

USER GUIDE

Essential Studio

for EJ2 ASP.NET MVC

Version - v24.1.41 | Release Date - December 18, 2023

| | |
|---|-----|
| Kanban | 89 |
| Getting Started with ASP.NET MVC Kanban Control | 89 |
| Prerequisites | 89 |
| Create ASP.NET MVC application with HTML helper | 89 |
| Install ASP.NET MVC package in the application | 89 |
| Add namespace..... | 89 |
| Add stylesheet and script resources | 89 |
| Register Syncfusion script manager | 90 |
| Add ASP.NET MVC Kanban control | 90 |
| Populating cards..... | 90 |
| Enable swimlane | 94 |
| See also | 95 |
| Columns in Kanban Board | 95 |
| Single-key mapping | 95 |
| Multi-key mapping | 99 |
| Header text | 103 |
| Header template | 103 |
| Toggle columns | 109 |
| Stacked headers | 117 |
| Cards in ASP.NET MVC Kanban component..... | 121 |
| Drag-and-drop..... | 121 |
| Header..... | 121 |
| Content | 125 |
| Template | 125 |
| Selection..... | 130 |
| Data binding in ASP.NET MVC Kanban component | 134 |
| Local data | 134 |
| Remote data..... | 138 |
| Loading data via ajax..... | 147 |
| Swimlane in ASP.NET MVC Kanban control | 148 |
| Render swimlane row | 148 |
| Custom row text..... | 152 |
| Template | 156 |
| Sorting | 160 |
| Drag-and-drop..... | 164 |

| | |
|---|-----|
| Create empty row | 167 |
| Calculate cards count..... | 171 |
| Enable frozen rows | 175 |
| Drag and drop in ASP.NET MVC Kanban control | 179 |
| Internal drag and drop | 179 |
| External drag and drop | 186 |
| Sort in ASP.NET MVC Kanban control | 200 |
| Index..... | 200 |
| DataSource Order | 208 |
| Custom | 211 |
| Change the direction..... | 214 |
| Card Editing in ASP.NET MVC Kanban control | 218 |
| Default Dialog..... | 218 |
| Custom Fields..... | 222 |
| Dialog Template | 235 |
| Prevent Dialog..... | 241 |
| Persisting data in server..... | 244 |
| Tooltip in ASP.NET MVC Kanban control | 252 |
| Tooltip template | 252 |
| Card Order in ASP.NET MVC Kanban control..... | 256 |
| Validation in ASP.NET MVC Kanban control | 261 |
| Minimum card limit..... | 261 |
| Maximum card limit | 261 |
| Virtualization | 265 |
| Virtual scrolling | 265 |
| Limitations for virtual scrolling | 272 |
| Globalization in ASP.NET MVC Kanban control | 272 |
| Loading translations..... | 273 |
| Right to left (RTL) | 277 |
| Kanban dimensions in ASP.NET MVC Kanban control | 281 |
| Auto height and width | 281 |
| Height and width in pixel | 285 |
| Height and width in percentage | 289 |
| State Persistence in ASP.NET MVC Kanban control..... | 293 |
| Responsive mode | 296 |

| | |
|---|-----|
| Layouts | 296 |
| Scrolling | 298 |
| Selection | 299 |
| Styling and appearance | 302 |
| To set fixed position to the Kanban header | 305 |
| Accessibility in ASP.NET MVC Kanban control | 305 |
| WAI-ARIA attributes | 306 |
| Keyboard interaction | 307 |
| Disable keyboard interaction | 307 |
| Ensuring accessibility | 311 |
| See also | 311 |
| How To | 311 |
| Add header double click | 311 |
| Change Kanban columns dynamically | 315 |
| Filtering Cards | 319 |
| Searching Cards | 323 |
| Linear Gauge | 327 |
| Getting Started with ASP.NET MVC Linear Gauge Control | 327 |
| Prerequisites | 327 |
| Create ASP.NET MVC application with HTML helper | 328 |
| Install ASP.NET MVC package in the application | 328 |
| Add namespace | 328 |
| Add script resources | 328 |
| Register Syncfusion script manager | 328 |
| Add ASP.NET MVC Linear Gauge control | 329 |
| Add Gauge Title | 329 |
| Axis | 330 |
| Dimensions in ASP.NET MVC Linear Gauge | 331 |
| Size for Linear Gauge | 331 |
| Axis in ASP.NET MVC Linear Gauge | 333 |
| Setting the start value and end value of the axis | 333 |
| Line Customization | 334 |
| Ticks Customization | 335 |
| Labels Customization | 338 |
| Orientation | 346 |

| | |
|---|-----|
| Inverted Axis | 347 |
| Opposed Axis..... | 348 |
| Multiple Axes | 349 |
| Ranges in ASP.NET MVC Linear Gauge..... | 351 |
| Customizing the range | 352 |
| Setting the range color for the labels | 354 |
| Multiple ranges | 355 |
| Gradient Color..... | 357 |
| Radial Gradient | 359 |
| Pointers in ASP.NET MVC Linear Gauge..... | 360 |
| Types of pointer | 362 |
| Multiple pointers | 371 |
| Pointer animation | 372 |
| Gradient Color..... | 373 |
| Annotations in ASP.NET MVC Linear Gauge | 377 |
| Adding annotation | 377 |
| Customization | 378 |
| Multiple annotations | 383 |
| Animation in ASP.NET MVC Linear Gauge | 384 |
| User Interaction in ASP.NET Linear Gauge..... | 386 |
| Tooltip | 386 |
| Positioning the tooltip..... | 391 |
| Pointer Drag | 393 |
| Print and Export in ASP.NET MVC Linear Gauge..... | 394 |
| Print..... | 394 |
| Export..... | 395 |
| Appearance in ASP.NET MVC Linear Gauge..... | 399 |
| Customizing the Linear Gauge area | 399 |
| Setting up the Linear Gauge title | 400 |
| Customizing the Linear Gauge container | 402 |
| Fitting the Linear Gauge to the control..... | 407 |
| Accessibility in ASP.NET MVC Linear Gauge | 408 |
| WAI-ARIA attributes..... | 408 |
| Screen reading in Linear Gauge | 408 |
| Ensuring accessibility | 409 |

| | |
|--|-----|
| See also | 409 |
| Internationalization in ASP.NET MVC Linear Gauge | 409 |
| Numeric Format | 409 |
| Events in ASP.NET MVC Linear Gauge | 410 |
| AnimationComplete | 410 |
| AnnotationRender | 411 |
| AxisLabelRender | 411 |
| BeforePrint | 411 |
| DragEnd | 412 |
| DragMove | 412 |
| DragStart | 413 |
| GaugeMouseDown | 413 |
| GaugeMouseLeave | 413 |
| GaugeMouseMove | 414 |
| GaugeMouseUp | 414 |
| Load | 414 |
| Loaded | 414 |
| Resized | 415 |
| TooltipRender | 415 |
| ValueChange | 415 |
| Methods in ASP.NET MVC Linear Gauge | 416 |
| setPointerValue | 416 |
| setAnnotationValue | 417 |
| refresh | 417 |
| Migration from Essential JS 1 | 418 |
| Linear gauge dimensions | 418 |
| Line customization | 418 |
| Ticks | 419 |
| Labels | 420 |
| Axis | 422 |
| Ranges | 422 |
| Bar Pointer | 423 |
| Marker Pointer | 424 |
| Annotation | 426 |
| Tooltip | 427 |

| | |
|--|-----|
| Appearance of Linear Gauge..... | 428 |
| Gauge Container type | 428 |
| Events..... | 429 |
| How To | 430 |
| Rendering linear gauges dynamically | 431 |
| ListBox..... | 437 |
| Getting Started with ASP.NET MVC ListBox Control | 437 |
| Prerequisites | 437 |
| Create ASP.NET MVC application with HTML helper..... | 437 |
| Install ASP.NET MVC package in the application | 437 |
| Add namespace..... | 438 |
| Add stylesheet and script resources | 438 |
| Register Syncfusion script manager | 438 |
| Add ASP.NET MVC ListBox control..... | 439 |
| Accessibility in List Box Component..... | 439 |
| WAI-ARIA attributes..... | 440 |
| Keyboard interaction | 441 |
| Ensuring accessibility | 441 |
| See also | 441 |
| Data Binding in ASP.NET MVC List Box Control | 441 |
| Local Data..... | 442 |
| Remote Data | 444 |
| Drag and drop in ListBox Control | 444 |
| Single listbox | 445 |
| Multiple listbox | 445 |
| Dual list box in ASP.NET MVC ListBox Control | 446 |
| Icons and Customization | 447 |
| Icons | 447 |
| Templates..... | 451 |
| Selection in ASP.NET MVC ListBox Control | 452 |
| Single selection | 453 |
| Multiple selection | 453 |
| sorting and grouping..... | 454 |
| Sorting..... | 454 |
| Grouping | 454 |

| | |
|---|-----|
| Styles and Appearances | 456 |
| Horizontal ListBox | 456 |
| How To | 457 |
| Add items to the list box | 457 |
| Enable or disable items | 458 |
| Enable Scroller | 458 |
| Form submit to the list box | 459 |
| Select items to the list box | 460 |
| ListView | 460 |
| Getting Started with ASP.NET MVC ListView control | 460 |
| Prerequisites | 460 |
| Create ASP.NET MVC application with HTML helper | 461 |
| Install ASP.NET MVC package in the application | 461 |
| Add namespace | 461 |
| Add stylesheet and script resources | 461 |
| Register Syncfusion script manager | 462 |
| Add ASP.NET MVC ListView control | 462 |
| Bind dataSource | 462 |
| See also | 463 |
| Data binding | 463 |
| Bind to local data | 464 |
| Bind to remote data | 465 |
| Grouping | 466 |
| Customization | 468 |
| Checklist in ASP.NET MVC Listview Control | 468 |
| Checkbox Position | 470 |
| Nested List | 472 |
| Customizing templates | 475 |
| Header Template | 475 |
| Template | 477 |
| Group template | 481 |
| UI Virtualization | 483 |
| Getting started | 483 |
| Conditional rendering | 488 |
| Scrolling in ASP.NET MVC Listview Control | 490 |

| | |
|--|-----|
| CSS Structure..... | 493 |
| Customizing ListView | 493 |
| Customizing the list items | 494 |
| Customizing ListView's header..... | 494 |
| Customizing group header of ListView | 494 |
| Customizing the hover state of ListView control | 494 |
| Customizing selected item of ListView control..... | 495 |
| Accessibility in ASP.NET MVC ListView component..... | 495 |
| WAI-ARIA attributes..... | 496 |
| Keyboard interaction | 497 |
| Ensuring accessibility | 497 |
| See also | 497 |
| Migration from Essential JS 1..... | 497 |
| How To | 500 |
| Get selected items from ListView | 500 |
| Use Dynamic templates in ListView based on device | 502 |
| Create Dual List from ListView | 507 |
| Load List Items in child list dynamically | 514 |
| Show Items Count in Group Header | 516 |
| Filter List Items in the ListView | 519 |
| Add and Remove List Items from the ListView | 521 |
| Trace all events in ListView | 523 |
| Create Mobile contact layout from ListView | 526 |
| Display spinner until List Items are loaded | 530 |
| Hide checkbox in ListView..... | 532 |
| Manipulate ListView as Grid Layout | 536 |
| element .e-list-item { | 536 |
| Drag and Drop List Items..... | 543 |
| Render ListView with hyper-link navigation | 545 |
| Customize ListView as Chat Window | 547 |
| Customize Each List Item's Text in ListView Component..... | 552 |
| Maps | 553 |
| Getting Started with ASP.NET MVC Maps Component | 553 |
| Prerequisites | 553 |
| Create ASP.NET MVC application with HTML helper | 553 |

| | |
|--|-----|
| Install ASP.NET MVC package in the application | 553 |
| Add namespace..... | 554 |
| Add script resources | 554 |
| Register Syncfusion script manager | 554 |
| Add ASP.NET MVC Maps component | 554 |
| Populate data..... | 555 |
| Geometry types..... | 555 |
| Shape data | 556 |
| Data source | 556 |
| Data binding..... | 557 |
| Binding complex data source | 560 |
| Layers | 562 |
| Multilayer..... | 562 |
| Sublayer | 562 |
| Displaying different layer in the view | 564 |
| Rendering custom shapes | 566 |
| Providers | 566 |
| OpenStreetMaps in ASP.NET MVC Maps Component..... | 566 |
| Bing Maps in ASP.NET MVC Maps Component..... | 575 |
| Azure Maps in ASP.NET MVC Maps Component | 587 |
| Other Maps providers | 595 |
| Customization in ASP.NET MVC Maps Component | 605 |
| Setting the size for Maps | 605 |
| Maps title | 607 |
| Setting theme..... | 609 |
| Customizing Maps container | 611 |
| Customizing Maps area..... | 613 |
| Customizing the shapes | 615 |
| Setting color to the shapes from the data source | 617 |
| Applying border to individual shapes | 619 |
| Projection type..... | 621 |
| Color Mapping in ASP.NET MVC Maps Component | 623 |
| Types of color mapping..... | 624 |
| Multiple colors for a single shape | 631 |
| Color for items excluded from color mapping | 633 |

| | |
|--|-----|
| Color mapping for bubbles | 636 |
| Data labels in ASP.NET MVC Maps Component..... | 637 |
| Adding data labels..... | 638 |
| Customization | 641 |
| Label animation..... | 643 |
| Smart labels..... | 644 |
| Intersect action | 646 |
| Adding data label as a template | 648 |
| Polygon shape in ASP.NET MVC Maps component | 650 |
| Markers | 653 |
| Adding marker..... | 653 |
| Adding marker template | 655 |
| Customization | 657 |
| Marker shapes | 659 |
| Multiple marker groups | 662 |
| Customize marker shapes from data source | 664 |
| Repositioning the marker using drag and drop | 668 |
| Marker zooming..... | 670 |
| Marker clustering..... | 672 |
| Customization of marker cluster..... | 675 |
| Expanding the marker cluster | 677 |
| Tooltip for marker | 680 |
| Bubbles in ASP.NET MVC Maps Component | 682 |
| Bubble shapes | 684 |
| Customization | 686 |
| Setting colors to the bubbles from the data source | 688 |
| Setting the range of the bubble size | 690 |
| Multiple bubble groups..... | 692 |
| Enable tooltip for bubble | 695 |
| Legend in ASP.NET MVC Maps Component..... | 696 |
| Modes of legend | 696 |
| Positioning of the legend | 699 |
| Legend for shapes | 701 |
| Enable legend for bubbles | 721 |
| Enable legend for markers | 722 |

| | |
|---|-----|
| Annotations in ASP.NET MVC Maps Component..... | 726 |
| Annotation | 726 |
| Annotation customization | 728 |
| Multiple Annotation..... | 732 |
| Navigation lines..... | 734 |
| Customization | 734 |
| Enabling the arrows | 736 |
| User Interactions..... | 738 |
| Zooming | 738 |
| Selection..... | 752 |
| Highlight | 768 |
| Tooltip | 777 |
| Print and Export in ASP.NET MVC Maps component..... | 785 |
| Print..... | 785 |
| Export..... | 786 |
| State Persistence..... | 790 |
| State persistence..... | 790 |
| Accessibility in ASP.NET MVC Maps component | 792 |
| WAI-ARIA attributes..... | 792 |
| Screen reading in Maps..... | 792 |
| Keyboard Navigation..... | 793 |
| Ensuring accessibility | 793 |
| See also | 793 |
| Internationalization..... | 793 |
| Globalization | 794 |
| Numeric format..... | 794 |
| Localization | 796 |
| Methods in ASP.NET MVC Maps component | 798 |
| Methods | 798 |
| getMinMaxLatitudeLongitude | 798 |
| Migration from Essential JS 1..... | 800 |
| Size Customization | 800 |
| Title and Subtitle Customization | 801 |
| Layer Customization..... | 801 |
| Shape Customization | 802 |

| | |
|--|-----|
| Marker Customization | 803 |
| Bubble Customization | 805 |
| DataLabel Customization | 807 |
| Legend Customization..... | 808 |
| Zooming Customization | 811 |
| Highlight And Selection Customization..... | 812 |
| Navigation Line Customization | 814 |
| Tooltip Customization | 815 |
| Annotation Cutomization..... | 816 |
| Maps Other Properties Customization | 816 |
| Events..... | 817 |
| How To | 820 |
| Annotations in ASP.NET MVC Maps Component..... | 820 |
| Custom path map in ASP.NET MVC Maps Component..... | 822 |
| Drill-down in ASP.NET MVC Maps Component | 824 |
| Marker types in ASP.NET MVC Maps Component..... | 827 |
| Adding multiple layers in the Map..... | 832 |
| Center position zooming..... | 834 |
| MaskedTextBox..... | 836 |
| Getting Started with ASP.NET MVC MaskedTextBox control | 836 |
| Prerequisites | 836 |
| Create ASP.NET MVC application with HTML helper..... | 836 |
| Install ASP.NET MVC package in the application | 836 |
| Add namespace..... | 836 |
| Add stylesheet and script resources | 837 |
| Register Syncfusion script manager..... | 837 |
| Add ASP.NET MVC MaskedTextBox control..... | 837 |
| Set the mask..... | 838 |
| See also | 838 |
| Mask Configuration in MaskedTextBox Control | 838 |
| Standard mask elements..... | 838 |
| Custom mask elements..... | 840 |
| Prompt character | 842 |
| Accessibility..... | 842 |
| WAI-ARIA attributes..... | 843 |

Kanban

Getting Started with ASP.NET MVC Kanban Control

This section briefly explains about how to include [ASP.NET MVC Kanban](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

<add namespace="Syncfusion.EJ2"/>

</namespaces>

,

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
```

```
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{ site.ej2version
  }/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ _LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Kanban control

Now, add the Syncfusion ASP.NET MVC Kanban control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().Kanban("kanban").Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Kanban control will be rendered in the default web browser.

Populating cards

To populate the empty Kanban with cards, define the list or remote data using the [DataSource](#) property. To define [DataSource](#), the mandatory fields in the list should be relevant to [KeyField](#). In the following example, you can see the cards defined with default fields such as ID, Summary, and Status.

CSHTML

```
@model List<KanbanSample.Controllers.KanbanDataModels>
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)Model).Columns(col =>
```

```

        {
            col.HeaderText("To Do").KeyField("Open").Add();
            col.HeaderText("In Progress").KeyField("InProgress").Add();
            col.HeaderText("Testing").KeyField("Testing").Add();
            col.HeaderText("Done").KeyField("Close").Add();
        }).CardSettings(card => {
            card.ContentField("Summary").HeaderField("Id");
        }).Render()
    }
}

```

HOMECONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View(KanbanDataModels.KanbanTasks());
    }
}

public class KanbanDataModels
{
    public string Id { get; set; }
    public string Title { get; set; }
    public string Status { get; set; }
    public string Summary { get; set; }
    public string Type { get; set; }
    public string Priority { get; set; }
    public string Tags { get; set; }
    public double Estimate { get; set; }
    public string Assignee { get; set; }
    public int RankId { get; set; }
    public string Color { get; set; }
    public static List<KanbanDataModels> KanbanTasks()
    {
        List<KanbanDataModels> TaskDetails = new List<KanbanDataModels>();
        TaskDetails.Add(new KanbanDataModels { Id = "Task 1", Title = "Task - 29001", Status = "Open", Summary = "Analyze the new requirements gathered from the customer.", Type = "Story", Priority = "Low", Tags = "Analyze,Customer", Estimate = 3.5, Assignee = "Nancy Davloio", RankId = 1, Color = "#8b447a" });

3.5, Assignee = "Janet Leverling", RankId = 6, Color = "#cc0000" });
TaskDetails.Add(new KanbanDataModels { Id = "Task 24", Title = "Task -
29030", Status = "Testing", Summary = "Fix the issues reported by the
customer.", Type = "Bug", Priority = "Critical", Tags = "Customer", Estimate
= 3.5, Assignee = "Steven walker", RankId = 1 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 25", Title = "Task -
29031", Status = "Testing", Summary = "Fix the issues reported in Safari
browser.", Type = "Bug", Priority = "Release Breaker", Tags = "Fix,Safari",
Estimate = 1.5, Assignee = "Nancy Davloio", RankId = 2 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 26", Title = "Task -
29032", Status = "Testing", Summary = "Check Login page validation.", Type =
"Story", Priority = "Release Breaker", Tags = "Testing", Estimate = 0.5,
Assignee = "Michael Suyama", RankId = 3 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 27", Title = "Task -
29033", Status = "Testing", Summary = "Fix the issues reported in data
binding.", Type = "Story", Priority = "Normal", Tags = "Databinding",
Estimate = 3.5, Assignee = "Janet Leverling", RankId = 4 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 28", Title = "Task -
29034", Status = "Testing", Summary = "Test editing functionality.", Type =
"Story", Priority = "Normal", Tags = "Editing,Test", Estimate = 0.5,
Assignee = "Nancy Davloio", RankId = 5 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 29", Title = "Task -
29035", Status = "Testing", Summary = "Fix editing issues reported in
Firefox.", Type = "Bug", Priority = "Critical", Tags = "Editing,Fix",
Estimate = 1.5, Assignee = "Robert King", RankId = 7 });
TaskDetails.Add(new KanbanDataModels { Id = "Task 30", Title = "Task -
29036", Status = "Testing", Summary = "Test editing feature in the IE
browser.", Type = "Story", Priority = "Normal", Tags = "Testing", Estimate =
5.5, Assignee = "Janet Leverling", RankId = 10 });
return TaskDetails;
}
}

```

Enable swimlane

Swimlane can be enabled by mapping the tags [SwimlaneSettings.KeyField](#) to appropriate column name in dataSource. This enables the grouping of the cards based on the mapped column values.

CSHTML

```
@model List<KanbanSample.Controllers.KanbanDataModels>
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)Model).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {
    swim.KeyField("Assignee");
}).Render()
```

Note: [View Sample in GitHub.](#)

- [Real time example using Kanban](#)

Columns in Kanban Board

The **Kanban** columns represent the each stage of the process. The column definitions are used as the **DataSource** schema in the Kanban. The Kanban operations such as drag-and-drop, swimlane, and toggle columns are performed based on column definitions.

Single-key mapping

Kanban columns are categorized by mapping the **Key** from the datasource using the **KeyField** property. The corresponding **Value** in the datasource is mapped inside the columns **KeyField**. Based on this categorization, Kanban columns are split on this board.

Note: The **KeyField** property is mandatory to render the columns in the Kanban board.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<obj>
ct>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

    return TaskDetails;
}
}

```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

**Multi-key mapping**

Kanban board allows to render a single column by mapping multiple keys using **KeyField** property. In below sample, specified the multiple keys(Open, Validate) to a single column.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open, Validate").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

        return TaskDetails;
    }
}

```

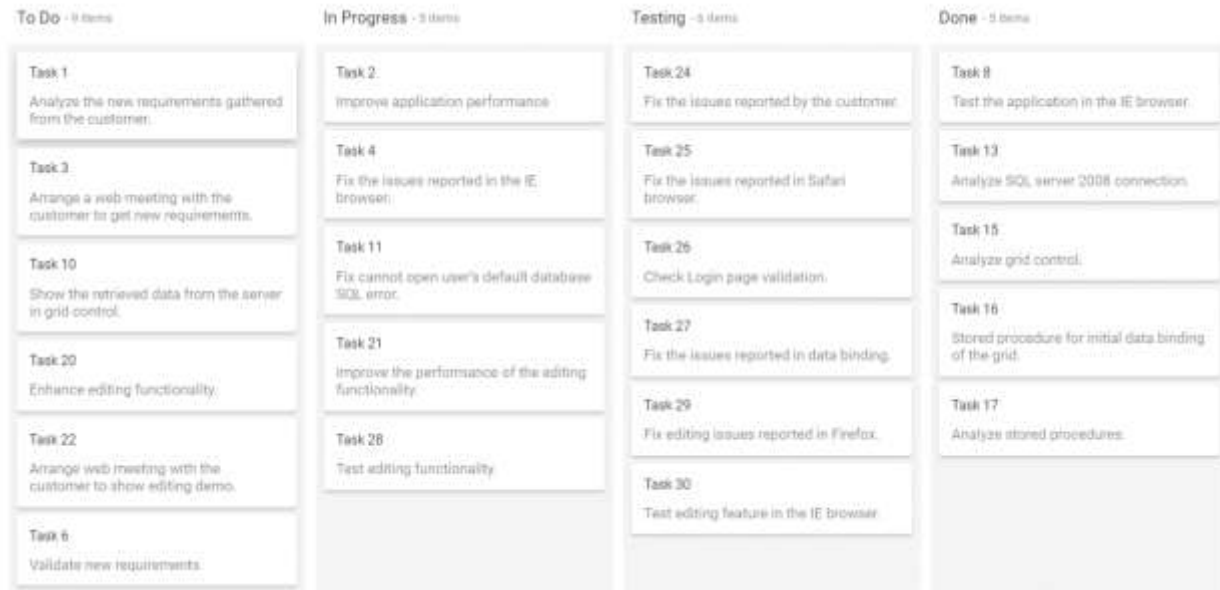

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Header text

You can provide the column header text of Kanban columns using the `HeaderText` property. If you have not specified any header text, it will render the header without any text.

Header template

You can customize the column header with any HTML or CSS element using the `Template` property as shown in the following code.

You can get the following columns data when using header template.

- `keyField`
- `headerText`
- `minCount`
- `maxCount`
- `allowToggle`
- `isExpanded`
- `showItemCount`
- `count`

CSHTML

```
<div>
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To
Do").KeyField("Open").Template("#headerTemplate").Add();
    col.HeaderText("In
Progress").KeyField("InProgress").Template("#headerTemplate").Add();
    col.HeaderText("In
Review").KeyField("Review").Template("#headerTemplate").Add();
    col.HeaderText("Done").KeyField("Close").Template("#headerTemplate").Add();
}).CardSettings(card => {
```

```

        card.ContentField("Summary").HeaderField("Id");
    }).Render()
</div>
<script id="headerTemplate" type="text/x-jsrender">

```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

Toggle columns

Kanban allows to expand or collapse its columns using `AllowToggle` inside the `Columns` property. When enable the property, it will render the expand or collapse icon to the column header.

Note: By default, collapsed column width is set to 50px.

CSHTML

```
<div>
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").AllowToggle(true).Add();
    col.HeaderText("In
Progress").KeyField("InProgress").AllowToggle(true).Add();

    col.HeaderText("Testing").KeyField("Testing").AllowToggle(true).Add();
    col.HeaderText("Done").KeyField("Close").AllowToggle(true).Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
});
</div>
```

```

    }).Render()
</div>

```

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
    }
}

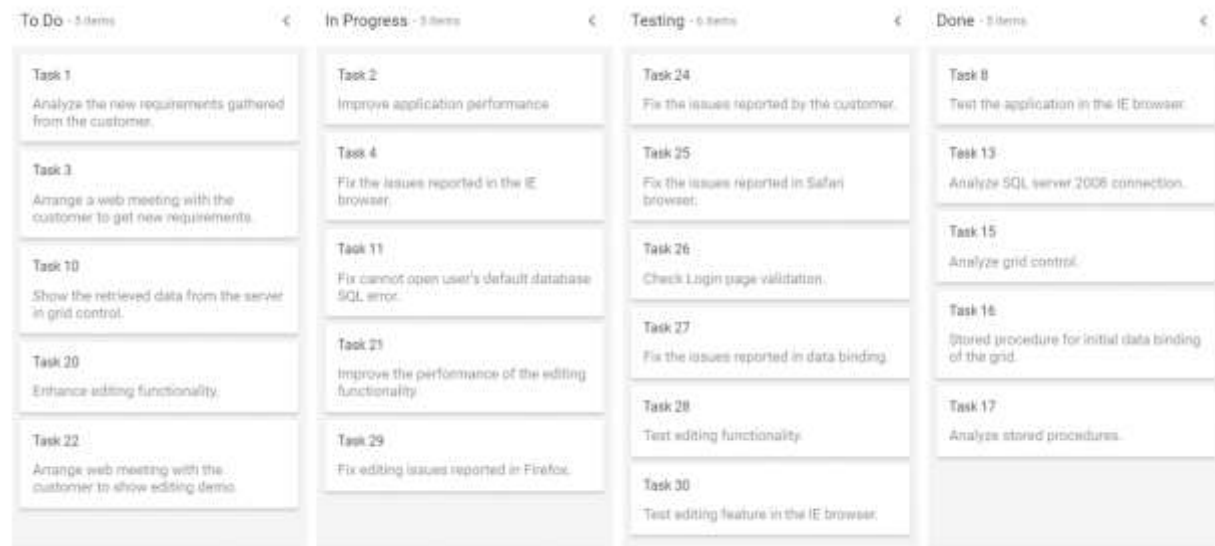

```

```

        return View();
    }
}

```

Output be like the below.

Initially collapsed column

By default, all columns are on expanded state when loading the Kanban board initially. But, you can render the columns with collapsed state using the `IsExpanded` property.

Note: The `IsExpanded` property only works when enabling the `AllowToggle` property on particular column.

In the following example, the To Do column is collapsed on initialization of Kanban board.

CSHTML

```

<div>
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").AllowToggle(true).IsExpanded(false).Add();
    col.HeaderText("In Progress").KeyField("InProgress").AllowToggle(true).Add();

    col.HeaderText("Testing").KeyField("Testing").AllowToggle(true).IsExpanded(false).Add();
    col.HeaderText("Done").KeyField("Close").AllowToggle(true).Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
</div>

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Stacked headers

Stacked headers are the additional headers to column header that will group the similar columns.

Define the grouping of columns **Key** value to the **KeyFields** property and provide the custom header text name to grouped columns using the **Text** property, which is placed inside the **StackedHeaders** property.

In the following code, the kanban columns 'InProgress, Review' are grouped under 'Development phase' category.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col=> {
    col.HeaderText("Open").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("In Review").KeyField("Review").Add();
    col.HeaderText("Completed").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).StackedHeaders(stackedHeaders => {
    stackedHeaders.Text("To Do").KeyFields("Open").Add();
    stackedHeaders.Text("Development Phase").KeyFields("InProgress, Review").Add();
    stackedHeaders.Text("Done").KeyFields("Close").Add(); }).Render()
```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Cards in ASP.NET MVC Kanban component

The cards are main elements in Kanban board, which represent the task information with header and content. The header and content of a card is fetched from the corresponding mapping fields. The card layout can be customized with template also.

Drag-and-drop

Transit or change the card position using the drag-and-drop functionality. By default, the `AllowDragAndDrop` property is enabled on the Kanban board, which is used to change the card position by column-to-column or within the column.

Added dotted border on Kanban cells except the dragged clone cells when dragging, which indicates the possible ways for dropping the cards into the cells.

Header

The card header is achieved by mapping the `HeaderField` property, which is placed inside the `CardSettings` property. By default, the `ShowHeader` property enabled by Kanban board that is used to show the header at the top of the card.

Note: The `HeaderField` property of `CardSettings` is mandatory to render the cards in the Kanban board. It acts as a unique field that is used to avoid the duplication of card data. You can not change the `HeaderField` of mapped data value using the `updateCard` public method or server-side update of data.

In the following demo, the `ShowHeader` property is disabled on Kanban board.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
```

```
card.ContentField("Summary").HeaderField("Id").ShowHeader(false);
}).Render()
```

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
    }
}

```

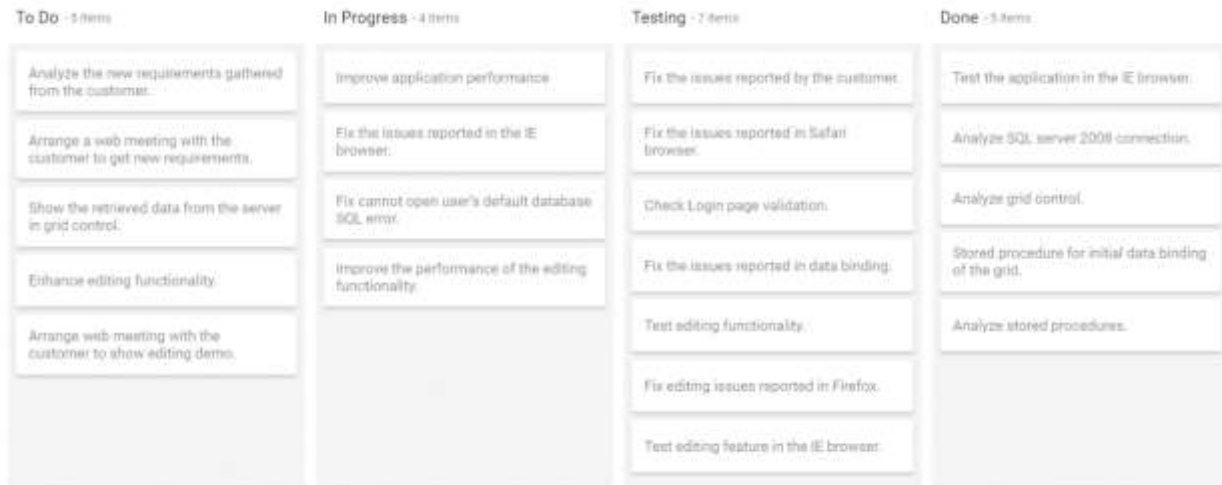

```

        return View();
    }
}

```

Output be like the below.

Content

The card's content is fetched from data source using the **ContentField** property, which is placed inside the **CardSettings** property. If the **ContentField** property is not used, card is rendered with empty content.

Template

You can customize the default card layout using template as per your application needs. This can be achieved by template of the **CardSettings** property.

Output be like the below.

Selection

Kanban board allows to select single and multiple selection of cards when mouse or keyboard interactions using **SelectionType** property. The property contains following types.

- **None:** No cards are allowed to select from Kanban board.
- **Single:** Only one card allowed to select at a time in the Kanban board.
- **Multiple:** Multiple cards are allowed to select in a board.

Multiple Selection

Select the multiple cards randomly using Ctrl + mouse click and select the multiple cards continuously using Shift + mouse click action on Kanban board. Set **Multiple** in **SelectionType** to enable the multiple selection in a board.

        return View();
    }
}

```

Output be like the below.

Data binding in ASP.NET MVC Kanban component

The Kanban uses **DataManager**, which supports both RESTful data service binding and list binding. The **DataSource** property of Kanban can be assigned either with the instance of **DataManager** or List, as it supports the following two data binding methods:

- Local data
- Remote data

Local data

To bind local list data to the Kanban, you can simply assign a list to the **DataSource** property. The list can also be provided as an instance of **DataManager** and assigned to the Kanban **DataSource** property.

the customer.", Type = "Bug", Priority = "Critical", Tags = "Customer",
Estimate = 3.5, Assignee = "Steven walker", RankId = 1 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 25", Title =
"Task - 29031", Status = "Testing", Summary = "Fix the issues reported in
Safari browser.", Type = "Bug", Priority = "Release Breaker", Tags =
"Fix,Safari", Estimate = 1.5, Assignee = "Nancy Davloio", RankId = 2 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 26", Title =
"Task - 29032", Status = "Testing", Summary = "Check Login page
validation.", Type = "Story", Priority = "Release Breaker", Tags =
"Testing", Estimate = 0.5, Assignee = "Michael Suyama", RankId = 3 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 27", Title =
"Task - 29033", Status = "Testing", Summary = "Fix the issues reported in
data binding.", Type = "Story", Priority = "Normal", Tags = "Databinding",
Estimate = 3.5, Assignee = "Janet Leverling", RankId = 4 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 28", Title =
"Task - 29034", Status = "Testing", Summary = "Test editing
functionality.", Type = "Story", Priority = "Normal", Tags = "Editing,Test",
Estimate = 0.5, Assignee = "Nancy Davloio", RankId = 5 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 29", Title =
"Task - 29035", Status = "Testing", Summary = "Fix editing issues reported
in Firefox.", Type = "Bug", Priority = "Critical", Tags = "Editing,Fix",
Estimate = 1.5, Assignee = "Robert King", RankId = 7 });
    TaskDetails.Add(new KanbanDataModels { Id = "Task 30", Title =
"Task - 29036", Status = "Testing", Summary = "Test editing feature in the
IE browser.", Type = "Story", Priority = "Normal", Tags = "Testing",
Estimate = 5.5, Assignee = "Janet Leverling", RankId = 10 });
    return TaskDetails;
}
}

```

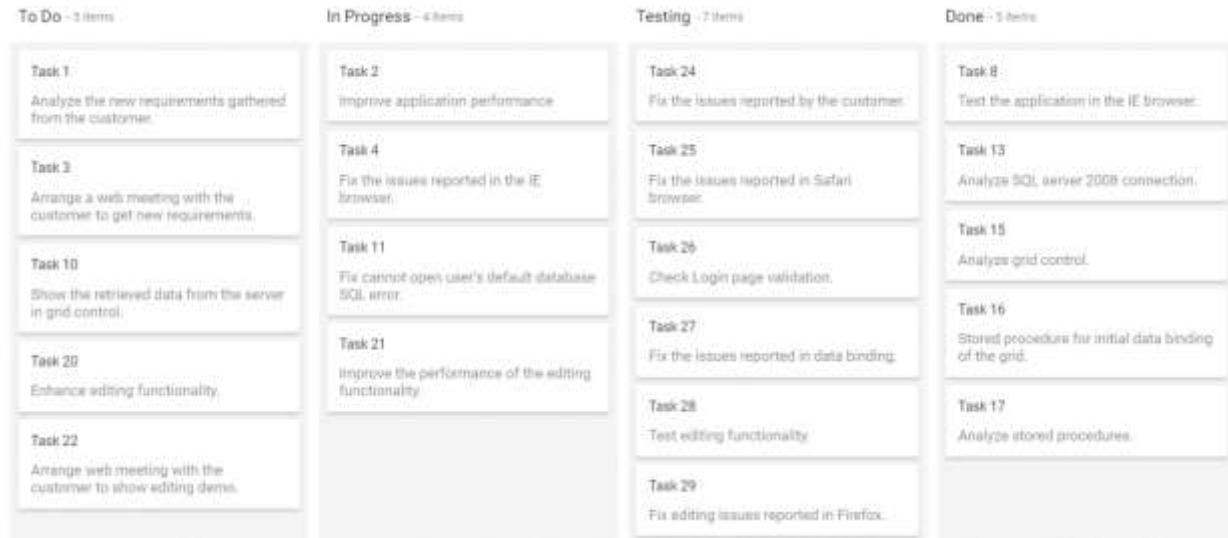

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Note: By default, **DataManager** uses **JsonAdaptor** for binding local data.

Remote data

To bind remote data to kanban component, assign service data as an instance of **DataManager** to the **DataSource** property. To interact with remote data source, provide the endpoint **url**.

CSHTML

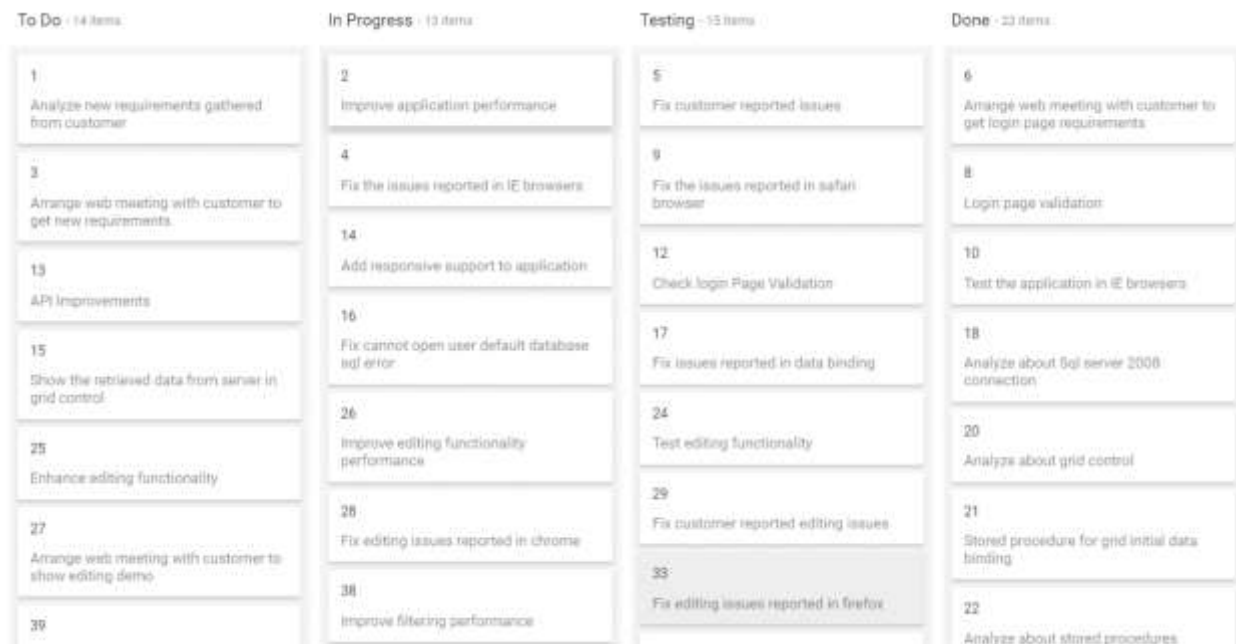

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger =>
{
    dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/Kanban").CrossDomain(true);
}).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).DialogOpen("onDialogOpen").Render()

<script>
function onDialogOpen(args) {
    args.cancel = true;
}
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

Output be like the below.

Note: By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

OData services

[OData](#) is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger => {

    dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/Kanban").CrossDomain(true).Adaptor("ODataAdaptor");
    }).Columns(col=> {
        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id");
    }).DialogOpen("onDialogOpen").Render()

<script>
    function onDialogOpen(args) {
        args.cancel = true;
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
```

```
{
    public ActionResult Index()
    {
        return View();
    }
}
```

OData v4 services

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [OData Documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger => {

    dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/Kanban").CrossDomain(true).Adaptor("ODataAdaptor");
    }).Columns(col=> {
        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id");
    }).DialogOpen("onDialogOpen").Render()

<script>
    function onDialogOpen(args) {
        args.cancel = true;
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

Output be like the below.

Web API

You can use **WebApiAdaptor** to bind kanban with Web API created using OData endpoint.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger =>
{
    dataManger.Url("/api/Tasks").CrossDomain(true).Adaptor("WebApiAdaptor");
}).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).DialogOpen("onDialogOpen").Render()
<script>
    function onDialogOpen(args) {
        args.cancel = true;
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

Below server-side controller code to get the Kanban data.

`typescript

[HttpGet]

public object Get()

```
{
var data = OrdersDetails.GetAllRecords().ToList();
return data;
}
```

URL adaptor

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Kanban cards using the various adaptors available within the **DataManager**. Most preferably, we will be using **UrlAdaptor** for performing CRUD actions on Kanban.

The CRUD operation in Kanban can be mapped to server-side controller actions using the properties **InsertUrl**, **RemoveUrl**, **UpdateUrl**, and **CrudUrl**.

- **InsertUrl** – You can perform a single insertion operation on the server-side.
- **UpdateUrl** – You can update single data on the server-side.
- **RemoveUrl** – You can remove single data on the server-side.
- **CrudUrl** – You can perform bulk data operation on the server-side.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource(dataManger =>
{
dataManger.Url("/Home/DataSource").UpdateUrl("/Home/Update").InsertUrl("/Home/Insert").RemoveUrl("/Home/Delete").CrossDomain(true).Adaptor("UrlAdaptor");
}).Columns(col=> {
col.HeaderText("To Do").KeyField("Open").Add();
col.HeaderText("In Progress").KeyField("InProgress").Add();
col.HeaderText("Testing").KeyField("Testing").Add();
col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
card.ContentField("Summary").HeaderField("Id");
}).Render()
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

The server-side controller code to handle the CRUD operations are as follows.

```

`typescript
private NORTHWNDEntities db = new NORTHWNDEntities();
public ActionResult DataSource() {
    var DataSource = db.Tasks.ToList();
    return Json(DataSource, JsonRequestBehavior.AllowGet);
}
public ActionResult Insert(Params value) {
    //Insert card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public ActionResult Update(Params value) {
    //Update card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}
public void Delete(Params value) {
    //Delete card data from the database
}
public class Params {
    public int Id { get; set; }
    public string Status { get; set; }
    public string Summary { get; set; }
    public string Assignee { get; set; }
}
`

```

Note: The `CrudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `SortBy` as `Index` properties are used for `CrudUrl` properties to update the modified bulk data to the server-side.

Custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field `TaskId` for the cards by overriding the built-in response processing using the `ProcessResponse` method of the `ODataAdaptor`.

CSHTML

```

@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).Columns(col=> {

```

```

        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id");
    }).DialogOpen("onDialogOpen").Created("onCreate").Render()
</script>
function onDialogOpen(args) {
    args.cancel = true;
}
function onCreate(args) {
    class TaskIdAdaptor extends ej.data.ODataAdaptor {
        processResponse() {
            var i = 0;
            // calling base class processResponse function
            var original = super.processResponse.apply(this, arguments);
            original.forEach((item) => item['Id'] = 'Task - ' + ++i);
            return original;
        }
    }
    var kanban = document.querySelector('#kanban').ej2_instances[0];
    kanban.dataSource = new ej.data.DataManager({
        url: "https://ej2services.syncfusion.com/production/web-
services/api/Kanban",
        adaptor: new TaskIdAdaptor()
    });
}
</script>

```

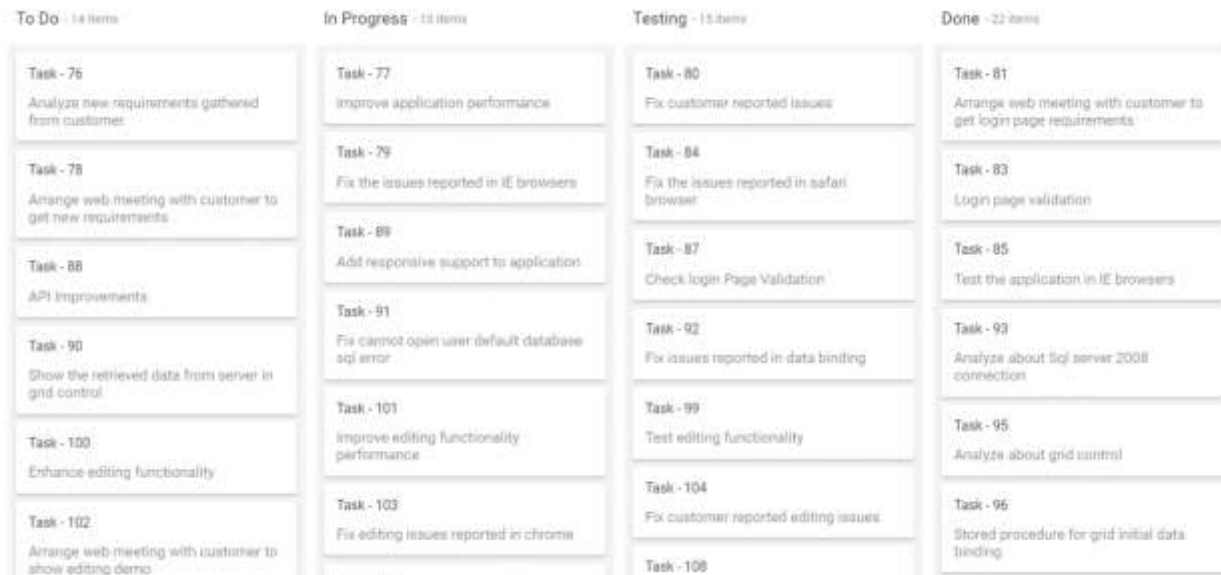

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

Output be like the below.

Sending additional parameters to the server

To add a custom parameter to the data request, use the **addParams** method of **Query** class. Assign the **Query** object with additional parameters to the kanban **Query** property.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger =>
    {
        dataManger.Url("https://ej2services.syncfusion.com/production/web-services/api/Kanban").CrossDomain(true);
    }).Query("new ej.data.Query().addParams('ej2kanban', 'true')").Columns(col=> {
        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id");
    }).DialogOpen("onDialogOpen").Render()

<script>
    function onDialogOpen(args) {
        args.cancel = true;
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}
```

Note: The parameters added using the **Query** property will be sent along with the data request for every kanban action.

Handling HTTP error

During server interaction from the kanban, some server-side exceptions may occur, and you can acquire those error messages or exception details

in client-side using the **ActionFailure** event.

The argument passed to the **ActionFailure** event contains the error details returned from the server.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").AllowDragAndDrop(false).DataSource(dataManger =>
{
    dataManger.Url("'http://some.com/invalidUrl").CrossDomain(true);
}).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).ActionFailure("onActionFailure").Render()

<script>
function onActionFailure() {
    var span = document.createElement('span');
    this.element.parentNode.insertBefore(span, this.element);
    span.style.color = '#FF0000'
    span.innerHTML = 'Server exception: 404 Not found'
}
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

Server exception: 404 Not found

Note: The **ActionFailure** event will be triggered not only for the server errors, but also when there is an exception while processing the kanban actions.

Loading data via ajax

You can use Kanban **DataSource** property to bind the datasource to Kanban from external ajax request. In the following code, we have fetched the datasource from the server using ajax request and provided that to the **DataSource** property by using the **OnSuccess** event of ajax.

CSHTML

```
@Html.EJS().Button("btn").Content("ajax").Render()

@Html.EJS().Kanban("kanban").KeyField("ShipCountry").Columns(col=> {
    col.HeaderText("Denmark").KeyField("Denmark").Add();
    col.HeaderText("Brazil").KeyField("Brazil").Add();
    col.HeaderText("Switzerland").KeyField("Switzerland").Add();
    col.HeaderText("Germany").KeyField("Germany").Add();
}).CardSettings(card => {
    card.ContentField("ShippedDate").HeaderField("OrderID");
}).Created("onCreate").Render()

<script>
    function onCreate() {
        var kanbanObj = this;
        var button = document.getElementById('btn');
        button.addEventListener("click", function (e) {
            let ajax = new
ej.base.Ajax("https://ej2services.syncfusion.com/production/web-
services/api/Orders", "GET");
            ajax.send();
            ajax.onSuccess = function (data) {
                kanbanObj.dataSource = JSON.parse(data);
            };
        });
    }
</script>
```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

| AJAX | Denmark - 9 Items | Brazil - 9 Items | Switzerland - 9 Items | Germany - 9 Items |
|------|------------------------------|------------------------------|------------------------------|------------------------------|
| | 10001 1996-07-16T00:00:00 | 10002 1996-09-11T00:00:00 | 10005 1997-12-03T00:00:00 | 10003 1996-10-07T00:00:00 |
| | 10006 1996-07-16T00:00:00 | 10007 1996-09-11T00:00:00 | 10010 1997-12-03T00:00:00 | 10008 1996-10-07T00:00:00 |
| | 10011 1996-07-16T00:00:00 | 10012 1996-09-11T00:00:00 | 10015 1997-12-03T00:00:00 | 10013 1996-10-07T00:00:00 |
| | 10016 1996-07-16T00:00:00 | 10017 1996-09-11T00:00:00 | 10020 1997-12-03T00:00:00 | 10018 1996-10-07T00:00:00 |
| | 10021 1996-07-16T00:00:00 | 10022 1996-09-11T00:00:00 | 10025 1997-12-03T00:00:00 | 10023 1996-10-07T00:00:00 |
| | 10026 1996-07-16T00:00:00 | 10027 1996-09-11T00:00:00 | 10030 1997-12-03T00:00:00 | 10028 1996-10-07T00:00:00 |
| | 10031 1996-07-16T00:00:00 | 10032 1996-09-11T00:00:00 | 10035 1997-12-03T00:00:00 | 10033 1996-10-07T00:00:00 |

Note: * If you bind the DataSource from this way, then it acts like a local dataSource. So you cannot perform any server-side crud actions.

Swimlane in ASP.NET MVC Kanban control

Swimlanes are horizontal categorizations of cards on the Kanban board. It is used for grouping of cards, which brings transparency to the workflow process.

Render swimlane row

Cards can be grouped based on **KeyField** and displayed in rows, which are separated by columns. It is mandatory to define the **KeyField** that is mapped from the datasource for rendering swimlane rows in the Kanban board.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {
    swim.KeyField("Assignee");
}).Render()
```

DATASOURCE.CS

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Custom row text

Customize the swimlane row header text by using the `TextField` property mapped from datasource.

Note: It is not mandatory to define the `TextField` to `SwimlaneSettings`. It will automatically consider the `KeyField` to swimlane row header text.

If the mapping `TextField` key is not present in the datasource, it will consider the swimlane `KeyField` as swimlane row header text.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {
    swim.KeyField("Assignee").TextField("AssigneeName");
}).Render()

```

CONTROLLER.CS

```

public class HomeController : Controller
{

```

```
public ActionResult Index()
{
    ViewBag.data = new KanbanDataModels().KanbanTasks();
    return View();
}
```

Template

You can customize the Kanban swimlane row by using the **Template** property, which is specified within the **SwimlaneSettings** property. In this demo, the swimlane header is customized with HTML element.

CSHTML

```
<div>

@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<obje
ct>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {

swim.KeyField("Assignee").Template("#swimlaneTemplate").TextField("AssigneeName");
    }).Render()

</div>
<script id="swimlaneTemplate" type="text/x-jsrender">
    <div class='swimlane-template e-swimlane-template-table'>
        <div class="e-swimlane-row-text"><span>${textField}</span></div>
    </div>
</script>
<style>
    .swimlane-template {
        font-size: 15px;
        font-weight: 500;
    }
    .swimlane-template img {
        height: 24px;
        width: 24px;
        border-radius: 50%;
    }
    .swimlane-template span {
        padding-left: 10px;
    }
</style>
```

        return TaskDetails;
    }
}

```

CONTROLLER.CS

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

**Calculate cards count**

Users can show or hide the cards count by swimlane row in header when enabling the **ShowItemCount** property, which is enabled by default on the Kanban board.

Note: Provided localization support for **Items** text.

In below demo, disabled on **ShowItemCount** property on rendering swimlane row without total count.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {
```

```
swim.KeyField("Assignee").ShowItemCount(false);
}).Render()
```

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
    }
}

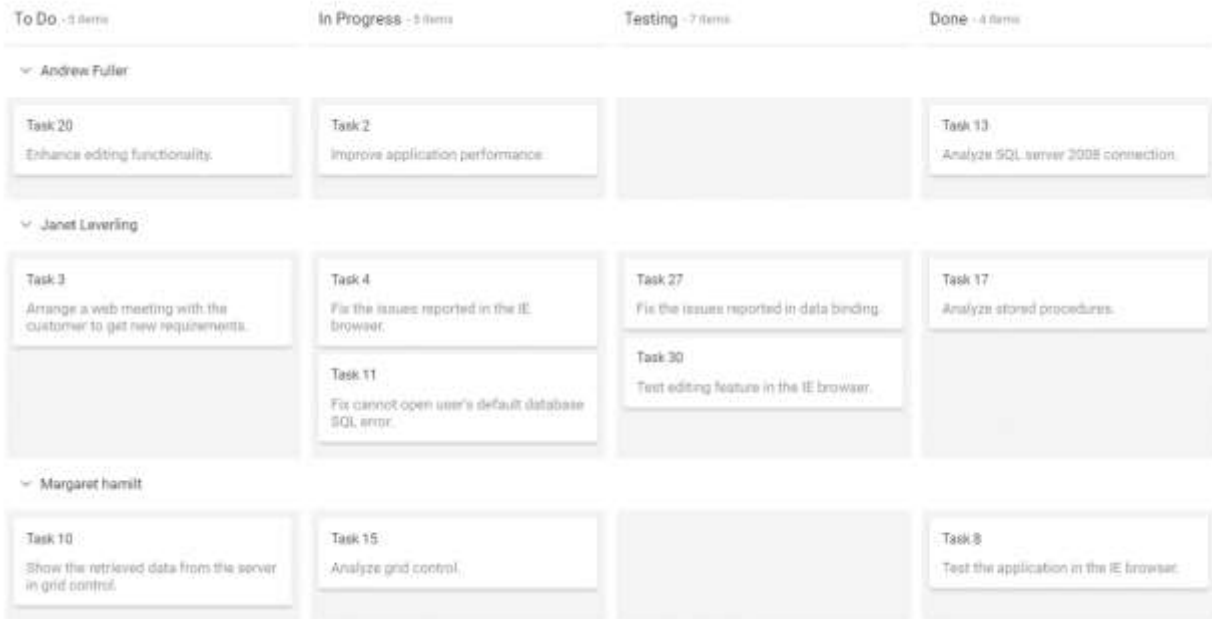

```

```

        return View();
    }
}

```

Output be like the below.

Enable frozen rows

Frozen rows provide an option to make the current swimlane row header text always visible on top of the content while scrolling the Kanban content. The swimlane header text will be changed dynamically, when you scroll to another swimlane row.

By default, the `EnableFrozenRows` property is set as `false`. If you wish to show the swimlane frozen rows, you can enable the `EnableFrozenRows` property.

Note: This feature support only when using Kanban content scrolling.

CSHTML

```

@Html.EJS().Kanban("kanban").KeyField("Status").Height("500").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}) .CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}) .SwimlaneSettings(swim => {
    swim.KeyField("Assignee").EnableFrozenRows(true);
}) .Render()

        return View();
    }
}

```

Output be like the below.

Drag and drop in ASP.NET MVC Kanban control

All cards can be dragged and dropped across the columns or within the columns or swimlane row or kanban to an external source and vice versa.

The following drag and drop types are available in the Kanban board.

- Internal drag and drop
- Column drag and drop
- Swimlane drag and drop
- External drag and drop
- Kanban to Kanban
- Kanban to External source and vice versa.

Note: Dropped card position varies based on the `SortSettings` property.

Internal drag and drop

Allows the user to drag and drop the cards within the kanban board. Based on this, we can categorize into two ways.

- Column drag and drop
- Swimlane drag and drop

Column drag and drop

By default, all cards can be dragged and dropped across the columns and within the columns. You cannot drag and drop the cards when disabling the `AllowDragAndDrop` property.

Note: You can prevent the drag or drop behavior of the particular column by disabling the `AllowDrag` or `AllowDrop` property.

 You can also control the flow of transition cards between the columns by using the **TransitionColumns** property.

In the following example, disable the drag and drop behavior on the Kanban board.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).AllowDragAndDrop(false).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

}

```

Swimlane drag and drop

By default, Swimlane allows drag and drop across the columns within the swimlane row. Kanban does not allow dragging the cards across the swimlane rows.

Enabling the `DragAndDrop` property allows you to drag the cards across the swimlane rows, which is specified inside the `SwimlaneSettings` property.

CSHTML

```

@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SwimlaneSettings(swim => {
    swim.KeyField("Assignee").AllowDragAndDrop(true);
}).Render()

```

External drag and drop

Allows the user to drag and drop the cards from one kanban to another kanban or Kanban to an external source and vice versa.

Kanban to kanban

Drag and drop the card from one kanban to another kanban and vice versa. This can be achieved by specifying the `ExternalDropId` property which is used to specify the id of the dropped kanban element and the `DragStop` event which is used to delete the card on dragged Kanban and add the card on dropped Kanban using the `deleteCard` and `addCard` public methods.

Note: Before adding a card to dropped kanban, you can manually change the card data **HeaderField** when the same card data **HeaderField** is dropped to another Kanban.

In the following example, Drag the card from one Kanban and drop it into another kanban using the **DragStop** event. In this event, remove the card from the dragged Kanban by using the **deleteCard** public method and add the card to the dropped Kanban by using the **addCard** public method.

Treeview to Kanban

Drag the card from the Kanban board and drop it to the Treeview component and vice versa.

In the following sample, remove the data from the Kanban board using the `deleteCard` public method and add to the Treeview component using the `addNodes` public method at Kanban `DragStop` event when dragging the card and dropping it to the Treeview component. Remove the data from Treeview using the `removeNodes` public method and add to Kanban board using the `openDialog` public method when dragging the list from the Treeview component and dropping it to the kanban board.

}

```

Sort in ASP.NET MVC Kanban control

The Kanban provides built-in support to arrange the cards in their columns based on the JSON data order and drop the cards in the columns based on the dropped clone. Initially, users can change the arrangement of cards in the columns and position of the dropped card by using the [sortBy](#) property. The [sortBy](#) property contains three enumeration values as follows.

- Index
- DataSourceOrder
- Custom

Index

SortBy [Index](#) property can be used with or without [field](#) mapping.

Index without field mapping

By default, SortBy [Index](#) property support without any [field](#) mapping. In this behavior, cards are loaded based on the JSON data order and cards are dropped based on the dropped clone.

CSHTML

```

@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<obje
ct>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()

```

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Index with field mapping

SortBy `Index` property also supports with `field` mapping. In this behavior, cards are loaded based on mapping `field` values, and cards are dropped based on the dropped clone.

Cards are placed in a particular position in the columns where you can drop the cards by specifying the `field` property, which is mapped from the data source. This property allows the users to drop the cards in the Kanban board where the dropped clone is created exactly. It is also helpful to render the cards based on the `field` property value.

Note: The `field` property mapping key value must be in `number` format.

The following cases will dynamically change their `field` value when dropping the cards.

- If the cell has no cards, the dropped card `field` value does not change.
- If the cell has one card and dropped a card to the last position or previous/next cards that do not have continuous order, then the dropped card `field` value will be changed based on their previous card value.
- If the cell has one card and dropped a card on the previous position, then it will compare both the values, and the dropped card `field` value will be changed if the cards have continuous order otherwise values will not be changed.
- When the previous and next cards do not have continuous order, the dropped card `field` value will be changed based on the previous card value.
- When the previous and next cards have continuous order or odd/even value, then the `field` value of the dropped card and the cards followed by the dropped card will be changed based on the **previous** card value with continuous order.

For Example,

Continuous Order -

Consider, Column A has Card A with priority value `1`, Card B with priority value `2`, and Card C with priority value `3` and Column B has Card D with priority value `5`, then the dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as `2`, `3`, and `4` respectively.

Odd/Even order -

Consider, Column A has Card A with priority value `1`, Card B with priority value `3`, and Card C with priority value `5` and Column B has Card D with priority value `5`, then the Dropped Card D will be placed between Card A and Card B. Now, the Cards D, B, and C will be dynamically changed to the priority values as `2`, `3`, and `5` respectively.

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Change the direction

Kanban board also provides support for aligning the cards in the columns using the [direction](#) property inside the [sortSettings](#) property. Based on this, cards can be aligned in the columns either in [Ascending](#) or [Descending](#) order. Sorting direction will be performed based on [sortBy](#) property.

Note: By default, cards are aligned in the columns based on **Ascending** order.

In the following sample, cards are aligned in **Descending** order.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).SortSettings(sort => {
    sort.SortBy(Syncfusion.EJ2.Kanban.SortOrderBy.Custom).Field("Summary").Direction(Syncfusion.EJ2.Kanban.SortDirection.Descending);
}).Render()
```

Card Editing in ASP.NET MVC Kanban control

The Kanban provides built-in support to add, edit and delete a card using dialog module. User can edit a card using the following ways.

- Built-in dialog module
- Custom Fields
- Dialog template

Default Dialog

When double-click on the cards, the dialog is opened with below fields to edit a card. This dialog contains **Delete**, **Save** and **Cancel** buttons.

- To edit a card, modify the card details and click the **Save** button.
- To delete a card, click **Delete** button.
- Click on the **Cancel** button to cancel the editing action.

The dialog displays with the following fields which mapped to dialog fields by default.

|Key|Type|Text|

|---|----|----|

cardSettings.headerField | Input | ID

keyField | DropDown | -

cardSettings.contentField | TextArea | -

cardSettings.priority(If applicable) | Numeric | -

swimlaneSettings.keyField(If applicable) | DropDown | -

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

    return TaskDetails;
}
}

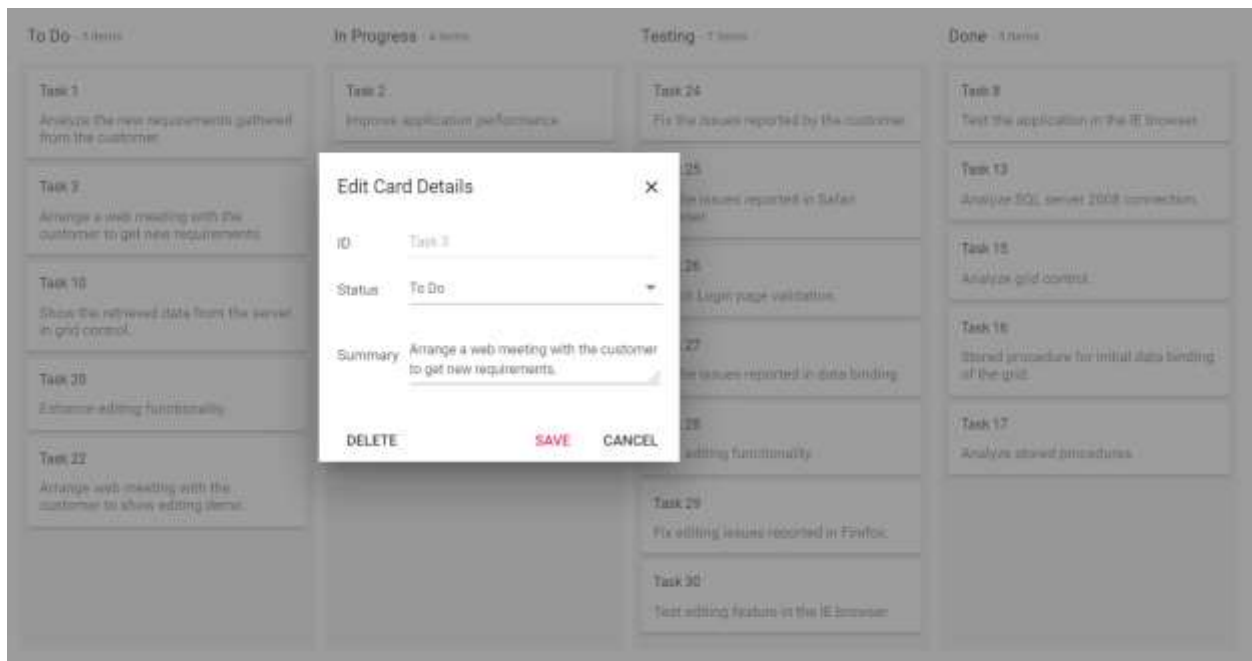

```

CONTROLLER.CS

```
public class HomeController : Controller
```

```
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

Custom Fields

You can change the default fields of dialog using **Fields** property inside the **DialogSettings** property. The **Key** property used to map the **DataSource** value and rendered the corresponding component based on specified **Type** property.

The following types are available in dialog fields.

- String
- Numeric
- TextArea
- DropDown
- TextBox
- Input

Note: If **Type** is not defined in the fields, then it renders as the HTML input element in dialog.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<obj>ct>)ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
```

```

col.HeaderText("In Progress").KeyField("InProgress").Add();
col.HeaderText("Testing").KeyField("Testing").Add();
col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).DialogSettings((item) => item.Fields(ViewBag.dialog)).Render()

```

DATASOURCE.CS

```

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        ViewBag.status = new KanbanDataModels().DialogStatus();
        ViewBag.assignee = new KanbanDataModels().AssigneeData();
        ViewBag.priority = new KanbanDataModels().PriorityData();
        return View();
    }
}

```

Output be like the below.

Prevent Dialog

The Kanban allows to prevent to open a dialog on card double-click by enabling `args.cancel` in `DialogOpen` event.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).DialogOpen("onOpen").Render()

<script>
function dialogOpen(args: DialogEventArgs): void {
    args.cancel = true;
}
</script>
```

    return TaskDetails;
}
}

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Persisting data in server

The modified card data can be persisted in the database using the RESTful web services. All the CRUD operations in the Kanban are done through **DataManager**. The **DataManager** has an option to bind all the CRUD related data in server-side.

Note: For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the below section covers how to get the edited data details on the server-side using the **UrlAdaptor**.

URL adaptor

You can use the **UrlAdaptor** of **DataManager** when binding data source for remote data. In the initial load of Kanban, data are fetched from remote data and bound to the Kanban using **Url** property of **DataManager**.

You can map the CRUD operation in Kanban can be mapped to server-side controller actions using the properties **InsertUrl**, **RemoveUrl**, **UpdateUrl**, and **CrudUrl**.

- **InsertUrl** – You can perform single insertion operation on server-side.
- **UpdateUrl** – You can update single data on server-side.
- **RemoveUrl** – You can remove single data on server-side.
- **CrudUrl** – You can perform bulk data operation on server-side.

The following code example describes the above behavior.

CSHTML

```

@Html.EJS().Kanban("kanban").KeyField("Status").DataSource(dataManger
=>
{
    dataManger.Url("DataSource").CrudUrl("UpdateData").Adaptor("UrlAdaptor").Cro
ssDomain(true);
}).Columns(col=> {

```

```

        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id");
    }).Render()

```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        return View();
    }
}

```

The server-side controller code to handle the CRUD operations are as follows.

```

`typescript
private NORTHWNDEntities db = new NORTHWNDEntities();

public ActionResult DataSource() {
    var DataSource = db.Tasks.ToList();
    return Json(DataSource, JsonRequestBehavior.AllowGet);
}

public ActionResult Insert(Params value) {
    //Insert card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}

public ActionResult Update(Params value) {
    //Update card data into the database
    return Json(value, JsonRequestBehavior.AllowGet);
}

public void Delete(Params value) {
    //Delete card data from the database
}

public class Params {
    public int Id { get; set; }
    public string Status { get; set; }
    public string Summary { get; set; }
}

```

```
public string Assignee { get; set; }  
}  
`
```

Insert card

Using the `InsertUrl` property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior.

```
`typescript  
public ActionResult Insert(Params value)  
{  
    //Insert card in the database  
}  
`
```

The newly added record details are bound to the `value` parameter.

Update card

Using the `UpdateUrl` property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the above behavior.

```
`typescript  
public ActionResult Update(Params value)  
{  
    //Update card data in the database  
}  
`
```

The updated record details are bound to the `value` parameter.

Delete card

Using the `RemoveUrl` property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the above behavior.

```
`typescript  
public void Delete(int key)  
{  
    //Delete card in the database  
}  
`
```

The deleted card primary key value is bound to the `key` parameter.

CRUD URL

Using the `CrudUrl` property, the controller action mapping URL can be specified to perform all the CRUD operations at the server-side using a single method instead of specifying a separate controller action method for CRUD (insert, update and delete) operations.

The action parameter of `CrudUrl` is used to get the corresponding CRUD action.

The following code example describes the above behavior.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource(dataManger
=>
{
    dataManger.Url("DataSource").CrudUrl("UpdateData").Adaptor("UrlAdaptor").Cro
ssDomain(true);
}).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

```

Note: The `CrudUrl` is used to update the bulk data sent to the server-side. Multiple selections and `SortBy` as `Index` properties are used for `CrudUrl` properties to update the modified bulk data to the server-side.

Tooltip in ASP.NET MVC Kanban control

The tooltip is used to show the card information when the cursor hover over the card elements using the `EnableTooltip` property. Tooltip content is dynamically set based on hovering over the card elements.

Note: If you wish to show tooltip on Kanban board custom elements, you need to add `e-tooltip-text` class name of a particular element.

Tooltip template

You can customize the tooltip content with any HTML or CSS element and styling using the `TooltipTemplate` property. In the following demo, the tooltip is customized with HTML elements.

CSHTML

```
<div>
@Html.EJS().Kanban("kanban").KeyField("Status").EnableTooltip(true).TooltipTemplate("#tooltipTemp").DataSource((IEnumerable<object>) ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
</div>
<script id="tooltipTemp" type="text/x-template">
    <div class='e-kanbantooltiptemp'>
        <table>
            <tr>
                <td class="details">
                    <table>
                        <colgroup>
                            <col style="width:30%">
                            <col style="width:70%">
                        </colgroup>

        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Card Order in ASP.NET MVC Kanban control

By default, the Kanban cards are initially placed and drop the card inside the columns based on JSON data orders.

Cards are placed in a particular position in the columns when you drop the cards by specifying the **Priority** property, which is mapped from the datasource. This property allows the users to drop the cards in the Kanban board where exactly created on dropped clone. It is also helpful to render the cards based on the **Priority** property value.

The following cases are dynamically changed their **Priority** value when drop the cards.

- If the cell has no cards, the dropped card **Priority** value does not change.
- If the cell has one card and dropped a card to last position or previous/next cards that do not have continuous order, then the dropped card **Priority** value changed based on their previous card value.
- If the cell has one card and dropped a card on previous position, then compare both values and the dropped card **Priority** value is changed if the cards have continuous order otherwise not changed their value.
- When the previous and next cards does not have continuous order, the dropped card **Priority** value changed based on the previous card value.
- When previous and next cards have continuous order or odd/even value, then the dropped card followed by next all cards up to **continuous value** are dynamically changed their **Priority** value based on the **previous** card value.

For Example,

Continuous Order -

Column A having Card A with priority value 1, Card B with priority value 2 and Card C with priority value 3.

Column B having Card D with priority value 5. Dropped Card D between Card A and Card B. Now, Card D, B and C dynamically changed their priority value to 2, 3, 4.

Odd/Even order -

Column A having Card A with priority value 1, Card B with priority value 3 and Card C with priority value 5.

Column B having Card D with priority value 5. Dropped Card D between Card A and Card B. Now, Card D, B and C dynamically changed their priority value to 2, 3, 5.

Note: The **Priority** property mapping key value must be **number** format.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id").Priority("RankId");
}).Render()

{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Validation in ASP.NET MVC Kanban control

Validate particular column using the **MinCount** or **MaxCount** properties. The corresponding columns gets different appearance when validation fails. In default layout, **ConstraintType** property accept only **Column** type. In swimlane layout, accept both **Column** and **Swimlane** constraint type.

There are two types of constraints:

1. Column
2. Swimlane

Note: By default, the column count validation is performed based on Kanban **Columns**.

Minimum card limit

The **MinCount** property is used to specify the minimum cards hold on particular column or swimlane cell. If the column or swimlane total card count falls short of the minimum count value, it shows the column or cell background colour with validation fails.

Maximum card limit

The **MaxCount** property is used to specify the maximum cards hold on particular column or swimlane cell. If the column or swimlane cell total card count exceeds the maximum count value, it shows the column or cell background colour with validation fails.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col=> {
    col.HeaderText("To Do").KeyField("Open").ShowItemCount(true).MinCount(6).Add();
    col.HeaderText("In Progress").KeyField("InProgress").ShowItemCount(true).MaxCount(5).Add();
})
```

```
col.HeaderText("Testing").KeyField("Testing").ShowItemCount(true).MaxCount(5)
).MinCount(3).Add();
col.HeaderText("Done").KeyField("Close").ShowItemCount(true).Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

```
public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

Virtualization

Kanban allows you to load a large amount of data without any performance degradation. This feature can be enabled by setting the `EnableVirtualization` property in the Kanban to `true`.

Virtual scrolling

Virtual scrolling optimizes data rendering within each column when using large datasets. Only a subset of cards that are visible and about to be loaded on the screen are rendered. The number of records displayed in the Kanban is determined implicitly by the height of the Kanban area and the card height. The `CardHeight` property of Kanban can be used to set the card's height in pixel value. By default, the card height will be `auto`.

When the Kanban column is scrolled, the virtual scrolling feature dynamically loads additional data on demand into view and unloads the data that is no longer visible.

CSHTML

```
@Html.EJS().Kanban("KanbanVirtualScrolling").KeyField("Status").EnableTooltp(true).EnableVirtualization(true).DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Code Review").KeyField("Review").Add();
    col.HeaderText("Done").KeyField("Close").Add();
})
```

```

    }).CardSettings(card =>
    {

card.HeaderField("Id").SelectionType(SelectionType.Multiple).ContentField("Summary");
    }).DialogSettings((item) => item.Fields(ViewBag.dialogData)).Render()

        ViewBag.dialogData = new
KanbanDialogModels().VirtualScrollDialogCardField();
        return View();
    }
}

```

Configure the remote data service

When the remote data is configured for the [DataSource](#), the service method will receive an additional `KanbanVirtualization` parameter to handle the initial data load for Kanban Virtualization.

To handle Kanban virtual scrolling, the server-side code needs to handle the `Where` and `Take` queries differently using the `KanbanVirtualization` parameter. The following is the example code for handling Kanban virtualization's initial data load using the `KanbanVirtualization` parameter.

HOMECONTROLLER.CS

```
public IActionResult LoadCard([FromBody] ExtendedDataManagerRequest dm)
{
    kanbanData = _context.KanbanCards.ToList();
    IEnumerable<KanbanCard> DataSource = kanbanData.AsEnumerable();
    DataOperations operation = new DataOperations();
    // For normal kanban data load `Where` query handling.
    if (dm.Where != null && dm.Where.Count > 0 && dm.KanbanVirtualization !=
        "KanbanVirtualization")
    {
        dm.Where[0].value = dm.Where[0].value.ToString();
        DataSource = operation.PerformFiltering(DataSource, dm.Where,
            dm.Where[0].Operator);
    }
    if (dm.Skip != 0)
    {
        DataSource = operation.PerformSkip(DataSource, dm.Skip);
    }
    // For normal Kanban data load `Take` query handling.
    if (dm.Take != 0 && dm.KanbanVirtualization != "KanbanVirtualization")
    {
        DataSource = operation.PerformTake(DataSource, dm.Take);
    }
    // For Kanban virtual scrolling data load `Where` and `Take` query handling.
    var columnCount = new List<KeyValuePair<string, int>>();
    if (dm.KanbanVirtualization == "KanbanVirtualization" && dm.Where != null &&
        dm.Where.Count > 0 && dm.Take != 0)
    {
        IEnumerable<KanbanCard> currentData = new List<KanbanCard>();
        List<WhereFilter> currentFilter = new List<WhereFilter>();
        for (int i = 0; i < dm.Where.Count; i++)
        {
            dm.Where[i].value = dm.Where[i].value.ToString();
            currentFilter.Add(dm.Where[i]);
            var filterData = operation.PerformFiltering(DataSource, currentFilter,
                dm.Where[i].Operator);
            columnCount.Add(new KeyValuePair<string, int>(dm.Where[i].value.ToString(),
                filterData.Count()));
            filterData = operation.PerformTake(filterData, dm.Take);
            currentData = currentData.Concat(filterData);
            currentFilter.Clear();
        }
        DataSource = currentData;
    }
    // To return the data for Kanban virtual scrolling.
    if (dm.KanbanVirtualization == "KanbanVirtualization") {
```

```
return Json(new { result = DataSource, count = columnCount });
}
// To return the data for Kanban virtual scrolling.
else
{
return Json(DataSource);
}
}
```

Limitations for virtual scrolling

- When virtualization is enabled in a Kanban board and the card height is not explicitly set, it will not default to `auto` height. Instead, a fixed height of `100px` will be applied to the cards. It's important to note that the card height should be specified in pixel values, as percentage values are not accepted.
- When a card is dragged and dropped, the index position of the card will not be preserved when scrolling through the column.
- Virtualization is not supported for swimlanes in the Kanban board.

Globalization in ASP.NET MVC Kanban control

The localization library allows you to localize the default text content of the Kanban to different cultures using the `Locale` property.

In Kanban, total count and min or max count text alone will be localized based on culture.

| | | |
|---------------|--|--|
| Locale key | en-US (default) | |
| ----- | ----- | |
| items | items | |
| min | Min | |
| max | Max | |
| cardsSelected | Cards Selected | |
| addTitle | Add New Card | |
| editTitle | Edit Card Details | |
| deleteTitle | Delete Card | |
| deleteContent | Are you sure you want to delete this card? | |
| save | Save | |
| delete | Delete | |
| cancel | Cancel | |
| yes | Yes | |
| no | No | |
| close | Close | |
| noCard | No cards to display | |

| unassigned | Unassigned |

Loading translations

To load translation object in an application, use `load` function of `L10n` class.

The following example demonstrates the Kanban in `Deutsch` culture.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)
ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Locale("de").SwimlaneSettings(swim => {
    swim.KeyField("Assignee");
}).Render()
<script>
    ej.base.L10n.load({
        'de': {
            'kanban': {
                'items': 'Artikel',
                'min': 'Min',
                'max': 'Max',
                'cardsSelected': 'Karten ausgewählt',
                'addTitle': 'Neue Karte hinzufügen',
                'editTitle': 'Kartendetails bearbeiten',
                'deleteTitle': 'Karte löschen',
                'deleteContent': 'Möchten Sie diese Karte wirklich
löschen?',
                'save': 'speichern',
                'delete': 'Löschen',
                'cancel': 'Stornieren',
                'yes': 'Ja',
                'no': 'Nein',
                'close': 'Schließen',
                'noCard': 'Keine Karten zum Anzeigen',
                'unassigned': 'nicht zugewiesen'
            }
        }
    })
</script>
```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

Right to left (RTL)

The Kanban provides an option to switch its text direction and layout from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable right-to-left mode in Kanban, set the `EnableRtl` to true.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").EnableRtl(true).DataSource((
IEnumerable<object>) ViewBag.data).Columns(col =>
{

    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}
```

Output be like the below.

Kanban dimensions in ASP.NET MVC Kanban control

The Kanban dimensions refers to both height and width of the entire layout and it accepts three types of values.

- Auto
- Pixel
- Percentage

Auto height and width

When height and width of the Kanban are set to **auto**, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Kanban, its width or height will be the sum of its children. By default, Kanban is assigned with **auto** values for both the height and width properties.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").Height("auto").Width("auto")
.DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
```

```

        {
            col.HeaderText("To Do").KeyField("Open").Add();
            col.HeaderText("In Progress").KeyField("InProgress").Add();
            col.HeaderText("Testing").KeyField("Testing").Add();
            col.HeaderText("Done").KeyField("Close").Add();
        }).CardSettings(card => {
            card.ContentField("Summary").HeaderField("Id");
        }).Render()
    }
}

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Output be like the below.

State Persistence in ASP.NET MVC Kanban control

State persistence refers to the Kanban state maintained in the browser's [LocalStorage](#) even if the browser is refreshed or if you move to the next page within the browser.

State persistence stores Kanban datasource, column or swimlane expand/collapse state in the local storage when the `EnablePersistence` is defined as true.

