = "1F600",
 iconCss = "e-emoji",
 icons = new[]
 {
 new { code = "1F600", desc = "Grinning face" },
 new { code = "1F603", desc = "Grinning face with big
eyes" },
 new { code = "1F604", desc = "Grinning face with smiling
eyes" },
 new { code = "1F606", desc = "Grinning squinting face" },
 new { code = "1F605", desc = "Grinning face with sweat" },
 new { code = "1F602", desc = "Face with tears of joy" },
 new { code = "1F923", desc = "Rolling on the floor
laughing" },
 new { code = "1F60A", desc = "Smiling face with smiling
eyes" }
 }
 },
 new {
 name = "Animals & Nature",
 code = "1F435",
```

```

 iconCss = "e-animals",
 icons = new[] {
 new { code = "1F436", desc = "Dog face" },
 new { code = "1F431", desc = "Cat face" },
 new { code = "1F42D", desc = "Mouse face" },
 new { code = "1F439", desc = "Hamster face" },
 new { code = "1F430", desc = "Rabbit face" },
 new { code = "1F98A", desc = "Fox face" }
 },
 new {
 name = "Food & Drink",
 code = "1F347",
 iconCss = "e-food-and-drinks",
 icons = new[] {
 new { code = "1F34E", desc = "Red apple" },
 new { code = "1F34C", desc = "Banana" },
 new { code = "1F347", desc = "Grapes" },
 new { code = "1F353", desc = "Strawberry" },
 new { code = "1F35E", desc = "Bread" },
 new { code = "1F950", desc = "Croissant" },
 new { code = "1F955", desc = "Carrot" },
 new { code = "1F354", desc = "Hamburger" }
 },
 },
 new {
 name = "Activities",
 code = "1F383",
 iconCss = "e-activities",
 icons = new[] {
 new { code = "26BD", desc = "Soccer ball" },
 new { code = "1F3C0", desc = "Basketball" },
 new { code = "1F3C8", desc = "American football" },
 new { code = "26BE", desc = "Baseball" },
 new { code = "1F3BE", desc = "Tennis" },
 new { code = "1F3D0", desc = "Volleyball" },
 new { code = "1F3C9", desc = "Rugby football" }
 },
 },
 };
 return View();
}
}

```

Additionally, you have the option to customize the icons of toolbar items using the `IconCSS` and `Code` properties. The `IconCSS` property allows you to define a custom CSS class for the toolbar item icon, while the `Code` property enables you to specify the Unicode character code for the icon.

When both `IconCSS` and `Code` properties are provided, the `IconCSS` property takes precedence in determining the appearance of the toolbar item icon.

Additionally, you have the option to enhance the user experience by implementing a filtering feature for efficiently managing a large dataset of emojis. By setting the `ShowSearchBox` property to true (which is the default value), users will be able to utilize a search box to filter the displayed emojis according to their preferences.

The following code example shows how to add the emoji picker tool in the RichTextEditor.

### CSHTML

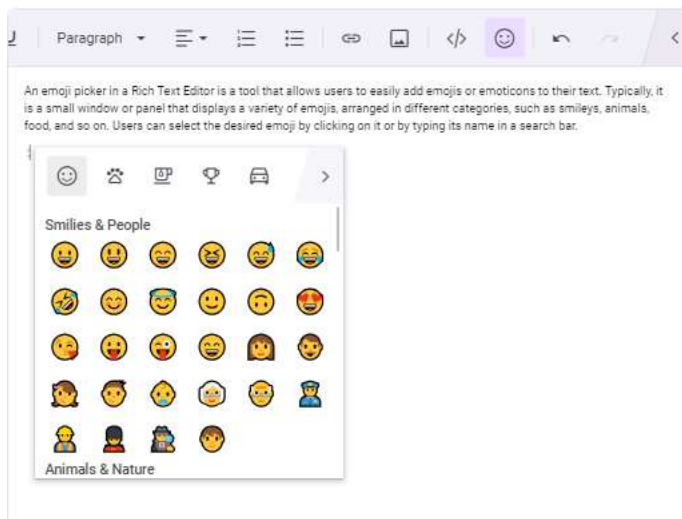

```
@Html.EJS().RichTextEditor("emojiPickerRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>
 <p>An emoji picker in a Rich Text Editor is a tool that allows users to
 easily add emojis or emoticons to their text.</p>
 <p>Typically, it is a small window or panel that displays a variety of
 emojis, arranged in different categories, such as smileys, animals, food,
 and so on. Users can select the desired emoji by clicking on it or by typing
 its name in a search bar.</p>
</div>).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "EmojiPicker", "ClearFormat", "Bold",
 "Italic", "Underline", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList", "|",
 "CreateLink", "Image", "|",
 "SourceCode", "Undo", "Redo"};
 return View();
 }
}
```

### Using the shortcut key to open the emoji picker

Quickly access the emoji picker by pressing the colon (:) key while typing a word prefix in an editor, allowing instant emoji selection and display. Moreover, continue typing in the editor after the colon (:) to filter and refine your search for the desired emojis.

### Navigating and selecting emojis using the keyboard

The emoji picker popup offers keyboard navigation options, allowing you to move the emoji focus from one emoji to another. The following keys are used for navigation:

**Arrow keys:** Use the arrow keys (up, down, left, right) to move the emoji focus in the corresponding direction.

**Enter:** Press Enter key to select the currently focused emoji.

**Escape:** Press Escape to close the emoji picker popup without selecting an emoji.

## Markdown

In Rich Text Editor, you click the toolbar buttons to format the words and the changes are visible immediately.

Markdown is not like that. When you format the word in Markdown format, you need to add Markdown syntax to the word to indicate which words and phrases should look different from each other.

Rich Text Editor supports markdown editing when the [EditorMode](#) set as **Markdown** and using both *keyboard interaction* and *toolbar action*, you can apply the formatting to text.

## Supported Commands

The ASP MVC Markdown editor supports the following commands to format the markdown content:

| Commands                | Syntax                                                                            | Description                                                                                                |
|-------------------------|-----------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------|
|                         | ----- ----- -----                                                                 |                                                                                                            |
| Bold                    | Sample content for <b>bold text</b> .                                             | For bold, add <b>or</b> to front and back of the text. For order list, precede each line with a number.    |
| Italic                  | Sample content for <i>Italic text</i> .                                           | For Italic, add <i>* or _</i> to front and back of the text.                                               |
| Bold and Italics        | Sample content for <b><i>bold and Italic text</i></b> .                           | For bold and Italics, add <i>* to the front and back of the text.</i>                                      |
| Heading 1               | <b>#</b> Heading 1 content                                                        | For heading 1, add <b>#</b> to start of the line.                                                          |
| Heading 2               | <b>##</b> Heading 2 content                                                       | For heading 2, add <b>##</b> to start of the line.                                                         |
| Heading 3               | <b>###</b> Heading 3 content                                                      | For heading 3, add <b>###</b> to start of the line.                                                        |
| Heading 4               | <b>####</b> Heading 4 content                                                     | For heading 4, add <b>####</b> to start of the line.                                                       |
| Heading 5               | <b>#####</b> Heading 5 content                                                    | For heading 5, add <b>#####</b> to start of the line.                                                      |
| Heading 6               | <b>#####</b> Heading 6 content                                                    | For heading 6, add <b>#####</b> to start of the line.                                                      |
| Line Break              | First line <b>&lt;br&gt;</b> Second line                                          | For line break, press enter two times (or) add <b>&lt;br&gt;</b> in between the first and the second line. |
| Blockquotes             | <b>&gt;</b> Blockquotes text                                                      | For blockquotes, add <b>&gt;</b> to start of the line.                                                     |
| Strike Through          | Sample content for <del>strike through text</del> .                               | For strike through, add <b>~~</b> to front and back of the text.                                           |
| Code (Single line)      | <b>\Single line code\</b>                                                         | For single line code, add <b>`</b> to front and back of the text.                                          |
| Code block (Multi Line) | <b>\\&lt;br&gt;Multi line code text&lt;br&gt;Multi line code text&lt;br&gt;\\</b> | For multiple line code, add <b>\\`</b> in the new line before and after the content.                       |

| Subscript | `<sub>Subscript text</sub>` | For subscript, add `<sub>` to the front and `</sub>` to the back of the text. |

| Superscript | `<sup>Superscript text</sup>` | For superscript, add `<sup>` to the front and `</sup>` to the back of the text. |

| Ordered List | `1. First<br>1. Second` | For ordered list, preceding one or more lines of text with `1.` |

| Unordered List | `First<br>second` | For unordered list, preceding one or more lines of text with `*`. |

| Links | **Link text without title text**`<br>` `Link text ` `<br>Link text with title text<br>[ Link text ](URL , "title text")` | Create an inline link by wrapping link text in brackets `[ ]`, and then wrapping the URL as first parameter and title as second parameter in the parentheses `()`.  
**Note:** The title text is optional, if needed it can be given manually. |

| Table | | Heading 1 | Heading 2 |`<br>|-----|-----|<br>| Col A1 | Col A2 |<br>| Col B1 | Col B2 |` | Create a table using the pipes and underscores as given in the syntax to create 2 x 2 table. |

| Horizontal Line | ***(three asterix in new line)<br>(or)<br>(three underscores in new line)*** | **For horizontal line, add *or* to the start of the new line.** |

| Image | `` | Create an image by wrapping the image source in parentheses `()`. |

| Image with alternate text | `![ alternate text ](URL path)` | Create an image with alternate text by wrapping an alternative text in brackets `[]`, and then link of the image source in parentheses `()`.  
**Note:** When inserting the image using toolbar, the alternate text cannot be provided that needs to be given manually. |

| Escape tick marks supported | Sample text content with **bold and not bold text can be in the same line.** | In the syntax, the whole content is made as bold where the content not bold can be made as normal text by adding the bold syntax to the start and end of the respective text. Likewise you can do the same for various inline commands. |

| Escape Character | `\(any syntax)` | Escape any markdown syntax by prefix `\` to the syntax.  
Example:`<br>\Bold text|`

| HTML Entities | Copyright: `&#169;` - `&#169;`; `<br>`Trade mark: `&#8482;` - `&#8482;`; `<br>`Registered: `&#174;` - `&#174;`; `<br>`Ampersand: `&#38;` - `&#38;`; `<br>`Less than: `<` - `<<br>`Greater than: `>` - `>>` | For HTML entities, add `&` and `;` to the front and back of the respective entities. |

**Note:** The above listed commands alone are supported in Syncfusion Markdown editor. For other unsupported commands, you can achieve using the HTML tags in Markdown editor. The foot notes, definitions, math, and check list markdown syntax are also not supported.

### Markdown to HTML

The Rich Text Editor allows you to preview markdown changes immediately using preview. The third-party library [Marked](#) is used in this sample to convert markdown into HTML content.

This sample demonstrates how to preview markdown changes in Rich Text Editor. Type or edit the display text and apply format to view the preview of markdown.

**CSHTML**

```

@using Syncfusion.EJ2.RichTextEditor
<div class="control-wrapper">
 <div class="control-section">

@Html.EJS().RichTextEditor("markdown").EditorMode(EditorMode.Markdown).Toolb
arSettings(e =>
e.Items((object)ViewBag.items)).Value((string)ViewBag.value).Created("create
d").Render()
 </div>
</div>
<script src="https://cdn.jsdelivr.net/npm/marked/marked.min.js"></script>
<script type="text/javascript">
 var mdsource, defaultRTE, textArea;
 function created() {
 defaultRTE = this;
 textArea = defaultRTE.contentModule.getEditPanel();
 textArea.addEventListener('keyup', (event) => {
markDownConversion(); });
 var rteObj = defaultRTE;

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 object tools1 = new
 {

```

```

 tooltipText = "Preview",
 template = "<button id='preview-code' class='e-tbar-btn e-control e-btn e-icon-btn'>" +
 "</button>"
 };
 ViewBag.items = new[] { "Bold", "Italic", "StrikeThrough", "|",
 "Formats", "OrderedList", "UnorderedList", "|", "CreateLink", "Image",
 "CreateTable", "|", tools1, "|", "Undo", "Redo" };
 ViewBag.value = @"In Rich Text Editor , you click the toolbar
 buttons to format the words and the changes are visible immediately.
 Markdown is not like that. When you format the word in Markdown format, you
 need to add Markdown syntax to the word to indicate which words
 and phrases should look different from each other.
 RichTextEditor supports markdown editing when the editorMode set as
 markdown and using both *keyboard interaction* and *toolbar action*, you
 can apply the formatting to text.
 We can add our own custom formation syntax for the Markdown formation,
 [sample link] (https://ej2.syncfusion.com/javascript/demos/#/material/rich-
 text-editor/markdown-editor-custom-format.html) .
 The third-party library Marked is used in this sample to convert
 markdown into HTML content";
 return View();
}
}

```

## Table

Rich Text Editor allows to insert Markdown table in edit panel with 2 X 2 rows and columns along with the heading.

To use table tool, add the **CreateTable** item in toolbar items.

### Insert Table

To insert the table in Rich Text Editor, click the **table** toolbar option to insert the table into Rich Text Editor content and this is the default way in all the devices. Refer the below sample and code snippets to add the table in Markdown editor.

## CSHTML

```

@using Syncfusion.EJ2.RichTextEditor
<div class="control-wrapper">
 <div class="control-section">

@Html.EJS().RichTextEditor("markdown").EditorMode(EditorMode.Markdown).Toolb
arSettings(e =>
e.Items((object)ViewBag.items)).Value((string)ViewBag.value).Created("create
d").Render()
 </div>
</div>
<script src="https://cdn.jsdelivr.net/npm/marked/marked.min.js"></script>
<script type="text/javascript">
 var mdsources, defaultRTE, textArea;
 function created() {
 defaultRTE = this;
 textArea = defaultRTE.contentModule.getEditPanel();

### File Browser

Rich Text Editor allows to browse and insert images in the edit panel using the file browser. File browser allows the users to browse and select a file or folder from the file system and it supports various cloud services.

The following example explains how to configure the file browser within the Rich Text Editor component.

- Configure the `FileManager` toolbar item in the `ToolbarSettings` API `Items` property.
- Set `Enable` property as `true` on `FileManagerSettings` property to make the file browser in the Rich Text Editor to appear on the `FileManager` toolbar click action.

**CSHTML**

```
@Html.EJS().RichTextEditor("fileBrowser").ToolBarSettings(e =>
e.Items((object)ViewBag.items)).FileManagerSettings(e => { e.Enable(true);
e.Path("/Pictures/Food"); e.AjaxSettings((object)ViewBag.ajaxSettings);
}).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).Render()
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 string hostUrl = "https://ej2-aspcore-service.azurewebsites.net/";
 ViewBag.ajaxSettings = new {
 url = hostUrl + "api/FileManager/FileOperations",
 getImageUrl = hostUrl + "api/FileManager/GetImage",
 uploadUrl = hostUrl + "api/FileManager/Upload",
 downloadUrl = hostUrl + "api/FileManager/Download"
 };
 ViewBag.items = new[] { "FileManager", "Image" };
 return View();
 }
}
```

**Format Painter in ASP.NET MVC Rich Text Editor Control | Syncfusion**

A format painter is a tool that allows you to copy the formatting from a piece of text and apply it to another one. Format Painter can be accessed via the toolbar or the keyboard shortcuts. The format painter can copy the formatting of a single word or a whole paragraph. The format painter can be customized using the [FormatPainterSettings](#) property.

### Enabling the toolbar option for Format Painter

You can add the **FormatPainter** tool in the Rich Text Editor using the **ToolbarSettings** [Items](#) property.

By double-clicking the format painter toolbar button, **sticky mode** will be enabled. In sticky mode, the format painter will be disabled when the user clicks the **Escape** key again.

The following code example shows how to add the format painter tool in the Rich Text Editor.

#### CSHTML

```
@Html.EJS().RichTextEditor("formatPainterRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).ContentTemplate(@<div>
 <h3>Format Painter</h3>
 <p>
 A Format Painter is a Rich Text Editor feature allowing users to
 quickly
 <span style="background-color: rgb(198, 140,
83);">copy
 and
 <span style="background-color: rgb(198, 140,
83);">paste
 formatting from one text to another. With a rich text editor,
 utilize the format painter as follows:
 </p>

 Select the text whose format you want to copy.

 Click on the Format Painter button in
 the toolbar. It may look like a paintbrush icon.

 The cursor will change to a paintbrush icon.
 Click and drag the cursor over the text you want to apply the copied format.

 Release the mouse button to apply the format.

 <p>
 Using the format painter in a rich text editor can save you time
 when formatting a large document, You can quickly
 copy and apply formatting
 to <span style="background-color: rgb(198, 140,
83);">multiple sections.
 It's a helpful tool for anyone who works with text editing
 regularly, such as writers, editors, and content creators.
 </p>
</div>).Render()
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
```

```

{
 ViewBag.items = new[] { "FormatPainter", "ClearFormat", "Bold",
 "Italic", "Underline", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList", "|",
 "CreateLink", "Image", "|",
 "SourceCode", "Undo", "Redo"};
 return View();
}

```

### Customization of copy and paste format

You can customize the format painter tool in the Rich Text Editor using the `FormatPainterSettings` property.

The `AllowedFormats` property helps you to specify tag names that allow the formats to be copied from the selected text. For instance, you can include formats from the selected text using tags like `p`; `h1`; `h2`; `h3`; `div`; `ul`; `ol`; `li`; `span`; `strong`; `em`; `code`; . The following example demonstrates how to customize this functionality.

Similarly, with the `DeniedFormats` property, you can utilize the selectors to prevent specific formats from being pasted onto the selected text. The table below illustrates the selectors and their respective usage.

| Type | Description        | Selector                      | Usage                                                                |
|------|--------------------|-------------------------------|----------------------------------------------------------------------|
| ( )  | Class Selector     | h3(e-rte-block-blue-text)     | The class name e-rte-block-blue-text of H3 element is not copied.    |
| []   | Attribute Selector | span\[title]                  | The title attribute of span element is not copied.                   |
| { }  | Style Selector     | span{background-color, color} | The background-color and color styles of span element is not copied. |

Using the `DeniedFormats` property following styles are denied copying from the selected text such as `h3(e-rte-block-blue-text){background-color,padding}[title]`; `li{color}`; `span(e-inline-text-highlight)[title]`; `strong{color}(e-rte-strong-bg)`.

### CSHTML

```

@Html.EJS().RichTextEditor("formatPainterRTE").ToolbarSettings(e =>
e.Items((object)ViewBag.items)).FormatPainterSettings(e =>
{e.AllowedFormats((string)ViewBag.allowedFormats);e.DeniedFormats((string)Vi
ewBag.deniedFormats);}).ContentTemplate(@<div>
 <h3 class="e-rte-block-blue-text" title="Format Painter" style="color:
#0079f3; background-color: #eff6ff; padding: 10px;">Format
Painter</h3>
 <p>
 A Format Painter is a Rich Text Editor feature allowing users to
quickly

```

```

<span class="e-inline-text-highlight" style="color: blue;"
title="Styled by CSS Class selector">copy
and
<span class="e-inline-text-highlight" style="color: blue;"
title="Styled by CSS Class selector">paste
 formatting from one text to another. With a rich text editor,
 utilize the format painter as follows:
</p>

 <li style="color: crimson;">
 Select the text whose format you want to copy.

 <li style="color: crimson;">
 Click on the Format Painter button in
 the toolbar. It may look like a paintbrush icon.

 <li style="color: crimson;">
 The cursor will change to a paintbrush icon.
 Click and drag the cursor over the text you want to apply the copied format.

 <li style="color: crimson;">
 Release the mouse button to apply the format.

<p>
 Using the format painter in a rich text editor can save you time
 when formatting a large document, You can quickly
 copy and apply formatting
 to <strong class="e-rte-strong-bg" style="color: blue">multiple
 sections.
 It's a helpful tool for anyone who works with text editing
 regularly, such as writers, editors, and content creators.
</p>
</div>).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "FormatPainter", "ClearFormat", "Bold",
 "Italic", "Underline", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList", "|",
 "CreateLink", "Image", "|",
 "SourceCode", "Undo", "Redo"};
 ViewBag.allowedFormats =
 "p;h1;h2;h3;div;ul;ol;li;span;strong;em;code;";
 ViewBag.deniedFormats = "h3(e-rte-block-blue-text){background-
 color,padding,color}[title]; li{color}; span(e-inline-text-
 highlight){color}[title]; strong{color}(e-rte-strong-bg);";
 return View();
 }
}

```

### Using the shortcut key to copy and paste the format

You can use the following shortcut keys to copy and paste the format in the Rich Text Editor.

| Actions          | Keyboard shortcuts | Description                                                      |
|------------------|--------------------|------------------------------------------------------------------|
| Copy the format  | Alt + Shift + c    | Copy the selection format or current range.                      |
| Paste the format | Alt + Shift + v    | Paint the copied format.                                         |
| Escape           | Esc                | Remove the previously copied format and disable the sticky mode. |

The format painter retains the formatting after application making it possible to apply the same formatting multiple times by using the Alt + Shift + v keyboard shortcut.

Additionally, You can perform the format painter actions programmatically using the [executeCommand](#) public method.

### Form support

This below sample demonstrate how to get the Rich Text Editor value in button click.

#### Render the Rich Text Editor

Render the Rich Text Editor in form as below.

```
`html
<form id="myForm" class="form-vertical">
<div class="form-group">
@Html.EJS().RichTextEditor("defaultRTE").MaxLength(100).Render()
<div id="dateError" style="padding-top: 10px"></div>
</div>
<div style="text-align: center">
<button id="validateSubmit" class="samplebtn e-control e-btn" type="submit" data-
ripple="true">Submit</button>
<button id="resetbtn" class="samplebtn e-control e-btn" type="reset" data-
ripple="true">Reset</button>
</div>
</form>
`
```

#### Obtain the Value

Upon submitting the form, `getValue` method will be triggered. Through the `FormData` class, Rich Text Editor value obtained as below.