CSHTML

```
@Html.EJS().Kanban("kanban").EnablePersistence(true).KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

CONTROLLER.CS

```

public class HomeController : Controller
{
    public ActionResult Index()
    {
        ViewBag.data = new KanbanDataModels().KanbanTasks();
        return View();
    }
}

```

Responsive mode

The Kanban component has support for responsive behavior based on the client browser's width and height.

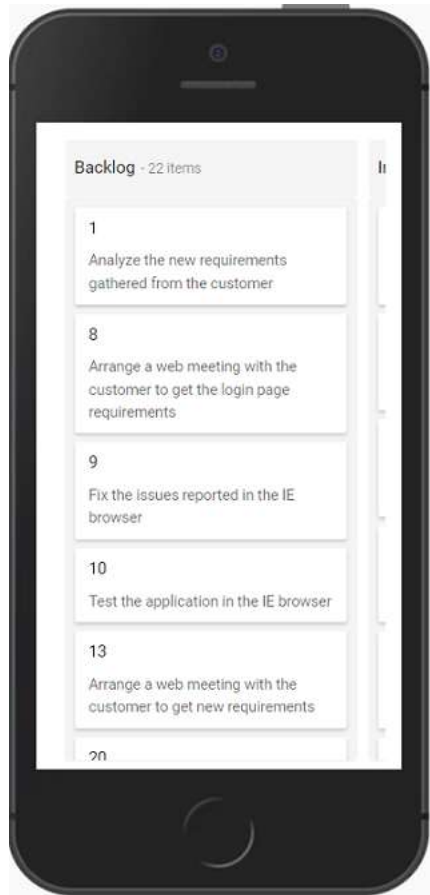

Layouts

Possible layouts are:

- Default Layout
- Swimlane Layout

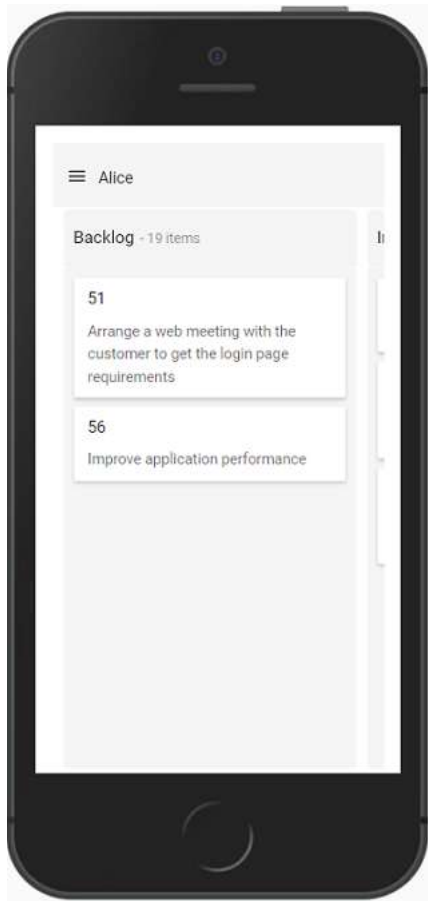

Default Layout

Kanban user interface is customized and redesigned for the best view on small screens. In responsive mode, the first column occupies 80% and the second column occupies 20% of the screen layout. Tap and hold the Kanban card to drag and drop it. Swipe left or right to view the columns.

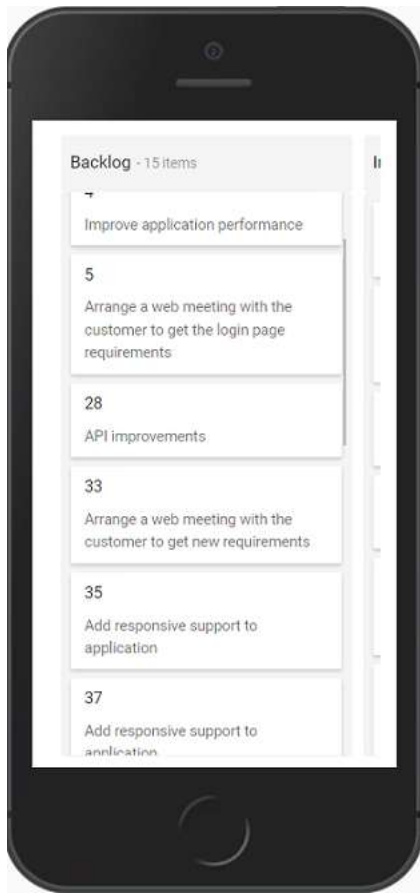

Swimlane Layout

Kanban swimlane header is rendered with menu icon on top of the kanban board. It will show all the available swimlane groups of the header text with a popup when clicking the menu icon. Swimlane selected grouped header text resultant data is rendered on the Kanban board. By default, the first swimlane grouped header text is selected and the resultant data is shown on the Kanban board. The Kanban board data will be changed when changing the swimlane group header text.

Scrolling

Column scrolling will be shown when exceeding the screen size in the columns.

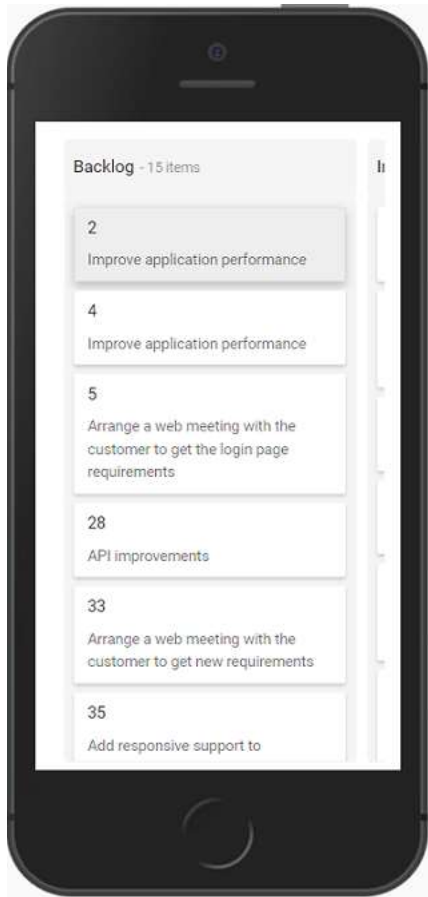

Selection

Select particular cards in the Kanban board by tapping the card.

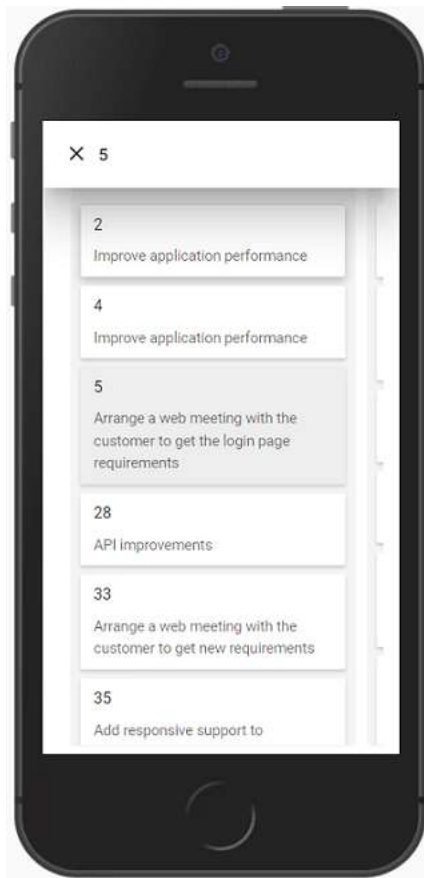

Single Selection

Single card will be selected when you tap the card once and selection will be removed when you select another card.

Multiple Selection

Enable [selectionType](#) as **Multiple** to select multiple cards. It will open the popup on the screen top. Selected card header text will be shown when selecting single card with a tap and hold action. If single card is selected, only tap action is required to select multiple cards. Multiple Selected card count will be shown on the popup when selecting multiple cards.

Styling and appearance

To modify the Kanban appearance, you need to override the default CSS of Kanban. Also, you have an option to create your own custom theme using our [Theme Studio](#). Find the list of CSS classes in Kanban.

| Css class | Purpose |
|---|------------------|
| ----- | ----- |
| .e-kanban | .e-kanban-table |
| customize the kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| Header cells of kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| .e-header-wrap | |
| .e-header-title | |
| Header title of kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| .e-min-color | |
| Header cells minimum color of kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| .e-max-color | |
| Header cells maximum color of kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| .e-collapsed | |
| .e-min-color | |
| Header cells of collapsed column minimum color in column constraint type of kanban. | |
| .e-kanban | .e-kanban-header |
| .e-header-cells | |
| .e-collapsed | |
| .e-max-color | |
| Header cells of collapsed column maximum color in column constraint type of kanban. | |

To set fixed position to the Kanban header

The Fixed header in Kanban control can be customized in following ways,

By setting a fixed height to the Kanban content,

```
`CSS
.e-kanban .e-kanban-content {
height: 500px;
}
`
```

By customizing the CSS for the Kanban header.

```
`CSS
.e-kanban-header {
position: -webkit-sticky;
position: sticky;
z-index: 100;
top: 0;
}
`
```

Note: It will not affect the Kanban content's height.

Accessibility in ASP.NET MVC Kanban control

The Kanban control has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This control is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Kanban control is outlined below.

| | | |
|-------------------------------------|---|--|
| Accessibility Criteria | Compatibility | |
| -- | -- | |
| WCAG 2.2 Support | ! [Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) | |
| Section 508 Support | ! [Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) | |
| Screen Reader Support | ! [Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) | |
| Right-To-Left Support | ! [Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) | |
| Color Contrast | ! [Intermediate](https://cdn.syncfusion.com/content/images/documentation/partial.png) | |
| Mobile Device Support | ! [Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) | |

| [Keyboard Navigation Support](#) |

![Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) |

| Accessibility Checker Validation |

![Intermediate](https://cdn.syncfusion.com/content/images/documentation/partial.png) |

| Axe-core Accessibility Validation |

![Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

![Yes](https://cdn.syncfusion.com/content/images/documentation/full.png) - All features of the control meet the requirement.

![Intermediate](https://cdn.syncfusion.com/content/images/documentation/partial.png) - Some features of the control do not meet the requirement.

![No](https://cdn.syncfusion.com/content/images/documentation/not-supported.png) - The control does not meet the requirement.

WAI-ARIA attributes

The Kanban control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Kanban control:

| Attributes | Purpose |

| --- | --- |

| **aria-label** | It helps to provides information about elements in a kanban control for assistive technology. |

| **aria-expanded** | Attributes indicate the state of a collapsible element. |

| **aria-selected** | This attribute is assigned to the Kanban control for the selection of elements, and its default value is **false**. The value changes to true when the user selects a Kanban card. |

| **aria-grabbed** | Indicates whether the attribute is set to true. It has been selected for dragging. If this attribute is set to false, the element can be grabbed for a drag-and-drop operation but will not be currently grabbed. |

| **aria-describedby** | This attribute contains the ID of the Kanban header column to indicate that the attribute establishes an association between the Kanban header column and the Kanban column body. |

| **aria-roledescription** | This attribute is assigned to the Kanban control and is used to provide alternative descriptions for card elements. |

Keyboard interaction

The Kanban control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Kanban control.

| **Press** | **To do this** |

| --- | --- |

| **Home** | To select the first card in the kanban |

| **End** | To select the last card in the kanban |

| **Arrow Up** | Select the card through the up arrow |

| **Arrow Down** | Select the card through the down arrow |

| **Arrow Right** | Move the column selection to the right |

| **Arrow Left** | Move the column selection to the left |

| **Ctrl + Enter** | Used to select the multi cards |

| **Ctrl + Space** | Used to select the multi cards |

| **Shift + Arrow Up** | Used to select the multiple cards towards up |

| **Shift + Arrow Down** | Used to select the multiple cards towards down |

| **Shift + Tab** | Reverse order of the tab action |

| **Enter** | Open the selected cards |

| **Tab** | To navigate the Kanban column |

| **Delete** | To delete the selected cards |

| **ESC** | Escape from the modified details |

| **Space** | Used to open the card edit dialog based on the column selection |

Disable keyboard interaction

Disables all the functionalities in the Kanban board performed using keyboard by setting the `AllowKeyboard` properties to `False`.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).AllowKeyboard(false).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card =>
{
    card.ContentField("Summary").HeaderField("Id");
}).Render()
```

    }
}

```

Ensuring accessibility

The Kanban control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Kanban control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Kanban control with accessibility tools.

How To

Add header double click

You can bind the header double click event by using the [dataBound](#) event at the initial rendering. You can get the column header text when you double click on the headers.

CSHTML

```
@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).DataBound("onDataBound").Render()

<script>
function onDataBound(args) {
    var headerEle = document.querySelector('.e-header-row');
    headerEle.addEventListener("dblclick", function (e) {
        var target = ej.base.closest(e.target, '.e-header-cells');
        ej.popups.DialogUtility.alert({
            title: 'Header',
            content: "Double clicked on " + target.querySelector('.e-header-text').innerText + " header",
            showCloseIcon: true,
            closeOnEscape: true,
            animationSettings: { effect: 'Zoom' }
        });
    });
}
</script>
```

Output be like the below.

Change Kanban columns dynamically

You can dynamically change the Kanban columns by using the [columns](#) property.

In the below sample, you can dynamically change the [allowToggle](#) property at the particular column when you click on the button. You can also change the initially created columns to the new Kanban columns by using the [columns](#) property when you click on the button.

CSHTML

```
@Html.EJS().Button("particularColumn").Content("Enable Allow Toggle").Render()
@Html.EJS().Button("column").Content("Change Columns").Render()
@Html.EJS().Kanban("kanban").KeyField("Status").Created("onCreate").DataSource(
    (IEnumerable<object>) ViewBag.data).Columns(col =>
    {
        col.HeaderText("To Do").KeyField("Open").Add();
        col.HeaderText("In Progress").KeyField("InProgress").Add();
        col.HeaderText("Testing").KeyField("Testing").Add();
        col.HeaderText("Done").KeyField("Close").Add();
    }).CardSettings(card => {
        card.ContentField("Summary").HeaderField("Id").ShowHeader(false);
    }).Render()
<script type="text/javascript">
    var kanbanObj;
    function onCreate() {
        kanbanObj = this;
    }
    document.getElementById('particularColumn').onclick = function () {
        kanbanObj.columns[1].allowToggle= true;
    };
    document.getElementById('column').onclick = function () {
        kanbanObj.columns = [
            { headerText: 'To Do', keyField: 'Open' },
            { headerText: 'Done', keyField: 'Close' }
        ]
    };
</script>
```

Output be like the below.

Filtering Cards

You can filter the collection of cards from the dataSource and display it on the Kanban board by using the [query](#) property.

In the below sample, you can filter the cards based on the 'where' query and display the filtered data to the Kanban board.

CSHTML

```
@Html.EJS().DropDownList("priority_filter").Placeholder("Select a
priority").Index(0).Created("change").DataSource((IEnumerable<object>)ViewBag.
PriorityData).Fields(new
Syncfusion.EJ2.DropDowns.DropDownListFieldSettings { Value = "Priority"
}).Render()
@Html.EJS().Kanban("kanban").KeyField("Status").Created("onCreate").DataSou
rce((IEnumerable<object>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id").ShowHeader(false);
}).Render()
<script type="text/javascript">
    var kanbanObj;
    function onCreate() {
        kanbanObj = this;
    }
    function change(args) {
        var filterQuery = new ej.data.Query();
        if (args.value !== 'None') {
            filterQuery = new ej.data.Query().where('Priority', 'equal',
args.value);
        }
        kanbanObj.query = filterQuery;
    }
</script>
```

- 29034", Status = "Testing", Summary = "Test editing functionality.", Type
= "Story", Priority = "Normal", Tags = "Editing,Test", Estimate = 0.5,
Assignee = "Nancy Davloio", RankId = 5 });

        TaskDetails.Add(new KanbanDataModels { Id = "Task 29", Title = "Task
- 29035", Status = "Testing", Summary = "Fix editing issues reported in
Firefox.", Type = "Bug", Priority = "Critical", Tags = "Editing,Fix",
Estimate = 1.5, Assignee = "Robert King", RankId = 7 });

        TaskDetails.Add(new KanbanDataModels { Id = "Task 30", Title = "Task
- 29036", Status = "Testing", Summary = "Test editing feature in the IE
browser.", Type = "Story", Priority = "Normal", Tags = "Testing", Estimate =
5.5, Assignee = "Janet Leverling", RankId = 10 });

        return TaskDetails;
    }
}

```

Output be like the below.

Low

Searching Cards

You can search the cards in Kanban by using the `query` property.

In the following sample, the searching operation starts as soon as you start typing characters in the external text box. It will search the cards based on the `Id` and `Summary` using the `search` query with `contains` operator.

C#HTML

```
<table>
  <tbody>
    <td style="width: 200px">
      @Html.EJS().TextBox("search_text").Placeholder("Enter search
text").ShowClearButton(true).Created("searchCreate").Render();
    </td>
    <td>
      @Html.EJS().Button("reset_filter").Content("Reset").Render()
    </td>
  </tbody>
</table>

@Html.EJS().Kanban("kanban").KeyField("Status").DataSource((IEnumerable<obje
ct>)ViewBag.data).Columns(col =>
{
    col.HeaderText("To Do").KeyField("Open").Add();
    col.HeaderText("In Progress").KeyField("InProgress").Add();
    col.HeaderText("Testing").KeyField("Testing").Add();
    col.HeaderText("Done").KeyField("Close").Add();
}).CardSettings(card => {
    card.ContentField("Summary").HeaderField("Id");
}).Created("kanbanCreate").Render()

<script>
```

```

var kanbanObj, textObj;
function kanbanCreate() {
    kanbanObj = this;
}
function searchCreate() {
    textObj = this;
}
function change(args) {
    var filterQuery = new ej.data.Query();
    if (args.value !== 'None') {
        filterQuery = new ej.data.Query().where('Priority', 'equal',
args.value);
    }
    kanbanObj.query = filterQuery;
}
document.getElementById('reset_filter').onclick = function () {
    textObj.value = '';
    kanbanObj.query = new ej.data.Query();
};
document.getElementById('search_text').onkeyup = function (e) {
    var searchValue = e.target.value;
    var searchQuery = new ej.data.Query();
    if (searchValue !== '') {
        searchQuery = new ej.data.Query().search(searchValue, ['Id',
'Summary'], 'contains', true);
    }
    kanbanObj.query = searchQuery;
};
</script>

```

}

```

Output be like the below.

Linear Gauge

Getting Started with ASP.NET MVC Linear Gauge Control

This section briefly explains about how to include [ASP.NET MVC Linear Gauge](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add script resources

Here, the script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Linear Gauge control

Now, add the Syncfusion ASP.NET MVC Linear Gauge control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().LinearGauge("container").Render();
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Linear Gauge control will be rendered in the default web browser.

**Add Gauge Title**

The title for the Linear Gauge can be set using [Title](#) property in Linear Gauge.

CSHTML

```
@Html.EJS().LinearGauge("container").Title("Temperature Measure").Render();
```

Temperature Measure

Axis

The start value and end value for the Linear Gauge can be set using the [Minimum](#) and [Maximum](#) properties in the `axis` object.

C#HTML

```
@Html.EJS().LinearGauge("container").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Minimum = 0, Maximum = 200
    })}.Render();
```

Note: [View Sample in GitHub.](#)

Note: You can also explore our [ASP.NET MVC Linear Gauge example](#) that shows you how to render the Linear Gauge in ASP.NET MVC.

Dimensions in ASP.NET MVC Linear Gauge

<!-- markdownlint-disable MD036 -->

Size for Linear Gauge

The height and width of the Linear Gauge can be set using the [Height](#) and [Width](#) properties in [LinearGauge](#).

In Pixel

The size of the Linear Gauge can be set in pixel as demonstrated below.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;  
@Html.EJS().LinearGauge("linear").Width("650px").Height("350px").Render()
```

PIXEL.CS

```
using System;  
using System.Collections.Generic;  
using System.Diagnostics;  
using System.Linq;  
using System.Threading.Tasks;  
using Microsoft.AspNetCore.Mvc;  
using EJ2_Core_Application.Models;  
using Newtonsoft.Json;  
using Syncfusion.EJ2.Charts;
```

```
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

In Percentage

By setting value in percentage, Linear Gauge receives its dimension matching to its parent. For example, when the height is set as **50%**, Linear Gauge renders to half of the parent height. The Linear Gauge will be responsive when the width is set as **100%**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").Width("100%").Height("50%").Render()
```

PERCENTAGE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {

```

```

        return View();
    }
}

```

Note: When the component's size is not specified, the height will be **450px** and the width will be the same as the parent element's width.

Axis in ASP.NET MVC Linear Gauge

Axis is used to indicate the numeric values in the linear scale. The Linear Gauge component can have any number of axes. The sub-elements of an axis are line, ticks, labels, ranges, and pointers.

Setting the start value and end value of the axis

The start value and end value for the Linear Gauge can be set using the [Minimum](#) and [Maximum](#) properties in the [LinearGaugeAxis](#) respectively. By default, the start value of the axis is **0** and the end value of the axis is **100**.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Minimum=20, Maximum=200
    }
}).Render()

```

Line Customization

The following properties in the [LinearGaugeLine](#) can be used to customize the axis line in the Linear Gauge.

- [Height](#) - To set the length of the axis line.
- [Width](#) - To set the thickness of the axis line.
- [Color](#) - To set the color of the axis line.
- [Offset](#) - To render the axis line with the specified distance from the Linear Gauge.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;  
@Html.EJS().LinearGauge("gauge").Axes(new  
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>  
{  
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis  
    {  
        Line = new Syncfusion.EJ2.LinearGauge.LinearGaugeLine  
        {  
            Height = 150, Width= 2, Color = "#4286f4", Offset = 2  
        }  
    }  
}).Render()
```

LINE-CUSTOMIZATION.CS

```
using System;
```

```

using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Ticks Customization

Ticks are used to specify the interval in the axis. Ticks are of two types, major ticks and minor ticks. The following properties in the [LinearGaugeMajorTicks](#) and [LinearGaugeMinorTicks](#) can be used to customize the major ticks and minor ticks respectively.

- [Height](#) - To set the length of the major and minor ticks in pixel values.
- [Color](#) - To set the color of the major and minor ticks of the Linear Gauge.
- [Width](#) - To set the thickness of the major and minor ticks in pixel values.
- [Interval](#) - To set the interval for the major ticks and minor ticks in the Linear Gauge.

<!-- markdownlint-disable MD036 -->

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        MajorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
        {
            Height=10, Width=2, Interval=20, Color="red"
        },
        MinorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
        {
            Height = 5, Width = 2, Interval = 5, Color = "Orange"
        }
    }
}).Render()
```

TICKS-CUSTOMIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Positioning the ticks

The minor and major ticks can be positioned by using the [Offset](#) and [Position](#) properties. The [Offset](#) is used to render the ticks with the specified distance from the axis. By default, the offset value is **0**. The possible values of the [Position](#) property are **Inside**, **Outside**, **Cross**, and **Auto**. By default, the ticks will be placed inside the axis.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        MajorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
        {
            Height=10, Width=2, Interval=20, Color="red", Position =
Position.Outside
        },
        MinorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
        {
            Height = 5, Width = 2, Interval = 5, Color = "Orange", Position
= Position.Cross
        }
    }
}).Render()
```

TICK-POSITION.CS

```
using Microsoft.AspNetCore.Mvc;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Labels Customization

The style of the labels can be customized using the following properties in [LinearGaugeFont](#) in the [LinearGaugeLabel](#).

- [Color](#) - To set the color of the axis label.
- [FontFamily](#) - To set the font family of the axis label.
- [FontStyle](#) - To set the font style of the axis label.
- [FontWeight](#) - To set the font weight of the axis label.
- [Opacity](#) - To set the opacity of the axis label.
- [Size](#) - To set the size of the axis label.

<!-- markdownlint-disable MD036 -->

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
```

```
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
        {
            Font = new LinearGaugeFont
            {
                FontFamily = "Roboto",
                Size = "12px",
                Color = "red",
                Opacity = 1,
                FontWeight = "Regular"
            }
        }
    }
}).Render()
```

LABELS-CUSTOMIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Positioning the axis label

Labels can be positioned by using [Offset](#) and [Position](#) properties in the [LinearGaugeLabel](#). The [Offset](#) defines the distance between the labels and ticks. By default, the offset value is **0**. The possible values of [Position](#) property are **Inside**, **Outside**, **Cross**, and **Auto**. By default, the labels will be placed inside the axis.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
        {
            Position = Position.Cross
        }
    }
}).Render()
```

LABEL-POSITION.CS

```
using Microsoft.AspNetCore.Mvc;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
        }
    }
}
```

```

    {
        return View();
    }
}

```

Customizing the display of the last label

If the last label is not in the visible range, it will be hidden by default. The last label can be made visible by setting the [ShowLastLabel](#) property as **true** in the [LinearGaugeAxis](#).

<!-- markdownlint-disable MD036 -->

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Minimum = 0, Maximum = 115, ShowLastLabel = true
    }
}).Render()

```

        {
            return View();
        }
    }
}

```

<!-- markdownlint-disable MD036 -->

Label Format

Axis labels in the Linear Gauge control can be formatted using the [Format](#) property in [LinearGaugeLabel](#). It is used to render the axis labels in a certain format or to add a user-defined unit in the label. It works with the help of placeholder like **{value}°C**, where **value** represents the axis value. For example, 20°C.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
        {
            Format = "{value}°C"
        }
    }
}).Render()
```

LABEL-FORMAT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Displaying numeric format in labels

The numeric formats such as currency, percentage, and so on can be displayed in the labels of the Linear Gauge using the [Format](#) property in the Linear Gauge component. The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

| Label Value | Label Format property value | Result | Description |
|-------------|-----------------------------|------------|---|
| 1000 | n1 | 1000.0 | The number is rounded to 1 decimal place. |
| 1000 | n2 | 1000.00 | The number is rounded to 2 decimal place. |
| 1000 | n3 | 1000.000 | The number is rounded to 3 decimal place. |
| 0.01 | p1 | 1.0% | The number is converted to percentage with 1 decimal place. |
| 0.01 | p2 | 1.00% | The number is converted to percentage with 2 decimal place. |
| 0.01 | p3 | 1.000% | The number is converted to percentage with 3 decimal place. |
| 1000 | c1 | \$1,000.0 | The currency symbol is appended to number and number is rounded to 1 decimal place. |
| 1000 | c2 | \$1,000.00 | The currency symbol is appended to number and number is rounded to 2 decimal place. |

CHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Format("c").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
    }
}) .Render()
```

CUSTOM-LABEL.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;

using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Orientation

By default, the Linear Gauge is rendered vertically. To change its orientation, the [Orientation](#) property must be set to **Horizontal**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Orientation(Orientation.Horizontal).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Minimum = 20, Maximum = 140
    }
}).Render()
```

ORIENTATION.CS

```
using System;
using System.Collections.Generic;

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
```

```
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Inverted Axis

The axis of the Linear Gauge component can be inverted by setting the [IsInversed](#) property to **true** in the [LinearGaugeAxis](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        IsInversed = true
    }
}).Render()
```

INVERTED-AXES.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Opposed Axis

To place an axis opposite from its original position, [OpposedPosition](#) property in the [LinearGaugeAxis](#) must be set as **true**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        OpposedPosition = true
    }
}).Render()
```

using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
```

```

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Multiple Axes

Multiple axes can be added to the Linear Gauge by adding multiple [LinearGaugeAxis](#) in the [LinearGaugeAxes](#) and customization can be done with the [LinearGaugeAxis](#). Each axis can be customized separately as shown in the following example.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
        {
            Format="{value}°C"
        }
    },
}

```

```
new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
{
    OpposedPosition = true,
    LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
    {
        Format="{value}°F"
    }
}
}).Render()
```

MULTIPLE-AXES.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Ranges in ASP.NET MVC Linear Gauge

Range is the set of values in the axis. The range can be defined using the [Start](#) and [End](#) properties in the [LinearGaugeRange](#). Any number of ranges can be added to the Linear Gauge using the [LinearGaugeRanges](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Ranges = new List<LinearGaugeRange>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {
                Start = 50, End = 80
            }
        }
    }
}).Render();
```

RANGES.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
```

```

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Customizing the range

Ranges can be customized using the following properties in [LinearGaugeRange](#).

- [StartWidth](#) - Customize the range thickness at the start axis value.
- [EndWidth](#) - Customize the range thickness at the end axis value.
- [Color](#) - Customize the range color.
- [Position](#) - To place the range. By default, the range is placed outside of the axis. To change the position, this property can be set as "Inside", "Outside", "Cross", or "Auto".
- [Offset](#) - To place the range with specified distance from the axis.
- [Border](#) - Customize color and width of range border.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Ranges = new List<LinearGaugeRange>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {

```

```
                Start = 20, End = 60, StartWidth = 10, EndWidth = 20, Color  
= "red"  
            }  
        }  
    }  
}).Render();
```

RANGE-CUSTOMIZATION.CS

```
using System;  
using System.Collections.Generic;  
using System.Diagnostics;  
using System.Linq;  
using System.Threading.Tasks;  
using Microsoft.AspNetCore.Mvc;  
using EJ2_Core_Application.Models;  
using Newtonsoft.Json;  
using Syncfusion.EJ2.Charts;  
using Syncfusion.EJ2.LinearGauge;  
namespace EJ2_Core_Application.Controllers  
{  
    public class HomeController : Controller  
    {  
        public IActionResult Index()  
        {  
            return View();  
        }  
    }  
}
```

Setting the range color for the labels

To set the color of the labels like the range color, set the [UseRangeColor](#) property as **true** in the [LinearGaugeLabel](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
        {
            UseRangeColor = true
        },
        Ranges = new List<LinearGaugeRange>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {
                Start = 20, End = 60, Color = "red"
            }
        }
    }
}).Render();
```

RANGE-LABELCOLOR.CS

```
using Microsoft.AspNetCore.Mvc;
```

```
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Multiple ranges

Multiple ranges can be added to the Linear Gauge by adding collections of [LinearGaugeRange](#) in the [LinearGaugeRanges](#) and customization of ranges can be done with [LinearGaugeRange](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Ranges = new List<LinearGaugeRange>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {
```

```
                Start = 0, End = 30, Color = "#41f47f", StartWidth = 10,
EndWidth = 10
            },
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {
                Start = 30, End = 50, Color = "#f49441", StartWidth = 10,
EndWidth = 10
            },
            new Syncfusion.EJ2.LinearGauge.LinearGaugeRange
            {
                Start = 50, End = 100, Color = "#cd41f4", StartWidth = 10,
EndWidth = 10
            }
        }
    }
}).Render();
```

MULTIPLE-RANGES.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Gradient Color

Gradient support allows the addition of multiple colors in the range. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear-gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [StartValue](#) property. The end value of the linear gradient will be set using the [EndValue](#) property. The color stop values such as [Color](#), [Opacity](#), and [Offset](#) to be defined in [ColorStop](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Load("onGaugeLoad").Orientation(Orientation.Horizontal).Container(
    new Syncfusion.EJ2.LinearGauge.LinearGaugeContainer {
        Width = 30, Offset = 30 }
).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin{
    Bottom=50}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Minimum = 0, Maximum = 100,
        Line = new Syncfusion.EJ2.LinearGauge.LinearGaugeLine {
            Width = 0 },
```

```

        MajorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
    { Interval= 25, Height= 0 },
        MinorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
    { Height=0 },
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
    { Offset = 55 },
    }
    }.Render();
<script type="text/javascript">
    function onGaugeLoad(sender) {
        sender.gauge.axes[0].pointers = [{
            value: 80, height: 25,
            width: 35, placement: 'Near',
            offset: -44, markerType: 'Triangle',
            color: '#f54ea2'
        }];
        sender.gauge.axes[0].ranges = [{
            start: 0, end: 80,
            startWidth: 30, endWidth: 30,
            offset: 30,
            linearGradient: {
                startValue: '0%',
                endValue: '100%',
                colorStop: [
                    { color: '#fef3f9', offset: '0%', opacity: 1 },
                    { color: '#f54ea2', offset: '100%', opacity: 1 }]
            }
        }]
    }
</script>

```

LINEARGRADIENT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;

        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [InnerPosition](#) property. The outer circle position of the radial gradient can be set using the [OuterPosition](#) property. The color stop values such as [Color](#), [Opacity](#), and [Offset](#) to be defined in [ColorStop](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Load("onGaugeLoad").Orientation(Orienta
tion.Horizontal).Container(
    new Syncfusion.EJ2.LinearGauge.LinearGaugeContainer
    {
        Width = 30, Offset = 30
    }).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin { Bottom = 50
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
    {

}

```

Note: If we set both gradients for the range, only the linear gradient gets rendered. If we set the [StartValue](#) and [EndValue](#) of the [LinearGradient](#) as empty strings, then the radial gradient gets rendered in the range of the Linear Gauge.

Pointers in ASP.NET MVC Linear Gauge

Pointers are used to indicate values on an axis. The value of the pointer can be modified using the [Value](#) property in [LinearGaugePointer](#).

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{

```

```
new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
{
    Pointers = new List<LinearGaugePointer>
    {
        new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
        {
            Value = 80
        }
    }
}).Render()
```

POINTERS.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Types of pointer

The Linear Gauge supports the following types of pointers:

- Bar
- Marker

The type of pointer can be modified by using the [Type](#) property in [LinearGaugePointer](#).

Marker pointer

A marker pointer is a shape that can be used to mark the pointer value in the Linear Gauge.

Types of marker shapes

By default, the marker shape for the pointer is **InvertedTriangle**. To change the shape of the pointer, use the [MarkerType](#) property in [LinearGaugePointer](#). The following marker types are available in Linear Gauge.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond
- Image
- Text

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
```

```
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, Type = Point.Marker, MarkerType =
MarkerType.Circle
            }
        }
    }
}).Render()
```

MARKER-POINTER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Image can be rendered instead of rendering a shape as a pointer. It can be achieved by setting the [MarkerType](#) property to **Image** and setting the source URL of image to [ImageUrl](#) property in [Pointer](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Orientation(Syncfusion.EJ2.LinearGauge.Orie
ntation.Horizontal).Axes(axes => axes.Minimum(0).Maximum(100)
    .LabelStyle(labelStyle => labelStyle.Font(font =>
font.FontFamily("inherit")).Position(Syncfusion.EJ2.LinearGauge.Position.Out
side))
    .Pointers(pointer =>
    {

pointer.Value(60).MarkerType(Syncfusion.EJ2.LinearGauge.MarkerType.Image).Wi
dth(40).Height(40).ImageUrl("https://ej2.syncfusion.com/aspnetmvc/Content/Li
nearGauge/step-count.png").Offset("-27").Add();
    })
    .MajorTicks(majorTick =>
majorTick.Interval(20).Height(7).Width(1).Position(Syncfusion.EJ2.LinearGaug
e.Position.Outside)).MinorTicks(minorTick =>
minorTick.Height(3).Width(1).Position(Syncfusion.EJ2.LinearGauge.Position.Ou
tside)).Add()).Render()
```

MARKER-POINTER-IMAGE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
```

```

using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Text can be added instead of rendering a shape as a pointer. It can be achieved by setting the [MarkerType](#) property to **Text**, and the text content can be set using the [Text](#) property in [Pointer](#).

The following properties in the [TextStyle](#) property can be used to set the text style for the text pointer.

- [FontFamily](#) - It is used to set the font family for the text pointer.
- [FontStyle](#) - It is used to set the font style for the text pointer.
- [FontWeight](#) - It is used to set the font weight for the text pointer.
- [Size](#) - It is used to set the font size for the text pointer.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@{
    var textStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeFont { Size =
    "18px", FontWeight = "bold" };
}
@Html.EJS().LinearGauge("gauge").Orientation(Syncfusion.EJ2.LinearGauge.Orie
ntation.Horizontal).Axes(axes => axes.Minimum(0).Maximum(100)
    .Line(line => line.Width(0)).LabelStyle(labelStyle =>
labelStyle.Font(font =>

```

```

font.FontFamily("inherit")).Position(Syncfusion.EJ2.LinearGauge.Position.Outside))
    .Pointers(pointer =>
    {

pointer.Value(13).MarkerType(Syncfusion.EJ2.LinearGauge.MarkerType.Text).Text("Low").Color("Black").Offset("-35").TextStyle(textStyle).Add();

pointer.Value(48).MarkerType(Syncfusion.EJ2.LinearGauge.MarkerType.Text).Text("Moderate").Color("Black").Offset("-35").TextStyle(textStyle).Add();

pointer.Value(83).MarkerType(Syncfusion.EJ2.LinearGauge.MarkerType.Text).Text("High").Color("Black").Offset("-35").TextStyle(textStyle).Add();
    })
    .Ranges(range =>
    {

range.Start(0).End(30).StartWidth(50).EndWidth(50).Color("#FB7D55").Position(Syncfusion.EJ2.LinearGauge.Position.Outside).Add();

range.Start(30).End(65).StartWidth(50).EndWidth(50).Color("#ECC85B").Position(Syncfusion.EJ2.LinearGauge.Position.Outside).Add();

range.Start(65).End(100).StartWidth(50).EndWidth(50).Color("#6FC78A").Position(Syncfusion.EJ2.LinearGauge.Position.Outside).Add();
    }).MajorTicks(majorTick =>
majorTick.Interval(20).Height(7).Width(1).Position(Syncfusion.EJ2.LinearGauge.Position.Outside)).MinorTicks(minorTick =>
minorTick.Height(3).Interval(10).Position(Syncfusion.EJ2.LinearGauge.Position.Outside)).Add()).Render()

```

MARKER-POINTER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;

        {
            return View();
        }
    }
}

```

<!-- markdownlint-disable MD036 -->

Marker pointer customization

The marker pointer can be customized using the following properties and class.

- [Height](#) - To set the height of the pointer.
- [Position](#) - The position of the pointer can be changed by setting the value as **Inside**, **Outside**, **Cross**, or **Auto**.
- [Width](#) - To set the width of the pointer.
- [Color](#) - To set the color of the pointer.
- [Placement](#) - To place the pointer in the specified position. By default, the pointer is placed **Far** from the axis. To change the placement, set the [Placement](#) property as **Near**, **Center**, or **None**.
- [Offset](#) - To place the pointer with specified distance from the axis.
- [Opacity](#) - To set the opacity of the pointer.
- [AnimationDuration](#) - To specify the duration of the animation in pointer.
- [Border](#) - To set the color and width for the border of the pointer.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, Type = Point.Marker, MarkerType =
MarkerType.Circle, Height = 15, Width = 15, Color = "#cd41f4"
            }
        }
    }
})
```

```
}
}).Render()
```

Bar pointer

The bar pointer is used to track the axis value. The bar pointer starts from the beginning of the gauge and ends at the pointer value. To enable bar pointer set the [Type](#) property in [LinearGaugePointer](#) as **Bar**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, Type = Point.Bar
            }
        }
    }
}).Render()
```

BAR-POINTER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
```

```
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

<!-- markdownlint-disable MD036 -->

Bar pointer customization

The bar pointer can be customized using following properties and class.

- [Width](#) - To set the thickness of the bar pointer.
- [Color](#) - To set the color of the bar pointer.
- [Offset](#) - To place the bar pointer with the specified distance from it's default position.
- [Opacity](#) - To set the opacity of the bar pointer.

- [RoundedCornerRadius](#) - To set the corner radius of the bar pointer.
- [Border](#) - To set the color and width for the border of the pointer.
- [AnimationDuration](#) - To set the duration of the animation in bar pointer.

Note: The Placement property is not applicable for the bar pointer.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, Type = Point.Bar, Color = "#f44141"
            }
        }
    }
}).Render()
```

BAR-POINTER-CUSTOMIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Multiple pointers

Multiple pointers can be added to the Linear Gauge by adding multiple [LinearGaugePointer](#) in the [LinearGaugePointers](#) and customization for the pointers can be done with [LinearGaugePointer](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            },
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 30, MarkerType = MarkerType.Circle
            },
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, MarkerType = MarkerType.Diamond
            }
        }
    }
}).Render()
```

MULTIPLE-POINTERS.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

**Pointer animation**

Pointer is animated on loading the gauge. This can be handled using the [AnimationDuration](#) property. The duration of the animation can be specified in milliseconds.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 60, AnimationDuration = 1000
            }
        }
    }
}).Render()

```

POINTER-ANIMATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

**Gradient Color**

Gradient support allows the addition of multiple colors in the pointers of the Linear Gauge. The following gradient types are supported in the Linear Gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [StartValue](#) property. The end value of the linear gradient will be set using the [EndValue](#) property. The color stop values such as [Color](#), [Opacity](#), and [Offset](#) are set using [ColorStop](#) property.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;

@Html.EJS().LinearGauge("container").Load("onGaugeLoad").Orientation(Orientation.Horizontal).Container(
    new Syncfusion.EJ2.LinearGauge.LinearGaugeContainer {
        Width = 30, Offset = 30
    }).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin {
        Bottom=50
    }).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
    {
        new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
        {
            Minimum = 0, Maximum = 100,
            Line = new Syncfusion.EJ2.LinearGauge.LinearGaugeLine {
                Width = 0 },
            MajorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
            { Interval= 25, Height= 0 },
            MinorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
            { Height=0 },
            LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
            { Offset = 55 },
        }
    }).Render();
<script type="text/javascript">
    function onGaugeLoad(sender) {
        sender.gauge.axes[0].pointers = [{
            value: 80, height: 25,
            width: 35, placement: 'Near',
            offset: -44, markerType: 'Triangle',
            linearGradient: {
                startValue: '0%',
                endValue: '100%',
                colorStop: [
                    { color: '#fef3f9', offset: '0%', opacity: 1 },
                    { color: '#f54ea2', offset: '100%', opacity: 1 }]
            }
        }];
        sender.gauge.axes[0].ranges = [{
            start: 0, end: 80,
            startWidth: 30, endWidth: 30,
            color: '#f54ea2', offset: 30,
        }]
    }
</script>
```

LINEARGRADIENT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [InnerPosition](#) property. The outer circle position of the radial gradient can be set using the [OuterPosition](#) property. The color stop values such as [Color](#), [Opacity](#), and [Offset](#) are set using [ColorStop](#) property.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Load("onGaugeLoad").Orientation(Orientation.Horizontal).Container(
    new Syncfusion.EJ2.LinearGauge.LinearGaugeContainer {
        Width = 30, Offset = 30
    }).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin {
        Bottom=50
    }).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
    {
        new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
        {
            Minimum = 0, Maximum = 100,
            Line = new Syncfusion.EJ2.LinearGauge.LinearGaugeLine {
                Width = 0 },
            MajorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
            { Interval= 25, Height= 0 },

```

```

        MinorTicks = new Syncfusion.EJ2.LinearGauge.LinearGaugeTick
    { Height=0 },
        LabelStyle = new Syncfusion.EJ2.LinearGauge.LinearGaugeLabel
    { Offset = 55 },
    }
    }.Render();
<script type="text/javascript">
    function onGaugeLoad(sender) {
        sender.gauge.axes[0].pointers = [{
            value: 80, height: 25,
            width: 35, placement: 'Near',
            offset: -44, markerType: 'Triangle',
            radialGradient: {
                radius: '60%',
                outerPosition: { x: '50%', y: '50%' },
                innerPosition: { x: '50%', y: '50%' },
                colorStop: [
                    { color: '#fff5f5', offset: '0%', opacity: 0.9 },
                    { color: '#f54ea2', offset: '100%', opacity: 0.8 }]
            }
        }];
        sender.gauge.axes[0].ranges = [{
            start: 0, end: 80,
            startWidth: 30, endWidth: 30,
            color: '#f54ea2', offset: 30,
        }]
    }
</script>

```

RADIALGRADIENT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Note: If we set both gradients, only the linear gradient gets rendered. If we set the [StartValue](#) and [EndValue](#) of the [LinearGradient](#) as empty strings, then the radial gradient gets rendered in the pointer of the Linear Gauge.

Annotations in ASP.NET MVC Linear Gauge

<!-- markdownlint-disable MD013 -->

Annotations are used to mark the specific area of interest in the Linear Gauge with text, HTML elements, or images. Any number of annotations can be added to the Linear Gauge component.

Adding annotation

To render the custom HTML elements in the Linear Gauge component, use the [Content](#) property in the [LinearGaugeAnnotation](#). The annotation can be rendered either by specifying the id of the element or specifying the code to create a new element that needs to be displayed in the gauge area.

<!-- markdownlint-disable MD036 -->

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Orientation(Orientation.Horizontal).Annotations(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "#walking",
        ZIndex = "1", X = 100, Y = 100
    },
}).Render()
<div>
    <script id="walking" type="text/x-template">
        <div id="annotation" style="width:100px;">
            
            </div>
        </script>
    </div>
```

ANNOTATIONS.CS

```
using System;

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Customization

The following properties are used to customize the annotation.

- [ZIndex](#) - Bring the annotation to the front or back, when annotation overlaps with another element.
- [AxisValue](#) - To place the annotation in the specified axis value with respect to the provided axis index.
- [AxisIndex](#) - To place the annotation in the specified axis with respect to the provided axis value.
- [HorizontalAlignment](#) - To place the annotation horizontally.

- [VerticalAlignment](#) - To place the annotation vertically.
- [X, Y](#) - To place the annotation in the specified location.

Changing the z-index

To change the stack order of an annotation element, the [ZIndex](#) property of the [LinearGaugeAnnotation](#) can be used.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Annotations(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div id='first'><h1>Gauge</h1></div>",
        ZIndex = "1"
    },
}).Render()
```

Z-ORDER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Gauge

Positioning an annotation

The annotation can be placed anywhere in the Linear Gauge by setting the pixel value to the [X](#), and [Y](#) properties in the [LinearGaugeAnnotation](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Annotations(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div id='first'><h1>Gauge</h1></div>",
        ZIndex = "1", X=250, Y=100
    },
}).Render()
```

ANIMATION-POSITION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
```

```
public class HomeController : Controller
{
    public IActionResult Index()
    {
        return View();
    }
}
```

<!-- markdownlint-disable MD036 -->

Alignment of annotation

The annotation can be aligned horizontally and vertically by using the [HorizontalAlignment](#), and [VerticalAlignment](#) properties respectively. The possible values can be **Center**, **Far**, **Near**, and **None**. The [HorizontalAlignment](#), and [VerticalAlignment](#) are not applicable when the [X](#), and [Y](#) properties are set in the [LinearGaugeAnnotation](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Annotations(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div id='first'><h1>Gauge</h1></div>",
        ZIndex = "1", VerticalAlignment=Placement.Center,
        HorizontalAlignment=Placement.Center
    },
}).Render()
```

ANIMATION-ALIGNMENT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Multiple annotations

Multiple annotations can be added to the Linear Gauge component by adding the multiple [LinearGaugeAnnotation](#) in the [LinearGaugeAnnotations](#) and customization for the annotation can be done with the [LinearGaugeAnnotation](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Annotations(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div><h1 style='color: red;'>Speed</h1></div>",
        ZIndex = "1", VerticalAlignment=Placement.Near,
        HorizontalAlignment=Placement.Center, X=100, Y=150
    },
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div><h1 style='color: blue;'>Meter</h1></div>",
        ZIndex = "1", VerticalAlignment=Placement.Center,
        HorizontalAlignment=Placement.Center, X=-100, Y=-100
    }
}).Render()
```

MULTIPLE-ANNOTATIONS.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Animation in ASP.NET MVC Linear Gauge

All of the elements in the Linear Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the [AnimationDuration](#) property. The animation for the Linear Gauge is enabled when the [AnimationDuration](#) property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the component. If the [AnimationDuration](#) property is set to **0**, which is the default value, the animation effect is disabled. If the animation is enabled, the component will behave in the following order.

1. The axis line, ticks, labels, and ranges will all be animated at the same time.
2. If available, pointers will be animated in the same way as [pointer animation](#).
3. If available, annotations will be animated.

The animation of the Linear Gauge is demonstrated in the following example.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("container").Load("gaugeLoad").Orientation(Syncfusion.EJ2.LinearGauge.Orientation.Horizontal).Annotations(
    annotation => annotation.AxisIndex(0).AxisValue(10).X(10).Y(-70).ZIndex("1").Content("<div style='width: 70px;margin-left:-3%;margin-top: 42%;font-size: 16px;'>10 MPH</div>").Add()).Axes(axes =>
    axes.Pointers(pointer =>
        pointer.Width(15).Height(15).Value(10).Offset("-40").Placement(Syncfusion.EJ2.LinearGauge.Placement.Near).MarkerType(Syncfusion.EJ2.LinearGauge.MarkerType.Triangle).Add())
```

```

        .MajorTicks(majorTick =>
majorTick.Interval(10).Height(20).Color("#9E9E9E"))
        .MinorTicks(minorTick =>
minorTick.Interval(2).Height(10).Color("#9E9E9E"))
        .Ranges(range =>
range.Start(0).End(50).StartWidth(10).EndWidth(10).Color("#F45656").Offset(3
5).Add())
        .LabelStyle(labelStyle => labelStyle.Offset(48).Font(font =>
font.FontFamily("inherit"))).Add()).Render()
<script>
    window.gaugeLoad = function (args) {
        args.gauge.animationDuration = 3000;
    }
</script>

```

ANIMATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Only the pointer of the Linear Gauge can be animated individually, not the axis lines, ticks, labels, ranges, and annotations. You can refer this [link](#) to enable only pointer animation.

User Interaction in ASP.NET Linear Gauge

Tooltip

<!-- markdownlint-disable MD036 -->

Linear Gauge displays the details about a pointer value through [LinearGaugeTooltipSettings](#), when the mouse hovers over the pointer. To enable the tooltip, set [Enable](#) property as **true**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings
{
    Enable = true
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
}).Render()
```

TOOLTIP.CS

```
using System;
using System.Collections.Generic;
```

```

using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

<!-- markdownlint-disable MD013 -->

Tooltip format

<!-- markdownlint-disable MD013 -->

Tooltip in the Linear Gauge control can be formatted using the [Format](#) property in [LinearGaugeTooltipSettings](#). It is used to render the tooltip in certain format or to add a user-defined unit in the tooltip. By default, the tooltip shows the pointer value only. In addition to that, more information can be added in the tooltip. For example, the format **{value}km** shows pointer value with kilometer unit in the tooltip.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings {
    Enable = true, Format = "{value}km"
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
}

```

```

    }
}
}) .Render ()

```

TOOLTIP-FORMAT.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Tooltip Template

The HTML element can be rendered in the tooltip of the Linear Gauge using the [Template](#) property in [LinearGaugeTooltipSettings](#). The **{value}** can be used as placeholders in the HTML element to display the pointer values of the corresponding axis.

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings {
    Enable = true, Template = "<div>Pointer: 80 </div>"
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
}).Render()

```

TOOLTIP-TEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Customize the appearance of the tooltip

The tooltip can be customized using the following properties in [LinearGaugeTooltipSettings](#).

- [Fill](#) - To fill the color for tooltip.
- [EnableAnimation](#) - To enable or disable the tooltip animation.
- [Border](#) - To set the border color and width of the tooltip.
- [TextStyle](#) - To customize the style of the text in tooltip.
- [ShowAtMousePosition](#) - To show the tooltip at the mouse position.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings {
    Enable = true, Fill = "#e5bcbc",
    Border = new Syncfusion.EJ2.LinearGauge.TooltipSettingsBorderTooltip
    {
        Width = 2, Color = "#d80000"
    }
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
})
```

```
}).Render()
```

TOOLTIP-APPEARANCE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Positioning the tooltip

The tooltip is positioned at the **End** of the pointer. To change the position of the tooltip at the start, or center of the pointer, set the [Position](#) property to **Start** or **Center**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings {
    Enable = true, Position = TooltipPosition.Center
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 50, Type=Point.Bar, Color="blue"
            }
        }
    }
}).Render()
```

TOOLTIP-POSITION.CS

```
using Microsoft.AspNetCore.Mvc;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Pointer Drag

To drag either marker or bar pointer to the desired axis value, set the [EnableDrag](#) property as **true** in [LinearGaugePointer](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80, EnableDrag = true
            }
        }
    }
}).Render()
```

POINTER-DRAG.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Print and Export in ASP.NET MVC Linear Gauge

Print

The rendered Linear Gauge can be printed directly from the browser by calling the [print](#) method. To use the print functionality, set the [AllowPrint](#) property as **true**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Print").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Height("450px").AllowPrint(true).Width("65
0px").Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.print();
    };
</script>
```

PRINT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
```

```
using Syncfusion.EJ2.LinearGauge;  
namespace EJ2_Core_Application.Controllers  
{  
    public class HomeController : Controller  
    {  
        public IActionResult Index()  
        {  
            return View();  
        }  
    }  
}
```

PRINT

Export

Image Export

To use the image export functionality, set the [AllowImageExport](#) property as **true**. The rendered Linear Gauge can be exported as an image using the [export](#) method. This method requires two parameters: export type and file name. The Linear Gauge can be exported as an image with the following formats.

- JPEG
- PNG
- PDF

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Height("450px").AllowImageExport(true).Wid
th("650px").Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.export('PNG', 'LinearGauge');
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Export

PDF Export

To use the PDF export functionality, set the [AllowPdfExport](#) property as **true**. The rendered Linear Gauge can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters: file type, file name, and orientation of the PDF document. The orientation of the PDF document can be set as **Portrait** or **Landscape**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Height("450px").AllowPdfExport(true).Width
("650px").Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.export('PDF', 'LinearGauge', 0);
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Export

*Exporting Linear Gauge as base64 string of the file*

The Linear Gauge can be exported as base64 string for the JPEG, PNG and PDF formats. The rendered Linear Gauge can be exported as base64 string of the exported image or PDF document used in the

[export](#) method. The arguments that are required for this method is export type, file name, orientation of the exported PDF document and **allowDownload** boolean value that is set as **false** to return base64 string. The value for the orientation of the exported PDF document is set as **null** for image export and **Portrait** or **Landscape** for the PDF document.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Height("450px").AllowImageExport(true).Width("650px").Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.export('JPEG', 'LinearGauge', null, false).then((data) =>
        {
            let base64 = data;
            document.writeln(base64);
        });
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Export

Note: The exporting of the Linear Gauge as base64 string is not applicable for the SVG format.

Appearance in ASP.NET MVC Linear Gauge

Customizing the Linear Gauge area

The following property and classes are available in the [LinearGauge](#) to customize the Linear Gauge area.

- [Background](#) - Applies the background color for the Linear Gauge.
- [Border](#) - To customize the color and width of the border in Linear Gauge.
- [Margin](#) - To customize the margins of the Linear Gauge.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Width("200px").Height("400px").Background("skyblue").Border(new Syncfusion.EJ2.LinearGauge.LinearGaugeBorder
{
    Width = 3, Color = "red"
}).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin {
    Left = 20, Bottom = 20, Right = 20, Top = 20
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
    }
}
).Render()
```

GAUGE-BACKGROUND.CS

        {
            return View();
        }
    }
}
```

Setting up the Linear Gauge title

The title for the Linear Gauge can be set using [Title](#) property in Linear Gauge. Its appearance can be customized using the [TitleStyle](#) with the below properties.

- [Color](#) - Specifies the text color of the title.
- [FontFamily](#) - Specifies the font family of the title.
- [FontStyle](#) - Specifies the font style of the title.
- [FontWeight](#) - Specifies the font weight of the title.
- [Opacity](#) - Specifies the opacity of the title.
- [Size](#) - Specifies the font size of the title.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
```

```
@Html.EJS().LinearGauge("gauge").Title("Linear Gauge").TitleStyle(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTitleStyleLinearGauge {
    FontFamily = "Arial",
    FontStyle = "italic",
    FontWeight = "regular",
    Color = "#E27F2D",
    Size = "23px",
    Opacity = 1
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
    }
})
).Render()
```

using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Linear Gauge

Customizing the Linear Gauge container

The area used to render the ranges and pointers at the center position of the gauge is called container. The following types of container to be applicable for Linear Gauge.

- Normal
- Rounded Rectangle
- Thermometer

The type of the container can be modified by using the [Type](#) property in [LinearGaugeContainer](#). The container can be customized by using the following properties and class in [LinearGaugeContainer](#).

- [Offset](#) - To place the container with the specified distance from the axis of the Linear Gauge.
- [Width](#) - To set the thickness of the container.
- [Height](#) - To set the length of the container.
- [BackgroundColor](#) - To set the background color of the container.
- [Border](#) - To set the color and width for the border of the container.

Normal

The **Normal** type will render the container as a rectangle and this is the default container type.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;  
@Html.EJS().LinearGauge("gauge").Container(new  
Syncfusion.EJ2.LinearGauge.LinearGaugeContainer  
{
```

```
        Width = 30
    }).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
    {
        new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
        {
            Pointers = new List<LinearGaugePointer>
            {
                new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
                {
                    Type = Point.Bar, Value = 50, Width = 15
                }
            }
        }
    })
    .Render()
```

GAUGE-CONTAINER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Rounded Rectangle

The **RoundedRectangle** type will render the container as a rectangle with rounded corner radius. The rounded corner radius of the container can be customized using the [RoundedCornerRadius](#) property in [LinearGaugeContainer](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Container(new
Syncfusion.EJ2.LinearGauge.LinearGaugeContainer
{
    Width = 30, Type= ContainerType.RoundedRectangle
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Type = Point.Bar, Value = 50, Width = 15
            }
        }
    }
}).Render()
```

ROUNDED-RECTANGLE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Thermometer

The **Thermometer** type will render the container similar to the appearance of thermometer.

CHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").Container(new
Syncfusion.EJ2.LinearGauge.LinearGaugeContainer
{
```

```
Width = 30, Type= ContainerType.Thermometer
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Type = Point.Bar, Value = 50, Width = 15
            }
        }
    }
}).Render()
```

THERMO-METER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Fitting the Linear Gauge to the control

The Linear Gauge component is rendered with margin by default. To remove the margin around the Linear Gauge, the [AllowMargin](#) property in the [LinearGauge](#) is set as **false**.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").AllowMargin(false).Orientation(Orientation.
Horizontal).Height("300px").Background("skyblue").Border(new
Syncfusion.EJ2.LinearGauge.LinearGaugeBorder
{
    Width = 3, Color = "red"
}).Margin(new Syncfusion.EJ2.LinearGauge.LinearGaugeMargin {
    Left = 0, Bottom = 0, Right = 0, Top = 0
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
    }
}
).Render()
```

GAUGE-MARGIN.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
```

```

using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
using Syncfusion.EJ2.LinearGauge;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Note: To use this feature, set the [AllowMargin](#) property to **false**, the [Width](#) property to **100%** and the properties of [e-lineargauge-margin](#) to **0**.

Accessibility in ASP.NET MVC Linear Gauge

Linear Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

WAI-ARIA attributes

The Linear Gauge component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Linear Gauge component:

| Attributes | Purpose |
|--------------------|---|
| --- | --- |
| role=region | It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value. |
| aria-label | Provides an accessible name for the axis labels, text pointer and annotation. |

Screen reading in Linear Gauge

Accessibility in the Linear Gauge component ensures that all users, regardless of ability or disability, can use screen reading. The following Linear Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |
|--------------|--|
| --- | --- |
| Axis labels | Reads the axis labels of the Linear Gauge. |
| Text pointer | Reads the text content shown as a pointer in Linear Gauge. |

| Annotation | Reads the content specified in the annotation. |

Ensuring accessibility

The Linear Gauge component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Linear Gauge component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Linear Gauge component with accessibility tools.

Internationalization in ASP.NET MVC Linear Gauge

Globalization is the process of designing and developing a component that works in different cultures. Internationalization is used to globalize the number content in Linear Gauge component using [Format](#) property in Linear Gauge. It has static text on some features such as

- Axis label
- Tooltip

The static text on above features can be changed to any culture such as Arabic, Deutsch and French. To know more about the globalization in ASP.NET MVC components, refer [here](#).

Numeric Format

The text in axis labels and tooltip can be displayed in the numeric format such as currency, percentage and so on. To know more about the numeric formats in axis labels, refer [here](#). In the below example, the axis label is displayed in the currency format.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;  
@Html.EJS().LinearGauge("gauge").Format("c").Axes(new  
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>  
{  
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis  
    {  
    }  
}) .Render()
```

Events in ASP.NET MVC Linear Gauge

This section describes the Linear Gauge component's event that gets triggered when corresponding operations are performed.

AnimationComplete

When the pointer animation is completed, the [AnimationComplete](#) event will be triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").AnimationComplete("animationComplete").Axes(
    new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
    {
        new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
        {
            Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
            {
                new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
                {
                    Value = 10
                }
            }
        }
    }
).Render()
<script>
    function animationComplete(args) {
    }
```

```
</script>
```

AnnotationRender

Before the annotation is rendered in the Linear Gauge, the [AnnotationRender](#) event will be triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").AnnotationRender("annotationRender").Annotations(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "<div id='first'><h1>Gauge</h1></div>",
        ZIndex = "1",
        AxisValue = 0
    },
}).Render()
<script>
    function annotationRender(args) {
    }
</script>
```

AxisLabelRender

Before each axis label is rendered in the Linear Gauge, the [AxisLabelRender](#) event is fired. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").AxisLabelRender("axisLabelRender").Render()
<script>
    function axisLabelRender(args) {
    }
</script>
```

BeforePrint

The [BeforePrint](#) event is fired before the print begins. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").Content("Print").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Height("450px").AllowPrint(true).BeforePrint("beforePrint").Width("650px").Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.print();
    };

    function beforePrint(args) {
```

```

    }
</script>

```

DragEnd

The [DragEnd](#) event will be fired before the pointer drag is completed. To know more about the argument of this event, refer [here](#).

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").DragEnd("dragEnd").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                EnableDrag = true
            }
        }
    }
}).Render()
<script>
    function dragEnd(args) {
    }
</script>

```

DragMove

The [DragMove](#) event will be fired when the pointer is dragged. To know more about the arguments of this event, refer [here](#).

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").DragMove("dragMove").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                EnableDrag = true
            }
        }
    }
}).Render()
<script>
    function dragMove(args) {
    }
</script>

```

DragStart

When the pointer drag begins, the [DragStart](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").DragStart("dragStart").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                EnableDrag = true
            }
        }
    }
}).Render()
<script>
    function dragStart(args) {
    }
</script>
```

GaugeMouseDown

When mouse is pressed down on the gauge, the [GaugeMouseDown](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").GaugeMouseDown("gaugeMouseDown").Render()
<script>
    function gaugeMouseDown(args) {
    }
</script>
```

GaugeMouseLeave

When mouse pointer moves over the gauge, the [GaugeMouseLeave](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").GaugeMouseLeave("gaugeMouseLeave").Render(
)
<script>
    function gaugeMouseLeave(args) {
    }
</script>
```

GaugeMouseMove

When mouse pointer leaves the gauge, the [GaugeMouseMove](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").GaugeMouseMove("gaugeMouseMove").Render()
<script>
    function gaugeMouseMove(args) {
    }
</script>
```

GaugeMouseUp

When the mouse pointer is released over the Linear Gauge, the [GaugeMouseUp](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").GaugeMouseUp("gaugeMouseUp").Render()
<script>
    function gaugeMouseUp(args) {
    }
</script>
```

Load

Before the Linear Gauge is loaded, the [Load](#) event is fired. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").Load("load").Render()
<script>
    function load(args) {
    }
</script>
```

Loaded

After the Linear Gauge has been loaded, the [Loaded](#) event will be triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").Loaded("loaded").Render()
<script>
    function loaded(args) {
    }
</script>
```

Resized

After the window resizing, the [Resized](#) event is triggered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").Resized("resized").Render()

<script>
    function resized(args) {
    }
</script>
```

TooltipRender

The [TooltipRender](#) event is fired before the tooltip is rendered. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("gauge").TooltipRender("tooltipRender").Tooltip(new
Syncfusion.EJ2.LinearGauge.LinearGaugeTooltipSettings
{
    Enable = true
}).Axes(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
}).Render()

<script>
    function tooltipRender(args) {
    }
</script>
```

ValueChange

The [ValueChange](#) event is triggered when the pointer is dragged from one value to another. To know more about the arguments of this event, refer [here](#).

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().LinearGauge("linear").ValueChange("valueChange").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
```

```

        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                EnableDrag = true
            }
        }
    }).Render()
<script>
    function valueChange(args) {
    }
</script>

```

Methods in ASP.NET MVC Linear Gauge

The following methods are available in the Linear Gauge component.

setPointerValue

To change the pointer value dynamically, use the [setPointerValue](#) method in the Linear Gauge component. The following are the arguments for this method.

| Argument name | Description |
|---------------|--|
| axisIndex | Specifies the index of the axis in which the pointer value is to be updated. |
| pointerIndex | Specifies the index of the pointer to be updated. |
| pointerValue | Specifies the value of the pointer to be updated. |

CSHTML

```

@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().Button("togglebtn").Content("Print").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 80
            }
        }
    }
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.setPointerValue(0, 0, 30);
    };
</script>

```

setAnnotationValue

To change the annotation content dynamically, use the [setAnnotationValue](#) method in the Linear Gauge component. The following are the arguments for this method.

| Argument name | Description |
|-----------------|---|
| annotationIndex | Specifies the index number of the annotation to be updated. |
| content | Specifies the text for the annotation to be updated. |
| axisValue | Specifies the value of the axis where the annotation is to be placed. |

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().Button("togglebtn").Content("Print").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
            {
                Value = 10
            }
        }
    }
}).Annotations(new List<Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation> {
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAnnotation
    {
        Content = "10", ZIndex = "1", AxisValue = 0
    }
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.setAnnotationValue(0, '50', 50);
    };
</script>
```

refresh

The [refresh](#) method can be used to change the state of the component and render it again.

CSHTML

```
@using Syncfusion.EJ2.LinearGauge;
@Html.EJS().Button("togglebtn").Content("Print").CssClass("e-flat").Render()
@Html.EJS().LinearGauge("linear").Axes(new
List<Syncfusion.EJ2.LinearGauge.LinearGaugeAxis>
{
    new Syncfusion.EJ2.LinearGauge.LinearGaugeAxis
    {
        Pointers = new List<Syncfusion.EJ2.LinearGauge.LinearGaugePointer>
        {
            new Syncfusion.EJ2.LinearGauge.LinearGaugePointer
```

```

        {
            Value = 10
        }
    }
}
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var linearObj = document.getElementById('linear').ej2_instances[0];
        linearObj.refresh();
    };
</script>

```

Migration from Essential JS 1

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Linear gauge dimensions

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Height | **Property:** *height*

 @Html.EJ().LinearGauge("container")

 .Height("150px") | **Property:** *height*

 @Html.EJS().LinearGauge("container")

 .Height("150px").Render() |

| Width | **Property:** *width*

 @Html.EJ().LinearGauge("container")

 .Width("200px") | **Property:** *width*

 @Html.EJS().LinearGauge("container")

 .Width("200px").Render() |

| Height(In Percentage) | Not Applicable | **Property:** *height*

 @Html.EJS().LinearGauge("container")
 .Height("70%").Render() |

| Width(In Percentage) | Not Applicable | **Property:** *width*

 @Html.EJS().LinearGauge("container")

Property: *locale*

 @Html.EJS().LinearGauge("container")
 .Locale("en-
 US").Render() |

| Theme | **Property:** *theme*

 @Html.EJ().LinearGauge("container")

 .Theme("saffron") | **Property:** *theme*

 @Html.EJS().LinearGauge("container")

 .Theme("Material").Render() |

| Gauge Title | Not Applicable | **Property:** *title*

 @Html.EJS().LinearGauge("container")

 .Title("LinearGauge").Render() |

Gauge Container type

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Container Type | **Property:** *scales.type*

 @Html.EJ().LinearGauge("container")

 .Scales(sc => {sc.Type("Thermometer").Add()}) | **Property:** *container.type*

 @Html.EJS().LinearGauge("container")
 .Container(con =>
 con.Type("Thermometer").Add())
 .Render() |

| Container Height | Not Applicable | **Property:** *container.height*

 @Html.EJS().LinearGauge("container")
 .Container(con =>
 con.Type("Thermometer").Height(20).Add())
 .Render() |

| Container Width | Not Applicable | **Property:** *container.width*

 @Html.EJS().LinearGauge("container")
 .Container(con =>
 con.Type("Thermometer").Width(10).Add())
 .Render() |

| Container Offset | Not Applicable | **Property:** *container.offset*

 @Html.EJS().LinearGauge("container")
 .Container(con =>
 con.Type("Thermometer").Offset(5).Add())
 .Render() |

Events

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Animation Complete Event | Not Applicable | **Event:** *animationComplete*

 @Html.EJS().LinearGauge("container")

 .AnimationComplete("animationComplete").Render()
 function animationComplete(args)

 @Html.EJ().CircularGauge("container")

 .RenderComplete("renderComplete")
 function renderComplete(args) {} | Not
 Applicable |

| Double Click Event | **Event:** *doubleClick*

 @Html.EJ().CircularGauge("container")

 .DoubleClick("doubleClick")
 function doubleClick(args) {} | Not Applicable |

| Right Click Event | **Event:** *rightClick*

 @Html.EJ().CircularGauge("container")

 .RightClick("rightClick")
 function rightClick(args) {} | Not Applicable |

| BarPointers Event | **Event:** *drawBarPointers*

 @Html.EJ().CircularGauge("container")

 .DrawBarPointers("drawBarPointers")
 function drawBarPointers(args) {} | Not
 Applicable |

| Indicators Event | **Event:** *drawIndicators*

 @Html.EJ().CircularGauge("container")

 .DrawIndicators("drawIndicators")
 function drawIndicators(args) {} | Not Applicable |

| MarkerPointer Event | **Event:** *drawMarkerPointers*

 @Html.EJ().CircularGauge("container")

 .DrawMarkerPointers("drawMarkerPointers")
 function drawMarkerPointers(args) {} | Not
 Applicable |

| Ranges Event | **Event:** *drawRange*

 @Html.EJ().CircularGauge("container")

 .DrawRange("drawRange")
 function drawRange(args) {} | Not Applicable |

| Gauge Initialized Event | **Event:** *init*

 @Html.EJ().CircularGauge("container")

 .Init("init")
 function init(args) {} | Not Applicable |

How To

<!-- markdownlint-disable MD034 -->

<!-- markdownlint-disable MD036 -->

Rendering linear gauges dynamically

In the linear gauge control, you can render the number of gauges dynamically and update the pointer values in ajax call.

To render the number of linear gauges dynamically, follow the given steps:

Step 1:

Initialize the data table collection with stock details.

```
`cs
public ActionResult Index()
{
    DataTable dt = new DataTable();
    dt.Columns.Add("Name");
    dt.Columns.Add("FullName");
    dt.Columns.Add("Stock");
    dt.Columns.Add("MaxStock");
    dt.Columns.Add("FreeStock");
    dt.Columns.Add("AvailableStock");
    dt.Columns.Add("StockCode");
    dt.Columns.Add("Status");
    dt.Rows.Add(new Object[] { "T13", "PM01 T13", 5000, 10000, 5000, 8230, "F" });
    dt.Rows.Add(new Object[] { "T14", "PM01 T14", 4000, 9000, 5000, 7230, "F" });
    dt.Rows.Add(new Object[] { "T15", "PM01 T15", 3000, 8000, 5000, 5230, "F" });
    dt.Rows.Add(new Object[] { "T16", "PM01 T16", 2000, 7000, 5000, 5230, "F" });
    List<LinearData> gauges = new List<LinearData>();
    foreach (DataRow row in dt.Rows)
    {
        gauges.Add(CreateLinearGauge(row));
    }
    ViewBag.GaugeData = gauges;
    return View();
}

LinearData CreateLinearGauge(DataRow row)
{
    double minimum = Convert.ToDouble(row["FreeStock"]);
    double maximum = Convert.ToDouble(row["MaxStock"]);
    double value = Convert.ToDouble(row["AvailableStock"]);
    return new LinearData() { Minimum = minimum, Maximum = maximum, Value = value };
}
```

```
}
`
```

Step 2:

Render the linear gauges based on the length of data collection that is from controller page.

```
`html
@{
    var count = 0;
    foreach (LinearData gauge in ViewBag.GaugeData)
    {
        @(Html.EJS().LinearGauge("PointerGauge" + (++count).ToString()).Border(br =>
            br.Color("black").Width(2)).Axes(axes =>
            {
                axes.LabelStyle(ls =>
                    ls.Font(font)).Minimum(gauge.Minimum).Maximum(gauge.Maximum).Ranges(range =>
                    {
                        range.Start(gauge.Minimum).End(gauge.Maximum).StartWidth(6).EndWidth(6).Color("red").Add();
                    }).Pointers(pointer =>
                    {
                        pointer.Value(gauge.Value).Add();
                    }).Add();
                }
            ).Width("550").Render())
        }
    }
`
```

Step 3:

Create a button element to call the ajax request in the button click event. In ajax call, you can update the gauge pointer values based on the ajax data.

```
`html
<button id="updatePointer" onclick="updatePointer()">Update Pointer</button>
<script>
var updatePointer = function () {
$.ajax({
    type: "POST",
```

```

url: '@Url.Action("GetServerData","maps")',
async: false,
success: function (data) {
var gauge;
for (var i = 0; i < data.length; i++) {
gauge = document.getElementById('PointerGauge' + (i+1).toString()).ej2_instances[0];
gauge.axes[0].pointers[0].value = data[i].value;
gauge.refresh();
}
}
});
}
</script>
`cs
public ActionResult GetServerData()
{
List<pointData> data1 = new List<pointData>();
data1.Add(new pointData(5600));
data1.Add(new pointData(5700));
data1.Add(new pointData(6700));
data1.Add(new pointData(6700));
return Json(data1);
}
public class pointData
{
public pointData(double value)
{
this.value = value;
}
public double value { get; set; }
}
`

```

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().LinearGauge("linear").Axes(axis=>axis.Minimum(0).Maximum(120).MajorTicks(new
{
    interval = 10,
    height = 10
}).MinorTicks(new
{
    interval = 5,
    height = 5
}).LabelStyle(new
{
    format = "c"
})).Render()
<script>
    ej.base.setCulture('de');
    ej.base.setCurrencyCode('EUR');
</script>
```

ListBox

Getting Started with ASP.NET MVC ListBox Control

This section briefly explains about how to include [ASP.NET MVC ListBox](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
```

```
</body>
```

Add ASP.NET MVC ListBox control

Now, add the Syncfusion ASP.NET MVC ListBox control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@model List<string>
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    List<string> data = new List<string>() { "BadmHennessey Venominton",
    "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
    "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
    return View(data);
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC ListBox control will be rendered in the default web browser.

```
BadmHennessey Venominton
Bugatti Chiron
Bugatti Veyron Super Sport
SSC Ultimate Aero
Koenigsegg CCR
McLaren F1
Aston Martin One- 77
Jaguar XJ220
```

Note: [View Sample in GitHub.](#)

Accessibility in List Box Component

The ListBox component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ListBox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The ListBox component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the ListBox component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the ListBox component wrapper element as **listbox**, the **UL** element as **presentation**, and its list item as **option**. |

| **aria-label** | Provides an accessible name for the ListBox component. |

| `aria-multiselectable` | Applied to the element with the ListBox role, tells assistive technologies that the list supports multiple selection. The default value is true. |

| `aria-selected` | Applied to elements with role option that are visually styled as selected to inform assistive technologies that the options are selected. |

Keyboard interaction

The ListBox component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ListBox component.

| **Press** | **To do this** |

| --- | --- |

| Up arrow | Moves focus to the previous option. |

| Down arrow | Moves focus to the next option. |

| Home | Moves focus to first option. |

| End | Moves focus to last option. |

| Space | Changes the selection state of the focused option. |

| Ctrl + A | Selects all options in the list. |

| Ctrl + Shift + Home | Selects the focused option and all options up to the first option. |

| Ctrl + Shift + End | Selects the focused option and all options down to the last option. |

| Ctrl + (Up or Down) | Press Ctrl key with up / down arrow or mouse to select multiple items. |

Ensuring accessibility

The ListBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ListBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ListBox component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET Core controls](#)

Data Binding in ASP.NET MVC List Box Control

The ListBox loads the data either from local data sources or remote data services using the [DataSource](#) property. It supports the data type of `array` or `DataManager`.

| Fields | Type | Description |

|-----|-----|-----|

| [text](#) | `string` | Specifies the display text of each list item. |

| [value](#) | `string` | Specifies the hidden data value mapped to each list item that should contain a unique value. |

| [groupBy](#) | string | Specifies the category under which the list item has to be grouped. |

| [iconCss](#) | string | Specifies the iconCss class that needs to be mapped. |

| [htmlAttributes](#) | string | Allows additional attributes to configure the elements in various ways to meet the criteria. |

Note: When binding complex data to the ListBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Local Data

Local data can be represented by the following ways as described below.

Array of string

The ListBox has support to load array of primitive data such as strings or numbers. Here, both value and text field acts as same.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Render()
```

DATABINDING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult databinding()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
            "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
            "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

Array of object

The ListBox can generate its list items through an array of object data. For this, the appropriate columns should be mapped to the [Fields](#) property.

In the following example, **id** and **sports** column from complex data have been mapped to the **value** field and **text** field, respectively.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Render()
```

DATABINDING.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult databinding()
        {
            List<object> Data = new List<object> {
                new { text = "Hennessey Venom", id = "list-01" },
                new { text = "Bugatti Chiron", id = "list-02" },
                new { text = "Bugatti Veyron Super Sport", id = "list-03" },
                new { text = "SSC Ultimate Aero", id = "list-04" },
                new { text = "Koenigsegg CCR", id = "list-05" },
                new { text = "McLaren F1", id = "list-06" },
                new { text = "Aston Martin One- 77", id = "list-07" },
                new { text = "Jaguar XJ220", id = "list-08" }
            };
            ViewBag.data = Data;
            return View();
        }
    }
}

```

Array of complex object

The ListBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [Fields](#) property.

In the following example, `Sports.Name` column from complex data have been mapped to the `text` field.

CSHTML

```

@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Fields(new Syncfusion.EJ2.DropDowns.ListBoxFieldSettings {
    Text="sports.Name"}).Render()

```

DATABINDING.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult databinding()
        {
            List<object> Data = new List<object>

```

```
{
    new { id = "game0", sports = new {Name = "Badminton" } },
    new { id = "game1", sports = new {Name = "Cricket" } },
    new { id = "game2", sports = new {Name = "Football" } },
    new { id = "game3", sports = new {Name = "Golf" } },
    new { id = "game4", sports = new {Name = "Tennis" } },
    new { id = "game5", sports = new {Name = "Basket Ball" } },
    new { id = "game6", sports = new {Name = "Base Ball" } },
    new { id = "game7", sports = new {Name = "Hockey" } }
};
ViewBag.data = Data;
return View();
}
```

Remote Data

The ListBox supports retrieval of data from remote data services with the help of [DataManager](#) component. The [Query](#) property is used to fetch data from the database and bind it to the ListBox.

The following sample displays the employee names from Employee table.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.DataSource(dataManager=>

dataManager.Url("https://services.syncfusion.com/aspnet/production/api/Employees").Adaptor("ODataAdaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.ListBoxFieldSettings { Text="FirstName",
Value="EmployeeID" }).Render()
```

DATABINDING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult databinding()
        {
            return View();
        }
    }
}
```

Drag and drop in ListBox Control

The ListBox has support to drag an item or a group of selected items and drop it within the same list box or into another list box.

The elements can be customized on drag and drop by using the following events,

| Events | Description |
|---------------------------|--|
| ----- ----- | |
| dragStart | Triggers when the selected element is being dragged. |
| drag | Triggers when the selected element is being dragged. |
| drop | Triggers when the selected element is being dropped. |

Single listbox

To drag and drop an item or group of item within the list box can be achieved by setting [allowDragAndDrop](#) property as `true`.

The following sample illustrates how to drag and drop an item within the same list box by enabling [allowDragAndDrop](#) property.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.AllowDragAndDrop(true).Render()
```

DRAGDROP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult dragdrop()
        {
            ViewBag.data = new string[] { "Australiia", "Bermuda", "Canada",
            "Cameroon", "Denmark", "France", "Finland", "Germany", "Hong kong" };
            return View();
        }
    }
}
```

Multiple listbox

In the following sample, the [allowDragAndDrop](#) property is set as `true` and [scope](#) is set as `combined-list` to enable drop and drop in both list boxes.

CSHTML

```
<div style="width:50%; margin:auto">
    <div style="float:left; width:48%">

@Html.EJS().ListBox("listbox1").DataSource((IEnumerable<object>)ViewBag.grou
pA).AllowDragAndDrop(true).Scope("combined-list").Render()
    </div>
```

```
<div style="float:right; width:48%">
@Html.EJS().ListBox("listbox2").DataSource((IEnumerable<object>)ViewBag.groupB).AllowDragAndDrop(true).Scope("combined-list").Render()
</div>
</div>
```

DRAGDROP.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult dragdrop()
        {
            ViewBag.groupA = new string[] { "Austrelia", "Bermuda", "Canada", "Cameroon", "Denmark", "France", "Finland", "Germany", "Hong kong" };
            ViewBag.groupB = new string[] { "India", "Italy", "Japan", "Mexico", "Norway", "Poland", "Switzerland", "United Kingdom", "United States" };
            return View();
        }
    }
}
```

Dual list box in ASP.NET MVC ListBox Control

The dual list box allows the user to move items between two list boxes by clicking the toolbar buttons. Dual list box can be created by listing items in the [toolbarSettings](#) along with the `scope` property.

The following operations can be performed in dual list box,

| Options | Description |
|-------------|---|
| ----- ----- | |
| moveUp | Move the selected item in the upward direction within the list box. |
| moveDown | Move the selected item in the downward direction within the list box. |
| moveTo | Move the selected item to the another list box. |
| moveFrom | Move the selected item from one list box to the another list box. |
| moveAllTo | Move all the items to the another list box. |
| moveAllFrom | Move all the items from one list box to the another list box. |

The following example illustrates how to move items from `Group A` to `Group B` list box.

CSHTML

```
<div style="width:50%; margin:auto">
```

```
<div style="float:left; width:48%">

@Html.EJS().ListBox("listbox1").DataSource((IEnumerable<object>)ViewBag.groupA).Scope("#listbox2").ToolBarSettings(new
Syncfusion.EJ2.DropDowns.ListBoxToolBarSettings { Items = ViewBag.items
}).Render()
</div>
<div style="float:right; width:48%">

@Html.EJS().ListBox("listbox2").DataSource((IEnumerable<object>)ViewBag.groupB).Render()
</div>
</div>
```

DUALLISTBOX.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult duallistbox()
        {
            ViewBag.groupA = new string[] { "Australiia", "Bermuda", "Canada",
"Cameroon", "Denmark", "France", "Finland", "Germany", "Hong kong" };
            ViewBag.groupB = new string[] { "India", "Italy", "Japan",
"Mexico", "Norway", "Poland", "Switzerland", "United Kingdom", "United
States" };
            ViewBag.items = new string[] { "moveUp", "moveDown", "moveTo",
"moveFrom", "moveAllTo", "moveAllFrom" };
            return View();
        }
    }
}
```

Icons and Customization

Icons

To place the icon on a list box, set the [iconCss](#) property to **e-icons** with the required icon CSS. By default, the icon is positioned to the left side of the list.

In the following sample, icon classes are mapped with **iconCss** field.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.Data)
.Fields(new Syncfusion.EJ2.DropDowns.ListBoxFieldSettings { Text="Text",
IconCss="IconCss" }).Render()
<style>
    @@font-face {
        font-family: 'e-listbox-icons';
```

448

```

                new { Text = "Undo", IconCss = "e-list-icons e-list-undo" },
            };
        }
    }
}

```

```

        ViewBag.data = Data;
        return View();
    }
}

```

Templates

ListBox items can be customized according to the requirement using [itemTemplate](#) property.

In the following sample, the items in the cart are displayed using list box template,

CSHTML

```

@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.ItemTemplate("<div class='list-wrapper'><span class='{Pic}' e-avatar e-
avatar-xlarge e-avatar-circle'></span><span class='text'>${Text}</span><span
class='description'>${Description}</span></div'>.Render()
<style>
    .e-listbox-wrapper {
        margin: auto;
        max-width: 400px;
        box-sizing: border-box;
    }
    .e-listbox-wrapper:not(.e-list-template) .e-list-item {
        padding: 0;
        position: unset;
        cursor: pointer;
        height: 76px;
        line-height: normal;
    }
    .list-wrapper {
        height: inherit;
        position: relative;
        padding: 14px 12px 14px 78px;
    }
    .list-wrapper .text,
    .list-wrapper .description {
        display: block;
        margin: 0;
        padding-bottom: 3px;
        white-space: normal;
    }
    .list-wrapper .description {
        font-size: 12px;
        font-weight: 500;
    }
    #container .e-listbox-wrapper .list-wrapper .text {
        font-weight: bold;
        font-size: 13px;
    }
    .list-wrapper .e-avatar {
        position: absolute;
        left: 5px;
        background-color: transparent;
        font-size: 22px;
        top: calc(50% - 33px);
    }

```

```

    }
    .javascript, .typeScript {
        background-image: url('images/javascript1.svg');
    }
    .angular {
        background-image: url('images/angular1.svg');
    }
    .vue {
        background-image: url('images/vue.svg');
    }
    .react {
        background-image: url('images/react.svg');
    }
}
</style>

```

TEMPLATE.CS

```

using System;
using System.Collections.Generic;

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult template()
        {
            List<object> Data = new List<object>{
                new { Text="JavaScript", Pic="javascript", Description="It is a lightweight interpreted or JIT-compiled programming language." },
                new { Text="TypeScript", Pic="typeScript", Description="It is a typed superset of Javascript that compiles to plain JavaScript." },
                new { Text="Angular", Pic="angular", Description="It is a TypeScript-based open-source web application framework." },
                new { Text="React", Pic="react", Description="A JavaScript library for building user interfaces. It can also render on the server using Node." },
                new { Text="Vue", Pic="vue", Description="A progressive framework for building user interfaces. it is incrementally adoptable." }
            };
            ViewBag.data = Data;
            return View();
        }
    }
}

```

Selection in ASP.NET MVC ListBox Control

The ListBox provides support to select an item or a group of item by mouse or keyboard action. There are two selection modes available in list box,

- Single - To select single item in the list box.
- Multiple - To select multiple items in the list box.

On selection of each list box item, [change](#) event is triggered.

Single selection

To enable single selection in the list box, [mode](#) should be set as **Single** in [SelectionSettings](#) property.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.SelectionSettings(new Syncfusion.EJ2.DropDowns.ListBoxSelectionSettings {
Mode = Syncfusion.EJ2.DropDowns.SelectionMode.Single}).Render()
```

SELECTION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult selection()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
"Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
"Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

Multiple selection

To enable multiple selection in the list box, [mode](#) should be set as **Multiple** in [selectionSettings](#) property.

To select multiple items, use the SHIFT, CTRL, and arrow keys to make selections.

Note: By default, the selection mode is set as **Multiple**.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.SelectionSettings(new Syncfusion.EJ2.DropDowns.ListBoxSelectionSettings {
Mode = Syncfusion.EJ2.DropDowns.SelectionMode.Multiple}).Render()
```

SELECTION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult selection()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
"Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
"Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

```
{
    public class ListBoxController : Controller
    {
        public IActionResult selection()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
            "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
            "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

Note: To select all the items in the list box, [ShowSelectAll](#) method can also be used.

sorting and grouping

Sorting

The ListBox supports sorting of available items in the alphabetical order that can be either ascending or descending. This can be achieved using [sortOrder](#) property. Sort order can be **None**, **Ascending** or **Descending**.