#### CSHTML

```

<div id="content" class="box-form" style="margin: 0 auto; width:750px;
padding:25px">
 <form id="form-element" class="form-vertical">
 <div class="form-group">
 @Html.EJS().RichTextEditor("form-
support").ShowCharCount(true).MaxLength(100).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
 Users can format their content using standard toolbar commands.
 </p>
 <p> Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

 </div>).Created("created").Render()
 <div id="dateError" style="padding-top: 10px"></div>
 </div>
 <div class="form-group">
 <div class="col-sm-3 control-label"></div>
 <div class="col-sm-6">
 <div id='error'></div>
 </div>
 </div>
 <div style="text-align: center">
 <button id="validateSubmit" class="samplebtn e-control e-btn"
type="submit" data-ripple="true">Submit</button>
 <button id="resetbtn" class="samplebtn e-control e-btn"
type="reset" data-ripple="true">Reset</button>
 </div>
 </form>
</div>
<script>
 var defaultRTE, formObject, options;
 function created() {
 options = {
 rules: {
 'rteForm': {
 required: true
 }
 }
 };
 };

```

```

 formObject = new ej.inputs.FormValidator('#form-element', options);
 defaultRTE = this;
 this.element.firstChild.setAttribute("required", "");
 this.element.firstChild.setAttribute('data-required-message', '*
This field is required');
 this.element.firstChild.setAttribute('data-msg-containerid',
'dateError');
 this.element.firstChild.setAttribute('name', 'rteForm');
 };
 window.onload = function () {
 document.getElementById('validateSubmit').onclick = function () {
 getValue();
 };
 }
 function getValue() {
 formObject.validate();
 }
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

### Validation

Validate the Rich Text Editor's value on form submission by applying Validation Rules and Validation Message to the Rich Text Editor.

#### Validation Rules

The Rich Text Editor is a textarea control. The Rich Text Editor also provides the functionality of character count and its validation. So, you can validate the Rich Text Editor's value on form submission by applying Validation Rules and Validation Message to the Rich Text Editor.

| Rules     | Description                                                 |
|-----------|-------------------------------------------------------------|
| required  | Requires value for the Rich Text Editor control.            |
| minlength | Requires the value to be of given minimum characters count. |
| maxlength | Requires the value to be of given maximum characters count. |

This sample is used to validate form using the obtrusive Validation. Type the values in Rich Text Editor and the form enables the validation with the formvalidator rules by clicking on the submit externally. All rules are validated by the formvalidator rules.

### CSHTML

```
<div class="control-section">
 <div id="content" class="box-form" style="margin: 0 auto; width:750px;
padding:25px">
 <form id="form-element" class="form-vertical">
 <div class="form-group">

@Html.EJS().RichTextEditor("defaultRTE").ShowCharCount(true).MaxLength(100).
Placeholder("Type something").Created("created").Change("onChange").Render()

 <div id="dateError" style="padding-top: 10px"></div>
 </div>
 <div style="text-align: center">

@Html.EJS().Button("validateSubmit").Disabled("true").Render()
 <button id="resetbtn" class="samplebtn e-control e-btn"
type="reset" data-ripple="true">Reset</button>
 </div>
 </form>
 </div>
</div>
<script>
 var defaultRTE, formObject, options;
 function created() {
 options = {
 rules: {
 'rteForm': {
 required: true
 }
 }
 };
 formObject = new ej.inputs.FormValidator('#form-element', options);
 defaultRTE = this;
 this.element.firstChild.setAttribute("required", "");
 this.element.firstChild.setAttribute('data-msg-containerid',
'dateError');
 this.element.firstChild.setAttribute('name', 'rteForm');
 };
 window.onload = function () {
 document.getElementById('validateSubmit').onclick = function () {
 getValue();
 };
 }
 function getValue() {
 formObject.validate();
 }
 function onChange() {
 var submitButton =
document.getElementById("validateSubmit").ej2_instances[0];
 submitButton.disabled = false;
 }
</script>
```

**CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

## Validation Message

The default error message for a rule can be customizable by defining it along with concern rule object as follows

**CSHTML**

```
<div class="control-section">
 <div id="content" style="margin: 0 auto; width:750px; padding:25px">
 <form id="form-element" class="form-vertical">
 <div class="form-group">
 @Html.EJS().RichTextEditor("form-
support").ShowCharCount(true).MaxLength(100).Placeholder("Type
something").Created("created").Change("onChange").Render()
 <div id="dateError" style="padding-top: 10px"></div>
 </div>
 <div style="text-align: center">

@Html.EJS().Button("validateSubmit").Disabled("true").Render()
 <button id="resetbtn" class="samplebtn e-control e-btn"
type="reset" data-ripple="true">Reset</button>
 </div>
 </form>
 </div>
</div>
<script>
var defaultRTE, formObject, options;
function created() {
 options = {
 rules: {
 'rteForm': {
 required: true,
 minLength: [20, 'Need atleast 20 character length'],
 maxLength: [100, 'Maximum 100 character only']
 }
 }
 };
 formObject = new ej.inputs.FormValidator('#form-element', options);
 this.element.firstChild.setAttribute("required", "");
 this.element.firstChild.setAttribute('data-required-message', '*
This field is required');
 this.element.firstChild.setAttribute('data-msg-containerid',
'dateError');
 this.element.firstChild.setAttribute('name', 'rteForm');
};
document.getElementById('validateSubmit').onclick = function () {
 getValue();
}
```

```

 }
 function getValue() {
 formObject.validate();
 }
 function onChange() {
 var submitButton =
document.getElementById("validateSubmit").ej2_instances[0];
 submitButton.disabled = false;
 }
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Custom Placement of Validation Message

The FormValidator has an event `customPlacement` which can be used to place the error message from default position to desired custom location.

## CSHTML

```

<div class="control-section">
 <div id="content" class="box-form" style="margin: 0 auto; width:750px;
padding:25px">
 <form id="form-element" class="form-vertical">
 <div class="form-group">

@Html.EJS().RichTextEditor("defaultRTE").ShowCharCount(true).MaxLength(100).
Placeholder("Type something").Created("created").Change("onChange").Render()
 <div id="dateError" style="padding-top: 10px"></div>
 </div>
 <div style="text-align: center">

@Html.EJS().Button("validateSubmit").Disabled("true").Render()
 <button id="resetbtn" class="samplebtn e-control e-btn"
type="reset" data-ripple="true">Reset</button>
 </div>
 </form>
 </div>
</div>
<script>
 var defaultRTE, formObject, options;
 function created() {
 options = {
 rules: {
 'rteForm': {
 required: true,
 minLength: [6, 'Need atleast 6 character length'],
 maxLength: [100, 'Maximum 100 character only']
 }
 }
 }
 }

```

```

 },
 customPlacement: function (inputElement, error) {
 document.getElementById('dateError').appendChild(error);
 }
};
formObject = new ej.inputs.FormValidator('#form-element', options);
defaultRTE = this;
this.element.firstChild.setAttribute("required", "");
this.element.firstChild.setAttribute('data-required-message', '*
This field is required');
this.element.firstChild.setAttribute('data-msg-containerid',
'dateError');
this.element.firstChild.setAttribute('name', 'rteForm');
}
window.onload = function () {
 document.getElementById('validateSubmit').onclick = function () {
 getValue();
 };
}
function getValue() {
 formObject.validate();
}
function onChange() {
 var submitButton =
document.getElementById("validateSubmit").ej2_instances[0];
 submitButton.disabled = false;
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Globalization

### Localization

The Rich Text Editor provides an option to localize its strings; it is used to adapting the editor to a particular local language. By default, the editor will use the **US English (en-US)** as its language. Find the table with a list of keys and their corresponding values for the default language (en-US).

`typescript

```

{
 "en-US": {
 "richtexteditor": {
 "alignments": "Alignments",
 "justifyLeft": "Align Left",

```

"justifyCenter": "Align Center",  
"justifyRight": "Align Right",  
"justifyFull": "Align Justify",  
"fontName": "Font Name",  
"fontSize": "Font Size",  
"fontColor": "Font Color",  
"backgroundColor": "Background Color",  
"bold": "Bold",  
"italic": "Italic",  
"underline": "Underline",  
"strikethrough": "Strikethrough",  
"clearFormat": "Clear Format",  
"clearAll": "Clear All",  
"cut": "Cut",  
"copy": "Copy",  
"paste": "Paste",

})
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## RTL

Specifies the direction of the Rich Text Editor control using the [EnableRtl](#) property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

## CSHTML

```

@Html.EJS().RichTextEditor("rtl").EnableRtl(true).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

```

```

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

 </div>).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

**Note:** [EnableRtl](#) property will not change based on [Locale](#) property.

## XHTML validation

The editor provides an option to validate the source content of the Rich Text Editor against the XHTML standard using the 'enableXhtml' property. When you enter or modify content in the editor, it continuously checks the XHTML source content and removes elements and attributes that are not valid.

The editor checks the following settings on validation:

### Attributes

- Must be specified in lowercase.
- Proper use of quotation marks around the attributes.
- Must be valid attributes for corresponding HTML element.
- All the required attributes must be included in the HTML element.

### HTML Elements

- Must be in lowercase.
- All opening tags must be closed.
- Allows only the valid HTML elements.
- Elements must be properly nested.
- All elements must have one root element.

- Should not use inline elements inside the block elements.

### CSHTML

```
<div class="control-section">
 @Html.EJS().RichTextEditor("form-
support").EnableXhtml(true).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
</div>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Miscellaneous

#### Placeholder

Specifies the placeholder for the RichTextEditor's content used when the Rich Text Editor body is empty through the [Placeholder](#) property.

Through the `e-rte-placeholder` class we can able to define our custom font family, font color and styles to the placeholder text.

```
`css
```

```
.e-richtexteditor .e-rte-placeholder {
```

```
font-family: monospace;
}
,
```

The below sample demonstrates the **Placeholder** option in Rich Text Editor.

#### CSHTML

```
@Html.EJS().RichTextEditor("placeholder").Placeholder("Type
something").Render()
<style>
 .e-richtexteditor .rte-placeholder {
 font-family: monospace;
 }
</style>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

#### Character Count

The Rich Text Editor automatically counts the number of characters in the content area while typing using [ShowCharCount](#) property. The characters count displayed at the bottom right of the editor. Limit the number of character in the Rich Text Editor's content using [MaxLength](#) property. By default, the editor sets the characters limit value is infinity.

The character count color will be modified based on the characters in the Rich Text Editor.

| Status  | Description                                                                                                                                                                                                              |
|---------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| normal  | Till 70% of given maxLength count reach, character count color is black.                                                                                                                                                 |
| warning | Once the number of character count in the Rich Text Editor reached 70% of given maxLength count, the character count color will be orange, indicating that, the Rich Text Editor value going to reach the maximum count. |
| error   | Once the number of character count in the Rich Text Editor reached 90% of given maxLength count, the character count color will be red, indicating that, the Rich Text Editor value reached the maximum count.           |

#### CSHTML

```
@Html.EJS().RichTextEditor("characterCount").ShowCharCount(true).MaxLength(2000).ContentTemplate(@<div>
<p>
```

The Rich Text Editor control is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content.

Users can format their content using standard toolbar commands.

```

etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Print

The editor provides print tools which use to print the contents of the editor.

## CSHTML

```

@Html.EJS().RichTextEditor("print").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>

</div>

```

```

<p> Provides HTML view to edit the source directly for
developers.</p>
<p> Supports third - party library integration.</p>
<p> Allows preview of modified content before saving
it.</p>
<p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Print" };
 return View();
 }
}

```

## Code View

Rich Text Editor includes the ability for users to directly edit HTML code via **Source View** in the text area. If you made any modification in Source view directly, the changes will be reflected in the Rich Text Editor's content. So, the users will have more flexibility over the content they have created.

This sample used [Code mirror](#) plugin helps to highlight the HTML content and when changes happens in code view, the same has been reflected in preview mode.

## CSHTML

```

<div class="control-section">
 @Html.EJS().RichTextEditor("defaultRTE").ToolBarSettings(e =>
e.Items((object)ViewBag.tools)).ContentTemplate(@<div>
 <p>The Rich Text Editor is WYSIWYG ('what you see is what you get')
editor useful to create and edit content, and return the valid HTML

 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "FullScreen" };
 return View();
 }
}
```

```
}

```

### Prevention of cross-site scripting (XSS)

The Rich Text Editor allows the users to edit the content with security by preventing cross-site scripting (XSS). By default, provided built-in support to remove the elements from editor content, which cause XSS attack. The editor removes the elements based on the attributes if it is possible to execute script.

In the following sample, removed `script` tag and `onmouseover` attribute from content of the Rich Text Editor.

#### CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<div><div
onmouseover="javascript:alert(1)">Prevention of Cross Sit Scripting
(XSS)</div><script>alert("hi")</script></div>).Render()
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

**Note:** It is only applicable to editorMode as HTML.

#### Custom cross-site scripting

You can also filter the elements and attributes additionally, which cause the XSS attack through [BeforeSanitizeHtml](#) event. Return the value from the event argument `helper` function to apply in the editor. To prevent the built-in support and make own cross-site scripting rules, set `cancel` argument to true.

The following sample demonstrates how to filter `script` tag from value.

#### CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<div><div>Preventi
on of Cross Sit Scripting
(XSS)</div><script>alert("hi")</script></div>).BeforeSanitizeHtml("beforeSan
itizeHtml").Render()
<script>
function beforeSanitizeHtml(args) {
 args.helper = (value) => {
 args.cancel = true;
 var temp = document.createElement('div');
 temp.innerHTML = value;
 var scriptTag = temp.querySelector('script');
 if (scriptTag) {
 ej.base.detach(scriptTag);
 }
 return temp.innerHTML;
 }
}
```

```
}
</script>
```

### **CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Resizable support

This feature allows the editor to be resized dynamically. The users can enable or disable this feature using the `EnableResize` property in the Rich Text Editor. If `EnableResize` is set to true, the Rich Text Editor component creates grip at the bottom right corner, which allows resizing the component in the diagonal direction. The following code demonstrates the resizable feature.

### *Enabling the resizable support*

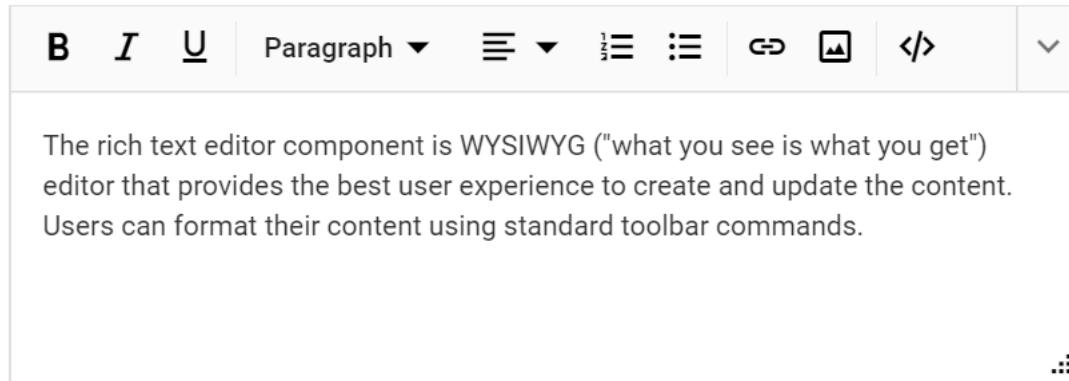

To render the Rich Text Editor in the resizable mode, set the `EnableResize` property to true.

### **CSHTML**

```
@Html.EJS().RichTextEditor("resizable").EnableResize(true).ContentTemplate(@
<div>
<p>The Rich Text Editor component is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
 Users can format their content using standard toolbar
commands.</p>
</div>).Render()
```

### **CONTROLLER.CS**

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### *Specifying the Minimum and Maximum width and height for Resize*

To have a restricted resizable area for the Rich Text Editor, you need to specify the min-width, max-width, min-height, and max-height CSS properties for the control's wrapper element. By default, the control is capable of resizing upto the current viewport. The `e-richtexteditor` CSS class will be available in the component's wrapper and can be used for applying the above mentioned styles.

### CSHTML

```
@Html.EJS().RichTextEditor("resizable").EnableResize(true).ContentTemplate(@
<div>
<p>The Rich Text Editor component is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
 Users can format their content using standard toolbar
commands.</p>
 <p> Key features:</p>
</div>).Render()
<script>
 .e-richtexteditor {
 min-width: 200px;
 max-width: 800px;
 min-height: 100px;
 max-height: 300px;
 }
</script>
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Number and Bullet Format Lists

This feature allows the user to change the appearance of the Numbered and Bulleted lists. Users can also apply different numbering or bullet formats lists such as lowercase greek, upper Alpha, square and

circles. You can also customize the style type of the lists to be populated in the dropdown from the toolbar by using the `NumberFormatList` and `BulletFormatList` properties in the Rich Text Editor.

### CSHTML

```
@Html.EJS().RichTextEditor("format-lists").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).ToolbarSettings(e => e.Items((object)ViewBag.items)).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "NumberFormatList", "BulletFormatList" };
 return View();
 }
}
```

### Third party Integration

The Rich Text Editor can be integrated with third-party to suite the application scenario.

#### Code-Mirror Integration

Rich Text Editor comes with a basic HTML source editor through view-source property. [Code mirror](#) plugin can be used to highlight the syntax of HTML. CodeMirror plugin for Rich Text Editor makes editing of HTML source code with a pleasant experience.

Import necessary CSS and JS files of CodeMirror to the HTML page.

Required JS files of code mirror.

`html

```
<script src="scripts/CodeMirror/codemirror.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/javascript.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/css.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/htmlmixed.js" type="text/javascript"></script>
```

Required CSS file of code mirror.

```
`html
```

```
<link href="scripts/CodeMirror/codemirror.min.css" rel="stylesheet" />
```

Add a custom icon for HTML source editor in the toolbar of Rich Text Editor using template option of [ToolbarSettings](#) and define the code mirror plugins, and then pass the Rich Text Editor content as argument in [ActionComplete](#) event.

### CSHTML

```
<div class="control-section">
 @Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>
e.Items((object) ViewBag.tools)).ContentTemplate(@<div>
 <p>The Rich Text Editor is WYSIWYG ('what you see is what you get')
editor useful to create and edit content, and return the valid HTML
markup or markd
own of the content</p>
 <p> Toolbar </p>

 <p> Toolbar contains commands to align the text, insert link,
insert image, insert list, undo / redo operations, HTML view, etc </p>

 <p> Toolbar is fully customizable </p>

 <p> Links </p>

 <p> You can insert a hyperlink with its corresponding dialog</p>

 <p> Attach a hyperlink to the displayed text. </p>

 <p> Customize the quick toolbar based on the hyperlink </p>

 <p> Image.</p>

```

```

 <p> Allows you to insert images from an online source as well as
the local computer</p>

 <p> You can upload an image</p>

 <p> Provides an option to customize quick toolbar for an image
</p>

<img alt='Logo' src='https://ej2.syncfusion.com/demos/src/rich-text-
editor/images/RTEImage-Feather.png' style='width: 300px' />
</div>).ShowCharCount(true).MaxLength(2000).Created("created").ActionComple
e("actionCompleteHandler").Render()
</div>
<link
href="https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.39.0/codemirror.cs
s" rel="stylesheet" />
<script
src="https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/codemirror.js"
type="text/javascript"></script>

" type="text/javascript"></script>
<script
src="https://cdnjs.cloudflare.com/ajax/libs/codemirror/5.3.0/mode/htmlmixed/
htmlmixed.js" type="text/javascript"></script>
<style>
 .e-code-mirror::before {
 content: '\e345';
 }
 .e-html-preview::before {
 content: '\e350';
 }
 .CodeMirror-linenumber,
 .CodeMirror-gutters {
 display: none;
 }
 .sb-header {
 z-index: 100;
 }
</style>
<script type="text/javascript">
 var defaultRTE;
 var divPreview;
 var myCodeMirror;
 var textArea
 divPreview = document.getElementById('DIV_Preview');
 function created() {
 defaultRTE = this;
 textArea = defaultRTE.contentModule.getEditPanel();
 }
 function mirrorConversion(e) {

```

```

var id = defaultRTE.getID() + 'mirror-view';
var mirrorView = defaultRTE.element.querySelector('#' + id);
var charCount = defaultRTE.element.querySelector('.e-rte-character-
count');
if (e.targetItem === 'Preview') {
 textArea.style.display = 'block';
 mirrorView.style.display = 'none';
 textArea.innerHTML = myCodeMirror.getValue();
 charCount.style.display = 'block';
}
else {
 if (!mirrorView) {
 mirrorView = ej.base.createElement('div', { className: 'e-
content' });
 mirrorView.id = id;
 textArea.parentNode.appendChild(mirrorView);
 }
 else {
 mirrorView.innerHTML = '';
 }
 textArea.style.display = 'none';
 mirrorView.style.display = 'block';
 renderCodeMirror(mirrorView, defaultRTE.value);
 charCount.style.display = 'none';
}
}
function renderCodeMirror(mirrorView, content) {
 myCodeMirror = CodeMirror(mirrorView, {
 value: content,
 lineNumbers: true,
 mode: 'text/html',
 lineWrapping: true,
 });
}
function actionCompleteHandler(e) {
 if (e.targetItem && (e.targetItem === 'SourceCode' || e.targetItem
=== 'Preview')) {
 this.sourceCodeModule.getPanel().style.display = 'none';
 mirrorConversion(e);
 }
 else {
 setTimeout(function () {
defaultRTE.toolbarModule.refreshToolbarOverflow(); }, 400);
 }
}
}
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "SourceCode" };
 return View();
 }
}

```

```
}

```

### Embed.ly Integration

Rich Text Editor easily integrate with [Embed.ly](#) which is probably the best service when it comes to embed the rich content such as Twitter, Facebook, Instagram and lots of other publishing platform embeds.

```
`html

```

```
<script src="https://cdn.embedly.com/widgets/platform.js" charset="UTF-8"></script>

```

In the following sample, the `Embed.ly` class `embedly-card` has been added to `<a>` tag in [ActionComplete](#) event.

### CSHTML

```
<div class="control-section">
 @Html.EJS().RichTextEditor("thirdparty").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p> Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

 </div>).ActionComplete("actionComplete").ToolbarSettings(e =>
 e.Items((object)ViewBag.items)).Render()
</div>
<script async src="https://cdn.embedly.com/widgets/platform.js"
charset="UTF-8"></script>
<script>
 function actionComplete(args) {
 if (args.requestType === 'Links') {
 if (args.elements[0].parentNode &&
 args.elements[0].parentNode.tagName === 'A') {
 var emberEle = document.createElement('blockquote');
 emberEle.setAttribute('class', 'embedly-card');
 emberEle.appendChild(args.elements[0].parentElement);
 }
 }
 }

```

```

 emberEle.appendChild(document.createElement('p'));
 args.range.insertNode(emberEle);
 }
}
}
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new object[] { "CreateLink" };
 return View();
 }
}

```

## Inline Mode

This is the inline example for the Rich Text Editor. For this you must set the [InlineMode](#) property.

Inline edition allows you to select any editable element or click the element on the page and edit it in-place.

Inline editing is a true WYSIWYG formation and on the contrary to Rich Text Editor HTML/MD editing, the styles that are used for edited content comes directly from the document stylesheet. This means that inline editors ignore the default Rich Text Editor content styles.

## Show on Select/Click

Enabling the `onSelection` option of `inlineMode` makes the inline Rich Text Editor to appear. You can select the text in the editable area otherwise the inline Rich Text Editor will be appear once click into the editable area.

## CSHTML

```

@Html.EJS().RichTextEditor("inlineMode").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>

</div>

```

```

<p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
<p> Contains undo / redo manager.</p>
<p> Creates bulleted and numbered lists.</p>