In the following example, the **SortOrder** is set as **Descending**.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.SortOrder(ViewBag.value).Render()
```

SORTING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult sorting()
        {
            ViewBag.data = new string[] { "Austrelia", "Bermuda", "Canada",
            "Cameroon", "Denmark", "France", "Finland", "Germany", "Hong kong" };
            ViewBag.value = "Descending";
            return View();
        }
    }
}
```

Grouping

The ListBox supports to wrap the nested element into a group based on its category. The category of each list item can be mapped with [groupBy](#) field in the data table.

In the following example, vegetables are grouped based on its category.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Fields(new Syncfusion.EJ2.DropDowns.ListBoxFieldSettings {
    GroupBy="Category", Text="Vegetable", Value="Id"}).Render()
```

GROUPING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult grouping()
        {
            List<object> Data = new List<object> {
                new { Vegetable = "Cabbage", Category = "Leafy and Salad", Id =
"item1" },
                new { Vegetable = "Spinach", Category = "Leafy and Salad", Id =
"item2" },
                new { Vegetable = "Wheat grass", Category = "Leafy and Salad",
Id = "item3" },
                new { Vegetable = "Yarrow", Category = "Leafy and Salad", Id =
"item4" },
                new { Vegetable = "Pumpkins", Category = "Leafy and Salad", Id =
"item5" },
                new { Vegetable = "Chickpea", Category = "Beans", Id = "item6"
},
                new { Vegetable = "Green bean", Category = "Beans", Id = "item7"
},
                new { Vegetable = "Horse gram", Category = "Beans", Id = "item8"
},
                new { Vegetable = "Garlic", Category = "Bulb and Stem", Id =
"item9" },
                new { Vegetable = "Nopal", Category = "Bulb and Stem", Id =
"item10" },
                new { Vegetable = "Onion", Category = "Bulb and Stem", Id =
"item11" }
            };
            ViewBag.data = Data;
            return View();
        }
    }
}
```

Styles and Appearances

To modify the ListBox appearance, you need to override the default CSS of ListBox component. Find the list of CSS classes and its corresponding section in ListBox component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-listbox-wrapper|To customize the listbox wrapper
- |.e-list-parent .e-list-item|To customize the listbox list items
- |.e-list-parent .e-list-item:hover|To customize the listbox list items on hover
- |.e-list-parent .e-list-item.e-selected|To customize the listbox selected list item
- |.e-listboxtool-wrapper .e-listbox-tool|To customize the listbox toolbar
- |.e-listboxtool-wrapper .e-listbox-tool .e-btn|To customize the listbox toolbar button
- |.e-listboxtool-wrapper .e-listbox-tool .e-btn .e-btn-icon.e-icons::before|To customize the listbox toolbar icon

Horizontal ListBox

You can use [CssClass](#) property to display the Listbox horizontally.

CSHTML

```
<div id="listbox-container">
@Html.EJS().ListBox("listbox").CssClass("e-horizontal-
listbox").DataSource((IEnumerable<object>)ViewBag.data).Render()
</div>
<style>
#listbox-container {
    margin: 20px auto 0;
    width: 250px;
}
/* Custom css for horizontal listbox */
.e-horizontal-listbox .e-list-parent {
    display: inline-flex;
    align-items: center;
}
.e-horizontal-listbox {
    overflow-y: hidden;
    height: 100px;
}
.e-horizontal-listbox .e-list-parent .e-list-item {
    width: max-content;
    line-height: 100px;
    height: 100px;
}
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
```

```
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class AutoCompleteController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
            "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
            "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

How To

Add items to the list box

To add an item or multiple items, [addItem](#) method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items will be added while clicking Add Items button.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Render()
<button class="e-btn" id="additem">Add Items</button>
<script>
    document.getElementById("additem").onclick = function () {
        var items = ['Bugatti Veyron Super Sport', 'SSC Ultimate Aero'];
        var listboxobj =
document.getElementById("listbox").ej2_instances[0];
        if (!listboxobj.getDataByValue('Bugatti Veyron Super Sport')) {
            listboxobj.addItem(items);
        }
    }
}
```

ADDITEM.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult additem()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
            "Bugatti Chiron", "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77",
            "Jaguar XJ220" };
            return View();
        }
    }
}
```

```
}
}
```

Enable or disable items

To enable or disable items in the list box, [enableItems](#) method can be used. In the following example, the Bugatti Veyron Super Sport and SSC Ultimate Aero items are disabled by default and by clicking Enable Items buttons, the disabled items will be enabled.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Created("create").Render()
<button class="e-btn" id="enableitem">Enable Items</button>
<script>
    var disableItems = ['Bugatti Veyron Super Sport', 'SSC Ultimate Aero'];
    function create() {
        var listboxobj =
document.getElementById("listbox").ej2_instances[0];
        listboxobj.enableItems(disableItems, false);
    }
    document.getElementById('enableitem').onclick = function () {
        var listboxobj1 =
document.getElementById("listbox").ej2_instances[0];
        listboxobj1.enableItems(disableItems, true);
    }
</script>
```

ENABLEITEM.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult enableitem()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
"Bugatti Veyron Super Sport", "SSC Ultimate Aero", "Bugatti Chiron",
"Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

Enable Scroller

The ListBox supports scrolling and it can be achieved by restricting the height of the list box using [height](#) property.

In the following sample, [height](#) of the list box is restricted to 250px.

CSHTML

```
@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Height("250px").Render()
```

SCROLLER.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult scroller()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
"Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
"Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}
```

Form submit to the list box

In the following code snippet, the value that is in selected state will be sent on form submit.

CSHTML

```
<form>

@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Render()
    @Html.EJS().Button("button").IsPrimary(true).Content("Submit").Render()
</form>
```

FORMSUBMIT.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult formsubmit()
        {

```

```

        ViewBag.data = new string[] { "BadmHennessey Venominton",
        "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
        "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
        return View();
    }
}

```

Select items to the list box

In the following example, **Bugatti Chiron** is selected using [selectItems](#) method.

CSHTML

```

@Html.EJS().ListBox("listbox").DataSource((IEnumerable<object>)ViewBag.data)
.Created("create").Render()
<script>
    function create() {
        var listboxobj =
document.getElementById("listbox").ej2_instances[0];
        listboxobj.selectItems(['Bugatti Chiron'])
    }
</script>

```

SELECTITEM.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class ListBoxController : Controller
    {
        public IActionResult selectitem()
        {
            ViewBag.data = new string[] { "BadmHennessey Venominton",
            "Bugatti Chiron", "Bugatti Veyron Super Sport", "SSC Ultimate Aero",
            "Koenigsegg CCR", "McLaren F1", "Aston Martin One- 77", "Jaguar XJ220" };
            return View();
        }
    }
}

```

ListView

Getting Started with ASP.NET MVC ListView control

This section briefly explains about how to include [ASP.NET MVC ListView](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ _LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC

controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC ListView control

Now, add the Syncfusion ASP.NET MVC ListView control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().ListView("listview").Render()
```

Bind dataSource

After initialization, populate the ListView with data using the [DataSource](#) property. Here, the JSON values are passed to the ListView control.

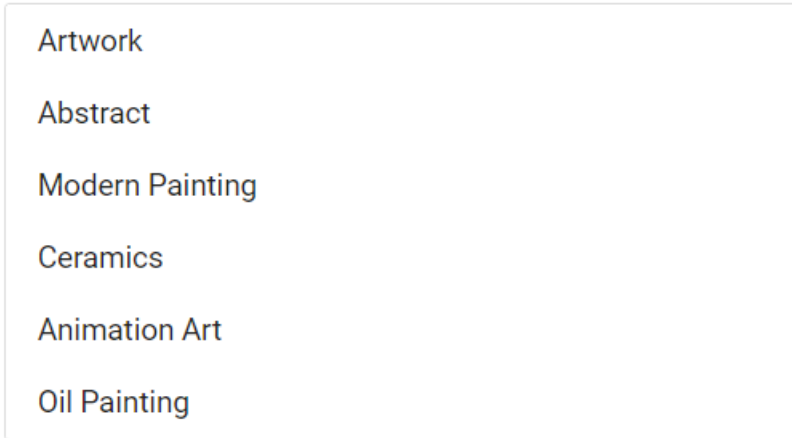

CSHTML

```
@model List<object>
@Html.EJS().ListView("listview").DataSource((IEnumerable<object>)Model).Render()
```

HOMECONTROLLER.CS

```
public IActionResult Index()
{
    //define the array of JSON
    List<object> data = new List<object>();
    data.Add(new { text= "Artwork", id= "01" });
    data.Add(new { text= "Abstract", id= "02" });
    data.Add(new { text= "Modern Painting", id= "03" });
    data.Add(new { text= "Ceramics", id= "04" });
    data.Add(new { text= "Animation Art", id= "05" });
    data.Add(new { text= "Oil Painting", id= "06" });
    return View(data);
}
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC ListView control will be rendered in the default web browser.

Note: [View Sample in GitHub.](#)

See also

- [Data Binding Types](#)
- [ListView customization](#)
- [Virtualization](#)

Note: You can refer to our [ASP.NET MVC ListView](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC ListView Example](#) that shows you how to render and configure the ListView in ASP.NET MVC.

Data binding

ListView provides an option to load the data either from local dataSource or remote data services. This can be done through the dataSource property that supports the data type of array or [DataManager](#).

ListView supports different kind of data services such as OData, OData V4, and Web API, and data formats like XML, JSON, and, JSONP with the help of DataManager Adaptors.

| Fields | Type | Description |
|-----------|---------|---|
| id | string | Specifies ID attribute of list item, mapped in dataSource. |
| text | string | Specifies list item display text field. |
| isChecked | boolean | Specifies checked status of list item. |
| isVisible | boolean | Specifies visibility state of list item. |
| enabled | boolean | Specifies enabled state of list item. |
| iconCss | string | Specifies the icon class of each list item that will be added before to the list item text. |
| child | string | Specifies child dataSource fields. |
| tooltip | string | Specifies tooltip title text field. |
| groupBy | string | Specifies category of each list item. |

| sortBy | string | Specifies sorting field, that is used to sort the listview data. |

| htmlAttributes | string | Specifies list item html attributes field. |

Note: When complex data bind to ListView, you should map the fields properly. Otherwise, the ListView properties remain as undefined or null.

Bind to local data

Local data can be represented in two ways, they are as follows:

- Array of simple data.
- Array of JSON data.

Array of simple data

ListView supports to load the array of primitive data like string and numbers. Here, both value and text field act as same.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Render()
<style>
    #element {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        ViewBag.dataSource = new string[] { "Artwork", "Abstract", "Modern
Painting", "Ceramics", "Animation Art", "Oil Painting" };
        return View();
    }
}
```

Array of JSON data

ListView can generate its list items through an array of complex data. To get it work properly, you should map the appropriate columns to the field property.

In the following example, role column is mapped with the text field.

CSHTML

```
@using Syncfusion.EJ2
```

```
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Fields(new ListViewFieldSettings { Text = "Name", Tooltip= "Name" ,
Id="id"}).ShowHeader(true).HeaderTitle("Device settings").Render()
<style>
    #element {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listdata = new List<object>();
        listdata.Add(new
        {
            Name = "Display",
            id = "list-01"
        }); listdata.Add(new
        {
            Name = "Notification",
            id = "list-02"
        }); listdata.Add(new
        {
            Name = "Sound",
            id = "list-03"
        }); listdata.Add(new
        {
            Name = "Apps",
            id = "list-04"
        }); listdata.Add(new
        {
            Name = "Storage",
            id = "list-05"
        }); listdata.Add(new
        {
            Name = "Battery",
            id = "list-06"
        });
        ViewBag.dataSource = listdata;
        return View();
    }
}
```

Bind to remote data

The ListView supports to retrieve the data from remote data services with the help of DataManager component. The Query property allows to fetch data and return it to the ListView from the database.

In the following sample, first 6 products from the Product table of NorthWind data service are displayed.

CSHTML

```
@using Syncfusion.EJ2
<div class="control-section">
    @Html.EJS().ListView("remotelist").Enable(true).DataSource(dataManger =>
    {
        dataManger.Url("//js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/").CrossDomain(true);
    }).Query("new
ej.data.Query().from('Products').select('ProductID,ProductName').take(10)").Fields(new Syncfusion.EJ2.Lists.ListViewFieldSettings { Id = "ProductID" ,
Text = "ProductName" }).ShowHeader(true).HeaderTitle("Products").Render()
</div>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        return View();
    }
}
```

Output be like the below.

| Products |
|------------------------------|
| Chai |
| Chang |
| Aniseed Syrup |
| Chef Anton's Cajun Seasoning |
| Chef Anton's Gumbo Mix |
| Grandma's Boysenberry Spread |

Grouping

The ListView supports to wrap the nested element into a group based on the category. The category of each list item can be mapped with `groupBy` field in the data table, that also supports single-level navigation.

In the following sample, The cars are grouped based on its category by using the `groupBy` field.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { GroupBy = "category" }).Render()
<style>
    #element {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>

```

LISTCONTROLLER.CS

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listdata = new List<object>();
        listdata.Add(new
        {
            text = "Audi A4",
            id = "9bdb",
            category = "Audi"
        }); listdata.Add(new
        {
            text = "Audi A5",
            id = "4589",
            category = "Audi"
        }); listdata.Add(new
        {
            text = "BMW 501",
            id = "f849",
            category = "BMW"
        }); listdata.Add(new
        {
            text = "BMW 502",
            id = "7aff",
            category = "BMW"
        });
        ViewBag.dataSource = listdata;
        return View();
    }
}

```

Output be like the below.

| |
|-------------|
| Audi |
| Audi A4 |
| Audi A5 |
| BMW |
| BMW 501 |
| BMW 502 |

Customization

The grouping header can be customized by using the `groupTemplate` property for both inline and fixed group header. The complete customization description and explanation with an example is given in the following link.

[ASP .NET Core ListView - Group Template.](#)

Checklist in ASP.NET MVC Listview Control

The ListView supports checkbox in default and group-lists which is used to select multiple items. The checkbox can be enabled by the `showCheckBox` property.

The Checkbox will be useful in the scenario where we need to select multiple options. For Example, in Shipping cart we can be able to select or unselect the desired items before checkout and also it will be useful in selecting multiple items that belongs to same category using the group list.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>) ViewBag.data
Source).Fields(new ListViewFieldSettings { Text = "text",
Id="id"}).ShowCheckBox(true).Render()
<style>
    #element {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

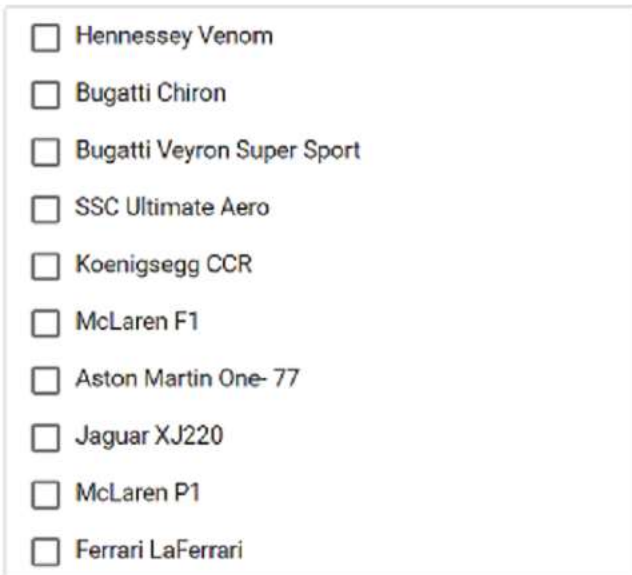

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
```

```
List<object> listdata = new List<object>();
listdata.Add(new
{
    text = "Hennessey Venom",
    id = "list-01"
}); listdata.Add(new
{
    text = "Bugatti Chiron",
    id = "list-02"
}); listdata.Add(new
{
    text = "Bugatti Veyron Super Sport",
    id = "list-03"
}); listdata.Add(new
{
    text = "SSC Ultimate Aero",
    id = "list-04"
}); listdata.Add(new
{
    text = "Koenigsegg CCR",
    id = "list-05"
}); listdata.Add(new
{
    text = "McLaren F1",
    id = "list-06"
}); listdata.Add(new
{
    text = "Aston Martin One- 77",
    id = "list-07"
}); listdata.Add(new
{
    text = "Jaguar XJ220",
    id = "list-08"
}); listdata.Add(new
{
    text = "McLaren P1",
    id = "list-09"
}); listdata.Add(new
{
    text = "Ferrari LaFerrari",
    id = "list-10"
});
ViewBag.dataSource = listdata;
return View();
}
```

Output be like the below.

Checkbox Position

In ListView the checkbox can be positioned into either **Left** or **Right** side of the list-item text. This can be achieved by **checkboxPosition** property. By default, checkbox will be positioned to **Left** of list-item text.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Fields(new ListViewFieldSettings { Text = "text",
Id="id"}).ShowCheckBox(true).CheckBoxPosition(CheckBoxPosition.Right).Render
()
<style>
    #element {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listdata = new List<object>();
        listdata.Add(new
        {
            text = "Hennessey Venom",
            id = "list-01"
        }); listdata.Add(new
        {
```

```
        text = "Bugatti Chiron",
        id = "list-02"
    }); listdata.Add(new
    {
        text = "Bugatti Veyron Super Sport",
        id = "list-03"
    }); listdata.Add(new
    {
        text = "SSC Ultimate Aero",
        id = "list-04"
    }); listdata.Add(new
    {
        text = "Koenigsegg CCR",
        id = "list-05"
    }); listdata.Add(new
    {
        text = "McLaren F1",
        id = "list-06"
    }); listdata.Add(new
    {
        text = "Aston Martin One- 77",
        id = "list-07"
    }); listdata.Add(new
    {
        text = "Jaguar XJ220",
        id = "list-08"
    }); listdata.Add(new
    {
        text = "McLaren P1",
        id = "list-09"
    }); listdata.Add(new
    {
        text = "Ferrari LaFerrari",
        id = "list-10"
    });
    ViewBag.dataSource = listdata;
    return View();
}
}
```

Output be like the below.

| | |
|----------------------------|--------------------------|
| Hennessey Venom | <input type="checkbox"/> |
| Bugatti Chiron | <input type="checkbox"/> |
| Bugatti Veyron Super Sport | <input type="checkbox"/> |
| SSC Ultimate Aero | <input type="checkbox"/> |

| Jaguar XJ220 | <input type="checkbox"/> |
| McLaren P1 | <input type="checkbox"/> |
| Ferrari LaFerrari | <input type="checkbox"/> |

Nested List

The ListView component supports Nested list. For that, the child property should be defined for the nested list in the array of JSON.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("listview").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { Tooltip = "text"
}).ShowHeader(true).HeaderTitle("Continent").Render()
<style>
    #listview {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listdata = new List<object>();
        listdata.Add(new
        {
            text = "Asia",
            id = "01",
            category = "Continent",
            child = new List<object>() { new { text = "India", id = "1",
category = "Asia",
```

```

        child= new List<object>() {
            new { id= "1001", text= "Delhi", category= "India"
        },
            new {text= "Kashmir", id= "1002", category=
"India"},
            new { text= "Goa",id= "1003", category= "India" }
        },
        new { text = "China",id = "2",category = "Asia",
        child = new List<object>() {
            new { text = "Zhejiang", id = "2001", category =
"China" },
            new {text= "Hunan",id= "2002", category= "China"},
            new { text= "Shandong", id= "2003",category=
"China"}
        }
    }
});
listdata.Add(new
{
    text = "North America",
    id = "02",
    category = "Continent",
    child = new List<object>() { new { text = "USA", id = "3",
category = "North America",
        child= new List<object>() {
            new {text= "California", id= "3001", category=
"USA"},
            new { text= "New York",id= "3002", category= "USA"
        },
            new { text= "Florida",id= "3003", category= "USA" }
        },
        new { text = "Canada",id = "4",category = "North America",
        child = new List<object>() {
            new { text = "Ontario", id = "4001", category =
"Canada" },
            new {text= "Alberta",id= "4002", category=
"Canada"},
            new { text= "Manitoba", id= "4003",category=
"Canada"}
        }
    }
});
listdata.Add(new
{
    text = "Europe",
    id = "03",
    category = "Continent",
    child = new List<object>() { new { text = "Germany", id = "5",
category = "Europe",
        child= new List<object>() {
            new {text= "Berlin", id= "5001", category=
"Germany"},

```

```

        new { text= "Bavaria",id= "5002", category=
"Germany" },
        new { text= "Hesse",id= "5003", category= "Germany"
    }
    },
    new { text = "France",id = "6",category = "Europe",
        child = new List<object>() {
            new { text = "Paris", id = "6001", category =
"France" },
            new {text= "Lyon",id= "6002", category= "France"},
            new { text= "Marseille", id= "6003",category=
"France"}
        }
    }
});
listdata.Add(new
{
    text = "Australia",
    id = "04",
    category = "Continent",
    child = new List<object>() { new { text = "Australia", id = "7",
category = "Australia",
        child= new List<object>() {
            new {text= "Sydney", id= "7001", category=
"Australia"},
            new { text= "Melbourne",id= "7002", category=
"Australia" },
            new { text= "Brisbane",id= "7003", category=
"Australia" }
        },
        new { text = "New Zealand",id = "8",category = "Australia",
            child = new List<object>() {
                new { text = "Milford Sound", id = "8001", category
= "New Zealand" },
                new {text= "Tongariro National Park",id= "8002",
category= "New Zealand"},
                new { text= "Fiordland National Park", id=
"8003",category= "New Zealand"}
            }
        },
    });
listdata.Add(new
{
    text = "Africa",
    id = "05",
    category = "Continent",
    child = new List<object>() { new { text = "Morocco", id = "9",
category = "Africa",
        child= new List<object>() {
            new {text= "Rabat", id= "9001", category=
"Morocco"},
            new { text= "Toubkal",id= "9002", category=
"Morocco" },

```

```

        new { text= "Todgha Gorge",id= "9003", category=
"Morocco" }
    },
    new { text = "South Africa",id = "10",category = "Africa",
    child = new List<object>() {
        new { text = "Cape Town", id = "10001", category =
"South Africa" },
        new {text= "Pretoria",id= "10002", category=
"South Africa"},
        new { text= "Bloemfontein", id= "10003",category=
"South Africa"}
    }
    },
    });
ViewBag.dataSource = listdata;
return View();
}
}

```

Output be like the below.

| Continent | |
|---------------|---|
| Asia | > |
| North America | > |
| Europe | > |
| Australia | > |
| Africa | > |

Customizing templates

The ListView component is designed to customize each list items and group title. It uses Essential JS2 **Template engine** to render the elements.

Header Template

ListView header can be customized with the help of the **headerTemplate** property.

To customize header template in your application, set your customized template string to **headerTemplate** property along with **showHeader** property as **true** to display the ListView header.

In the following example, we have rendered Listview with customized header which contains search, add and sort buttons.

CSHTML

```
@using Syncfusion.EJ2
```

```

@using Syncfusion.EJ2.Lists
@{ var headerTemplate = "<div class='headerContainer'><span
class='fruitHeader'>Fruits</span>" +
    "<button id='search'></button><button
id='add'></button><button id='sort'></button></div>";
}

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.fruitsdata).ShowHeader(true).HeaderTemplate(headerTemplate).ActionComplete("renderHeaderButtons").Render()
<style>
    #element {
        display: block;
        max-width: 353px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
    #element .e-list-header {
        padding: 0;
    }
    #element .headerContainer {
        width: 350px;
        height: 48px;
        line-height: 48px;
        background: rgb(2, 120, 215);
        color: white;
        margin-bottom: 3px;
    }
    .headerContainer .fruitHeader {
        margin-left: 20px;
        font-weight: 500;
        font-size: 22px;
    }
    .headerContainer #add,
    .headerContainer #sort,
    .headerContainer #search {
        float: right;
        margin-right: 15px;
        margin-top: 7px;
        background: white;
        color: black
    }
    .headerContainer .e-search-icon::before {
        content: '\e961';
        color: lightslategray;
    }
    .headerContainer .e-add-icon::before {
        content: '\e823';
    }
    .headerContainer .e-sort-icon::before {
        content: '\e840';
    }
</style>
<script>
    function renderHeaderButtons() {
        ['search', 'sort', 'add'].forEach((item) => {

```

```

        new ej.buttons.Button({ iconCss: `e-icons e-${item}-icon`,
cssClass: 'e-small e-round', isPrimary: true }, `#${item}`)
    });
}
</script>

```

LISTCONTROLLER.CS

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        //define the array of JSON
        List<object> fruitsdata = new List<object>();
        fruitsdata.Add(new { text = "Date", id = "1", imgUrl = "../dates.jpg"
    });
        fruitsdata.Add(new { text = "Fig", id = "2", imgUrl = "../fig.jpg"
    });
        fruitsdata.Add(new { text = "Apple", id = "3", imgUrl =
        "../apple.png" });
        fruitsdata.Add(new { text = "Apricot", id = "4", imgUrl =
        "../apricot.jpg" });
        fruitsdata.Add(new { text = "Grape", id = "5", imgUrl =
        "../grape.jpg" });
        fruitsdata.Add(new { text = "Strawberry", id = "6", imgUrl =
        "../strawberry.jpg" });
        fruitsdata.Add(new { text = "Pineapple", id = "7", imgUrl =
        "../pineapple.jpg" });
        fruitsdata.Add(new { text = "Melon", id = "8", imgUrl =
        "../melon.jpg" });
        fruitsdata.Add(new { text = "Lemon", id = "9", imgUrl =
        "../lemon.jpg" });
        fruitsdata.Add(new { text = "Cherry", id = "10", imgUrl =
        "../cherry.jpg" });
        ViewBag.fruitsdata = fruitsdata;
        return View();
    }
}

```

Template

ListView items can be customized with the help of the `template` property.

To customize list items in your application, set your customized template string to `template` property.

We provided the following built-in CSS classes to customize the list-items. Refer to the following table.

| CSS class | Description |
|-----------|-------------|
| ----- | ----- |

| e-list-template, e-list-wrapper | These classes are used to differentiate normal and template rendering, which are mandatory for template rendering. The `e-list-template` class should be added to the root of the ListView element and `e-list-wrapper` class should be added to the template element wrapper.

| e-list-content | This class is used to align list content and it should be added to the content element
`

 <div class="e-list-wrapper">
ListItem
</div>|`

| e-list-avatar | This class is used for avatar customization. It should be added to the template element wrapper. After adding it, we can customize our element with [Avatar](#) classes
`

 <div class="e-list-wrappere-list-avatar">
 MR
ListItem
</div>|`

| e-list-avatar-right | This class is used to align avatar to right side of the list item. It should be added to the template element wrapper. After adding it, we can customize our element with [Avatar](#) classes
`

 <div class="e-list-wrappere-list-avatar-right">
 ListItem
MR
</div>|`

| e-list-badge | This class is used for badge customization .It should be added to the template element wrapper. After adding it, we can customize our element with [Badge](#) classes
`

 <div class="e-list-wrappere-list-badge">
 ListItem
MR
</div>|`

| e-list-multi-line | This class is used for multi-line customization. It should be added to the template element wrapper. After adding it, we can customize List item's header and description
`

<div class="e-list-wrappere-list-multi-line">
 ListItem
</div>|`

| e-list-item-header | This class is used to align a list header and it should be added to the header element along with the multi-line class
`

 <div class="e-list-wrappere-list-multi-line">
 ListItem Header
 ListItem
</div>|`

In the following example, we have customized list items with built-in CSS classes.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{ var template = "<div class='e-list-wrapper e-list-multi-line e-list-avatar'>" +
    "${if (avatar!='')}" +
    "<span class='e-avatar e-avatar-circle'>${avatar}</span>" +
    "${else}" +
    "<span class='${pic} e-avatar e-avatar-circle'> </span>" +
    "${/if}" +
    "<span class='e-list-item-header'>${text}</span>" +
    "<span class='e-list-content'>${contact}</span>" +
    "</div>";
}

@Html.EJS().ListView("List").DataSource((IEnumerable<object>) ViewBag.listData).Template(template).CssClass("e-list-template").SortOrder(SortOrder.Ascending).Width(350).HeaderTitle("Contacts")
```

```

.ShowHeader(true).Fields(new ListViewFieldSettings { Text =
"name"}).Render()
<style>
    #List {
        margin: 0 auto;
        font-size: 15px;
        border: 1px solid #ccc;
    }
    .ic01 {
        background-image:
url("https://ej2.syncfusion.com/demos/src/grid/images/1.png");
    }
    .pic02 {
        background-image:
url("https://ej2.syncfusion.com/demos/src/grid/images/3.png");
    }
    .pic03 {
        background-image:
url("https://ej2.syncfusion.com/demos/src/grid/images/5.png");
    }
    .pic04 {
        background-image:
url("https://ej2.syncfusion.com/demos/src/grid/images/2.png");
    }
    #List .e-list-item:nth-child(1) .e-avatar {
        background-color: #039be5;
    }
    #List .e-list-item:nth-child(2) .e-avatar {
        background-color: #e91e63;
    }
    #List .e-list-item:nth-child(6) .e-avatar {
        background-color: #009688;
    }
    #List .e-list-item:nth-child(8) .e-avatar {
        background-color: #000088;
    }
</style>

```

LISTCONTROLLER.CS

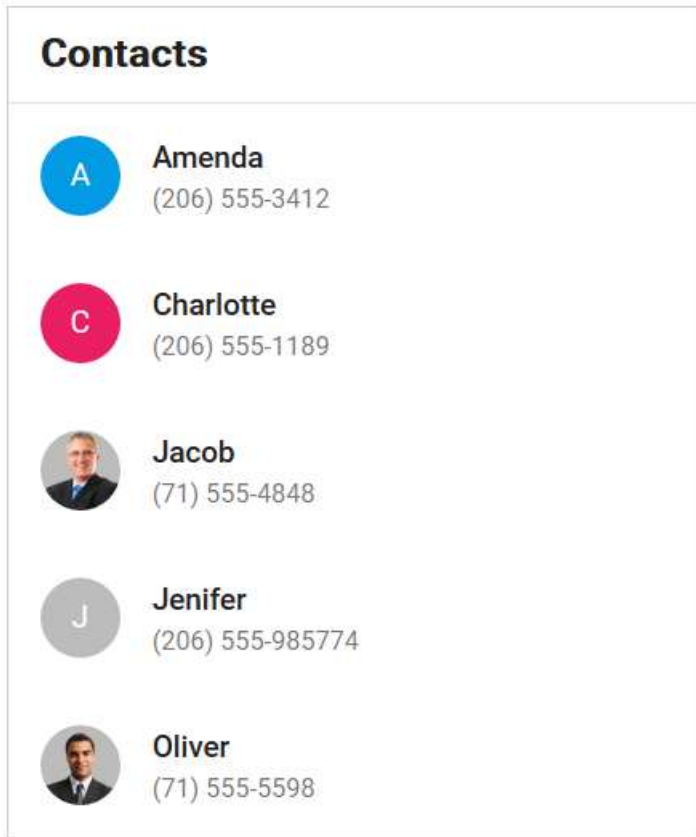

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listData = new List<object>();
        listData.Add(new
        {
            text = "Jenifer",
            contact = "(206) 555-985774",
            id = "1",
            avatar = "J",
            pic = "pic01"
        });
        listData.Add(new
        {
            text = "Amenda",

```

```
        contact = "(206) 555-3412",
        id = "2",
        avatar = "A",
        pic = ""
    });
    listData.Add(new
    {
        text = "Isabella",
        contact = "(206) 555-8122",
        id = "4",
        avatar = "",
        pic = "pic02"
    });
    listData.Add(new
    {
        text = "William ",
        contact = "(206) 555-9482",
        id = "5",
        avatar = "W",
        pic = ""
    });
    listData.Add(new
    {
        text = "Jacob",
        contact = "(71) 555-4848",
        id = "6",
        avatar = "",
        pic = "pic04"
    });
    listData.Add(new
    {
        text = "Matthew",
        contact = "(71) 555-7773",
        id = "7",
        avatar = "M",
        pic = ""
    });
    listData.Add(new
    {
        text = "Oliver",
        contact = "(71) 555-5598",
        id = "8",
        avatar = "",
        pic = "pic03"
    });
    listData.Add(new
    {
        text = "Charlotte",
        contact = "(206) 555-1189",
        id = "9",
        avatar = "C",
        pic = ""
    });
    ViewBag.listData = listData;
    return View();
}
```

Output be like the below.

Group template

ListView group header can be customized with the help of the `groupTemplate` property.

To customize the group template in your application, set your customized template string to `groupTemplate` property.

In the following example, we have grouped Listview based on the category. The category of each list item should be mapped with `groupBy` field of the data. We have also displayed grouped list items count in the group list header.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{ var template = "<div class='e-list-wrapper e-list-multi-line e-list-
avatar'>" +
    "<img class='e-avatar e-avatar-circle' src=${image}
style='background:#BCBCBC' />" +
    "<span class='e-list-item-header'>${Name}</span>" +
    "<span class='e-list-content'>${contact}</span>" +
    "</div>";
    var groupTemplate = "<div><span
class='category'>${items[0].category}</span> <span class='count'>
${items.length} Item(s)</span></div>";
```

```

    }

@Html.EJS().ListView("List").DataSource((IEnumerable<object>)ViewBag.listData).Template(template).GroupTemplate(groupTemplate).CssClass("e-list-template").Width(350).Fields(new ListViewFieldSettings { Text = "name", GroupBy = "category" }).Render()
<style>
    #List {
        display: block;
        margin: auto;
        font-size: 15px;
        border: 1px solid;
        border-color: #ccc;
        border-color: #00001f;
        width: 350px;
    }

    #List .e-list-group-item {
        height: 56px;
        line-height: 56px;
    }

    #List .count {
        float: right;
    }
</style>

```

LISTCONTROLLER.CS

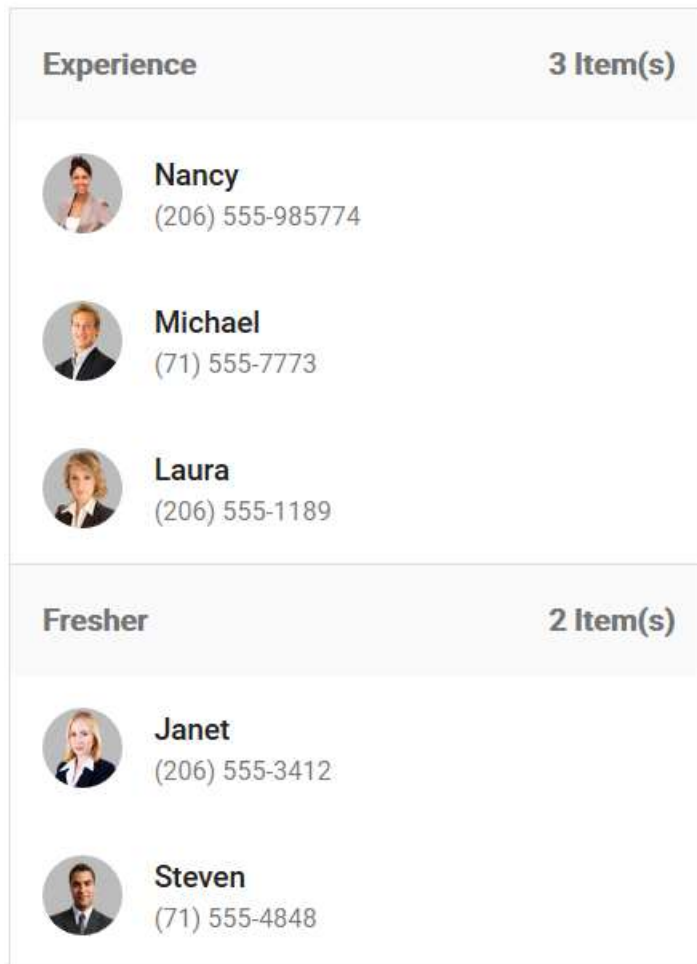

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        //define the array of JSON
        List<object> listData = new List<object>();
        listData.Add(new { Name = "Nancy", contact = "(206) 555-985774", id = "1", image = "https://ej2.syncfusion.com/demos/src/grid/images/1.png", category = "Experience" });
        listData.Add(new { Name = "Janet", contact = "(206) 555-3412", id = "2", image = "https://ej2.syncfusion.com/demos/src/grid/images/3.png", category = "Fresher" });
        listData.Add(new { Name = "Margaret", contact = "(206) 555-8122", id = "4", image = "https://ej2.syncfusion.com/demos/src/grid/images/4.png", category = "Experience" });
        listData.Add(new { Name = "Andrew ", contact = "(206) 555-9482", id = "5", image = "https://ej2.syncfusion.com/demos/src/grid/images/2.png", category = "Experience" });
        listData.Add(new { Name = "Steven", contact = "(71) 555-4848", id = "6", image = "https://ej2.syncfusion.com/demos/src/grid/images/5.png", category = "Fresher" });
        listData.Add(new { Name = "Michael", contact = "(71) 555-7773", id = "7", image = "https://ej2.syncfusion.com/demos/src/grid/images/6.png", category = "Experience" });
        listData.Add(new { Name = "Robert", contact = "(71) 555-5598", id = "8", image = "https://ej2.syncfusion.com/demos/src/grid/images/7.png", category = "Fresher" });
    }
}

```

```
listData.Add(new { Name = "Laura", contact = "(206) 555-1189", id =  
"9", image = "https://ej2.syncfusion.com/demos/src/grid/images/8.png",  
category = "Experience" });  
ViewBag.listData = listData;  
return View();  
}  
}
```

Output be like the below.

UI Virtualization

UI virtualization loads only viewable list items in a view port, which will improve the ListView performance while loading a large number of data.

Getting started

UI virtualization can be enabled in the ListView by setting the [enableVirtualization](#) property to true.

It has two types of scrollers as follows:

Window scroll: This scroller is used in the ListView by default.

Container scroll: This scroller is used, when the height property of the ListView is set.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
    @Html.EJS().ListView("ui-
list").DataSource((IEnumerable<object>)ViewBag.listData).EnableVirtualizatio
n(true).Height(500).Render()
<style>
    #ui-list {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
        cursor: pointer;
    }
</style>

```

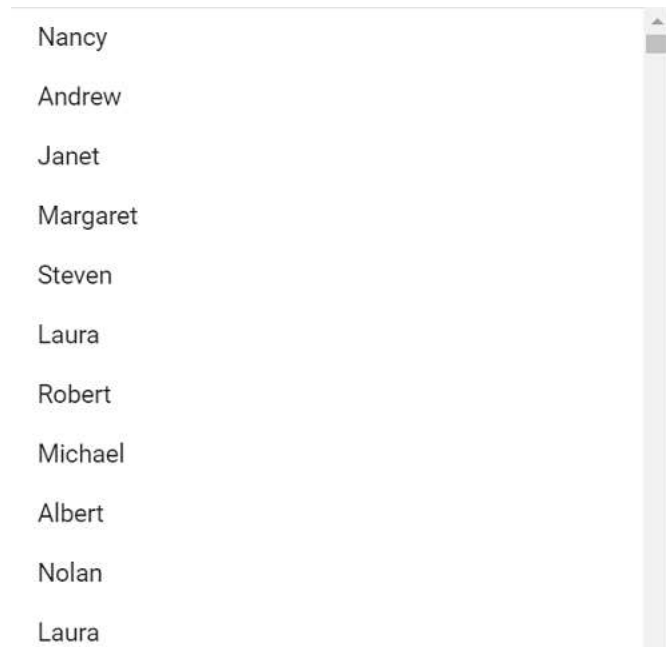

LISTCONTROLLER.CS

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listData = new List<object>();
        listData.Add(new { text = "Nancy", id = "0" });
        listData.Add(new { text = "Andrew", id = "1" });
        listData.Add(new { text = "Janet", id = "2" });
        listData.Add(new { text = "Margaret", id = "3" });
        listData.Add(new { text = "Steven", id = "4" });
        listData.Add(new { text = "Laura", id = "5" });
        listData.Add(new { text = "Robert", id = "6" });
        listData.Add(new { text = "Michael", id = "7" });
        listData.Add(new { text = "Albert", id = "8" });
        listData.Add(new { text = "Nolan", id = "9" });
        for (int i = 10; i < 1000; i++)
        {
            int index = new Random().Next(0, 10);
            listData.Add(new
            {
                text =
listData[index].GetType().GetProperty("text").GetValue(listData[index],
null).ToString(),
                id = i.ToString()
            });
        }
        ViewBag.listData = listData;
        return View();
    }
}

```

Output be like the below.

We can use `template` property to customize list items in UI virtualization.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{ var template = "<div class='list-container'><div id='icon'
class=\"${$imgUrl ? \"'img\" : \"icon\"}\">\" +
    \"<span class=\"${$imgUrl ? \"'hideUI\" : \"showUI\"}\">\" +
    \"${icon}</span> <img class=\"${$imgUrl ? \"'showUI\" : \"hideUI\"}\"
}\" width = 45 height = 45 src=\"${$imgUrl ? $imgUrl : \"\"}\" />\" +
    \"</div><div class='text'>${text}</div></div>\";
}
@Html.EJS().ListView("ui-
list").DataSource((IEnumerable<object>)ViewBag.listData).EnableVirtualizatio
n(true).ShowHeader(true).HeaderTitle("Contacts").Template(@template).Height(
500).Render()
<style>
    #ui-list {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
        cursor: pointer;
    }
    button {
        float: right
    }
    #icon {
        width: 45px;
        height: 45px;
        text-align: center;
        line-height: 45px;
        border-radius: 50%;
    }
```

```
    font-size: 20px;
    font-weight: 500;
    float: left;
    margin-top: 17px;
    margin-right: 35px;
}
img {
    border-radius: 50%;
    border: #ddd;
    border: 1px solid rgba(40, 40, 40, 0.12);
}
.R {
    background: purple;
}
.M {
    background: pink;
}
.A {
    background: green;
}
.S {
    background: lightskyblue;
}
.J {
    background: orange;
}
.N {
    background: blue;
}
#ui-list .e-list-item {
    height: 80px;
    border: #ddd;
    border: 1px solid rgba(184, 184, 184, 0.12);
}
.list-container {
    width: inherit;
    height: 100%;
}
.showUI {
    display: inline;
}
.hideUI {
    display: none;
}
.content {
    height: 100%;
    float: left;
}
.name {
    height: 100%;
    font-size: 20px;
    font-weight: 600;
    line-height: 78px;
}
</style>
```

LISTCONTROLLER.CS

```

public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listData = new List<object>();
        listData.Add(new { text = "Nancy", imgUrl = "", icon = "N", id = "0"
    });
        listData.Add(new { text = "Andrew", imgUrl = "", icon = "A", id =
    "1" });
        listData.Add(new { text = "Janet", imgUrl = "", icon = "J", id = "2"
    });
        listData.Add(new { text = "Margaret", icon = "", imgUrl =
    "./margaret.png", id = "3" });
        listData.Add(new { text = "Steven", imgUrl = "", icon = "S", id =
    "4" });
        listData.Add(new { text = "Laura", icon = "", imgUrl =
    "./images/laura.png", id = "5" });
        listData.Add(new { text = "Robert", imgUrl = "", icon = "R", id =
    "6" });
        listData.Add(new { text = "Michael", imgUrl = "", icon = "M", id =
    "7" });
        listData.Add(new { text = "Albert", icon = "", imgUrl =
    "./images/albert.png", id = "8" });
        listData.Add(new { text = "Nolan", imgUrl = "", icon = "N", id = "9"
    });

        for (int i = 10; i < 1000; i++)
        {
            int index = new Random().Next(0, 10);
            listData.Add(new
            {
                text =
listData[index].GetType().GetProperty("text").GetValue(listData[index],
null).ToString(),
                icon =
listData[index].GetType().GetProperty("icon").GetValue(listData[index],
null).ToString(),
                imgUrl =
listData[index].GetType().GetProperty("imgUrl").GetValue(listData[index],
null).ToString(),
                id = i.ToString()
            });
        }
        ViewBag.listData = listData;
        return View();
    }
}

```

Output be like the below.

Conditional rendering

The following conditional rendering support is provided for the template and groupTemplate.

| Name | Syntax |

| --- | --- | --- |

| conditional class | `<div class="{ $id % 2 === 0 ? 'even-list' : 'odd-list' }"></div>` |

| conditional attribute | `<div id="{ $id % 2 === 0 ? 'even-list' : 'odd-list' }"></div>` |

| conditional text content | `<div>{ $id % 2 === 0 ? 'even-list' : 'odd-list' }</div>` |

In the following sample, the light blue is applied for the even list and light coral is applied for the odd list based on the conditional class.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{ var template = "<div id='list-container' class='{ $id % 2 === 0 ?
\'even-list\' : \'odd-list\' }' > {text} </div>"; }
@Html.EJS().ListView("ui-
list").DataSource((IEnumerable<object>)ViewBag.listData).EnableVirtualizatio
n(true).Template(@template).Height(500).Render()
<style>
    #ui-list {
        display: block;
        max-width: 400px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
        cursor: pointer;
    }
    #list-container{
        height: inherit;
        width: inherit;
        padding-left: 30px;
    }
    #ui-list .e-list-item{
```

```
padding: 0;
}
#ui-list .even-list{
    background-color: #cfd8dc;
}
#ui-list .odd-list{
    background-color: #eceff1;
}
</style>
```

LISTCONTROLLER.CS

```
public class ListViewController : Controller
{
    public IActionResult List()
    {
        List<object> listData = new List<object>();
        listData.Add(new { text = "Nancy", id = "0" });
        listData.Add(new { text = "Andrew", id = "1" });
        listData.Add(new { text = "Janet", id = "2" });
        listData.Add(new { text = "Margaret", id = "3" });
        listData.Add(new { text = "Steven", id = "4" });
        listData.Add(new { text = "Laura", id = "5" });
        listData.Add(new { text = "Robert", id = "6" });
        listData.Add(new { text = "Michael", id = "7" });
        listData.Add(new { text = "Albert", id = "8" });
        listData.Add(new { text = "Nolan", id = "9" });
        for (int i = 10; i < 1000; i++)
        {
            int index = new Random().Next(0, 10);
            listData.Add(new
            {
                text =
listData[index].GetType().GetProperty("text").GetValue(listData[index],
null).ToString(),
                id = i.ToString()
            });
        }
        ViewBag.listData = listData;
        return View();
    }
}
```

Output be like the below.

Scrolling in ASP.NET MVC Listview Control

Scrolling is a technique that allows you to load more items as the user scrolls through a list, providing a seamless and dynamic user experience.

Render the ListView with `dataSource`, and bind the `(scroll)`[\[https://help.syncfusion.com/cr/aspnetmvc-js2/Syncfusion.EJ2.Lists.ListView.html#SyncfusionEJ2ListsListViewScroll\]](https://help.syncfusion.com/cr/aspnetmvc-js2/Syncfusion.EJ2.Lists.ListView.html#SyncfusionEJ2ListsListViewScroll) event. Within the scroll event, you can access information such as the scroll direction, event name and the distance from the scrollbar to the top and bottom ends through the `distanceY` parameter.

In the given example, new data is seamlessly added while scrolling. When you scrolls to the bottom and the distance scrolled is less than 100 pixels, it dynamically loads a batch of items into the list as long as there are more items to render.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{
    var template =
        "<div style='display: flex;' class='e-list-wrapper e-list-multi-line'>" +
        "<span style='display: block; white-space: normal; max-width: 80%; padding: 10px; background-color: #e0e0e0; border-radius: 10px; word-wrap: break-word; ' class='e-list-item-header'>${ text }</span>" +
        "</div>";
}
<div class="control-section">
    <div class="grid-container">
        <div>
            <h3>Chat</h3>

@Html.EJS().ListView("listview").DataSource((IEnumerable<object>)ViewBag.dataSource).Height("320px").Width("400px").Template(template).Scroll("onListScrolled").Render()
        </div>
    </div>
</div>
<style>
```

```

.grid-container {
    display: grid;
    grid-template-columns: repeat(3, 1fr);
    grid-gap: 20px;
    align-items: center;
}
h3 {
    margin: 0;
}
/* Optional: Add styling to headings and divs */
.grid-container > div {
    border: 1px solid #ddd;
    padding: 20px;
    border-radius: 5px;
    background-color: #f4f4f4;
}
.e-listview{
    background-color: white;
}
</style>
<script>
    function onListScrolled(args) {
        var listObj_1 =
document.getElementById('listview').ej2_instances[0];
        var data = listObj_1.dataSource;
        var itemsPerScroll = 5;
        var result = [];
        if (args.scrollDirection === 'Bottom') {
            if (args.distanceY < 100) {
                if (initialData < data.length) {
                    var startIndex = initialData;
                    var endIndex = Math.min(initialData + itemsPerScroll,
data.length);

                    result = data.slice(startIndex, endIndex);
                    listObj_1.addItem(result);
                    initialData = endIndex;
                }

    ViewBag.dataSource = initialData;  

    return View();  

}

```

Output be like the below.

CSS Structure

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

Customizing ListView

Use the following CSS to customize the ListView.

`CSS

```
.e-listview {
```

```
border: 5px solid rgb(173, 255, 47);  
}
```

,

Customizing the list items

Use the following CSS to customize the items of ListView.

```
`CSS
```

```
.e-listview .e-list-item {  
text-align: center;  
color: pink;  
background-color: #2fa1ff;  
}
```

,

Customizing ListView's header

Use the following CSS to customize the header of ListView control.

```
`CSS
```

```
.e-listview .e-list-header{  
color: #2fa1ff;  
justify-content: center;  
}
```

,

Customizing group header of ListView

Use the following CSS to customize the category of the group items.

```
`CSS
```

```
.e-listview .e-list-group-item {  
color: rgb(173, 255, 47);  
background-color: maroon;  
text-align: end;  
}
```

,

Customizing the hover state of ListView control

Use the following CSS to customize the list item when hovering.

Customizing ListView hover state with the checkbox checked

```
`CSS
```

```
.e-listview .e-list-item.e-hover.e-active.e-checklist {
```

```
color: rgb(83, 5, 79);
background-color: rgb(173, 255, 47);
}
,
```

Customizing ListView hover state

```
`CSS
.e-listview .e-list-item.e-hover {
color:red;
background-color: rgb(173, 255, 47);
}
,
```

Customizing selected item of ListView control

Use the following CSS to customize the selected list item.

Customizing ListView's selected item with the checkbox checked

```
`CSS
.e-listview .e-list-item.e-checklist.e-focused.e-active {
color: rgb(83, 5, 79);
background-color: rgb(0, 15, 100);
}
,
```

Customizing ListView's selected item

```
`CSS
.e-listview .e-list-item.e-focused {
color: #2fa1ff;
background-color: rgb(0, 15, 100);
}
,
```

Accessibility in ASP.NET MVC ListView component

The ListView component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ListView component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The ListView component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the ListView component:

- | Attributes | Purpose |
- | --- | --- |
- | **role=list** | Specifies the non selectable list container. |
- | **role=listitem** | Specifies the role of each item in a selectable ListView and its containment within the list. |
- | **role=presentation** | Specifies the role of non selectable list element. |

- | `role=checkbox` | Indicates checkbox control along with listitem element. |
- | `aria-checked` | Indicates the current checked state of checkbox. |
- | `aria-label` | Provides an accessible name for the ListView Checkbox. |
- | `aria-disabled` | Indicates element is perceivable but disabled. |

Keyboard interaction

The ListView component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ListView component.

| Keyboard shortcuts | Actions |

|-----|-----|

| Arrow Up | Move to the previous list item |

| Arrow Down | Move to the next list item |

| Space | Check and uncheck the targeted list from the whole list |

| BackSpace | Get back to the previous lists if it is nested list |

| Home | Moves focus to first list item |

| End | Moves focus to last list item |

Ensuring accessibility

The ListView component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ListView component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ListView component with accessibility tools.

Migration from Essential JS 1

This article describes the API migration process of ListView component from Essential JS 1 to Essential JS 2.

| Behaviour | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Virtualization | **Property:** `AllowVirtualScrolling`

`@Html.EJ().ListView("list").AllowVirtualScrolling(true)
.VirtualScrollMode(VirtualScrollMode.Continuous)` | **Property:** `EnableVirtualization`

`@Html.EJS().ListView("list").DataSource((IEnumerable<object>)
ViewBag.dataSource).EnableVirtualization(true).Render()` |

| Fields | **Property:** `FieldSettings`

 `@Html.EJ().ListView("list").FieldSettings(e => e.Text("text"))` | **Property:** `Fields`

 Inner properties: `child, enabled, groupBy`

htmlAttributes, iconCss, id, isChecked etc.

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Fields(new Syncfusion.EJ2.Lists.ListViewFieldSettings { GroupBy="type"}).Render() |
```

| Template | **Property:** *RenderTemplate*

```
@Html.EJ().ListView("list").RenderTemplate(true)<br/>.TemplateId("template") <br/> <br/>
```

```
<div id="template"><div>Data 1</div><div>Data 2</div><div>Data 3</div> </div> | Property:
```

```
Template <br/><br/> @ { var template = "<div class='template'>${text}</div>"; } <br/><br/>
```

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Template(template).Render() |
```

| Animation | **Not Applicable** | **Property:** *Animation*

 List<object> animation = new List<object>();
 animation.Add(new { effect = "SlideLeft", duration = "400", easing = "ease" });

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Animation(ViewBag.animation).Render() |
```

| Enable | **Not Applicable** | **Property:** *Enable*

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Enable(true).Render() |
```

| Template for grouping | **Not Applicable** | **Property:** *GroupTemplate*

 @ { var groupTemplate = "<div class='template'>\${text}</div>"; }

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).GroupTemplate(groupTemplate).Render() |
```

| Template for header | **Not Applicable** | **Property:** *HeaderTemplate*

 @ { var headerTemplate = "<div class='template'>\${text}</div>"; }

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).HeaderTemplate(headerTemplate).Render() |
```

| HTML attributes | **Not Applicable** | **Property:** *HtmlAttributes*

 @ {
IDictionary<string, object> htmlAttribute = new Dictionary<string, object>();
htmlAttribute.Add("class", "listViewCustom");
}

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).HtmlAttributes(htmlAttribute).Render() |
```

| Clear | **Method:** *clear()*

 @Html.EJ().ListView("list").DataSource(ViewBag.data)

 var listObj = \$("#list").ejListView("instance");
 listObj.clear(); | **Property** *clear*

```
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Render() <br/><br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/> listObj.clear(); |
```

| isChecked | **Method:** *isChecked()* @Html.EJ().ListView("list").EnableCheckMark(true) var listObj = \$("#list").ejListView("instance"); listObj.isChecked(); | **Not Applicable** |

| Load Ajax Content | **Property:** *EnableAjax*

```
@Html.EJ().ListView("list").EnableAjax(true).Items(items => items.Add().Text("Data
```

```

1").Href("/html/template.html")) | Event: onSuccess <br/><br/>
@Html.EJS().ListView("list").ActionBegin("onBegin").Render() <br/> <br/> function onBegin() {
<br/> var ajax = new ej.base.Ajax("/html/template.html", "GET", false); <br/> ajax.onSuccess =
function (value) { <br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.template = value; <br/> listObj.dataSource = @Json.Serialize(ViewBag.data); <br/> }
<br/> ajax.send(); <br/> }|

| Remove CheckMark | Method: removeCheckMark() <br/><br/>
@Html.EJ().ListView("list").EnableCheckMark(true) <br/><br/> var listObj =
$("#list").ejListView("instance"); <br/> listObj.removeCheckMark(2); | Method: uncheckItem()
<br/><br/>
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Render()
<br/><br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.uncheckItem({ id:'2' });|

| Set Active | Method: setActive() <br/><br/>
@Html.EJ().ListView("list").DataSource(ViewBag.data) <br/><br/> var listObj =
$("#list").ejListView("instance"); <br/> listObj.setActive(2); | Method: selectItem() <br/><br/>
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Render()
<br/><br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.selectItem({ id:'2' });|

| Select | Not Applicable | Event: select <br/><br/>
@Html.EJS().ListView("list").DataSource((IEnumerable<object>)<br/>ViewBag.dataSource).Select(
"onSelect").Render() <br/> <br/> function onSelect() { } |

| Ajax Before Load | Event: AjaxBeforeLoad <br/><br/>
@Html.EJ().ListView("list").EnableAjax(true).Items(items => items.Add().Text("Data
1").Href("/html/template.html")).ClientSideEvents(e => e.AjaxBeforeLoad("onAjaxBefore"))
<br/> <br/> function onAjaxBefore() { } | Event: beforeSend <br/><br/>
@Html.EJS().ListView("list").ActionBegin("onBegin").Render() <br/> <br/> function onBegin() {
<br/> var ajax = new ej.base.Ajax("/html/template.html", "GET", false); <br/> ajax.onSuccess =
function (value) { <br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.template = value; <br/> listObj.dataSource = @Json.Serialize(ViewBag.data); <br/> }
<br/> ajax.beforeSend = function (value) { } <br/> ajax.send(); <br/> } |

| Ajax Complete | Event: AjaxComplete <br/><br/>
@Html.EJ().ListView("list").EnableAjax(true).Items(items => items.Add().Text("Data
1").Href("/html/template.html")).ClientSideEvents(e => e.AjaxComplete("onAjaxComplete"))
<br/> <br/> function onAjaxComplete() { } | Event: onSuccess <br/><br/>
@Html.EJS().ListView("list").ActionBegin("onBegin").Render() <br/> <br/> function onBegin() {
<br/> var ajax = new ej.base.Ajax("/html/template.html", "GET", false); <br/> ajax.onSuccess =
function (value) { <br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.template = value; <br/> listObj.dataSource = @Json.Serialize(ViewBag.data); <br/> }
<br/> ajax.send(); <br/> }|

| Ajax Error | Event: AjaxError <br/><br/>
@Html.EJ().ListView("list").EnableAjax(true).Items(items => items.Add().Text("Data

```

```
1").Href("/html/template.html")).ClientSideEvents(e => e.AjaxError("onAjaxError")) <br/> <br/>
function onAjaxError() { } | Event: onError <br/><br/>
@Html.EJS().ListView("list").ActionBegin("onBegin").Render() <br/> <br/> function onBegin() {
<br/> var ajax = new ej.base.Ajax("/html/template.html", "GET", false); <br/> ajax.onSuccess =
function (value) { <br/> var listObj = document.getElementById('list').ej2_instances[0]; <br/>
listObj.template = value; <br/> listObj.dataSource = @Json.Serialize(ViewBag.data); <br/> }
<br/> ajax.onError = function (value) { } <br/> ajax.send(); <br/> }|
```

How To

Get selected items from ListView

Single or many items can be selected by users in the ListView component. An API is used to get selected items from the list items. This is called as the [getSelectedItems](#) method.

getSelectedItems method

This is used to get the details of the currently selected item from the list items. It returns the [SelectedItem](#) | [SelectedCollection](#)

The [getSelectedItems](#) method returns the following items from the selected list items.

| Return type | Purpose |
|-------------|--|
| ----- ----- | |
| text | Returns the text of selected item lists |
| data | Returns the whole data of selected list items, i.e., returns the fields data of selected li. |
| item | Returns the collections of list items |

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists

@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Fields(new ListViewFieldSettings { Text = "text",
Id="id"}).ShowCheckBox(true).Render()
    <div id="text">
        @Html.EJS().Button("btn").Content("Get selected Items").Render()
        <table id="val"></table>
    </div>
<style>
    #text {
        margin-left: 10px;
        margin-top: 20px;
    }
    #element {
        max-width: 350px;
        margin: auto;
        margin-top: 10px;
        display: block;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
<script>
```

```

document.getElementById('btn').addEventListener('click', () => {
    var selecteditem =
document.getElementById('element').ej2_instances[0].getSelectedItems();
    var data = document.getElementById('val');
    data.innerHTML = "";
    var row1 = document.createElement('tr');
    var header1 = document.createElement('th');
    header1.innerHTML = 'Text';
    row1.appendChild(header1);
    var header2 = document.createElement('th');
    header2.innerHTML = 'Id';
    row1.appendChild(header2);
    document.getElementById('val').appendChild(row1);
    for (var i= 0; i < (selecteditem["data"]).length; i++) {
        var row2 = document.createElement('tr');
        row2.setAttribute("id", i.toString());
        var data1 = document.createElement('td');
        data1.innerHTML = selecteditem["text"][i];
        row2.appendChild(data1);
        var data2 = document.createElement('td');
        data2.innerHTML = (selecteditem["data"][i].id.toString());
        row2.appendChild(data2);
        document.getElementById('val').appendChild(row2);
    }
});
</script>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            List<object> listdata = new List<object>();
            listdata.Add(new
            {
                text = "Hennessey Venom",
                id = "list-01"
            }); listdata.Add(new
            {
                text = "Bugatti Chiron",
                id = "list-02"
            }); listdata.Add(new
            {
                text = "Bugatti Veyron Super Sport",
                id = "list-03"
            }); listdata.Add(new
            {
                text = "SSC Ultimate Aero",

```

```

        id = "list-04"
    }); listdata.Add(new
    {
        text = "Koenigsegg CCR",
        id = "list-05"
    }); listdata.Add(new
    {
        text = "McLaren F1",
        id = "list-06"
    }); listdata.Add(new
    {
        text = "Aston Martin One- 77",
        id = "list-07"
    }); listdata.Add(new
    {
        text = "Jaguar XJ220",
        id = "list-08"
    });
    ViewBag.dataSource = listdata;
    return View();
}
}
}

```

Use Dynamic templates in ListView based on device

The Syncfusion Essential JS2 components are desktop and mobile-friendly. So, you can use Syncfusion components in both modes. The component templates are not always fixed. Applications may need to load various templates depending upon the device.

Integration

In the ListView component, template support is being used. In some cases, the component wrapper is always responsive across all devices, but the template contents are dynamically changed with unspecified (sample side) dimensions. CSS customization is also needed in sample-side to align template content responsively in both mobile and desktop modes. Here, two templates have been loaded for mobile and desktop modes. To check the device mode, a **browser module** has been imported from the [ej2-base](#) package.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@{
    var wintemplate = "";
    var width = "";
    var mob_template = "<div class='settings'>"
        + "<div id='postContainer'><div id='postImg'> "
        + "<img src=${image} /></div>"
        + "<div id='content'> "
        + "<div id='info'> "
        + "<div id='logo'> <div id= 'share'> "
        + "<span class='share'></span> </div> <div id='comments'>
        <span class='comments'></span> </div>"
        + "<div id='bookmark'> <span class='bookmark'></span>
        </div></div></div>"
        + "<div class='name'>${Name}</div>"
    }

```

```

        + "<div class='description'>${content}</div>"
        + "<div class='timeStamp'>${timeStamp} </div>"
        + "</div>";
    var template = "<div class='settings'><div id='postContainer'><div
id='postImg'><img src=${image} /></div><div id='content'>"
        + "<div class='name'>${Name}</div><div
class='description'>${content}</div><div id='info'>"
        + "<div id='logo'><div id='share'><span
class='share'></span>"
        + "</div> <div id='comments'> <span
class='comments'></span> </div>"
        + "<div id='bookmark'> <span
class='bookmark'></span> </div></div>"
        + "<div class='timeStamp'>${timeStamp}
</div></div></div>";
    if (Request.Browser.IsMobileDevice)
    {
        width = "350px";
        wintemplate = mob_template;
    }
    else
    {
        wintemplate = template;
    }

Create Dual List from ListView

The dual list contains two ListView. This allows you to move list items from one list to another using the client-side events. This section explains how to integrate the ListView component to achieve dual list.

Use cases

- Stock exchanges of two different countries
- Job applications (skill sets)

Integration of Dual List

Here, two ListView components have been used to display the list items. An ej2-button is used to transfer data between the ListView, and a textbox is used to achieve the UI of filtering support.

The dual list supports:

- Moving whole data from one list to another.
- Moving selected data from one list to another.
- Filtering the list by using a client-side typed character.

In the ListView component, sorting is enabled using the [sortOrder](#) property, and the [select](#) event is triggered while selecting an item. Here, the select event is triggered to enable and disable button states.

Manipulating data

Moving whole data from the first list to the second list(>>)

- Here, the whole data can be moved from the first ListView to the second by clicking the first button. When clicking the button, the whole list items are sliced, and `concat` with the second ListView. This button is enabled only when the data source of the first ListView is not empty.

Moving whole data from the second list to the first list(<<)

- The functionality of the second button is the same as above, and data is transferred from the second list to the first list. This button is enabled only when the data source of the second ListView is not empty.

Moving selected item from one list to another list (>) and (<)

- The [Select](#) event is triggered when selecting a list item in the ListView. The selected items can be transferred between two lists. These buttons will be enabled when selecting an item in lists.

Filtering method

- The filtering method is used to filter list items when typing a character in the text box. In this method, the [dataManager](#) has been used to fetch data from the data source and display in ListView.

Sorting

- By using the dual list, list items can be sorted in the ListView component using the [sortOrder](#) property.

You can enable sorting in one ListView; in the same order, data can be transferred to another ListView.

```

Load List Items in child list dynamically

To load list items in child list dynamically, push the new list item data into the existing [dataSource](#) using the [select](#) event.

Refer to the following steps to load list item into the child list:

1. Initially, render the ListView with the required data source.
2. Bind the [select](#) event that triggers selecting list item in the ListView component. By using the select event, you can push the new list item to the child list of the data source on specifying its item index. Item index can be obtained from the [SelectEventArgs](#) of the select event.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
@Html.EJS().ListView("listview").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { IconCss = "icon", Tooltip = "text"
}).Select("onSelect").ShowIcon(true).ShowHeader(true).HeaderTitle("Folders")
.Render()
<style>
    #listview {
        display: block;
        max-width: 350px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }

ViewBag.dataSource = listdata;
return View();
}
}

```

Show Items Count in Group Header

The ListView component supports wrapping list items into a group based on the category. The category of each list item can be mapped with `groupBy` field of the data source. You can display grouped list items count in the list-header using the group header template. Refer to the following code sample to display grouped list item count.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
@{
    var template = "<div class='settings'>"
        + "<div id='postContainer'><div id='postImg'>"
        + "<img src=${image} style='height:35px;width:35px;border-radius:50%;border: 1px solid #ccc;' /></div>"
        + "<div id='content'><div class='name'>${Name}</div><div id='info'>${contact}</div></div></div>";
}
@Html.EJS().ListView("List").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { GroupBy = "category", Text = "Name"
}).GroupTemplate("<div><span class='category'>${items[0].category}</span><span class='count'> ${items.length} Item(s)</span></div>").Template(template).Render()
<style>
    .count{
        float:right;
    }
    #List {
        display: block;
        margin: auto;
        border: 1px solid;

        return View();
    }
}

```

Filter List Items in the ListView

The filtered data can be displayed in the ListView component depending upon on user inputs using the [DataManager](#). Refer to the following steps to render the ListView with filtered data.

- Render a textbox to get input for filtering data.
- Render ListView with [dataSource](#), and set the [sortOrder](#) property.
- Bind the `keyup` event for textbox to perform filtering operation. To filter list data, pass the list data source to the `DataManager`, manipulate the data using the [executeLocal](#) method, and then update filtered data as ListView dataSource.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
<div id="sample">
    <input class="e-input" type="text" id="textbox" placeholder="Filter"
title="Type in a name">

@Html.EJS().ListView("list").DataSource((IEnumerable<object>)ViewBag.dataSou
rce).Fields(new ListViewFieldSettings { Id = "id", Text = "text"
}).SortOrder(SortOrder.Ascending).Render()
</div>
<style>
    #list {
        box-shadow: 0 1px 4px #ddd;
        border-bottom: 1px solid #ddd;
    }
    #sample {
        height: 220px;
        margin: 0 auto;
        display: block;
        max-width: 350px;
    }
</style>
<script>
    document.getElementById("textbox").addEventListener("keyup", onKeyUp);
    //Here, the list items are filtered using the DataManager instance for
    ListView
    function onKeyUp() {

```

```

        var listData =
@ (Html.Raw (Newtonsoft.Json.JsonConvert.SerializeObject (ViewBag.dataSource)))
;

        var listObj = (document.getElementById("list")).ej2_instances[0];
        var value = (document.getElementById("textbox")).value;
        var data = new ej.data.DataManager(listData).executeLocal(
            new ej.data.Query().where("text", "startswith", value, true)
        );
        if (!value) {
            listObj.dataSource = listData.slice();
        } else {
            listObj.dataSource = data;
        }
        listObj.dataBind();
    }
</script>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            List<object> listdata = new List<object>();
            listdata.Add(new
            {
                text = "Hennessey Venom",
                id = "list-01"
            }); listdata.Add(new
            {
                text = "Bugatti Chiron",
                id = "list-02"
            }); listdata.Add(new
            {
                text = "Bugatti Veyron Super Sport",
                id = "list-03"
            }); listdata.Add(new
            {
                text = "SSC Ultimate Aero",
                id = "list-04"
            }); listdata.Add(new
            {
                text = "Koenigsegg CCR",
                id = "list-05"
            }); listdata.Add(new
            {
                text = "McLaren F1",
                id = "list-06"
            });
        }
    }
}

```

```

        ViewBag.dataSource = listdata;
        return View();
    }
}
}

```

Note: In this demo, data has been filtered with starting character of the list items. You can also filter list items with ending character by passing the `endswith` in [where](#) clause instead of `startswith`.

Add and Remove List Items from the ListView

You can add or remove list items from the ListView component using the [addItem](#) and [removeItem](#) methods.

Refer to the following steps to add or remove a list item.

- Render the ListView with data source, and use the [template](#) property to append the delete icon

for each list item. Also, bind the click event for the delete icon using the [actionComplete](#) handler.

- Render the Add Item button, and bind the click event. On the click event handler, pass data with random id to the [addItem](#) method to add a new list item on clicking the Add Item button.
- Bind the click handler to the delete icon created in step 1. Within the click event, remove the list item by passing the delete icon list item to [removeItem](#) method.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
<div id="sample">
    @Html.EJS().ListView("sample-list-flat").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new
    ListViewFieldSettings { IconCss = "icon", Text = "text"
    }).ActionComplete("onComplete").Template("<div class='text-content'> ${text}
    <span class = 'delete-icon'></span> </div>").Render()
    @Html.EJS().Button("btn").Content("Add Item").Render()
</div>

            return View();
        }
    }
}
```

Trace all events in ListView

The ListView component triggers events based on its actions. The events can be used as extension points to perform custom operations. Refer to the following steps to trace the ListView events:

1. Render the ListView with [dataSource](#), and bind the [actionBegin](#), [actionComplete](#), and [select](#) events.
2. Perform custom operations in actionBegin, actionComplete, and select events.
3. Provide event log details for actionBegin and actionComplete events, and they will be displayed in the event trace panel when the ListView action starts and the dataSource bound successfully.
4. Get the selected item details from the [SelectEventArgs](#) in the select event, and display the selected list item text in the event trace panel while selecting list items.

5. Use clear button to remove event trace information.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
<h4 id="evt-text">
    <b>Event Trace</b>
</h4>
<div id="list-container">
    <!-- ListView element -->
    @Html.EJS().ListView("listview-
def").DataSource((IEnumerable<object>)ViewBag.dataSource).ActionComplete("on
ActionComplete").ActionBegin("onActionBegin").Select("onSelect").Width("250"
).Render()
    <div id="list_event">
        <div id="evt">
            <div class="eventarea" style="height:273px;overflow: auto">
                <!-- Event log element -->
                <span class="EventLog" id="EventLog" style="word-break:
normal"></span>
            </div>
            <div class="evtbtn">
                <!-- clear button element -->
                @Html.EJS().Button("clear").Content("Clear").Render()
            </div>

            listdata.Add(new { text= "McLaren P1", id= "6", icon= "delete-
icon" });
            ViewBag.dataSource = listdata;
            return View();
        }
    }
}

```

```
}

```

Create Mobile contact layout from ListView

You can customize the ListView using the [template](#) property. Refer to the following steps to customize ListView as mobile contact view with our `ej2-avatar`.

- Render the ListView with [dataSource](#) that has avatar data. You can set avatar data as either text or class names. Refer to the following codes.

```
`typescript

```

```
List<object> listdata = new List<object>();

```

```
listdata.Add(new

```

```
{

```

```
text = "Jenifer",

```

```
contact = "(206) 555-985774",

```

```
id = "1",

```

```
avatar = "",

```

```
pic = "pic01"

```

```
});

```

```
listdata.Add(new

```

```
{

```

```
text = "Amenda",

```

```
contact = "(206) 555-3412",

```

```
id = "2",

```

```
avatar = "A",

```

```
pic = ""

```

```
});

```

```
`

```

- Set `avatar` classes in ListView template to customize contact icon. In the following codes, medium size avatar has been set using the class name `e-avatar e-avatar-circle` from data source.

```
`typescript

```

```
var template: "<div class='settings'>" +

```

```
"${if(avatar!=="")}" +

```

```
"<span class='e-avatar e-avatar-circle'>${avatar}</span>" +

```

```

"${else}" +
"<span class='${pic} e-avatar e-avatar-circle'> </span>" +
"${/if}" +
"<div id='content'>" +
"<div class='name'>${text}</div>" +
"<div id='info'>${contact}</div>" +
"</div>";
`

```

Note: Avatars can be set in different sizes in avatar classes. To know more about avatar classes, refer to [Avatar](#).

- Sort the contact names using the [sortOrder](#) property of ListView.
- Enable the [showHeader](#) property, and set the [headerTitle](#) as `Contacts`.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
@{
    var template = "<div class='settings'>" +
        "${if (avatar != '')}" +
        "<span class='e-avatar e-avatar-circle'>${avatar}</span>" +
        "${else}" +
        "<span class='${pic} e-avatar e-avatar-circle'> </span>" +
        "${/if}" +
        "<div id='content'>" +

        id= "9",
        avatar= "C",
        pic= ""
    });
    ViewBag.dataSource = listdata;
    return View();
}
}
}

```

Display spinner until List Items are loaded

The features of the ListView component such as remote data-binding take more time to fetch data from corresponding dataSource/remote URL. In this case, you can use EJ2

[Spinner](#) to enhance the appearance of the UI. This section explains how to load a spinner component to groom the appearance.

Refer to the following code sample to render the spinner component.

```

`typescript
ej.popups.createSpinner({
target: document.getElementById('spinner')
});
ej.popups.showSpinner(document.getElementById('spinner'));
`

```

Refer to the following code sample to render the ListView component.

```

`typescript
<!-- ListView element -->
@Html.EJS().ListView("element").DataSource(dataManger =>
{dataManger.Url("https://js.syncfusion.com/ejServices/Wcf/Northwind.svc/").CrossDomain(true);
}).Query("new
ej.data.Query().from('Products').select('ProductID,ProductName').take(10)").ActionBegin("onBegin").Fields(
new ListViewFieldSettings { Id = "ProductID", Text = "ProductName"

```

```
}).ShowHeader(true).HeaderTitle("Product
Name").Width("300").ActionComplete("oncomplete").Render()
```

Here, the data is fetched from **Northwind** Service URL; it takes a few seconds to load the data. To enhance the UI, the spinner component has been rendered initially. After the data is loaded from remote URL, the spinner component will be hidden in ListView [actionComplete](#) event.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
<!-- ListView element -->
@Html.EJS().ListView("element").DataSource(dataManger =>
{dataManger.Url("http://js.syncfusion.com/ejServices/Wcf/Northwind.svc/").Cr
ossDomain(true);
}).Query("new
ej.data.Query().from('Products').select('ProductID,ProductName').take(10)").
ActionBegin("onBegin").Fields(new ListViewFieldSettings { Id = "ProductID",
Text = "ProductName" }).ShowHeader(true).HeaderTitle("Product
Name").Width("300").ActionComplete("oncomplete").Render()
<style>
    #element {
        display: block;
        max-width: 350px;
        min-height: 200px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
</style>
<script>
    function oncomplete() {
        document.getElementById('spinner').style.display = "none";
    }
    function onBegin() {
        var ele = document.createElement('div');
        ele.id = 'spinner';
        document.getElementById('element').appendChild(ele);
        ej.popups.createSpinner({
            target: document.getElementById('spinner')
        });
        ej.popups.showSpinner(document.getElementById('spinner'));
    }
</script>
```

LIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
```

```

    {
        public IActionResult list()
        {
            return View();
        }
    }
}

```

Hide checkbox in ListView

The checkbox of the any list item can be hidden by using [htmlAttributes](#) of [fields](#) object. With the help of [htmlAttributes](#) we can add unique class to each list item that will be rendered from the data source, from the CSS class we can hide the checkbox of the list item.

In this sample, we had hidden the multiple leaf node of nested list. The `e-checkbox-hidden` class has been added in the data source where the checkbox needs to be hidden. Refer the below snippet for simple data source.

```

`typescript
{
    text= 'New York',
    id= '3002',
    category= 'USA',
    htmlAttributes= { 'class': 'e-file e-checkbox-hidden' }
}
,

```

Even though we have hidden the checkbox the functionality will be same for the list item which might affect the `getSelectedItems` method. So, to counteract that we will follow certain logic in the `select` event. The Logic here is to remove the `e-active` class from the other checkbox hidden list item which will be added when we select on that item and retain `e-active` on currently selected item.

Note: In this process we will exclude the visible checkbox list items and only consider the hidden checkbox items.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
<!-- ListView element -->
@Html.EJS().ListView("folderCheckbox").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { Tooltip = "text"
}).ShowHeader(true).HeaderTitle("Mixed Leaf Checkbox Hidden
List").ShowCheckBox(true).Select("onSelect").Render()
<style>
    #folderCheckbox {
        border: 1px solid #dddddd;
        border-radius: 3px;
        width: 350px;
        margin: auto;
    }

```

```

        #folderCheckbox .e-checkbox-hidden .e-checkbox-wrapper {
            visibility: hidden;
        }
    </style>
    <script>
        function onSelect(args) {
            var listViewInstance =
document.getElementById("folderCheckbox").ej2_instances[0];
            // Selecting all the e-active elements from the list.
            var normalElements =
Array.prototype.slice.call(listviewInstance.element.getElementsByClassName('
e-checkbox-hidden'));
            // Looping through all the selected element and removing e-active
class
            // to avoid behaviour interference with getSelectedItems method
normalElements.forEach((element) => {
                element.classList.remove('e-active');
            });
            // Finally adding e-active class to currently selected item except
checkbox item.
            // because if it is checkbox item their actions will taken care from
the source side itself.
            if (args.item.classList.contains('e-checkbox-hidden')) {
                args.item.classList.add('e-active');
            }
        }
    </script>

```

LIST.CS

"South Africa",htmlAttributes= new { @class= "e-file" }}
            }
        },
    }
});
ViewBag.dataSource = listdata;
return View();
}
}
}

```

Manipulate ListView as Grid Layout

In Listview, list items can be rendered in grid layout with following data manipulations.

- Add Item
- Remove Item
- Sort Items
- Filter Items

Grid Layout

In this section, we will discuss about rendering of list items in grid layout.

- Initialize and render ListView with dataSource which will render list items in list layout.
- Now, add the below CSS to list item. This will make list items to render in grid layout

`css

```

element .e-list-item {
height: 100px;
width: 100px;
float: left;
}
`

```

In the below sample, we have rendered List items in grid layout.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
@{
    var template = "<img id='listImage' src='./apple.png' alt='apple' />";
}

```

```

<!-- ListView element -->
@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Template(template).Render()
<style>
#element {
    display: block;
    max-width: 303px;
    margin: auto;
    border: 1px solid #dddddd;
    border-radius: 3px;
}
#element .e-list-item {
    height: 100px;
    width: 100px;
    float: left;
    padding: 0;
}
#listImage {
    width: 55px;
    height: 55px;
    margin-left: 20px;
    margin-top: 20px;
}
</style>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            string[] listdata = { "1", "2", "3", "4", "5", "6", "7", "8", "9"
};
            ViewBag.dataSource = listdata;
            return View();
        }
    }
}

```

Data manipulation

In this section, we will discuss about ListView data manipulations.

Add Item

We can add list item using [addItem](#) API. This will accept array of data as argument.

```
`typescript
```

```
listViewInstance.addItem([{text: 'Apricot', id: '32'}]);
```

In the below sample, you can add new fruit item by clicking add button which will open dialog box with fruit name and image URL text box. After entering the item details, click the add button. This will add your new fruit item.

Remove item

We can remove list item using [removeItem](#) API. This will accept fields with `id` or list item element as argument.

`typescript

```
listViewInstance.removeItem({id: '32'});
```

In the below sample, you can remove fruit by hovering the fruit item which will show delete button and click that delete button to delete that fruit from your list.

Sort Items

ListView can be sorted either in Ascending or Descending order. To enable sorting in your ListView, set [sortOrder](#) as `Ascending` or `Descending`.

`typescript

```
@Html.EJS().ListView("element").SortOrder(SortOrder.Ascending).Render()
```

We can also set sorting after component initialization.

`typescript

```
listViewInstance.sortOrder = 'Ascending'
```

In the below sample, we have sorted fruits in `Ascending` order. To sort it in descending, click on sort order icon and vice versa.

CSHTML

```

```

Drag and Drop List Items

In ListView component, we don't have drag and drop support. But we can achieve this requirement using [TreeView](#) component with ListView appearance.

Drag and Drop in TreeView component was enabled by setting [allowDragAndDrop](#) to `true`.

`typescript

```

@Html.EJS().TreeView("element").Fields(ViewBag.TreeViewFields).AllowDragAndDrop(true).Render()
,

```

The TreeView component is used to represent hierarchical data in a tree like structure. So, list items in TreeView can be dropped to child of target element. we can prevent this behaviour by cancelling the [nodeDragStop](#) and [nodeDragging](#) events.

`typescript

```

@Html.EJS().TreeView("element").Fields(ViewBag.TreeViewFields).AllowDragAndDrop(true).NodeDraggi
ng("onDragStop").NodeDragStop("onDragStop").Render()

```

```

function onDragStop(args) {

```

```

//Block the Child Drop operation in TreeView

```

```

var draggingItem = document.getElementsByClassName("e-drop-in");

```

```

if (draggingItem.length == 1) {

```

```

    draggingItem[0].classList.add('e-no-drop');

```

```

    args.cancel = true;
}

```

```

}
}
,

```

In the below sample, we have rendered draggable list items.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
using Syncfusion.EJ2.Navigations;
@Html.EJS().TreeView("element").Fields(ViewBag.TreeViewFields).AllowDragAndDrop(true).NodeDragging("onDragStop").NodeDragStop("onDragStop").Render()
<style>
    #element.e-treeview .e-ul {
        padding: 0;
    }
    #element.e-treeview .e-list-item {
        padding: 0 16px;
    }
    #element.e-treeview .e-text-content {
        padding: 0;
    }
    #element.e-treeview .e-fullrow {
        height: 36px;
    }
    #element.e-treeview .e-list-text {
        line-height: 34px;
    }
    #element.e-treeview .e-list-item:last-child {
        margin-bottom: 9px;
    }
    #element.e-treeview .e-list-item:first-child {
        margin-top: 9px;
    }
</style>
<script>
    function onDragStop(args) {
        //Block the Child Drop operation in TreeView
        var draggingItem = document.getElementsByClassName("e-drop-in");
        if (draggingItem.length == 1) {
            draggingItem[0].classList.add('e-no-drop');
            args.cancel = true;
        }
    }
</script>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using Syncfusion.EJ2.Navigations;
namespace WebApplication1.Controllers

```

```
{  
    public class ListViewController : Controller  
    {  
        public IActionResult list()  
        {  
            List<object> listdata = new List<object>();  
            listdata.Add(new  
            {  
                text = "Hennessey Venom",  
                id = "list-01"  
            }); listdata.Add(new  
            {  
                text = "Bugatti Chiron",  
                id = "list-02"  
            }); listdata.Add(new  
            {  
                text = "Bugatti Veyron Super Sport",  
                id = "list-03"  
            }); listdata.Add(new  
            {  
                text = "SSC Ultimate Aero",  
                id = "list-04"  
            }); listdata.Add(new  
            {  
                text = "Koenigsegg CCR",  
                id = "list-05"  
            }); listdata.Add(new  
            {  
                text = "McLaren F1",  
                id = "list-06"  
            }); listdata.Add(new  
            {  
                text = "Aston Martin One- 77",  
                id = "list-07"  
            }); listdata.Add(new  
            {  
                text = "Jaguar XJ220",  
                id = "list-08"  
            }); listdata.Add(new  
            {  
                text = "McLaren P1",  
                id = "list-09"  
            }); listdata.Add(new  
            {  
                text = "Ferrari LaFerrari",  
                id = "list-10"  
            });  
            ViewBag.dataSource = listdata;  
            return View();  
        }  
    }  
}
```

Render ListView with hyper-link navigation

We can use `anchor` tag along with `href` attribute in our ListView `template` property for navigation.

```
`typescript
```

```
var anchor_template = "<a target='blank' href='${url}'>${name}</a>";
```

```
,
```

In the below sample, we have rendered **ListView** with search engines URL.