</div>).InlineMode(e => e.Enable(true).OnSelection(true)).ToolbarSettings(e
=> e.Items((object)ViewBag.items)).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Bold", "Italic", "Underline",
"StrikeThrough", "-",
"Formats", "Alignments", "OrderedList", "UnorderedList" };
 return View();
 }
}

```

The RichTextEditor component is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.

### Key features:

Provides the necessary functionality on demand.

- Provides a fully customizable toolbar.
- Provides HTML view to edit the source directly for developers.
- Supports third - party library integration.
- Allows preview of modified content before saving it.
- Handles images, hyperlinks, video, hyperlinks, uploads, etc.
- Contains undo / redo manager.
- Creates bulleted and numbered lists.

## Paste from MS Word

The Rich Text Editor allows you to reduce the effort while converting the Microsoft Word content to HTML format with format and styles.

### MS Word to HTML

By default, Rich Text Editor consider the following processes on paste content from Microsoft Word.

**List conversion:** The list elements copied from the Microsoft Word document contains paragraph tags with styles and classes. The list elements are converted to standard HTML list elements by referring the styles and class names in the paragraph tags.

**Converting style:** The styles of the elements copied from the Microsoft Word document are converted to standard CSS styles and added as inline styles for each respective element.

**Tags and comments:** The Microsoft Word specific XML tags and comments are removed when cleanup on paste.

### Paste cleanup

You can control the formatting and styles on pasting the content to the editor using the pasteCleanup settings property. The following settings are available to clean up the content:

| API                               | Description                                                                                   | Default Value                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Type     |

| <a href="#">deniedTags</a>        | To ignore the tags when pasting HTML content.                                                 | null                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | string[] |
| <a href="#">deniedAttrs</a>       | To paste the content by filtering out these attributes from the content.                      | null                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | string[] |
| <a href="#">allowedStyleProps</a> | To paste the content by accepting these style attributes and removing other style attributes. | ['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width'] | string[] |

### Prompt dialog

When **prompt** is set to true, pasting the content in the editor will open a dialog box that contains three options **Keep**, **Clean**, and **Plain Text** as radio buttons:

1. **Keep:** Radio button to keep the same format with copied content.
2. **Clean:** Radio button to clear all the style formats with copied content.
3. **Plain Text:** Radio button to paste the copied content as plain text without any formatting or style (including the removal of all tags).

**Note:** When `prompt` value is set true, the API properties `plainText` and `keepFormat` will not be considered for processing when pasting the content.

#### Paste as plain text

When `plainText` is set to true, the copied content will be converted as plain text by removing all the HTML tags and styles applied to it and only the plain text is pasted in the editor.

**Note:** When `plainText` value is set true, the API property `prompt` should be set to false, and `keepFormat` will not be considered for processing when pasting the content.

#### Keep format

When `keepFormat` is set to true, the copied content will maintain all the style formatting allowed in the `allowedStyleProps` on pasting the content in the editor.

When `keepFormat` is set to false, the style in the copied content will be removed without considering the allowed styles in the `allowedStyleProps` when pasting the content in the editor.

**Note:** When `keepFormat` value is set true, the API property `prompt` and `plainText` should be set to false.

#### Denied tags

When `deniedTags` values are set, the tags that matches the 'denied tags' list will be removed on pasting the copied content in the editor. For Example,

1. `'a'`: Paste the content by filtering out anchor tags.
2. `'a[!href]'`: Paste the content by filtering out anchor tags that do not have the 'href' attribute.
3. `'a[href, target]'`: Paste the content by filtering out anchor tags that have the 'href' and 'target' attributes.

#### Denied attributes

When the `deniedAttrs` values are set, the attributes that matches the 'denied attributes' list will be removed on pasting the copied content in the editor. For Example,

`'id', 'title'`: This will remove the attributes 'id' and 'title' from all tags.

#### Allowed style properties

By default, the following basic styles are allowed on pasting the content to the editor.

`['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']`

When you configure `allowedStyleProps`, the styles, which matches the 'allowed style properties' list are allowed, all other style properties will be removed on pasting the content in the editor.

For Example,

`allowedStyleProps: ['color', 'margin']`: This will allow only the style properties 'color' and 'margin' in each pasted element.

In the following example, the paste cleanup related settings are explained with its module configuration

### CSHTML

```
@Html.EJS().RichTextEditor("pasteCleanup").ShowCharCount(true).MaxLength(1000).ContentTemplate(@<div>
 <p>RichTextEditor is a WYSIWYG editing control which will reduce the effort for users while trying to express their formatting word content as HTML format.</p>
 <p>Paste Cleanup properties:</p>

 <p>prompt - specifies whether to enable the prompt when pasting in Rich Text Editor.</p>

 <p>plainText - specifies whether to paste as plain text or not in Rich Text Editor.</p>

 <p>keepFormat- specifies whether to keep or remove the format when pasting in Rich Text Editor.</p>

 <p>deniedTags - specifies the tags to restrict when pasting in Rich Text Editor.</p>

 <p>deniedAttributes - specifies the attributes to restrict when pasting in Rich Text Editor.</p>

 <p>allowedStyleProperties - specifies the allowed style properties when pasting in Rich Text Editor.</p>

</div>).PasteCleanupSettings(p => p.Prompt(true)).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Mention Integration with Rich Text Editor

By integrating the [Mention](#) control with a Rich Text Editor, users can easily mention or tag other users or objects from the suggested list without having to manually type out their names or other identifying information.

The [Target](#) property of the Mention control allows you to specify the ID of the content editable div element within the Rich Text Editor that you want to bind the Mention control to. This allows you to enable the Mention functionality within the Rich Text Editor, so that users can mention or tag other users or objects from the suggested list while editing the text.

When the user types the @ symbol followed by a character, the Rich Text Editor will display a list of suggestions for items that the user can select from. The user can then select an item from the list by clicking on it, or by typing the name of the item they want to tag.

In the following sample, configured the following properties with popup dimensions.

- [AllowSpaces](#) - Allow to continue search action if user enter space after mention character while searching.
- [SuggestionCount](#) - The maximum number of items that will be displayed in the suggestion list.
- [ItemTemplate](#) - Used to display the customized appearance in suggestion list.

### CSHTML

```
@{
 char nameMentionChar = '@';
 List<EmployeeData> data = new EmployeeData().EmployeeList();
}
@Html.EJS().RichTextEditor("mentionIntegration").ContentTemplate(@<div>
 <p>Hello @Maria​</p>
 <p>Welcome to the mention integration with rich text editor demo. Type
 <code>@@</code> character and tag user from the suggestion list. </p>
</div>).Render()
@Html.EJS().Mention("mentionRTE").MentionChar(nameMentionChar).Target("#ment
ionIntegration_rte-edit-
view").DataSource((IEnumerable<EmployeeData>)data).AllowSpaces(true).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Name",
Value="EmailId" }).SuggestionCount(8).Highlight(true).DisplayTemplate("@${ Name}").ItemTemplate("<table><tr><td><div
id=\"mention-TemplateList\"><img class=\"mentionEmpImage\"
src=\"./images/${EmployeeImage}\" alt=\"employee\" /><span class=\"e-badge
e-badge-success e-badge-overlap e-badge-dot e-badge-bottom

### Enter and Shift-Enter Key's Customization

Rich Text Editor allows to customize the tag that is inserted when pressing the enter key and shift + enter key in the Rich Text Editor.

#### Enter key customization

By default, the `<p>` tag will be created while pressing the enter key. The enter key can be customized by using the [EnterKey](#) property, where the possible tags that can be used to customize are `<p>`, `<div>`, and `<br>`.

When the enter key is customized with any of the possible values, pressing the enter key in the editor will create a new tag that is configured. Also, when the enter key is configured the default value of the Rich Text Editor will also change respectively with the configured values.

#### CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<p>
 In Rich text Editor, the enter key and shift + enter key actions can be
 customized using the enterKey and shiftEnterKey APIs.
</p>).EnterKey(Syncfusion.EJ2.RichTextEditor.EnterKey.DIV).Render()
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Shift-Enter key customization

By default, the `<br>` tag will be created while pressing the shift + enter key. The shift + enter key can be customized by using the [ShiftEnterKey](#) property where the possible tags that can be used to customize are `<br>`, `<p>`, `<div>`.

When the shift + enter key is customized with any of the possible values, pressing the shift + enter key in the editor will create a new tag that is configured. Also, when the shift + enter key is configured the default value of the Rich Text Editor will change respectively with the configured values.

### CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<p>
 In Rich text Editor, the enter key and shift + enter key actions can be
 customized using the enterKey and shiftEnterKey APIs.
</p>).ShiftEnterKey(Syncfusion.EJ2.RichTextEditor.ShiftEnterKey.BR).Render()
```

### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Iframe

When the [IframeSettings](#) option is enabled, the Rich Text Editor creates the iframe element as the content area on control initialization; it is used to display and editing the content. In content area, the editor displays only the body tag of a `<iframe>` document.

### CSHTML

```
@Html.EJS().RichTextEditor("iframe").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>

</div>
```

```

 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).IframeSettings(iframeSettings =>
iframeSettings.Enable(true)).Render()

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Iframe Attributes

The editor allows you to pass an additional attribute to body tag of a <iframe> element using attributes fields of the `attributes` fields of `IframeSettings` property. This property contains name/value pairs in string format. It is used to override the default appearance of the content area.

## CSHTML

```

@Html.EJS().RichTextEditor("iframe").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Created("created").IframeSettings(iframeSettings =>
iframeSettings.Enable(true)).Render()
<script>
 function created() {
 this.setProperties({
 iframeSettings: {
 attributes: {

```

```

 readonly: 'readonly'
 }
 }, false);
}
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Adding External CSS/Script File

The editor offers you to add external CSS file to style the `<iframe>` element. Easily change the appearance of editor's content using an external CSS file using `styles` field in [IframeSettings](#) property.

Likewise, add the external script file to the `<iframe>` element using `scripts` field of [IframeSettings](#) to provide the additional functionalities to the Rich Text Editor.

## CSHTML

```

@Html.EJS().RichTextEditor("iframe").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV > modes
 </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>).IframeSettings(iframeSettings =>
 iframeSettings.Enable(true).Resources(ViewBag.resources)).Render()

```

**CONTROLLER.CS**

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.resources = new
 {
 styles = new[] { "myStyle.css" }
 };
 return View();
 }
}

```

### ExecCommand in Rich Text Editor

In Rich Text Editor, execCommand used to perform commands for the modification of content in editable area.

The execCommand will perform the following commands.

| Commands          | Description                                                        | Code snippets                                              |
|-------------------|--------------------------------------------------------------------|------------------------------------------------------------|
| ----- ----- ----- |                                                                    |                                                            |
| bold              | Bold the selected content in the Rich Text Editor.                 | <code>rteObj.executeCommand('bold');</code>                |
| italic            | The selected text will be italics.                                 | <code>rteObj.executeCommand('italic');</code>              |
| underline         | Underline the selected text in the Rich Text Editor.               | <code>rteObj.executeCommand('underline');</code>           |
| strikeThrough     | Apply single line strike through formatting for the selected text. | <code>rteObj.executeCommand('strikeThrough');</code>       |
| superscript       | Makes the selected text as superscript (higher).                   | <code>rteObj.executeCommand('superscript');</code>         |
| subscript         | Makes the selected text as subscript (lower).                      | <code>rteObj.executeCommand('subscript');</code>           |
| uppercase         | Change the case of selected text to upper in the content.          | <code>rteObj.executeCommand('uppercase');</code>           |
| lowercase         | Change the case of selected text to lower in the content.          | <code>rteObj.executeCommand('lowercase');</code>           |
| fontColor         | Apply the specified font color for the selected text.              | <code>rteObj.executeCommand('fontColor', 'yellow');</code> |
| fontName          | Apply the specified font name for the selected text.               | <code>rteObj.executeCommand('fontName', 'Arial');</code>   |

| **fontSize** | Apply the specified font size for the selected text. | `rteObj.executeCommand('fontSize', '10pt');` |

| **formatBlock** | Apply the specified format styles for the selected text. | `rteObj.executeCommand('formatBlock', 'H1');` |

| **backColor** | Apply the specified background color the selected text. | `rteObj.executeCommand('backColor', 'red');` |

| **justifyCenter** | Align the content with center margin. | `rteObj.executeCommand('justifyCenter');` |

| **justifyFull** | Align the content with justify margin. | `rteObj.executeCommand('justifyFull');` |

| **justifyLeft** | Align the content with left margin. | `rteObj.executeCommand('justifyLeft');` |

| **justifyRight** | Align the content with right margin. | `rteObj.executeCommand('justifyLeft');` |

| **undo** | Allows to undo the actions. | `rteObj.executeCommand('undo');` |

| **createLink** | Creates a hyperlink to a text or image to a specific location in the content. | `rteObj.executeCommand('createLink', { text: 'Links', url: 'http://', title : 'Link' });` |

| **indent** | Allows to increase the indent level of the content. | `rteObj.executeCommand('indent');` |

| **insertHTML** | Insert the html content to the current cursor position. | `rteObj.executeCommand('insertHTML', 'inserted an html');` |

| **insertOrderedList** | Create a new list item(numbered). | `rteObj.executeCommand('insertOrderedList');` |

| **insertUnorderedList** | Create a new list item(bulleted). | `rteObj.executeCommand('insertUnorderedList');` |

| **outdent** | Allows to decrease the indent level of the content. | `rteObj.executeCommand('outdent');` |

| **redo** | Allows to redo the actions | `rteObj.executeCommand('redo');` |

| **removeFormat** | remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. | `rteObj.executeCommand('removeFormat');` |

| **insertText** | Insert text to the current cursor position. | `rteObj.executeCommand('insertText', 'inserted a text');` |

| **insertImage** | Insert an image to the current cursor position. | `rteObj.executeCommand('insertImage', { url: 'https://ej2.syncfusion.com/javascript/demos/src/rich-text-editor/images/RTEImage-Feather.png', cssClass: 'rte-img' });` |

| **copyFormatPainter** | Copy the format of selected text and apply it to another text. | `rteObj.executeCommand('copyFormatPainter', formatPainterSettings);` |

| **applyFormatPainter** | Apply the copied format to the selected text. | `rteObj.executeCommand('applyFormatPainter');` |

| **escapeFormatPainter** | Remove the previously copied format and disable the sticky mode | `rteObj.executeCommand('escapeFormatPainter');` |

**Note:** The 'ExecuteCommand' public method is not supported in Syncfusion Markdown Editor

### CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the Rich Text Editor's content

Use the following CSS to customize the default Rich Text Editor's content properties like font-family, font-size and color.