CSHTML

```
@{
    var anchor_template = "<a target='_blank' href='${url}'>${name}</a>";
}
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
@Html.EJS().ListView("element").DataSource((IEnumerable<object>)ViewBag.data
Source).Template(anchor_template).HeaderTitle("Search
engines").ShowHeader(true).Render()
<style>
    #element {
        display: block;
        max-width: 350px;
        margin: auto;
        border: 1px solid #dddddd;
        border-radius: 3px;
    }
    #element a {
        text-decoration: none;
    }
    #element .e-list-header {
        background: rgb(2, 120, 215);
        color: white;
        font-size: 19px;
        font-weight: 500;
    }
</style>
```

LIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            List<object> listdata = new List<object>();
            listdata.Add(new { name = "Google", url =
"https://www.google.com" });
            listdata.Add(new { name = "Bing", url = "https://www.bing.com"
});
            listdata.Add(new { name = "Yahoo", url = "https://www.yahoo.com"
});
        }
    }
}
```

```

        listdata.Add(new { name = "Ask.com", url = "https://www.ask.com"
    });
        listdata.Add(new { name = "AOL.com", url =
    "https://www.aol.com"});
        ViewBag.dataSource = listdata;
        return View();
    }
}

```

Customize ListView as Chat Window

ListView can be customized as chat window. To achieve that, use the ListView [template](#) property and [Avatar](#) component.

- The Listview template property is used to showcase the ListView as chat window.
- Avatar component is used to design the image of contact person.

Refer the below template code snippet for Template of chat window.

```

`typescript
var template = "<div class='settings'>" +
    "${if(chat!=='receiver')} " +
    "<div id='content'>" +
    "<div class='name'>${text}</div>" +
    "<div id='info'>${contact}</div></div>" +
    "${if(avatar!=='')} " +
    "<div id='image'><span class='e-avatar img1 e-avatar-circle'>${avatar}</span></div>" +
    "${else}" +
    "<div id='image'><span class='${pic} img1 e-avatar e-avatar-circle'> </span></div>" +
    "${/if}" +
    "${else}" +
    "${if(avatar!=='')} " +
    "<div id='image2'><span class='e-avatar img2 e-avatar-circle'>${avatar}</span></div>" +
    "${else}" +
    "<div id='image2'><span class='${pic} img2 e-avatar e-avatar-circle'> </span></div>" +
    "${/if}" +
    "<div id='content1'>" +
    "<div class='name1'>${text}</div>" +
    "<div id='info1'>${contact}</div>" +
    "</div>" +

```

```
"${/if}" +
"</div>";
`
```

Chat order in template

In ListView template, we have rendered the list items based on receiver and sender information from dataSource of listview.

Adding messages to chat window

- Use textbox to get message from user.
- Add the textbox message to ListView dataSource using [addItem](#) method.

```
`typescript
```

```
document.getElementById('btn').addEventListener('click', (e) => {
var value = document.getElementById('name').value;

document.getElementById('List').ej2_instances[0].addItem([{ text: "Amenda", contact: value, id: "2",
avatar: "A", pic: "", chat: "receiver" }]);

});
`
```

CSHTML

```
@{
    var template = "<div class='settings'>" +
        "${if(chat!=='receiver')}" +
        "<div id='content'>" +
        "<div class='name'>${text}</div>" +
        "<div id='info'>${contact}</div></div>" +
        "${if(avatar!=='')}" +
        "<div id='image'><span class='e-avatar img1 e-avatar-circle'>${avatar}</span></div>" +
        "${else}" +
        "<div id='image'><span class='${pic} img1 e-avatar e-avatar-circle'> </span></div>" +
        "${/if}" +
        "${else}" +
        "${if(avatar!=='')}" +
        "<div id='image2'><span class='e-avatar img2 e-avatar-circle'>${avatar}</span></div>" +
        "${else}" +
        "<div id='image2'><span class='${pic} img2 e-avatar e-avatar-circle'> </span></div>" +
        "${/if}" +
        "<div id='content1'>" +
        "<div class='name1'>${text}</div>" +
        "<div id='info1'>${contact}</div>" +
        "</div>" +
        "${/if}" +
        "</div>";
}
```

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists;
@Html.EJS().ListView("List").DataSource((IEnumerable<object>)ViewBag.dataSource).Fields(new ListViewFieldSettings { Text = "text"
}).Template(template).HeaderTitle("Chat").Width("350px").ShowHeader(true).Render()
<div style="width: 350px;margin: 0 auto;">
<input id="name" style="width: 275px" class="e-input" type="text"
placeholder="Type your message" />
@Html.EJS().Button("btn").Content("Send").Render()
</div>
<style>
    #btn {
        float: right;
    }
    #List {
        margin: 0 auto;
        border: 1px solid #ccc;
    }
    #List .e-list-item {
        height: auto;
        cursor: pointer;
    }
    #List .e-list-header .e-text {
        font-family: sans-serif;
        font-size: 18px;
        line-height: 26px;
    }
    #List #info,
    #List .name {
        font-size: 11px;
        line-height: 20px;
    }
    #List .name {
        padding-top: 3px;
        font-weight: 500;
        padding-left: 150px;
    }
    #List #info {
        float: right;

        display: inline-block;
    }
    .img1.e-avatar {
        margin-right: 10px;
        margin: 5px;
        font-size: 13px;
    }
    .e-listview .e-list-item {
        padding: 0px !important;
    }
    .e-listview .e-list-header {
        color: white !important;
    }
    .e-listview .e-list-header {
        background: rgb(2, 120, 215) !important;
    }
    #List.e-listview .e-list-item.e-hover {
        background-color: transparent;
    }
</style>
<script>
    document.getElementById('btn').addEventListener('click', (e) => {

```

```

        let value = document.getElementById('name').value;
        document.getElementById('List').ej2_instances[0].addItem([{ text:
"Amenda", contact: value, id: "2", avatar: "A", pic: "", chat: "receiver"
}]);
        document.getElementById('name').value = "";
    });
</script>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            List<object> listData = new List<object>();
            listData.Add(new
            {
                text = "Jenifer",
                contact = "Hi",
                id = "1",
                avatar = "",
                pic = "pic01",
                chat = "sender"
            });
            listData.Add(new { text = "Amenda", contact = "Hello", id = "2",
avatar = "A", pic = "", chat = "receiver" });
            listData.Add(new
            {
                text = "Jenifer",
                contact = "What Knid of application going to launch",
                id = "4",
                avatar = "",
                pic = "pic02",
                chat = "sender"
            });
            listData.Add(new
            {
                text = "Amenda ",
                contact = "A knid of Emergency broadcast App",
                id = "5",
                avatar = "A",
                pic = "",
                chat = "receiver"
            });
            listData.Add(new
            {
                text = "Jacob",
                contact = "Can you please elaborate",
                id = "6",
            });
        }
    }
}

```

```

        avatar = "",
        pic = "pic04",
        chat = "sender"
    });
    ViewBag.dataSource = listData;
    return View();
}
}
}

```

Customize Each List Item's Text in ListView Component

To customize the text of each list item in the ListView component, you can make use of the [HtmlAttributes](#) property. This property allows you to specify HTML attributes and styles for individual items within the list, enabling you to create visually appealing and interactive lists tailored to your requirements.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Lists
<div>

@Html.EJS().ListView("listview").Enable(true).CssClass("custom").DataSource(
    (IEnumerable<object>)ViewBag.dataSource).Render()
</div>
<style>
    .custom.e-listview .e-list-item.e-high .e-text-content {
        color: red;
    }
    .custom.e-listview .e-list-item.e-moderate .e-text-content {
        color: yellow;
    }
    .custom.e-listview .e-list-item.e-normal .e-text-content {
        color: black;
    }
</style>

```

LIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
namespace WebApplication1.Controllers
{
    public class ListViewController : Controller
    {
        public IActionResult list()
        {
            List<object> data = new List<object>();
            data.Add(new { text = "Hennessey Venom", id = "list-01",
            htmlAttributes = new Dictionary<string, object>() { { "class", "e-high" } }
            });
        }
    }
}

```

```

        data.Add(new { text = "Bugatti Chiron", id = "list-02",
htmlAttributes = new Dictionary<string, object>() { { "class", "e-moderate"
} } });
        data.Add(new { text = "Bugatti Veyron Super Sport", id = "list-
03", htmlAttributes = new Dictionary<string, object>() { { "class", "e-
normal" } } });
        data.Add(new { text = "SSC Ultimate Aero", id = "list-04",
htmlAttributes = new Dictionary<string, object>() { { "class", "e-moderate"
} } });
        data.Add(new { text = "Koenigsegg CCR", id = "list-05",
htmlAttributes = new Dictionary<string, object>() { { "class", "e-normal" }
} });
        data.Add(new { text = "McLaren F1", id = "list-06",
htmlAttributes = new Dictionary<string, object>() { { "class", "e-high" } }
});
        data.Add(new { text = "Aston Martin One- 77", id = "list-07",
htmlAttributes = new Dictionary<string, object>() { { "class", "e-moderate"
} } });
        ViewBag.dataSource = data;
        return View();
    }
}
}

```

Maps

Getting Started with ASP.NET MVC Maps Component

This section briefly explains about how to include [ASP.NET MVC MapsLink to the Video](#) component in your ASP.NET MVC application using Visual Studio.

You can explore some useful features in the Maps component using the following video.

Prerequisites

[System requirements for ASP.NET MVC components](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add ASP.NET MVC controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add script resources

Here, the script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Maps component

Now, add the Syncfusion ASP.NET MVC Maps component in **~/Views/Home/Index.cshtml** page.

CSHTML

```
@Html.EJS().Maps("container").Layers(layer => {
layer.ShapeData(Model).Add(); }).Render();
```

Place the **WorldMap.json** file in **App_Data** folder of the project. Read the content in **WorldMap.json** file in the code behind and assign the deserialized object to the **shapeData** property of the Maps component using the **ViewBag** object in **HomeController.cs** as shown below.

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    return View(GetWorldMap());
}
public object GetWorldMap()
{
    string allText =
        System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
    return JsonConvert.DeserializeObject(allText, typeof(object));
}
```

Note: The `shapeData` in the `ViewBag` object is already assigned to the Maps component.

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Maps component will be rendered in the default web browser.

Note: [View Sample in GitHub.](#)

Populate data

Geometry types

GeoJSON data contains geometry objects with properties such as geometry types and coordinates. The geometry types are the values present in the geometry objects of the GeoJSON data that specify the type of shape to be rendered, as well as the coordinates that help to draw the shape's boundary line. The supportive geometry types are:

| Shapes | Supported |

| --- | --- |

| Polygon | Yes |

| MultiPolygon | Yes |

| LineString | Yes |

| MultiLineString | Yes |

| Point | Yes |

| MultiPoint | Yes |

| GeometryCollection | Yes |

[Shape data](#)

The shape data collection describes geographical shape information that is available in GeoJSON format. The Map shapes are rendered with this data. The custom shapes such as seat selection in bus, seat selection in a cricket stadium and more useful information can be also added as ShapeData in the layer of the Maps.

[Data source](#)

The **DataSource** property is used to represent statistical data in the Maps component, and it accepts a collection of values as input. For example, a list of objects as input can be provided to the data source. This data source will be used to color the map, display data labels, and display tooltip, among other things.

The data source is populated with JSON data relative to shape data and stored as JSON object. In the below example, the below JSON object can be used as data source in Maps.

```
`json
[
{
'code': 'AF',
'value': 53,
'name': 'Afghanistan',
'population': 29863010,
'density': 119
},
{
'code': 'AL',
'value': 117,
'name': 'Albania',
'population': 3195000,
'density': 111
```

```
,  
{  
  'code': 'DZ',  
  'value': 15,  
  'name': 'Algeria',  
  'population': 34895000,  
  'density': 15  
},  
{  
  'code': 'AO',  
  'value': 15,  
  'name': 'Angola',  
  'population': 18498000,  
  'density': 15  
},  
{  
  'code': 'AR',  
  'value': 15,  
  'name': 'Argentina',  
  'population': 40091359,  
  'density': 14  
},  
{  
  'code': 'AM',  
  'value': 109,  
  'name': 'Armenia',  
  'population': 3230100,  
  'density': 108  
}  
]  
,
```

Data binding

The following properties in the `Layers` are used for binding data in the Maps component. Both the properties are related to each other.

- ShapePropertyPath
- ShapeDataPath

ShapePropertyPath

The **ShapePropertyPath** property is used to refer the field name in the **ShapeData** property of shape layers to identify the shape. When the values of **ShapeDataPath** property from the **DataSource** property and **ShapePropertyPath** property from the **ShapeData** property match, then the associated object from the data source is bound to the corresponding shape.

Note: **world-map.json** file contains following data and its field **name** value is used to map the corresponding shape with the provided data source.

```
`json
{
  "type": "Feature",
  "properties": {
    "admin": "Afghanistan",
    "name": "Afghanistan",
    "continent": "Asia"
  },
  "geometry": { "type": "Polygon", "coordinates": [[[61.21081709172573, ... ],
...
}
`
```

ShapeDataPath

The **ShapeDataPath** property is similar to the **ShapePropertyPath** property, but it refers to the field name in the **DataSource** property. For example, [populationData](#) contains the **code**, **value**, **name**, **population** and **density** fields. Here, the **name** field is set to the **shapeDataPath** to map the corresponding value of field name in shape data.

In the below example, both **name** fields contain the same value as **Afghanistan**, this value is matched in both shape data and data source, so that the details associated with **Afghanistan** will be mapped to the corresponding shape and used to color the corresponding shape, display data labels, display tooltips, and more.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Height("450px").Width("650px").Layers(m =>
{
    m.ShapeSettings(ss =>
ss.Fill("#E5E5E5").ColorValuePath("color")).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").DataSource(ViewBag.populationData).Add();
}).Render()
```

POPULATE-DATA.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            ViewBag.populationData = GetPopulationData();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetPopulationData()
        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/populationdensity.js"
);
            return JsonConvert.DeserializeObject(text);
        }
    }
}
```

Binding complex data source

Data from data source can be bind to the Maps in two different ways.

1. Bind the field name directly to the properties as `ShapeDataPath`, `ColorValuePath`, `ValuePath` and `ShapeValuePath`.
2. Bind the field name as `data.field` to the properties as `ShapeDataPath`, `ColorValuePath`, `ValuePath` and `ShapeValuePath`.

Refer the data values for [ViewBag.bubbleData](#), [ViewBag.complexData](#) and [ViewBag.markerData](#) here.

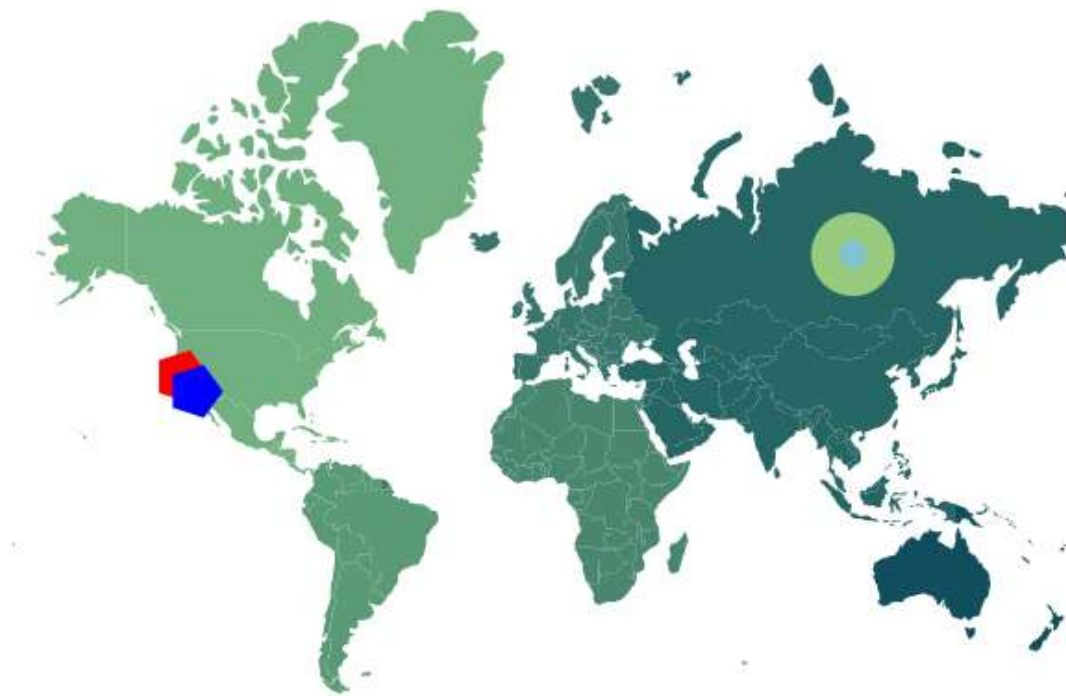

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Height("450px").Width("650px").Layers(m =>
{
    m.ShapeData(ViewBag.worldmap).ShapeDataPath("data.name").ShapePropertyPath("name").DataSource(ViewBag.populationData).Add();
}).Render()
```

COMPLEX-DATA.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
```

```
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            ViewBag.bubbleData = GetBubbleData();
            ViewBag.markerData = GetMarkerData();
            ViewBag.complexData = GetComplexData();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetComplexData()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/ComplexData.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetBubbleData()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/BubbleData.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMarkerData()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/MarkerData.json");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Layers

The Maps component is rendered through [Layers](#) and any number of layers can be added to the Maps.

Multilayer

The Multilayer support allows loading multiple shape files and map providers in a single container, enabling Maps to display more information. The shape layer or map providers are the main layers of the Maps. Multiple layers can be added as **SubLayer** over the main layers using the [Type](#) property of [Layers](#).

Sublayer

Sublayer is a type of shape file layer. It allows loading multiple shape files in a single map view. For example, a sublayer can be added over the main layer to view geographic features such as rivers, valleys and cities in a map of a country. Similar to the main layer, elements in the Maps such as markers, bubbles, color mapping and legends can be added to the sub-layer.

In this example, the United States map shape is used as shape data by utilizing **usa.ts** file, and **texas.ts** and **california.ts** files are used as sub-layers in the United States map.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").Border(border =>
border.Color("black").Width(0.1).Opacity(1)))
    .ShapeData(ViewBag.usamap).Add();
    l.ShapeSettings(ss => ss.Fill("rgba(141, 206, 255, 0.6)").Border(border
=> border.Color("#1a9cff").Width(0.25).Opacity(1)))
```

```
.ShapeData(ViewBag.texasmap).Type(Syncfusion.EJ2.Maps.Type.SubLayer).Add();
    l.ShapeSettings(ss => ss.Fill("rgba(141, 206, 255, 0.6)").Border(border
=> border.Color("#1a9cff").Width(0.25).Opacity(1)))

.ShapeData(ViewBag.californiamap).Type(Syncfusion.EJ2.Maps.Type.SubLayer).Ad
d();
}).Render()
```

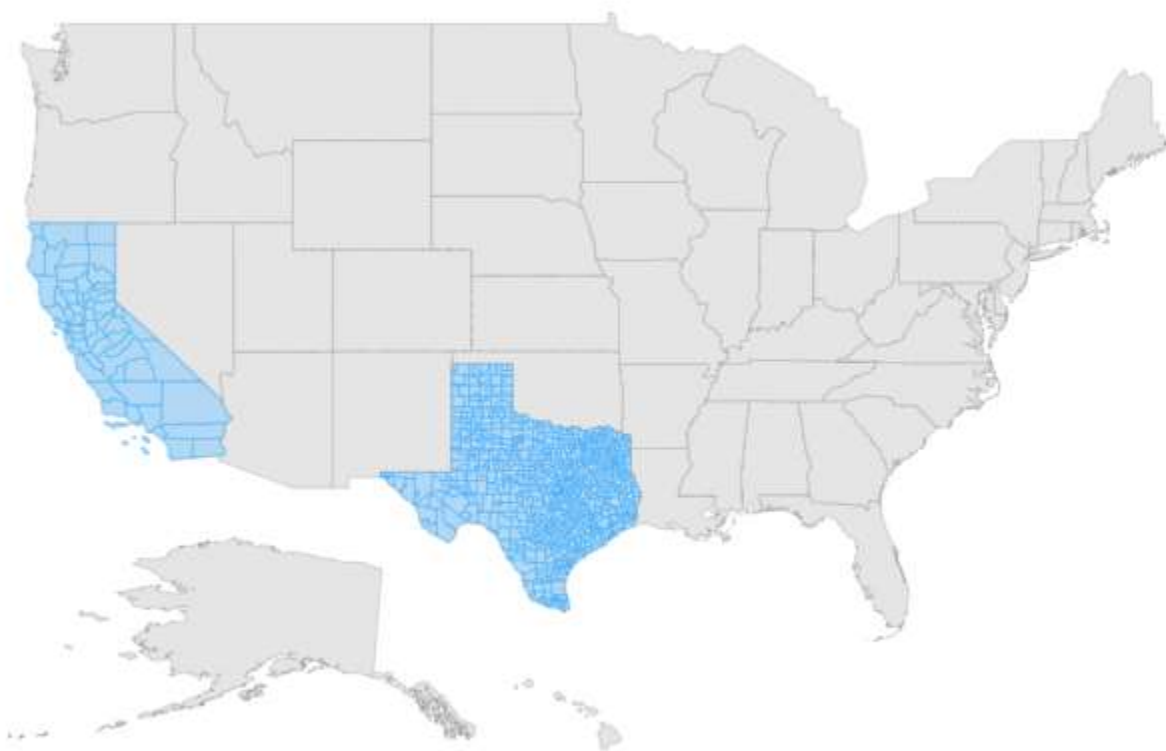

LAYERS.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.usa = GetUSMap();
            ViewBag.california = GetCaliforniaMap();
            ViewBag.texas = GetTexasMap();
            ViewBag.usamap = GetUSMaps();
            ViewBag.californiamap = GetCaliforniaMaps();
            ViewBag.texasmap = GetTexasMaps();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/USA.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetCaliforniaMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/California.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetTexasMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/Texas.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetUSMaps()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
```

```

        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
    public object GetCaliforniaMaps()
    {
        string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/California.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
    public object GetTexasMaps()
    {
        string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Texas.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}

```

Displaying different layer in the view

Multiple shape files and map providers can be loaded simultaneously in Maps. The **BaseLayerIndex** property is used to determine which layer on the user interface should be displayed. This property is used for the Maps drill-down feature, so when the **BaseLayerIndex** value is changed, the corresponding shape is loaded. In this example, two layers can be loaded with the World map and the United States map. Based on the given **BaseLayerIndex** value the corresponding shape will be loaded in the user interface. If the **BaseLayerIndex** value is set to **0**, then the world map will be loaded.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").BaseLayerIndex(1).Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
    l.ShapeData(ViewBag.usaMap).Add();
}).Render()
```

LAYERVIEW.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.usa = GetUSMap();
            ViewBag.worldMap = GetWorldMaps();
            ViewBag.usaMap = GetUSMaps();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/USA.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetWorldMaps()
        {
            string allText =

        }
    }
}
```

```
}  
}
```

Rendering custom shapes

Providers

OpenStreetMaps in ASP.NET MVC Maps Component

The OpenStreetMap (OSM) is the online Maps provider built by a community of developers; it is free to use under an open license. It allows to view geographical data in a collaborative way from anywhere on the earth. The OSM Maps provides small tile images based on our requests and combines those images into a single image to display the Maps area in the Maps component.

Adding OpenStreetMap

The OSM Maps can be rendered using the [UriTemplate](#) property.

CSHTML

```
@using Syncfusion.EJ2;  
@Html.EJS().Maps("maps").Layers(l=> {  
  
    l.UriTemplate("http://a.tile.openstreetmap.org/level/tileX/tileY.png").Add()  
    ;  
}).Render()
```

OSM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

**Changing the tile server of the OpenStreetMap**

The OSM tile server can be changed by setting the tile URL in the `UrlTemplate` property. For more details about the OSM tile server, refer [here](#).

Enabling zooming and panning

The OSM Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true)).Layers(l=> {

    l.UrlTemplate("http://a.tile.openstreetmap.org/level/tileX/tileY.png").Add()
;
}).Render()
```

OSMZOOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Adding markers and navigation line

Markers can be added to the layers of OSM Maps by setting the corresponding location's coordinates of latitude and longitude using [MarkerSettings](#). Navigation lines can be added on top of an OSM Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [NavigationLineSettings](#).

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.UrlTemplate("http://a.tile.openstreetmap.org/level/tileX/tileY.png").MarkerSettings(marker =>
    {
        marker.Visible(true).DataSource(ViewBag.markerData).Add();
    }).NavigationLineSettings(ns =>
    {
        ns.Visible(true).Latitude(new double[] { 34.060620, 40.724546 })
        .Longitude(new double[] { -118.330491, -73.850344
    }).Color("black").Angle(90)
        .Width(2).DashArray("4").Add();
    }).Add();
}).Render()
```

OSMMARKER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            List<MarkerData> data = new List<MarkerData>
            {
                new MarkerData {latitude= 37.0000, longitude= -120.0000,
city= "California" },
                new MarkerData {latitude= 40.7127, longitude= -74.0059,
city= "New York" },
                new MarkerData {latitude= 42.0000, longitude= -93.0000,
city= "Iowa" }
            };
            ViewBag.markerData = data;
            return View();
        }
        public class MarkerData
        {
            public double latitude { get; set; }
            public double longitude { get; set; }
            public string city { get; set; }
        }
    }
}
```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the OSM Maps layer for highlighting a particular continent or country in OSM Maps by adding another layer and specifying the [Type](#) property of Maps layer to **SubLayer**.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.UrlTemplate("http://a.tile.openstreetmap.org/level/tileX/tileY.png").Add();
    l.ShapeSettings(s =>
    s.Fill("blue")).ShapeData(ViewBag.africaMapShape).Type(Syncfusion.EJ2.Maps.Type.SubLayer).Add();
}).Render()
```

SUBLAYER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.africeMap = GetAfricaMap();
            ViewBag.africaMapShape = GetAfricaShape();
            return View();
        }
        public object GetAfricaMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/Africa.json");
            return JsonConvert.DeserializeObject(allText);
        }

        public object GetAfricaShape()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Africa.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Enabling legend

The legend can be added to the tile Maps by setting the [Visible](#) property of [LegendSettings](#) to **true**.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps
@{
    var urlTemplate =
    "https://tile.openstreetmap.org/level/tileX/tileY.png";
}
<div class="control-section">
    <div id="outer" style="width:100%">

@Html.EJS().Maps("container").Load("mapsLoad").UseGroupingSeparator(true).Format("n").TitleSettings(title => title.Text("Top 10 populated cities in the World").TextStyle(new MapsFont { Size = "16px", FontFamily = "inherit", Opacity = 1 })).LegendSettings(legend =>
legend.Position(LegendPosition.Float).Visible(true).Type(LegendType.Markers).Background("#E6E6E6").Height("170px").TextStyle(new MapsFont { Color = "#000000", FontFamily = "inherit" })).Layers(new
List<Syncfusion.EJ2.Maps.MapsLayer>
    {
        new Syncfusion.EJ2.Maps.MapsLayer
        {
            AnimationDuration = 0, UrlTemplate = urlTemplate,
```

```

MarkerSettings = new
List<Syncfusion.EJ2.Maps.MapsMarker>
{
    new Syncfusion.EJ2.Maps.MapsMarker
    {
        Visible = true, Height = 15, Width = 15,
        ColorValuePath = "color", LegendText = "name", Shape = MarkerType.Circle,
        AnimationDuration = 0,
        DataSource = new [] {
            new { name="Tokyo",

    }
}
```

**Bing Maps in ASP.NET MVC Maps Component**

Bing Maps is an online Maps provider, owned by Microsoft. As like OSM, it provides Maps tile images based on our requests and combines those images into a single one to display the Maps area.

Adding Bing Maps

The Bing Maps can be rendered using the [UrlTemplate](#) property, which is based on the URL generated by the `GetBingUrlTemplate` method in the Maps. The format of the required URL of Bing Maps varies from other online map providers. As a result, a built-in `GetBingUrlTemplate` method has been included that returns the URL in a generic format. In the meantime, a subscription key is required for Bing Maps. The Bing Maps key can be obtained from [here](#), then append it to the Bing Maps URL before passing it to the `GetBingUrlTemplate` method. The URL returned by this method must be passed to the [UrlTemplate](#) property.

CSHTML

```
@using Syncfusion.EJ2;
<div class="control-section">
    <div id="outer" style="width:100%">
        @Html.EJS().Maps("container").Load("mapsLoad").Layers(l =>
        {
            l.Add();
        }).Render()
    </div>
</div>
<style>
    #container {
        display: block;
    }
</style>
<script type="text/javascript">
    function mapsLoad(args) {

args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/M
etadata/CanvasLight?output=json&uriScheme=https&key=?").then(function (url)
{
    args.maps.layers[0].urlTemplate = url;
});
    }
</script>
```

BING.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

```
}
```

Types of Bing Maps

Bing Maps provides different types of Maps and it is supported in the Maps component.

- **Aerial** - Displays satellite images to highlight roads and major landmarks for easy identification.
- **AerialWithLabel** - Displays aerial Maps with labels for the continent, country, ocean, etc.
- **Road** - Displays the default Maps view of roads, buildings, and geography.
- **CanvasDark** - Displays dark version of the road Maps.
- **CanvasLight** - Displays light version of the road Maps.
- **CanvasGray** - Displays grayscale version of the road Maps.

To render the light version of the road Maps, set the **CanvasLight** value is passed via the URL into the `GetBingUrlTemplate` method demonstrated in the following code sample.

CSHTML

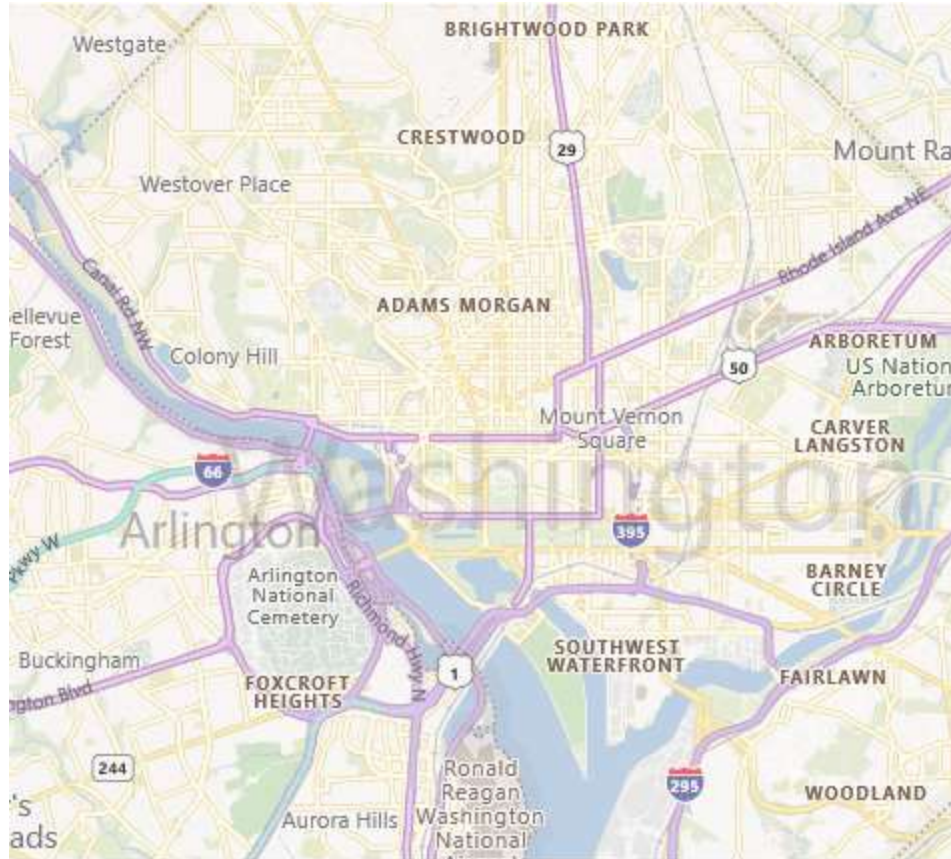

```
@using Syncfusion.EJ2;  
<div class="control-section">  
  <div id="outer" style="width:100%">  
    @Html.EJS().Maps("container").Load("mapsLoad").Layers(l =>  
    {  
      l.Add();  
    }).Render()  
  </div>  
</div>
```

```
</div>
<style>
    #container {
        display: block;
    }
</style>
<script type="text/javascript">
    function mapsLoad(args) {

args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/M
etadata/CanvasLight?output=json&uriScheme=https&key=?").then(function (url)
{
    args.maps.layers[0].urlTemplate = url;
});
    }
</script>
```

BING.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Enabling zooming and panning

Bing Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("mapsLoad").ZoomSettings(zoom=>zoom.Enable(true)).Layers(l=> {
    l.Add();
}).Render()
<script type="text/javascript">
    function mapsLoad(args) {

args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/Metadata/CanvasLight?output=json&uriScheme=https&key=?").then(function (url)
{
    args.maps.layers[0].urlTemplate = url;
});
    }
</script>
```

BINGZOOM.CS

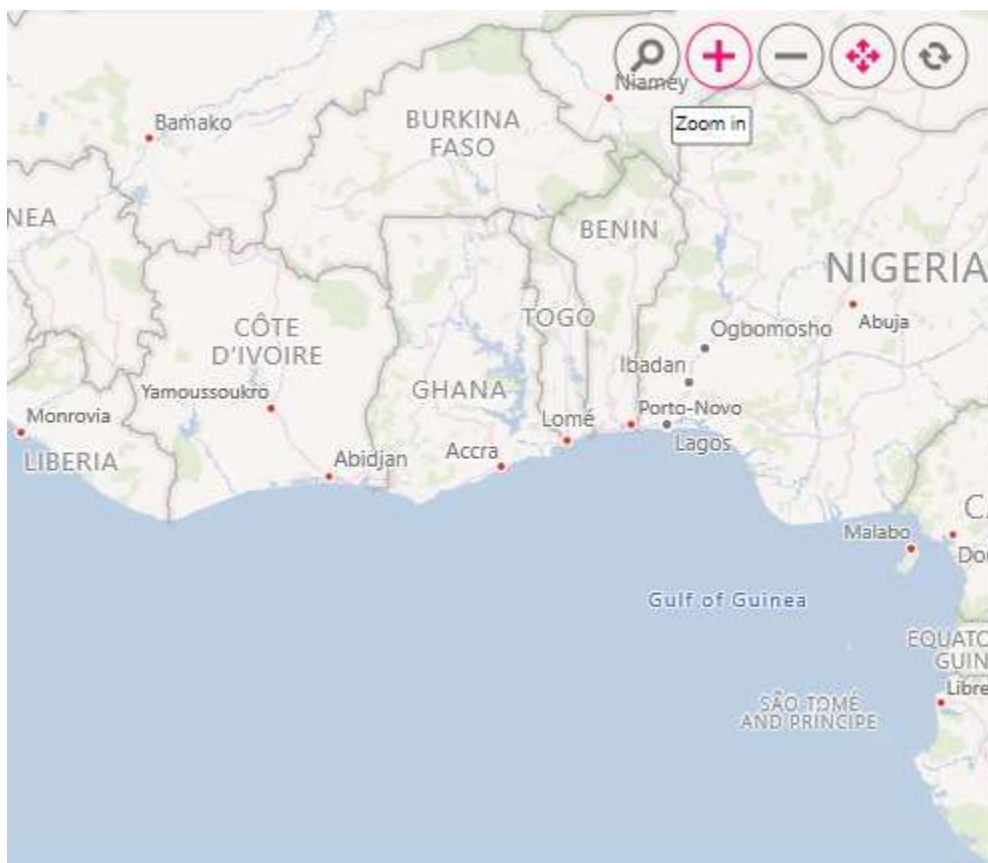

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
```

```

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Adding markers and navigation line

Markers can be added to the layers of Bing Maps by setting the corresponding location's coordinates of latitude and longitude using [MarkerSettings](#). Navigation lines can be added on top of an Bing Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [NavigationLineSettings](#).

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Load("mapsLoad").Layers(1 =>

```

```

{
    l.MarkerSettings(marker =>
    {
        marker.Visible(true).DataSource(ViewBag.markerData).Add();
    }).NavigationLineSettings(ns =>
    {
        ns.Visible(true).Latitude(new double[] { 34.060620, 40.724546 })
        .Longitude(new double[] { -118.330491, -73.850344
    }).Color("black").Angle(90)
        .Width(2).DashArray("4").Add();
    }).Add();
    }).Render()
<script type="text/javascript">
    function mapsLoad(args) {

args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/M
etadata/CanvasLight?output=json&uriScheme=https&key=?").then(function (url)
{
    args.maps.layers[0].urlTemplate = url;
});
    }
</script>

```

BINGMARKER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            List<MarkerData> data = new List<MarkerData>
            {
                new MarkerData {latitude= 37.0000, longitude= -120.0000,
city= "California" },
                new MarkerData {latitude= 40.7127, longitude= -74.0059,
city= "New York" },
                new MarkerData {latitude= 42.0000, longitude= -93.0000,
city= "Iowa" }
            };
            ViewBag.markerData = data;
            return View();
        }
        public class MarkerData
        {
            public double latitude { get; set; }
            public double longitude { get; set; }
            public string city { get; set; }
        }
    }
}

```

```

    }
  }
}

```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Bing Maps layer for highlighting a particular continent or country in Bing Maps by adding another layer and specifying the [Type](#) property of Maps layer to **SubLayer**.

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Load("mapsLoad").Layers(l =>
{
    l.Add();
    l.ShapeSettings(s =>
s.Fill("blue")).ShapeData(ViewBag.africaShape).Type(Syncfusion.EJ2.Maps.Type
.SubLayer).Add();
}).Render()
<script type="text/javascript">
    function mapsLoad(args) {

args.maps.getBingUrlTemplate("https://dev.virtualearth.net/REST/V1/Imagery/M
etadata/Aerial?output=json&uriScheme=https&key=?").then(function (url) {
    args.maps.layers[0].urlTemplate = url;

```

```
    });  
}  
</script>
```

BINGSUBLAYER.CS

```
using Newtonsoft.Json;  
namespace EJ2_Core_Application.Controllers  
{  
    public class HomeController : Controller  
    {  
        public IActionResult Index()  
        {  
            ViewBag.africa = GetAfricaMap();  
            ViewBag.africaShape = GetAfricaShape();  
            return View();  
        }  
        public object GetAfricaShape()  
        {  
            string allText =  
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Africa.json"));  
            return JsonConvert.DeserializeObject(allText, typeof(object));  
        }  
        public object GetAfricaMap()  
        {  
            string text =  
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/Africa.json");  
            return JsonConvert.DeserializeObject(text);  
        }  
    }  
}
```

Enabling legend

The legend can be added to the tile Maps by setting the [Visible](#) property of [LegendSettings](#) to **true**.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps
<div class="control-section">
    <div id="outer" style="width:100%">

@Html.EJS().Maps("container").Load("mapsLoad").UseGroupingSeparator(true).Fo
rmat("n").TitleSettings(title => title.Text("Top 10 populated cities in the
World").TextStyle(new MapsFont { Size = "16px", FontFamily = "inherit",

using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Azure Maps in ASP.NET MVC Maps Component

Azure Maps is yet another online Maps provider, owned by Microsoft. As like OSM and Bing Maps, it provides Maps tile images based on our requests and combines those images into a single one to display Maps area.

Adding Azure Maps

The Azure Maps can be rendered using the [UrlTemplate](#) property with the tile server URL provided by online map providers. In the meantime, a subscription key is required for Azure Maps. Follow the steps in this [link](#) to generate an API key, and then added the key to the URL.

Note: Refer to [Azure Maps Licensing](#).

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l=> {
    l.UrlTemplate("https://atlas.microsoft.com/map/imagery/png?subscription-
key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY").Add();
}).Render()
<style>
    #maps {
        display: block;
    }
</style>
```

AZURE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

*Enabling zooming and panning*

The Azure Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a map for in-depth analysis. Panning helps to move a map around to focus the targeted area.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true)).Layers(l=> {
    l.UrlTemplate("https://atlas.microsoft.com/map/imagery/png?subscription-
key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY").Add();
}).Render()
<style>
    #maps {
        display: block;
    }
</style>
```

AZUREZOOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Adding markers and navigation line

Markers can be added to the layers of Azure Maps by setting the corresponding location's coordinates of latitude and longitude using [MarkerSettings](#). Navigation lines can be added on top of the Azure Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [NavigationLineSettings](#).

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").ZoomSettings(zoom =>
zoom.ZoomFactor(4)).CenterPosition(c=>c.Latitude(29.394708).Longitude(-
94.954653)).Layers(l =>
{
    l.UrlTemplate("https://atlas.microsoft.com/map/imagery/png?subscription-
key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY").MarkerSettings(mark
er =>
{
    marker.Visible(true).DataSource(ViewBag.markerData).Height(25).Width(15).Add
();
    }).NavigationLineSettings(ns =>
{
    ns.Visible(true).Latitude(new double[] { 34.060620, 40.724546 })
    .Longitude(new double[] { -118.330491, -73.850344
}).Color("Blue").Angle(0.1).Add();
    }).Add();
    }).Render()
<style>
#maps {
    display: block;
}
</style>
```

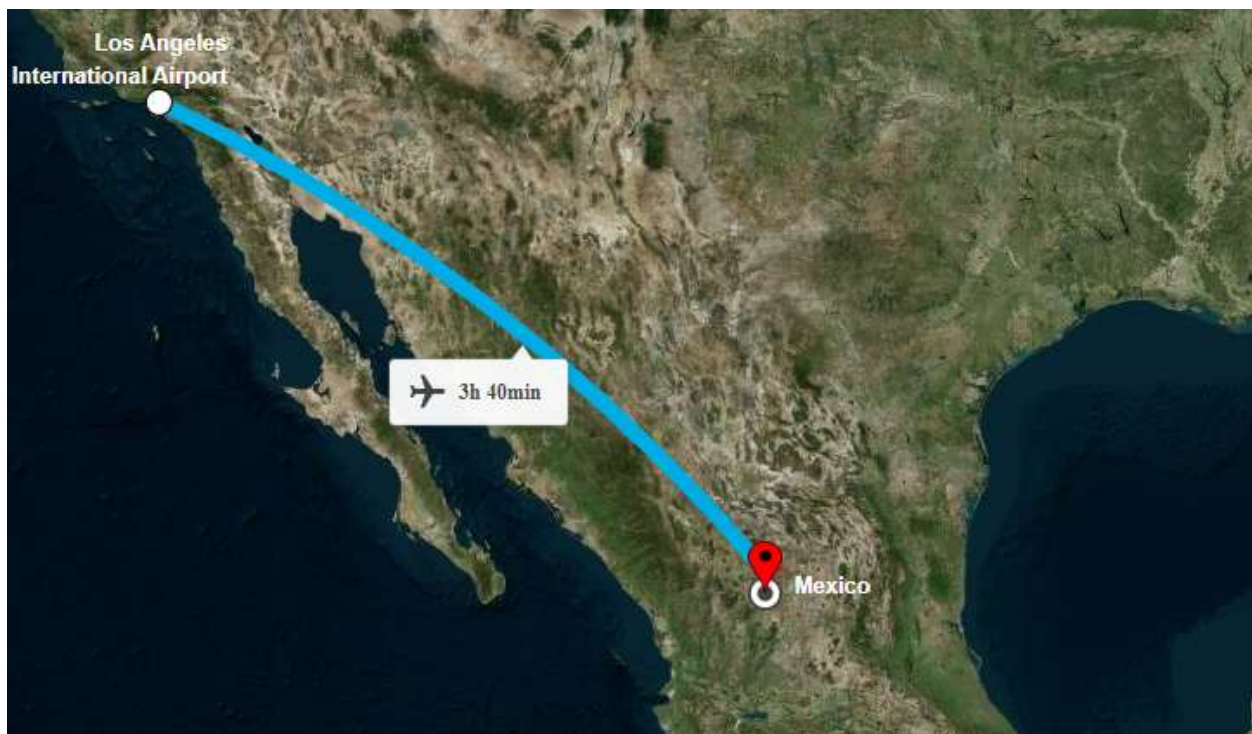

AZUREMARKER.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            List<MarkerData> data = new List<MarkerData>
            {
                new MarkerData {latitude= 34.060620, longitude= -
118.330491, city= "California" },
            }
```

```

        new MarkerData {latitude= 40.724546, longitude= -73.850344,
city= "New York" }
        };
        ViewBag.markerData = data;
        return View();
    }
    public class MarkerData
    {
        public double latitude { get; set; }
        public double longitude { get; set; }
        public string city { get; set; }
    }
}

```

Adding sublayer

Any GeoJSON shape can be rendered as a sublayer on top of the Azure Maps layer for highlighting a particular continent or country in Azure Maps by adding another layer and specifying the [Type](#) property of Maps layer to **SubLayer**.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.UrlTemplate("https://atlas.microsoft.com/map/imagery/png?subscription-
key=Your-Key &api-
version=1.0&style=satellite&zoom=level&x=tileX&y=tileY").Add();
}

```

```

        l.ShapeSettings(s =>
s.Fill("blue")).ShapeData(ViewBag.africaMapShape).Type(Syncfusion.EJ2.Maps.Type.SubLayer).Add();
    }).Render()
<style>
    #maps {
        display: block;
    }
</style>

```

AZURESUBLAYER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.africeMap = GetAfricaMap();
            ViewBag.africaMapShape = GetAfricaShape();
            return View();
        }
        public object GetAfricaMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/Africa.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetAfricaShape()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Africa.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Enabling legend

The legend can be added to the tile Maps by setting the [Visible](#) property of [LegendSettings](#) to **true**.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps
@{
    var urlTemplate =
    "https://atlas.microsoft.com/map/imagery/png?subscription-key=Your-Key &api-
    version=1.0&style=satellite&zoom=level&x=tileX&y=tileY";
}
<div class="control-section">
    <div id="outer" style="width:100%">

@Html.EJS().Maps("container").Load("mapsLoad").UseGroupingSeparator(true).Fo
rmat("n").TitleSettings(title => title.Text("Top 10 populated cities in the
World").TextStyle(new MapsFont { Size = "16px", FontFamily = "inherit",
Opacity = 1 })).LegendSettings(legend =>
legend.Position(LegendPosition.Float).Visible(true).Type(LegendType.Markers)
.Background("#E6E6E6").Height("170px").TextStyle(new MapsFont { Color =
"#000000", FontFamily = "inherit" })).Layers(new
List<Syncfusion.EJ2.Maps.MapsLayer>
    {
        new Syncfusion.EJ2.Maps.MapsLayer
        {
            AnimationDuration = 0, UrlTemplate = urlTemplate,
            MarkerSettings = new List<Syncfusion.EJ2.Maps.MapsMarker>
```

```

        {
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true, Height = 15, Width = 15, ColorValuePath =
"color", LegendText = "name", Shape = MarkerType.Circle, AnimationDuration =
0,

                DataSource = new [] {
                    new { name="Tokyo", latitude=35.6805245924747,
longitude=139.76770396213337, population=37435191, color="#2EB6C8"},
                    new { name="Delhi", latitude=28.644800, longitude=77.216721,

        {
            return View();
        }
    }
}
```

Other Maps providers

Apart from OpenStreetMap and Bing Maps, you can also render Maps from other online map service providers by specifying the URL provided by those providers in the [UrlTemplate](#) property. The URL template concept has been implemented in such a way that any online map service providers using the following template can benefit from previewing their Map in the Syncfusion ASP.NET MVC Maps component.

<!-- markdownlint-disable MD034 -->

Sample Template: https://< domain_name >/maps/basic/{z}/{x}/{y}.PNG

- "{z}" - It represents zoom factor (level).
- "{x}" - It indicates tile image x-position (tileX).
- "{y}" - It indicates tile image y-position (tileY).

In this case, the key generated for those online map service providers can also be appended to the URL. This allows to create personalized Maps with your own content and imagery.

Below is the example of adding TomTom map. You can follow the steps in this [link](#) to generate an API key, and then added the key to the URL.

CHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l=> {

    l.UrlTemplate("http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY
.png?key=subscription_key").Add();
}).Render()
```

OTHERMAP.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}
```

Enabling zooming and panning

Tile Maps layer can be zoomed and panned. Zooming helps to get a closer look at a particular area on a Maps for in-depth analysis. Panning helps to move a Maps around to focus the targeted area.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true)).Layers(l=> {
    l.UrlTemplate("http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY
.png?key=subscription_key").Add();
}).Render()
```

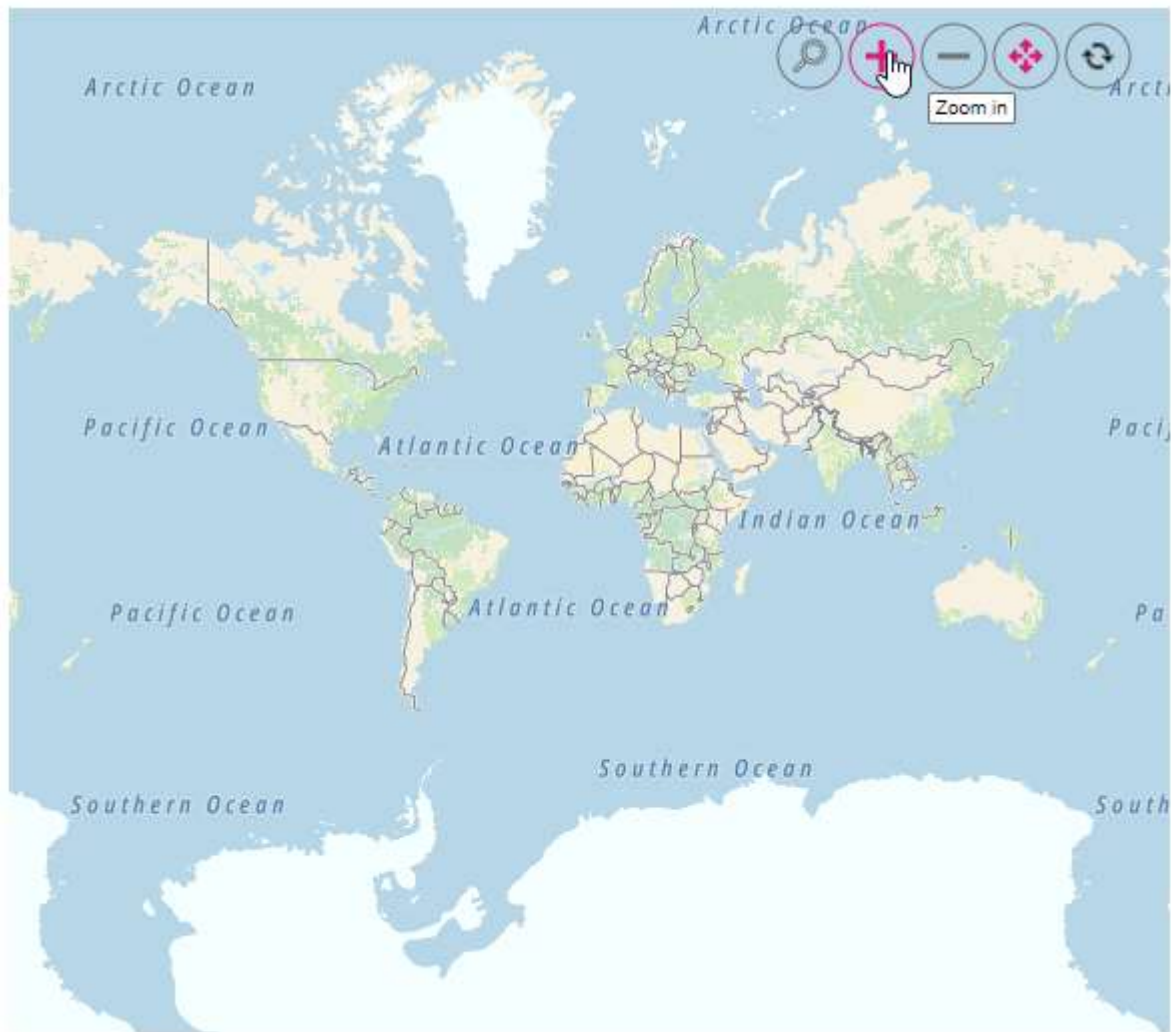

OTHERZOOM.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```

using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            return View();
        }
    }
}

```

Adding markers and navigation line

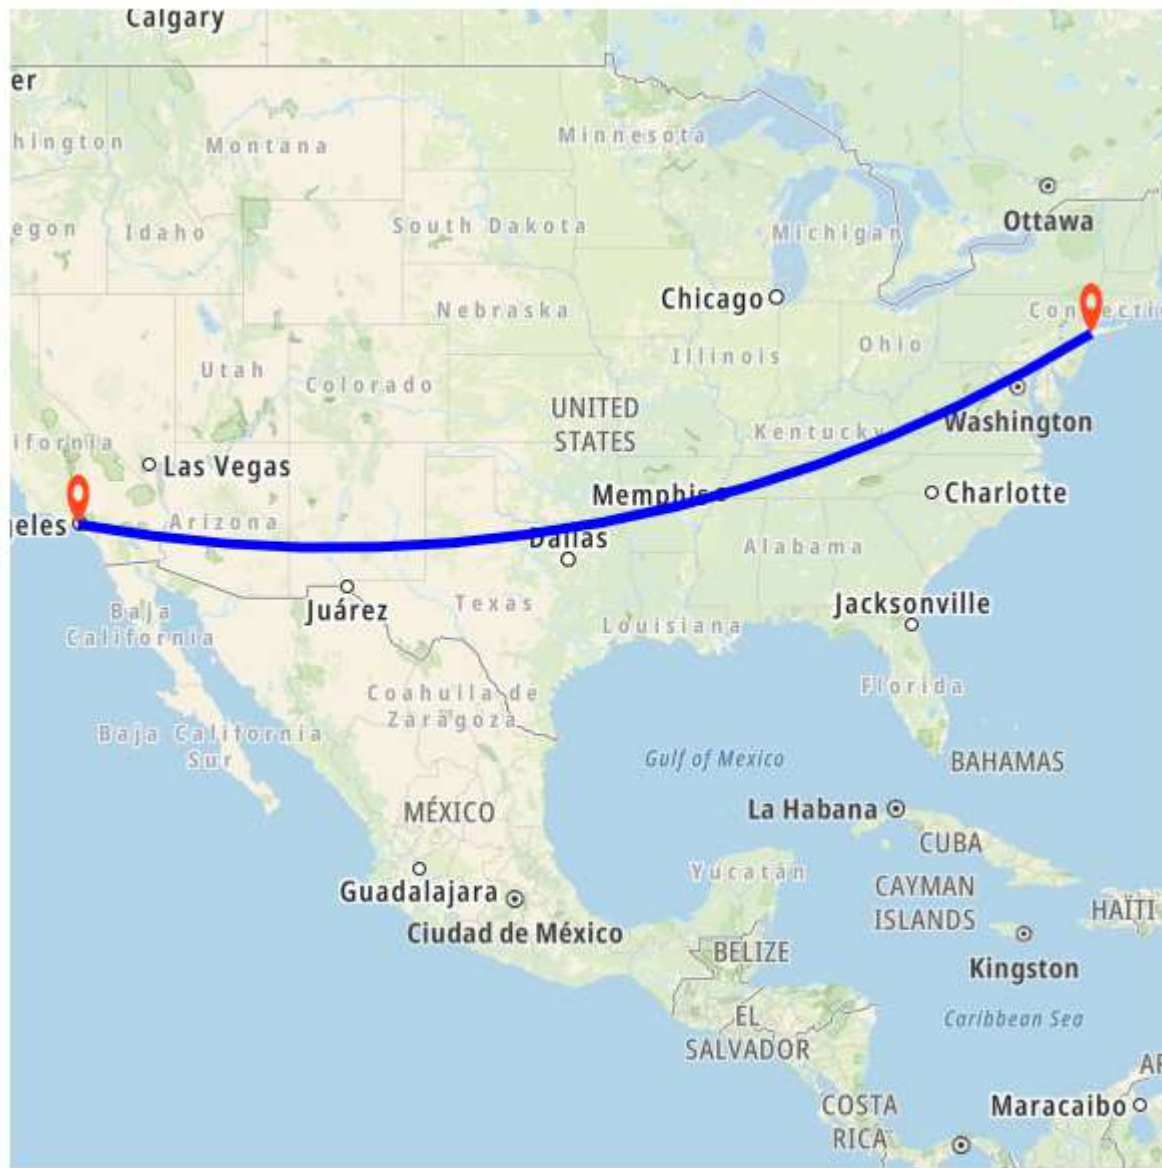

Markers can be added to the layers of tile Maps by setting the corresponding location's coordinates of latitude and longitude using [MarkerSettings](#). Navigation lines can be added on top of an tile Maps layer for highlighting a path among various places by setting the corresponding location's coordinates of latitude and longitude in the [NavigationLineSettings](#).

CHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    1.UrlTemplate("http://api.tomtom.com/map/1/tile/basic/main/level/tileX/tileY
.png?key=subscription_key").MarkerSettings(marker =>
        {
            marker.Visible(true).DataSource(ViewBag.markerData).Add();
        }).NavigationLineSettings(ns =>
        {
            ns.Visible(true).Latitude(new double[] { 34.060620, 40.724546 })
            .Longitude(new double[] { -118.330491, -73.850344
        }).Color("black").Angle(90)
            .Width(2).DashArray("4").Add();
        }).Add();
    }).Render();
```

OTHERMARKER.CS

```
using System;
using System.Collections.Generic;

Customization in ASP.NET MVC Maps Component

Setting the size for Maps

The width and height of the Maps can be set using the **Width** and **Height** properties in the Maps component. Percentage or pixel values can be used for the height and width values.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Height("500px").Width("300px").Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()
```

SIZE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Maps title

The title for the Maps can be set using the `MapsTitleSettings`. It can be customized using the following properties.

- **Alignment** - To customize the alignment for the text in the title for the Maps. The possible values are **Center**, **Near** and **Far**.
- **Description** - To set the description of the title in Maps.
- **Text** - To set the text for the title in Maps.
- **TextStyle** - To customize the text of the title in Maps.
- **SubtitleSettings** - To customize the subtitle for the Maps.

CSHTML

```
@using Syncfusion.EJ2.Maps;  
@using Syncfusion.EJ2;  
@{  
    var title = new Syncfusion.EJ2.Maps.MapsTitleSettings  
    {  
        Text = "Maps control",  
        TextStyle = new Syncfusion.EJ2.Maps.MapsFont  
        {  
            Color = "red",  
            FontFamily = "arial",  
            FontStyle = "italic",
```

```

        FontWeight = "regular",
        Size = "14px"
    },
    Alignment = Syncfusion.EJ2.Maps.Alignment.Center
};
}
@Html.EJS().Maps("maps").TitleSettings(title).Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Maps control

Setting theme

The Maps component supports following themes.

- Material
- Fabric
- Bootstrap
- Highcontrast
- MaterialDark
- FabricDark
- BootstrapDark
- Bootstrap4
- HighContrastLight
- Tailwind

By default, the Maps are rendered by the **Material** theme. The theme of the Maps component is changed using the **Theme** property.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().Maps("maps").Theme(Syncfusion.EJ2.Maps.MapsTheme.MaterialDark).Layers(l =>
{
    l.ShapeData(ViewBag.worldmap).Add();
}).Render()
```

THEME.CS

```
using System;
using System.Collections.Generic;

using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Customizing Maps container

The following properties are available to customize the container in the Maps.

- **Background** - To apply the background color to the container in the Maps.
- **Border** - To customize the color, width and opacity of the border of the Maps.
- **Margin** - To customize the margins of the Maps.

CSHTML

```
@using Syncfusion.EJ2;  
@using Syncfusion.EJ2.Maps;  
@{  
    var border = new Syncfusion.EJ2.Maps.MapsBorder  
    {  
        Color = "green",
```

```

        Width = 2,
        Opacity = 1
    };
    var margin = new Syncfusion.EJ2.Maps.MapsMargin
    {
        Bottom = 10,
        Top = 10,
        Left = 20,
        Right = 20
    };
}
@Html.EJS().Maps("maps").Background("#CCD1D1").Border(border).Margin(margin)
.Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

```

MAP-CONTAINER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
            System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Customizing Maps area

By default, the background color of the shape maps is set as **white**. To modify the background color of the Maps area, the **Background** property in the **MapsMapsAreaSettings** is used. The border of the Maps area can be customized using the **Border** property in the **MapsMapsAreaSettings** class.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var maparea = new Syncfusion.EJ2.Maps.MapsMapsAreaSettings
    {
        Background = "#CCD1D1",
        Border = new Syncfusion.EJ2.Maps.MapsAreaSettingsBorderMapsArea
        {
            Width = 2,
```

```

        Color = "green",
        Opacity = 1
    }
};
}
@Html.EJS().Maps("maps").MapsArea(maparea).Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

```

MAP-AREA.CS

```

using System;
using System.Collections.Generic;

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Customizing the shapes

The following properties are available in `MapsShapeSettings` class to customize the shapes of the Maps.

- `Fill` - To apply the fill color to the all the shapes.
- `Autofill` - To apply the palette colors to the shapes if it is set as true.
- `Palette` - To set the custom palette for the shapes.
- `DashArray` - To define the pattern of dashes and gaps that is applied to the outline of the shapes.
- `Opacity` - To customize the transparency for the shapes.
- `Border` - To customize the color, width and opacity of the border of the shapes.

CSHTML

```

@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var shapsettings = new Syncfusion.EJ2.Maps.MapsShapeSettings
    {
        Autofill = true,
        Palette = new string[] { "#C7DE6C", "#59A076", "#88D0BC", "#FEA78C",
"#FFC557" },
        Border = new Syncfusion.EJ2.Maps.MapsBorder
        {
            Width = 3,
            Color = "#FEE1DD",
            Opacity = 1
        },
        DashArray = "1",
        Opacity = 0.9
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(shapsettings)
    .ShapeData(ViewBag.worldMap).Add();
}).Render()

```

SHAPE-CUSTOMIZATION.CS

```

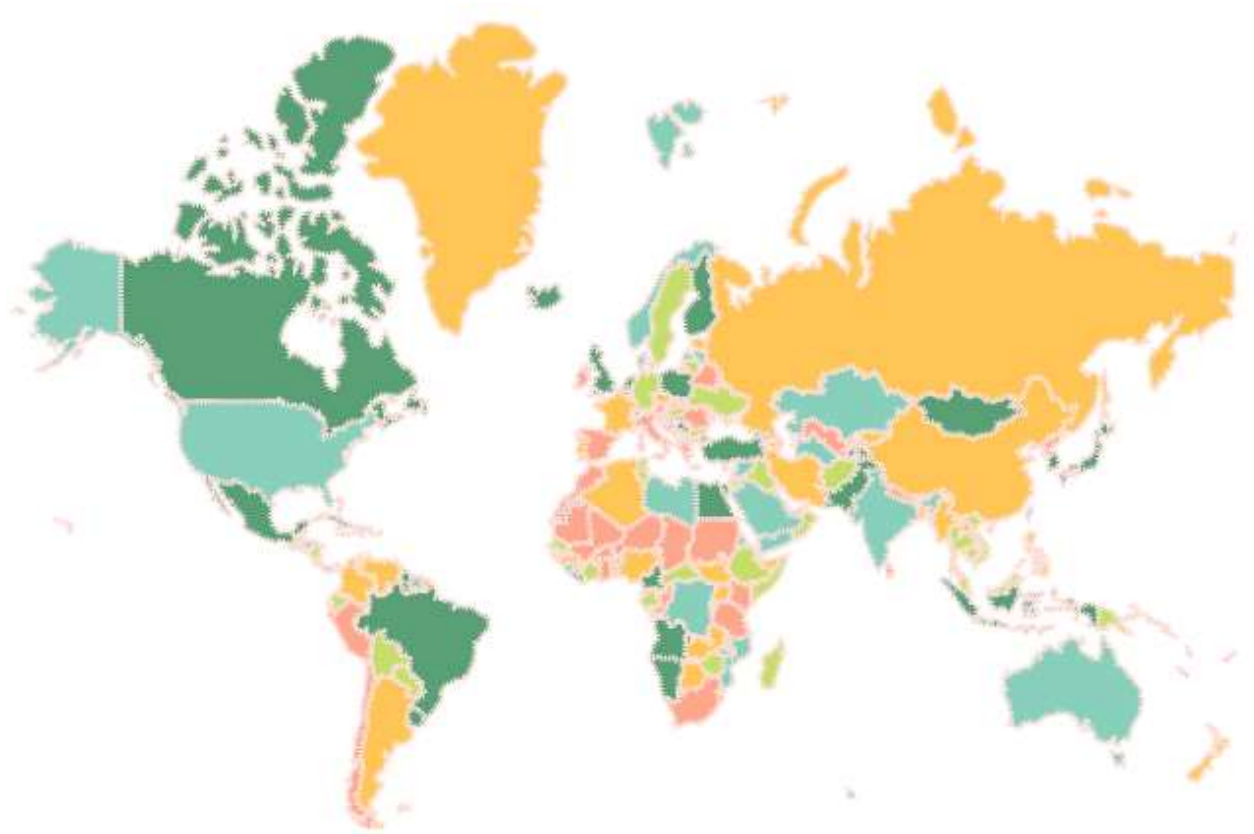

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

```

    }
}
}

```

Setting color to the shapes from the data source

The color for each shape in the Maps can be set using the `ColorValuePath` property of `MapsShapeSettings` class. The value for the `ColorValuePath` property is the field name from the data source of the `MapsShapeSettings` class which contains the color values.

CSHTML

```

@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var data = new[]
    {
        new { continent="North America", color="#71B081"},
        new { continent="South America", color="#5A9A77"},
        new { continent="Africa", color="#498770"},
        new { continent="Europe", color="#39776C"},
        new { continent="Asia", color="#266665"},
        new { continent="Australia", color="#124F5E"}
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss

```

```

        .ColorValuePath("color"))

        .ShapeDataPath("continent").DataSource(data).ShapePropertyPath("continent").
        ShapeData(ViewBag.worldMap).Add();
    }).Render()

```

SHAPE-COLORDS.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
            System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Applying border to individual shapes

The border of each shape in the Maps can be customized using the `BorderColorValuePath` and `BorderWidthValuePath` properties to modify the color and the width of the border respectively. The field name in the data source of the layer which contains the color and the width values must be set in the `BorderColorValuePath` and `BorderWidthValuePath` properties respectively. If the values of `BorderWidthValuePath` and `BorderColorValuePath` do not match with the field name from the data source, then the color and width of the border will be applied to the shapes using the `Border` property in the `MapsShapeSettings` class.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var data = new[]
    {
        new { continent="North America", color="#71B081",
borderColor="#CCFFE5", width=2},
        new { continent="South America", color="#5A9A77", borderColor="red",
width=2},
        new { continent="Africa", color="#498770", borderColor="#FFCC99",
width=2},
        new { continent="Europe", color="#39776C", borderColor="#66B2FF",
width=2},
    }
```

```

        new { continent="Asia", color="#266665", borderColor="#999900",
width=2},
        new { continent="Australia", color="#124F5E", borderColor="blue",
width=2}
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss

.ColorValuePath("color").BorderColorValuePath("borderColor").BorderWidthValuePath("width")

.ShapeDataPath("continent").DataSource(data).ShapePropertyPath("continent").ShapeData(ViewBag.worldMap).Add());
}).Render()

```

        }
    }
}

```

Projection type

The Maps component supports the following projection types:

- Mercator
- Equiarectangular
- Miller
- Eckert3
- Eckert5
- Eckert6
- Winkel3
- AitOff

By default, the Maps are rendered by the **Mercator** projection type in which the Maps are rendered based on the coordinates. So, the Maps is not stretched. To change the type of projection in the Maps, the **ProjectionType** property is used.

CSHTML

```
@using Syncfusion.EJ2;  
@Html.EJS().Maps("maps").ProjectionType(Syncfusion.EJ2.Maps.ProjectionType.M  
iller).Layers(l =>  
{  
    l.ShapeData(ViewBag.worldMap).Add();  
}).Render()
```

        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Color Mapping in ASP.NET MVC Maps Component

Color mapping is used to customize the shape colors based on the given values. It has three types.

1. Range color mapping
2. Equal color mapping
3. Desaturation color mapping

To add color mapping to the shapes of the Maps, bind the data source to the `DataSource` property of `MapsLayer` and set the field name which contains the color value in the data source to the `ColorValuePath` property.

Types of color mapping

Range color mapping

Range color mapping applies the color to the shapes of the Maps which matches the numeric values in the data source within the given color mapping ranges. The **From** and **To** properties in the **MapsColorMapping** are used to mention the color mapping ranges in the Maps.

Bind the **ViewBag.populationData** data to the **DataSource** property of **MapsLayer** and set the **ColorValuePath** property of **MapsShapeSettings** as **density**. The range values can be set using the **From** and **To** properties of **MapsColorMapping**.

```
`sh
[
...
{
'code': 'AE',
'value': 90,
'name': 'United Arab Emirates',
'population': 8264070,
'density': 99
},
{
'code': 'GB',
'value': 257,
'name': 'United Kingdom',
'population': 62041708,
'density': 255
},
{
'code': 'US',
'value': 34,
'name': 'United States',
'population': 325020000,
'density': 33
}
...
];
`
```

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var colorMapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping {From = 0.00001, To = 100, Color =
"rgb(153,174,214)"},
        new MapsColorMapping {From = 100, To = 200, Color =
"rgb(115,143,199)"},
        new MapsColorMapping {From = 200, To = 300, Color =
"rgb(77,112,184)"},
        new MapsColorMapping {From = 300, To = 500, Color =
"rgb(38,82,168)"},
        new MapsColorMapping {From = 500, To = 19000, Color =
"rgb(0,51,153)"}
    };
}
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").ColorValuePath("density")
        .ColorMapping(colorMapping)).DataSource(ViewBag.populationDensity)

    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name")
    .Add();
}).Render()

```

COLORVALUEPATH.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Syncfusion.EJ2;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.populationData = GetPopulationData();
            ViewBag.populationDensity = GetPopulationDensity();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}

```

```
    }  
    public object GetPopulationData()  
    {  
        string text =  
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/Population-  
density.json");  
        return JsonConvert.DeserializeObject(text);  
    }  
    public object GetMap()  
    {  
        string allText =  
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));  
        return JsonConvert.DeserializeObject(allText, typeof(object));  
    }  
    public object GetPopulationDensity()  
    {  
        string text =  
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Population-  
density.json"));  
        return JsonConvert.DeserializeObject(text, typeof(object));  
    }  
}
```

Note: Refer the data values of [Population-density.json](#) here.

Equal color mapping

Equal color mapping applies the color to the shapes of the Maps when the **Value** property of **MapsColorMapping** matches with the values provided in the data source. The following example shows how to apply equal color mapping to the shapes with the data source **unCountries** which illustrates the permanent and non-permanent countries in the UN security council.

```
`sh
[
{ Country: 'China', Membership: 'Permanent' },
{ Country: 'France', Membership: 'Permanent' },
{ Country: 'Russia', Membership: 'Permanent' },
{ Country: 'United Kingdom', Membership: 'Permanent' },
{ Country: 'United States', Membership: 'Permanent' },
{ Country: 'Bolivia', Membership: 'Non-Permanent' },
{ Country: 'Eq. Guinea', Membership: 'Non-Permanent' },
{ Country: 'Ethiopia', Membership: 'Non-Permanent' },
{ Country: "Côte d'Ivoire", Membership: 'Permanent' },
{ Country: 'Kazakhstan', Membership: 'Non-Permanent' },
{ Country: 'Kuwait', Membership: 'Non-Permanent' },
{ Country: 'Netherlands', Membership: 'Non-Permanent' },
{ Country: 'Peru', Membership: 'Non-Permanent' },
{ Country: 'Poland', Membership: 'Non-Permanent' },
{ Country: 'Sweden', Membership: 'Non-Permanent' },
]
```

Bind the **ViewBag.unitedCountries** data to the **DataSource** property of **MapsLayer** and set the **ColorValuePath** property of **MapsShapeSettings** as **Membership**. Set the **Value** property in the **MapsColorMapping** to **Permanent** and **Non-Permanent** in the different set of shape color mapping properties. If the corresponding value of the **ColorValuePath** property matches with the corresponding field name in the data source, then the given color will be applied.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ Color = "#EDB46F",Value= "Permanent" },
        new MapsColorMapping { Color= "#F1931B", Value = "Non-Permanent" }
    };
}
@Html.EJS().Maps("maps").Layers(l =>
```

```
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").ColorValuePath("Membership")
        .ColorMapping(ViewBag.colorData)).DataSource(ViewBag.unitedCountries)

    .ShapeData(ViewBag.worldMap).ShapeDataPath("Country").ShapePropertyPath("name").Add();
})).Render();
```

EQUALCOLORMAPPING.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.unCountries = GetUnCountries();
            ViewBag.unitedCountries = GetUnitedCountries();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetUnCountries()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/uncountries.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetWorldMap()
        {
            string text =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public object GetUnitedCountries()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/uncountries.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

```
}
}
```

Desaturation color mapping

Desaturation color mapping applies the color to the shapes of the Maps, similar to the range color mapping. The opacity will be applied in this color mapping based on the **MinOpacity** and **MaxOpacity** properties in the **MapsColorMapping**.

Note: The following example shows how to apply desaturation color mapping to the shapes with the data source **Population_Density** that is available in the [Range color mapping](#) section.

Bind the **Population_Density** data to the **DataSource** property of **MapsLayer** class and set the **ColorValuePath** property of **MapsShapeSettings** as **density**. The range values can be set using the **From** and **To** properties in the **MapsColorMapping**.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ From = 1, To = 100, MinOpacity = 0.3,
        MaxOpacity = 1, Color = "rgb(153,174,214)" },
        new MapsColorMapping { From = 101, To = 200, MinOpacity = 0.4,
        MaxOpacity = 1, Color = "rgb(115,143,199)" }
```

```

    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").ColorValuePath("density")
    .ColorMapping(colormapping)).DataSource(ViewBag.populationDensity)

    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name")
    .Add();
}).Render()

```

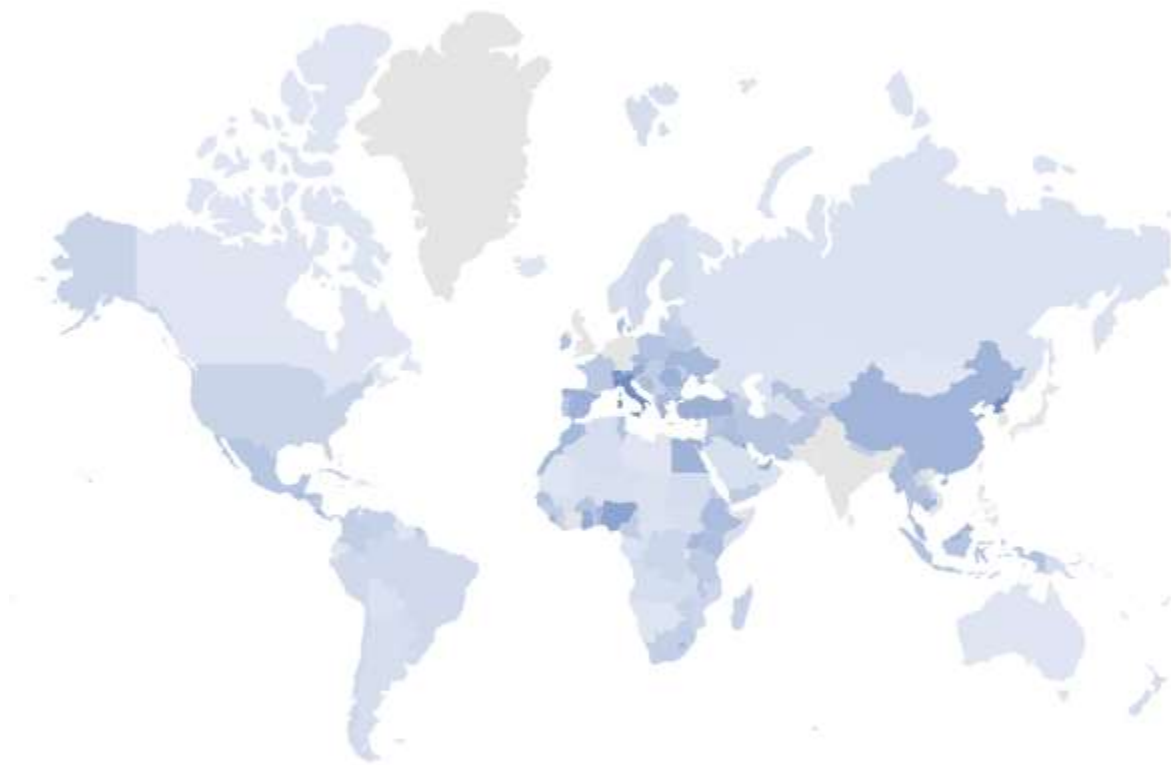

DESATURATIONCOLORMAPPING.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.populationData = GetPopulationData();
            ViewBag.populationDensity = GetPopulationDensity();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetPopulationData()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/Population-
density.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);

        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public object GetPopulationDensity()
        {

```

```
string text =  
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/Population-  
density.json"));  
return JsonConvert.DeserializeObject(text, typeof(object));  
}  
}
```

Refer the data values of [Population-density.json](#) here.

Multiple colors for a single shape

Multiple colors can be added to the color mapping which can be used as gradient effect to a specific shape based on the ranges in the data source. By using the **Color** property of **MapsColorMapping**, any number of colors can be set to the shapes as a gradient.

Note: The following example demonstrates how to use multiple colors in color mapping with the data source **Population_Density** that is available in the [Range color mapping](#) section.

Bind the **Population_Density** data to the **DataSource** property of **MapsLayer** class and set the **ColorValuePath** property of **MapsShapeSettings** as **density**. The range values can be set using the **From** and **To** properties of **MapsColorMapping**.

CSHTML

```
@using Syncfusion.EJ2;
```

```

@using Syncfusion.EJ2.Maps;
@{
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ From = 0, To = 100, Color = new string[]
{"red", "blue"} },
        new MapsColorMapping { From = 101, To = 200, Color = new string[]
{"green", "yellow"} }
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").ColorValuePath("density")
        .ColorMapping(colormapping)).DataSource(ViewBag.populationDensity)

    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name")
    .Add();
}).Render()

```

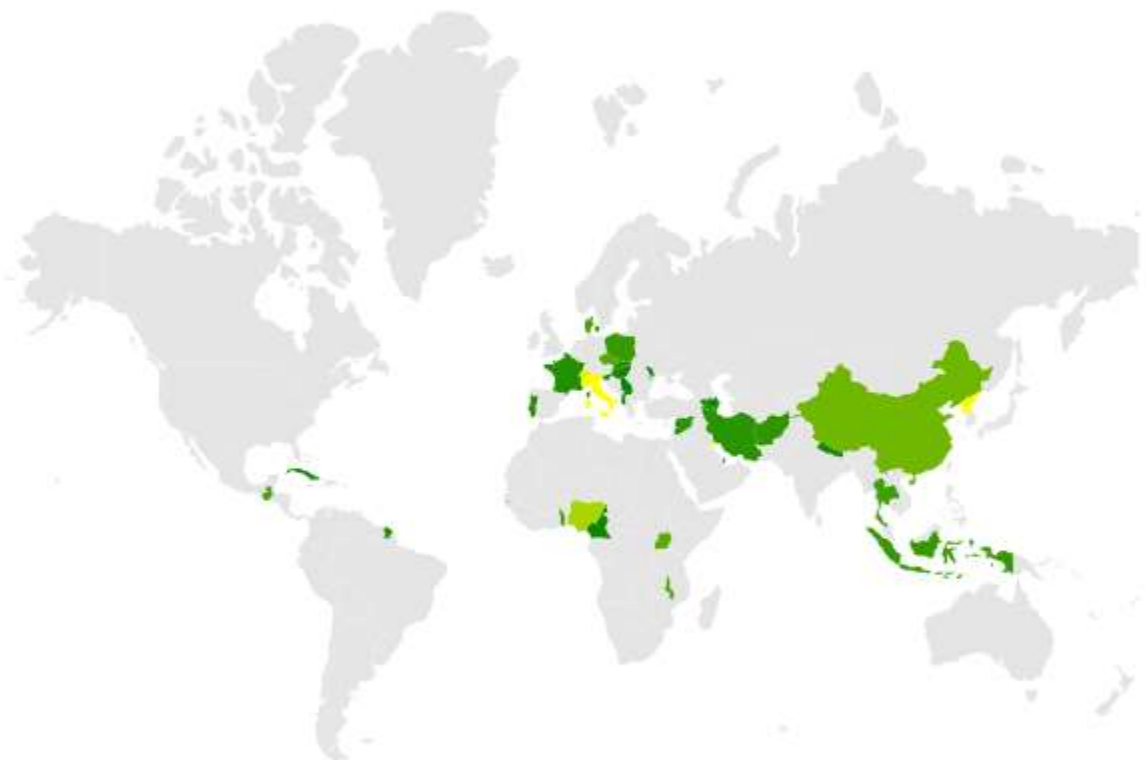

DESATURATIONWITHMULTIPLECOLORS.CS

}
}
```

Note: Refer the data values of [Population-density.json](#) here.

Color for items excluded from color mapping

Color mapping can be applied to the shapes in the Maps which does not match color mapping criteria such as range or equal values using the **Color** property of **MapsColorMapping**.

Note: The following example shows how to set the color for items excluded from the color mapping with the data source **Population_Density** that is available in the [Range color mapping](#) section.

In the following example, color mapping is added for the ranges from 0 to 200. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the `Color` property alone in the `MapsColorMapping`.

CSHTML

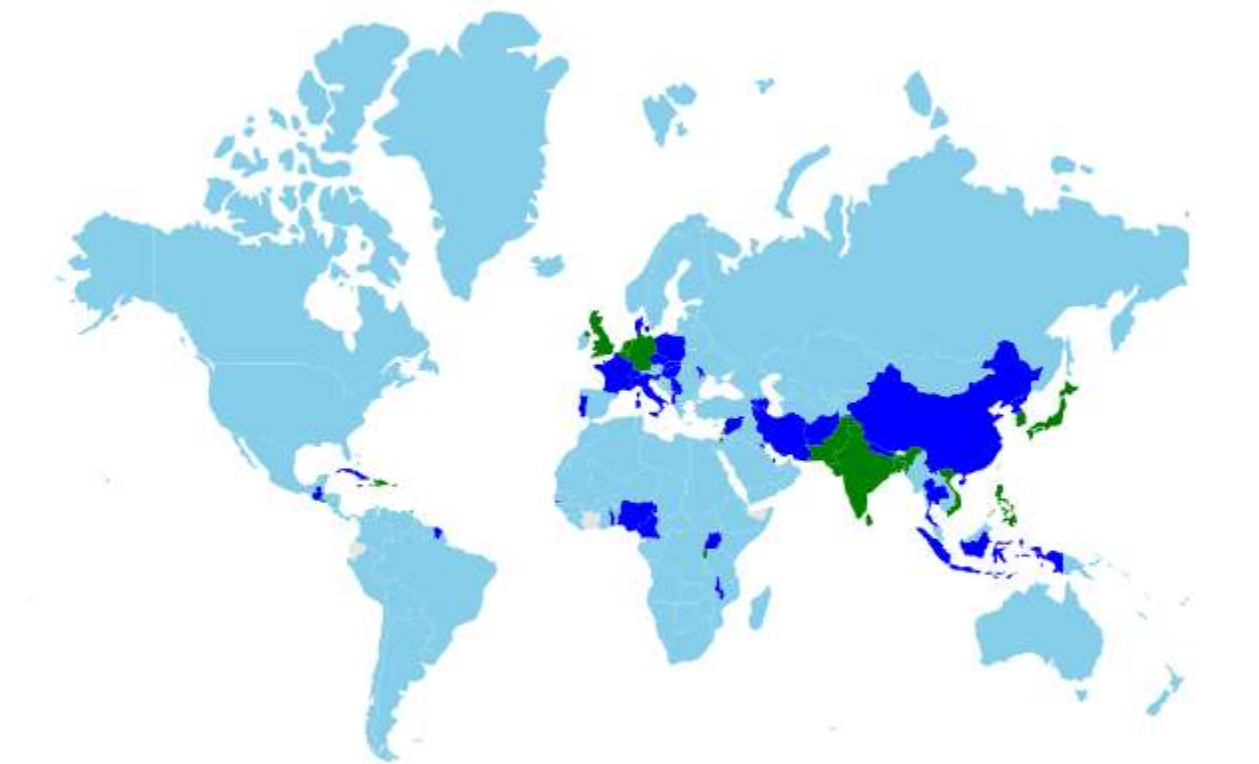

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ From = 0.001, To = 100, Color = "skyblue" },
        new MapsColorMapping { From = 101, To = 200, Color = "blue" },
        new MapsColorMapping {Color = "green"}
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(ss => ss.Fill("#E5E5E5").ColorValuePath("density")
        .ColorMapping(colormapping)).DataSource(ViewBag.populationDensity)

    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name")
    .Add();
}).Render()
```

Color mapping for bubbles

The color mapping types such as range color mapping, equal color mapping and desaturation color mapping are applicable for bubbles in the Maps. To add color mapping for bubbles of the Maps, bind the data source to the **DataSource** property of **MapsBubble** class and set the field name which contains the color value in the data source to the **ColorValuePath** property. Multiple colors for a single set of bubbles and color for excluded items from **ColorMapping** are also applicable for bubbles.

        return JsonConvert.DeserializeObject(allText, typeof(object));  
    }  
}
```

Data labels in ASP.NET MVC Maps Component

Data labels provide information to users about the shapes of the Maps component. It can be enabled by setting the `Visible` property of the `MapsDataLabelSettings` to `true`.