```
`CSS

/ To change font family and font size /
.e-richtexteditor .e-rte-content .e-content,
.e-richtexteditor .e-source-content .e-content {
font-size: 20px;
font-family: Segoe ui;
}

/ To change font color and content background /
.e-richtexteditor .e-rte-content,
.e-richtexteditor .e-source-content {
background: seashell;
color: blue;
}
,
```

#### Customizing the Rich Text Editor's toolbar

Use the following CSS to customize the default color in the Rich Text Editor's toolbar icon.

```
`CSS

/ To change font color for toolbar icon /
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons,
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons:active {
color: red;
}

/ To change font color for toolbar button /
.e-toolbar .e-tbar-btn,
.e-toolbar .e-tbar-btn:active,
.e-toolbar .e-tbar-btn:hover {
color: red;
```

```

}
/ To change font color for toolbar button in active state/
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-icons, .e-richtexteditor .e-
rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-rte-dropdown-btn-text {
color: red;
}
/ To change font color for expanded toolbar items /
.e-richtexteditor .e-rte-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn .e-icons,
.e-toolbar.e-extended-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn {
color: red;
}
`

```

### Customizing the Rich Text Editor's character count

Use the following CSS to customize the default color in the Rich Text Editor's character count.

```

`CSS
/ To change font color, font family, font size and opacity /
.e-richtexteditor .e-rte-character-count {
color: red;
font-family: segoe ui;
font-size: 18px;
opacity: 0.54;
padding-bottom: 2px;
padding-right: 14px;
}
`

```

### Keyboard Support

The editor has full keyboard accessibility that includes shortcuts to open and other actions with toolbar items, drop-down lists, and dialogs.

#### HTML Formation Shortcut Key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| **Toolbar focus | Alt + f10 |**

| **Insert link | Ctrl + k |**

| Insert image | Ctrl + Shift + i |

| Insert audio | Ctrl + Shift + a |

| Insert video | Ctrl + Alt + v |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

| Underline | Ctrl + u |

| Strikethrough | Ctrl + Shift + s |

| Uppercase | Ctrl + Shift + u |

| Lowercase | Ctrl + Shift + l |

| Superscript | Ctrl + Shift + = |

| Subscript | Ctrl + = |

| Indents | Ctrl + ] |

| Outdents | Ctrl + [ |

| HTML source | Ctrl + Shift + h |

| Fullscreen | Ctrl + Shift + f |

| Exit Fullscreen | Esc |

| Justify center | Ctrl + e |

| Justify full | Ctrl + j |

| Justify left | Ctrl + l |

| Justify right | Ctrl + r |

| Clear format | Ctrl + Shift + r |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

| Format Painter Copy | Alt + Shift + c |

| Format Painter Paste | Alt + Shift + v |

## | Format Painter Escape | Esc |

### CSHTML

```

 "Outdent", "Indent", "|",

```

```

 "CreateLink", "Image", "CreateTable", "|", "FormatPainter" ,
 "ClearFormat", "Print",
 "SourceCode", "FullScreen", "|", "Undo", "Redo"
 };
 return View();
}
}

```

### Markdown Formation Shortcut Key

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

| Strikethrough | Ctrl + Shift + s |

| Uppercase | Ctrl + Shift + u |

| Lowercase | Ctrl + Shift + l |

| Superscript | Ctrl + Shift + = |

| Subscript | Ctrl + = |

| Fullscreen | Ctrl + Shift + f |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

### CSHTML

```

@using Syncfusion.EJ2.RichTextEditor
@Html.EJS().RichTextEditor("keyboard").EditorMode(EditorMode.Markdown).Value
((string)ViewBag.value).Created("created").Height(300).ToolbarSettings(e =>
e.Items((object)ViewBag.items)).Render()
<script type="text/javascript">

```

```

var rteObj;
function created() {
 rteObj = this;
}
document.addEventListener('keyup', function (e) {
 if (e.altKey && e.keyCode === 84) { /* t */
 // press alt+t to focus the control.
 rteObj.focusIn();
 }
});
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new[] { "Bold", "Italic", "StrikeThrough", "|",
 "Formats", "OrderedList", "UnorderedList", "|",
 "CreateLink", "Image", "CreateTable", "|", "Undo", "Redo" };
 ViewBag.value = @"The sample is added to showcase **markdown
editing**.
Type or edit the content and apply formatting to view markdown formatted
content.
We can add our own custom formation syntax for the Markdown formation.
The third-party library Marked is used in this sample to convert
markdown into HTML content";
 return View();
 }
}

```

## Custom Key Config

Customize the key config for the keyboard interaction of Rich Text Editor, using the [KeyConfig](#) property.

In the following sample, customize the bold, italic, underline toolbar action with ctrl + alt + b, ctrl + alt + i and ctrl + alt + u respectively.

## CSHTML

```

@Html.EJS().RichTextEditor("customKey").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>

## Accessibility

The Rich Text Editor control has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This control is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Rich Text Editor control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| WCAG 2.2 Support |  alt="Yes"> |

| [Section 508 Support](#) |  alt="Yes"> |

| Screen Reader Support |  alt="Yes"> |

| Right-To-Left Support |  alt="Yes"> |

| Color Contrast |  alt="Intermediate"> |

| Mobile Device Support |  alt="Yes"> |

| [Keyboard Navigation Support](#) |  alt="Yes"> |

| Accessibility Checker Validation |  alt="Intermediate"> |

| Axe-core Accessibility Validation |  alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

## ARIA Attributes

The toolbar of Rich Text Editor, assigned the role of Toolbar and has the following list of ARIA attributes.

| Roles and Attributes | Functionalities |

| --- | --- |

| role="toolbar" | This attribute added to the toolbar element describes the actual role of the element.  
|

| aria-orientation | Indicates the toolbar orientation. Default value is horizontal. |

| aria-haspopup | Indicates the popup mode of the toolbar. The default value is false. When popup mode is enabled, attribute value has to be changed to true. |

| aria-disabled | Indicates the disabled state of the toolbar. |

| aria-owns | Identifies an element to define a visual, functional, or contextual parent/child relationship between DOM elements when the DOM hierarchy cannot represent the relationship. In the Rich Text Editor, the attribute contains the ID of the Rich Text Editor to indicate the popup as a child element. |

For further details of toolbar ARIA attributes, refer the accessibility of [Toolbar](#) documentation.

The Rich Text Editor element is assigned the role of application.

| **Roles and Attributes** | **Functionalities** |

| --- | --- |

| role="application" | This attribute added to the Rich Text Editor element describes the actual role of the element. |

| aria-disabled | Indicates the disabled state of the Rich Text Editor. |

## CSHTML

```
@Html.EJS().RichTextEditor("accessibility").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you

 return View ();
}

```

### Keyboard interaction

The Rich Text Editor control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Rich Text Editor control.

#### HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

| Underline | Ctrl + u |

| Strikethrough | Ctrl + Shift + s |

| Uppercase | Ctrl + Shift + u |

| Lowercase | Ctrl + Shift + l |

| Superscript | Ctrl + Shift + = |

| Subscript | Ctrl + = |

| Indents | Ctrl + ] |

| Outdents | Ctrl + [ |

| HTML source | Ctrl + Shift + h |

| Fullscreen | Ctrl + Shift + f |

| Exit Fullscreen | Esc |

| Justify center | Ctrl + e |

| Justify full | Ctrl + j |

| Justify left | Ctrl + l |

| Justify right | Ctrl + r |

| Clear format | Ctrl + Shift + r |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

| Format Painter Copy | Alt + Shift + c |

| Format Painter Paste | Alt + Shift + v |

| Format Painter Escape | Esc |

#### *Markdown formation shortcut key*

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert table | Ctrl + Shift + e |

### Ensuring accessibility

The Rich Text Editor control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Rich Text Editor control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Rich Text Editor control with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC controls](#)

### How To

#### Add Google fonts

To use web fonts in Rich Text Editor, it is not needed for the web fonts to be present in local machine.

To add the web fonts to Rich Text Editor, we need to refer the web font links and add the font names in the [FontFamily](#) property.

#### CSHTML

```
@Html.EJS().RichTextEditor("google-font").FontFamily(e =>
e.Items((object)ViewBag.fontItems)).ToolbarSettings(e =>
e.Items((object)ViewBag.tools)).ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Roboto">
<link rel="stylesheet"
href="http://fonts.googleapis.com/css?family=Great+Vibes">
```

**CONTROLLER.CS**

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 object item1 = new
 {
 text = "Segoe UI",
 value = "Segoe UI"
 };
 object item2 = new
 {
 text = "Roboto",
 value = "Roboto"
 };
 object item3 = new
 {
 text = "Great vibes",
 value = "Great Vibes,cursive"
 };
 object item4 = new
 {
 text = "Noto Sans",
 value = "Noto Sans"
 };
 object item5 = new
 {
 text = "Impact",
 value = "Impact,Charcoal,sans-serif"
 };
 object item6 = new
 {
 text = "Tahoma",
 value = "Tahoma,Geneva,sans-serif"
 };
 ViewBag.fontItems = new[] { item1, item2, item3, item4, item5, item6 };

 ViewBag.tools = new[] {
 "Bold", "Italic", "Underline", "StrikeThrough",
 "FontName", "FontSize", "FontColor", "BackgroundColor",
 "LowerCase", "UpperCase", "|",
 "Formats", "Alignments", "OrderedList", "UnorderedList",
 "Outdent", "Indent", "|",
 "CreateLink", "Image", "CreateTable", "|", "ClearFormat", "Print",
 "SourceCode", "FullScreen", "|", "Undo", "Redo"
 };

 return View();
 }
}

```

The below font style links are referred in the page.

`typescript

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Roboto">

```
<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Great+Vibes">
```

In the above sample, you can see that we have added two Google web fonts (**Roboto** and **Great vibes**) to Rich Text Editor.

### Customize the placeholder style

By using **e-rte-placeholder** class, you can customize the placeholder style.

#### CSHTML

```
@Html.EJS().RichTextEditor("placeholder").Placeholder("Type
Something").Render()
<style>
 .e-richtexteditor .e-rte-placeholder {
 font-family: monospace;
 color: deeppink;
 }
</style>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Restrict the image uploading while uploading with large size

By using the Rich text editor's **ImageUploading** event, you can get the image size before uploading and restrict the image to upload, when the given image size is greater than the allowed size.

In the following, we have validated the image size before uploading and determined whether the image has been uploaded or not.

#### CSHTML

```
@Html.EJS().RichTextEditor("editor").InsertImageSettings(obj =>
obj.SaveUrl("https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save").
Path("../Images/")).ImageUploading("onImageUploading").Render()
<script>
 function onImageUploading(args) {
 console.log("file is uploading");
 var imgSize = 500000;
 var sizeInBytes = args.fileData.size;
 if (imgSize < sizeInBytes) {
 args.cancel = true;
 }
 }
</script>
```

#### CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

### Save Rich Text Editor content in a file in the server

Rich Text Editor content can be passed from view to controller through `XMLHttpRequest` post. Content will be sent to the corresponding method into the controller and this value can be saved in a text file or any other format using `StreamWriter`. Refer to the following given code.

### CSHTML

```
<div>
 <div>
 @Html.EJS().RichTextEditor("saveFile").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is
 what you get') editor that provides the best user experience to create and
 update the content.
 Users can format their content using standard toolbar
 commands.
 </p>
 <p>Key features:</p>

 <p>Provides < IFRAME > and < DIV >
 modes </p>
 <p>Capable of handling markdown editing.</p>
 <p>Contains a modular library to load the necessary
 functionality on demand.</p>
 <p>Provides a fully customizable toolbar.</p>
 <p>Provides HTML view to edit the source directly for
 developers.</p>
 <p>Supports third - party library integration.</p>
 <p>Allows preview of modified content before saving
 it.</p>
 <p>Handles images, hyperlinks, video, hyperlinks,
 uploads, etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

 </div>).Render()
 </div>
 <div> <button id="btn">save content</button></div>
</div>
<script>
 document.getElementById('btn').addEventListener('click', function () {
 var obj = document.getElementById('saveFile').ej2_instances[0];
 var value = JSON.stringify({ text: obj.value });
 const Http = new XMLHttpRequest();
 const url = '@Url.Action("Save")';
 Http.open("POST", url);
 Http.setRequestHeader('Content-Type', 'application/json');
 Http.send(value);
 });
</script>
```

```
});
</script>
```

### SAVEFILE.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
 public class RichTextEditorValue
 {
 public string text { get; set; }
 }
 [HttpPost]
 public ActionResult
Save([System.Web.Http.FromBody]RichTextEditorValue value)
 {
 string RootPath = Server.MapPath("~/data.txt");
 StreamWriter writeFile = new StreamWriter(RootPath, true);
 writeFile.WriteLine(value.text);
 writeFile.Close();
 writeFile.Dispose();
 return View();
 }
}
```

### Set the cursor at the specific range

This can be achieved by using `setRange` method in the Rich Text Editor using `NodeSelection` instance. In this below sample, we have passed the text node (specific location in Rich Text Editor content) in `setStart` method and passed the range in `setRange` method of Rich Text Editor.

### CSHTML

```
@Html.EJS().RichTextEditor("cursor").ContentTemplate(@<div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
 get') editor that provides the best user experience to create and update the
 content.
 Users can format their content using standard toolbar commands.
 </p>
 <p><b id='key'> Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
 </p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
 functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>
 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
</div>
```

```

 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
<input id="btn" type="button" value="Set cursor point" onclick="btnClick()"
/>
<script>
 function btnClick() {
 var selectioncursor = new ej.richtexteditor.NodeSelection();
 var element =
document.getElementById("cursor").ej2_instances[0].contentModule.getDocument
().getElementById("key");
 var range = document.createRange();
 range.setStart(element, 1); // to set the range
 selectioncursor.setRange(document, range); // to set the cursor
 }
</script>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

## Capture ctrl+s to update the value

To achieve this, we need to bind the `keydown` event to the Rich Text Editor content and capture the `ctrl + s` key press using its `keyCode`.

In the `keydown` event handler, the `updateValue` method is called to update the `Value` property and then we can save the content in the required database using the same.

## CSHTML

```

@Html.EJS().RichTextEditor("default").Created("onCreate").ContentTemplate(@<
div>
 <p>
 The Rich Text Editor control is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
 Users can format their content using standard toolbar commands.
 </p>
 <p> Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
</p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary
functionality on demand.</p>
 <p> Provides a fully customizable toolbar.</p>

</div>

```

```

 <p> Provides HTML view to edit the source directly for
 developers.</p>
 <p> Supports third - party library integration.</p>
 <p> Allows preview of modified content before saving
 it.</p>
 <p> Handles images, hyperlinks, video, hyperlinks, uploads,
 etc.</p>
 <p> Contains undo / redo manager.</p>
 <p> Creates bulleted and numbered lists.</p>

</div>).Render()
<script>
 function onCreate() {
 var rteObj = this;
 rteObj.contentModule.getDocument().addEventListener("keydown",
function (e) {
 if (e.key === 's' && e.ctrlKey === true) {
 e.preventDefault(); // to prevent default ctrl+s action
 rteObj.updateValue(); // to update the value after editing
 var value = rteObj.value; // you can get the Rich Text
 Editor content to save in the desired database
 }
});
 }
}
</script>

```

### CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}

```

### Render the RichTextEditorFor control

The RichTextEditorFor control can be rendered by passing values from the controller. The formatted Rich Text Editor value is retrieved when submitting the form using the post method.

In the following sample, the RichTextEditorFor control is rendered.

### CSHTML

```

@model EJ2MVCSampleBrowser.Controllers.RichTextEditorModel
@using (Html.BeginForm()) {
 @Html.ValidationSummary(true)
 <div class="col-lg-12 control-section">
 <div style='padding-top:40px;'>
 <div id="wrapper">
 @Html.EJS().RichTextEditorFor(model => model.Value).Render()
 <div id="errorMessage">
 @Html.ValidationMessageFor(model => model.Value)
 </div>
 <div id="submitbutton">
 @Html.EJS().Button("btn").Content("Submit").Render()
 </div>
 </div>
 </div>
 </div>
}

```

```

 </div>
 </div>
</div>
}
<style>
 #submitButton {
 margin: 10px auto;
 text-align: center;
 }
 #errorMessage {
 color: red;
 }
</style>

```

### CONTROLLER.CS

```

using System.ComponentModel.DataAnnotations;
public class RichTextEditorModel
{
 [Required(ErrorMessage = "Value is required")]
 // Specify AllowHtml attribute on MVC application alone
 [AllowHtml]
 public string Value { get; set; }
}
public partial class HomeController : Controller
{
 RichTextEditorModel rteModel = new RichTextEditorModel();
 public ActionResult RichTextEditorFor()
 {
 rteModel.Value = "<p>Type or edit the content to post the
Rich Text Editor value.</p>";
 return View(rteModel);
 }
 [HttpPost]
 public ActionResult RichTextEditorFor(RichTextEditorModel model)
 {
 rteModel.Value = model.Value;
 return View(rteModel);
 }
}

```

The output will be as follows.

The screenshot displays a web form with a Rich Text Editor. The toolbar includes icons for Bold (B), Italic (I), Underline (U), Paragraph, Bulleted List, Numbered List, Link, and Unlink. The text area contains the placeholder text: "Type or edit the content to post the Rich Text Editor value." Below the text area is a "SUBMIT" button.

Rename uploaded images in server before inserting it in the Rich Text Editor

By using the [InsertImageSettings](#) property, you can specify the server handler to upload the selected image. Then you can bind the [ImageUploadSuccess](#) event, to receive the modified file name from the server and update it in the Rich Text Editor's insert image dialog.

Refer `rename.cs` controller file for configure the server-side.

**Note:** The runnable demo application is available in this [Github](#) repository.

### CSHTML

```
@Html.EJS().RichTextEditor("editor").InsertImageSettings(obj =>
obj.SaveUrl("/Home/Rename").Path("../Uploads/")).ImageUploadSuccess("onImage
UploadSuccess").Render()
<script>
 function onImageUploadSuccess(args) {
 if (args.e.currentTarget.getResponseHeader('name') != null) {
 args.file.name = args.e.currentTarget.getResponseHeader('name');
 var filename = document.querySelectorAll(".e-file-name")[0];
 filename.innerHTML =
args.file.name.replace(document.querySelectorAll(".e-file-
type")[0].innerHTML, '');
 filename.title = args.file.name;
 }
 }
</script>
```

### RENAME.CS

```
using System;
using System.IO;
using System.Web;
using System.Web.Mvc;
namespace RenameImage.Controllers
{
 public class HomeController : Controller
 {
 int x = 0;
 string imageFile;
 public ActionResult Index()
 {
 return View();
 }
 [AcceptVerbs("Post")]
 public void Rename(HttpPostedFileBase UploadFiles)
 {
 try
 {
 if (UploadFiles != null)
 {
 imageFile = UploadFiles.FileName;
 if (UploadFiles != null)
 {
 var fileSave =
System.Web.HttpContext.Current.Server.MapPath("~/Uploads");
 // Create a new directory, if it does not exists
 }
 }
 }
 }
 }
}
```

```

 if (!System.IO.Directory.Exists(fileSave))
 {
 System.IO.Directory.CreateDirectory(fileSave);
 }
 var fileName =
Path.GetFileName(UploadFiles.FileName);
 var fileSavePath = Path.Combine(fileSave, fileName);
// Rename a uploaded image file name
 while (System.IO.File.Exists(fileSavePath))
 {
 imageFile = "rteImage" + x + "-" + fileName;
 fileSavePath = Path.Combine(fileSave,
imageFile);

 x++;
 }
 if (!System.IO.File.Exists(fileSavePath))
 {
 UploadFiles.SaveAs(fileSavePath);
// Modified file name shared through response
header by adding custom header
 Response.Headers.Add("name", imageFile);
 Response.StatusCode = 200;
 Response.ContentType = "application/json";
charset=utf-8";
 }
 }
}
catch (Exception)
{
 Response.StatusCode = 204;
}
}
}
}

```

## File Attachments

The Rich Text Editor allows you to attach a file based on the file upload. You can attach your files using the file upload or drag-and-drop from your local path. When the file upload gets success, the attachment link inserts into the content.

In the below sample, configure the `saveUrl` and `path` properties to achieve file attachments.

1. `saveUrl`: Provides service URL to save the files.
2. `path`: Specifies the location to store the image.

The following sample illustrates how to attach a file in the Rich Text Editor.

## CSHTML

```
@Html.EJS().RichTextEditor("defaultRTE").ContentTemplate(@<div>
 <p>
 The Rich Text Editor component is WYSIWYG ('what you see is what you
get') editor that provides the best user experience to create and update the
content.
```

```

 Users can format their content using standard toolbar commands.
 </p>
 <p>Key features:</p>

etc.</p>
 <p>Contains undo / redo manager.</p>
 <p>Creates bulleted and numbered lists.</p>

</div>
).InsertImageSettings(obj =>
obj.SaveUrl("[SERVICE_HOSTED_PATH]/api/uploadbox/Save").Path("../Files/").C
reated("created").Render()
@Html.EJS().Uploader("UploadFiles").DropArea(".e-
richtexteditor").AsyncSettings(new
Syncfusion.EJ2.Inputs.UploaderAsyncSettings { SaveUrl =
@Url.Content("[SERVICE_HOSTED_PATH]/api/uploadbox/Save") }).Success("onImageU
ploadSuccess").Render()
<script>
 var rteObj;
 var selection = new ej.richtexteditor.NodeSelection();
 var range;
 let saveSelection;
 function created() {
 rteObj = this;
 }
 function onImageUploadSuccess(e) {
 rteObj.contentModule.getEditPanel().focus();
 range = selection.getRange(document);
 saveSelection = selection.save(range, document);
 var fileUrl = document.URL + rteObj.insertImageSettings.path +
e.file.name;
 if (rteObj.formatter.getUndoRedoStack().length === 0) {
 rteObj.formatter.saveData();
 }
 saveSelection.restore();
 rteObj.executeCommand('createLink', { url: fileUrl, text: fileUrl,
selection: saveSelection });
 rteObj.formatter.saveData();
 rteObj.formatter.enableUndo(rteObj);
 this.clearAll();
 }
</script>

```

## CONTROLLER.CS

```
public class HomeController : Controller
{
 public ActionResult Index()
 {
 return View();
 }
}
```

To config server-side handler, refer the below code.