Adding data labels

To display data labels in the Maps, the `LabelPath` property of `MapsDataLabelSettings` must be used. The value of the `LabelPath` property can be taken from the field name in the shape data or data source. In the following example, the value of the `LabelPath` property is the field name in the shape data of the Maps layer.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(s => s.Autofill(true)).DataLabelSettings(label =>
label.Visible(true).LabelPath("name")).
    ShapeData(ViewBag.usmap).Add();
}).Render()
```

LABEL.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.usa = GetUSMap();
            ViewBag.usmap = GetUnitedStatesMap();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/USA.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetUnitedStatesMap()
        {
            string text =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
            return JsonConvert.DeserializeObject(text, typeof(object));
        }
    }
}
```

In the following example, the value of `LabelPath` property is set from the field name in the data source of the layer settings.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var data = new[]
    {

Customization

The following properties are available in the `MapsDataLabelSettings` to customize the data label of the Maps component.

- **Border** - To customize the color, width and opacity for the border of the data labels in Maps.
- **Fill** - To apply the color of the data labels in Maps.
- **Opacity** - To customize the transparency of the data labels in Maps.
- **TextStyle** - To customize the text style of the data labels in Maps.

CSHTML

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.usa = GetUSMap();
            ViewBag.usmap = GetUnitedStatesMap();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/USA.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetUnitedStatesMap()
        {
            string text =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
            return JsonConvert.DeserializeObject(text, typeof(object));
        }
    }
}
```

Adding data label as a template

The data label can be added as a template in the Maps component. The `Template` property of `MapsDataLabelSettings` is used to set the data label as a template. Any text or HTML element can be added as the template in data labels.

Note: The properties of data label such as, `SmartLabelMode`, `IntersectionAction`, `AnimationDuration`, `Border`, `Fill`, `Opacity` and `TextStyle` properties are not applicable to `Template` property. The styles can be applied to the label template using the CSS styles of the HTML element.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var label = new MapsDataLabelSettings
    {
        Visible = true,
        Template = "Label"
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(s => s.Autofill(true)).DataLabelSettings(label).
    ShapeData(ViewBag.usmap).Add();
}).Render()
```

LABEL-TEMPLATE.CS

            ViewBag.usmap = GetUnitedStatesMap();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/USA.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetUnitedStatesMap()
        {
            string text =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
            return JsonConvert.DeserializeObject(text, typeof(object));
        }
    }
}
```

Polygon shape in ASP.NET MVC Maps component

The Maps component allows you to add polygon shape to a geometry map or an online map by using the properties in the [Polygons](#). This section describes how to add polygon shape to the map and customize them.

The polygon shape can be rendered over the map layer by defining the [Points](#) property in the [Polygons](#) of the Maps component. The [Points](#) property uses a collection of latitude and longitude values to define the polygon shape.

The [Polygons](#) provides the following properties for customizing the polygon shape of the Maps component.

- [Fill](#) - It is used to change the color of the polygon shape.
- [Opacity](#) - It is used to change the opacity of the polygon shape.
- [BorderColor](#) - It is used to change the color of the border in the polygon shape.
- [BorderWidth](#) - It is used to change the width of the border in the polygon shape.
- [BorderOpacity](#) - It is used to change the opacity of the border in the polygon shape.

You can also include “n” polygon shapes using the [Polygons](#) property.

The following example shows how to customize the polygon shape over the geometry map.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@{

}  
}
```

Markers

Markers are notes that are used to leave a message on the Maps. It indicates or marks a specific location with desired symbols on the Maps. It can be enabled by setting the **Visible** property of the **MapsMarker** to **true**.

Adding marker

To add the markers, the **DataSource** property of the **MapsMarker** has a list of objects that contains the data for markers. Using this property, any number of markers can be added to the layers of the Maps. By default, it displays the markers based on the specified latitude and longitude in the given data source. Each data source object contains the following list of properties.

- latitude - The latitude point which determines the X location of the marker.
- longitude - The longitude point which determines the Y location of the marker.

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Adding marker template

The Marker can be added as a template in the Maps component. The `Template` property of the `MapsMarker` is used to set the HTML element or id of an element as a template.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l=> {
    l.ShapeData( ViewBag.world_map).MarkerSettings(new List<MapsMarker>
    {
        new MapsMarker{Visible=true, Template="#template", DataSource= new[]
        {
            new {latitude= 37.0000, longitude= -120.0000, city= "California"
        },
            new {latitude= 40.7127, longitude= -74.0059, city= "New York" },
            new {latitude= 42.0000, longitude= -93.0000, city= "Iowa" }
        }
    }).Add();
}).Render()
<div id="template" style="display: none;">
    <div>
```

```

<div style="margin-left:8px;height:45px;width:120px;margin-top:-
23px;">
    <label style="color:black;margin-left:15px;font-
weight:normal;">\{\{\:city\}\}</label>
    </div>
</div>
</div>

```

MARKER-LABEL.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            ViewBag.world_map = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Customization

The following properties are available in `MapsMarker` class to customize the Markers of the Maps component.

- **Border** - To customize the color, width and opacity of the border for the markers in Maps.
- **Fill** - To apply the color for markers in Maps.
- **DashArray** - To define the pattern of dashes and gaps that is applied to the outline of the markers in Maps.
- **Height** - To customize the height of the markers in Maps.
- **Width** - To customize the width of the markers in Maps.
- **Offset** - To customize the position of the markers in Maps.
- **Opacity** - To customize the transparency of the markers in Maps.
- **AnimationDelay** - To change the time delay in the transition for markers.
- **AnimationDuration** - To change the time duration of animation for markers.

CSHTML

            return JsonConvert.DeserializeObject(allText, typeof(object));  
        }  
    }  
}
```

Marker shapes

The Maps component supports the following marker shapes. To set the shape of the marker, the **Shape** property in **MapsMarker** is used.

- Balloon
- Circle
- Cross
- Diamond
- Image
- Rectangle
- Start
- Triangle
- VerticalLine
- HorizontalLine

Rendering marker shape as image

To render a marker as an image in Maps, set the **Shape** property of **MapsMarker** as **Image** and specify the path of the image to **ImageUrl** property. There is another way to render a marker as an image using the **ImageUrlValuePath** property of the **MapsMarker**. Bind the field name that contains the path of the image in the data source to the **ImageUrlValuePath** property.

CSHTML

```
using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@{ var data = new[]
    {
        new {latitude = 37.0000, longitude = -120.0000, city= "California"},

    }
}

```

Customize marker shapes from data source

Bind different colors and shapes to the marker from data source

Using the **ShapeValuePath** and **ColorValuePath** properties, the color and shape of the marker can be applied from the given data source. Bind the data source to the **DataSource** property of the **MapsMarker** class and set the field names that contains the shape and color values in the data source to the **ShapeValuePath** and **ColorValuePath** properties.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@{
    var data = new[]
    {
        new {latitude = 49.95121990866204, longitude = 18.468749999999998,
        name="Europe", color="red",
        shape="Triangle"},

```

```

        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}

```

Setting value path from the data source

The latitude and longitude values are used to determine the location of each marker in the Maps. The `LatitudeValuePath` and `LongitudeValuePath` properties are used to specify the value path that presents in the data source of the marker. In the following example, the field name from the data source is set to the `LatitudeValuePath` and `LongitudeValuePath` properties.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@{
    var data = new[]
    {
        new {latitude = 49.95121990866204, longitude = 18.468749999999998},
        new {latitude = 59.88893689676585, longitude = -109.3359375},
        new {latitude = -6.64607562172573, longitude = -55.546874999999999}
    };
}
@Html.EJS().Maps("container").Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>
{
    new Syncfusion.EJ2.Maps.MapsLayer
    {

```

```

        ShapeData = ViewBag.world_map,
        MarkerSettings = new
List<Syncfusion.EJ2.Maps.MapsMarker>
    {
        new Syncfusion.EJ2.Maps.MapsMarker
        {
            Visible = true,
            LatitudeValuePath = "latitude",
            LongitudeValuePath = "longitude",
            DataSource = data
        }
    }
}).Render()

```

MARKER-VALUEPATH.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            ViewBag.world_map = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {

Marker zooming

The Maps can be initially scaled to the center value based on the marker distance. This can be achieved by setting the `ShouldZoomInitially` property in `MapsZoomSettings` as **true**.

CSHTML

}
```

Marker clustering

Maps provide support to cluster the markers when they overlap each other. The number on a cluster indicates how many overlapped markers it contains. If zooming is performed on any of the cluster locations in Maps, the number on the cluster will decrease, and the individual markers will be seen on the map. When zooming out, the overlapping marker will increase. So that it can cluster again and increase the count over the cluster.

To enable clustering in markers, set the `AllowClustering` property of `MapsMarkerClusterSettings` as **true** and customization of clustering can be done with the `MapsMarkerClusterSettings`.

CSHTML

```
@using Syncfusion.EJ2
```

```

@using Syncfusion.EJ2.Maps
@Html.EJS().Maps("container").ZoomSettings(new
Syncfusion.EJ2.Maps.MapsZoomSettings
{
    Enable = true
}).Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>

Customization of marker cluster

The following properties are available to customize the marker clustering in the Maps component.

- **Border** - To customize the color, width and opacity of the border of cluster in Maps.
- **ConnectorLineSettings** - To customize the connector line in cluster separating the markers.
- **DashArray** - To customize the dash array for the marker cluster in Maps.
- **Fill** - Applies the color of the cluster in Maps.
- **Height** - To customize the height of the marker cluster in Maps.
- **ImageUrl** - To customize the URL path for the marker cluster when the cluster shape is set as image in Maps.
- **LabelStyle** - To customize the text in marker cluster.
- **Offset** - To customize the offset position for the marker cluster in Maps.
- **Opacity** - To customize the opacity of the marker cluster.
- **Shape** - To customize the shape for the cluster of markers.
- **Width** - To customize the width of the marker cluster in Maps.

CSHTML

```
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@Html.EJS().Maps("container").ZoomSettings(new
Syncfusion.EJ2.Maps.MapsZoomSettings
{

```

Expanding the marker cluster

The cluster is formed by grouping an identical and non-identical marker from the surrounding area. By clicking on the cluster and setting the `AllowClusterExpand` property in `MapsMarkerClusterSettings` as **true** to expand the identical markers. If zooming is performed in any of the locations of the cluster,

the number on the cluster will decrease and the overlapping marker will be split into an individual marker on the map. When performing zoom out, it will increase the marker count and then cluster it again.

Tooltip for marker

Tooltip is used to display more information about a marker on mouse over or touch end event. This can be enabled separately for marker by setting the **Visible** property of **MapsTooltipSettings** to **true**. The **ValuePath** property in the **MapsTooltipSettings** takes the field name that presents in **dataSource** and displays that value as tooltip text.

CSHTML

```

Bubbles in ASP.NET MVC Maps Component

Bubbles in the Maps component represent the underlying data values of the Maps. It can be scattered throughout the Maps shapes that contain values in the data source. Bubbles are enabled by setting the **Visible** property of **MapsBubble** to **true**. To add bubbles to the Maps, bind the data source to the **DataSource** property of **MapsBubble** and set the field name, that contains the numerical data, in the data source to the **ValuePath** property.

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.BubbleSettings(bubble =>
    {
        bubble.Visible(true).MinRadius(20).MaxRadius(40).ValuePath("population").DataSource(ViewBag.bubbleData).Add();
    })
    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
})

        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public class BubbleData
        {
            public string name { get; set; }
            public string population { get; set; }
        }
    }
}
```

Bubble shapes

The following types of shapes are available to render the bubbles in Maps.

- Circle
- Square

By default, bubbles are rendered in the **Circle** type. To change the type of the bubble, set the **BubbleType** property of **MapsBubble** as **Square** to render the square shape bubbles.

CSHTML

```
@using Syncfusion.EJ2;  
@using Syncfusion.EJ2.Maps;  
@Html.EJS().Maps("maps").Layers(l =>  
{  
    l.BubbleSettings(bubble =>  
    {  
  
        bubble.Visible(true).ValuePath("population").BubbleType(Syncfusion.EJ2.Maps.  
            BubbleType.Square).DataSource(ViewBag.bubbleData).Add();  
  
    }).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();  
    }).Render()
```

BUBBLE-SHAPE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            List<BubbleData> data = new List<BubbleData>
            {
                new BubbleData { name= "India", population= "38332521" },
                new BubbleData { name= "Pakistan", population= "3090416" }
            };
            ViewBag.bubbleData = data;
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public class BubbleData
        {
            public string name { get; set; }
            public string population { get; set; }
        }
    }
}
```

Customization

The following properties are available in **MapsBubble** to customize the bubbles of the Maps component.

- **Border** – To customize the color, width and opacity of the border of the bubbles in Maps.
- **Fill** – To apply the color for bubbles in Maps.
- **Opacity** – To apply opacity to the bubbles in Maps.
- **AnimationDelay** - To change the time delay in the transition for bubbles.
- **AnimationDuration** - To change the time duration of animation for bubbles.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@{
    var data = new[]
    {
        new { name= "Australia", population= "383521" },
        new { name= "Pakistan", population= "3090416" },
        new { name= "Russia", population= "30916" }
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.BubbleSettings(bubble =>
```

```

    {

bubble.Visible(true).ValuePath("population").MinRadius(10).MaxRadius(30).ValuePath("population").

DataSource(data).Fill("green").Opacity(1).AnimationDelay(100).AnimationDuration(1000).Border(border => border.Color("blue").Width(2).Opacity(1)).Add();

}).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
}).Render()

```

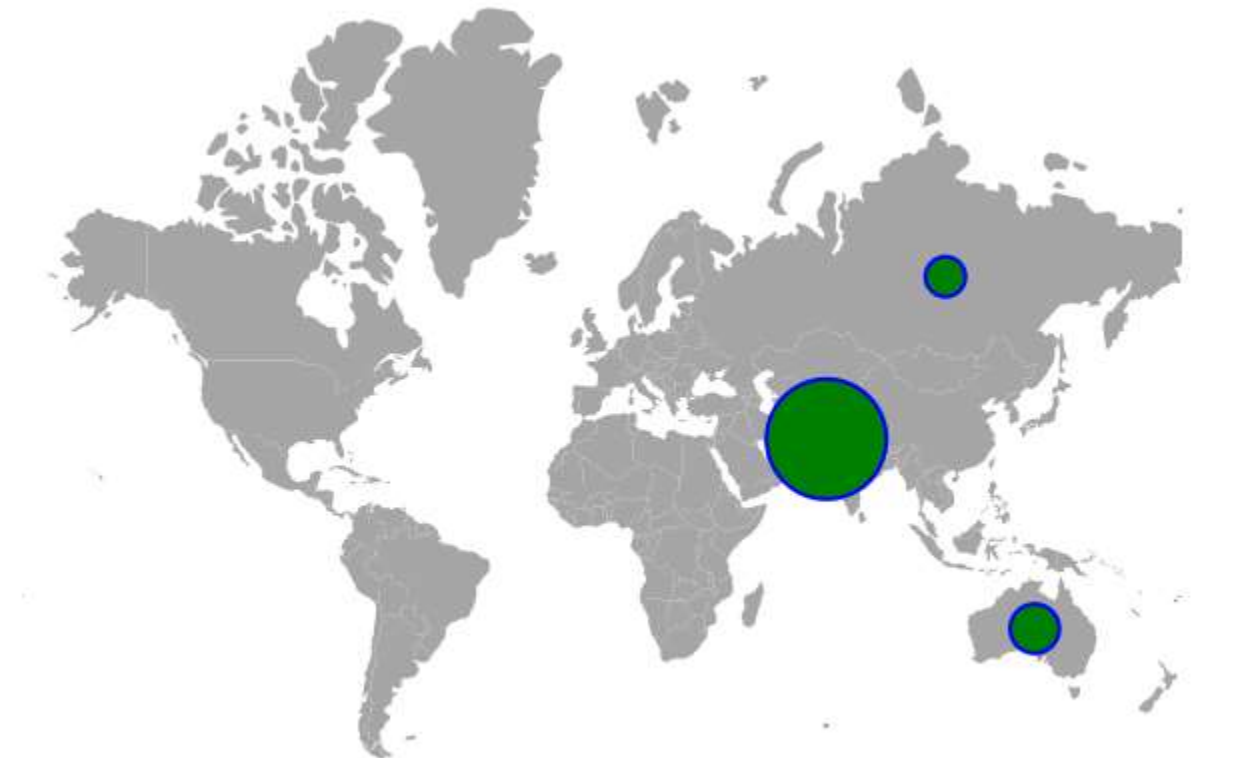

BUBBLE-CUSTOMIZATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            List<BubbleData> data = new List<BubbleData>
            {
                new BubbleData { name= "Australia", population= "383521" },
                new BubbleData { name= "Pakistan", population= "3090416" },
                new BubbleData { name= "Russia", population= "30916" }
            };
            ViewBag.bubbleData = data;
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public class BubbleData
        {
            public string name { get; set; }
            public string population { get; set; }
        }
    }
}

```

```
}
}
```

Setting colors to the bubbles from the data source

The color for each bubble in the Maps can be set using the `ColorValuePath` property of `MapsBubble`. The value for the `ColorValuePath` property is the field name from the data source of the `MapsBubble` which contains the color values.

CSHTML

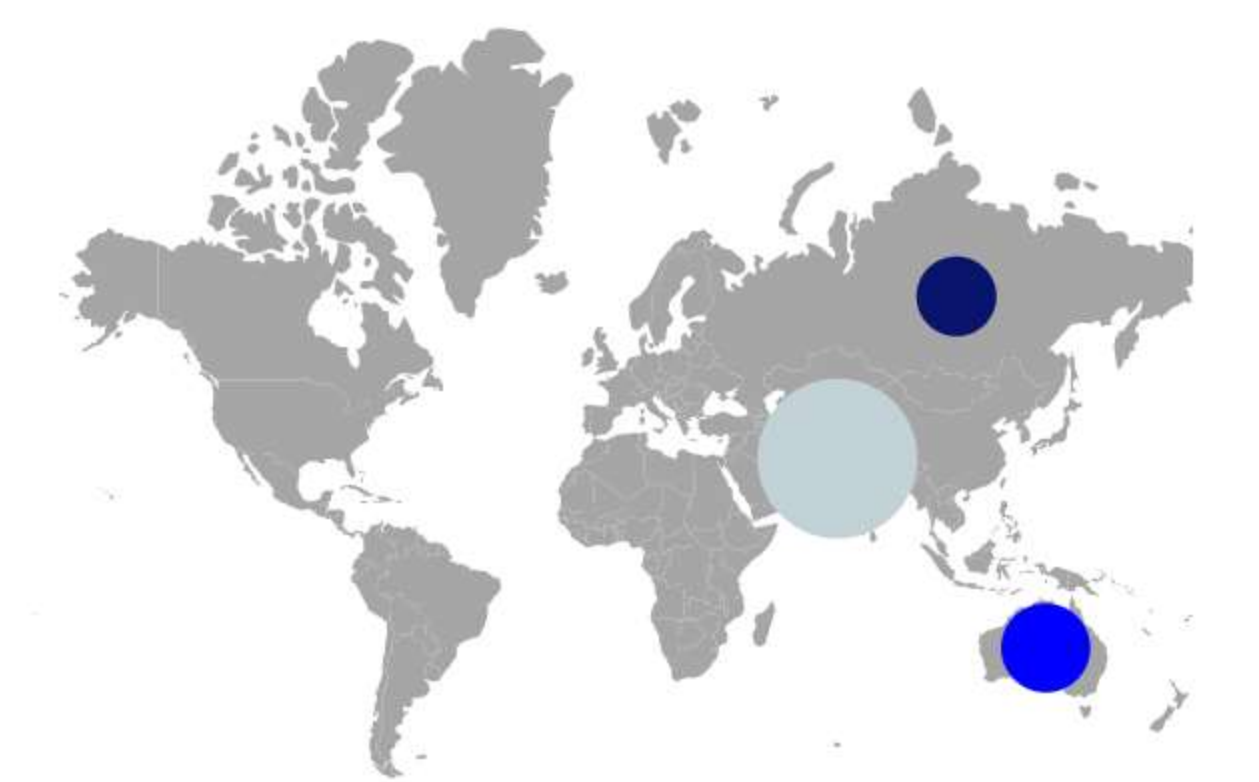

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.BubbleSettings(bubble =>
    {
        bubble.Visible(true).ValuePath("population").MinRadius(20).MaxRadius(40).ColorValuePath("color").ValuePath("population").
            DataSource(ViewBag.bubbleData).Add();
    }).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
    }).Render()
```

BUBBLE-VALUEPATH.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            List<BubbleData> data = new List<BubbleData>
            {
                new BubbleData { name= "Australia", population= "383521",
color="blue" },
                new BubbleData { name= "Pakistan", population= "3090416",
color="#c2d2d6" },
                new BubbleData { name= "Russia", population= "30916",
color="#09156d" }
            };
            ViewBag.bubbleData = data;
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public class BubbleData
        {
            public string name { get; set; }
            public string population { get; set; }
        }
    }
}

```

Setting the range of the bubble size

The size of the bubbles is calculated from the values got from the `ValuePath` property. The range for the radius of the bubbles can be modified using `MinRadius` and `MaxRadius` properties.

C#HTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.BubbleSettings(bubble =>
    {

bubble.Visible(true).ValuePath("population").MinRadius(20).MaxRadius(40).ValuePath("population").
        DataSource(ViewBag.bubbleData).Add();

    }) .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name") .Add();
    }) .Render();
```

BUBBLESIZE.CS

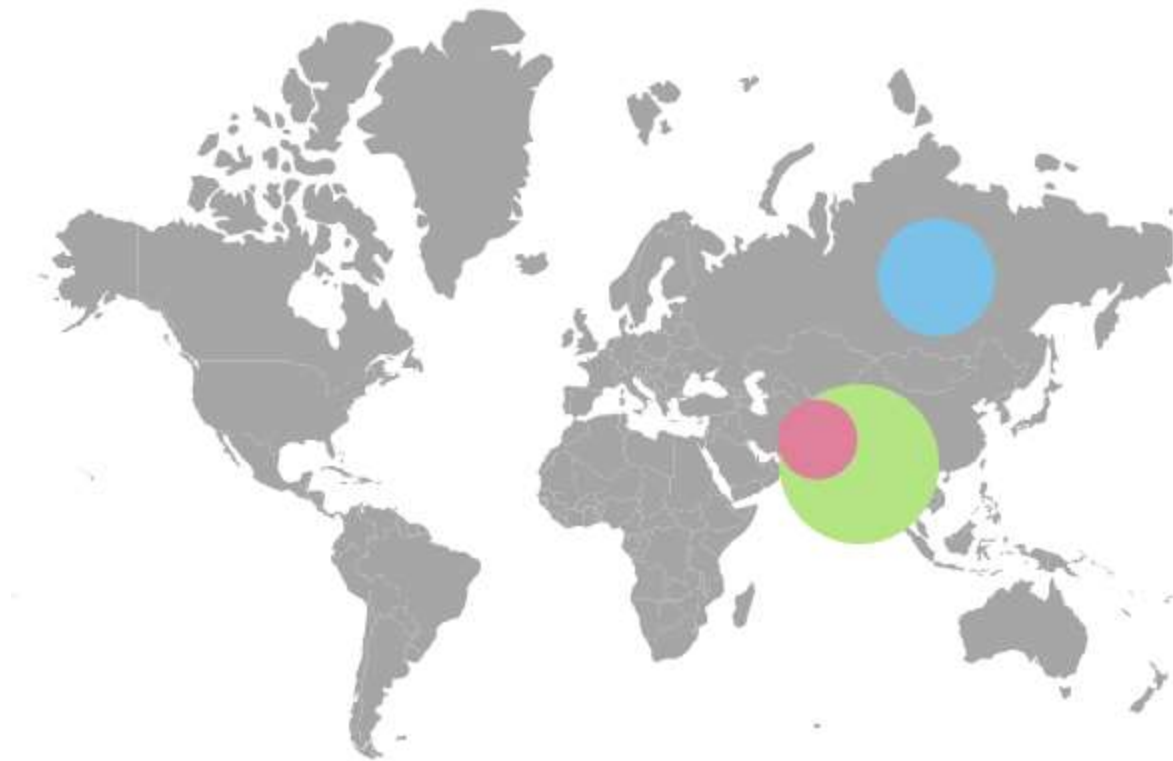

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
```

```
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            List<BubbleData> data = new List<BubbleData>
            {
                new BubbleData { name= "India", population= "38332521" },
                new BubbleData { name= "Russia", population= "19651127" },
                new BubbleData { name= "Pakistan", population= "3090416" }
            };
            ViewBag.bubbleData = data;
            return View();
        }

        public object GetWorldMap()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }

        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }

        public class BubbleData
        {
            public string name { get; set; }
            public string population { get; set; }
        }
    }
}
```

Multiple bubble groups

Multiple groups of bubbles can be added in the Maps by adding multiple `MapsBubble` in the `MapsBubbles` and customization for the bubbles can be done with the `MapsBubble` class. In the following example, the gender-wise population ratio is demonstrated with two different bubble groups.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    1.BubbleSettings(ViewBag.bubbleSettings).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
}).Render()
```

MULTIPLE-BUBBLE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
```

```

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {

        return JsonConvert.DeserializeObject(allText);
    }
    public object GetMap()
    {
        string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
    public class BubbleData
    {
        public string country { get; set; }
        public double femaleRatio { get; set; }
        public double maleRatio { get; set; }
        public string femaleRatioColor { get; set; }
        public string maleRatioColor { get; set; }
    }
}
```

Enable tooltip for bubble

The tooltip for the bubbles can be enabled by setting the `Visible` property of the `MapsTooltipSettings` as `true`. The content for the tooltip can be set using the `ValuePath` property in the `MapsTooltipSettings` of the `MapsBubble` where the value for the `ValuePath` property is the field name from the data source of the `MapsBubble`. Any HTML element can be added as the template in tooltip using the `Template` property.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.BubbleSettings(bubble =>
    {
        bubble.Visible(true).ValuePath("population").MinRadius(20).MaxRadius(40).TooltipSettings(tooltip => tooltip.Visible(true).ValuePath("population")).DataSource(ViewBag.bubbleData).Add();
    })
    .ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
}).Render();
```

BUBBLE-TOOLTIP.CS

```

Legend in ASP.NET MVC Maps Component

A Legend is a visual representation of the symbols used on the Maps. It can be represented in various colors, shapes or other identifiers based on the data and provides valuable information for interpreting what the Maps are displaying. It explains what each symbol in the Maps represents. Legends are enabled by setting the `Visible` property of `MapsLegendSettings` to `true`.

Modes of legend

Legend had two types of mode.

1. **Default** mode
2. **Interactive** mode

Default mode

Default mode legends having symbols with legend labels, used to identify the shape or bubble or marker color. To enable this option by setting the **Mode** property of **MapsLegendSettings** as **Default**.

Interactive mode

The legends can be made interactive with an arrow mark indicating the exact range color in the legend when the mouse hovers over the corresponding shapes. To enable this type of mode by setting the **Mode** property of **MapsLegendSettings** as **Interactive**. The **InvertedPointer** property is used to enable or disable the visibility of the inverted pointer in interactive legend in Maps.

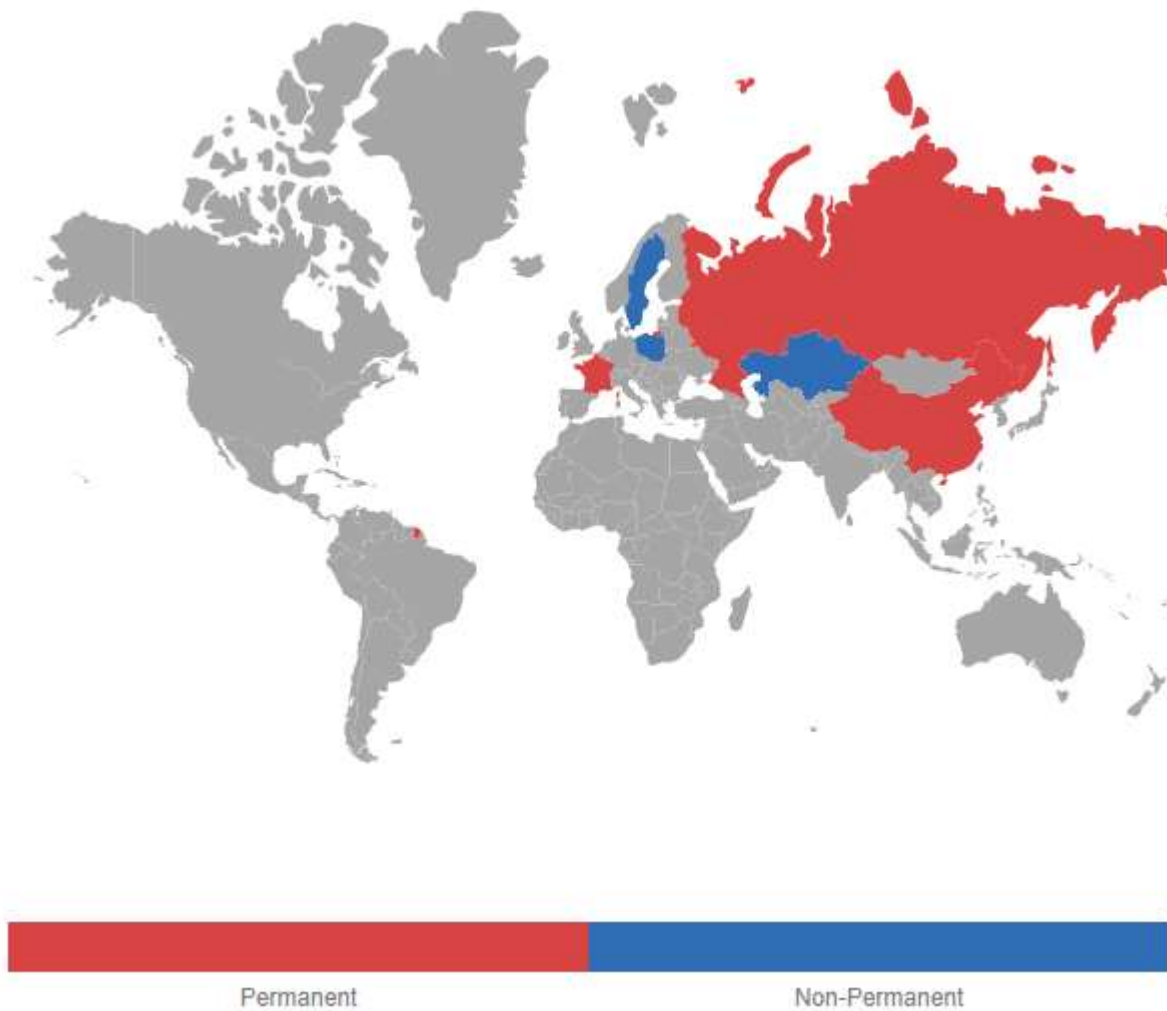

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var data = new[]
    {
        new { Country= "China", Membership= "Permanent" },
        new { Country= "France", Membership= "Permanent" },
        new { Country= "Russia", Membership= "Permanent" },
        new { Country= "Kazakhstan", Membership= "Non-Permanent" },
        new { Country= "Poland", Membership= "Non-Permanent" },
        new { Country= "Sweden", Membership= "Non-Permanent" },
    };
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ Color = "#D84444",Value= "Permanent" },
        new MapsColorMapping { Color= "#316DB5", Value = "Non-Permanent" },
    };
}
@Html.EJS().Maps("maps").LegendSettings(legend =>
legend.Visible(true).Mode(Syncfusion.EJ2.Maps.LegendMode.Interactive).InvertedPointer(true)).Layers(l =>
{
    l.ShapeSettings(ss =>
ss.ColorValuePath("Membership").ColorMapping(colormapping)).ShapeData(ViewBag.worldMap)
        .ShapeDataPath("Country").ShapePropertyPath("name")
        .DataSource(data).Add();
}).Render()
```

LEGEND-MODE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
```

```
public class HomeController : Controller
{
    public IActionResult Index()
    {
        ViewBag.world_map = GetWorldMap();
        ViewBag.worldMap = GetMap();
        return View();
    }
    public object GetWorldMap()
    {
        string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
        return JsonConvert.DeserializeObject(allText);
    }
    public object GetMap()
    {
        string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}
```

Positioning of the legend

The legend can be positioned in the following two ways:

- Absolute position
- Dock position

Absolute position

The legend of the Maps can be positioned using the `Location` property in the `MapsLegendSettings`. For positioning the legend based on co-ordinates corresponding to a Maps, the `Position` property is set as **Float**.

Dock position

Legends are positioned in the following locations within the container. The `Position` property in `MapsLegendSettings` is used to set these options in Maps.

- Top
- Left

- Bottom
- Right

The above four positions can be aligned with combination of **Near**, **Center** and **Far** using **Alignment** property in **MapsLegendSettings**. So, the legend can be aligned to 12 positions.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var data = new[]

Legend for shapes

Legend for shapes can be generated from color mapping types such as equal color mapping, range color mapping and desaturation color mapping.

The below code snippet demonstrate the equal color mapping legends for the shapes. To bind the given data source to the `DataSource` property of `MapsLayer`. Set the value of `ShapePropertyPath` to `name` and `ShapeDataPath` to `Country`. To enable equal color mapping, set the multiple `MapsColorMapping` to the `MapsShapeSettings`. Finally, set the `Visible` property of `MapsLegendSettings` as `true`. The `Label` property in `MapsColorMapping` is used to set the text name for legend in Maps.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var ColorMapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping>
    {
        new MapsColorMapping{Value="Permanent", Color="#D84444"},
        new MapsColorMapping{Value="Non-Permanent", Color="#316DB5"}
    };
}
@Html.EJS().Maps("maps").LegendSettings(legend =>
legend.Visible(true)).Layers(l =>
{
    l.ShapeSettings(ss =>
ss.ColorValuePath("Membership").ColorMapping(ColorMapping))

    .ShapeData(ViewBag.worldMap).ShapeDataPath("Country").ShapePropertyPath("name")
        .DataSource(ViewBag.uncountries).Add();
}).Render()
```

    }
}
```

Legend shape

Maps supports the following types of legend shapes. The `Shape` property in the `MapsLegendSettings` class can be used to change the type of legend shapes.

- Circle
- Rectangle
- Triangle
- Diamond
- Cross
- Star
- HorizontalLine
- VerticalLine
- Pentagon
- InvertedTriangle

The shape of legends can be customized by using the `ShapeWidth`, `ShapeHeight`, `ShapeBorder` and `ShapePadding` properties.

Customization

The following properties are available in legend to customize the legend shape and legend text in Maps.

- **Background** - To customize the background color of the Legend.
- **Border** - To customize the color, width and opacity of the border for the Legend.
- **Fill** - To apply the color for the Legend.
- **LabelDisplayMode** - To customize the display mode for the Legend text.
- **LabelPosition** - To customize the position of the Legend text.
- **Orientation** - To customize the orientation of the Legend.
- **TextStyle** - To customize the text style for Legend.
- **Title** - To apply the title for the Legend.
- **TitleStyle** - To customize the style of the title for the Legend.
- **Height** - To customize the height of the Legend.
- **Width** - To customize the width of the Legend.
- **Opacity** - To apply the opacity to the Legend.

CSHTML

        .DataSource(data).Add();
}).Render()

```

LEGEND-CUSTOMIZATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Legend for items excluded from color mapping

The legend can be enabled for items excluded from the color mapping using the `Color` property in `MapsColorMapping`. Refer to the **population_density** data which demonstrates the population density of some countries.

```
`sh
[
...
{
'code': 'AE',
'value': 90,
'name': 'United Arab Emirates',
'population': 8264070,
'density': 99
```

```

},
{
  'code': 'GB',
  'value': 257,
  'name': 'United Kingdom',
  'population': 62041708,
  'density': 255
},
{
  'code': 'US',
  'value': 34,
  'name': 'United States',
  'population': 325020000,
  'density': 33
}
...
];
`

```

In the following example, color mapping is added for the ranges from **0** to **200**. If there are any records in the data source that are outside of this range, the color mapping will not be applied. To apply the color for these excluded items, set the **Color** property alone in the **MapsColorMapping**. To enable legend for these items, set the **Visible** property of **MapsLegendSettings** to **true**.

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var colorMapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping>
    {
        new MapsColorMapping {From = 1, To = 100, Color =
"rgb(153,174,214)"},
        new MapsColorMapping {From = 101, To = 200, Color =
"rgb(115,143,199)"},
        new MapsColorMapping {Color = "rgb(77,112,184)"}
    };
}

            return JsonConvert.DeserializeObject(text);
        }
        public object GetLegendData()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/populationdensity.js"
);
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
        public object GetLegendData1()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/LegendData.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Toggle option in legend

The toggle option has been provided for legend. If the legend can be toggled, the given color will be changed to the corresponding Maps shape item. To enable the toggle options in Legend, set the **Enable** property of the **MapsToggleLegendSettings** to **true**.

The following properties are available to customize the toggle option in legend.

- **ApplyShapeSettings** – To apply the **Fill** property value to the shape of the Maps when toggling the legend items.
- **Fill** - To apply the color to the shape of the Maps for which legend item is toggled.
- **Opacity** – To customize the transparency for the shapes for which legend item is toggled.
- **Border** – To customize the color, width and opacity of the border of the shapes in Maps.

CSHTML

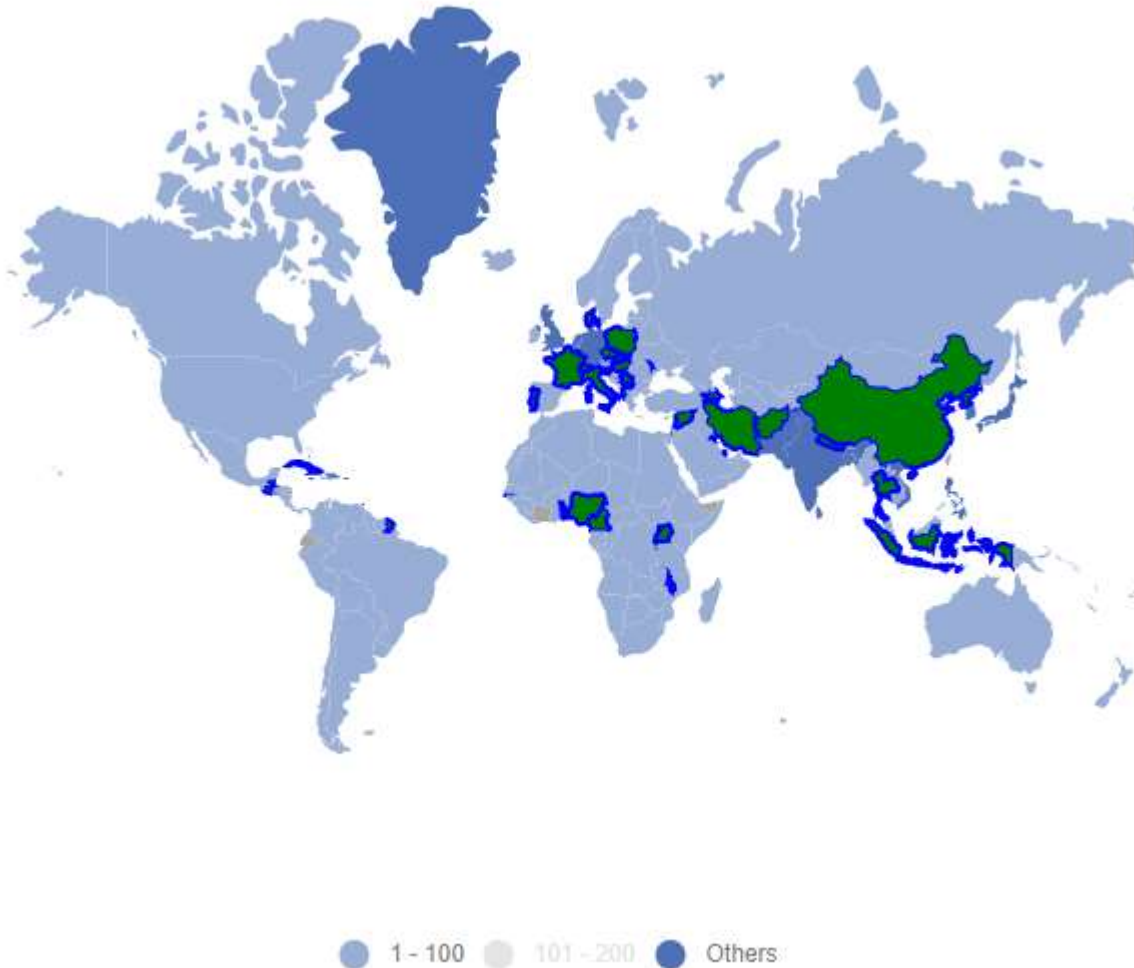

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("container").LegendSettings(legend =>
    legend.Visible(true).ToggleLegendSettings(Tl => Tl.Enable(true))
```

```
.ApplyShapeSettings(false).Fill("green").Border(Br =>
Br.Color("green").Width(2).Opacity(1))).Layers(layer =>
{
    layer.DataSource(ViewBag.populationDensity).ShapeDataPath("name")
    .ShapePropertyPath("name").ShapeSettings(new MapsShapeSettings
    {
        ColorValuePath = "density",
        ColorMapping = new List<MapsColorMapping> {
            new MapsColorMapping { From = 1 , To = 100,
Color="rgb(153,174,214)" },
            new MapsColorMapping { From = 101 , To = 200,
Color="rgb(115,143,199)" },
            new MapsColorMapping { Color="rgb(77,112,184)" },
        }
    }).ShapeData(ViewBag.worldMap).Add();
}).Render()
```

    }
}
```

Enable legend for bubbles

To enable the legend for the bubble by setting the **Visible** property of **MapsLegendSettings** as **true** and **Type** property of **MapsLegendSettings** as **Bubbles**.

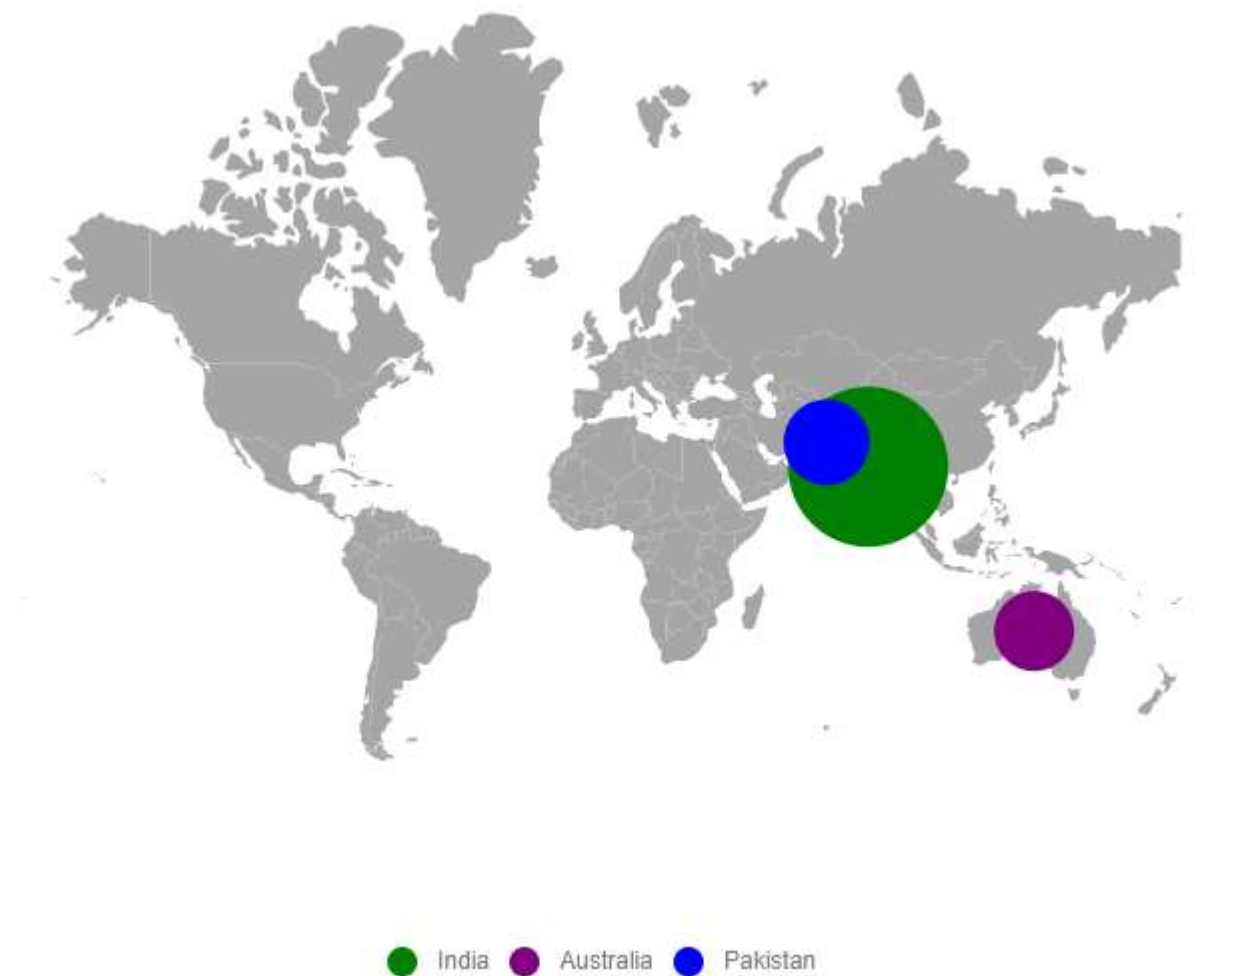

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").LegendSettings(legend =>
legend.Visible(true).Type(LegendType.Bubbles)).Layers(l =>
{
    l.BubbleSettings(bubble =>
    {
        bubble.Visible(true).MinRadius(20).MaxRadius(40).ColorValuePath("color").ValuePath("population").DataSource(ViewBag.bubbleData).Add();
    }).ShapeData(ViewBag.worldMap).ShapeDataPath("name").ShapePropertyPath("name").Add();
}).Render()
```

BUBBLE-LEGEND.CS

```
using System;

    public string population { get; set; }  
    public string color { get; set; }  
}  
}
```

Enable legend for markers

To enable legend for marker by setting the **Visible** property of **MapsLegendSettings** as **true** and **Type** property of **MapsLegendSettings** as **Markers**. The **LegendText** property in the **MapsMarker** can be used to show the legend text based on values provided in the data source.

CHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var data = new[]
    {
        new {latitude= 37.0000, longitude= -120.0000, city= "California"
    },
        new {latitude= 40.7127, longitude= -74.0059, city= "New York" },
        new {latitude= 42.0000, longitude= -93.0000, city= "Iowa" }
    };
}
@Html.EJS().Maps("maps").LegendSettings(legend =>
legend.Visible(true).Type(LegendType.Markers)).Layers(l =>
{
    l.MarkerSettings(marker =>
    {
        marker.Visible(true).Shape(MarkerType.Diamond).LegendText("city").DataSource
        (data).Add();
        }).ShapeData(ViewBag.worldmap).Add();
    }).Render()

```

LEGEND.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            List<MarkerData> data = new List<MarkerData>
            {
                new MarkerData {latitude= 37.0000, longitude= -120.0000,
city= "California" },
                new MarkerData {latitude= 40.7127, longitude= -74.0059,
city= "New York" },
                new MarkerData {latitude= 42.0000, longitude= -93.0000,
city= "Iowa" }
            };
            ViewBag.markerData = data;
            return View();
        }
        public object GetWorldMap()
        {

```

```
string allText =  
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");  
return JsonConvert.DeserializeObject(allText);  
}

{  
    public double latitude { get; set; }  
    public double longitude { get; set; }  
    public string city { get; set; }  
}  
}
```

● California ● New York ● Iowa

Imitate/Map marker shape to the legend shape

To imitate or map the marker shape with its legend item shape, set the `UseMarkerShape` property to **true** in the `MapsLegendSettings` property.

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("container").LegendSettings(legend =>
legend.Visible(true).Type(Syncfusion.EJ2.Maps.LegendType.Markers).UseMarkersS
hape(true).ToggleLegendSettings(toggle=>
toggle.ApplyShapeSettings(false))).Layers(l =>
{
    l.MarkerSettings(marker =>
    {

marker.Visible(true).ColorValuePath("color").ShapeValuePath("shape").LegendT
ext("Country").DataSource(ViewBag.markerdata).Add();

}).ShapeSettings(ss=>ss.Fill("#E5E5E5")).ShapeData(ViewBag.world_map).Add();
}).Render()

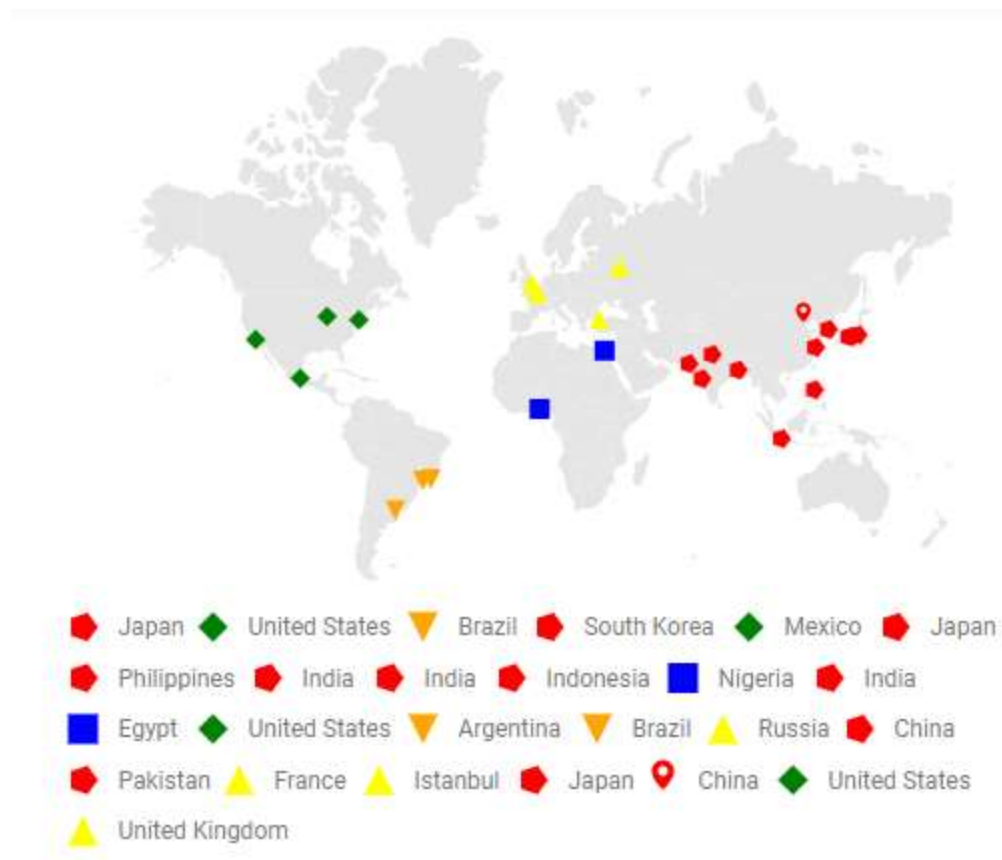

```

MARKER-LEGEND.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.markerdata = GetMarkerData();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMarkerData()
        {
            string allText =
System.IO.File.ReadAllText("./wwwroot/scripts/MapsData/markerdata.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}

```

Annotations in ASP.NET MVC Maps Component

<!-- markdownlint-disable MD013 -->

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Annotation

By using the **Content** property of **MapsAnnotation**, text content or id of an element or an HTML string can be specified to render a new HTML element in Maps.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Annotations(new
List<Syncfusion.EJ2.Maps.MapsAnnotation>{
    new Syncfusion.EJ2.Maps.MapsAnnotation
    {
        Content = "<div id='annotation' style='display:none'><img
src='~/App_Data/ballon.png'></div>",
        X = "0%",
        Y = "50%",
    }
}).Layers(layer =>
{
    layer.ShapeData(ViewBag.worldmap).Add();
}).Render()
```

ANNOTATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Annotation customization

Changing the z-index

The stack order of an annotation element can be changed using the **ZIndex** property in the **MapsAnnotation**.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Annotations(new
List<Syncfusion.EJ2.Maps.MapsAnnotation>{
    new Syncfusion.EJ2.Maps.MapsAnnotation
    {
        Content = "<div id='first'><h1>Maps</h1></div>",
        X = "20%",
        Y = "50%",
        ZIndex = "-1"
    }
}).Layers(layer =>
{
    layer.ShapeData(ViewBag.worldmap).Add();
}).Render()
```

ANNOTATION-ZINDEX.CS

```
using System;
using System.Collections.Generic;
```

```
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Positioning an annotation

Annotations can be placed anywhere in the Maps by specifying pixel or percentage values to the **X** and **Y** properties in the **MapsAnnotation**.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Annotations(new
List<Syncfusion.EJ2.Maps.MapsAnnotation>{
    new Syncfusion.EJ2.Maps.MapsAnnotation
    {
        Content = "<div id='first'><h1>Maps</h1></div>",
        X = "40%",
        Y = "50%",
        ZIndex = "-1"
    }
}).Layers(layer =>
{
    layer.ShapeData(ViewBag.worldmap).Add();
}).Render()
```

ANNOTATION-POSITION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Alignment of an annotation

Annotations can be aligned using the `HorizontalAlignment` and `VerticalAlignment` properties in the `MapsAnnotation`. The possible values can be **Center**, **Far**, **Near** and **None**.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Annotations(new
List<Syncfusion.EJ2.Maps.MapsAnnotation>{
    new Syncfusion.EJ2.Maps.MapsAnnotation
    {
        Content = "<div id='first'><h1>Maps</h1></div>",
        X = "20%",
        Y = "50%",
        ZIndex = "-1",
        HorizontalAlignment = AnnotationAlignment.Center
    }
}).Layers(layer =>
{
    layer.ShapeData(ViewBag.worldmap).Add();
}).Render()
```

ANNOTATION-ALIGNMENT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
```

```
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
                System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Multiple Annotation

Multiple annotations can be added to the Maps by adding Multiple `MapsAnnotation` in the `MapsAnnotations` and customization for the annotations can be done with the `MapsAnnotation`.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
```

```

@Html.EJS().Maps("maps").Annotations(new
List<Syncfusion.EJ2.Maps.MapsAnnotation>{
    new Syncfusion.EJ2.Maps.MapsAnnotation
    {
        Content = "<div id='first'><h1>Maps</h1></div>",
        X = "50%",
        Y = "0%",
        ZIndex = "-1"
    },
    new Syncfusion.EJ2.Maps.MapsAnnotation {
        Content = "<div id='first'><h1>Maps-Annotation</h1></div>",
        X = "20%",
        Y = "50%",
        ZIndex = "-1"
    }
}).Layers(layer =>
{
    layer.ShapeData(ViewBag.worldmap).Add();
}).Render()

```

MULTIPLE-ANNOTATION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}

```

Navigation lines

The navigation lines are used to denote the path between two locations. This feature can be used to draw flight or sea routes. Navigation lines are enabled by setting the `Visible` property of the `MapsNavigationLine` to `true`.

Customization

The following properties are available in `MapsNavigationLine` to customize the navigation line of the Maps component.

- `Color` - To apply the color for navigation lines in Maps.
- `DashArray` - To define the pattern of dashes and gaps that is applied to the outline of the navigation lines.
- `Width` - To customize the width of the navigation lines.
- `Angle` - To customize the angle of the navigation lines.
- `HighlightSettings` - To customize the highlight settings of the navigation line.
- `SelectionSettings` - To customize the selection settings of the navigation line.

To navigate the line between two cities on the world map, `Latitude` and `Longitude` values are used to indicate the start and end points of navigation lines drawn on Maps.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").LegendSettings(legend=>
    legend.Visible(true)).Layers(l =>
    {
        l.NavigationLineSettings(ns => {
```

```
        ns.Visible(true).Latitude(new double[] { 40.7128, 36.7783})
        .Longitude(new double[] { -74.0060, -119.4179
    }).Color("black").Angle(90)
        .Width(4).DashArray("4").Add();
    }).ShapeData(ViewBag.worldmap).Add();
}).Render()
```

NAVIGATION-LINE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Enabling the arrows

To enable the arrow in the navigation line, set the **ShowArrow** property of **MapsArrow** to **true**. The following properties are available in **MapsArrow** to customize the arrow of the navigation lines.

- **Color** - To apply the color for arrow of the navigation line.
- **Offset** - To customize the offset position of the arrow of the navigation line.
- **Position** - To customize the position of the arrow in navigation line. The possible values can be **Start** and **End**.
- **Size** - To customize the size of the arrow in pixels.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").LegendSettings(legend =>
    legend.Visible(true)).Layers(l =>
    {
        l.NavigationLineSettings(ns =>
            {
                ns.Visible(true).Latitude(new double[] { 40.7128, 36.7783 })
                .Longitude(new double[] { -74.0060, -119.4179
            }).Color("black").Angle(90)
                .Width(4).DashArray("4").ArrowSettings(new
                Syncfusion.EJ2.Maps.MapsArrow
                {
                    ShowArrow = true,
                    Size = 15,
```

```
        Position = "Start",
    }).Add();
    }).ShapeData(ViewBag.worldmap).Add();
}).Render()
```

ARROW.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;

System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

User Interactions

Zooming

The zooming feature is used to zoom in and out of Maps to show in-depth information. It is controlled by the `ZoomFactor` property of the `MapsZoomSettings` of the Maps. The `ZoomFactor` is increased or decrease dynamically based on zoom in and out interaction.

Enable zooming

Zooming of Maps is enabled by setting the `Enable` property of `MapsZoomSettings` to **true**.

Enable panning

To enable the panning feature, set the `EnablePanning` property of `MapsZoomSettings` to **true**.

CSHTML

```
@using Syncfusion.EJ2;  
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true).EnablePanning(  
true)).Layers(l=> {  
    l.ShapeData(ViewBag.worldMap).Add();  
}).Render()
```

PANNING.CS

```
using System;  
using System.Collections.Generic;  
using System.Diagnostics;  
using System.Linq;
```

```

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Various type of zooming

Zooming can be performed in following types:

Zooming toolbar

By default, the toolbar is rendered with **zoom-in**, **zoom-out**, and **reset** options when it is set to **true** in the **Enable** property of **MapsZoomSettings**.

The following options are available in toolbar.

1. Zoom - Provides rectangular zoom support.
2. ZoomIn - Zoom in the Maps.
3. ZoomOut - Zoom out the Maps.
4. Pan - Switches to panning if rectangular zoom is activated.
5. Reset - Restores the Maps to the default view.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("load").ZoomSettings(zoom =>
zoom.Enable(true)).Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()
<script>
    function load(args) {

```

```

var maps = document.getElementById('maps').ej2_instances[0];
maps.zoomSettings.toolbarSettings.buttonSettings.toolbarItems =
['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset'];
}
</script>

```

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Pinch zooming

To enable or disable the pinch zooming, use the `PinchZooming` property in `MapsZoomSettings`.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true).PinchZooming(true)).Layers(l=> {
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

```

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

Single-click zooming

To enable or disable the single-click zooming, use the `ZoomOnClick` property in `MapsZoomSettings`.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true).ZoomOnClick(true)).Layers(l=> {
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}
}

```

Double-click zooming

To enable or disable the double-click zooming, use the `DoubleClickZoom` property in `MapsZoomSettings`.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true).DoubleClickZoom(true)).Layers(l=> {
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()

```

System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {

```

```

        string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}

```

Selection zooming

To enable or disable selection zooming, use the `EnableSelectionZooming` property in `MapsZoomSettings`. The `EnablePanning` property must be set to **false** to enable the selection zooming in Maps.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom =>
zoom.Enable(true).EnableSelectionZooming(true).EnablePanning(false)).Layers(
1 =>
{
    1.ShapeData(ViewBag.worldMap).Add();
}).Render()

```

SELECTIONZOOMING.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

```
}
```

Setting minimum and maximum values for zoom factor

The zooming range can be adjusted using the `MinZoom` and `MaxZoom` properties in `MapsZoomSettings`. The `minZoom` value is set to 1 by default, and the `maxZoom` value is set to 10.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom =>
zoom.Enable(true).MinZoom(2).MaxZoom(12)).Layers(l =>
{
    l.ShapeData(ViewBag.worldMap).Add();
}).Render()
```

MINZOOMING.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Zooming with animation

To zoom in or zoom out the Maps with animation, use the `AnimationDuration` property in `MapsLayer`.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").ZoomSettings(zoom=>zoom.Enable(true)).Layers(l=> {
    l.AnimationDuration(500).ShapeData(ViewBag.worldMap).Add();
}).Render();
```

ANIMATIONZOOM.CS

```

namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Customizing the zoom toolbar

The zoom toolbar can be customized by using the **ToolbarSettings** option in the [ZoomSettings](#). The following properties can be used to customize the zoom toolbar.

- **BackgroundColor** - It is used to customize the background color of the zoom toolbar.
- **BorderOpacity** - It is used to customize the opacity of the border of the zoom toolbar.
- **BorderWidth** - It is used to customize the thickness of the border of the zoom toolbar.
- **BorderColor** - It is used to customize the color of the border of the zoom toolbar.
- **HorizontalAlignment** - It is used to position the zoom toolbar in near, far, and center positions to customize its horizontal placement.
- **VerticalAlignment** - It is used to position the zoom toolbar in near, far, and center positions to customize its vertical placement.

- **Orientation** - It is used to change the orientation (horizontal/vertical) of the zoom toolbar.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("load").ZoomSettings(zoom =>
zoom.Enable(true)).Layers(l =>
{

l.ShapeSettings(sh=>sh.Fill("#C1DFF5")).ShapeData(ViewBag.worldMap).Add();
}).Render()
<script>
    function load(args) {
        var maps = document.getElementById('maps').ej2_instances[0];
        maps.zoomSettings.toolbarSettings.orientation = "Vertical";
        maps.zoomSettings.toolbarSettings.backgroundColor = "pink";
        maps.zoomSettings.toolbarSettings.borderWidth = 3;
        maps.zoomSettings.toolbarSettings.borderColor = "green";
        maps.zoomSettings.toolbarSettings.verticalAlignment = "Near";
        maps.zoomSettings.toolbarSettings.buttonSettings.toolbarItems =
        ['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset'];
    }
</script>
```

ZOOMTOOLBAR.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
            System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
            System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

```
}  
}
```

<!-- markdownlint-disable MD036 -->

Customizing the buttons in the zoom toolbar

The appearance of the buttons in the zoom toolbar can be customized by using the `ButtonSettings` option in the `ToolbarSettings` of the [ZoomSettings](#) property. The following properties can be used to customize the zoom toolbar buttons.

- `Fill` - It is used to set the background color of the buttons.
- `Color` - It is used to customize the color of the icons inside the button.
- `BorderOpacity` - It is used to set the opacity of the border of the zoom toolbar buttons.
- `BorderWidth` - It is used to set the thickness of the border of the zoom toolbar buttons.
- `BorderColor` - It is used to set the color of the border of the zoom toolbar buttons.
- `Radius` - It is used to set the size of the button.
- `SelectionColor` - It is used to set the color of the icons inside the button when selection is performed.
- `HighlightColor` - It is used to change the color of the button when the mouse is hovered over it.
- `Padding` - It is used to change the padding space between each button.
- `Opacity` - It is used to change the opacity of the button.

- **ToolBarItems** - It is used to change the items that should be displayed in the zoom toolbar. By default, zoom-in, zoom-out, and reset buttons will be available. Other options include selection zoom and panning.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("load").ZoomSettings(zoom =>
zoom.Enable(true)).Layers(l =>
{
    l.ShapeSettings(sh=>sh.Fill("#C1DFF5")).ShapeData(ViewBag.worldMap).Add();
}).Render()
<script>
    function load(args) {
        var maps = document.getElementById('maps').ej2_instances[0];
        maps.zoomSettings.toolbarSettings.buttonSettings.fill = "pink";
        maps.zoomSettings.toolbarSettings.buttonSettings.padding = 10;
        maps.zoomSettings.toolbarSettings.buttonSettings.color = "red";
        maps.zoomSettings.toolbarSettings.buttonSettings.borderColor =
"green";
        maps.zoomSettings.toolbarSettings.buttonSettings.radius = 35;
        maps.zoomSettings.toolbarSettings.buttonSettings.selectionColor =
"#d55e5e";
        maps.zoomSettings.toolbarSettings.buttonSettings.selectionColor =
"#5ed59a";
        maps.zoomSettings.toolbarSettings.buttonSettings.opacity = 0.6;
        maps.zoomSettings.toolbarSettings.buttonSettings.borderWidth = 2;
        maps.zoomSettings.toolbarSettings.buttonSettings.toolbarItems =
['Zoom', 'ZoomIn', 'ZoomOut', 'Pan', 'Reset'];
    }
</script>
```

Customizing the tooltip of the zoom toolbar

The appearance of the tooltip of the zoom toolbar can be customized by using the `TooltipSettings` option in the `ToolbarSettings` of the [ZoomSettings](#) property. The following properties are available to customize the zoom toolbar tooltip.

- **Visible** - Enables or disables the tooltip of the zoom toolbar.
- **Fill** - It is used to change the background color of the tooltip of the zoom toolbar.
- **BorderOpacity** - It is used to change the opacity of the border of the zoom toolbar's tooltip.
- **BorderWidth** - It is used to change the thickness of the border of the zoom toolbar's tooltip.

- **BorderColor** - It is used to change the color of the border of the zoom toolbar's tooltip.
- **FontColor** - It is used to change the color of the text in the tooltip of the zoom toolbar.
- **FontFamily** - It is used to change the font family of the text in the tooltip of the zoom toolbar.
- **FontStyle** - It is used to change the font style of the text in the tooltip of the zoom toolbar.
- **FontWeight** - It is used to change the font weight of the text in the tooltip of the zoom toolbar.
- **FontSize** - It is used to change the size of the text in the tooltip of the zoom toolbar.
- **FontOpacity** - It is used to change the opacity of the text in the tooltip of the zoom toolbar.

CSSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("load").ZoomSettings(zoom =>
zoom.Enable(true)).Layers(l =>
{
    1.ShapeSettings(sh=>sh.Fill("#C1DFF5")).ShapeData(ViewBag.worldMap).Add();
}).Render()
<script>
    function load(args) {
        var maps = document.getElementById('maps').ej2_instances[0];
        maps.zoomSettings.toolbarSettings.tooltipSettings.visible = true;
        maps.zoomSettings.toolbarSettings.tooltipSettings.borderWidth = 2;

        return JsonConvert.DeserializeObject(allText, typeof(object));
    }
}

```

Selection

Each shape in the Maps can be selected and deselected during interaction with the shapes. Selection is enabled by setting the `Enable` property of `MapsSelectionSettings` to `true`.

The following properties are available to customize the selection of Maps elements such as shapes, bubbles, markers and legends.

- **Border** - To customize the color, width and opacity of the border of which element is selected in Maps.
- **Fill** - Applies the color for the element that is selected.
- **Opacity** - To customize the transparency for the element that is selected.
- **EnableMultiSelect** - To enable or disable the selection for multiple shapes or markers or bubbles in the Maps.

By tapping on the specific legend, the shapes which are bounded to the selected legend is also selected and vice versa.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var select = new Syncfusion.EJ2.Maps.MapsSelectionSettings

}

```

Enable selection for polygons

When the [Enable](#) property of [SelectionSettings](#) is set to **true**, the polygon shapes can be selected via user interaction. The following properties are available in [SelectionSettings](#) to customize the polygon shape when it is selected.

- [EnableMultiSelect](#) - It is used to enable multiple selection of polygon shapes.
- [Fill](#) - It is used to change the color of the selected polygon shape.
- [Opacity](#) - It is used to change the opacity of the selected polygon shape.
- [Border](#) - This property is used to change the color, width, and opacity of the border of the selected polygon shape.

The following example shows how to select the polygon shape in the geometry map.

```

Highlight

Each shape in the Maps can be highlighted during mouse hover on the Maps elements such as shapes, bubbles, markers and legends. Highlight is enabled by setting the **Enable** property of **MapsHighlightSettings** to **true**.

The following properties are available to customize the highlight of Maps elements such as shapes, bubbles, markers and legends.

- **Border** - To customize the color, width and opacity of the border of which element is highlighted in Maps.
- **Fill** - Applies the color for the element that is highlighted.
- **Opacity** - To customize the transparency for the element that is highlighted.

Hovering on the specific legend, the shapes which are bounded to the selected legend is also highlighted and vice versa.

    }
}

```

Enable highlight for polygons

The polygon shapes can be highlighted via user interaction if the [Enable](#) property of [HighlightSettings](#) is set to **true**. The following properties are available in [HighlightSettings](#) to customize the polygon shape when it is highlighted.

- [Fill](#) - It is used to change the color of the highlighted polygon shape.
- [Opacity](#) - It is used to change the opacity of the highlighted polygon shape.
- [Border](#) - This property is used to change the color, width, and opacity of the border of the highlighted polygon shape.

The following example shows how to highlight a polygon shape on a geometry map.

C#HTML

```
@using Syncfusion.EJ2.Maps;

    }
}

```

Tooltip

On mouse over or touch end event, the tooltip is used to get more information about the layer, bubble, or marker. It can be enabled separately for layer or bubble or marker by using the **Visible** property of **MapsTooltipSettings** as **true**. The **ValuePath** property in the tooltip takes the field name that presents in data source and displays that value as tooltip text. The **TooltipDisplayMode** property is used to change the display mode of the tooltip in Maps. Following display modes of tooltip are available in the Maps component. By default, **TooltipDisplayMode** is set to **MouseMove**.

CSHTML

```

@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Layers(l =>
{
    l.TooltipSettings(ts =>ts.ValuePath("name").Visible(true))
    .ShapeData(ViewBag.worldMap).Add();
}).Render()

```

        new { name= "Haiti", value1= "3", value2="2", country="West Indies"
    },
        new { name= "Guyana", value1= "3", value2="2", country="West Indies"
    },
        new { name= "Suriname", value1= "3", value2="2", country="West
Indies" },
        new { name= "Trinidad and Tobago", value1= "3", value2="2",
country="West Indies" },
        new { name= "Sri Lanka", value1= "3", value2="1", country="Sri
Lanka" },
        new { name= "United Kingdom", value1= "3", value2="0",
country="England" },
        new { name= "Pakistan", value1= "2", value2="1", country="Pakistan"
    },
        new { name= "New Zealand", value1= "1", value2="0", country="New
Zealand" },
        new { name= "Australia", value1= "7", value2="5",
country="Australia" },
    };
}
@Html.EJS().Maps("maps").TooltipRender("tooltipRender").Layers(l =>
{
    l.ShapeSettings(shape =>
shape.Fill("#E5E5E5").ColorValuePath("value1").ColorMapping(colormapping))

    .ShapeDataPath("name").ShapePropertyPath("name").DataSource(data).TooltipSet
tings(tooltip).ShapeData(ViewBag.worldMap).Add();
}).Render()
<script>
    function tooltipRender(args) {
        if (!args.options['data']) {
            args.cancel = true;
        }
    }
</script>

```

TOOLTIP-CUSTOMIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.worldmap = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.js");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Tooltip template

The HTML element can be rendered in the tooltip of the Maps using the **Template** property of the **MapsTooltipSettings**. In the following example, `#{value1}` and `#{value2}` are the place holders in the HTML element to display the value1 and value2 values of the corresponding shape.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var tooltip = new Syncfusion.EJ2.Maps.MapsTooltipSettings
    {
        Visible = true,
        ValuePath = "name",
        Template = "#template"
    };
    var colormapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping{ Color = "#b3daff",Value= "1" },
        new MapsColorMapping { Color= "#80c1ff", Value = "2" },
        new MapsColorMapping { Color= "#1a90ff", Value = "3" },
        new MapsColorMapping { Color= "#005cb3", Value = "7" }
```

```

};
var data = new[]
{
    new { name= "India", value1= "3", value2="2", country="India" },
    new { name= "Dominican Rep.", value1= "3", value2="2", country="West
Indies" },
    new { name= "Cuba", value1= "3", value2="2", country="West Indies"
},
    new { name= "Jamaica", value1= "3", value2="2", country="West

        return JsonConvert.DeserializeObject(allText, typeof(object));  
    }  
}
```

Print and Export in ASP.NET MVC Maps component

Print

The rendered maps can be printed directly from the browser by calling the [print](#) method. To use the print functionality, set the [AllowPrint](#) property to **true**.

CSHTML

```
@using Syncfusion.EJ2;
```

```
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Print").CssClass("e-flat").Render()
@Html.EJS().Maps("maps").Height("450px").AllowPrint(true).Width("650px").Layers(l =>
{
    l.TooltipSettings(ts => ts.ValuePath("name").Visible(true))
    .DataLabelSettings(ds =>
ds.Visible(true).LabelPath("name").SmartLabelMode(Syncfusion.EJ2.Maps.SmartLabelMode.Trim))
    .ShapeSettings(ss =>
ss.Autofill(true)).ShapeData(ViewBag.ShapeData).Add();
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var map = document.getElementById('maps').ej2_instances[0];
        map.print();
    };
</script>
```

PRINT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.ShapeData = this.GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Export

Image Export

To use the image export functionality, we should set the [AllowImageExport](#) property to **true**. The rendered maps can be exported as an image using the [export](#) method. The method requires two parameters: image type and file name. The maps can be exported as an image in the following formats.

- JPEG

- PNG
- SVG

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().Maps("maps").Height("450px").AllowImageExport(true).Width("650px")
.Layers(l => {
    l.TooltipSettings(ts => ts.ValuePath("name").Visible(true))
    .DataLabelSettings(ds =>
ds.Visible(true).LabelPath("name").SmartLabelMode(Syncfusion.EJ2.Maps.SmartL
abelMode.Trim))
    .ShapeSettings(ss
=>ss.Autofill(true)).ShapeData(ViewBag.ShapeData).Add();
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var map = document.getElementById('maps').ej2_instances[0];
        map.export('PNG', 'Export');
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.ShapeData = this.GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

We can get the image file as base64 string for the JPEG and PNG formats. The maps can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file

name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().Maps("maps").Height("450px").AllowImageExport(true).Width("650px")
.Layers(l => {
    l.TooltipSettings(ts => ts.ValuePath("name").Visible(true))
    .DataLabelSettings(ds =>
ds.Visible(true).LabelPath("name").SmartLabelMode(Syncfusion.EJ2.Maps.SmartL
abelMode.Trim))
    .ShapeSettings(ss
=>ss.Autofill(true)).ShapeData(ViewBag.ShapeData).Add();
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var map = document.getElementById('maps').ej2_instances[0];
        map.export('PNG', 'Export');
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.ShapeData = this.GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

PDF Export

To use the PDF export functionality, we should set the [AllowPdfExport](#) property to **true**. The rendered maps can be exported as PDF using the [export](#) method. The [export](#) method requires three parameters:

file type, file name and orientation of the PDF document. The orientation setting is optional and **0** indicates portrait and **1** indicates landscape.

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().Maps("maps").Height("450px").AllowImageExport(true).Width("650px")
.Layers(l => {
    l.TooltipSettings(ts => ts.ValuePath("name").Visible(true))
    .DataLabelSettings(ds =>
ds.Visible(true).LabelPath("name").SmartLabelMode(Syncfusion.EJ2.Maps.SmartL
abelMode.Trim))
    .ShapeSettings(ss
=>ss.Autofill(true)).ShapeData(ViewBag.ShapeData).Add();
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var map = document.getElementById('maps').ej2_instances[0];
        map.export('PNG', 'Export');
    };
</script>
```

EXPORT.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.ShapeData = this.GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

Export the tile maps

The rendered map with providers such as OSM, Bing and Google static maps can be exported using the [export](#) method. It supports the following export formats.

- JPEG
- PNG
- PDF

CSHTML

```
@using Syncfusion.EJ2;
@Html.EJS().Button("togglebtn").IconCss("e-icons e-play-
icon").Content("Export").CssClass("e-flat").Render()
@Html.EJS().Maps("maps").AllowImageExport(true).Layers(l=> {
    l.LayerType(Syncfusion.EJ2.Maps.ShapeLayerType.OSM).Add();
}).Render()
<script>
    document.getElementById('togglebtn').onclick = function () {
        var map = document.getElementById('maps').ej2_instances[0];
        map.export('PNG', 'Export');
    };
</script>
```

EXPORT-TILE.CS

```
using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.shapeData = this.GetWorldMap();
            return View();
        }
        public object GetWorldMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/world_map.js");
            return JsonConvert.DeserializeObject(allText);
        }
    }
}
```

State Persistence

State persistence

For state maintenance, state persistence allows Maps to save the current model value in browser cookies. This action is handled through the `EnablePersistence` property which is set to **false** by default. When this property is set to true, some of the Maps component model values are preserved even after the page is refreshed.

CSHTML

```

@using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@Html.EJS().Maps("container").EnablePersistence(true).TitleSettings(title =>
    title.Text("Top 50 largest cities in the World").
        TextStyle(new MapsFont { Size = "16px" })).ZoomSettings(new
Syncfusion.EJ2.Maps.MapsZoomSettings
{
    Enable = true
}).Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>
{
    new Syncfusion.EJ2.Maps.MapsLayer
    {
        ShapeSettings = new MapsShapeSettings
        {
            Fill = "#C1DFF5"
        },
        ShapeData = ViewBag.shapeData,
        MarkerSettings = new
List<Syncfusion.EJ2.Maps.MapsMarker>
{
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true,
                DataSource = ViewBag.ClusterData,
                Shape=MarkerType.Circle,
                Height= 20,
                Width= 20,
                AnimationDuration= 0,
            }
        }
    }
}).Render()

```

Accessibility in ASP.NET MVC Maps component

Maps has built-in accessibility features like screen reading, keyboard navigation, and WAI-ARIA attributes.

WAI-ARIA attributes

To meet accessibility standards, the Maps component follows to the [WAI-ARIA](#) patterns. In the Maps component, the following ARIA attributes are used:

| Attributes | Purpose |
|--------------------|--|
| --- | --- |
| role=region | It specifies the Maps areas that do not support interactive functions like selection and highlight. |
| role=button | It specifies the Maps areas where interactive functions such as selection and highlight are available. |
| aria-label | Provides an accessible name for Maps elements such as geometric map shapes, legend title, data labels, and so on. To learn more, see the next topic. |

Screen reading in Maps

Accessibility in the Maps component ensures that all users, regardless of ability or disability, can use screen reading. The following Map elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |
|---------------------|--|
| --- | --- |
| Shapes in the layer | Reads the names of the geographical shapes (such as countries, states, and regions) that appear on the Maps. |
| Legend title | Reads the contents of the legend's title as specified in Maps. |
| Legend item label | Reads the label of a legend item in Maps. |
| Data label | Reads the label specified for the shapes in the Maps layer. |
| Annotation | Reads the content specified in the annotation. |

- | Marker template | Reads the content provided in the marker template. |
- | Tooltip template | Reads the content provided in the tooltip template. |
- | Data label template | Reads the content provided in the data label template. |

Keyboard Navigation

All the Maps actions can be controlled via keyboard keys. The applicable key combinations and their relative functionalities are listed below for the appropriate UI features available in the component.

Interaction Keys | Description

Tab | Moves to the next focusable element on the map, such as the legend or shape.

Shift + Tab | Moves to the previous focusable element on the map, such as the legend or shape.

+ | When zooming is enabled, zoom in operation can be performed.

- | When zooming is enabled, zoom out operation can be performed.

Left arrow | When zoomed in, the map can be scrolled to the left.

Right arrow | When zoomed in, the map can be scrolled to the right.

Up arrow | When zoomed in, the map can be scrolled upward.

Down arrow | When zoomed in, the map can be scrolled downward.

R | When zooming is enabled, reset operation can be performed.

Enter | The page can be navigated to the next and previous states in legend. Similarly, the selection can be made while navigating over the shape.

Ensuring accessibility

The Maps component's accessibility levels are ensured using an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Maps component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Maps component with accessibility tools.

See also

- [Accessibility in Syncfusion Maps components](#)

Internationalization

Maps provide support for internationalization for the below elements.

- Data label
- Tooltip

For more information about number and date formatter, refer to the [internationalization](#) section.

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, time values in Maps component using `Format` property in the `Maps`.

Numeric format

The numeric formats such as currency, percentage and so on can be displayed in the tooltip and data labels of the Maps using the `Format` property in the `Maps`. In the below example, the tooltip is globalized to **German** culture. When setting the `UseGroupingSeparator` property as **true**, the numeric text in the Maps separates with the comma separator.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var internData = new[]
    {
        new { Country= "China", Membership="Permanent", population=
"38332521" },
        new { Country= "France", Membership="Permanent", population=
"19651127" },
        new { Country= "Russia", Membership="Permanent", population=
"3090416" },
        new { Country= "Kazakhstan", Membership="Non-Permanent", population=
"1232521" },
        new { Country= "Poland", Membership="Non-Permanent", population=
"90332521" },
        new { Country= "Sweden", Membership="Non-Permanent", population=
"383521" }
    };
    var colorMapping = new List<Syncfusion.EJ2.Maps.MapsColorMapping> {
        new MapsColorMapping {Value="Permanent", Color="#D84444"},
        new MapsColorMapping {Value="Non-Permanent", Color="#316DB5"}
    };
}
@Html.EJS().Maps("maps").Format("c").UseGroupingSeparator(true).Layers(l =>
{
    l.ShapeSettings(s =>
s.ColorValuePath("Membership").Fill("#E5E5E5").ColorMapping(colorMapping)).
    TooltipSettings(tooltip =>
tooltip.Visible(true).ValuePath("population")).

DataSource(internData).ShapeDataPath("Country").ShapePropertyPath("name").
    ShapeData(ViewBag.worldMap).Add();
}).Render()

            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Localization

The localization library allows localizing the default text content of the Maps component. The Maps component has the static text of some features such as tooltip of zoom toolbar, and that can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

| Locale key words | Text to display |
|------------------|-----------------|
| Zoom | Zoom |
| ZoomIn | Zoom In |
| ZoomOut | Zoom Out |
| Reset | Reset |
| Pan | Pan |

To load translation object in the application, use `load` function of **L10n** class. For more information about localization, refer [here](#).

CSHTML

```

@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@Html.EJS().Maps("maps").Locale("ar-AR").Layers(l => {
    l.ShapeData(ViewBag.usmap).Add();
}).ZoomSettings(zs=>zs.Enable(true)).Render()
<script>
    ej.base.L10n.load({
        'ar-AR': {
            'maps': {
                ZoomIn: 'تكبير',
                ZoomOut: 'تصغير',
                Zoom: 'زوم',
                Pan: 'مقللة',
                Reset: 'إعادة تعيين'
            }
        }
    });
</script>

```

Methods in ASP.NET MVC Maps component

Methods

This section explains the methods used in the Maps component.

getMinMaxLatitudeLongitude

The `getMinMaxLatitudeLongitude` method returns the minimum and maximum latitude and longitude values of the Maps visible area. This method returns a `IMinMaxLatitudeLongitude` object that contains the Maps minimum and maximum latitude and longitude coordinates.

CSHTML

```
@{
    var data = new []
    {
        new { latitude= 22.572646, longitude= 88.363895 },
        new { latitude= 25.0700428, longitude= 67.2847875 }
    };
}

< button id = "button" > GetMinMaxLatitudeLongitude</button >
<p id="coordinatesDisplay"></p>
@(Html.EJS().Maps("maps").Width("450px").ZoomSettings(zoom =>
zoom.ZoomFactor(7).Enable(true)).CenterPosition(center =>
center.Latitude(21.815447).Longitude(80.1932)).Layers(layers => {
    layers.MarkerSettings(marker => {

marker.Visible(true).AnimationDuration(1500).Shape(MarkerType.Circle).DataSource(data).Height(25).Width(25).Add();
    }).ShapeData(ViewBag.worldMap).Add();
}).Render())
<script>
    function formatKey(key) {
    if (key === 'minLatitude') {
        return 'Minimum Latitude';
    } else if (key === 'maxLatitude') {
        return 'Maximum Latitude';
    } else if (key === 'minLongitude') {
        return 'Minimum Longitude';
    } else if (key === 'maxLongitude') {
        return 'Maximum Longitude';
    }
    }
}
document.getElementById('button').onclick = () => {
    var maps = document.getElementById('maps').ej2_instances[0];
    mapBoundCoordinates = maps.getMinMaxLatitudeLongitude();
    const displayDiv = document.getElementById('coordinatesDisplay');
    displayDiv.innerHTML = '';
    if (mapBoundCoordinates) {
        for (const key in mapBoundCoordinates) {
            if (Object.hasOwnProperty.call(mapBoundCoordinates, key)) {
                const p = document.createElement('p');
                const formattedKey = formatKey(key);
                p.textContent = `${formattedKey}: ${mapBoundCoordinates[key]}`;
                displayDiv.appendChild(p);
            }
        }
    }
} else {
```

```
        displayDiv.textContent = 'No coordinates available';  
    }  
};  
</script>

Migration from Essential JS 1

This article describes the API migration process of Maps component from Essential JS 1 to Essential JS 2.