```
`csharp
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Save()
{
 try
 {
 var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
 file = httpPostedFile.FileName;
 if (httpPostedFile != null)
 {
 Console.WriteLine(System.Web.HttpContext.Current.Server.MapPath("~/Files"));
 var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
 if (!Directory.Exists(fileSave))
 {
 Directory.CreateDirectory(fileSave);
 }
 var fileName = Path.GetFileName(httpPostedFile.FileName);
 var fileSavePath = Path.Combine(fileSave, fileName);
 while (System.IO.File.Exists(fileSavePath))
 {
 file = "rte" + x + "-" + fileName;
 fileSavePath = Path.Combine(fileSave, file);
 x++;
 }
 if (!System.IO.File.Exists(fileSavePath))
```

```

{
 httpPostedFile.SaveAs(fileSavePath);
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.Headers.Add("name", file);
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusDescription = "File uploaded succesfully";
 Response.Headers.Add("url", fileSavePath);
 Response.End();
}
}
}
catch (Exception e)
{
 HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
 Response.Clear();
 Response.ContentType = "application/json; charset=utf-8";
 Response.StatusCode = 204;
 Response.Status = "204 No Content";
 Response.StatusDescription = e.Message;
 Response.End();
}
}
,

```

#### Format code block using toolbar button

You can configure code block formatting as a separate toolbar button by adding the **InsertCode** keyword within the [ToolbarSettings](#) items property.

The InsertCode button has a toggle state to apply code block formatting to the editor and remove code block formatting from the editor.

The following sample demonstrates how to config the InsertCode button in toolbar and set the background color to “pre” tag for highlighting the code block.

#### CSHTML

```
@Html.EJS().RichTextEditor("code").ContentTemplate(@<div>
 <p>
```

The Rich Text Editor control is WYSIWYG ('what you see is what you get') editor that provides the best user experience to create and update the content.

Users can format their content using standard toolbar commands.

```

</p>
<p>Key features:</p>

 <p> Provides < IFRAME > and < DIV > modes
</p>
 <p> Capable of handling markdown editing.</p>
 <p> Contains a modular library to load the necessary

 padding: 10px;
 background: #F4F5F7;
 }
</style>

```

## CONTROLLER.CS

```

public class HomeController : Controller
{
 public ActionResult Index()
 {
 ViewBag.items = new object[] { "InsertCode" };
 return View();
 }
}

```

The output will be as follows.

<>

The rich text editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content.

Users can format their content using standard toolbar commands.

**Key features:**

- Provides <IFRAME> and <DIV> modes
- Capable of handling markdown editing.
- Contains a modular library to load the necessary functionality on demand.
- Provides a fully customizable toolbar.
- Provides HTML view to edit the source directly for developers.
- Supports third-party library integration.
- Allows preview of modified content before saving it.
- Handles images, hyperlinks, video, hyperlinks, uploads, etc.
- Contains undo/redo manager.
- Creates bulleted and numbered lists.

## Migration from Essential JS 1

This article describes the API migration process of Rich Text Editor control from Essential JS 1 to Essential JS 2.

### Accessibility

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Keyboard Navigation | **Property:** AllowKeyboardNavigation <br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").AllowKeyboardNavigation(true).Render();} | No separate Property for enable/disable keyboard navigation. Its enabled by default. |

| Localization | **Property:** Locale <br/> <br/> @{Html.EJ().RichTextEditor("rteSample").Locale("en-US").Render();} | **Property:** Locale <br/> <br/> @{Html.EJS().RichTextEditor("default").Locale("en-US").Render()} |

| RTL | **Property:** EnableRtl<br/> <br/>

@{Html.EJ().RichTextEditor("rteSample").EnableRTL(true).Render();} | **Property:** EnableRtl <br/> <br/>@{Html.EJS().RichTextEditor("rtl").EnableRtl(true).Render()} |

| Key Config | Not Applicable | **Property:** KeyConfig<br/>

<br/>@{Html.EJS().RichTextEditor("default").KeyConfig((object)ViewBag.keyConfig).Render()} |

| Tab Key Navigation | **Property:** EnableTabKeyNavigation <br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").EnableTabKeyNavigation(true).Render();} |

**Property:** EnableTabKey<br/>

<br/>@{Html.EJS().RichTextEditor("default").EnableTabKey(true).Render()} |

| Key Down | **Event:** KeyDown<br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ClientSideEvents(evt => evt.KeyDown("onkeydown")).Render();} | Not Applicable |

| Key Up | **Event:** keyUp<br/> <br/>@{Html.EJ().RichTextEditor("rteSample").ClientSideEvents(evt => evt.keyUp("keyup")).Render();} | Not Applicable |

## Toolbar

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| showToolbar | **Property:** ShowToolbar<br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ShowToolbar(true).Render();} | **Property:** Enable  
<br/>

<br/>@Html.EJS().RichTextEditor("types").Value((string)ViewBag.value).Height("720px").Toolba  
rSettings(e => e.Enable(true)).Render() |

| Tools item | **Property:** Tools <br/> <br/>List<String> lists = new List<string>() { "unorderedList",

 rteObj.
showFullScreen() |
```

### Custom Formats and Fonts

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

```
|-----|-----|-----|
```

```
| Format | Property: Format

@{Html.EJ().RichTextEditor("rteSample").Format(format).Render();} | Property: Format

```

```

@Html.EJS().RichTextEditor("defaultRTE").Format(t=>t.Width("70px").Default("Paragraph
").Types("items")).ToolbarSettings(e => e.Items((object)ViewBag.items)).Render() |
```

```
| Font Size | Property: FontSize

@{Html.EJ().RichTextEditor("rteSample").FontSize(size).Render();} | Property: FontSize

@Html.EJS().RichTextEditor("defaultRTE").FontSize(t=>t.Width("70px").Default("Paragrap
h").Types("items")).ToolbarSettings(e => e.Items((object)ViewBag.items)).Render() |
```

```
| Font Family | Property: FontName

@{Html.EJ().RichTextEditor("rteSample").FontName(fontname).Render();} | Property:
FontFamily

@Html.EJS().RichTextEditor("defaultRTE").FontFamily(t=>t.Width("70px").Default("Paragr
aph").Types("items")).ToolbarSettings(e => e.Items((object)ViewBag.items)).Render() |
```

```
| Show Font Option | Property: ShowFontOption

@{Html.EJ().RichTextEditor("rteSample").ShowFontOption(true).Render();} | Property:
FontFamily

viewBag.fontFamily = new {default= "0", types = "items", width = "70px"}
```

<br/>

<br/>@Html.EJS().RichTextEditor("defaultRTE").FontFamily(f=>e.Items((object)ViewBag.fontFamily)).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

### Custom Font Colors

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Font Color | **Property:** ColorCode <br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ColorCode(colorCode).Render();} | **Property:** FontColor<br/>

<br/>@Html.EJS().RichTextEditor("defaultRTE").FontColor(t=>t.columns("10").default("#fff").modeSwitcher(false)).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

| Background Color | Not Applicable | **Property:** BackgroundColor<br/>

<br/>@Html.EJS().RichTextEditor("defaultRTE").BackgroundColor(t=>t.columns("10").Default("#fff").ModeSwitcher(false).Mode("Palette")).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

| Color Palette Columns | **Property:** ColorPaletteColumns <br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ColorPaletteColumns(10).Render();} | **Property:** BackgroundColor<br/>

<br/>@Html.EJS().RichTextEditor("defaultRTE").BackgroundColor(b=>b.Columns(10)).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

| Color Palette Rows | **Property:** ColorPaletteRows <br/>

<br/>@{Html.EJ().RichTextEditor("rteSample").ColorPaletteRows(6).Render();} | Not Applicable |

| Color Picker Type | **Method:** setColorPickerType () <br/> <br/> var rteObj = \$("#rte ").data("ejRTE"); <br/> <br/> rteObj.setColorPickerType("picker") | **Property:** ColorModeType <br/> <br/>

@Html.EJS().RichTextEditor("defaultRTE").BackgroundColor(b=>b.Mode("Palette")).ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

### Link

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Link | Not Applicable | **Property:** CreateLink<br/> <br/> ViewBag.item = new[] { "CreateLink" }<br/>

<br/>@Html.EJS().RichTextEditor("defaultRTE").ToolBarSettings(e => e.Items((object)ViewBag.items)).Render() |

| Quick Toolbar | Not Applicable | **Property:** Link<br/> <br/> ViewBag.link = new [] { Open, Edit, UnLink }<br/> <br/>@Html.EJS().RichTextEditor("defaultRTE").ToolBarSettings(e =>

e.Items((object)ViewBag.items)).QuickToolBarSettings(e => e.Link((object)ViewBag.link)).Render() |

### Image

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Image | Not Applicable | **Property:** Image <br/> <br/> viewBag.item = new [] { "Image" } <br/>  
<br/>@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>  
e.Items((object)ViewBag.items)).Render() |

| Quick Toolbar | Not Applicable | **Property:** Image <br/> <br/>viewBag.link = new [] { "Replace",  
"Align", "Caption", "Remove", "-", "InsertLink", "OpenImageLink", "EditImageLink",  
"RemoveImageLink", "Display", "AltText", "Dimension" } <br/>  
<br/>@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>  
e.Items((object)ViewBag.items)).QuickToolbarSettings(e =>  
e.Image((object)ViewBag.image)).Render() |

| Image Setting | **Property:** Images<br/> <br/> List<String> images = new List<string>() { "image" };  
<br/> <br/>@{Html.EJ().RichTextEditor("rteSample").Tools(tool=>tool.Image(image)).Render();}  
| **Property:** InsrtlImageSettings <br/> <br/>@Html.EJS().RichTextEditor("image").ToolbarSettings(e  
=>  
e.Items((object)ViewBag.items)).InsertImageSettings(obj=>obj.Display("inline")).Value((string)V  
iewBag.value).Render() |

#### Table

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

|-----|-----|-----|

| Table | Not Applicable | **Property:** CreateTable<br/> <br/> viewBag.item = new [] { "CreateTable" }  
<br/> <br/>@Html.EJS().RichTextEditor("table").ToolbarSettings(e =>  
e.Items((object)ViewBag.items)).Render() |

| Quick Toolbar | Not Applicable | **Property:** Table<br/> <br/>viewBag.table = new []  
{ "TableHeader", "TableRows", "TableColumns", "BackgroundColor", "-", "TableRemove",  
"Alignments", "TableCellVerticalAlign", "Styles"  
}<br/><br/>@Html.EJS().RichTextEditor("defaultRTE").ToolbarSettings(e =>  
e.Items((object)ViewBag.items)).QuickToolbarSettings(e =>  
e.Table((object)ViewBag.table)).Render() |

| Table Setting | **Property:** TableColumns, TableRows<br/>  
<br/>@{Html.EJ().RichTextEditor("rteSample").TableColumns(10).Render();} <br/>  
<br/>@{Html.EJ().RichTextEditor("rteSample").TableRows(10).Render();} | **Property:**  
TableSettings<br/> <br/>@Html.EJS().RichTextEditor("image").ToolbarSettings(e =>  
e.Items((object)ViewBag.items)).TableSettings(obj=>obj.width("80%")).Render() |

| Custom table | **Property:** ShowCustomTable<br/>  
<br/>@{Html.EJ().RichTextEditor("rteSample").ShowCustomTable(true).Render();} | Not  
Applicable |