Size Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Height** | Not Applicable | **Property:**

`height`
`@Html.EJS().Maps("container").Load("load").Height('300px').Render()`

| Width | Not Applicable | **Property:** *width*

 @Html.EJS().Maps("container")
.Load("load")
.Width('400px').Render()|

Title and Subtitle Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Title Text | Not Applicable | **Property:** *title.text*

 @Html.EJS().Maps("container")
.Load("load").TitleSettings
(new
 Syncfusion.EJ2.Maps.MapsTitleSettings
{Text="Members of the UN Security
 Council"}).Render()|

| Subtitle Text | Not Applicable | **Property:** *title.subtitle.text*

 @Html.EJS().Maps("container")
.Load("load")
.TitleSettings(title
 =>SubtitleSettings
(new MapsSubTitleSettings
{Text="- In 2017"})).Render()|

| Title Alignment | Not Applicable | **Property:** *title.alignment*

 @Html.EJS().Maps("container")
.Load("load").TitleSettings
(new
 Syncfusion.EJ2.Maps.MapsTitleSettings
{Text="Members of the UN Security
 Council",
Alignment('Far')}).Render()|

| Subtitle Alignment | Not Applicable | **Property:** *title.subtitle.alignment*

 @Html.EJS().Maps("container")
.Load("load")
.TitleSettings(title
 =>SubtitleSettings
(new MapsSubTitleSettings
{Text="- In 2017",
Alignment='Far'
 })).Render()|

Layer Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Type | Not Applicable | **Property:** *layers.type*

 @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.Type('Layer')}).Render()|

| Layer Type | **Property:** *layers.layerType*

@Html.EJ().Map("container").Layers(lr
 =>{lr.LayerType(LayerType.Geometry)}))| **Property:**
layers.layerType

@Html.EJS().Maps("container").Load("load").Layers(lr
 =>{lr.LayerType('Geometry')}).Render()|

| Visible | Not Applicable | **Property:** *layers.visible*

 @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.Visible(true)}).Render()|

| Bing Map Type | **Property:** *layers.bingMapType*

 @Html.EJ().Map("container").Layers(lr
 =>{lr.LayerType(Syncfusion.JavaScript.DataVisualization.Models.LayerType.Bing)}))| **Property:**
layers.bingMapType

 @Html.EJS().Maps("container").Load("load").Layers(lr
 =>{lr.BingMapType('Aerial')}).Render()|

| Bing Map Key | **Property:** *layers.key*

 @Html.EJ().Map("container").Layers(lr
 =>{lr.Key("")})|

| **Property:** *layers.key*

 @Html.EJS().Maps("container").Load("load").Layers(lr
 =>{lr.Key("")}).Render()|

| URL Template | **Property:** *layers.urlTemplate* @Html.EJ().Map("container").Layers(lr =>{lr.UrlTemplate:'http://a.tile.openstreetmap.org/level/tileX/tileY.png' })| **Property:** *layers.urlTemplate* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.UrlTemplate:'http://a.tile.openstreetmap.org/level/tileX/tileY.png' }).Render()|

| Shape Data | **Property:** *layers.shapeData* @Html.EJ().Map("container").Layers(lr =>{lr.ShapeData(usmap).Add}))| **Property:** *layers.shapeData* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.ShapeData('usmap')}).Render()|

| Data Source | **Property:** *layers.dataSource* @Html.EJ().Map("container").Layers(lr =>{lr.dataSource('PopulationData')})| **Property:** *layers.dataSource* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.DataSource("")}).Render()|

| Query | Not Applicable | **Property:** *layers.query* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.Query("")}).Render()|

| Shape Data Path | **Property:** *layers.shapeDataPath* @Html.EJ().Map("container").Layers(lr =>{lr.shapeDataPath('population')})| **Property:** *layers.shapeDataPath* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.ShapeDataPath("")}).Render()|

| Shape Property Path | **Property:** *layers.shapePropertyPath* @Html.EJ().Map("container").Layers(lr =>{lr.ShapePropertyPath('Continent')})| **Property:** *layers.shapePropertyPath* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.shapePropertyPath("")}).Render()|

| Layer Animation | Not Applicable | **Property:** *layers.animationDuration* @Html.EJS().Maps("container").Load("load").Layers(lr =>{lr.ShapePropertyPath("")}).Render()|

Shape Customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Shape Fill | **Property:** *layers.shapeSettings.fill* @Html.EJ().Map("container").Layers(lr =>{lr.ShapeSettings(ss =>{ss.Fill('#626171')})})| **Property:** *layers.shapeSettings.fill* @Html.EJS().Maps("container").Load("load").ShapeSettings(new MapsShapeSettings{Fill="red"}).Render()|

| Shape Palette | **Property:** *layers.shapeSettings.colorPalette* @Html.EJ().Map("container").Layers(lr =>{lr.ShapeSettings(ss =>{ss.ColorPalette(ColorPalette.CustomPalette)})}) .CustomPalette(new List<string>{"#E51400", "#A4C400", "#730202", })| **Property:** *layers.shapeSettings.palette* @Html.EJS().Maps("container").Load("load").ShapeSettings(new MapsShapeSettings{ColorMapping = ViewBag.colorMappings}).Render() ViewBag.colorMappings = data;|

| Shape Point Radius | Not Applicable | **Property:** *layers.shapeSettings.circleRadius* @Html.EJS().Maps("container").Load("load").ShapeSettings(new MapsShapeSettings{circleRadius= 10 }).Render()|

| Shape Color Value Path | **Property:** *layers.shapeSettings.colorValuePath*

 @(Html.EJ().Map("container").Layers(lr =>{lr.ShapeSettings(ss =>{ss.ColorValuePath("")}})) |
Property: *layers.shapeSettings.colorValuePath*

 @Html.EJS().Maps("container").Load("load").ShapeSettings(new
 MapsShapeSettings{ColorValuePath=""}.Render() |

| Shape Value Path | **Property:** *layers.shapeSettings.valuePath*

 @(Html.EJ().Map("container").Layers(lr =>{lr.ShapeSettings(ss =>{ss.ValuePath("")}})) | **Property:**
layers.shapeSettings.valuePath

 @Html.EJS().Maps("container").Load("load").ShapeSettings(new MapsShapeSettings{
 valuePath='population'}).Render() |

| Shape DashArray | Not Applicable | **Property:** *layers.shapeSettings.dashArray*

 @Html.EJS().Maps("container").Load("load").ShapeSettings(new
 MapsShapeSettings{DashArray='1,2'}).Render() |

| Shape Opacity | Not Applicable | **Property:** *layers.shapeSettings.opacity*

 @Html.EJS().Maps("container").Load("load").ShapeSettings(new MapsShapeSettings{
 Opacity='0.5'}).Render() |

| Range Color Mapping | **Property:** *layers.shapeSettings.colorMappings.rangeColorMapping*

 @(Html.EJ().Map("container").Layers(lr =>{lr.ShapeSettings(ss =>{ss..RangeColorMappings(cm
 =>cm.From(10).To(100).color('blue')}})) | **Property:** *layers.shapeSettings.colorMapping*

How To

Annotations in ASP.NET MVC Maps Component

Annotations are used to mark the specific area of interest in the Maps with texts, shapes, or images. Any number of annotations can be added to the Maps component.

Initialize the Maps component with annotation option, text content or ID of an HTML element or an HTML string can be specified to render a new element that needs to be displayed in the Maps by using the **Content** property. To specify the content position with **X** and **Y** properties as mentioned in the following example.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@Html.EJS().Maps("maps").Load("mapsLoad").Layers(layer =>
{
    layer.ShapeSettings(s =>
    s.Fill("url(#grad1)").ShapeData(ViewBag.africa).Add();
    }).Render()
<script>
    function mapsLoad(args) {
        var maps = args.maps;
        args.maps.annotations = [
            {
                content: '#maps-annotation',
                x: '0%', y: '70%'
            },
            {
                content: '#compass-maps',
                x: '80%', y: '5%'
            }
        ]
    }
}
```

```

    ];
}
}
</script>
<svg height="150" width="400">
  <defs>
    <linearGradient id="grad1" x1="0%" y1="0%" x2="0%" y2="100%">
      <stop offset="0%" style="stop-color:#C5494B;stop-
opacity:1"></stop>
      <stop offset="100%" style="stop-color:#4C134F;stop-
opacity:1"></stop>
    </linearGradient>
  </defs>
</svg>
<div id="maps-annotation" style="display: none;">
  <div id="annotation">
    <div>
      <p style="margin-left:10px;font-size:13px;font-weight:500">Facts
about Africa</p>
    </div>
    <hr style="margin-top:-3px;margin-bottom:10px;border:0.5px solid
#DDDDDD">
    <div>
      <ul style="list-style-type:disc; margin-left:-20px;margin-
bottom:2px; font-weight:400">
        <li>Africa is the second largest and second most populated
continent in the world.</li>

HOWTO-ANNOTATION.CS

```

using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.africa = GetAfricaMap();
            return View();
        }
        public object GetAfricaMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/Africa.json");
            return JsonConvert.DeserializeObject(text);
        }
    }
}

```

Custom path map in ASP.NET MVC Maps Component

Maps component can be customized as the desired layout using the custom path map feature. Here, the Maps component has been showcased with normal geometry type shapes to represent the bus seat selection layout.

CSHTML

```

@using Syncfusion.EJ2.Maps
@using Syncfusion.EJ2
@Html.EJS().Maps("container").Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>
{
    new Syncfusion.EJ2.Maps.MapsLayer
    {
        GeometryType = GeometryType.Normal,

```

```

        ShapeData = ViewBag.seatData,
        ShapeSettings = new MapsShapeSettings
        {
            ColorValuePath = "fill"
        },
    } }).Render()
<div class="col-lg-9">
    <div style="width:200px;margin:auto;padding-bottom:20px">
        
        <div style="padding-left:30px;font-size:20px;font-weight:400;">Bus
seat selection</div>
    </div>
    <div style="border: 3px solid
darkgray;width:200px;display:block;margin:auto;border-radius:5px">
        
    </div>
</div>

```

CUSTOM-PATH.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.seatData = GetSeatData();
            return View();
        }
        public object GetSeatData()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/seat.json");
            return JsonConvert.DeserializeObject(text);
        }
    }
}

```

Bus seat selection

Drill-down in ASP.NET MVC Maps Component

By clicking a continent, all the countries available in that continent can be viewed using the drill-down feature. For example, the countries in the **Africa** continent have been showcased here. To showcase all the countries in **Africa** continent by clicking the **ShapeSelected** event as mentioned in the following example.

CSHTML

```
@{ var data = new[]
{
    new { drillColor = "#C13664", continent = "North America",
    CategoryName = "Books", Sales = 10882,
    color="#71B081", visibility = true},
    new { drillColor = "#9C3367", continent = "South America",
    CategoryName = "Books", Sales = 13776,
    color="#5A9A77", visibility = true},
    new { drillColor = "#80306A", continent = "Europe", CategoryName =
    "Books", Sales = 3746,
    color="#39776C", visibility = false},
```

```

        new { drillColor = "#462A6D", continent = "Asia", CategoryName =
"Books", Sales = 10688,
            color="#266665", visibility = false},
        new { drillColor = "#80306A", continent = "Africa", CategoryName =
"Books", Sales = 18718,
            color="#498770", visibility = true},
        new { drillColor = "#2A2870", continent = "Australia", CategoryName
= "Books", Sales = 30716,
            color="#124F5E", visibility = false}
    };
    var markerData = new[]
    {
        new {latitude = 10.97274101999902, longitude = 16.390625}
    };
}
@Html.EJS().Maps("maps").ShapeSelected("shapeSelected").Layers(l =>
{
    l.ShapeSettings(ss => ss.ColorValuePath("drillColor")).MarkerSettings(m
=>m.Visible(true).Template("<div id='marker3'
class='markerTemplate'>Africa</div>").DataSource(markerData).AnimationDurati
on(0).Add()).ShapeDataPath("continent").ShapePropertyPath("continent").DataS
ource(data).ShapeData(ViewBag.worldMap).Add();
    l.ShapeSettings(ss =>
ss.Fill("#80306A")).ShapeData(ViewBag.africaMap).Add();
}).Render()
<script>
    function shapeSelected(args) {
        window.maps = args.maps;
        let shape = args.shapeData.continent;
        if (shape === 'Africa') {
            window.maps.baseLayerIndex = 1;
            window.maps.refresh();
        }
    }
</script>
<style>
    .markerTemplate {
        font-size: 12px;
        color: white;
        text-shadow: 0px 1px 1px black;
        font-weight: 500
    }
    .markerTemplate {
        height: 30px;
        width: 30px;
        display: block;
        margin: auto;
    }
</style>

```

DRILLDOWN.CS

```

            return JsonConvert.DeserializeObject(text);
        }
    }
}
```

Marker types in ASP.NET MVC Maps Component

Add different types of markers

Different marker objects can be added to the Maps component using the marker settings. To update different marker settings in Maps, follow the given steps.

Step 1:

Initialize the Maps component with marker settings. Here, a marker has been added with specified latitude and longitude of California by using the `DataSource` property. To customize the shape of the marker using the `Shape` property and change the border color and width of the marker using the `Border` property as mentioned in the following example.

CSHTML

```
@{
    var data = new[]
    {
        new { latitude= 40.7424509, longitude = -74.0081468, city = "New
York"}
    };
    var border = new Syncfusion.EJ2.Maps.MapsBorder
    {
        Width = 2,
        Color = "#333",
        Opacity = 1
    };
}
@using Syncfusion.EJ2
```

```

@using Syncfusion.EJ2.Maps
@Html.EJS().Maps("container").Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>
{
    new Syncfusion.EJ2.Maps.MapsLayer
    {
        ShapeData = ViewBag.usMap,
        MarkerSettings = new List<Syncfusion.EJ2.Maps.MapsMarker>
        {
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true,
                DataSource = data,
                Width= 2,
                AnimationDuration= 0,
                Border = border,
                Fill = "white",
                Shape =
Syncfusion.EJ2.Maps.MarkerType.Circle
            }
        }
    }
}).Render()

```

MARKER1.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.usmap = GetUSMap();
            ViewBag.usMap = GetMap();
            return View();
        }
        public object GetUSMap()
        {
            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/USA.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

**Step 2:**

Customize the above option for n number of markers as mentioned in the following example.

C#HTML

```
@{
    var data = new[]
    {
        new { latitude= 40.7424509, longitude = -74.0081468, city = "New
York"}
    };
    var data1 = new[]
    {
        new { latitude= 33.5302186, longitude = -117.7418381, city =
"Laguna Niguel"}
    };
    var data2 = new[]
    {
        new { latitude= 37.6276571, longitude = -122.4276688, city = "San
Bruno"}
    };
    var border = new Syncfusion.EJ2.Maps.MapsBorder
    {
        Width = 2,
        Color = "#333",
        Opacity = 1
    };
    var border1 = new Syncfusion.EJ2.Maps.MapsBorder
```

```

    {
        Width = 2,
        Color = "#333",
        Opacity = 1
    };
    var border2 = new Syncfusion.EJ2.Maps.MapsBorder
    {
        Width = 2,
        Color = "blue",
        Opacity = 1
    };
}
@using Syncfusion.EJ2
@using Syncfusion.EJ2.Maps
@Html.EJS().Maps("container").Layers(new List<Syncfusion.EJ2.Maps.MapsLayer>
{
    new Syncfusion.EJ2.Maps.MapsLayer
    {
        ShapeData = ViewBag.usMap,
        MarkerSettings = new List<Syncfusion.EJ2.Maps.MapsMarker>
        {
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true,
                DataSource = data2,
                Width= 3,
                AnimationDuration= 0,
                Border = border,
                Fill = "white",
                Shape =
Syncfusion.EJ2.Maps.MarkerType.Circle
            },
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true,
                DataSource = data1,
                Width= 15,
                Height = 4,
                AnimationDuration= 0,
                Border = border,
                Fill = "yellow",
                Shape =
Syncfusion.EJ2.Maps.MarkerType.Rectangle
            },
            new Syncfusion.EJ2.Maps.MapsMarker
            {
                Visible = true,
                DataSource = data,
                Width= 10,
                Height = 10,
                AnimationDuration= 0,

            string allText =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/USA.json");
            return JsonConvert.DeserializeObject(allText);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/USA.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}
```

Adding multiple layers in the Map

The multilayer support allows loading multiple shape files in a single container and enables Maps to display more information. The shape layer is the main layer of the Maps. Multiple layers can be added in a shape layer as **SubLayer** using the **Type** property.

CSHTML

```
@using Syncfusion.EJ2.Maps;
@using Syncfusion.EJ2;
@{
    var shapeSettings = new Syncfusion.EJ2.Maps.MapsShapeSettings
    {
        Fill = "#E5E5E5",
        Border = new Syncfusion.EJ2.Maps.MapsBorder
        {
            Color = "black",
            Width = 0.1,
            Opacity = 1
        }
    };
    var shapeSettings1 = new Syncfusion.EJ2.Maps.MapsShapeSettings
    {
        Fill = "rgba(141, 206, 255, 0.6)",
        Border = new Syncfusion.EJ2.Maps.MapsBorder
        {
            Color = "#1a9cff",
            Width = 0.25,
            Opacity = 1
        }
    };
}
```

```

    }
    };
    var shapeSettings2 = new Syncfusion.EJ2.Maps.MapsShapeSettings
    {
        Fill = "rgba(141, 206, 255, 0.6)",
        Border = new Syncfusion.EJ2.Maps.MapsBorder
        {
            Color = "#1a9cff",
            Width = 0.25,
            Opacity = 1
        }
    };
}
@Html.EJS().Maps("maps").Layers(l =>
{
    l.ShapeSettings(shapeSettings).ShapeData(ViewBag.usmap).Add();

    l.ShapeSettings(shapeSettings1).Type(Syncfusion.EJ2.Maps.Type.SubLayer).ShapeData(ViewBag.california).Add();

    l.ShapeSettings(shapeSettings2).Type(Syncfusion.EJ2.Maps.Type.SubLayer).ShapeData(ViewBag.texas).Add();
}).Render()

```

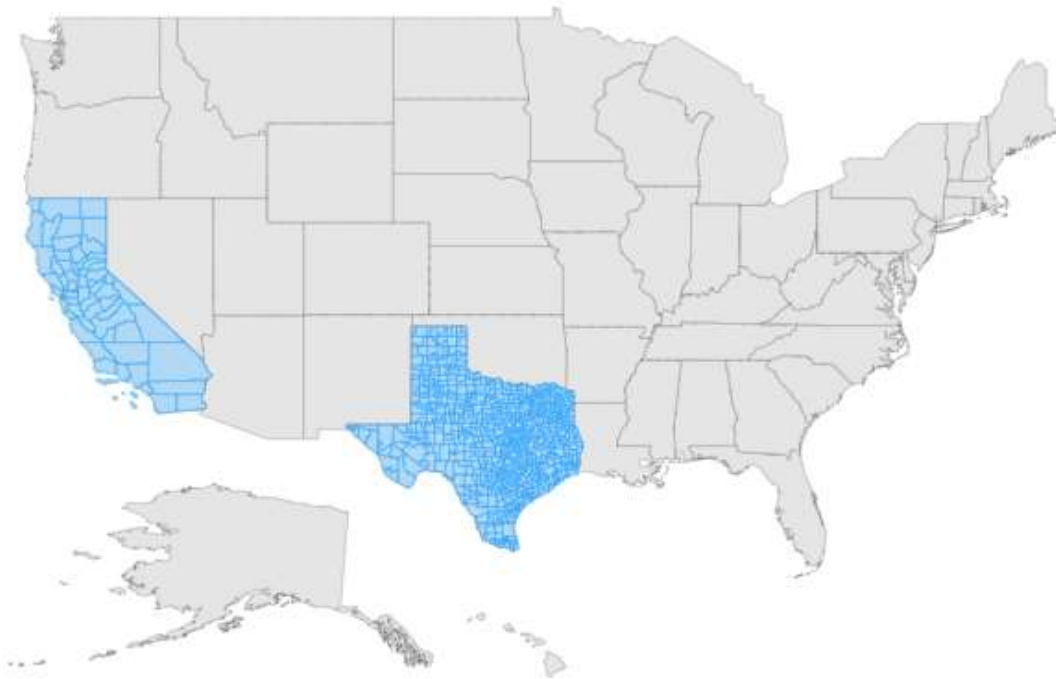

MULTILAYER.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.usa = GetUSMap();
            ViewBag.california = GetCaliforniaMap();
            ViewBag.texas = GetTexasMap();
            return View();
        }
        public object GetUSMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/USA.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetCaliforniaMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/California.json");

```

```
        return JsonConvert.DeserializeObject(text);
    }
    public object GetTexasMap()
    {
        string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/Texas.json");
        return JsonConvert.DeserializeObject(text);
    }
}
```

Center position zooming

The center position zooming can be achieved by using the `MapsCenterPosition` class and `ZoomFactor` property as mentioned in the following example. The center position is used to configure the zoom level of Maps, and the zoom factor is used to specify the center position where the Maps should be displayed.

CSHTML

```
@using Syncfusion.EJ2;
@using Syncfusion.EJ2.Maps;
@{
    var zoom = new Syncfusion.EJ2.Maps.MapsZoomSettings
    {
        Enable = true,
        ZoomFactor = 13
    };
    var centerPosition = new Syncfusion.EJ2.Maps.MapsCenterPosition
```

```

        {
            Latitude = 25.5424414701248,
            Longitude = -89.62646484375
        };
    }
    @Html.EJS().Maps("maps").ZoomSettings(zoom).CenterPosition(centerPosition).Layers(l =>
    {
        l.ShapeData(ViewBag.worldMap).Add();
    }).Render()

```

CENTERPOSITION.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using EJ2_Core_Application.Models;
using Newtonsoft.Json;
using Syncfusion.EJ2.Charts;
namespace EJ2_Core_Application.Controllers
{
    public class HomeController : Controller
    {
        public IActionResult Index()
        {
            ViewBag.world_map = GetWorldMap();
            ViewBag.worldMap = GetMap();
            return View();
        }
        public object GetWorldMap()
        {
            string text =
System.IO.File.ReadAllText("../wwwroot/scripts/MapsData/WorldMap.json");
            return JsonConvert.DeserializeObject(text);
        }
        public object GetMap()
        {
            string allText =
System.IO.File.ReadAllText(Server.MapPath("~/App_Data/WorldMap.json"));
            return JsonConvert.DeserializeObject(allText, typeof(object));
        }
    }
}

```

MaskedTextBox

Getting Started with ASP.NET MVC MaskedTextBox control

This section briefly explains about how to include [ASP.NET MVC MaskedTextBox](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
,
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

~/_LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/_LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC MaskedTextBox control

Now, add the Syncfusion ASP.NET MVC MaskedTextBox control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Placeholder("MaskedTextBox").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC MaskedTextBox control will be rendered in the default web browser.

Set the mask

You can set the mask to the MaskedTextBox to validate the user input by using the [Mask](#) property. To know more about the usage of mask and configuration, refer to this [link](#).

The following example demonstrates the usage of mask element **0** that allows any single digit from **0** to **9**.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Mask("000-000-0000").Placeholder("MaskedTextBox").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
```

MaskedTextBox

Note: [View Sample in GitHub](#).

See also

- [How to set cursor position while focus on the input textbox](#)
- [How to display numeric keypad when focus on mobile devices](#)

Mask Configuration in MaskedTextBox Control

The mask is a combination of standard and custom mask elements that validates the user input based on its behavior.

Note: When the mask value is empty, the MaskedTextBox behaves as an input element with text type.

Standard mask elements

The following table shows the list of mask elements and its behavior based on [MSDN](#) standard.

The mask can be formed by combining any one or more of these mask elements.

| Mask Element | Description |
|--------------|---|
| ----- | ----- |
| 0 | Digit required. This element will accept any single digit from 0 to 9 . |
| 9 | Digit or space, optional. |
| # | Digit or space, optional, Plus(+) and minus(-) signs are allowed. |
| L | Letter required. It will accept letters a-z and A-Z . |
| ? | Letter or space, optional. |
| & | Requires a character. |
| C | Character or space, optional. |
| A | Alphanumeric (A-Za-z0-9) required. |

| a | Alphabetic (**A-Za-z0-9**) or space, optional. |

| < | Shift down. Converts all characters to lower case. |

| > | Shift up. Converts all characters to upper case. |

| | | Disable a previous shift up or shift down. |

| \\\ | Escapes a mask character, turning it into a literal. |

| All other characters | Literals. All non-mask elements (literals) will appear as themselves within MaskedTextBox. |

The following example demonstrates the usage of standard mask elements.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Mask("#####").Placeholder("Mask #####
(ex: 012+-
)") .FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
@Html.EJS().MaskedTextBox("mask2").Mask("LLLLLL").Placeholder("Mask LLLLLL
(ex:
Sample)").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render
()
@Html.EJS().MaskedTextBox("mask3").Mask("&&&&&").Placeholder("Mask &&&&&
(ex:
A12@#)").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render(
)
@Html.EJS().MaskedTextBox("mask4").Mask(">LLL<LLL").Placeholder("Mask
>LLL<LL (ex:
SAmple)").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render
()
@Html.EJS().MaskedTextBox("mask5").Mask("\\A999").Placeholder("Mask \\A999
(ex:
A321)").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
```

STANDARDMASKS.CS

```
public ActionResult standardMasks()
{
    return View();
}
```

Output be like the below.

Mask ##### (ex: 012+-)

Mask LLLLLL (ex: Sample)

Mask &&&&& (ex: A12#)

Mask >LLL<LL (ex: SAMple)

Mask \A999 (ex: A321)

A__

Custom mask elements

Other than the above standard mask elements, the mask can be configured with the custom characters or regular expression to define a custom behavior.

Custom characters

You can define any of the non-mask element as the mask element and its behavior through the [customCharacters](#) property.

In the following example, non-mask element **P** accepts the values **P, A, p, a**, and **M** accepts the values **M, m** as mentioned in the custom characters collection.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Mask("00:00
>PM").CustomCharacters(ViewBag.cusObj).Placeholder("Time (ex: 10:00 PM,
10:00
AM) ").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
```

CUSTOM-MASK.CS

```
namespace EJ2CoreSampleBrowser.Controllers.MaskedTextBox
{
    public partial class MaskedTextBoxController : Controller
    {
        public IActionResult CustomMask()
        {
            CustomCharacters customObj = new CustomCharacters();
            customObj.P = "P,A,a,p";
            customObj.M = "M,m";
            ViewBag.cusObj = customObj;
            return View();
        }
    }
}

public class CustomCharacters
```

```
{
    public string P { get; set; }
    public string M { get; set; }
}
```

Output be like the below.

Regular expression

Instead of the mask element, you can define your own regular expression to validate the input of a particular input place. The regular expressions should be wrapped by the square brackets (e.g., [Regex]).

In the following example, regular expression has been set for each input places.

CSHTML

```
<div class="control-section">
    <div class="control-label">IP Address (ex: 212.212.111.222)</div>
    @Html.EJS().MaskedTextBox("mask1").Mask("[0-2][0-9][0-9].[0-2][0-9][0-9].[0-2][0-9][0-9].[0-2][0-9][0-9]").Render()
</div>
<style>

    .control-label {
        padding-right: 200px;
        font-size: 12px;
    }
    .control-section {
        min-height: 200px;
    }
</style>
```

REGULAREXPRESSION.CS

```
namespace EJ2CoreSampleBrowser.Controllers.MaskedTextBox
{
    public partial class MaskedTextBoxController : Controller
    {
        public IActionResult RegularExpression()
        {
            return View();
        }
    }
}
```

Output be like the below.

IP Address (ex: 212.212.111.222)

234. . .

Prompt character

The Prompt character is a prompting symbol in the MaskedTextBox for the mask elements. The symbol is used to show the input positions in the MaskedTextBox. You can customize the prompt character of MaskedTextBox by using the [promptChar](#) property.

The following example demonstrates the MaskedTextBox with customized prompt character as #.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Mask("999-999-9999").PromptChar("#").Render()
```

PROMPT.CS

```
public ActionResult prompt()
{
    return View();
}
```

Output be like the below.

###-###-####

Accessibility

The Maskedtextbox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Maskedtextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

```

| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

The MaskedTextBox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This control is designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The MaskedTextBox uses the `textbox` role and following ARIA properties for its element based on its state.

| Property | Functionality |

| Property | Functionality |
|------------------|--|
| aria-live | The <code>aria-live</code> attribute indicates the priority of updates to a live region. |
| aria-disabled | The <code>aria-disabled</code> property indicates the disabled state of the MaskedTextBox. |
| aria-valuenow | The <code>aria-valuenow</code> property specifies the current value of the MaskedTextBox. |
| aria-invalid | The <code>aria-invalid</code> property indicates that the user input is incorrect or not within the acceptable ranges. |
| aria-placeholder | The <code>aria-placeholder</code> is a short hint to help the users with data entry when the MaskedTextBox has no value. |
| aria-labelledby | The <code>aria-labelledby</code> property indicates the floating label element of the MaskedTextBox. |

Ensuring accessibility

The MaskedTextBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the MaskedTextBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the MaskedTextBox component with accessibility tools.

See also

- [Accessibility in Syncfusion ASP.NET MVC components](#)

Style and appearance in MaskedTextBox Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of MaskedTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
/ To specify height, font size, and border /
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
font-size: 20px;
border-color: red;
height: 40px;
border: 2px solid;
}
```

Customizing the MaskedTextBox element on hovering

Use the following CSS to customize the Input Mask element on hovering

```
`css
/ To specify border /
.e-input-group input.e-input, .e-input-group input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):not(:focus), .e-input-group.e-control-wrapper input.e-input, .e-input-group.e-control-wrapper input.e-input:hover:not(.e-success):not(.e-warning):not(.e-error):not([disabled]):not(:focus){
border: 3px solid red;
}
```

How To

Perform custom validation using FormValidator

To perform custom validation on the MaskedTextBox use the FormValidator along with custom validation rules.

In the following example, the MaskedTextBox is validated for invalid mobile number by adding custom validation in the rules collection of the FormValidator.

CSHTML

```
<form id="form-element">
    @Html.EJS().MaskedTextBox("mask1").Mask("000-000-0000").Placeholder("Mobile Number").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Created("onCreate").Render()
    @Html.EJS().Button("submit_btn").Content("Button").Render()
</form>
<script>
    var customFn = function (args) {
        var argsLength = args.element.ej2_instances[0].value.length;
        if (argsLength != 0) {
            return argsLength >= 10;
        }
        else return true;
    };
    var custom = function (args) {
        var argsLength = args.element.ej2_instances[0].value.length;
        if (argsLength == 0) {
            return 0;
        }
        else {
            return argsLength;
        }
    };
    // sets required property in the FormValidator rules collection
    var options = {
        rules: {
            'mask': { numberValue: [customFn, 'Enter valid mobile number']
        },
    },
    };
    // defines FormValidator to validate the MaskedTextBox
    var formObject = new ej.inputs.FormValidator('#form-element', options);
    formObject.addRules('mask', { maxLength: [custom, 'Enter mobile number']
});
    // places error label outside the MaskedTextBox using the customPlacement event of FormValidator
    formObject.customPlacement = function (element, errorElement) {
        document.querySelector("#mask1").parentNode.appendChild(errorElement);
    };
    document.getElementById("submit_btn").addEventListener('click', function () {
        formObject.validate("mask");
        var ele = document.getElementById('mask1');
        // checks for incomplete value and alerts the formt submit
```

```

        if (ele.value !== "" &&
ele.value.indexOf(ele.ej2_instances[0].promptChar) === -1) {
            alert("Submitted");
        }
    });
    function onCreate() {
        document.getElementById(this.element.id).setAttribute("name",
"mask");
    }
</script>

```

HOWTO.CS

```

public ActionResult howto()
{
    return View();
}

```

Output be like the below.

Set cursor position while focus on the input textbox

By default, on focusing the MaskedTextBox the entire mask gets selected. You can customize by using any one of the following methods:

- Setting cursor position at the start of the MaskedTextBox.
- Setting cursor position at the end of the MaskedTextBox.
- Setting cursor at the specified position in the MaskedTextBox.

Note: The **selectionStart** and **selectionEnd** set to **0** instead of the input element value's length, when we focus on a MaskedTextBox control filled with all mask characters. This is the default behavior of the HTML 5 input element.

Following is an example that demonstrates the above cases to set cursor position in the MaskedTextBox using [focus](#) event.

CSHTML

```

@Html.EJS().MaskedTextBox("mask1").Mask("00000-00000").Value("93828-32132").Placeholder("Default cursor position").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
@Html.EJS().MaskedTextBox("mask2").Mask("00000-00000").Value("83929-4342").Placeholder("Cursor positioned at start").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Focus("onfocus").Render()

```

```
@Html.EJS().MaskedTextBox("mask3").Mask("00000-00000").Value("83929-3213").Placeholder("Cursor positioned at end").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Focus("onfocus1").Render()
@Html.EJS().MaskedTextBox("mask4").Mask("+1 000-000-0000").Value("234-432-432").Placeholder("Cursor at specified position").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Focus("onfocus2").Render()
<script>
    function onfocus(args) {
        //sets cursor position at start of MaskedTextBox
        args.selectionEnd = args.selectionStart = 0;
    }
    function onfocus1(args) {
        //sets cursor position at end of MaskedTextBox
        args.selectionStart = args.selectionEnd = args.maskedValue.length;
    }
    function onfocus2(args) {
        //sets cursor at specified position
        args.selectionStart = 3;
        args.selectionEnd = 3;
    }
</script>
```

CURSORPOSITION.CS

```
public ActionResult cursorPosition()
{
    return View();
}
```

Output be like the below.

Display numeric keypad when focus on mobile devices

By default, on focusing the MaskedTextBox, alphanumeric keypad will be displayed on mobile devices. Sometimes only numeric keypad for number values is needed, and this can be achieved by setting "type" property to tel.

Refer to the following example to enable numeric keypad in MaskedTextBox.

CSHTML

```
@Html.EJS().MaskedTextBox("mask1").Mask("000-000-0000").Created("onCreate").Render()
<script>
    function onCreate() {
        var key = document.getElementById("mask1");
        key.type = "tel";
    }
</script>
```

NUMERICKEYPAD.CS

```
public ActionResult numericKeypad()
{
    return View();
}
```

Customize the UI appearance of the control

The appearance of the MaskedTextBox can be changed by adding custom `cssClass` to the control and enabling styles.

Refer to the following example to change the appearance of the MaskedTextBox.

CSHTML

```
@Html.EJS().MaskedTextBox("mask4").Mask("00000").Value("42648").CssClass("e-style").Placeholder("Enter user ID").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Focus("onfocus").Render()
<script>
    function onfocus(args) {
        //sets cursor position at start of MaskedTextBox
        args.selectionEnd = args.selectionStart;
    }
</script>
<style>
    .e-mask.e-style .e-control.e-maskedtextbox {
        color: #00ffff;
        letter-spacing: 10px;
        font-size: xx-large;
        border: 1px;
        border-color: #ffffff;
    }
    .e-control-wrapper.e-mask.e-float-input.e-style .e-float-line::before {
        background: #ffffff;
    }
    .e-control-wrapper.e-mask.e-float-input.e-style .e-float-line::after {
        background: #ffffff;
    }
    .e-control-wrapper.e-mask.e-float-input.e-style .e-float-text.e-label-top {
        color: #00ffff;
        font-size: medium;
    }
```

```
}
</style>
```

CUSTOMCSS.CS

```
public ActionResult customCss()
{
    return View();
}
```

Output be like the below.

MaskedTextBoxFor and Model Binding

This section demonstrates the Strongly typed extension support in MaskedTextBox. The view which bind with any model is called as strongly typed view. You can bind any class as model to view. You can access model properties on that view. You can use data associated with model to render controls.

In this sample, first click the submit button to post the selected value in the MaskedTextBox. When posting the null value, validation error message will be shown below the MaskedTextBox.

CSHTML

```
@using (Html.BeginForm())
{
    @Html.ValidationSummary(true)
    <div class="col-lg-12 control-section">
        <div id="wrapper">
            @Html.EJS().MaskedTextBoxFor(model =>
model.value).Width("200px").Created("onCreate").Render()
            <div>
                @Html.ValidationMessageFor(model => model.value)
            </div>
            <div id="submitbutton">
                @Html.EJS().Button("btn").Content("Post").Render()
            </div>
        </div>
    </div>
}
<script>
    function onCreate() {
        document.getElementById(this.element.id).setAttribute("name",
"value");
    }
</script>
<style>
    #wrapper {
        max-width: 246px;
        margin: 30px auto;
        padding-top: 50px;
    }
    #submitbutton {
```

```

        margin-top: 20px;
        margin-left: 65px;
    }
    #control-content #wrapper .field-validation-error {
        color: red;
    }
</style>

```

MODELBINDING.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using System.ComponentModel.DataAnnotations;
namespace EJ2CoreSampleBrowser.Controllers.MaskedTextBox
{
    public class MaskValue
    {
        [Required]
        public string value { get; set; }
    }
    public partial class MaskedTextBoxController : Controller
    {
        public ActionResult DefaultFunctionalities()
        {
            MaskValue val = new MaskValue();
            val.value = "10";
            return View(val);
        }
        [HttpPost]
        public ActionResult DefaultFunctionalities(MaskValue model)
        {
            MaskValue val = new MaskValue();
            val.value = model.value;
            return View(val);
        }
    }
}

```

Output be like the below.

Migration from Essential JS 1

This article describes the API migration process of MaskEdit component from Essential JS 1 to Essential JS 2.

Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

```
| Adding custom class | Property: CssClass <br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("9999").InputMode(InputMode.Text).CssClass("custom") |  
Property: CssClass <br /><br />@Html.EJS().MaskedTextBox("mask").Mask("9999").CssClass("custom").Render() |
```

```
| Destroy editor | Not Applicable | Method: destroy<br /><br />@Html.EJS().MaskedTextBox("mask").Mask("00-000").Render()<br /><br />Script<br /><br />var mask = document.getElementById('mask').ej2_instances[0]<br />mask.destroy(); |
```

```
| Disable the maskedit control | Method: disable <br /><br />
/>@Html.EJ().MaskEdit("mask").MaskFormat("0000").Value("1234").InputMode(InputMode.Text)<br />
/><br />Script<br /><br />var maskObj = $("#mask").data("ejMaskEdit");<br />maskObj.disable(); | Can
be achieved using<br />@Html.EJS().MaskedTextBox("mask").Mask("00-
000").Render()<br />Script<br />var maskObj =
document.getElementById("mask").ej2_instances[0];<br />maskObj.enabled= false<br /> |
```

```
| Enable the maskedit control | Method: enable<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("0000").Value("1234").InputMode(InputMode.Text)<br /><br /><b>Script</b><br /><br />var maskObj = $("#mask").data("ejMaskEdit");<br />maskObj.enable(); | Can be achieved using</b><br />@Html.EJS().MaskedTextBox("mask").Mask("00-000").Render()<br /><b>Script</b><br />var maskObj = document.getElementById("mask").ej2_instances[0];<br />maskObj.enabled= true<br /> |
```

```
| Control state | Property: enabled<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("00-000").InputMode(InputMode.Text).Enabled(false) | Property: Enabled<br /><br />@Html.EJS().MaskedTextBox("mask").Mask("00-000").Enabled(false).Render() |
```

```
| Persistence | Property: EnablePersistence<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("00-000").InputMode(InputMode.Text).EnablePersistence(true) | Property: EnablePersistence<br /><br />@Html.EJS().MaskedTextBox("mask").Mask("00-000").EnablePersistence(true).Render() |
```

```
| Triggers when editor is focused in | Event: FocusIn<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Text).ClientSideEvents(s => s.FocusIn("onFocus"))<br /><br />Script<br /><br />function onFocus(){} | Event: Focus<br /><br />@Html.EJS().MaskedTextBox("mask").Mask("0000").Focus("onFocus")<br />Script<br />function onFocus(){} |
```

```
| Triggers when editor is focused out | Event: FocusOut<br /><br />
/>@Html.EJ().MaskEdit("mask").MaskFormat("00-00").InputMode(InputMode.Text).ClientSideEvents(s
=> s.FocusOut("onFocusOut"))<br /><br />Script<br /><br />function onFocusOut(){} | Event: Blur<br
/><br />
/>@Html.EJS().MaskedTextBox("mask").Mask("0000").InputMode(InputMode.Text).Blur("onBlur")<br />
Script<br />function onBlur(){} |
```

| Sets height | **Property:** *height*
/>@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Text).Height("30px") |
Can be achieved using,
/>@Html.EJS().MaskedTextBox("mask").Mask("9999").CssClass("custom").Render()
/>e-maskedTextBox.custom{height: 30px;}

```
| HTML Attributes | Property: HtmlAttributes<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Text).HtmlAttributes(htmlAttr)<br /><br />Script<br /><br />@{<br />Dictionary<string, object> htmlAttr = new Dictionary<string,
```

object>());
htmlAttr.Add("name", "maskedtextbox");
} | **Can be achieved**

```
by<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").setAttribute("name", "textbox");<br/>} |
```

| Specifies Input mode | **Property:** *InputMode*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Password) | Can be achieved
```

```
by<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").setAttribute("type", "password");<br/>} |
```

| Triggers on key press | **Event:** *KeyPress*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("000").InputMode(InputMode.Text).ClientSideEvents(s => s.KeyPress("onKeyPress"))<br /><br />Script<br /><br />function onKeyPress(){} | Can be achieved using native
```

```
event<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").addEventListener("keypress", function () {});<br/>} |
```

| Triggers on key up | **Event:** *KeyUp*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("000").InputMode(InputMode.Text).ClientSideEvents(s => s.KeyUp("onKeyUp"))<br /><br />Script<br /><br />function onKeyUp(){} | Can be achieved using native event<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").addEventListener("keyup", function () {});<br/>} |
```

| Triggers on mouse out in maskedit control | **Event:** *MouseOut*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("000").InputMode(InputMode.Text).ClientSideEvents(s => s.MouseOut("onMouseOut"))<br /><br />Script<br /><br />function onMouseOut(){} | Can be achieved using native
```

```
event<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").addEventListener("mouseout", function () {});<br/>} |
```

| Triggers when mouse over in maskedit control | **Event:** *MouseOver*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("00-00").InputMode(InputMode.Text).ClientSideEvents(s => s.MouseOver("onMouseOver"))<br /><br />Script<br /><br />function onMouseOver(){} | Can be achieved using native
```

```
event<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").addEventListener("mouseover", function () {});<br/>} |
```

| Name of maskedit control | **Property:** *name*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Text).Name("pin") | Can be achieved
```

```
using<br/>@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br/>Script<br/>function onCreate() {<br/>document.getElementById("mask").setAttribute("name", "TextBox")<br/><br/>}; |
```

| Triggers on keydown | **Event:** *OnKeyDown*
<br

```
/>@Html.EJ().MaskEdit("mask").MaskFormat("9999-
```

```
9999").InputMode(InputMode.Text).ClientSideEvents(s => s.OnKeyDown("keyDown"))<br /><br />
</Script><br /><br />function keyDown(){} | Can be achieved using native event<br />
@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Render()<br />
</Script><br />function onCreate() {<br />document.getElementById("mask").addEventListener("keydown",
function () {});<br />} |
```

```
| Read only | Property: ReadOnly<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("99-
9999").InputMode(InputMode.Text).ReadOnly(true) | Can be achieved using<br />
@Html.EJS().MaskedTextBox("mask").Enabled(false).Mask("0000").Render()<br />
Css<br />.e-mask<br />background-image: none !important;<br />border-bottom-color: rgba(0, 0, 0, 0.42)
!important;<br />} |
```

```
| Right to left | Property: TextAlign<br /><br />
@Html.EJ().MaskEdit("mask").MaskFormat("9999").InputMode(InputMode.Text).TextAlign("Right") |
Property: EnableRtl<br /><br />
@Html.EJS().MaskedTextBox("mask").Mask("9999").EnableRtl(true).Render() |
```

```
| Sets width | Property: width<br /><br />
@Html.EJ().MaskEdit("mask").MaskFormat("0000").InputMode(InputMode.Text).Width("100px") |
Property: Width<br /><br />
@Html.EJS().MaskedTextBox("mask").Mask("0000").Width("100px").Render() |
```

Mask Configuration

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

```
| Triggers on value change | Event Change<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("00-
00").InputMode(InputMode.Text).ClientSideEvents(s => s.Change("onChange"))<br /><br />
</Script><br />function onChange(){} | Event: Change<br /><br />
@Html.EJS().MaskedTextBox("mask").Mask("00-00").Change("onChange").Render()<br /><br />
</Script><br /><br />function onChange(){} |
```

```
| Clears maskedit text/value | Method: clear<br /><br />
@Html.EJ().MaskEdit("mask").MaskFormat("0000").Value("1234").InputMode(InputMode.Text)<br />
<br /></Script><br /><br />var maskObj = $("#mask").data("ejMaskEdit");<br />maskObj.clear(); | Can be achieved using<br />
@Html.EJS().MaskedTextBox("mask").Mask("00-0000").Value("1234").Render()<br />
</Script><br />var maskObj = document.getElementById("mask").ej2_instances[0];<br />maskObj.value = ""<br /> |
```

```
| Triggers on creation | Event: Create<br /><br />@Html.EJ().MaskEdit("mask").MaskFormat("00-
00").InputMode(InputMode.Text).ClientSideEvents(s => s.Create("onCreate"))<br /><br />
</Script><br />function onCreate(){} | Event: Created<br /><br />
@Html.EJS().MaskedTextBox("mask").Mask("00-00").Created("onCreated").Render()<br /><br />
</Script><br /><br />function onCreated(){} |
```

```
| Custom Character | Property: CustomCharacter<br /><br />
@Html.EJ().MaskEdit("mask").MaskFormat("C-0000").InputMode(InputMode.Text).CustomCharacter("#") | Property: CustomCharacters<br /><br />
@Html.EJS().MaskedTextBox("mask").Mask("C-0000").CustomCharacters(ViewBag.cusObj).Render()<br /><br />
</Controller><br /><br />CustomCharacters customObj = new CustomCharacters();<br />customObj.C = "#";<br />
ViewBag.cusObj = customObj; |
```

| Triggers when maskedit control is destroyed | **Event:** *Destroy*
 />@Html.EJ().MaskEdit("mask").MaskFormat("00-00").InputMode(InputMode.Text).ClientSideEvents(s
 => s.Destroy("onDestroy"))

Script

function onDestroy(){ | **Event:** *Destroyed*
 />
@Html.EJS().MaskedTextBox("mask").Mask("00-00").Destroyed("onDestroy").Render()

 />**Script**

function onDestroy(){ |

| Placeholder float type | Not Applicable | **Property:** *floatLabelType*
 />@Html.EJS().MaskedTextBox("mask").Mask("9,999").Placeholder("Enter
 value").FloatLabelType("Auto").Render() |

| Gets pure value of maskedit control | **Method:** *getStrippedValue*
 />@Html.EJ().MaskEdit("mask").Mask("000").Value("1234").InputMode(InputMode.Text)

 />**Script**

var maskObj = \$("#mask").data("ejMaskEdit");
maskObj.getStrippedValue(); |
Can be achieved using
@Html.EJS().MaskedTextBox("mask").Mask("00-
 000").Value("1234").Render()
Script
var maskObj =
 document.getElementById("mask").ej2_instances[0];
alert(maskObj.value)
 |

| Get whole maskedit value | **Method:** *getUnstrippedValue*
 />@Html.EJ().MaskEdit("mask").MaskFormat("00-00").Value("1234").InputMode(InputMode.Text)

 />
Script

var maskObj = \$("#mask").data("ejMaskEdit");

 />maskObj.getUnstrippedValue(); | **Method:** *getMaskedValue*
 />@Html.EJS().MaskedTextBox("mask").Mask("00-000").Render()

Script

var mask
 = document.getElementById('mask').ej2_instances[0]
mask.getMaskedValue(); |

| Hides prompt character on focus out | **Property:** *HidePromptOnLeave*
 />@Html.EJ().MaskEdit("mask").MaskFormat("aaaa").InputMode(InputMode.Text).HidePromptOnLeave
 (true) | **Can be achieved**
using
@Html.EJS().MaskedTextBox("mask").Mask("0000").Created("onCreate").Focus("onFocus").R
 ender()
Script
function onCreate() {
var maskObj =
 this;
document.getElementById("mask").addEventListener("focusout", function ()
 {
maskObj.promptChar = " ";
});

function onFocus() {
this.promptChar =
 " _";
}} |

| Mask format | **Property:** *maskFormat*
 />@Html.EJ().MaskEdit("mask").MaskFormat("99,999") | **Property:** *mask*
 />@Html.EJS().MaskedTextBox("mask").Mask("99,999").Render() |

| Prompt character | Not Applicable | **Property:** *PromptChar*
 />@Html.EJS().MaskedTextBox("mask").Mask("99,999").PromptChar("#").Render() |

| Clear Button | Not Applicable | **Property:** *ShowClearButton*
 />@Html.EJS().MaskedTextBox("mask").Mask("99,999").ShowClearButton(true).Render() |

| Prompt character display | **Property:** *ShowPromptChar*
 />@Html.EJ().MaskEdit("mask").MaskFormat("99-999").ShowPromptChar(false) |
 @Html.EJS().MaskedTextBox("mask").Mask("99999").PromptChar("#").Render() |

| Show rounded corner | **Property:** *ShowRoundedCorner*
 />@Html.EJ().MaskEdit("mask").MaskFormat("0000").ShowRoundedCorner(true) | **Can be achieved**
using
@Html.EJS().MaskedTextBox("mask").Mask("0000").Render()
Css
#mask
 {
border: 2px solid grey;
padding: 7px;
border-radius: 10px;
}
e-control-
 wrapper.e-mask.e-float-input.e-style .e-float-line::before,e-control-wrapper.e-mask.e-float-input.e-
 style .e-float-line::after {
 background: none;
}
 |

| Value of maskedit control | **Property:** *value* @Html.EJ().MaskEdit("mask").MaskFormat("0000").Value("1234") | **Property:** *value* @Html.EJS().MaskedTextBox("mask").Mask("0000").Value("1234").Render() |

| Displays hint on maskedit control | **Property:** *WatermarkText* @Html.EJ().MaskEdit("mask").MaskFormat("9999").WatermarkText("Enter value") | **Property:** *Placeholder* @Html.EJS().MaskedTextBox("mask").Mask("9999").Placeholder("Enter value").Render() |

Validation

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

|-----|-----|-----|

| Displays error until correct value is entered | **Property:** *show-error* @Html.EJ().MaskEdit("mask").MaskFormat("99-999").ShowError(true) | **MaskedTextBox by default shows error until correct value is entered** @Html.EJS().MaskedTextBox("mask").Mask("0000").Render() |

| Validation message | **Property:** *validation-message* @Html.EJ().MaskEdit("mask").MaskFormat("0000").ValidationRules(rule => rule.AddRule("required", true)).ValidationMessage(msg => msg.AddMessage("required", "Required value")) | **Validation in MaskedTextBox can be achieved by Form validation** <form id="form-element"> @Html.EJS().MaskedTextBox("mask").Mask("000-000-0000").Placeholder("Mobile Number").FloatLabelType(FloatLabelType.Always).Created("onCreate").Render() </form> **Script** var options = { rules: { 'mask': { required: [true, 'Enter valid mobile number'] }, }, }; var formObject = new ej.inputs.FormValidator('#form-element', options); formObject.customPlacement = function (element, errorElement) { document.querySelector("#mask").parentNode.appendChild(errorElement); }; function onCreate() { document.getElementById(this.element.id).setAttribute("name", "mask"); } |

| Validation Rules | **Property:** *validation-rules* @Html.EJ().MaskEdit("mask").MaskFormat("0000").ValidationRules(rule => rule.AddRule("required", true)) | **Validation in MaskedTextBox can be achieved by Form validation** <form id="form-element"> @Html.EJS().MaskedTextBox("mask").Mask("000-000-0000").Placeholder("Mobile Number").FloatLabelType(FloatLabelType.Always).Created("onCreate").Render() </form> **Script** var options = { rules: { 'mask': { required: [true] }, }, }; var formObject = new ej.inputs.FormValidator('#form-element', options); formObject.customPlacement = function (element, errorElement) { document.querySelector("#mask").parentNode.appendChild(errorElement); }; function onCreate() { document.getElementById(this.element.id).setAttribute("name", "mask"); } |

Mention

Getting Started with ASP.NET MVC Mention Control

This section briefly explains about how to include [ASP.NET MVC Mention](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ _LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC

controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Mention control

Now, add the Syncfusion ASP.NET MVC Mention control in `~/Home/Index.cshtml` page.

CSHTML

```
@{
    char nameMentionChar = '@';
}
<label style="font-size: 15px; font-weight: 600;">Comments</label>
<div id="defaultMention" placeholder="Type @Html.Raw("@") and tag user"
style="min-height: 100px; border: 1px solid #D7D7D7; border-radius: 4px;
padding: 8px; font-size: 14px; width: 600px;"></div>
@Html.EJS().Mention("default").MentionChar(nameMentionChar).Target("#defaultMention").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Mention control will be rendered in the default web browser.

Binding data source

After initialization, populate the Mention with data using the [DataSource](#) property. Here, an array of string values is passed to the Mention control.

CSHTML

```
@model List<string>
```

```
@{
    char nameMentionChar = '@';
}
<label style="font-size: 15px; font-weight: 600;">Comments</label>
<div id="defaultMention" placeholder="Type @Html.Raw("@") and tag user"
style="min-height: 100px; border: 1px solid #D7D7D7; border-radius: 4px;
padding: 8px; font-size: 14px; width: 600px;"></div>
@Html.EJS().Mention("default_data").MentionChar(nameMentionChar).Target("#de
faultMention").DataSource((IEnumerable<object>)ViewBag.data).Render()
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            ViewBag.data = new string[] { "Selma Rose", "Garth", "Robert",
"William", "Joseph" };
            return View();
        }
    }
}
```

Display mention character

By using the [ShowMentionChar](#) property, the text content can be displayed along with the mention character. You can customize the mention character by using the [MentionChar](#) property in the Mention control.

Note: By default, the [MentionChar](#) is @ and the [ShowMentionChar](#) property is disabled.

The following example, displays the text content along with the mention character configured as #.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '#';
}
<label style="font-size: 15px; font-weight: 600;">Comments</label>
<div id="defaultMention" placeholder="Type @Html.Raw("#") and tag user"
style="min-height: 100px; border: 1px solid #D7D7D7; border-radius: 4px;
padding: 8px; font-size: 14px; width: 600px;"></div>
@Html.EJS().Mention("showMention").Target("#defaultMention").MentionChar(nam
eMentionChar).ShowMentionChar(true).DataSource((IEnumerable<object>)ViewBag.
data).Render()
```

SUGGESTIONLIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            ViewBag.data = new string[] { "Selma Rose", "Garth", "Robert",
"William", "Joseph" };
            return View();
        }
    }
}

```

Working with Data in Mention

The Mention loads the data either from local data source or remote data services using the [DataSource](#) property. It supports the data type of either `array` or `DataManager`.

The Mention also supports different kinds of data services such as OData V4 and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

| Fields | Type | Description |
|---------|------------------|--|
| text | string | Specifies the display text of each list item. |
| value | number or string | Specifies the hidden data value mapped to each list item that should contain a unique value. |
| groupBy | string | Specifies the category under which the list item has to be grouped. |
| iconCss | string | Specifies the icon class of each list item. |

Note: When binding complex data to the Mention, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in three ways as described in the following.

Array of simple data

The Mention has provided support to load an array of primitive data such as strings and numbers. Here, both the value and text fields act the same.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    string[] data = new string[] { "Selma Rose", "Garth", "Robert",
"William", "Joseph" };
}

```

```

<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("Array-Of-Simple-
Data").MentionChar(nameMentionChar).Target("#mentionElement").DataSource((IE
numerable<object>)data).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        {
            public ActionResult Index()
            {
                return View();
            }
        }
    }
}

```

Array of JSON data

The Mention can generate its list of items through an array of JSON data. Therefore the appropriate columns should be mapped to the [Fields](#) property.

In the following example, **ID** column and **Game** column from complex data have been mapped to the **Value** field and **Text** field, respectively.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    List<SportsData> data = new SportsData().SportsList();
}

<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag sport"></div>
@Html.EJS().Mention("Array-Of-Json-Data").MentionChar(nameMentionChar).Target("#mentionElement").DataSource((IEnumerable<object>)data).Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Game" , Value = "ID" }).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class SportsData
    {
        public string ID { get; set; }
        public string Game { get; set; }
        public List<SportsData> SportsList()
        {
            List<SportsData> sports = new List<SportsData>()
            {
                new SportsData { ID = "game1", Game = "Badminton" },
                new SportsData { ID = "game2", Game = "Football" },
                new SportsData { ID = "game3", Game = "Tennis" },
                new SportsData { ID = "game4", Game = "Hockey" },
                new SportsData { ID = "game5", Game = "Basketball" },
            };
            return sports;
        }
    }
}
```

```

    }
  }
}

```

Array of complex data

The Mention can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [Fields](#) property.

In the following example, `Code.ID` and `Country.Name` columns from the complex data have been mapped to the `Value` and `Text` fields respectively.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    List<CountryGroup> data = new CountryGroup().GetData();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
country"></div>
@Html.EJS().Mention("Complex-data-
biding").MentionChar(nameMentionChar).Target("#mentionElement").DataSource((
IEnumerable<object>)data).Fields(new
Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Country.Name", Value
= "Code.Id" }).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>

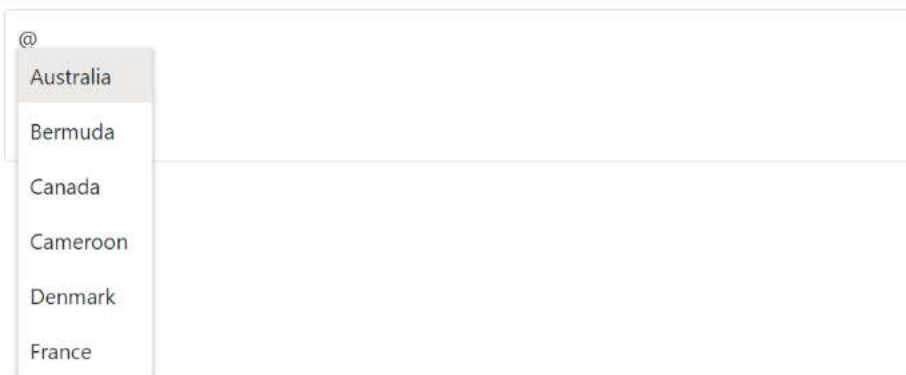

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Code
    {
        public string ID { get; set; }
    }
    public class Country
    {
        public string Name { get; set; }
    }
    public class CountryGroup
    {
        public Country Country { get; set; }
        public Code Code { get; set; }
        public List<CountryGroup> GetData()
        {
            List<CountryGroup> data = new List<CountryGroup>
            {
                new CountryGroup() { Country = new Country() { Name =
"Australia" }, Code = new Code() { ID = "AU" } },
                new CountryGroup() { Country = new Country() { Name =
"Bermuda" }, Code = new Code() { ID = "BM" } },
                new CountryGroup() { Country = new Country() { Name =
"Canada" }, Code = new Code() { ID = "CA" } },
                new CountryGroup() { Country = new Country() { Name =
"Cameroon" }, Code = new Code() { ID = "CM" } },
                new CountryGroup() { Country = new Country() { Name =
"Denmark" }, Code = new Code() { ID = "DK" } },
                new CountryGroup() { Country = new Country() { Name =
"France" }, Code = new Code() { ID = "FR" } }
            };
            return data;
        }
    }
}

```

Binding remote data

The Mention supports retrieval of data from remote data services with the help of **DataManager** control. The [Query](#) property is used to fetch the data from the database and bind it to the Mention control.

OData v4 adaptor - Binding OData v4 service

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

The following sample displays the first 6 contacts from **Customers** table of the **Northwind** Data Service.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new
ej.data.Query().from('Employees').select('EmployeeID,FirstName,Title').take(
6)";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").Target("#mentionElement").MentionChar(nameMe
ntionChar).DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
div#mentionElement[placeholder]:empty:before {
    content: attr(placeholder);
}
#mentionElement {
    min-height: 100px;
    border: 1px solid #D7D7D7;
    border-radius: 4px;
    padding: 8px;
    font-size: 14px;
    width: 600px;
}
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
```

```
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}
```

@

Nancy

Andrew

Janet

Margaret

Steven

Michael

Web API adaptor

You can use **WebApiAdaptor** to bind mention with Web API created using OData endpoint.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new ej.data.Query().select(['FirstName','Country',
'EmployeeID']).take(6).requiresCount()";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").MentionChar(nameMentionChar).Target("#mentio
nElement").DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor").Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
```

```
width: 600px;
}
```

</style>

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}
```

- [Customization](#)
- [How to perform filtering](#)

Filtering data in Mention

The Mention control has built-in support to filter data items. The filter operation starts as soon as you start typing characters in the mention element.

Limit the minimum filter character

You can control the minimum length of user input to initiate the search action using the [MinLength](#) property. This can be useful if you have a very large list of data. The default value is 0, where the suggestion list opens as soon as the user inputs the mention character.

The remote request does not fetch the search data until the search key contains three characters as shown in the following example.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new ej.data.Query().select(['FirstName','Country',
'EmployeeID']).take(6).requiresCount()";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").MinLength(3).MentionChar(nameMentionChar).Ta
rget("#mentionElement").DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}

```

Change the filter type

While filtering, you can change the filter type to **Contains**, **StartsWith**, or **EndsWith** in the [FilterType](#) property. The default filter operator is **Contains**.

- **StartsWith** - Filter the items that begin with the specified text value.
- **Contains** - Filter the items that contain the specified text value.
- **EndsWith** - Filter the items that end with the specified text value.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new ej.data.Query().select(['FirstName', 'Country',
'EmployeeID']).take(6).requiresCount()";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").FilterType(FilterType.StartsWith).Target("#m
entionElement").MentionChar(nameMentionChar).DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}
```

Allow spacing between search

While filtering the data in the data source, you can allow the space in the middle of the mention using the [AllowSpaces](#) property. If the data source does not match with the mentioned element data, the popup will be hidden on the space key press. The default value of the [AllowSpaces](#) is `false`.

Note: By default, the [AllowSpaces](#) property is disabled, and the space ends the mention control search.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    List<Employees> data = new Employees().GetData();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag employee"></div>
@Html.EJS().Mention("Allow-
Space").Target("#mentionElement").MentionChar(nameMentionChar).Fields(new
Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Name"
}).DataSource((IEnumerable<object>)data).AllowSpaces(true).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement{
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Employees
    {
        public string Name { get; set; }
        public string ID { get; set; }
        public List<Employees> GetData()
        {
            List<Employees> data = new List<Employees>
            {
                new Employees() { Name = "Andrew Fuller", ID = "1" },
                new Employees() { Name = "Anne Dodsworth", ID = "2" },
                new Employees() { Name = "Janet Leverling", ID = "3" },
                new Employees() { Name = "Laura Callahan", ID = "4" },
                new Employees() { Name = "Margaret Peacock", ID = "5" }
            };
            return data;
        }
    }
}

```

Customize the suggestion item count

While filtering, you can customize the number of list items to be displayed in the suggestion list using the [SuggestionCount](#) property.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    List<EmailData> data = new EmailData().EmailList();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag user"></div>
@Html.EJS().Mention("SuggestionCount").MentionChar(nameMentionChar).Target("#mentionElement").SuggestionCount(8).DataSource((IEnumerable<object>)data).Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Name" }).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
    }
</style>

```

```

border: 1px solid #D7D7D7;
border-radius: 4px;
padding: 8px;
font-size: 14px;
width: 600px;
}
</style>

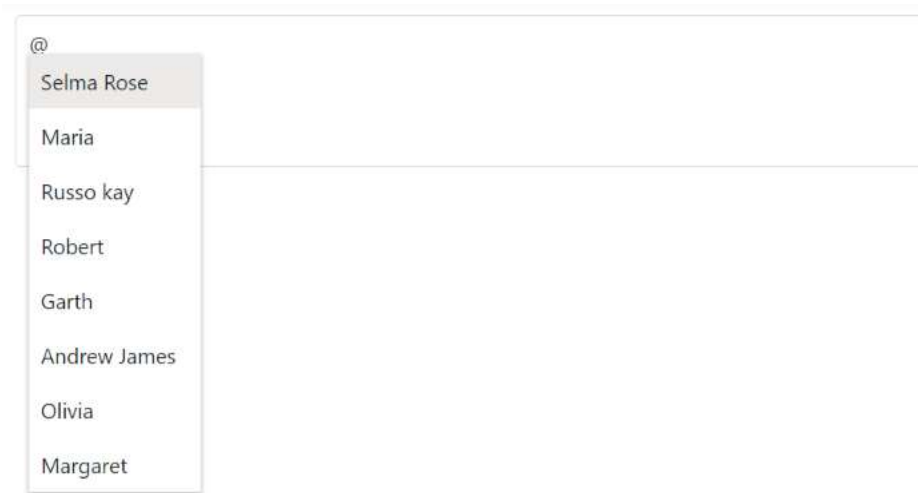

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class EmailData
    {
        public string Name { get; set; }
        public string EmailId { get; set; }
        public List<EmailData> EmailList()
        {
            List<EmailData> email = new List<EmailData>()
            {
                new EmailData { Name = "Selma Rose", EmailId =
"selma@gmail.com" },
                new EmailData { Name = "Maria", EmailId = "maria@gmail.com"
},
                new EmailData { Name = "Russo kay", EmailId =
"russo@gmail.com" },
                new EmailData { Name = "Robert", EmailId =
"robert@gmail.com" },
                new EmailData { Name = "Garth", EmailId = "garth@gmail.com"
},
                new EmailData { Name = "Andrew James", EmailId =

Sorting datasource in Mention

Sort order type

You can display the suggestion list items in a specific order. It has possible types as **Ascending**, **Descending**, and **None** in the [SortOrder](#) property.

- **None** - The data source is not sorted.
- **Ascending** - The data source is sorted in ascending order.
- **Descending** - The data source is sorted in descending order.

CSHTML

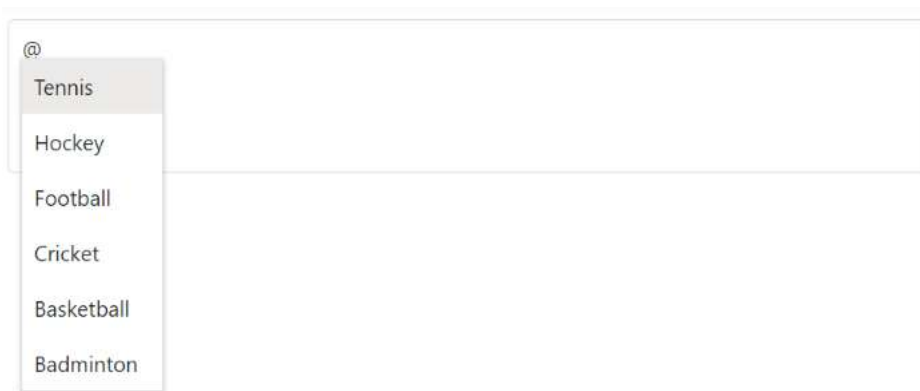

```
@model List<string>
@{
    char nameMentionChar = '@';
    List<SportsData> data = new SportsData().SportsList();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag sport"></div>
@Html.EJS().Mention("Sorting").MentionChar(nameMentionChar).Target("#mentionElement").Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Game" , Value = "ID"
}).DataSource((IEnumerable<object>) data).SortOrder(Syncfusion.EJ2.DropDowns.SortOrder.Descending).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement{
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
    }
```

```
font-size: 14px;
width: 600px;
}

</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class SportsData
    {
        public string ID { get; set; }
        public string Game { get; set; }
        public List<SportsData> SportsList()
        {
            List<SportsData> sports = new List<SportsData>()
            {
                new SportsData { ID = "game1", Game = "Badminton" },
                new SportsData { ID = "game2", Game = "Football" },
                new SportsData { ID = "game3", Game = "Tennis" },
                new SportsData { ID = "game4", Game = "Hockey" },
                new SportsData { ID = "game5", Game = "Basketball" },
            };
            return sports;
        }
    }
}
```

Templates in Mention

The Mention has been provided with several options to customize each suggestion list item, display item, and data loading indication.

Item template

The content of each list item in the Mention can be customized using the [ItemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data using `ItemTemplate`.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new ej.data.Query().select(['FirstName','Country',
'EmployeeID']).take(6).requiresCount()";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").PopupWidth("250px").MentionChar(nameMentionC
har).SuggestionCount(6).Target("#mentionElement").ItemTemplate("<span><span
class=\"name\"> ${FirstName}</span><span
class=\"city\"> ${Country}</span></span>").DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    .city {
        right: 15px;
        position: absolute;
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;

namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
    }
}
```

```

    {
        return View();
    }
}

```

| | |
|------------------|---------|
| @ | |
| Andrew Fuller | England |
| Anne Dodsworth | USA |
| Janet Leverling | USA |
| Laura Callahan | USA |
| Margaret Peacock | USA |
| Michael Suyama | USA |

Display template

You can customize the mentioned value's display appearance using the [DisplayTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both FirstName and City in the mention element, which is separated by a hyphen.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    var query = "new ej.data.Query().select(['FirstName', 'Country',
'EmployeeID']).take(6).requiresCount()";
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").PopupWidth("250px").MentionChar(nameMentionC
har).Target("#mentionElement").ItemTemplate("<span><span class=\"name\">
${FirstName}</span><span
class=\"city\">${Country}</span></span>").DisplayTemplate("<span>${FirstName
} - ${City}</span>").DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string) query).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    .city {
        right: 15px;
        position: absolute;
    }
</style>
#mentionElement {

```

```

        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}

```

No records template

You can show the custom design of the popup list content when no data and matches are found on the search with the help of [NoRecordsTemplate](#) property.

CSHTML

```

@model List<string>
@{
    char nameMentionChar = '@';
    string[] data = new string[] { };
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag user"></div>

```

```
@Html.EJS().Mention("noRecord-
template").MentionChar(nameMentionChar).NoRecordsTemplate("<span
class='norecord'> NO DATA
AVAILABLE</span>").Target("#mentionElement").DataSource((IEnumerable<object>
)data).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement {
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MentionController : Controller
    {
        {
            public ActionResult Index()
            {
                return View();
            }
        }
    }
}
```

Spinner template

Display the customized waiting spinner, when data fetching takes time to load in the suggestion list by using the [SpinnerTemplate](#) property.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
```

```

var query = "new
ej.data.Query().select(['FirstName','Country','EmployeeID']).take(6).require
sCount();"
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
user"></div>
@Html.EJS().Mention("employee").MentionChar(nameMentionChar).Target("#mentio
nElement").PopupWidth("200px").SpinnerTemplate("<div
class='spinner_loader'></div>").DataSource(obj =>
obj.Url("https://ej2services.syncfusion.com/production/web-
services/api/Employees").CrossDomain(true).Adaptor("WebApiAdaptor")).Fields(
new Syncfusion.EJ2.DropDowns.MentionFieldSettings
{
    Text = "FirstName",
    Value = "EmployeeID"
}).Query((string)query).Render()
<style>
div#mentionElement[placeholder]:empty:before {
    content: attr(placeholder);
}
#mentionElement {
    min-height: 100px;
    border: 1px solid #D7D7D7;
    border-radius: 4px;
    padding: 8px;
    font-size: 14px;
    width: 600px;
}
.spinner_loader {
    border: 10px solid #f3f3f3;
    border-radius: 50%;
    border-top: 10px solid #3498db;
    width: 5px;
    height: 5px;
    position: absolute;
    top: 6px;
    left: 85px;
    -webkit-animation: spin 2s linear infinite; /* Safari */

- [Accessibility](#)

Customization in Mention

Show or hide mention character

You can show the mention character as the prefix of the selected item in mention control using [ShowMentionChar](#) property. The default value of `ShowMentionChar` is `false`.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '#';
```

```

        List<EmailData> data = new EmailData().EmailList();
    }
    <div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag
    user"></div>
    @Html.EJS().Mention("Mention-Char-
    Customize").Target("#mentionElement").MentionChar(nameMentionChar).DataSourc
    e((IEnumerable<object>)data).Fields(new
    Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Name"
    }).ShowMentionChar(true).Render()
    <style>
        div#mentionElement[placeholder]:empty:before {
            content: attr(placeholder);
        }
        #mentionElement{
            min-height: 100px;
            border: 1px solid #D7D7D7;
            border-radius: 4px;
            padding: 8px;
            font-size: 14px;
            width: 600px;
        }
    </style>

```

DATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class EmailData
    {
        public string Name { get; set; }
        public string EmailId { get; set; }
        public List<EmailData> EmailList()
        {
            List<EmailData> email = new List<EmailData>()
            {
                new EmailData { Name = "Selma Rose", EmailId =
                "selma@gmail.com" },
                new EmailData { Name = "Maria", EmailId = "maria@gmail.com"
            },
                new EmailData { Name = "Russo kay", EmailId =
                "russo@gmail.com" },
                new EmailData { Name = "Robert", EmailId =
                "robert@gmail.com" },
                new EmailData { Name = "Garth", EmailId = "garth@gmail.com"
            }
            };
            return email;
        }
    }
}

```

Adding the suffix character after selection

You can add the suffix character while selecting an item in the Mention control using [SuffixText](#) property. You can add space or new line as suffix to the selected item. The default values are empty string.

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    List<SportsData> data = new SportsData().SportsList();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag sport"></div>
@Html.EJS().Mention("Suffix").Target("#mentionElement").MentionChar(nameMentionChar).DataSource((IEnumerable<object>)data).Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Game" , Value = "ID" }).SuffixText("&#160;").Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement{
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class SportsData
    {
        public string ID { get; set; }
    }
}
```

```

public string Game { get; set; }
public List<SportsData> SportsList()
{
    List<SportsData> sports = new List<SportsData>()
    {
        new SportsData { ID = "game1", Game = "Badminton" },
        new SportsData { ID = "game2", Game = "Football" },
        new SportsData { ID = "game3", Game = "Tennis" },
        new SportsData { ID = "game4", Game = "Hockey" },
        new SportsData { ID = "game5", Game = "Basketball" },
    };
    return sports;
}
}

```

Configure the popup list

You can customize the suggestion list as width and height using the [PopupHeight](#) and [PopupWidth](#) properties.

By default, the popup list width value is set as `auto`. Depending on the mentioned suggestion data list, the width value is automatically adjusted. The popup list height value is set as `300px`.

CSHTML

```

@model List<string>
@{
    List<Countries> data = new Countries().GetData();
    char nameMentionChar = '@';
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag country"></div>
@Html.EJS().Mention("Popup-Litst-Customize").Target("#mentionElement").MentionChar(nameMentionChar).DataSource((IEnumerable<object>)data).Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Country" }).PopupWidth("250px").PopupHeight("200px").Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement{
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>

```

DATA.CS

```
using System;
```

```

using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Countries
    {
        public string Country { get; set; }
        public string Code { get; set; }
        public List<Countries> GetData()
        {
            List<Countries> data = new List<Countries>()
            {
                new Countries() { Country = "Australia", Code = "AU" },
                new Countries() { Country = "Bermuda", Code = "BM" },
                new Countries() { Country = "Canada", Code = "CA" },
                new Countries() { Country = "Cameroon", Code = "CM" },
                new Countries() { Country = "Denmark", Code = "DK" }
            };
            return data;
        }
    }
}

```

Trigger character

You can customize the trigger character by using the [MentionChar](#) property in the Mention control. The trigger character triggers the suggestion list to display in the target area.

By default, the [MentionChar](#) is @.

Accessibility in Mention

Web accessibility makes web contents and applications more accessible to people with disabilities. The Mention control provides built-in compliance with WAI-ARIA specifications. The WAI-ARIA support is achieved using attributes such as `aria-selected` and `aria-activedescendent`.

The Mention component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Mention component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Mention control uses the **Listbox** role where each list item has an **option** role. The following **ARIA attributes** denote the Mention state.

| **Properties** | **Functionalities** |

| --- | --- |

| aria-selected | Indicates the selected option. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the Mention without interruptions.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Selects the first item in the Mention list. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Esc(Escape) | Closes the popup list when it is in an open state. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, inserts the selected popup list item and closes the popup list. |

CSHTML

```
@model List<string>
@{
    char nameMentionChar = '@';
    List<Employees> data = new Employees().GetData();
}
<div id="mentionElement" placeholder="Type @Html.Raw("mention") and tag employee"></div>
@Html.EJS().Mention("Accessibility").Target("#mentionElement").MentionChar(nameMentionChar).DataSource((IEnumerable<object>)data).Fields(new Syncfusion.EJ2.DropDowns.MentionFieldSettings { Text = "Name" }).Render()
<style>
    div#mentionElement[placeholder]:empty:before {
        content: attr(placeholder);
    }
    #mentionElement{
        min-height: 100px;
        border: 1px solid #D7D7D7;
        border-radius: 4px;
        padding: 8px;
        font-size: 14px;
        width: 600px;
    }
</style>
```

DATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Employees
    {
    }
```

```
public string Name { get; set; }
public string ID { get; set; }
public List<Employees> GetData()
{
    List<Employees> data = new List<Employees>
    {
        new Employees() { Name = "Andrew Fuller", ID = "1" },
        new Employees() { Name = "Anne Dodsworth", ID = "2" },
        new Employees() { Name = "Janet Leverling", ID = "3" },
        new Employees() { Name = "Laura Callahan", ID = "4" },
        new Employees() { Name = "Margaret Peacock", ID = "5" }
    };
    return data;
}
}
```

Ensuring accessibility

The Mention component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Mention component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Mention component with accessibility tools.

Menu

Getting Started with ASP.NET MVC Menu Control

This section briefly explains about how to include [ASP.NET MVC Menu](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in nuget.org. Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Menu control

Now, add the Syncfusion ASP.NET MVC Menu control in `~/Views/Home/Index.cshtml` page.

CSHTML

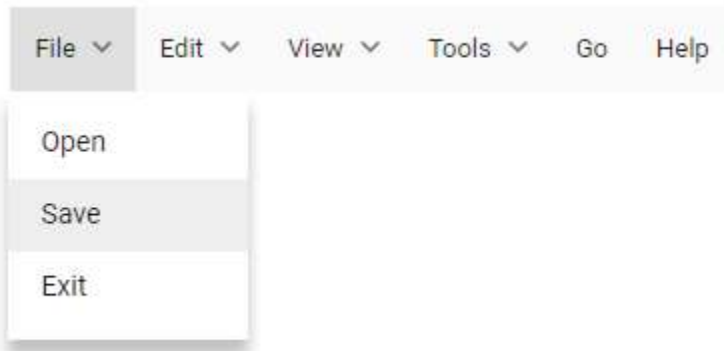

```
@model List<object>
@Html.EJS().Menu("menu").Items(Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "File",
        items = new List<object>()
        {
            new { text = "Open" },
            new { text = "Save" },
            new { text = "Exit" }
        }
    });
    menuItems.Add(new
    {
        text = "Edit",
        items = new List<object>()
        {
            new { text = "Cut" },
            new { text = "Copy" },
            new { text = "Paste" }
        }
    });
    menuItems.Add(new
    {
        text = "View",
        items = new List<object>()
        {
            new { text = "Toolbar" },
            new { text = "Sidebar" },
            new { text = "Fullscreen" }
        }
    });
    menuItems.Add(new
    {
        text = "Tools",
        items = new List<object>()
        {
            new { text = "Spelling & Grammar" },
            new { text = "Customize" },
            new { text = "Options" }
        }
    });
    menuItems.Add(new
    {
        text = "Go"
```

```
});  
menuItems.Add(new  
{  
text = "Help"  
});  
return View(menuItems);  
}
```

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Menu control will be rendered in the default web browser.

Note: This example demonstrates the basic rendering of Menu with items support. For more information about data source support, refer to the [Data Source Binding](#) section.

Group menu items with separator

The separators are both horizontal and vertical lines used to separate the menu items. You cannot select the separators, but you can enable separators to group the menu items using the [Separator](#) property.

The **Open** and **Save** sub menu items are grouped using the **separator** property in the following sample.

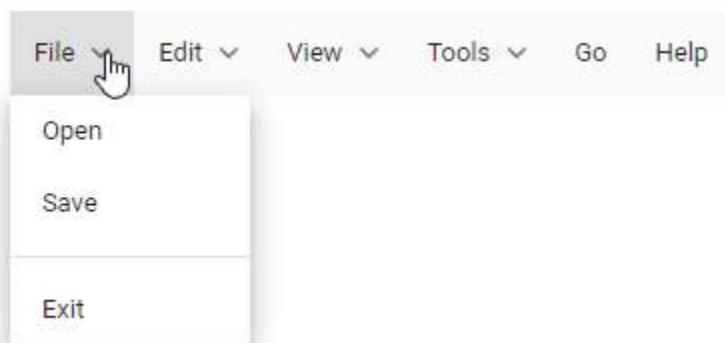

CSHTML

```
@model List<object>  
@Html.EJS().Menu("menu").Items(Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()  
{  
List<object> menuItems = new List<object>();  
menuItems.Add(new  
{  
text = "File",  
items = new List<object>()  
{  
new { text = "Open" },  
new { text = "Save" },  
new { separator = true },  
new { text = "Exit" }  
}  
});  
}
```

```
menuItems.Add(new
{
    text = "Edit",
    items = new List<object>()
    {
        new { text = "Cut" },
        new { text = "Copy" },
        new { text = "Paste" }
    }
});
menuItems.Add(new
{
    text = "View",
    items = new List<object>()
    {
        new { text = "Toolbar" },
        new { text = "Sidebar" },
        new { text = "Fullscreen" }
    }
});
menuItems.Add(new
{
    text = "Tools",
    items = new List<object>()
    {
        new { text = "Spelling & Grammar" },
        new { text = "Customize" },
        new { text = "Options" }
    }
});
menuItems.Add(new
{
    text = "Go"
});
menuItems.Add(new
{
    text = "Help"
});
return View(menuItems);
}
```

Note: The `separator` property should not be given along with the other fields in the `MenuItem`. You can also enable the separator to group **horizontal** menu items.

Icons and Sub menu items

Icons

The menu item contains an icon/image in it to provide a visual representation of an action. To place the icon on a menu item, set the [IconCss](#) property with the required icon CSS. By default, the icon is positioned at the left of the menu item. In the following sample, the icons of File and Edit menu items and Open, Save, Cut, Copy, and Paste sub menu items are added using the `iconCss` property.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()

<style>

    });
}

```

```

});
menuItems.Add(new
{
    text = "Help"
});
ViewBag.menuItems = menuItems;
return View();
}

```

Navigation

Navigation in Menu is used to navigate to the other web page when a menu item is clicked. It can be achieved by providing a link to the menu item using the url property. In the following sample, the Navigation URL is added to sub menu items using the url property.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeItemRender("beforeItemRender").Render()
<script>
function beforeItemRender(args) {
    if (args.item.url) {
        // To open url in blank page.
        args.element.getElementsByTagName('a')[0].setAttribute('target',
        '_blank');
    }
}
</script>
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>

```

NAVIGATION.CS

```

// Menu Navigation
public ActionResult MenuNavigation()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "Appliances",
        items = new List<object>()
        {
            new { text= "Washing Machine", url=
            "https://www.google.com/search?q=washing+machine"},
            new {text= "Air Conditioners", url=
            "https://www.google.com/search?q=air+conditioners" }
        }
    });
    menuItems.Add(new
    {
        text = "Mobile",
        items = new List<object>()
    }

```

```

        {
            new { text= "Headphones", url=
"https://www.google.com/search?q=headphones" },
            new { text= "Memory Cards", url=
"https://www.google.com/search?q=memory+cards" },
            new { text= "Power Banks", url=
"https://www.google.com/search?q=power+banks" }
        }
    });
    menuItems.Add(new
    {
        text = "Entertainment",
        items = new List<object>()
        {
            new { text= "Televisions", url=
"https://www.google.com/search?q=televisions" },
            new { text= "Home Theatres", url=
"https://www.google.com/search?q=home+theatres" },
            new { text= "Gaming Laptops", url=
"https://www.google.com/search?q=gaming+laptops" }
        }
    });
    menuItems.Add(new
    {
        text = "Fashion",
        url = "https://www.google.com/search?q=fashion"
    });
    menuItems.Add(new
    {
        text = "Offers",
        url = "https://www.google.com/search?q=offers"
    });
    ViewBag.menuItems = menuItems;
    return View();
}

```

Multilevel nesting

The Menu supports multiple level nesting, and it can be achieved by mapping the [Items](#) property inside the parent `menuItem`s.

In the following sample, three-level nesting of menu has been provided.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>

```

NESTING.CS

```

// Menu Multi Level
public ActionResult MultiLevelNesting()

```

```

{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "Fashion",
        items = new List<object>()
        {
            new {
                text = "Men Fashion",
                items = new List<object>()
                {
                    new {
                        text = "Personal Care",
                        items = new List<object>()
                        {
                            new { text = "Trimmers" },
                            new { text = "Shavers" }
                        }
                    },
                    new {
                        text = "Clothing",
                        items = new List<object>()
                        {
                            new { text = "Shirts" },
                            new { text = "Jackets" },
                            new { text = "Track Suits" }
                        }
                    },
                    new { text = "Footwear" }
                }
            },
            new {
                text = "Women Fashion",
                items = new List<object>()
                {
                    new {
                        text = "Clothing",
                        items = new List<object>()
                        {
                            new { text = "Kurtas" },
                            new { text = "Salwars" },
                            new { text = "Sarees" }
                        }
                    },
                    new {
                        text = "Jewellery",
                        items = new List<object>()
                        {
                            new { text = "Nosepins" },
                            new { text = "Anklets" }
                        }
                    }
                }
            }
        }
    });
    menuItems.Add(new

```

```

{
    text = "Home & Living",
    items = new List<object>()
    {
        new {
            text = "Washing Machine",
            items = new List<object>()
            {
                new { text = "Fully Automatic" },
                new { text = "Semi Automatic" }
            }
        },
        new {
            text = "Air Conditioners",
            items = new List<object>()
            {
                new { text = "Inverter ACs" },
                new { text = "Split ACs" }
            }
        }
    }
});
menuItems.Add(new
{
    text = "Accessories",
});
menuItems.Add(new
{
    text = "Sports",
});
menuItems.Add(new
{
    text = "Gaming",
});
ViewBag.menuItems = menuItems;
return View();
}

```

Note: You can achieve multi level nesting with data source by mapping **name** of the child items to the **children** sub-property of **fields** property. For more information, refer to the [data source binding](#) section.

The below table represents the MenuItem properties and its description.

| Property Name | Type | Description |
|---------------|-----------------|--|
| iconCss | string | Defines class/multiple classes separated by a space for the menu Item that is used to include an icon. Menu Item can include font icon and sprite image. |
| id | string | Specifies the id for menu item. |
| separator | boolean | Specifies separator between the menu items. Separator are either horizontal or vertical lines used to group menu items. |
| items | MenuItemModel[] | Specifies the sub menu items that is the array of MenuItem model/ |
| text | string | Specifies text for menu item. |

|url|string|Specifies url for menu item that creates the anchor link to navigate to the url provided.

- [Group menu items with separator](#)

Data source binding and Custom menu items

Data binding

The Menu supports data source bindings such as array of JavaScript objects that can be structured as either **hierarchical** or **self-referential** data.

Hierarchical data

The Menu can be populated with hierarchical data source by assigning it to the **items** property, and the fields with corresponding keys can be mapped to the [fields](#) property.

JSON data

The Menu can generate its menu items through an array of complex data source by mapping fields from the [fields](#) property.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Fields(ViewBag.menuFields)
.Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>
```

MODEL.CS

```
public class Model
{
    public static List<object> GetLocalData()
    {
        List<object> data = new List<object>()
        {
            new
            {
                continent = "Asia",
                countries = new List<object>()
                {
                    new
                    {
                        country = "China",
                        languages = new List<object>()
                        {
                            new { language= "Chinese"},
                            new { language= "Cantonese"}
                        }
                    },
                    new {
```

```

        country = "India",
        languages =new List<object>() {

        }
    }
};
return data;
}
}

```

Self-referential data

Menu can be populated from self-referential data structure that contains array of JSON objects with `parentId` mapping.

You can directly assign self-referential data to the `items` property, and map all the field members with corresponding keys from self-referential data to `fields` property.

To render the root level nodes, specify the `parentId` as null or no need to specify the `parentId` in data source.

In the following example, `id`, `pId`, and `text` columns from self-referential data have been mapped to `itemId`, `parentId`, and `text` fields, respectively.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Fields(ViewBag.menuFields)
.Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>
```

SELFREFERENTIAL.CS

```
// Self Referential Data
public ActionResult SelfReferential()
{
    List<object> menuItems = new List<object>()
    {
        new { id = "parent1", text = "Events" },
        new { id = "parent2", text = "Movies" },
        new { id = "parent3", text = "Directory" },
        new { id = "parent4", text = "Queries", pId = "null" },
        new { id = "parent5", text = "Services", pId = "null" },
        new { id = "parent6", text = "Conferences", parentId =
"parent1" },
        new { id = "parent7", text = "Music", parentId = "parent1"
},
        new { id = "parent8", text = "Workshops", parentId =
"parent1" },
        new { id = "parent9", text = "Now Showing", parentId =
"parent2" },
        new { id = "parent10", text = "Coming Soon", parentId =
"parent2" },
        new { id = "parent10", text = "Media Gallery", parentId =
"parent3" },
        new { id = "parent11", text = "Newsletters", parentId =
"parent3" },
        new { id = "parent12", text = "Our Policy", parentId =
"parent4" },
        new { id = "parent13", text = "Site Map", parentId =
"parent4" },
        new { id = "parent14", text = "Pop", parentId = "parent7" },
    }
```

```

        new { id = "parent15", text = "Folk", parentId = "parent7"
    },
        new { id = "parent16", text = "Classical", parentId =
"parent7" }
    };
    // For MenuFieldSettings type, include Syncfusion.EJ2.Navigations in the
using directive section.
    MenuFieldSettings menuFields = new MenuFieldSettings()
    {
        ItemId = "id",
        Text = "text",
        ParentId = "parentId"
    };
    ViewBag.menuItems = menuItems;
    ViewBag.menuFields = menuFields;
    return View();
}

```

Custom menu items

The Menu can be customized using Essential JS2 [Template engine](#) to render the elements.

To customize menu items in your application, set your customized template string to the [template](#) property.

In the following example, the menu has been rendered with customized menu items.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.data).Fields(ViewBag.menuFields).Template("#menuTemplate").Render()
<script id="menuTemplate" type="text/x-template">
    ${if(category)}
    ${category}
    ${else if (value && url)}
    <div class="e-avatar e-avatar-small image" style="background-image:
url(images/${url}.png);">${value}</div>
    ${else if (support)}
    <ul>
        ${for(val of support)}
        <li>
            ${val.value}
            ${if(val.count)}
            <span class='e-badge e-badge-success'>${val.count}</span>
            ${/if}
        </li>
        ${/for}
    </ul>
    ${else}
    <div tabindex="0" class="e-card">
        <div class="e-card-header">
            <div class="e-card-header-caption">
                <div class="e-card-header-title">About Us</div>
            </div>
        </div>
        <div class="e-card-content">
            ${about.value}

```

```

        </div>
        <div class="e-card-actions">
            <button class="e-btn e-outline">
                Read More
            </button>
        </div>
    </div>
    ${/if}
</script>
<style>

Use case scenarios

Scrollable menu

The menu component supports horizontal and vertical scrolling to render large menus and submenus in an adaptive way. This can be achieved by enabling the [enableScrolling](#) property and by restricting the corresponding menu/submenu size.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).EnableScrolling(true).CssClass('e-scrollable-menu').BeforeOpen('onBeforeOpen').Render()
<script>
    function onBeforeOpen(args) {
        // Restricting sub menu wrapper height
        if (args.parentItem.text === 'Appliances') {
            ej.base.closest(args.element, '.e-menu-wrapper').style.height =
'230px';
        }
    }
</script>
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
    /* Restricting the parent menu wrapper size */
    .e-menu-wrapper.e-scrollable-menu:not(.e-menu-popup) {
        width: 492px;
    }
</style>
```

SCROLLABLE.CS

```
public ActionResult Scrollable()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "Appliances",
        items = new List<object>()
        {
            new {
                text= "Kitchen",
                items = new List<object>()
                {
                    new { text= "Electric Cookers" },
                    new { text= "Coffee Makers" },
                    new { text= "Blenders" },
                    new { text= "Microwave Ovens" }
                }
            },
            new {
                text= "Television",
                items = new List<object>()
                {
                    new { text= "Our Exclusive TVs" },
                    new { text= "Smart TVs" },

    {
        text = "Help"
    });
    ViewBag.menuItems = menuItems;
    return View();
}

```

Menu in toolbar

The following example demonstrates how to integrate Menu with Toolbar component.

CSHTML

```

<div class="control-section">
    <div class="toolbar-menu-control">

@Html.EJS().Toolbar("shoppingtoolbar").Created("create").Items(ViewBag.items)
.Render()
    </div>
</div>
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
    @@font-face {

```

```

font-family: 'e-menu';

}

```

Accessibility in Menu Control

The Menu component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Menu component is outlined below.

| Accessibility Criteria | Compatibility |

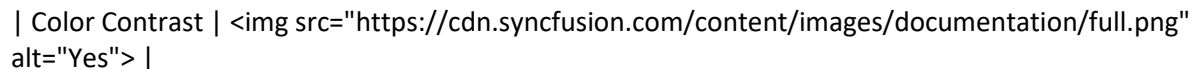

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" > |

| [Section 508](#) Support |  alt="Yes" > |

| Screen Reader Support |  alt="Yes" > |

| Right-To-Left Support |  alt="Yes" > |

| Color Contrast |  alt="Yes" > |

| Mobile Device Support |  alt="Yes" > |

| Keyboard Navigation Support |  alt="Yes" > |

| [Accessibility Checker](#) Validation |  alt="Yes" > |

| [Axe-core](#) Accessibility Validation |  alt="Yes" > |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Menu component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Menu component:

- | Attributes | Purpose |
|------------------|--|
| role | Indicates Menu component's root menu as <code>menubar</code> , popup as <code>menu</code> , and the popup items as <code>menuitem</code> . |
| aria-haspopup | Indicates the availability and type of interactive popup element. |
| aria-expanded | Indicates whether the subtree can be expanded or collapsed, and indicates whether its current state can be expanded or collapsed. |
| aria-orientation | Indicates whether the orientation is horizontal or vertical. The default orientation is horizontal. |
| aria-label | Indicates the menu item text. |
| aria-disabled | Indicates the state of menu item whether it is disabled. |

Keyboard interaction

The Menu component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Menu component.

- | Press | To do this |
|-------|---|
| Esc | Closes the sub menu that contains focus and returns focus to the parent element. |
| Enter | Opens the sub menu if focused menu item has sub menu, and places focus on its first item or activates the item and closes the sub menu. |
| Up | Navigates up or to the previous menu item. |
| Down | Navigates down or to the next menu item. |

| Left | Closes the current sub menu and navigates to the parent menu. |

| Right | Navigates and open the next sub menu. |

| Home | Focuses the first item. |

| End | Focuses the last item.

Ensuring accessibility

The Menu component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Menu component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Menu component with accessibility tools.

Styles and Appearances

To modify the Menu appearance, you need to override the default CSS of Menu component. Find the list of CSS classes and its corresponding section in Menu component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

|.e-menu-wrapper|To customize the menu wrapper

|.e-menu-wrapper.e-menu-popup|To customize the menu popup wrapper

|.e-menu-wrapper ul .e-menu-item|To customize the menu items

|.e-menu-wrapper.e-menu-popup .e-menu-item|To customize the menu popup items

|.e-menu-wrapper ul .e-menu-item .e-caret|To customize the menu items caret icon

How To

Change orientation in Menu Control

Orientation in menu items can be changed horizontally or vertically using the [orientation](#) property. By default, it is horizontally aligned.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Orientation(ViewBag.orientation).Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>
```

ORIENTATION.CS

```
using Syncfusion.EJ2.Navigations;
using System;
```

```
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
namespace EssentialJS2MvcApplication2.Controllers
{
    public class OrientationController : Controller
    {
        // GET: Orientation
        public ActionResult Orientation()
        {
            List<object> menuItems = new List<object>();
            menuItems.Add(new
            {
                text = "File",
                items = new List<object>()
                {
                    new { text = "Open" },
                    new { text = "Save" },
                    new { text = "Exit" }
                }
            });
            menuItems.Add(new
            {
                text = "Edit",
                items = new List<object>()
                {
                    new { text = "Cut" },
                    new { text = "Copy" },
                    new { text = "Paste" }
                }
            });
            menuItems.Add(new
            {
                text = "View",
                items = new List<object>()
                {
                    new { text = "Toolbar" },
                    new { text = "Sidebar" },
                    new { text = "Fullscreen" }
                }
            });
            menuItems.Add(new
            {
                text = "Tools",
                items = new List<object>()
                {
                    new { text = "Spelling & Grammar" },
                    new { text = "Customize" },
                    new { text = "Options" }
                }
            });
            menuItems.Add(new
            {
                text = "Help"
            });
        }
    }
}
```

```

        ViewBag.orientation =
Syncfusion.EJ2.Navigations.Orientation.Vertical;
        ViewBag.menuItems = menuItems;
        return View();
    }
}
}

```

Customize menu using events

The Menu provides a set of **events** to enable users to customize it.

CSHTML

```

<div class="control-section">
    <div class="menu-section">

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeOpen("updateEventLog")
.BeforeClose("updateEventLog").OnClose("updateEventLog").OnOpen("updateEventLog")
.Select("updateEventLog").Render()
    </div>
    <div class="property-section">
        <table id="propertyTable" title="Event trace">
            <tbody>
                <th>Event trace:-</th>
                <tr>
                    <td></td>
                </tr>
            </tbody>
        </table>
    </div>

@Html.EJS().Button("clear").Content("Clear").Created("onClearBtnCreated").Render()
</div>
<style>
    html, body, .control-section {
        height: 95%;
    }
    .menu-section {
        margin-top: 100px;
        text-align: center;
        float: left;
    }
    .property-section {
        overflow: auto;
        width: 40%;
        height: 330px;
        float: right;
        font-family: monospace;
    }
    .property-section th {
        text-align: left;
    }
    #clear {
        float: right;
        clear: both;
    }

```

```

    }
</style>
<script>
    function updateEventLog(args) {
        var propertyElem = document.getElementById('propertyTable');

        propertyElem.getElementsByTagName('td')[0].insertAdjacentHTML('beforeend',
        args.name + ' Event triggered. <br />');
    }
    function onClearBtnCreated() {
        document.getElementById("clear").onclick = function () {
            var propertyElem = document.getElementById('propertyTable');
            propertyElem.getElementsByTagName('td')[0].innerHTML = '';
        };
    }
</script>

```

HANDLEEVENTS.CS

```

// GET: HandleEvents
public ActionResult HandleEvents()
{
    List<object> menuItems = new List<object>() {
        new {
            text = "Events",
            items = new List<object>() {
                new { text= "Conferences" },
                new { text= "Music" },
                new { text= "Workshops" }
            }
        },
        new {
            text = "Movies",
            items = new List<object>() {
                new { text= "Now Showing" },
                new { text= "Coming Soon" }
            }
        },
        new {
            text = "Directory",
            items = new List<object>() {
                new { text= "Media Gallery" },
                new { text= "Newsletters" }
            }
        },
        new {
            text = "Queries",
            items = new List<object>() {
                new { text= "Our Policy" },
                new { text= "Site Map"},
                new { text= "24x7 Support"}
            }
        },
        new { text= "Services" }
    };

    ViewBag.menuItems = menuItems;
}

```

```
return View();
}
```

Customize menu items

Add or remove menu items

Menu items can be added or removed using the `insertAfter`, `insertBefore` and `removeItems` methods.

In the following example, the **Europe** menu items are added before the **Oceania** item, the **Africa** menu items are added after the **Asia**, and the **South America** and **Mexico** items are removed from menu.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Fields(ViewBag.menuFields)
.Created("created").Render()
<script>
function created(args) {
    var insertBefore = [
        {
            continent: 'Europe',
            countries: [
                { country: 'Finland' },
                { country: 'Austria' }
            ]
        }
    ];
    var insertItem = [
        {
            continent: 'Africa',
            countries: [
                { country: 'Nigeria' }
            ]
        }
    ];
    menuObj = document.getElementById("menu").ej2_instances[0];
    // Add items before to 'Oceania'
    menuObj.insertBefore(insertBefore, "Oceania", false);
    // Add items after to 'Asia'
    menuObj.insertAfter(insertItem, "Asia", false);
    // Remove items
    menuObj.removeItems(['South America', 'Mexico'], false);
}
</script>
<style>
body {
    margin-top: 100px;
    text-align: center;
}
</style>
```

CUSTOMIZEMENUITEMS.CS

```
// Customize Menu Items
public ActionResult CustomizeMenuItems()
{
    List<object> menuItems = new List<object>();
```

```

menuItems.Add(new
{
    continent = "Asia",
    countries = new List<object>()
    {
        new { country = "China" },
        new { country = "India" },
        new { country = "Japan" }
    },
});
menuItems.Add(new
{
    continent = "North America",
    countries = new List<object>()
    {
        new { country = "Canada" },
        new { country = "Mexico" },
        new { country = "USA" }
    },
});
menuItems.Add(new
{
    continent = "South America",
    countries = new List<object>()
    {
        new { country = "Brazil" },
        new { country = "Colombia" },
        new { country = "Argentina" }
    },
});
menuItems.Add(new
{
    continent = "Oceania",
    countries = new List<object>()
    {
        new { country = "Australia" },
        new { country = "New Zealand" },
        new { country = "Samoa" }
    },
});
menuItems.Add(new { continent = "Antarctica" });
MenuFieldSettings menuFields = new MenuFieldSettings()
{
    Text = new string[] { "continent", "country" },
    Children = new string[] { "countries" }
};
ViewBag.menuItems = menuItems;
ViewBag.menuFields = menuFields;
return View();
}

```

Note: To process items with ID values, set `isUnique` to `true`.

Enable or disable menu items

You can enable and disable the menu items using the `enableItems` method in Menu. To enable menu items, set the `enable` property in argument to `true` and vice-versa.

In the following example, the **Directory** header item, **Conferences**, and **Music** sub menu items are disabled.

CSHTML

```
@Html.EJS().Button("enableAll").Content("Enable all
items").Created("btnCreated").Render()
<div class="menu-section">

@Html.EJS().Menu("menu").Items(ViewBag.data).Created("created").BeforeOpen("
beforeOpen").Render()
</div>
<style>
    .menu-section {
        margin-top: 100px;
        text-align: center;
    }
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>
<script>
    var disableItems = ['Conferences', 'Music', 'Directory'], menuObj;
    function beforeOpen(args) {
        menuObj = ej.base.getComponent(document.getElementById("menu"),
"menu");
        //Handling sub menu items
        for (var i = 0; i < args.items.length; i++) {
            if (disableItems.indexOf(args.items[i].text) > -1) {
                menuObj.enableItems([args.items[i].text], false, false);
            }
        }
    }
    function created(args) {
        menuObj = ej.base.getComponent(document.getElementById("menu"),
"menu");
        //Disable items
        menuObj.enableItems(disableItems, false, false);
    }
    function btnCreated(args) {
        var buttonObj =
ej.base.getInstance(document.getElementById("showAll"), ej.buttons.Button);
        buttonObj.element.onclick = () => {
            //Enable items
            menuObj.enableItems(disableItems, true, false);
            disableItems = [];
        }
    }
</script>
```

ENABLEDISABLE.CS

```
// Enable and Disable Menu Items
public ActionResult EnableDisable()
{
    List<object> data = new List<object>() {
        new {
            text = "Events",
            items = new List<object>() {
                new { text= "Conferences" },
                new { text= "Music" },
                new { text= "Workshops" }
            }
        },
        new {
            text = "Movies",
            items = new List<object>() {
                new { text= "Now Showing" },
                new { text= "Coming Soon" }
            }
        },
        new {
            text = "Directory",
            items = new List<object>() {
                new { text= "Media Gallery" },
                new { text= "Newsletters" }
            }
        },
        new {
            text = "Queries",
            items = new List<object>() {
                new { text= "Our Policy" },
                new { text= "Site Map" },
                new { text= "24x7 Support" }
            }
        },
        new { text= "Services" }
    };
    ViewBag.data = data;
    return View();
}
```

Note: To disable sub menu items, use the [beforeOpen](#) event.

Hide or show menu items

You can show or hide the menu items using the `showItems` and `hideItems` methods.

In the following example, the **Movies** header item, **Workshops**, and **Music** sub menu items are hidden in menu.

CSHTML

```
@Html.EJS().Button("showAll").Content("Show All
items").Created("btnCreated").Render()
<div class="menu-section">
```

```

@Html.EJS().Menu("menu").Items(ViewBag.data).Created("created").BeforeOpen("
beforeOpen").Render()
</div>
<style>
    .menu-section {
        margin-top: 100px;
        text-align: center;
    }
    body {
        margin-top: 100px;
        text-align: center;
    }
</style>
<script>
    var hiddenItems = ['Workshops', 'Music', 'Movies'], menuObj;
    function beforeOpen(args) {
        menuObj = ej.base.getComponent(document.getElementById("menu"),
"menu");
        //Handling sub menu items
        for (var i = 0; i < args.items.length; i++) {
            if (hiddenItems.indexOf(args.items[i].text) > -1) {
                menuObj.hideItems([args.items[i].text], false);
            }
        }
    }
    function created(args) {
        menuObj = ej.base.getComponent(document.getElementById("menu"),
"menu");
        menuObj.hideItems(hiddenItems, false);
    }
    function btnCreated(args) {
        var buttonObj =
ej.base.getInstance(document.getElementById("showAll"), ej.buttons.Button);
        buttonObj.element.onclick = () => {
            menuObj.showItems(hiddenItems, false);
            hiddenItems = [];
        }
    }
</script>

```

HIDESHOW.CS

```

public ActionResult ShowHide()
{
    List<object> data = new List<object>() {
        new {
            text = "Events",
            items = new List<object>() {
                new { text= "Conferences" },
                new { text= "Music" },
                new { text= "Workshops" }
            }
        },
        new {
            text = "Movies",

```

```

        items = new List<object>() {
            new { text= "Now Showing" },
            new { text= "Coming Soon" }
        },
        new {
            text = "Directory",
            items = new List<object>() {
                new { text= "Media Gallery" },
                new { text= "Newsletters" }
            }
        },
        new {
            text = "Queries",
            items = new List<object>() {
                new { text= "Our Policy" },
                new { text= "Site Map"},
                new { text= "24x7 Support"}
            }
        },
        new { text= "Services" }
    };
    ViewBag.data = data;
    return View();
}

```

Note: Using the [beforeOpen](#) event, you can hide the sub menu items as in the above example since the menu supports to hide items only for headers initially.

Create mnemonic UI in menu item

A particular character in a text can be underlined in the [beforeItemRender](#) event by adding `<u>` tag in between the text and assign the innerHTML to the `li` element.

In the following example, the first character in `File`, `Open`, and `Save` menu items are underlined.

In the below example, `File`, `Open` and `Save` items are underlined with first character in menu items.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeItemRender("beforeItemRender").Render()
<script>
    function beforeItemRender(args) {
        if (['File', 'Open', 'Save'].indexOf(args.item.text) > -1) {
            // To underline a First character.
            var underlinedText = '<u>' + args.item.text.slice(0, 1) + '</u>'
            + args.item.text.slice(1);
            args.element.innerHTML =
            args.element.innerHTML.replace(args.item.text, underlinedText);
        }
    }
</script>
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }

```

```

}

UNDERLINE.CS

```

// Underline
public ActionResult Underline()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "File",
        iconCss = "em-icons e-file",
        items = new List<object>()
        {
            new { text = "Open", iconCss= "em-icons e-open" },
            new { text = "Save", iconCss= "e-icons e-save" },
            new { separator = true },
            new { text = "Exit" }
        }
    });
    menuItems.Add(new
    {
        text = "Edit",
        iconCss = "em-icons e-edit",

```

```

        items = new List<object>()
        {
            new { text = "Cut", iconCss= "em-icons e-cut" },
            new { text = "Copy", iconCss= "em-icons e-copy" },
            new { text = "Paste", iconCss= "em-icons e-paste" }
        }
    });
    menuItems.Add(new
    {
        text = "Format",
    });
    menuItems.Add(new
    {
        text = "View"
    });
    menuItems.Add(new
    {
        text = "Bookmarks"
    });
    menuItems.Add(new
    {
        text = "Tools"
    });
    menuItems.Add(new
    {
        separator = true
    });
    menuItems.Add(new
    {
        text = "Help"
    });
    ViewBag.menuItems = menuItems;
    return View();
}

```

Change sub menu position

The submenu position can be changed by using the [beforeOpen](#) event. Assign the top and left position where you want to open the submenu to the [beforeOpen](#) event arguments `args.top` and `args.left` respectively.

In the below sample, the sub menu opens above the parent menu item.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeOpen('onBeforeOpen')
.Render()
<script>
    function onBeforeOpen(args) {
        // Getting parent menu item element offset
        var relativeOffset = ej.base.closest(args.event.target, '.e-menu-
item').getBoundingClientRect();
        // Getting sub menu wrapper element using closest method
        var subMenuEle = ej.base.closest(args.element, '.e-menu-wrapper');
        subMenuEle.style.display = 'block';
        args.top = (relativeOffset.top -
subMenuEle.getBoundingClientRect().height) + pageYOffset;
    }

```

```

        args.left = relativeOffset.left + pageXOffset;
        subMenuEle.style.display = '';
    }
</script>
<style>
    body {
        margin-top: 200px;
        text-align: center;
    }
</style>

```

POSITION.CS

```

public ActionResult Position()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "File",
        items = new List<object>()
        {
            new { text = "Open" },
            new { text = "Save" },
            new { text = "Exit" }
        }
    });
    menuItems.Add(new
    {
        text = "Edit",
        items = new List<object>()
        {
            new { text = "Cut" },
            new { text = "Copy" },
            new { text = "Paste" }
        }
    });
    menuItems.Add(new
    {
        text = "View",
        items = new List<object>()
        {
            new { text = "Toolbar" },
            new { text = "Sidebar" },
            new { text = "Fullscreen" }
        }
    });
    menuItems.Add(new
    {
        text = "Tools",
        items = new List<object>()
        {
            new { text = "Spelling & Grammar" },
            new { text = "Customize" },
            new { text = "Options" }
        }
    });
}

```

```

menuItem.Add(new
{
    text = "Help"
});
ViewBag.menuItems = menuItem;
return View();
}

```

Note: For custom positioning, set both **top** and **left** position in the [beforeOpen](#) event.

Menu with rounded corner

The rounded corner can be achieved by using the [cssClass](#) property. Add a custom class to the menu component and customize it using the **border-radius** CSS property. For more information, refer to the styles specified in the below sample.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).CssClass('e-rounded-menu').showItemOnClick("true").Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
    /* Styles to achieve rounder corner in menu */
    .e-menu-wrapper.e-rounded-menu:not(.e-menu-popup),
    .e-menu-wrapper.e-rounded-menu .e-menu {
        border-radius: 20px;
    }
    /* Increased the menu component left and right padding for better
    rounded corner UI */
    .e-menu-wrapper.e-rounded-menu ul.e-menu {
        padding: 0 14px;
    }
</style>

```

ROUNDED.CS

```

public ActionResult Rounded()
{
    List<object> menuItem = new List<object>();
    menuItem.Add(new
    {
        text = "File",
        items = new List<object>()
        {
            new { text = "Open" },
            new { text = "Save" },
            new { text = "Exit" }
        }
    });
    menuItem.Add(new
    {
        text = "Edit",
        items = new List<object>()
    });
}

```

```

        {
            new
            {
                text= "Toolbars",
                items = new List<object>()
                {
                    new { text= "Menu Bar"},
                    new { text= "Bookmarks Toolbar"}
                }
            },
            new
            {
                text = "Zoom",
                items =new List<object>()
                {
                    new { text= "Zoom In"},
                    new { text= "Zoom Out"},
                    new { text= "Reset"}
                }
            },
            new
            {
                text = "Full Screen",
                items =new List<object>()
                {
                    new { text= "cancel"}
                }
            },
        }
    });
    menuItems.Add(new
    {
        text = "View",
        items = new List<object>()
        {
            new { text = "Toolbar" },
            new { text = "Sidebar" },
            new { text = "Fullscreen" }
        }
    });
    menuItems.Add(new
    {
        text = "Tools",
        items = new List<object>()
        {
            new { text = "Spelling & Grammar" },
            new { text = "Customize" },
            new { text = "Options" }
        }
    });
    menuItems.Add(new
    {
        text = "Help"
    });
    ViewBag.menuItems = menuItems;
    return View();
}

```

Set title for Menu Items

In this sample, the title for settings icon can be achievable by using `beforeItemRender` client-side event in Menu component.

CSHTML

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeItemRender("itemRender").Render()
<script>
function itemRender(args) {
    if (args.item.id == 'settingIcon') {
        args.element.setAttribute('title', 'Settings');
    }
}
</script>
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
    .em-icons {
        font-family: 'e-menu';
        font-style: normal;
        font-variant: normal;
        font-weight: normal;
        line-height: 1;
        text-transform: none;
    }
    .e-file::before {
        content: '\e886';
    }
    .e-menu-wrapper .e-menu .e-menu-item.e-menu-caret-icon .e-icons.e-caret {
        display: none;
    }

    .e-menu-wrapper .e-menu .e-menu-item.e-menu-caret-icon {
        padding-right: 5px;
    }
</style>
```

TITLE.CS

```
public ActionResult Title()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        id: 'settingIcon',
        iconCss: 'em-icons e-file',
        items = new List<object>()
        {
            new { text = "Open",
                items = new List<object>()
            }
        }
    });
}
```

```

        new { text = "Option 1" },
        new { text = "Option 2" }
    } },
    new { text = "Save" },
    { separator: true },
    new { text = "Exit" }
}
});
ViewBag.menuItems = menuItems;
return View();
}

```

Open menu and sub menu on click only

You can open menu items and sub menu on menu item click by setting [showItemOnClick](#) property of the Menu. To open sub menu items only on item click, should be set as `true`.

CSHTML

```

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).CssClass('e-rounded-menu').showItemOnClick("true").Render()
<style>
    body {
        margin-top: 100px;
        text-align: center;
    }
    /* Styles to achieve rounder corner in menu */
    .e-menu-wrapper.e-rounded-menu:not(.e-menu-popup),
    .e-menu-wrapper.e-rounded-menu .e-menu {
        border-radius: 20px;
    }
    /* Increased the menu component left and right padding for better rounded corner UI */
    .e-menu-wrapper.e-rounded-menu ul.e-menu {
        padding: 0 14px;
    }
</style>

```

ROUNDED.CS

```

public ActionResult Rounded()
{
    List<object> menuItems = new List<object>();
    menuItems.Add(new
    {
        text = "File",
        items = new List<object>()
        {
            new { text = "Open" },
            new { text = "Save" },
            new { text = "Exit" }
        }
    });
    menuItems.Add(new
    {
        text = "Edit",

```

```

        items = new List<object>()
        {
            new
            {
                text= "Toolbars",
                items = new List<object>()
                {
                    new { text= "Menu Bar"},
                    new { text= "Bookmarks Toolbar"}
                }
            },
            new
            {
                text = "Zoom",
                items =new List<object>()
                {
                    new { text= "Zoom In"},
                    new { text= "Zoom Out"},
                    new { text= "Reset"}
                }
            },
            new
            {
                text = "Full Screen",
                items =new List<object>()
                {
                    new { text= "cancel"}
                }
            },
        }
    });
    menuItems.Add(new
    {
        text = "View",
        items = new List<object>()
        {
            new { text = "Toolbar" },
            new { text = "Sidebar" },
            new { text = "Fullscreen" }
        }
    });
    menuItems.Add(new
    {
        text = "Tools",
        items = new List<object>()
        {
            new { text = "Spelling & Grammar" },
            new { text = "Customize" },
            new { text = "Options" }
        }
    });
    menuItems.Add(new
    {
        text = "Help"
    });
    ViewBag.menuItems = menuItems;
    return View();

```

Migration from Essential JS 1

This article describes the API migration process of Menu component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Animation type on hover or click on the menu items | **Property:** *animationType*

@Html.EJ().Menu("menu").AnimationType(AnimationType.Default) | Not applicable |

| Context menu target | **Property:** *contextMenuTarget*

@Html.EJ().Menu("menu").ContextMenuTarget("#target") | Not applicable |

| Container element for submenu's collision | **Property:** *container*

@Html.EJ().Menu("menu").ContextMenuTarget("#target").Container("#target") | Not applicable |

| Menu items | Not applicable | **Property:** *items*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() |

| Properties of menu items | **Property:** *id, text, imageUrl, children and url*

@Html.EJ().Menu("menu").Items(items =>
 {

items.Add().Id("fileid").Text("File");

items.Add().Id("editid").Text("Edit").Children(child =>
 {

child.Add().Text("Cut");
 child.Add().Text("Copy");

child.Add().Text("Paste");
 });

items.Add().Id("viewid").Text("View").Url("#");

items.Add().Id("helpid").Text("Help");
 }) | **Property:** *id, text, items, iconCss and url*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
 List<object> menuItems =
new List<object>();
menuItems.Add(new
{
 text = "File", id =
"fileid"
});
menuItems.Add(new
{
 text = "Edit",
id= "editid",

items = new List<object>()
 {
 new { text= "Cut", iconCss= "e-icons e-
cut" },
 new { text= "Copy", iconCss= "e-icons e-copy" },
 new {
text= "Paste", iconCss= "e-icons e-paste" }
 };
menuItems.Add(new
{

 text = "view", id= "viewid", url= "#"
});
menuItems.Add(new
{
 text =
"Help", id= "helpid"
});
 ViewBag.menuItems = menuItems; |

| Adding custom class | **Property:** *cssClass*

@Html.EJ().Menu("menu").CssClass("custom-class") | **Property:** *cssClass*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).CssClass("custom-class").Render() |

| Enables or disables the animation on hover or click on the menu items | **Property:** *enableAnimation*

 @Html.EJ().Menu("menu").EnableAnimation(true) | Not applicable |

| Animation settings | Not applicable | **Property:** *animationSettings*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).AnimationSettings("ViewBag.animation").Render() |

| Root menu items to be aligned center in horizontal menu | **Property:** *enableCenterAlign* @Html.EJ().Menu("menu").EnableCenterAlign(true) | Not applicable |

| Disabled state | **Property:** *enabled* @Html.EJ().Menu("menu").Enabled(false) | **Property:** *disabled* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Disabled(true).Render() |

| RTL | **Property:** *enableRTL* @Html.EJ().Menu("menu").EnableRTL(true) | **Property:** *enableRtl* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).EnableRtl(true).Render() |

| Enables/Disables the separator | **Property:** *enableSeparator* @Html.EJ().Menu("menu").EnableSeparator(false) | Not applicable |

| Menu Type | **Property:** *menuType* @Html.EJ().Menu("menu").MenuType(MenuType.ContextMenu) | Not applicable |

| Exclude target for context menu | **Property:** *excludeTarget* @Html.EJ().Menu("menu").MenuType(MenuType.ContextMenu).ContextMenuTarget("#target").ExcludeTarget(".inner") | Not applicable |

| Fields | **Property:** *fields* @Html.EJ().Menu("menu").MenuFields(f => f.Datasource((IEnumerable<Check.Controllers.CheckController.MenuJson>)ViewBag.datasource).Id("id").Text("text").ParentId("parent")) | **Property:** *fields* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Fields("ViewBag.menuFields").Render() |

| Height | **Property:** *height* @Html.EJ().Menu("menu").Height("50") | Not applicable |

| Width | **Property:** *width* @Html.EJ().Menu("menu").Width("800") | Not applicable |

| HTML Attributes | **Property:** *htmlAttributes* @Html.EJ().Menu("menu").HtmlAttribute("") | Not applicable |

| Responsive | **Property:** *isResponsive* @Html.EJ().Menu("menu").IsResponsive(true) | Not applicable |

| Show item on click | **Property:** *openOnClick* @Html.EJ().Menu("menu").OpenOnClick(true) | **Property:** *showItemOnClick* @Html.EJS().Menu("menu").ShowItemOnClick(true).Items("ViewBag.menuItems").Render() |

| Orientation | **Property:** *orientation* @Html.EJ().Menu("menu").Orientation(Orientation.Vertical) | **Property:** *orientation* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Orientation("Vertical").Render() |

| Show root level arrows | **Property:** *showRootLevelArrows* @Html.EJ().Menu("menu").ShowRootLevelArrows(false) | Not applicable |

| Show sub level arrows | **Property:** *showSubLevelArrows* @Html.EJ().Menu("menu").ShowSubLevelArrows(false) | Not applicable |

| Sub menu direction | **Property:** *subMenuDirection* @Html.EJ().Menu("menu").SubMenuDirection(Direction.Left) | Not applicable |

| Title | **Property:** *titleText* @Html.EJ().Menu("menu").TitleText("Title of the Menu") |
Not applicable |

| Template | Not applicable | **Property:** *template*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Template("#menuTemplate").Render()
|

| Pop up menu height | **Property:** *overflowHeight*

@Html.EJ().Menu("menu").OverflowHeight("200") | Not applicable |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Disable Method | **Method:** *disable*

 @Html.EJ().Menu("menu")
 var menu =
\$("#menu").data("ejMenu");
 menu.disable(); | Not applicable |

| Disable menu items | **Method:** *disableItem*

 @Html.EJ().Menu("menu").Items(items =>

 {
 items.Add().Text("File");
 items.Add().Text("Edit");

items.Add().Text("Help");
 })
 var menu = \$("#menu").data("ejMenu");

menu.disableItem("File"); | **Method:** *enableItems*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
 var menu =
document.getElementById("menu").ej2_instances[0];
 menu.enableItems("File", false) |

| Disable menu items by ID | **Method:** *disableItemByID*

@Html.EJ().Menu("menu").Items(items =>
 {

items.Add().Id("fileid").Text("File");
 items.Add().Id("editid").Text("Edit");

 items.Add().Id("helpid").Text("Help");
 })
 var menu =
\$("#menu").data("ejMenu");
 menu.disableItemByID("fileid"); | **Method:** *enableItems*

 @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
 var menu =
document.getElementById("menu").ej2_instances[0];
 menu.enableItems("fileid", false, true) |

| Enable Method | **Method:** *enable*

 @Html.EJ().Menu("menu")
 var menu =
\$("#menu").data("ejMenu");
 menu.enable(); | Not applicable |

| Enable menu items | **Method:** *enableItem*

 @Html.EJ().Menu("menu").Items(items =>

 {
 items.Add().Text("File");
 items.Add().Text("Edit");

items.Add().Text("Help");
 })
 var menu = \$("#menu").data("ejMenu");

menu.enableItem("File"); | **Method:** *enableItems*

@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
 var menu =
document.getElementById("menu").ej2_instances[0];
 menu.enableItems("File", true); |

| Enable menu items by ID | **Method:** *enableItemByID*

@Html.EJ().Menu("menu").Items(items =>
 {

items.Add().Id("fileid").Text("File");
 items.Add().Id("editid").Text("Edit");

 items.Add().Id("helpid").Text("Help");
 })
 var menu =
\$("#menu").data("ejMenu");
 menu.enableItemByID("fileid"); | **Method:** *enableItems*

 @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render()
 var menu =
document.getElementById("menu").ej2_instances[0];
 menu.enableItems("fileid", true, true); |

| Hide Method | **Method:** *hide* @Html.EJ().Menu("menu") var menu = \$("#menu").data("ejMenu"); menu.hide(); | Not applicable |

| Hide menu items | **Method:** *hideItems* @Html.EJ().Menu("menu").Items(items => { items.Add().Id("fileid").Text("File"); items.Add().Id("editid").Text("Edit"); items.Add().Id("helpid").Text("Help"); }) var menu = \$("#menu").data("ejMenu"); menu.hideItems(["#helpid", "#editid"]); | **Method:** *hideItems* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() var menu = document.getElementById("menu").ej2instances[0]; menu.hideItems(["editid", "helpid"], true); |

| Insert menu items | **Method:** *insert* @Html.EJ().Menu("menu").Items(items => { items.Add().Id("fileid").Text("File"); items.Add().Id("editid").Text("Edit"); items.Add().Id("helpid").Text("Help"); }) var menu = \$("#menu").data("ejMenu"); menu.insert({ id: "viewid", text: "View" }, "#edit_id"); | Not applicable |

| Insert menu items after the specified menu item | **Method:** *insertAfter* @Html.EJ().Menu("menu").Items(items => { items.Add().Id("fileid").Text("File"); items.Add().Id("editid").Text("Edit"); items.Add().Id("helpid").Text("Help"); }) var menu = \$("#menu").data("ejMenu"); menu.insertAfter({ id: "viewid", text: "View" }, "#editid"); | **Method:** *insertAfter* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() var menu = document.getElementById("menu").ej2instances[0]; menu.insertAfter({ id: "view_id", text: "View" }, "Edit"); |

| Insert menu items before the specified menu item | **Method:** *insertBefore* @Html.EJ().Menu("menu").Items(items => { items.Add().Id("fileid").Text("File"); items.Add().Id("editid").Text("Edit"); items.Add().Id("helpid").Text("Help"); }) var menu = \$("#menu").data("ejMenu"); menu.insertBefore({ id: "viewid", text: "View" }, "#helpid"); | **Method:** *insertBefore* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() var menu = document.getElementById("menu").ej2instances[0]; menu.insertBefore({ id: "view_id", text: "View" }, "Help"); |

| Remove menu items | **Method:** *remove* @Html.EJ().Menu("menu").Items(items => { items.Add().Id("fileid").Text("File"); items.Add().Id("editid").Text("Edit"); items.Add().Id("helpid").Text("Help"); }) var menu = \$("#menu").data("ejMenu"); menu.remove(["#Edit"]); | **Method:** *removeItems* @Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() var menu = document.getElementById("menu").ej2instances[0]; menu.removeItems(["Edit"]); |

| To show menu | **Method:** *show* @Html.EJ().Menu("menu") var menu = \$("#menu").data("ejMenu"); menu.show(); | Not applicable |

| Destroy method | **Method:** *destroy*

 @Html.EJ().Menu("menu")
 var menu = \$("#menu").data("ejMenu");
 menu.destroy(); | **Method:** *destroy*

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Render() <br/> var menu =
document.getElementById("menu").ej2_instances[0]; <br/> menu.destroy(); |
```

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers before opening the menu | **Events:** *beforeOpen*

```
@Html.EJ().Menu("menu").BeforeOpen("beforeOpen") <br/> function beforeOpen(args) { <br/>
&#160; &#160; / code block / <br/> } | Events: beforeOpen <br/><br/>
```

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeOpen("beforeOpen").Render() <br/>
function beforeOpen(args) { <br/> &#160; &#160; / code block / <br/> } |
```

| Triggers before closing the menu | Not applicable | **Events:** *beforeClose*

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeClose("beforeClose").Render()
<br/> function beforeClose(args) { <br/> &#160; &#160; / code block */ <br/> } |
```

| Triggers before rendering each menu item | Not applicable | **Events:** *beforeItemRender*

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).BeforeItemRender("beforeItemRender")
.Render() <br/> function beforeItemRender(args) { <br/> &#160; &#160; / code block */ <br/> } |
```

| Triggers while selecting the menu item | **Events:** *click*

```
@Html.EJ().Menu("menu").Click("click") <br/> function click(args) { <br/> &#160; &#160; / code
block / <br/> } | Events: select <br/><br/>
```

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Select("select").Render() <br/> function
select(args) { <br/> &#160; &#160; / code block / <br/> } |
```

| Triggers after closing the menu | **Events:** *close*

```
@Html.EJ().Menu("menu").Close("close") <br/> function close(args) { <br/> &#160; &#160; / code
block / <br/> } | Events: onClose <br/><br/>
```

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).OnClose("onClose").Render() <br/> function
onClose(args) { <br/> &#160; &#160; / code block / <br/> } |
```

| Triggers after opening the menu | **Events:** *open*

```
@Html.EJ().Menu("menu").Open("open") <br/> function open(args) { <br/> &#160; &#160; / code
block / <br/> } | Events: onOpen <br/><br/>
```

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).OnOpen("onOpen").Render() <br/> function
onOpen(args) { <br/> &#160; &#160; / code block / <br/> } |
```

| Triggers once the component rendering is completed | **Events:** *create*

```
@Html.EJ().Menu("menu").Create("create") <br/> function create(args) { <br/> &#160; &#160; /
code block / <br/> } | Events: created <br/><br/>
```

```
@Html.EJS().Menu("menu").Items(ViewBag.menuItems).Created("created").Render() <br/> function
created() { <br/> &#160; &#160; / code block / <br/> } |
```

| Triggers once the component is destroyed | **Events:** *destroy*

```
@Html.EJ().Menu("menu").Destroy("destroy") <br/> function destroy(args) { <br/> &#160; &#160; /
code block */ <br/> } | Not applicable |
```

| Triggers when key down on menu items | **Events:** *keydown*

```
@Html.EJ().Menu("menu").Keydown("keydown") <br/> function keydown(args) { <br/> &#160;
&#160; / code block */ <br/> } | Not applicable |
```

| Triggers when mouse out from menu items | **Events:** *mouseout*

 @Html.EJ().Menu("menu").Mouseout("mouseout")
 function mouseout(args) {

 / code block */
 } | Not applicable |

| Triggers when mouse over the Menu items | **Events:** *mouseover*

 @Html.EJ().Menu("menu").Mouseover("mouseover")
 function mouseover(args) {

 / code block */
 } | Not applicable |

| Triggers when overflow popup menu opens | **Events:** *overflowOpen*

 @Html.EJ().Menu("menu").OverflowOpen("overflowOpen")
 function overflowOpen(args) {

 / code block */
 } | Not applicable |

| Triggers when overflow popup menu closes | **Events:** *overflowClose*

 @Html.EJ().Menu("menu").OverflowClose("overflowClose")
 function overflowClose(args) {

 / code block */
 } | Not applicable |

Message

Getting Started with ASP.NET MVC Message Control

This section briefly explains how to include ASP.NET MVC Message control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

<namespaces>

```
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the `<head>` of `~/Pages/Shared/_Layout.cshtml` file as follows,

~/ _LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager `EJS().ScriptManager()` at the end of `<body>` in the `~/Pages/Shared/_Layout.cshtml` file as follows.

~/ _LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC Message control

Now, add the Syncfusion ASP.NET MVC Message control in the `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().Message("msg-default").Content("Please read the comments
carefully").Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC Message control will be rendered in the default web browser.

 Please read the comments carefully

Severities in Message control

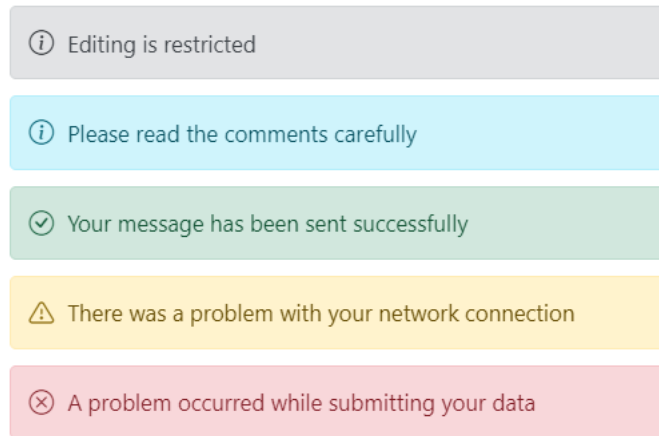

The severity denotes the importance and context of the message to the user. The message contains different severity types. Use the [Severity](#) property to display the messages with different severity levels.

The available severity types are **Normal**, **Success**, **Info**, **Warning** and **Error**. The default severity type for messages is **Normal**.

The following example demonstrates the severity of the messages.

CSHTML

```
<div class="msg-default-section">
  <div class="msg-content-section">
    @Html.EJS().Message("msg-
default").Severity(Severity.Normal).Content("Editing is
restricted").Render()
    @Html.EJS().Message("msg-
info").Severity(Severity.Info).Content("Please read the comments
carefully").Render()
    @Html.EJS().Message("msg-
success").Severity(Severity.Success).Content("Your message has been sent
successfully").Render()
    @Html.EJS().Message("msg-
warning").Severity(Severity.Warning).Content("There was a problem with your
network connection").Render()
    @Html.EJS().Message("msg-error").Severity(Severity.Error).Content("A
problem occurred while submitting your data").Render()
  </div>
</div>
<style>
  .msg-default-section .content-section {
    margin: 0 auto;
    max-width: 450px;
    padding-top: 10px;
  }
  .msg-default-section .e-message {
    margin: 10px 0;
  }
</style>
```

Variants in Message control

The Message has predefined appearance variants for different visual representations. The variants of the message can be changed based on the [Variant](#) property.

The available variants are **Text**, **Outlined** and **Filled**. The default variant type for messages is **Text**.

- **Text** - The severity is differentiated using a text color and a light background color.
- **Outlined** - The severity is differentiated using a text color and a border without a background.
- **Filled** - The severity is differentiated using a text color and a dark background color.

The following example demonstrates the default message with different variant types.

CSHTML

```
<div class="msg-variant-section">
  <div class="msg-content-section">
    <h4>Filled</h4>
    @Html.EJS().Message("msg-
default_filled").Severity(Severity.Normal).Variant(Variant.Filled).Content("
Editing is restricted").Render()
    @Html.EJS().Message("msg-
info_filled").Severity(Severity.Info).Variant(Variant.Filled).Content("Pleas
e read the comments carefully").Render()
    @Html.EJS().Message("msg-
success_filled").Severity(Severity.Success).Variant(Variant.Filled).Content(
"Your message has been sent successfully").Render()
    @Html.EJS().Message("msg-
warning_filled").Severity(Severity.Warning).Variant(Variant.Filled).Content(
"There was a problem with your network connection").Render()
    @Html.EJS().Message("msg-
error_filled").Severity(Severity.Error).Variant(Variant.Filled).Content("A
problem occurred while submitting your data").Render()
  </div>
  <div class="msg-content-section">
    <h4>Outlined</h4>
    @Html.EJS().Message("msg-
default_outlined").Severity(Severity.Normal).Variant(Variant.Outlined).Conte
nt("Editing is restricted").Render()
```

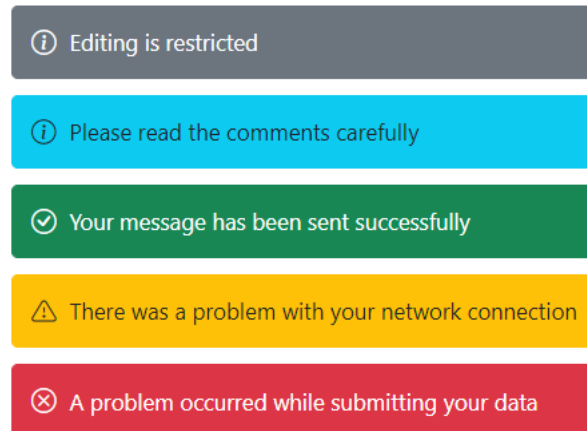

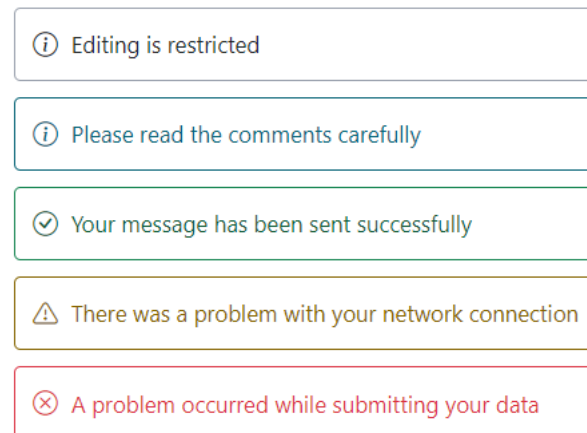

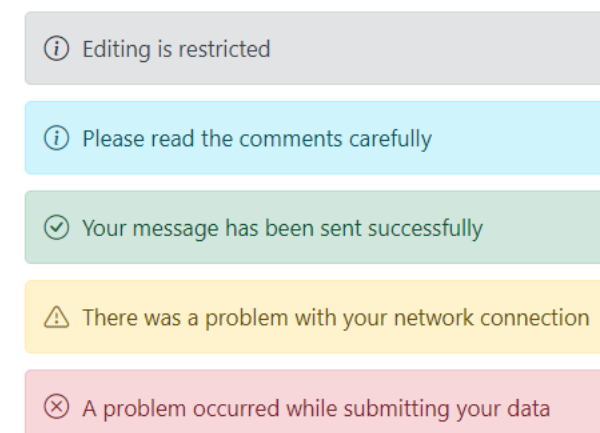

```

        @Html.EJS().Message("msg-
info_outlined").Severity(Severity.Info).Variant(Variant.Outlined).Content("P
lease read the comments carefully").Render()
        @Html.EJS().Message("msg-
success_outlined").Severity(Severity.Success).Variant(Variant.Outlined).Cont
ent("Your message has been sent successfully").Render()
        @Html.EJS().Message("msg-
warning_outlined").Severity(Severity.Warning).Variant(Variant.Outlined).Cont
ent("There was a problem with your network connection").Render()
        @Html.EJS().Message("msg-
error_outlined").Severity(Severity.Error).Variant(Variant.Outlined).Content(
"A problem occurred while submitting your data").Render()
    </div>
    <div class="msg-content-section">
        <h4>Text</h4>
        @Html.EJS().Message("msg-
default").Severity(Severity.Normal).Content("Editing is
restricted").Render()
        @Html.EJS().Message("msg-
info").Severity(Severity.Info).Content("Please read the comments
carefully").Render()
        @Html.EJS().Message("msg-
success").Severity(Severity.Success).Content("Your message has been sent
successfully").Render()
        @Html.EJS().Message("msg-
warning").Severity(Severity.Warning).Content("There was a problem with your
network connection").Render()
        @Html.EJS().Message("msg-error").Severity(Severity.Error).Content("A
problem occurred while submitting your data").Render()
    </div>
</div>
<style>
    .msg-variant-section .content-section {
        margin: 0 auto;
        max-width: 520px;
        padding: 10px;
    }

    .msg-variant-section .e-message {
        margin: 10px 0;
    }

    .msg-variant-section {
        display: flex;
    }
</style>

```

Filled**Outlined****Text**[Icons in Message control](#)

This section explains the message with no icons, how to show or hide the close icon and add the custom severity icon to the message.

No Icon

By default, severity icons can be displayed according to the severity types to make it more understandable to the user by visual information rather than text. To hide the severity icons, set the [ShowIcon](#) property to `false`.

The following example demonstrates the different severity messages without the severity icons.

CSHTML

```
<div class="msg-default-section">
  <div class="msg-content-section">
    @Html.EJS().Message("msg-
default").Severity(Severity.Normal).Content("Editing is
restricted").ShowIcon(false).Render()
    @Html.EJS().Message("msg-
info").Severity(Severity.Info).Content("Please read the comments
carefully").ShowIcon(false).Render()
    @Html.EJS().Message("msg-
success").Severity(Severity.Success).Content("Your message has been sent
successfully").ShowIcon(false).Render()
    @Html.EJS().Message("msg-
warning").Severity(Severity.Warning).Content("There was a problem with your
network connection").ShowIcon(false).Render()
    @Html.EJS().Message("msg-error").Severity(Severity.Error).Content("A
problem occurred while submitting your data").ShowIcon(false).Render()
  </div>
</div>
<style>
.msg-default-section .content-section {
  margin: 0 auto;
  max-width: 450px;
  padding-top: 10px;
}
.msg-default-section .e-message {
  margin: 10px 0;
}
</style>
```

Editing is restricted

Please read the comments carefully

Your message has been sent successfully

```

🔊 Essential JS 2 is a modern JavaScript UI Controls library built from the ground up to be lightweight, responsive, modular, and touch friendly. It is written in the TypeScript and has no external dependencies. It also includes complete support for Angular, React, Vue, ASP.NET MVC, and ASP.NET Core frameworks.

Close Icon

The message can be rendered with or without the close icon. The close icon is used to hide the message, either by manually clicking the close icon or through keyboard interaction.

By default, the close icon is not rendered in the message. To show the close icon, set the [ShowCloseIcon](#) property to **true**.

In the following example, the messages are rendered with the close icon.

CSHTML

```
<div class="msg-icon-section">
  <div class="msg-content-section">
    @Html.EJS().Button("btn1").Content("Show Default Message").CssClass("e-outline e-primary msg-hidden").Render()

    @Html.EJS().Message("msg_default_icon").Severity(Severity.Normal).Content("Editing is restricted").ShowCloseIcon(true).Closed("defaultClosed").Render()
    @Html.EJS().Button("btn2").Content("Show Info Message").CssClass("e-outline e-primary e-info msg-hidden").Render()

    @Html.EJS().Message("msg_info_icon").Severity(Severity.Info).Content("Please read the comments carefully").ShowCloseIcon(true).Closed("infoClosed").Render()
    @Html.EJS().Button("btn3").Content("Show Success Message").CssClass("e-outline e-primary e-success msg-hidden").Render()

    @Html.EJS().Message("msg_success_icon").Severity(Severity.Success).Content("Your message has been sent successfully").ShowCloseIcon(true).Closed("successClosed").Render()
```

```

    @Html.EJS().Button("btn4").Content("Show Warning Message").CssClass("e-
outline e-primary e-warning
msg-hidden").Render()

@Html.EJS().Message("msg_warning_icon").Severity(Severity.Warning).Content("
There was a problem with your network
connection").ShowCloseIcon(true).Closed("warningClosed").Render()
    @Html.EJS().Button("btn5").Content("Show Error Message").CssClass("e-
outline e-primary e-danger
msg-hidden").Render()

@Html.EJS().Message("msg_error_icon").Severity(Severity.Error).Content("A
problem has been occurred while submitting
your data").ShowCloseIcon(true).Closed("errorClosed").Render()
</div>
</div>
<script>
    document.getElementById("btn1").onclick = function (e) {
        var msgDefault =
ej.base.getComponent(document.getElementById("msg_default_icon"),
"message");
        var defaultBtn = ej.base.getComponent(document.getElementById("btn1"),
"btn");
        show(msgDefault, defaultBtn);
    }
    document.getElementById("btn2").onclick = function (e) {
        var msgInfo =
ej.base.getComponent(document.getElementById("msg_info_icon"), "message");
        var infoBtn = ej.base.getComponent(document.getElementById("btn2"),
"btn");
        show(msgInfo, infoBtn);
    }
    document.getElementById("btn3").onclick = function (e) {
        var msgSuccess =
ej.base.getComponent(document.getElementById("msg_success_icon"),
"message");
        var successBtn = ej.base.getComponent(document.getElementById("btn3"),
"btn");
        show(msgSuccess, successBtn);
    }
    document.getElementById("btn4").onclick = function (e) {
        var msgWarning =
ej.base.getComponent(document.getElementById("msg_warning_icon"),
"message");
        var warningBtn = ej.base.getComponent(document.getElementById("btn4"),
"btn");
        show(msgWarning, warningBtn);
    }
    document.getElementById("btn5").onclick = function (e) {
        var msgError =
ej.base.getComponent(document.getElementById("msg_error_icon"), "message");
        var errorBtn = ej.base.getComponent(document.getElementById("btn5"),
"btn");
        show(msgError, errorBtn);
    }
</script>
<script>

```

```
function defaultClosed() {
    var defaultBtn = ej.base.getComponent(document.getElementById("btn1"),
    "btn");
    defaultBtn.element.classList.remove("msg-hidden");
}
function infoClosed() {
    var infoBtn = ej.base.getComponent(document.getElementById("btn2"),
    "btn");
    infoBtn.element.classList.remove("msg-hidden");
}
function warningClosed() {
    var warningBtn = ej.base.getComponent(document.getElementById("btn4"),
    "btn");
    warningBtn.element.classList.remove("msg-hidden");
}
function successClosed() {
    var successBtn = ej.base.getComponent(document.getElementById("btn3"),
    "btn");
    successBtn.element.classList.remove("msg-hidden");
}
function errorClosed() {
    var errorBtn = ej.base.getComponent(document.getElementById("btn5"),
    "btn");
    errorBtn.element.classList.remove("msg-hidden");
}
function show(message, btn) {
    message.visible = true;
    btn.element.classList.add("msg-hidden");
}
</script>
<style>
.msg-icon-section .content-section {
    margin: 0 auto;
    max-width: 450px;
    padding-top: 10px;
}
.msg-icon-section .e-message {
    margin: 10px 0;
}
.msg-icon-section .e-btn {
    display: block;
    margin: 10px 0;
}
.msg-icon-section .e-btn.msg-hidden {
    display: none;
}
</style>
```

Customization in Message control

The Message control allows user to customize the content display positions and appearance. This section explains the details about changing the content alignments and border styles for messages.

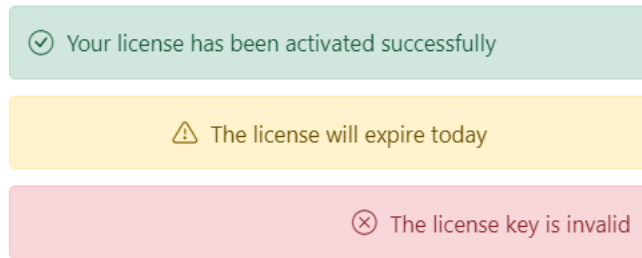

Content Alignment

Normally, the message content is aligned to the **left**. The Message control allows user to align the message content in the **center** or **right** through the built-in classes `e-content-center` and `e-content-right`.

The following example demonstrates the message with different content alignments.

CSHTML

```
<div class="msg-custom-section">
  <div class="msg-content-section">
    <h4>Content Alignment</h4>
    @Html.EJS().Message("msg-content-
left").Severity(Severity.Success).Content("Your license has been activated
successfully").Render()
    @Html.EJS().Message("msg-content-
center").Severity(Severity.Warning).Content("The license will expire
today").CssClass("e-content-center").Render()
    @Html.EJS().Message("msg-content-
right").Severity(Severity.Error).Content("The license key is
invalid").CssClass("e-content-right").Render()
  </div>
</div>
<style>
  .msg-custom-section .content-section {
    margin: 0 auto;
    max-width: 400px;
    padding-top: 10px;
  }
  .msg-custom-section .e-message {
    margin: 10px 0;
  }
</style>
```

Rounded and Square

To customize the Message control's appearance, add the custom class to the message through the [CssClass](#) property. This custom class will be added to the root element. Based on this custom class, the user can override the message styles at the application level.

The following example shows the rounded and squared appearance of the message, which can be achieved by adding the `CssClass` property.

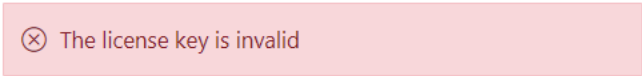

CSHTML

```
<div class="msg-custom-section">
  <div class="msg-content-section">
    <h4>Rounded</h4>
    @Html.EJS().Message("rounded").Severity(Severity.Warning).Content("The
license will expire today").CssClass("rounded").Render()
    <h4>Rounded</h4>
    @Html.EJS().Message("square").Severity(Severity.Error).Content("The
license key is invalid").CssClass("square").Render()
  </div>
</div>
<style>
.msg-custom-section .content-section {
  margin: 0 auto;
  max-width: 400px;
  padding-top: 10px;
}
.msg-custom-section .e-message {
  margin: 10px 0;
}
.msg-custom-section .e-message.rounded {
  border-radius: 5px;
}
.msg-custom-section .e-message.square {
  border-radius: 1px;
}
</style>
```

Rounded

Square

CSS Message

The Essential JS 2 Message has predefined CSS classes that can be defined in the HTML elements, which renders the message without any script reference. This can display a simple message with content and make the code lighter.

The following DOM structure is required to display the simple message with the content.

CSHTML

```
<div class="e-message">
<div class="e-msg-content">..content..</div>
</div>
```

The following DOM structure is required to display the simple message with the content and severity icon.

CSHTML

```
<div class="e-message">
<span class="e-msg-icon"></span>
<div class="e-msg-content">..content..</div>
</div>
```

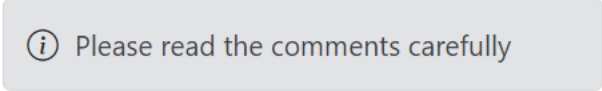

The following is the available list of predefined CSS classes to make the appearance of a message.

| Class | Description |
|------------------|---|
| ----- | ----- |
| e-message | Represents the message wrapper. |
| e-msg-icon | Represents the severity type icon. |
| e-msg-content | Represents the message content. |
| e-msg-close-icon | Represents the close icon. |
| e-info | Represents the information message. |
| e-success | Represents the success message. |
| e-warning | Represents the warning message. |
| e-error | Represents the error message. |
| e-content-center | Aligns the message content to the center. |
| e-content-right | Aligns the message content to the right. |

The following example shows the message which renders without any script reference.

CSHTML

```
<div class="msg-default">
  <div id="msg" class="e-message" role="alert">
    <span class="e-msg-icon"></span>
    <div class="e-msg-content">Please read the comments carefully</div>
  </div>
</div>
<style>
.msg-custom-section .content-section {
  margin: 0 auto;
  max-width: 400px;
  padding-top: 10px;
}
.msg-custom-section .e-message {
  margin: 10px 0;
}
.msg-custom-section .e-message.rounded {
  border-radius: 5px;
}
.msg-custom-section .e-message.square {
  border-radius: 1px;
}
</style>
```

Template in Message control

The message supports templates that allow you to customize the content with a custom structure. The content can be a string, paragraph, or any other HTML element. The template can be rendered through the [Content](#) property or to the [ContentTemplate](#) property.

In the following sample, the Message control content is customized with HTML elements and Syncfusion Button controls, which are directly added to the [ContentTemplate](#) property.

CSHTML

```
<div class="msg-template-section">
<div class="msg-content-section">
@Html.EJS().Button("showBtn").Content("Show pull request").CssClass("e-
outline e-primary msg-hidden").Render()
@Html.EJS().Message("msg_template").Severity(Severity.Success).Created("crea
ted").Closed("closed").ContentTemplate(@<div id="template"><h1>Merged pull
request</h1><p>Pull request #41 merged after a successful build</p><button
id='commitBtn' class='e-control e-btn e-link'>View Commit</button><button
id='btn1' class='e-control e-btn e-link'>Dismiss</button></div>).Render()
</div>
</div>
<script>
document.getElementById("showBtn").onclick = function (e) {
```

```

    var msgTemplate =
ej.base.getComponent(document.getElementById("msg_template"), "message");
    var showBtn = ej.base.getComponent(document.getElementById("showBtn"),
"btn");
    msgTemplate.visible = true;
    showBtn.element.classList.add("msg-hidden");
}
</script>
<script>
function created() {
    document.getElementById("btn1").onclick = function (e) {
        var msgTemplate =
ej.base.getComponent(document.getElementById("msg_template"), "message");
        msgTemplate.visible = false;
    }
}
function closed() {
    var showBtn = ej.base.getComponent(document.getElementById("showBtn"),
"btn");
    showBtn.element.classList.remove("msg-hidden");
}
</script>
<style>
.msg-template-section .content-section {
margin: 0 auto;
max-width: 450px;
padding-top: 20px;
}
.msg-template-section .e-btn.msg-hidden {
display: none;
}
.msg-template-section .e-message h1 {
margin: 0;
font-size: 16px;
font-weight: 600;
line-height: 1.25;
}
.msg-template-section .e-message .e-msg-icon {
padding: 0 4px;
margin-top: 3px;
}
.msg-template-section .e-message p {
margin: 8px 0 4px;
}
.msg-template-section .e-message .e-btn {
padding: 0;
}
</style>

```

[View commit](#) [Dismiss](#)

Accessibility in ASP.NET MVC Message control

The Message control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Message control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Message control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Message control:

| Attributes | Purpose |

| --- | --- |

| **role=alert** | Used to convey a significant and contextual message to the user. |

| **aria-label** | Provides an accessible name for the close icon. |

Keyboard interaction

The Message control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message control.

| Press | To do this |

| --- | --- |

| Tab / Shift + Tab | To focus the close icon in the message. |

| Enter / Space | Closes the focused close icon's message. |

Ensuring accessibility

The Message control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Message control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Message control with accessibility tools.

MultiSelect

Getting Started with ASP.NET MVC MultiSelect Control

This section briefly explains about how to include [ASP.NET MVC MultiSelect](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](https://www.nuget.org). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
```

```
</body>
```

Add ASP.NET MVC MultiSelect control

Now, add the Syncfusion ASP.NET MVC MultiSelect control in `~/Views/Home/Index.cshtml` page.

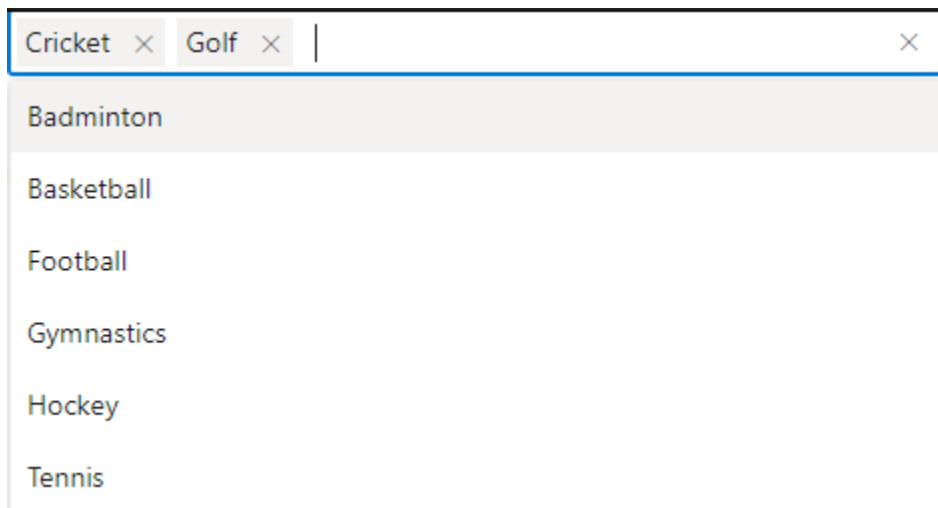

CSHTML

```
@model List<string>
@Html.EJS().MultiSelect("default").DataSource((IEnumerable<object>)Model).Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    List<string> data = new List<string>() { "Badminton", "Basketball",
    "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
    return View(data);
}
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC MultiSelect control will be rendered in the default web browser.

Configure the popup list

By default, the width of the popup list automatically adjusts according to the MultiSelect input element's width, and the height auto adjust's according to the height of the popup list items.

The height and width of the popup list can also be customized using the [popupHeight](#) and [popupWidth](#) properties respectively.

CSHTML

```
@model List<string>
@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)Model).PopupHeight("220px").PopupWidth("300px").Render()
```

HOMECONTROLLER.CS

```
public ActionResult Index()
{
    List<string> data = new List<string>() { "Badminton", "Basketball",
    "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
    return View(data);
}
```

Note: [View Sample in GitHub.](#)

See also

- [How to bind the data](#)

Data Binding

The MultiSelect loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of array or [DataManager](#).

The MultiSelect also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of [DataManager](#) adaptors.

| Fields | Type | Description |
|---------|------------------|--|
| text | string | Specifies the display text of each list item. |
| value | number or string | Specifies the hidden data value mapped to each list item that should contain a unique value. |
| groupBy | string | Specifies the category under which the list item has to be grouped. |
| iconCss | string | Specifies the icon class of each list item. |

Note: When binding complex data to the MultiSelect, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of string

The MultiSelect has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

CSHTML

```
@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>) ViewBag.data).Render()
```

ARRAYOFSTRINGS.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
```

```

using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult arrayofstrings()
        {
            ViewBag.data = new string[] { "Badminton", "Basketball",
            "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
            return View();
        }
    }
}

```

2. Array of object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

CSHTML

```

@Html.EJ2().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)ViewBag.data).Mode(Syncfusion.EJ2.Dr
opDowns.VisualMode.Box).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Game", Value =
"Id" }).Render()

```

GAMELIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
        });
            game.Add(new GameList { Id = "Game2", Game = "Badminton" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game4", Game = "Cricket" });
            game.Add(new GameList { Id = "Game5", Game = "Football" });
            game.Add(new GameList { Id = "Game6", Game = "Golf" });
            game.Add(new GameList { Id = "Game7", Game = "Hockey" });
            game.Add(new GameList { Id = "Game8", Game = "Rugby" });
        }
    }
}

```

```

        game.Add(new GameList { Id = "Game9", Game = "Snooker" });
        game.Add(new GameList { Id = "Game10", Game = "Tennis" });
        return game;
    }
}

```

3. Array of complex object

The MultiSelect can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, `Code.Id` column and `Country.CountryId` column from complex data have been mapped to the `value` field and `text` field, respectively.

CSHTML

```

@Html.EJS().MultiSelect("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<Object>)ViewBag.data).Fi
elds(new Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text =
"Country.CountryId", Value = "Code.Id" }).Render()

```

COMPLEX.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Code
    {
        public string Id { get; set; }
    }
    public class Country
    {
        public string CountryId { get; set; }
    }
    public class Complex
    {
        public Country Country { get; set; }
        public Code Code { get; set; }
        public List<Complex> GetData()
        {
            List<Complex> data = new List<Complex>();
            data.Add(new Complex() { Country = new Country() { CountryId =
"Australia" }, Code = new Code() { Id = "AU" } });
            data.Add(new Complex() { Country = new Country() { CountryId =
"Bermuda" }, Code = new Code() { Id = "BM" } });
            data.Add(new Complex() { Country = new Country() { CountryId =
"Canada" }, Code = new Code() { Id = "CA" } });
            data.Add(new Complex() { Country = new Country() { CountryId =
"Cameroon" }, Code = new Code() { Id = "CM" } });
            data.Add(new Complex() { Country = new Country() { CountryId =
"Denmark" }, Code = new Code() { Id = "DK" } });
        }
    }
}

```

```

        data.Add(new Complex() { Country = new Country() { CountryId =
"France" }, Code = new Code() { Id = "FR" } });
        return data;
    }
}

```

Binding remote data

The MultiSelect supports retrieval of data from remote data services with the help of **DataManager** control. The **Query** property is used to fetch data from the database and bind it to the MultiSelect.

The following sample displays the first 6 contacts from “Customers” table of the **Northwind** Data Service.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Text = "ContactName",
    Value = "CustomerID"
}).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()

```

REMOTEDATA.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult remotedata()
        {
            return View();
        }
    }
}

```

Bind to URL Adaptor

The MultiSelect supports retrieval of data from URL adaptor.

CSHTML

```

@Html.EJS().MultiSelect("games").Placeholder("Select a
Country").PopupHeight("200px").DataSource(dataManger =>

```

```
dataManger.Url("/MultiSelect/UrlDatasource").Adaptor("UrlAdaptor").CrossDomain(true)).Fields(new Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "ShipCountry"
}).Render()
```

URLDATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiselectController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
        public ActionResult UrlDatasource([FromBody]Data dm)
        {
            var val = OrdersDetails.GetAllRecords();
            var Data = val.ToList();
            var count = val.Count();
            if (dm.where != null)
            {
                Data = (from cust in Data
                        where
cust.ShipCountry.ToLower().StartsWith(dm.@where[0].value.ToString())
                        select cust).ToList();
            }
            if (dm.take != 0)
                Data = Data.Take(dm.take).ToList();
            return Json(Data);
        }
        public class Data
        {
            public int take { get; set; }
            public List<Wheres> where { get; set; }
        }
        public class Wheres
        {
            public string field { get; set; }
            public bool ignoreAccent { get; set; }
            public bool ignoreCase { get; set; }
            public bool isComplex { get; set; }
            public string value { get; set; }
            public string Operator { get; set; }
        }
        public class OrdersDetails
        {

```

```

        public static List<OrdersDetails> order = new
List<OrdersDetails>();
        public OrdersDetails()
        {
        }
        public OrdersDetails(int OrderID, string CustomerId, int
EmployeeId, double Freight, bool Verified, DateTime OrderDate, string
ShipCity, string ShipName, string ShipCountry, DateTime ShippedDate, string
ShipAddress)
        {
            this.OrderID = OrderID;
            this.CustomerID = CustomerId;
            this.EmployeeID = EmployeeId;
            this.Freight = Freight;
            this.ShipCity = ShipCity;
            this.Verified = Verified;
            this.OrderDate = OrderDate;
            this.ShipName = ShipName;
            this.ShipCountry = ShipCountry;
            this.ShippedDate = ShippedDate;
            this.ShipAddress = ShipAddress;
        }
        public static List<OrdersDetails> GetAllRecords()
        {
            if (order.Count() == 0)
            {
                int code = 10000;
                for (int i = 1; i < 10; i++)
                {
                    order.Add(new OrdersDetails(code + 1, "ALFKI", i +
0, 2.3 * i, false, new DateTime(1991, 05, 15), "Berlin", "Simons bistro",
"Denmark", new DateTime(1996, 7, 16), "Kirchgasse 6"));
                    order.Add(new OrdersDetails(code + 2, "ANATR", i +
2, 3.3 * i, true, new DateTime(1990, 04, 04), "Madrid", "Queen Cozinha",
"Brazil", new DateTime(1996, 9, 11), "Avda. Azteca 123"));
                    order.Add(new OrdersDetails(code + 3, "ANTON", i +
1, 4.3 * i, true, new DateTime(1957, 11, 30), "Cholchester",
"Frankenversand", "Germany", new DateTime(1996, 10, 7), "Carrera 52 con Ave.
Bolívar #65-98 Llano Largo"));
                    order.Add(new OrdersDetails(code + 4, "BLONP", i +
3, 5.3 * i, false, new DateTime(1930, 10, 22), "Marseille", "Ernst Handel",
"Austria", new DateTime(1996, 12, 30), "Magazinweg 7"));
                    order.Add(new OrdersDetails(code + 5, "BOLID", i +
4, 6.3 * i, true, new DateTime(1953, 02, 18), "Tsawassen", "Hanari Carnes",
"Switzerland", new DateTime(1997, 12, 3), "1029 - 12th Ave. S.));
                    code += 5;
                }
            }
            return order;
        }
        public int? OrderID { get; set; }
        public string CustomerID { get; set; }
        public int? EmployeeID { get; set; }
        public double? Freight { get; set; }
        public string ShipCity { get; set; }
        public bool Verified { get; set; }
        public DateTime OrderDate { get; set; }

```

```

        public string ShipName { get; set; }
        public string ShipCountry { get; set; }
        public DateTime ShippedDate { get; set; }
        public string ShipAddress { get; set; }
    }
}
}

```

Web API Adaptor

Use the **WebApiAdaptor** to bind MultiSelect with Web API created using OData.

CSHTML

```

<div id='web-data' class='col-lg-6' style='padding-top:15px'>
    <div class='content'>
        @Html.EJS().MultiSelect("games").Placeholder("Select
customer").DataSource(dataManger =>

dataManger.Url("/api/MultiSelect/").Adaptor("WebApiAdaptor")).Render()
    </div>
</div>

```

WEBAPI.CS

```

using System;
using System.Collections.Generic;
using System.Diagnostics;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    [Route("api/[controller]")]
    public class MultiselectController : Controller
    {
        List<string> game = new List<string>();
        [HttpGet]
        public List<string> Get()
        {
            game.Add("Badminton");
            game.Add("Basketball");
            game.Add("Cricket");
            game.Add("Golf");
            game.Add("Gymnastics");
            game.Add("Tennis");
            game.Add("Hockey");
            return game;
        }
    }
}

```

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManager**.

The following example for remote data binding using OData service.

CSHTML

```
<div id='o-data' class='col-lg-6' style='padding-top:15px'>
  <div class='content'>
    @Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://js.syncfusion.com/ejServices/Wcf/Northwind.svc/Order
s/").Adaptor("ODataAdaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
    {
        Value = "CustomerID"
    }).Query("new
ej.data.Query().select(['CustomerID']).take(7)").Render()
  </div>
</div>
```

ODATA.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiselectController : Controller
    {
        public ActionResult odata()
        {
            return View();
        }
    }
}
```

Offline mode

To avoid post back for every action, set the MultiSelect to load all data on initialization and make the actions process in client-side. To enable this behavior, use the **Offline** property of **DataManager**.

The following example for remote data binding and enabled offline mode.

CSHTML

```
<div id='o-data' class='col-lg-6' style='padding-top:15px'>
  <div class='content'>
    @Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("http://js.syncfusion.com/ejServices/Wcf/Northwind.svc/Orders
```

```

/").Offline(true).Adaptor("ODataAdaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "CustomerID"
}).Query("new
ej.data.Query().select(['CustomerID']).take(7)").Render()
</div>
</div>

```

OFFLINE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiselectController : Controller
    {
        public ActionResult offline()
        {
            return View();
        }
    }
}

```

Templates in MultiSelect Control

The MultiSelect has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 **Template engine** to compile and render the elements properly.

Item template

The content of each list item within the MultiSelect can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor("O
DataV4Adaptor").CrossDomain(true)).ItemTemplate("<span><span
class='name'>${FirstName}</span><span class
='city'>${City}</span></span>").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings

```

```

        {
            Value = "FirstName"
        }).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>
    .city {
        right: 15px;
        position: absolute;
    }
</style>

```

ITEMTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult Itemtemplate()
        {
            return View();
        }
    }
}

```

Value template

The currently selected value that is displayed by default on the MultiSelect input element can be customized using the [valueTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the MultiSelect input, which is separated by a hyphen.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).ItemTemplate("<span><span
class='name'>${FirstName}</span><span class
='city'>${City}</span></span>").ValueTemplate("<span>${FirstName} -
${City}</span>").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "FirstName",
}).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>

```

```
.city {
    right: 15px;
    position: absolute;
}
</style>
```

VALUETEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult valuetemplate()
        {
            return View();
        }
    }
}
```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

CSHTML

```
@Html.EJS().MultiSelect("customers").Placeholder("Select a customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor("ODataV4Adaptor").CrossDomain(true)).GroupTemplate("<strong>${City}</strong>").Fields(new Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "FirstName",
    GroupBy = "City"
}).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City', 'EmployeeID']).take(6).where(new ej.data.Predicate('City', 'equal', 'london').or('City', 'equal', 'seattle'))").Render()
```

GROUPTEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
```

```
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult grouptemplate()
        {
            return View();
        }
    }
}
```

Header template

The header element is shown statically at the top of the popup list items within the MultiSelect, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

CSHTML

```
@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).ItemTemplate("<span class='item'
><span class='name'>${FirstName}</span><span
class='city'>${City}</span></span>").HeaderTemplate("<span
class='head'><span class='name'>Name</span><span
class='city'>City</span></span>").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "FirstName",
}).Query("new
ej.data.Query().from('Employees').select(['FirstName', 'City',
'EmployeeID']).take(6)").Render()
<style>
    .head, .item {
        display: table;
        width: 100%;
        margin: auto;
    }
    .head {
        height: 40px;
        font-size: 15px;
        font-weight: 600;
    }
    .name, .city {
        display: table-cell;
        vertical-align: middle;
        width: 50%;
    }
    .head .name {
        text-indent: 16px;
    }
    .head .city {
```

```

        text-indent: 10px;
    }
</style>

```

HEADERTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult headertemplate()
        {
            return View();
        }
    }
}

```

Footer template

The MultiSelect has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the MultiSelect.

CSHTML

```

@Html.EJS().MultiSelect("games").DataSource((IEnumerable<object>)ViewBag.data).Placeholder("Select a game").PopupHeight("270px").FooterTemplate("<span class='foot'> Total list items: " + 5 + "</span>").Render()
<style>
    .foot {
        text-indent: 1.2em;
        display: block;
        font-size: 15px;
        line-height: 40px;
        border-top: 1px solid #e0e0e0;
    }
</style>

```

FOOTERTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{

```

```

public class MultiSelectController : Controller
{
    public ActionResult footertemplate()
    {
        ViewBag.data = new string[] { "Badminton", "Basketball",
"Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
        return View();
    }
}

```

No records template

The MultiSelect is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

CSHTML

```

@Html.EJS().MultiSelect("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).No
RecordsTemplate("<span class='norecord'> NO DATA AVAILABLE</span>").Render()

```

NORECORDSTEMPLATE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult norecords()
        {
            ViewBag.data = new string[] { };
            return View();
        }
    }
}

```

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the MultiSelect displays the notification.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svcs/").Ad

```

```
aptor("ODataV4Adaptor").CrossDomain(true)).ActionFailureTemplate("<span
class='action-failure'> Data fetch get fails</span>").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
{
    Value = "FirstName"
}).Query("new
ej.data.Query().from('Employees').select(['FirstName']).take(6)").Render()
```

ACTIONFAILURETEMPLATE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult actionfailure()
        {
            return View();
        }
    }
}
```

- [How to bind the data](#)
- [How to group the data using header](#)
- [How to customize the options in MultiSelect](#)

Grouping

The MultiSelect supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

CSHTML

```
@Html.EJS().MultiSelect("Vegetable").Placeholder("Select a
Vegetable").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.dat
a).Fields(new Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value =
"Vegetable", GroupBy = "Category" }).Render()
```

GROUPING.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
```

```

using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult grouping()
        {
            ViewBag.data = new Vegetables().VegetablesList();
            return View();
        }
    }
}

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the `groupTemplate` property for both inline and fixed headers as referred here: [Group Template support to MultiSelect](#).

Grouping with CheckBox

Previously, there is no checkbox for group headers. Now, this feature allow to render checkbox in group header to select the group items in single selection. You can enable this feature by setting `enableGroupCheckBox` property value as **true** and `mode` property as **CheckBox**.

Inject the `CheckBoxSelection` module in the MultiSelect to use the checkbox.

CSHTML

```

@Html.EJS().MultiSelect("Vegetable").Placeholder("Select
Vegetables").PopupHeight("200px").Mode(Syncfusion.EJ2.DropDowns.VisualMode.C
heckBox).ShowSelectAll(true).EnableGroupCheckBox(true).AllowFiltering(true).
FilterBarPlaceholder("Search
Vegetables").DataSource((IEnumerable<object>)ViewBag.data).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value = "Vegetable",
GroupBy = "Category" }).Render()

```

GROUPING.CS

```

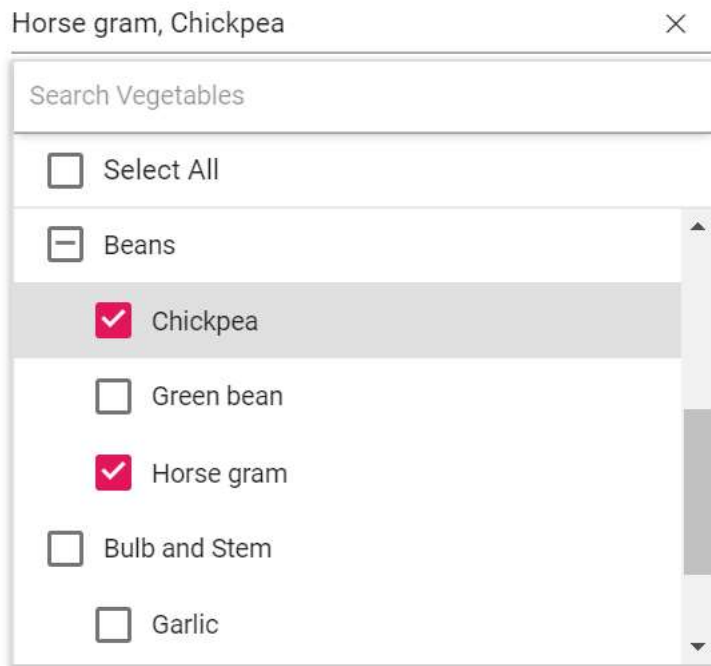

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult grouping()
        {
            ViewBag.data = new Vegetables().VegetablesList();
            return View();
        }
    }
}

```

```
}

```

Output be like the below:

Filtering

The MultiSelect has built-in support to filter data items when [allowFiltering](#) is enabled. The filter operation starts as soon as you start typing characters in the MultiSelect input.

To display filtered items in the popup, filter the required data and return it to the MultiSelect via `updateData` method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the MultiSelect through the `updateData` method in [filtering](#) event.

CSHTML

```
@Html.EJS().MultiSelect("country").Placeholder("Select a
Country").PopupHeight(
    "230px").DataSource((IEnumerable<object>)ViewBag.data).AllowFiltering(true).
Filtering("onfiltering").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value = "Name"
}).Render()
<script>
    function onfiltering(e) {
        var query = new ej.data.Query();
        query = (e.text !== '') ? query.where('Name', 'startswith',
e.text, true) : query;
e.updateData(@Html.Raw(JsonConvert.SerializeObject(ViewBag.data)), query)
    }
</script>
```

COUNTRIES.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Countries
    {
        public string Name { get; set; }
        public string Code { get; set; }
        public List<Countries> CountriesList()
        {
            List<Countries> country = new List<Countries>();
            country.Add(new Countries { Name = "Australia", Code = "AU" });
            country.Add(new Countries { Name = "Bermuda", Code = "BM" });
            country.Add(new Countries { Name = "Canada", Code = "CA" });
            country.Add(new Countries { Name = "Cameroon", Code = "CM" });
            country.Add(new Countries { Name = "Denmark", Code = "DK" });
            country.Add(new Countries { Name = "France", Code = "FR" });
            country.Add(new Countries { Name = "Finland", Code = "FI" });
            country.Add(new Countries { Name = "Germany", Code = "DE" });
            country.Add(new Countries { Name = "Greenland", Code = "GL" });
            country.Add(new Countries { Name = "Hong Kong", Code = "HK" });
            country.Add(new Countries { Name = "India", Code = "IN" });
            country.Add(new Countries { Name = "Italy", Code = "IT" });
            country.Add(new Countries { Name = "Japan", Code = "JP" });
            country.Add(new Countries { Name = "Mexico", Code = "MX" });
            country.Add(new Countries { Name = "Norway", Code = "NO" });
            country.Add(new Countries { Name = "Poland", Code = "PL" });
            country.Add(new Countries { Name = "Switzerland", Code = "CH"
        });
            country.Add(new Countries { Name = "United Kingdom", Code = "GB"
        });
            country.Add(new Countries { Name = "United States", Code = "US"
        });
            return country;
        }
    }
}

```

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the MultiSelect. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").Filtering("onfiltering").AllowFiltering(true).PopupHeight("200px"
).DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor(

```

```

        "ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "ContactName",
Value = "CustomerID" }).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
    function onfiltering(e) {
        var CBObj = document.getElementById("customers").ej2_instances[0];
        // load overall data when search key empty.
        if (e.text == '' && e.text.length < 3) {
            e.updateData(CBObj.dataSource);
        }
        let query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
        query = (e.text != '' && e.text.length >= 3) ?
query.where('ContactName', 'startswith', e.text, true) : query;
        e.updateData(CBObj.dataSource, query);
    }
</script>

```

FILTERLIMIT.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult filterlimit()
        {
            return View();
        }
    }
}

```

Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").AllowFiltering(true).Filtering("onfiltering").PopupHeight("200px")
.DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor(
    "ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "ContactName",
Value = "CustomerID" }).Query("new

```

```

ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>
    function onfiltering(e) {
        var CBObj = document.getElementById("customers").ej2_instances[0];
        // load overall data when search key empty.
        if (e.text == '')
            e.updateData(CBObj.dataSource);
        else {
            var query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
            query = (e.text != '') ? query.where('ContactName', 'endswith',
e.text, true) : query;
            e.updateData(CBObj.dataSource, query);
        }
    }
</script>

```

FILTERTYPE.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult filtertype()
        {
            return View();
        }
    }
}

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter.

CSHTML

```

@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").Filtering("onfiltering").AllowFiltering(true).PopupHeight("200px")
).DataSource(obj =>
obj.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Adaptor(
    "ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "ContactName",
Value = "CustomerID" }).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6)").Render()
<script>

```

```
function onfiltering(e) {
    var CBObj = document.getElementById("customers").ej2_instances[0];
    // load overall data when search key empty.
    if (e.text == '')
        e.updateData(CBObj.dataSource);
    else {
        var query = new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(6);
        query = (e.text != '') ? query.where('ContactName',
'startswith', e.text, false) : query;
        e.updateData(CBObj.dataSource, query);
    }
}
</script>
```

CASESENSITIVE.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult Index()
        {
            return View();
        }
    }
}
```

Diacritics Filtering

MultiSelect supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for MultiSelect.

CSHTML

```
@Html.EJS().MultiSelect("list").DataSource((string[])ViewBag.data).Placeholder("e.g: aero").IgnoreAccent(true).AllowFiltering(true).Render()
```

DIACRITICS.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
```

```
{
    public class MultiSelectController : Controller
    {
        public ActionResult diacritics()
        {
            ViewBag.data = new string[] { "Aeróbics", "Aeróbics en Agua",
            "Aerografía", "Aeromodelaje", "Águilas", "Ajedrez", "Ala Delta", "Álbumes de
            Música", "Alusivos", "Análisis de Escritura a Mano" };
            return View();
        }
    }
}
```

- [How to add custom value to the MultiSelect](#)

CustomValue

The MultiSelect allows user to add a new non-present option to the control value when [allowCustomValue](#) is enabled. while selecting the new custom value `customValueSelection` event will be triggered.

The following sample demonstrates configuration of custom value support with the MultiSelect control.

CSHTML

```
<div id='local-data'>
    <div class='control-wrapper'>
        @Html.EJS().MultiSelect("default").Placeholder("Select
        games").AllowCustomValue(true).DataSource((IEnumerable<object>)ViewBag.data)
        .Fields(new Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text =
        "Game", Value = "Id" }).Render()
    </div>
</div>
```

GAMELIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
        });
    }
}
```

```

        game.Add(new GameList { Id = "Game2", Game = "Badminton" });
        game.Add(new GameList { Id = "Game3", Game = "Basketball" });
        game.Add(new GameList { Id = "Game3", Game = "Basketball" });
        game.Add(new GameList { Id = "Game4", Game = "Cricket" });
        game.Add(new GameList { Id = "Game5", Game = "Football" });
        game.Add(new GameList { Id = "Game6", Game = "Golf" });
        game.Add(new GameList { Id = "Game7", Game = "Hockey" });
        game.Add(new GameList { Id = "Game8", Game = "Rugby" });
        game.Add(new GameList { Id = "Game9", Game = "Snooker" });
        game.Add(new GameList { Id = "Game10", Game = "Tennis" });
        return game;
    }
}

```

CheckBox in MultiSelect Control

The MultiSelect has built-in support to select multiple values through checkbox, when [mode](#) property set as **CheckBox**.

To use checkbox, inject the **CheckBoxSelection** module in the MultiSelect.

CSHTML

```

@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)ViewBag.data).Mode(Syncfusion.EJ2.Dr
opDowns.VisualMode.CheckBox).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Game", Value =
"Id" }).Render()

```

GAMELIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
});
            game.Add(new GameList { Id = "Game2", Game = "Badminton" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game4", Game = "Cricket" });
            game.Add(new GameList { Id = "Game5", Game = "Football" });
            game.Add(new GameList { Id = "Game6", Game = "Golf" });
            game.Add(new GameList { Id = "Game7", Game = "Hockey" });
            game.Add(new GameList { Id = "Game8", Game = "Rugby" });
            game.Add(new GameList { Id = "Game9", Game = "Snooker" });
            game.Add(new GameList { Id = "Game10", Game = "Tennis" });

```

```

        return game;
    }
}

```

Select All

The MultiSelect control has in-built support to select the all list items using **Select All** options in the header.

When the [showSelectAll](#) property is set to true, by default Select All text will show. You can customize the name attribute of the Select All option by using [selectAllText](#).

For the unSelect All option, by default unSelect All text will show. You can customize the name attribute of the unSelect All option by using [unselectAllText](#).

CSHTML

```

@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)ViewBag.data).Mode(Syncfusion.EJ2.Dr
opDowns.VisualMode.CheckBox).ShowSelectAll(true).SelectAllText("Select
All").UnSelectAllText("UnSelect All").Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Game", Value =
"Id" }).Render()

```

GAMELIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
});
            game.Add(new GameList { Id = "Game2", Game = "Badminton" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game4", Game = "Cricket" });
            game.Add(new GameList { Id = "Game5", Game = "Football" });
            game.Add(new GameList { Id = "Game6", Game = "Golf" });
            game.Add(new GameList { Id = "Game7", Game = "Hockey" });
            game.Add(new GameList { Id = "Game8", Game = "Rugby" });
            game.Add(new GameList { Id = "Game9", Game = "Snooker" });
            game.Add(new GameList { Id = "Game10", Game = "Tennis" });
            return game;
        }
    }
}

```

Selection Limit

Defines the limit of the selected items using [maximumSelectionLength](#).

CSHTML

```
@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)ViewBag.data).Mode(Syncfusion.EJ2.Dr
opDowns.VisualMode.CheckBox).MaximumSelectionLength(3).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Game", Value =
"Id" }).Render()
```

GAMELIST.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
});
            game.Add(new GameList { Id = "Game2", Game = "Badminton" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game4", Game = "Cricket" });
            game.Add(new GameList { Id = "Game5", Game = "Football" });
            game.Add(new GameList { Id = "Game6", Game = "Golf" });
            game.Add(new GameList { Id = "Game7", Game = "Hockey" });
            game.Add(new GameList { Id = "Game8", Game = "Rugby" });
            game.Add(new GameList { Id = "Game9", Game = "Snooker" });
            game.Add(new GameList { Id = "Game10", Game = "Tennis" });
            return game;
        }
    }
}
```

Selection Reordering

Using [enableSelectionOrder](#) to Reorder the selected items in popup visibility state.

CSHTML

```
@Html.EJS().MultiSelect("default").Placeholder("Select
games").DataSource((IEnumerable<object>)ViewBag.data).Mode(Syncfusion.EJ2.Dr
opDowns.VisualMode.CheckBox).EnableSelectionOrder(false).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Game", Value =
"Id" }).Render()
```

GAMELIST.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class GameList
    {
        public string Id { get; set; }
        public string Game { get; set; }
        public List<GameList> GameLists()
        {
            List<GameList> game = new List<GameList>();
            game.Add(new GameList { Id = "Game1", Game = "American Football"
});
            game.Add(new GameList { Id = "Game2", Game = "Badminton" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game3", Game = "Basketball" });
            game.Add(new GameList { Id = "Game4", Game = "Cricket" });
            game.Add(new GameList { Id = "Game5", Game = "Football" });
            game.Add(new GameList { Id = "Game6", Game = "Golf" });
            game.Add(new GameList { Id = "Game7", Game = "Hockey" });
            game.Add(new GameList { Id = "Game8", Game = "Rugby" });
            game.Add(new GameList { Id = "Game9", Game = "Snooker" });
            game.Add(new GameList { Id = "Game10", Game = "Tennis" });
            return game;
        }
    }
}

```

Chip Customization

The MultiSelect allows the user to customize the selected chip element through the [tagging](#) event. In that event, you can set the custom classes to chip element via that event argument of `setClass` method.

The following sample demonstrates chip-customization with the MultiSelect control.

CSHTML

```

<div id='local-data'>
    <div class='control-wrapper'>
        @Html.EJS().MultiSelect("chip-
customization").Tagging("onTagging").Placeholder("Select a
color").DataSource((IEnumerable<object>)ViewBag.data).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Text = "Color", Value =
"Code" }).Render()
    </div>
</div>

```

```

<style>
    .e-multi-select-wrapper .e-chips {
        opacity: 0.9;
    }
    .e-multi-select-wrapper .e-chips:hover {
        opacity: 1;
    }

    }
}
```

Localization in MultiSelct Control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the MultiSelect.

| Locale key | en-US (default)

|-----|-----

| noRecordsTemplate | No records found

| actionFailureTemplate | The request failed

Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the MultiSelect and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

CSHTML

```
@Html.EJS().MultiSelect("customers").Placeholder("Select a
customer").PopupHeight("200px").Locale("fr-BE").DataSource(dataManger =>

dataManger.Url("https://services.odata.org/V4/Northwind/Northwind.svc/").Ada
ptor("ODataV4Adaptor").CrossDomain(true)).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings
    {
        Value = "ContactName"
    }).Query("new
ej.data.Query().from('Customers').select(['ContactName',
'CustomerID']).take(0)").Render()
<script>
    ej.base.L10n.load({
        'fr-BE': {
            'multi-select': {
                'noRecordsTemplate': "Aucun enregistrement trouvé",
                'actionFailureTemplate': "Modèle d'échec d'action"
            }
        }
    });
</script>
```

LOCALIZATION.CS

```
using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult localization()
        {
            return View();
        }
    }
}
```

CSS structures

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the background color of wrapper element

Use the following CSS to customize the background color of wrapper element.

```
`css
.e-multiselect.e-input-group .e-multi-select-wrapper {
background-color: red;
}
`
```

Customizing the appearance of the delimiter wrapper element

Use the following CSS to customize the appearance of delimiter wrapper element.

```
`css
.e-multiselect .e-delim-values {
-webkit-text-fill-color: blue;
font-size: 16px;
font-family: cursive;
}
`
```

Customizing the appearance of chips

Use the following CSS to customize the appearance of selected chips.

```
`css
.e-multiselect .e-multi-select-wrapper .e-chips .e-chipcontent {
font-family: cursive;
font-size: 20px;
-webkit-text-fill-color: blue;
}
.e-multi-select-wrapper .e-chips {
background-color: aqua;
height: 26px;
}
`
```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```
`css
```

```
.e-multiselect.e-input-group .e-input-group-icon, .e-multiselect.e-input-group.e-control-wrapper .e-input-group-icon:hover {  
  color: red;  
  font-size: 14px;  
}  
`css
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
`css  
.e-multiselect.e-input-group.e-control-wrapper.e-input-focus::before, .e-multiselect.e-input-group.e-control-wrapper.e-input-focus::after {  
  background: #c000ff;  
}  
`css
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
`css  
.e-multiselect.e-disabled .e-multi-select-wrapper .e-delim-values {  
  -webkit-text-fill-color: red;  
}  
`css
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
`css  
.e-multiselect input.e-dropdownbase::placeholder {  
  color: red;  
}  
`css
```

Customizing the placeholder to add mandatory indicator(*)

Use the following CSS to add the mandatory indicator * to the float label element.

```
`css  
.e-input-group.e-control-wrapper.e-float-input .e-float-text::after {  
  content: "*";  
  color: red;  
}  
`css
```

`

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
`css
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-
wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-
float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left)
.e-float-line::after {
background-color: #2319b8;
}

.e-multiselect.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-
float-input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
color: #2319b8;
}
```

`

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
`css
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-
disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-
success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-
input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-
control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
border-color: #b1bd15;
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
}
```

`

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
`css
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
```

`

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
`css
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px
}
`
```

Customizing the color of the checkbox

Use the following CSS to customize the color of checkbox.

```
`css
.e-popup .e-checkbox-wrapper .e-frame.e-check, .e-popup .e-checkbox-wrapper:hover .e-frame.e-check
{
background-color: green;
color: white;
}
`
```

Accessibility

The MultiSelect control has been designed, keeping in mind the **WAI-ARIA** specifications, and applies the WAI-ARIA roles, states, and properties along with **keyboard support**. This control is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The MultiSelect component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the MultiSelect component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

```

| Right-To-Left Support |  |
| Color Contrast |  |
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

The MultiSelect control uses the **Listbox** role, and each list item has an **option** role. The following **ARIA attributes** denote the MultiSelect state.

| Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the MultiSelect input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the MultiSelect element. |

| aria-disabled | Indicates whether the MultiSelect control is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the MultiSelect without interruptions.

| Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Set focus at the first item in the MultiSelect when no item selected. Otherwise, moves focus next to the currently selected item. |

| Arrow Up | Moves focus previous to the currently selected one. |

| Page Down | Scrolls down to the next page and set focus to the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and set focus to the first item when popup list opens. |

| Enter | Selects the focused item, and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the control. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the control. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | set focus to the first item. |

| End | set focus to the last item. |

Note: In the below sample, focus the MultiSelect control using alt+t keys.

CSHTML

```
@Html.EJS().MultiSelect("games").Placeholder("Select a
game").PopupHeight("200px").DataSource((IEnumerable<object>)ViewBag.data).Re
nder()
<script>
    document.onkeyup = function (e) {
        if (e.altKey && e.keyCode === 84 /* t */) {
            var dropObj = document.getElementById("games"); //to get
            dropdown list object
            dropObj.ej2_instances[0].focusIn(); // call the focusIn method
            to focus the element.
        }
    };
</script>a
```

ACCESSIBILITY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult accessibility()
        {
            ViewBag.data = new string[] { "Badminton", "Basketball",
            "Cricket", "Football", "Golf", "Gymnastics", "Hockey", "Tennis" };
            return View();
        }
    }
}

```

Ensuring accessibility

The MultiSelect component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the MultiSelect component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the MultiSelect component with accessibility tools.

- [Accessibility in Syncfusion ASP.NET MVC components](#)

How To

Show the list items with icons

You can render **icons** to the list items by mapping the **iconCss** field. This **iconCss** field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with **iconCss** field.

CSHTML

```

@Html.EJS().MultiSelect("icons").Placeholder("Select a social
media").PopupHeight("200px").DataSource((IEnumerable<object>
)ViewBag.icondata).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value =
"SocialMediaName", IconCss = "Class" }).Render()
<style>
    @@font-face {
        font-family: 'Socialicons';
        src: url(data:application/x-font-ttf;charset=utf-

ICONS.CS

```
using System;
using System.Collections.Generic;
```

```

using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class MultiSelectController : Controller
    {
        public ActionResult icons()
        {
            ViewBag.icondata = new SocialMedia().SocialMediaList();
            return View();
        }
    }
}

```

Set preselected items through fields

You can use a boolean field(for ex:"isSelected") of MultiSelect dataSource to set preselected items through fields during initial rendering. You can use `itemCreated` event of fields to push items with **isSelected** field set to true and these values will be selected through [dataBound](#) event of MultiSelect. Pass empty string of array initially to load the control with preselected values.

In the following sample, selected values are mapped through **isSelected** field.

CSHTML

```

<div id='iconList' class='col-lg-6' style='padding-top:15px'>
    <div class='content'>

@Html.EJS().MultiSelect("local").Width("300px").Value(ViewBag.val).Placeholder(
"Select countries").Mode(Syncfusion.EJ2.DropDowns.VisualMode.CheckBox).DataSource((I
Enumerable<Object>)ViewBag.data).ActionBegin("onBegin").DataBound("onBound")
.Render()
        <script>
            var selected = [];
            function onBegin(e) {
                this.fields = {
                    text: 'Name', value: 'Code', itemCreated: function (e) {
                        var count = 0;
                        if (count === 0) {
                            for (let i = 0; i < e.dataSource.length; i++) {
                                if (e.curData.isSelected == true)
                                    itemSearch(e.curData.Code); //pass the
corresponding value
                            }
                        }
                    }
                }
            }
            function itemSearch(e) {
                if (selected.indexOf(e) == -1)
                    selected.push(e);
            }
            function onBound(e) {
                this.value = selected;
            }
        </script>
    </div>

```

```

    }
    </script>
</div>
</div>

```

COUNTRY.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
namespace WebApplication1.Models
{
    public class Countries
    {
        public string Code { get; set; }
        public string Id { get; set; }
        public string Name { get; set; }
        public bool isSelected { get; set; }
        public List<Countries> CountryList()
        {
            List<Countries> country = new List<Countries>();
            country.Add(new Countries { Id = "ct1", Name = "South Africa",
Code= "001" ,isSelected=true });
            country.Add(new Countries { Id = "ct2", Name = "North America",
Code="002", isSelected = false });
            country.Add(new Countries { Id = "ct3",Name = "West

            country.Add(new Countries { Id = "ct8", Name = "China", Code =
"008", isSelected = false });
            return country;
        }
    }
}

```

MultiSelectFor

The MultiSelectFor control can be rendered by passing values and data from the model. The selected values can be retrieved during form submit using the post method.

In the following sample, MultiSelectFor control is rendered.

CSHTML

```

@model Mvc_test.Models.Countries
@using (Html.BeginForm())
{
    @Html.EJS().MultiSelectFor(model => model.Values).Placeholder("Select a
Country").DataSource((IEnumerable<object>) ViewBag.data).Fields(new

```

```

Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value = "Name"
}).Render()
<div id="submitButton">
    @Html.EJS().Button("btn").Content("Post").Render()
</div>
}

```

FOR.CS

```

using System;
using System.Collections.Generic;
using System.Linq;
using System.Threading.Tasks;
using Microsoft.AspNetCore.Mvc;
using WebApplication1.Models;
namespace WebApplication1.Controllers
{
    public class AutoCompleteController : Controller
    {
        Countries model = new Countries();
        public ActionResult Index()
        {
            ViewBag.data = new Countries().CountriesList();
            model.Values = new string[] { "Cameroon" };
            return View(model);
        }
        [HttpPost]
        public ActionResult Index(Countries model)
        {
            ViewBag.data = new Countries().CountriesList();
            model.Values = model.Values;
            return View(model);
        }
    }
}

```

Data Annotation

Data Annotations help us to define the rules to the model classes or properties for data validation and displaying suitable messages to end users.

Data Annotations includes built-in validation attributes for different validation rules, which can be applied to the properties of model class. ASP.NET Framework will automatically enforce these validation rules and display validation messages in the view.

Using **value** property gets or sets the value of the selected item in the control.

CSHTML

```

@using (Html.BeginForm())
{
    @Html.EJS().MultiSelectFor(model =>
model.EnquiringAboutSelect).Placeholder("Select a
Country").DataSource(Model?.EnquiringAboutSelectListItems).Fields(new
Syncfusion.EJ2.DropDowns.MultiSelectFieldSettings { Value = "Text"
}).Placeholder("Please Select Enquiring About").Render()
<div>

```

```

        @Html.ValidationMessageFor(model => model.EnquiringAboutSelect)
    </div>
    <div id="submitButton">
        @Html.EJS().Button("btn").Content("Post").Render()
    </div>
}

Migration from Essential JS 1

This article describes the API migration process of multiselect component from Essential JS 1 to Essential JS 2.

Accessibility and Localization

Behavior | Property in Essential JS 1 | Property in Essential JS 2 |

|-----|-----|-----|

| Localization | **Property** : Locale @Html.EJ().DropDownList("locale").Locale("de-DE") |

Property : Locale

@Html.EJS().MultiSelect("locale").Locale("de-DE").Render() |

| Right to left | **Property**: EnableRTL @Html.EJ().DropDownList("rtl").EnableRTL(true) |

Property: EnableRtl

@Html.EJS().MultiSelect("rtl").EnableRtl(true).Render() |

Animation

Behavior | Property in Essential JS 1 | Property in Essential JS 2 |

|-----|-----|-----|

| Animation | **Property** : EnableAnimation

@Html.EJ().DropDownList("default").EnableAnimation(true) | Not Applicable |

Template

Behavior | Property in Essential JS 1 | Property in Essential JS 2 |

|-----|-----|-----|

| Header Template | **Property** : HeaderTemplate

@Html.EJ().DropDownList("DropDownList1").Datasource((IEnumerable<Employee1>)ViewData["LocalDataSource"]).HeaderTemplate("<div class='eheader'>PHOTODETAILS</div>") | **Property** : HeaderTemplate

@Html.EJS().MultiSelect("remote").HeaderTemplate("NameCity").Render() |

| Item Template | **Property** :ItemTemplate

@Html.EJ().DropDownList("DropDownList1").Datasource((IEnumerable<Employee1>)ViewData["LocalDataSource"]).Template("<div><Image class='ImageId' src='../Content/Employees/{Image}.png' alt='employee'/> <div class='ename'> \${Text} </div><div class='role'> \${Role} </div><div class='cont'> \${Country} </div></div>") | **Property** : ItemTemplate

@Html.EJS().MultiSelect("remote").ItemTemplate("<div>\${FirstName}\${City}</div>").Render() |

| Footer Template | **Property** : Not Applicable | **Property** : FooterTemplate

@Html.EJS().MultiSelect("remote").FooterTemplate(" Total list items: " + 4 + "").Render() |

| Group Template | **Property** : Not Applicable | **Property** : GroupTemplate

@Html.EJS().MultiSelect("remote").GroupTemplate("\${City}").Render()
 |

| Value Template | **Property** : Not Applicable | **Property** : ValueTemplate

@Html.EJS().MultiSelect("remote").ValueTemplate("\${FirstName} -
 \${City}").Render() |

| No Records Template | **Property** : Not Applicable | **Property** : NoRecordsTemplate

@Html.EJS().MultiSelect("remote").NoRecordsTemplate(" NO
 DATA AVAILABLE").Render() |

| Action Failure Template | **Property** : Not Applicable | **Property** : actionFailureTemplate

@Html.EJS().MultiSelect("remote").ActionFailureTemplate("
 Data fetch get fails").Render() |

Data Binding

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|-----|-----|-----|

| Data Source | **Property** : Datasource

@Html.EJ().DropDownList("DropDownList1").Datasource((IEnumerable<Employee>)ViewData["LocalDataSource"]).DropDownListFields(Df => Df.Text("Text").Value("Country")) | **Property**
 : Datasource

 @Html.EJS().MultiSelect("default").DataSource((IEnumerable<object>)ViewBag.localdata).Render()
 |

| Query | **Property** : Query

@Html.EJ().DropDownList("customerList").Datasource(ds =>
 ds.URL("https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/").CrossDomain(true)
).Query("ej.Query().from('Customers').take(6)").DropDownListFields(f => f.Text("CustomerID"))
 | **Property** : Query

@Html.EJS().MultiSelect("remote").Query((string)ViewBag.query).DataSource(obj =>
 obj.Url("http://services.odata.org/V4/Northwind/Northwind.svc/").CrossDomain(true).Adaptor
 ("ODataV4Adaptor")).Fields(new MultiSelectFieldSettings { Text = "FirstName", Value =
 "EmployeeID" }).Render() |

| Fields | **Property** : Fields

@Html.EJ().DropDownList("customerList").Datasource(ds =>
 ds.URL("https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/").CrossDomain(true)
).Query("ej.Query().from('Customers').take(6)").DropDownListFields(f => f.Text("CustomerID"))
 | **Property** : Fields

@Html.EJS().MultiSelect("remote").Query((string)ViewBag.query).DataSource(obj =>
 obj.Url("http://services.odata.org/V4/Northwind/Northwind.svc/").CrossDomain(true).Adaptor
 ("ODataV4Adaptor")).Fields(new MultiSelectFieldSettings { Text = "FirstName", Value =
 "EmployeeID" }).Render() |

| Action Begin | **Event** : ActionBegin

 @Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.ActionBegin("onActionBegin")) | **Event** : ActionBegin

@Html.EJS().MultiSelect("list").ActionBegin("onActionBegin").Render() |

| Action Complete | **Event** : ActionComplete

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.ActionComplete("onActionComplete") | **Event** : ActionComplete

@Html.EJS().MultiSelect("list").ActionComplete("onActionComplete").Render() |

| Action Failure | **Event** : ActionFailure

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.ActionFailure("onActionFailure") | **Event** : ActionFailure

@Html.EJS().MultiSelect("list").ActionFailure("onActionFailure").Render() |

| Action Success | **Event** : ActionSuccess

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.ActionSuccess("onActionSuccess") | Not Applicable |

| Data Bound | **Event** : DataBound

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.DataBound("onDataBound") | **Event** : DataBound

@Html.EJS().MultiSelect("list").DataBound("onDataBound").Render() |

Filtering

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|-----|-----|-----|

| Filtering | **Property** : EnableFilterSearch

@Html.EJ().DropDownList("default").EnableFilterSearch(true) | **Property** :
 AllowFiltering

@Html.EJS().MultiSelect("default").AllowFiltering(true).Render() |

| Server Filtering | **Property** : EnableServerFiltering

@Html.EJ().DropDownList("default").EnableServerFiltering(true) | **Event** : Filtering

@Html.EJS().MultiSelect("list").Filtering("onFiltering").Render() |

| Sorting | **Property** : EnableSorting

@Html.EJ().DropDownList("default").EnableSorting(true) | **Property** : SortOrder

@Html.EJS().MultiSelect("default").SortOrder('Ascending').Render() |

| Case Sensitive Search | **Property** : CaseSensitiveSearch

@Html.EJ().DropDownList("default").CaseSensitiveSearch(true) | **Property** : IgnoreCase

@Html.EJS().MultiSelect("default").IgnoreCase(true).Render() |

| Ignore Accent | Not Applicable | **Property** : IgnoreAccent

@Html.EJS().MultiSelect("default").IgnoreAccent(true).Render() |

| Filter Bar Placeholder | Not Applicable | **Property** : FilterBarPlaceholder

@Html.EJS().MultiSelect("default").Mode('CheckBox').FilterBarPlaceholder('search the
 value').Render() |

| Search | **Event** : Search

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e => e.Search("onSearch") |
Event : Filtering

@Html.EJS().MultiSelect("list").Filtering("onFiltering").Render() |

Popups

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

```

|-----|-----|-----|
| Popup Resize | Property : EnablePopupResize<br/>
<br/>@Html.EJ().DropDownList("default").EnablePopupResize(true) | Not Applicable |
| Maximum Popup Height | Property : MaxPopupHeight<br/>
<br/>@Html.EJ().DropDownList("default").MaxPopupHeight(300) | Not Applicable |
| Minimum Popup Height | Property : MinPopupHeight<br/>
<br/>@Html.EJ().DropDownList("default").MinPopupHeight(200) | Not Applicable |
| Maximum Popup Width | Property : MaxPopupWidth<br/>
<br/>@Html.EJ().DropDownList("default").MaxPopupWidth(300) | Not Applicable |
| Minimum Popup Width | Property : MinPopupWidth<br/>

| Un select Item By Value | **Method** : unselectItemByValue()

@Html.EJ().DropDownList("selectCompany")

var dropdown = \$("#dropdown
 ").data("ejDropDownList"); dropdown.unselectItemByValue ("Computer IT ,Comics ") | Not Applicable |

| Selected All | **Method** : checkAll()

@Html.EJ().DropDownList("selectCompany")

 var dropdown = \$("#dropdown ").data("ejDropDownList"); dropdown.checkAll() | **Method** :
 selectAll

@Html.EJS().MultiSelect("default").Render()

var mulObj =
 document.getElementById('multiselect').ej2_Instances[0];

 mulObj.selectAll(true) |

| Un Selected All | **Method** : unCheckAll()

@Html.EJ().DropDownList("selectCompany")

 var dropdown = \$("#dropdown
 ").data("ejDropDownList"); dropdown.unCheckAll() | **Method** : selectAll

@Html.EJS().MultiSelect("default").Render()

var mulObj =
 document.getElementById('multiselect').ej2_Instances[0];

 mulObj.selectAll(false) |

Common

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|-----|-----|-----|

| Virtual Scrolling | **Property** : AllowVirtualScrolling

@Html.EJ().DropDownList("default").AllowVirtualScrolling(true) | It will be achieved in
 sample level using actionComplete event |

| Virtual Scroll Mode | **Property** : VirtualScrollMode

@Html.EJ().DropDownList("default").AllowVirtualScrolling(true).VirtualScrollMode(Virtual
 ScrollMode.Normal) | Not Applicable |

| Custom class | **Property** : CssClass

@Html.EJ().DropDownList("default").CssClass('customstyle') | **Property** : CssClass

@Html.EJS().MultiSelect("default").CssClass('customstyle').Render() |

| Delimiter Char | **Property** : DelimiterChar

@Html.EJ().DropDownList("default").DelimiterChar('.') | **Property** : DelimiterChar

@Html.EJS().MultiSelect("default").DelimiterChar('.').Render() |

| Enable | **Property** : Enable @Html.EJ().DropDownList("default").Enable(true) |
Property : Enabled

@Html.EJS().MultiSelect("default").Enabled(true).Render() |

| Persistence | **Property** : EnablePersistence

@Html.EJ().DropDownList("default").EnablePersistence(true) | **Property** : EnablePersistence

@Html.EJS().MultiSelect("default").EnablePersistence(true).Render() |

| Load On Demand | **Property** : LoadOnDemand

@Html.EJ().DropDownList("default").LoadOnDemand(true) | By default, provided load on
 demand support |

| Height | **Property** : Height

@Html.EJ().DropDownList("default").Height(100) | Not
 Applicable |

| Html Attributes | **Property** : HtmlAttributes

@Html.EJ().DropDownList("default").HtmlAttributes((IDictionary<string,object>)ViewData[
 "HtmlAttrData"]) | **Property** : HtmlAttributes

@Html.EJS().MultiSelect("default").HtmlAttributes((IDictionary<string,object>)ViewData.h
 tmlAttrData).Render() |

| Width | **Property** : Width

@Html.EJ().DropDownList("default").Width(500) | **Property**
 : Width

@Html.EJS().MultiSelect("default").Width(400).Render() |

| Mode | **Property** : MultiSelectMode

@Html.EJ().DropDownList("default").MultiSelectMode(MultiSelectModeTypes.Delimiter) |
Property : Mode

 1. Delimeter

 2. Box

 3. Default

 4.
 CheckBox

 @Html.EJS().MultiSelect("default").Mode('Delimeter').Render() |

| Read Only | **Property** : ReadOnly

@Html.EJ().DropDownList("default").ReadOnly(true)
 | **Property** : Readonly @Html.EJS().MultiSelect("default").Readonly(true).Render() |

| Checkbox | **Property** : ShowCheckbox

@Html.EJ().DropDownList("default").ShowCheckbox(true) | **Property** : Mode

 @Html.EJS().MultiSelect("default").Mode('CheckBox').Render() |

| Rounded Corner | **Property** : ShowRoundedCorner

@Html.EJ().DropDownList("default").ShowRoundedCorner(true) | Not Applicable |

| Target ID | **Property** : TargetID

@Html.EJ().DropDownList("DropDownList1").TargetID("mail")<div id="mail"><div
 class="mailtools categorize"></div>Categorize and Move</div> | Not Applicable |

| Text | **Property** : Text @Html.EJ().DropDownList("DropDownList1").Text("Employee Name") | **Property** : Text @Html.EJS().MultiSelect("default").Text("Employee Name").Render() |

| Validation Message | **Property** : ValidationMessage @Html.EJ().DropDownList("DropDownList1").Datasource((IEnumerable<Data>)ViewData["DropDownSource"]).DropDownListFields(Df => Df.Text("Text").Value("Value")).ValidationMessage(message => message.AddMessage("required", "* Required").AddMessage("min", "Select > 30")) | The default error message for a rule can be customizable by defining it along with concern rule. |

| Validation Rules | **Property** : ValidationRules @Html.EJ().DropDownList("DropDownList1").Datasource((IEnumerable<Data>)ViewData["DropDownSource"]).DropDownListFields(Df => Df.Text("Text").Value("Value")).ValidationRules(vr => vr.AddRule("required", true).AddRule("min", 30)) | Use Form validator to validate the multiselect component and set validation rules. |

| Value | **Property** : Value @Html.EJ().DropDownList("DropDownList1").Value("Employee Value") | **Property** : Value @Html.EJS().MultiSelect("default").Value(ViewBag.value).Render() |

| Watermark Text | **Property** : WatermarkText @Html.EJ().DropDownList("DropDownList1").WatermarkText("Select employee") | **Property** : Placeholder @Html.EJS().MultiSelect("default").Placeholder('Select employee').Render() |

| Custom Value | Not Applicable | **Property** : AllowCustomValue @Html.EJS().MultiSelect("default").AllowCustomValue(true).Render() |

| Clear Button | Not Applicable | **Property** : ShowClearButton @Html.EJS().MultiSelect("default").ShowClearButton(true).Render() |

| DropDown Icon | Not Applicable | **Property** : ShowDropDownIcon @Html.EJS().MultiSelect("default").ShowDropDownIcon(true).Render() |

| Show Select All | Not Applicable | **Property** : ShowSelectAll @Html.EJS().MultiSelect("default").ShowSelectAll(true).Render() |

| z-Index | Not Applicable | **Property** : ZIndex @Html.EJS().MultiSelect("default").ZIndex(1000).Render() |

| Add Item | **Method** : addItem(object) @Html.EJ().DropDownList("DropDownList1") var dropdown = \$("#dropdown").data("ejDropDownList"); dropdown.addItem({ text : "new item"}); | **Method** : addItem(object) @Html.EJS().MultiSelect("default").Render() var mulObj = document.getElementById('multiselect').ej2_Instances[0]; mulObj.addItem({ text : "new item"}) |

| Clear Text | **Method** : clearText()

 @Html.EJ().DropDownList("DropDownList1")

 var dropdown = \$("#dropdown").data("ejDropDownList"); dropdown.clearText(); | **Property** :

```

value <br/> <br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var mulObj =
document.getElementById('multiselect').ej2_Instances[0];<br/><br/> mulObj.value = null |

| Destroy | Method : destroy() <br/> <br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/>
var dropdown = $("#dropdown ").data("ejDropDownList"); dropdown.destroy(); | Property : destroy
<br/> <br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var mulObj =
document.getElementById('multiselect').ej2_Instances[0];<br/><br/> mulObj.destroy() |

| Disable | Method : disable() <br/> <br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/>
var dropdown = $("#dropdown ").data("ejDropDownList"); dropdown.disable(); | Property : Enabled
<br/> <br/>@Html.EJS().MultiSelect("default").Enabled(false).Render() /> |

| Enable | Method : enable() <br/> <br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/>
var dropdown = $("#dropdown ").data("ejDropDownList"); dropdown.enable(); | Property : Enabled
<br/> <br/>@Html.EJS().MultiSelect("default").Enabled(true).Render() |

| Disable Items By Indices | Method : disableItemsByIndices() <br/>
<br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/> var dropdown = $("#dropdown
").data("ejDropDownList"); dropdown.disableItemsByIndices("3,4,5"); | Not Applicable |

| Enable Items By Indices | Method : enableItemsByIndices() <br/>
<br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/> var dropdown = $("#dropdown
").data("ejDropDownList"); dropdown.enableItemsByIndices("3,4,5"); | Not Applicable |

| Get Item Data By Value | Method : getItemDataByValue("value") <br/>
<br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/> var dropdown = $("#dropdown
").data("ejDropDownList"); dropdown.getItemDataByValue("value"); | Method :
getDataByValue("value") <br/> <br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var
mulObj = document.getElementById('multiselect').ej2_Instances[0];<br/><br/>
mulObj.getDataByValue("value") |

| Get List Data | Method : getListData() <br/>
<br/>@Html.EJ().DropDownList("DropDownList1")<br/> <br/> var dropdown = $("#dropdown
").data("ejDropDownList"); dropdown.getListData(); | Not Applicable |

| Hide Spinner | Not Applicable | Method : hideSpinner() <br/>
<br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var mulObj =
document.getElementById('multiselect').ej2_Instances[0];<br/><br/> mulObj.hideSpinner() |

| Show Spinner | Not Applicable | Method : showSpinner() <br/>
<br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var mulObj =
document.getElementById('multiselect').ej2_Instances[0];<br/><br/> mulObj.showSpinner() |

| Refresh | Not Applicable | Method : refresh() <br/>
<br/>@Html.EJS().MultiSelect("default").Render()<br/> <br/>var mulObj =
document.getElementById('multiselect').ej2_Instances[0];<br/><br/> mulObj.refresh() |

| Change | Event : Change<br/>
<br/>@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e => e.Change("onChange"))
| Event : Change<br/> <br/>@Html.EJS().MultiSelect("list").Change("onChange").Render() |

```

| Check Change | **Event** : CheckChange

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.CheckChange("onCheckChange")) | Not Applicable |

| Create | **Event** : Create

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e => e.Create("onCreate")) |
Event : Created

@Html.EJS().MultiSelect("list").Created("onCreated").Render() |

| Destroy | **Event** : Destroy

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.Destroy("onDestroy")) | **Event** : Destroyed

@Html.EJS().MultiSelect("list").Destroyed("onDestroyed").Render() |

| Focus In | **Event** : FocusIn

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.FocusIn("onFocusIn")) | **Event** : Focus

@Html.EJS().MultiSelect("list").Focus("onFocus").Render() |

| Focus Out | **Event** : FocusOut

@Html.EJ().DropDownList("selectCompany").ClientSideEvents(e =>
 e.FocusOut("onFocusOut")) | **Event** : Blur

@Html.EJS().MultiSelect("list").Blur("onBlur").Render() |

| Chip Selection | Not Applicable | **Event** : ChipSelection

@Html.EJS().MultiSelect("list").ChipSelection("onChipSelection").Render() |

| Custom Value Selection | Not Applicable | **Event** : CustomValueSelection

@Html.EJS().MultiSelect("list").CustomValueSelection("onCustomValueSelection").Render
 () |

| Removed | Not Applicable | **Event** : Removed

@Html.EJS().MultiSelect("list").Removed("onRemoved").Render() |

| Removing | Not Applicable | **Event** : Removing

@Html.EJS().MultiSelect("list").Removing("onRemoving").Render() |

| Tagging | Not Applicable | **Event** : Tagging

@Html.EJS().MultiSelect("list").Tagging("onTagging").Render() |

Numeric TextBox

Getting Started with ASP.NET MVC NumericTextBox Control

This section briefly explains about how to include [ASP.NET MVC NumericTextBox](#) control in your ASP.NET MVC application using Visual Studio.

Prerequisites

[System requirements for ASP.NET MVC controls](#)

Create ASP.NET MVC application with HTML helper

- [Create a Project using Microsoft Templates](#)
- [Create a Project using Syncfusion ASP.NET MVC Extension](#)

Install ASP.NET MVC package in the application

To add **ASP.NET MVC** controls in the application, open the NuGet package manager in Visual Studio (Tools → NuGet Package Manager → Manage NuGet Packages for Solution), search for [Syncfusion.EJ2.MVC5](#) and then install it.

PACKAGE MANAGER

```
Install-Package Syncfusion.EJ2.MVC5 -Version {{ site.ej2version }}
```

Note: Syncfusion ASP.NET MVC controls are available in [nuget.org](#). Refer to [NuGet packages topic](#) to learn more about installing NuGet packages in various OS environments. The Syncfusion.EJ2.MVC5 NuGet package has dependencies, [Newtonsoft.Json](#) for JSON serialization and [Syncfusion.Licensing](#) for validating Syncfusion license key.

Note: If you create ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add stylesheet and script resources

Here, the theme and script is referred using CDN inside the **<head>** of **~/Pages/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls. Checkout the [Adding Script Reference](#) topic to learn different approaches for adding script references in your ASP.NET MVC application.

Register Syncfusion script manager

Also, register the script manager **EJS().ScriptManager()** at the end of **<body>** in the **~/Pages/Shared/_Layout.cshtml** file as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Add ASP.NET MVC NumericTextBox control

Now, add the Syncfusion ASP.NET MVC NumericTextBox control in `~/Views/Home/Index.cshtml` page.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(10).Render()
```

Press **Ctrl+F5** (Windows) or **⌘+F5** (macOS) to run the app. Then, the Syncfusion ASP.NET MVC NumericTextBox control will be rendered in the default web browser.

Range validation

You can set the minimum and maximum range of values in the NumericTextBox using the [Min](#) and [Max](#) properties, so the numeric value should be in the min and max range.

The validation behavior depends on the [StrictMode](#) property.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(16).Min(10).Max(20).Step(2).Render()
```

Formatting the value

User can set the format of the NumericTextBox control using [Format](#) property. The value will be displayed in the specified format, when the control is in focused out state. For more information about formatting the value, refer to this [link](#).

The below example demonstrates format the value by using currency format value `c2`.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Format("c2").Value(10).Render()
```

Precision of numbers

You can restrict the number of decimals to be entered in the NumericTextBox by using the [Decimals](#) and [ValidateDecimalOnType](#) properties. So, you can't enter the number whose precision is greater than the mentioned decimals.

- If `validateDecimalOnType` is false, number of decimals will not be restricted. Else, number of decimals will be restricted while typing in the NumericTextBox.

CSHTML

```
<div id='container'>
  <div class='wrap'>

@Html.EJS().NumericTextBox("strict").Format("n3").Value(10).ValidateDecimalOnType(true).Decimals(3).Placeholder("ValidateDecimalOnType Enabled").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
  </div>
  <div class='wrap'>

@Html.EJS().NumericTextBox("allow").Format("n3").Value(10).Decimals(3).Placeholder("ValidateDecimalOnType Disabled").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
  </div>
</div>
```

ValidateDecimalOnType Enabled
10.000

ValidateDecimalOnType Disabled
10.000

Note: [View Sample in GitHub.](#)

See also

- [How to perform custom validation using FormValidator](#)
- [How to customize the UI appearance of the control](#)
- [How to customize the spin button's up and down arrow](#)
- [How to customize the step value and hide spin buttons](#)
- [How to prevent nullable input in NumericTextBox](#)
- [How to maintain trailing zeros in NumericTextBox](#)

Number Formats in NumericTextBox Control

You can format the value of NumericTextBox using `format` property. The value will be displayed in the specified format when the control is in focused out state. The format string supports both the [standard numeric format string](#) and [custom numeric format string](#).

Standard formats

From the [standard numeric format](#), you can use the numeric related format specifiers such as `n`, `p` and `c` in the NumericTextBox control. By using these format specifiers, you can achieve the percentage and currency textbox behavior also.

The below example demonstrates percentage and currency formats.

CSHTML

```
<div id='container'>
    <div class='wrap'>

@Html.EJS().NumericTextBox("percent").Format("p2").Value(0.5).Min(0).Max(1).
Step(0.01).Placeholder("Percentage
format").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
    </div>
    <div class='wrap'>

@Html.EJS().NumericTextBox("currency").Format("c2").Value(10).Placeholder("C
urrency
format").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
    </div>
</div>
```

STANDARD.CS

```
public ActionResult Standard()
{
    return View();
}
```

Output be like the below.

**Custom formats**

From the [custom numeric format string](#), you can provide any custom format by combining one or more custom specifiers.

The below examples demonstrate format the value by using currency format string **#** and **0**.

CSHTML

```
<div id='container'>
    <div class='wrap'>

@Html.EJS().NumericTextBox("numeric").Format("###.##").Value(10).Placeholder
("Custom format string
#").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
    </div>
    <div class='wrap'>

@Html.EJS().NumericTextBox("numeric1").Format("000.00").Value(10).Placeholde
```

```

r("Custom format string
0").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).Render()
</div>
</div>

```

CUSTOM.CS

```

public ActionResult Custom()
{
    return View();
}

```

Output be like the below.

Globalization

Internationalization

Internationalization library provides support for formatting and parsing the number by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data. The `NumericTextBox` comes with built-in internationalization support to adapt based on culture. For more information about internationalization, refer to this [link](#).

By default, all the Essential JS 2 control are specific to English culture (en-US).

If you want to go with the different culture other than `English`, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

,

```
npm install cldr-data --save
```

,

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

In ASP.NET MVC refer the culture files directly from `/node_modules/cldr-data` location as like the below code examples

```

`typescript
function loadCultureFiles(name) {
var files = ['currencies.json', 'numbers.json'];

```

```

if (name === 'zh') {
files.push('currencyData.json');
}
var loader = ej.base.loadCldr;
var loadCulture = function () {
var val, ajax;
if (name === 'zh' && prop === files.length - 1) {
ajax = new ej.base.Ajax(location.origin + location.pathname + '/../node_modules/cldr-
data/supplemental/' + files[prop], 'GET', false);
} else {
ajax = new ej.base.Ajax(location.origin + location.pathname + '/../node_modules/cldr-data/main/' +
name + '/' + files[prop], 'GET', false);
}
ajax.onSuccess = function (value) {
val = value;
};
ajax.send();
loader (JSON.parse(val));
};
for (var prop = 0; prop < files.length; prop++) {
loadCulture();
}
}
loadCultureFiles('de');
`

```

Localization

[Localization](#) library allows users to localize the default text contents of the NumericTextBox to different cultures using the [locale](#) property.

In NumericTextBox, spin buttons title for the tooltip will be localized based on the culture.

| | | | | |
|--|----------------|--|-----------------|--|
| | Locale key | | en-US (default) | |
| | ----- | | ----- | |
| | incrementTitle | | Increment value | |
| | decrementTitle | | Decrement value | |

- Before changing to a culture other than English, ensure that locale text for the concerned culture is loaded through `load` method of `L10n` class.

```
`typescript
ej.base.L10n.load({
  'en': {
    'numerictextbox': { incrementTitle: 'Increment value', decrementTitle: 'Decrement value' }
  },
  'de': {
    'numerictextbox': { incrementTitle: 'Wert erhöhen', decrementTitle: 'Dekrementwert' }
  },
  'zh': {
    'numerictextbox': { incrementTitle: '增值', decrementTitle: '遞減值' }
  }
});
`
```

CSHTML

```
<div class="content-wrapper">
  <div class="divelement">

    @Html.EJS().NumericTextBox("numeric").Value(10).Locale("de").Placeholder("Ge
    ben Sie den Wert
    ein").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
  </div>
  <div class="divelement">

    @Html.EJS().NumericTextBox("percentage").Format("p2").Value(0.5).Locale("de"
    ).Max(1).Min(0).Step(0.01).Placeholder("Geben Sie den Prozentsatz
    ein").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
  </div>
  <div class="divelement">

    @Html.EJS().NumericTextBox("currency").Format("c2").Value(100).Locale("de")
    .Currency("EUR").Placeholder("Geben Sie die Währung
    ein").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
  </div>
  <div class="wrapper">

值' }
        },
    });
</script>

```

LOCALIZATION.CS

```

public class HomeController : Controller
{
    public class Cultures
    {
        public string CultureName { get; set; }
    }
    public IActionResult Index()
    {
        List<Cultures> cultureData = new List<Cultures>();
        cultureData.Add(new Cultures() { CultureName = "de" });
        cultureData.Add(new Cultures() { CultureName = "zh" });
        cultureData.Add(new Cultures() { CultureName = "en" });
        ViewBag.cultureData = cultureData;
        return View();
    }
}

```

Output be like the below.

The image shows three instances of the NumericTextBox control, each with a label in Chinese and a value displayed in the text box. The first control is labeled '输入值' (Input Value) and shows '10.00'. The second is labeled '输入百分比' (Input Percentage) and shows '50.00%'. The third is labeled '输入货币' (Input Currency) and shows '¥ 100.00'. Each control has a horizontal line below the text box and two small triangular arrows (down and up) to its right. Below these controls is a 'Choose Culture' dropdown menu with 'zh' selected.

Right to Left

RTL provides an option to switch the text direction and layout of the NumericTextBox control from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL NumericTextBox, set the [enableRtl](#) to true.

CSHTML

```
<div class="content-wrapper">
  <div class="divelement">

        ViewBag.cultureData = cultureData;
        return View ();
    }
    ...
}

```

Output be like the below.

The screenshot displays a web form with four input elements. The first three are numeric textboxes, each with a label above it and a value to its right. The first is labeled 'Geben Sie den Wert ein' with a value of '10,00'. The second is labeled 'Geben Sie den Prozentsatz ein' with a value of '% 50,00'. The third is labeled 'Geben Sie die Währung ein' with a value of '€ 100,00'. Each of these three textboxes has small upward and downward arrow icons to its left. The fourth element is a dropdown menu labeled 'Choose Culture' with the value 'de' selected and displayed to its right.

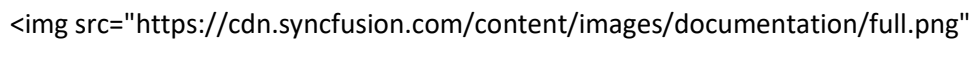

Accessibility

The Numerictextbox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Numerictextbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  alt="Yes"> |

| [Section 508 Support](#) |  alt="Yes"> |

```

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

The NumericTextBox characterized with complete ARIA Accessibility support which helps to accessible by on-screen readers and other assistive technology devices. This component designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The NumericTextBox uses the `spinbutton` role and following ARIA properties to its element based on its state.

| Property | Functionality |

| --- | --- |

| aria-live | The `aria-live` attribute indicates the priority of updates to a live region |

| aria-valuemin | The `aria-valuemin` property specifies the minimum allowable range of the NumericTextBox. |

| **aria-valuemax** | The **aria-valuemax** property specifies the maximum allowable range of the NumericTextBox. |

| **aria-disabled** | The **aria-disabled** property indicates disabled state of the NumericTextBox. |

| **aria-readonly** | The **aria-readonly** property indicates the read-only state of the NumericTextBox. |

| **aria-valuenow** | The **aria-valuenow** property specifies the current value of the NumericTextBox. |

| **aria-invalid** | The **aria-invalid** property indicates that the user input is incorrect or not within acceptable ranges. |

| **aria-label** | The **aria-label** property indicates a string value that labels the NumericTextBox. |

Keyboard interaction

Keyboard interaction of the NumericTextBox control has been designed based on [WAI-ARIA Practices](#) described for the NumericTextBox and it is an alternative to mouse actions to interact with the NumericTextBox.

The below table shows shortcut keys and its corresponding usage.

| Keyboard shortcuts | Actions |
|--------------------|-----------------------|
| --- --- | |
| Arrow Down | Increments the value. |
| Arrow Up | Decrements the value |

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(10).Render()
```

ACCESSIBILITY.CS

```
public ActionResult Accessibility()
{
    return View();
}
```

Output be like the below.

Ensuring accessibility

The NumericTextBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the NumericTextBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the NumericTextBox component with accessibility tools.

Style and appearance in NumericTextBox Component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of NumericTextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
/ To specify height and font size /

.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
height: 40px;
font-size: 20px;
}
```

Customizing the NumericTextBox icons

Use the following CSS to customize the Numeric TextBox icons

```
`css
/ To specify font size and background color /

.e-numeric.e-control-wrapper.e-input-group .e-input-group-icon {
font-size: 20px;
background-color: beige;
}
```

How To

Customize the UI appearance of the control

You can change the appearance of the NumericTextBox by adding custom `cssClass` to the control and enabling styles. Refer to the following example to change the appearance of the NumericTextBox.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(10).Placeholder("numeric").FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Auto).CssClass("e-style").Render()
<style>
    .e-numeric.e-style .e-control.e-numerictextbox {
        color: royalblue;
        font-size: xx-large;
        border: 0px;
    }
    .e-input-group.e-control-wrapper:not(.e-success):not(.e-warning):not(.e-error):not(.e-float-icon-left), .e-float-input.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left) {
        border-color: royalblue;
    }
```

```

    }
    .e-control-wrapper.e-numeric.e-float-input.e-style .e-spin-down {
        color: royalblue;
    }
    .e-control-wrapper.e-numeric.e-float-input.e-style .e-float-line::before
    {
        background: royalblue;
    }
    .e-control-wrapper.e-numeric.e-float-input.e-style .e-float-line::after
    {
        background: royalblue;
    }
    .e-control-wrapper.e-numeric.e-float-input.e-style .e-spin-up {
        color: royalblue;
    }
    .e-control-wrapper.e-numeric.e-float-input.e-style.e-input-group .e-
float-text.e-label-top {
        color: royalblue;
        font-size: medium;
    }
</style>

```

CUSTOMCSS.CS

```

public ActionResult customCss()
{
    return View();
}

```

Output be like the below.

Customize the spin button's up and down arrow

This section explains about how to change/customize spin up and down icons. You can customize spin button icons using `e-spin-up` and `e-spin-down` classes of those buttons.

You can override the default icons of `e-spin-up` and `e-spin-down` classes using the following CSS code snippets.

```

`css
.e-numeric .e-input-group-icon.e-spin-up:before {
content: "\e823";
color: rgba(0, 0, 0, 0.54);
}
.e-numeric .e-input-group-icon.e-spin-down:before {

```

```
content: "\e934";
color: rgba(0, 0, 0, 0.54);
}
```

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(10).Render()
<style>
  /* csslint ignore:start */
  .e-numeric .e-input-group-icon.e-spin-up:before {
    content: "\e823";
    color: rgba(0, 0, 0, 0.54);
  }
  .e-numeric .e-input-group-icon.e-spin-down:before {
    content: "\e934";
    color: rgba(0, 0, 0, 0.54);
  }
  /* csslint ignore:end */
</style>
```

BUTTONS.CS

```
public ActionResult Buttons()
{
    return View();
}
```

Output be like the below.

Customize the step value and hide spin buttons

The spin buttons allow you to increase or decrease the value with the predefined [step](#) value. The visibility of spin buttons can be set using the [showSpinButton](#) property.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Value(16).Min(10).Max(100).ShowSpinButton(false).Render()
```

ICONS.CS

```
public ActionResult Icons()
{
    return View();
}
```

Output be like the below.

16.00

Maintain trailing zeros in NumericTextBox

By default, trailing zeros disappear when the NumericTextBox gets focus. However, you can use the following sample to maintain the trailing zeros while focusing the NumericTextBox.

CSHTML

```
@Html.EJS().NumericTextBox("numeric").Format("n2").Value(10).Decimals(2).Change("numericFocus").Created("onCreate").Render()
<script>
    function numericFocus() {
        var numericObj = this.ej2_instances ? this.ej2_instances[0] : this;
        numericObj.element.value =
        numericObj.formattedValue(numericObj.decimals, +numericObj.element.value);
    }
    function onCreate() {
        document.getElementById('numeric').addEventListener('focus',
        numericFocus);
    }
</script>
```

TRAILINGZEROS.CS

```
public ActionResult nullableInput()
{
    return View();
}
```

NumericTextBoxFor and Model Binding

This section demonstrates the Strongly typed extension support in NumericTextBox. The view which bind with any model is called as strongly typed view. You can bind any class as model to view. You can access model properties on that view. You can use data associated with model to render controls.

In this sample, first click the submit button to post the selected value in the MaskedTextBox. When posting the null value, validation error message will be shown below the NumericTextBox.

CSHTML

```
@using (Html.BeginForm())
{
    @Html.ValidationSummary(true)
    <div class="col-lg-12 control-section">
        <div id="wrapper">
            @Html.EJS().NumericTextBoxFor(model =>
            model.value).Width("200px").Render()
            <div>
                @Html.ValidationMessageFor(model => model.value)
            </div>
            <div id="submitButton">
                @Html.EJS().Button("btn").Content("Post").Render()
            </div>
        </div>
    </div>
}
```

```
}  
<style>  
    #wrapper {  
        max-width: 246px;  
        margin: 30px auto;  
        padding-top: 50px;  
    }  
    #submitbutton {  
        margin-top: 20px;  
        margin-left: 65px;  
    }  
    #control-content #wrapper .field-validation-error {  
        color: red;  
    }  
</style>
```

MODELBINDING.CS

```
using System;  
using System.Collections.Generic;  
using System.Linq;  
using System.Threading.Tasks;  
using Microsoft.AspNetCore.Mvc;  
using System.ComponentModel.DataAnnotations;  
namespace EJ2CoreSampleBrowser.Controllers  
{  
    public class NumericValue  
    {  
        [Required]  
        public int value { get; set; }  
    }  
    public partial class NumericTextBoxController : Controller  
    {  
        public ActionResult DefaultFunctionalities()  
        {  
            NumericValue val = new NumericValue();  
            val.value = 10;  
            return View(val);  
        }  
        [HttpPost]  
        public ActionResult DefaultFunctionalities(NumericValue model)  
        {  
            NumericValue val = new NumericValue();  
            val.value = model.value;  
            return View(val);  
        }  
    }  
}
```

Output be like the below.

Perform custom validation using FormValidator

This section explains how to perform custom validation on the NumericTextBox using FormValidator. The NumericTextBox will be validated when the value changes or the user clicks the submit button. Validation can be performed by adding custom validation in the rules collection of the FormValidator.

CSHTML

```
<form id="form-element">

@Html.EJS().NumericTextBox("numeric").Min(10).Max(100).Change("onChange").Placeholder("numeric").Created("onCreate").StrictMode(false).FloatLabelType(Syncfusion.EJ2.Inputs.FloatLabelType.Always).Render()
    @Html.EJS().Button("submit_btn").Content("submit").Render()
</form>
<script>
    function onCreate() {
        document.getElementById(this.element.id).setAttribute("name",
"numericRange");
    }
    function onChange(args) {
        if (numeric.value != null) {
            formObject.validate("numericRange");
        }
    }
    var customFn = function (args) {
        if (numeric.value >= 10 && numeric.value <= 100) {
            return true;
        }
        else {
            return false;
        }
    };
    // sets required property in the FormValidator rules collection
    var options = {
        rules: {
            'numericRange': { required: [true, "Number is required"] },
        },
    };
    // defines FormValidator to validate the MaskedTextBox
    var formObject = new ej.inputs.FormValidator('#form-element', options);
    // places error label outside the MaskedTextBox using the
customPlacement event of FormValidator
    formObject.customPlacement = function (element, errorElement) {
        element.parentNode.parentNode.appendChild(errorElement);
    };
    formObject.addRules('numericRange', { range: [customFn, "Please enter a
number between 10 to 100"] });
    document.getElementById("submit_btn").addEventListener('click', function
() {
```

```

        formObject.validate("numericRange");
        var ele = document.getElementById('numeric');
        // checks for incomplete value and alerts the formt submit
        if (ele.value !== "" && ele.value >= 10 && ele.value <= 100) {
            alert("Submitted");
        }
    });
</script>
<style>
    .e-numeric.e-control-wrapper {
        margin-bottom: 20px;
    }
    label.e-error {
        margin-top: -50px;
    }
</style>

```

CUSTOMVALIDATION.CS

```

public ActionResult customValidation()
{
    return View();
}

```

Output be like the below.

Prevent nullable input in NumericTextBox

By default, the value of the NumericTextBox sets to null. In some applications, the value of the NumericTextBox should not be null at any instance. In such cases, following sample can be used to prevent nullable input in NumericTextBox.

CSHTML

```

@Html.EJS().NumericTextBox("numeric").Created("onCreate").Blur("onBlur").Render()
<script>
    function onCreate(args) {
        if (this.value == null) {
            this.value = 0;
        }
    }
    function onBlur(args) {
        if (args.value == null) {
            numeric.value = 0;
        }
    }
</script>

```

NULLABLEINPUT.CS

```
public ActionResult nullableInput()
{
    return View();
}
```

Output be like the below.

[Migration from Essential JS 1](#)

This article describes the API migration process of NumericTextBox component from Essential JS 1 to Essential JS 2.

[Common](#)

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers on creation | **Event** *Create* @Html.EJ().NumericTextbox("numeric").Value(120).ClientSideEvents(s => s.Create("onCreate")) Script function onCreate(){ } | **Event:** *Created* @Html.EJS().NumericTextBox("numeric").Value(120).Created("onCreate").Render() Script function onCreate(){ } |

| Adding custom classes | **Property** *CssClass* @Html.EJ().NumericTextbox("numeric").Value(100).CssClass("custom") | **Property:** *CssClass* @Html.EJS().NumericTextBox("numeric").Value(100).CssClass("custom").Render() |

| Triggers when editor is destroyed | **Event** *Destroy* @Html.EJ().NumericTextbox("numeric").Value(120).ClientSideEvents(s => s.Destroy("onDestroy")) Script function onDestroy(){ } | **Event:** *Destroyed* @Html.EJS().NumericTextBox("numeric").Value(120).Destroyed("onDestroy").Render() Script function onDestroy(){ } |

| Destroys textbox | **Method** *destroy* @Html.EJ().NumericTextbox("numeric").Value(100) Script var numericObj = \$("#numeric").data("ejNumericTextbox"); numericObj.destroy(); | **Method:** *destroy* @Html.EJS().NumericTextBox("numeric").Value(100).Render() Script var numeric = document.getElementById('numeric').ej2_instances[0] numeric.destroy(); |

| Control state | **Property** *Enabled* @Html.EJ().NumericTextbox("numeric").Value(100).Enabled(false) | **Property:** *Enabled* @Html.EJS().NumericTextBox("numeric").Value(100).Enabled(false).Render() |

| Persistence | **Property** *EnablePersistence*

@Html.EJ().NumericTextbox("numeric").Value(100).EnablePersistence(true) | **Property:**

var numericObj =
 \$("#numeric").data("ejNumericTextbox");
numericObj.getValue(); | **Method:** *getText*
 />@Html.EJS().NumericTextBox("numeric").Value(100).Render()

<Script>

var
 numeric = document.getElementById('numeric').ej2_instances[0]
numeric.getText(); |

| Increment value | Not Applicable | **Method:** *increment*
 />@Html.EJS().NumericTextBox("numeric").Value(80).Render()

<Script>

var
 numeric = document.getElementById('numeric').ej2_instances[0]
numeric.increment(); |

| Step value | **Property** *IncrementStep*
 />@Html.EJ().NumericTextbox("numeric").Value(100).IncrementStep(2) | **Property:** *Step*
 />@Html.EJS().NumericTextBox("numeric").Value(100).Step(2).Render() |

| Sets Maximum value | **Property** *MaxValue*
 />@Html.EJ().NumericTextbox("numeric").Value(100).MaxValue(200) | **Property:** *Max*
 />@Html.EJS().NumericTextBox("numeric").Value(100).Max(200).Render() |

| Sets Minimum value | **Property** *MinValue*
 />@Html.EJ().NumericTextbox("numeric").Value(100).MinValue(20) | **Property:** *Min*
 />@Html.EJS().NumericTextBox("numeric").Value(100).Min(20).Render() |

| Negative pattern for formatting values | **Property** *NegativePattern*
 />@Html.EJ().NumericTextbox("numeric").Value(-20).NegativePattern("(n)") | Not Applicable |

| Positive pattern for formatting values | **Property** *PositivePattern*
 />@Html.EJ().NumericTextbox("numeric").Value(20).PositivePattern("n kg") | Not Applicable |

| Specifies value | **Property** *Value*
 />@Html.EJ().NumericTextbox("numeric").Value(100) | **Property:** *value*
 />@Html.EJS().NumericTextBox("numeric").Value(100).Render() |

| Displays hint on editor | **Property** *WatermarkText*
 />@Html.EJ().NumericTextbox("numeric").Value(80).WatermarkText("Enter value") | **Property:**
Placeholder
 />@Html.EJS().NumericTextBox("numeric").Value(100).Placeholder("Enter
 value").Render() |

| Placeholder float type | Not Applicable | **Property:** *FloatLabelType*
 />@Html.EJS().NumericTextBox("numeric").Value(200).Placeholder("Enter
 value").FloatLabelType("Auto").Render() |

Number Formats

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Set Currency symbol | **Property** *CurrencySymbol*
 />@Html.EJ().CurrencyTextbox("currency").Value(100).CurrencySymbol("EUR") | **Property:** *Currency*
 />@Html.EJS().NumericTextBox("numeric").Format("c2").Value(100).Currency("EUR").Render() |

| Number Format | Not Applicable | **Property:** *Format* @Html.EJS().NumericTextBox("numeric").Format("n2").Value(200).Render() |

Validation

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Strict Mode | **Property** *EnableStrictMode* @Html.EJ().NumericTextbox("numeric").Value(80).EnableStrictMode(true) | **Property:** *StrictMode* @Html.EJS().NumericTextBox("numeric").StrictMode(true).Value(80).Render() |

| Validation on typing | **Property** *ValidateOnType* @Html.EJ().NumericTextbox("numeric").Value(100).ValidateOnType(true) | **Property:** *ValidateDecimalOnType* @Html.EJS().NumericTextBox("numeric").ValidateDecimalOnType(true).Value(100).Render() |

| Validation Message | **Property** *ValidationMessage* @Html.EJ().NumericTextbox("numeric").Value(100).ValidationRules(rule => rule.AddRule("required", true)).ValidationMessage(msg => msg.AddMessage("required", "Required value")) | **Can be achieved using** <form id="form-element"> @Html.EJS().NumericTextBox("numeric").Min(10).Max(100).Placeholder("Enter the number").Change("onChange").Created("onCreate").StrictMode(false).Render() </form> function onCreate() { document.getElementById(this.element.id).setAttribute("name", "numericRange"); </br></br>function onChange() { if (numeric.value != null) { formObject.validate("numericRange"); } var options = { rules: { 'numericRange': { required: [true, "Number is required"] }, }, }; var formObject = new ej.inputs.FormValidator('#form-element', options); formObject.customPlacement = function (element, errorElement) { element.parentNode.parentNode.appendChild(errorElement); }; |

| Validation Rules | **Property** *ValidationRules* @Html.EJ().NumericTextbox("numeric").Value(100).ValidationRules(rule => rule.AddRule("required", true)) | **Can be achieved using** <form id="form-element"> @Html.EJS().NumericTextBox("numeric").Min(10).Max(100).Placeholder("Enter the number").Change("onChange").Created("onCreate").StrictMode(false).Render() </form> function onCreate() { document.getElementById(this.element.id).setAttribute("name", "numericRange"); </br></br>function onChange(args) { if (numeric.value != null) { formObject.validate("numericRange"); } var options = { rules: { 'numericRange': { required: [true] }, }, }; var formObject = new ej.inputs.FormValidator('#form-element', options); formObject.customPlacement = function (element, errorElement) { element.parentNode.parentNode.appendChild(errorElement); }; |

PDF Viewer

Getting Started

Getting Started with ASP.NET MVC Standalone PDF Viewer Control

The [ASP.NET MVC PDF Viewer](#) control is used to viewing and printing PDF files in any web application. It provides the best viewing experience available with core interactions such as zooming, scrolling, text searching, text selection, and text copying. Thumbnail, bookmark, hyperlink and table of contents support provides easy navigation within and outside the PDF files.

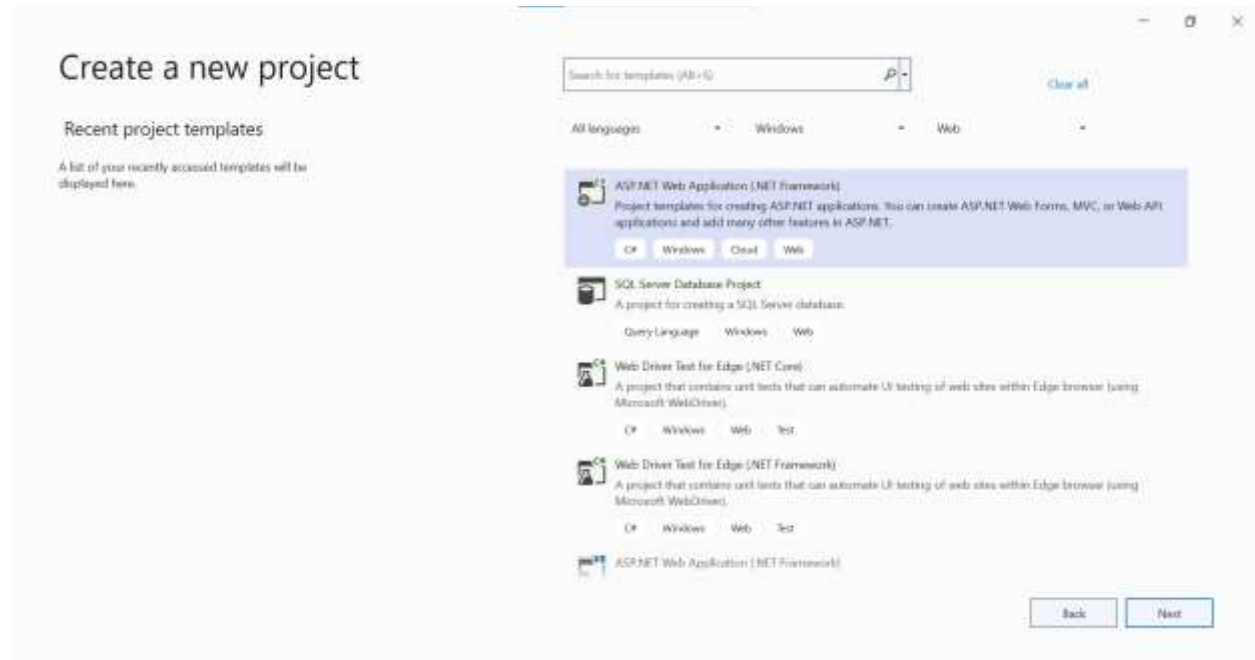

This section briefly explains about how to integrate ASP.NET MVC PDF Viewer control in your ASP.NET MVC application using Visual Studio.

Prerequisites

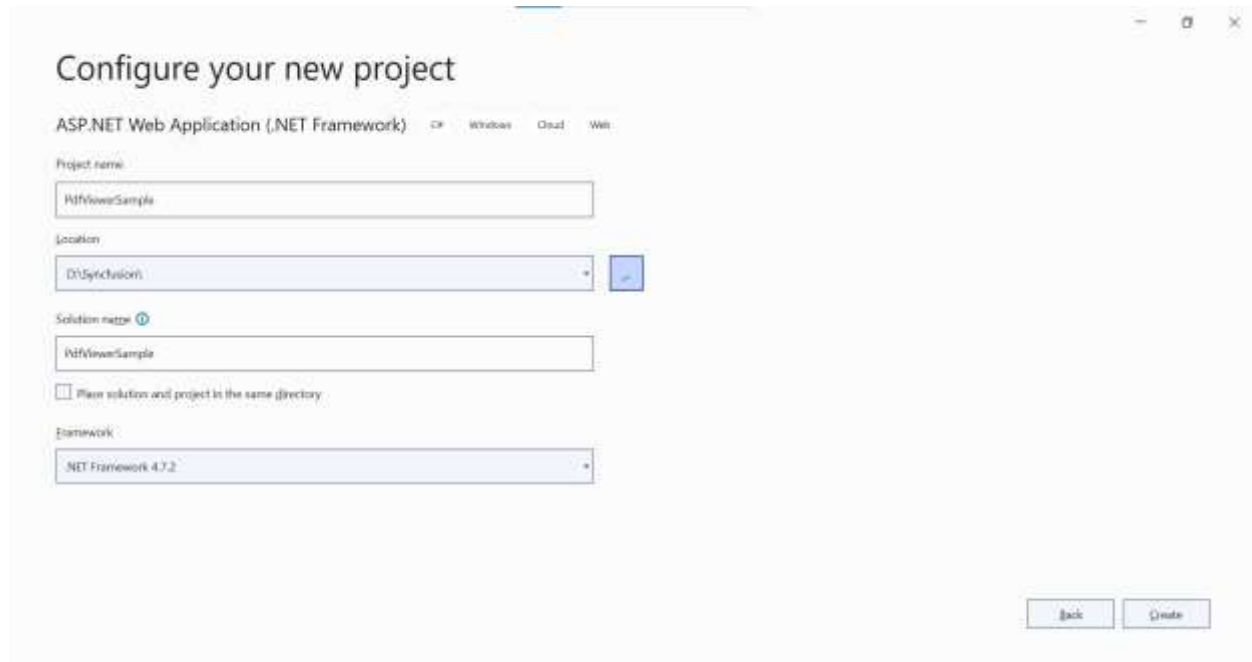

[System requirements for ASP.NET MVC controls](#)

Integrate PDF Viewer into an ASP.NET MVC application

1. Start Visual Studio and select **Create a new project**.
2. Create a new ASP.NET MVC Web Application project.

3. Choose the target framework.

Configure your new project

ASP.NET Web Application (.NET Framework) .NET Framework Windows Cloud Web

Project name
PdfViewerSample

Location
D:\Syncfusion\...

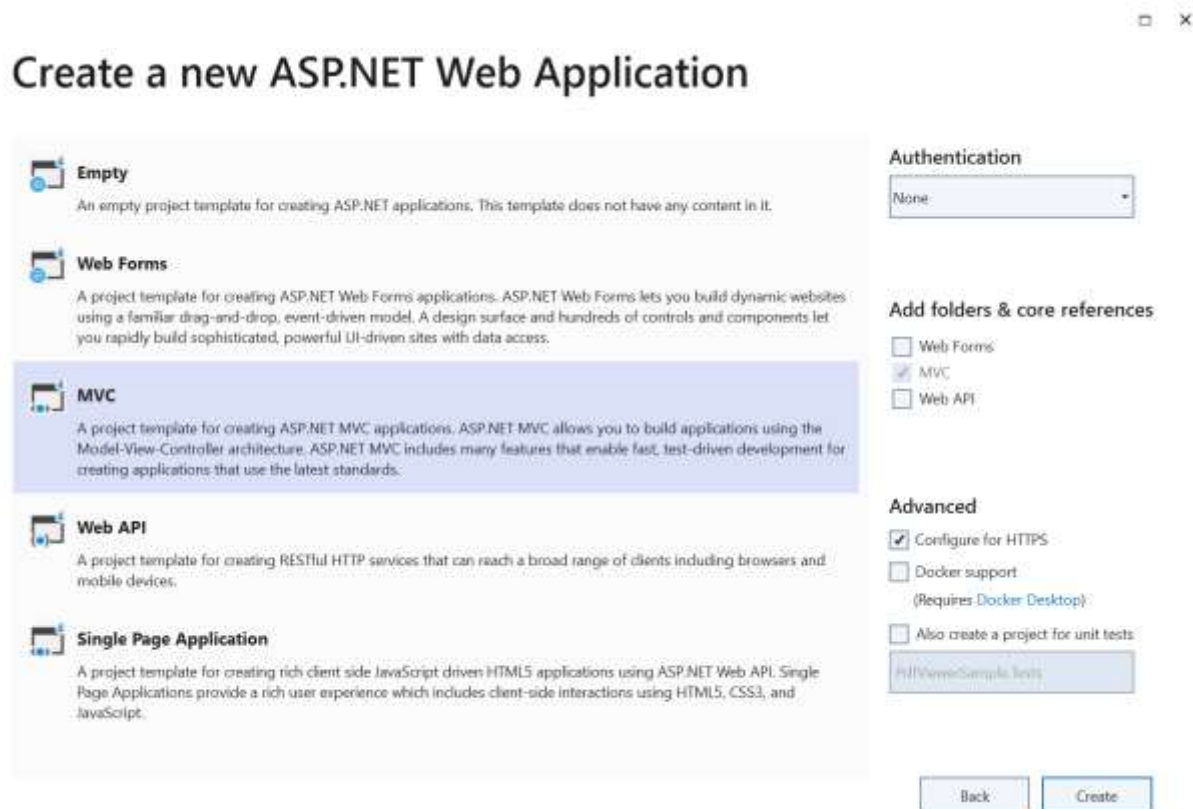

Solution name
PdfViewerSample

☐ Place solution and project in the same directory

Framework
.NET Framework 4.7.2

Back Create

4. Select Web Application pattern (MVC) for the project and then select **Create** button.

Create a new ASP.NET Web Application

Empty
An empty project template for creating ASP.NET applications. This template does not have any content in it.

Web Forms
A project template for creating ASP.NET Web Forms applications. ASP.NET Web Forms lets you build dynamic websites using a familiar drag-and-drop, event-driven model. A design surface and hundreds of controls and components let you rapidly build sophisticated, powerful UI-driven sites with data access.

MVC
A project template for creating ASP.NET MVC applications. ASP.NET MVC allows you to build applications using the Model-View-Controller architecture. ASP.NET MVC includes many features that enable fast, test-driven development for creating applications that use the latest standards.

Web API
A project template for creating RESTful HTTP services that can reach a broad range of clients including browsers and mobile devices.

Single Page Application
A project template for creating rich client side JavaScript driven HTML5 applications using ASP.NET Web API. Single Page Applications provide a rich user experience which includes client-side interactions using HTML5, CSS3, and JavaScript.

Authentication
None

Add folders & core references

- ☐ Web Forms
- ☒ MVC
- ☐ Web API

Advanced

- ☒ Configure for HTTPS
- ☐ Docker support
(Requires Docker Desktop)
- ☐ Also create a project for unit tests

Back Create

[ASP.NET MVC PDF Viewer NuGet packages installation](#)

To add .NET PDF Viewer control, the following NuGet packages need to be installed in your ASP.NET MVC application.

- [Syncfusion.EJ2.MVC5](#)

Note: If you creating ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

```
<namespaces>
<add namespace="Syncfusion.EJ2"/>
</namespaces>
```

Add style sheet

The theme is referred using CDN inside the **<head>** of **~/Views/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls.

Add script reference

Add the required scripts using CDN inside the **<head>** of **~/Views/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Note: While referring the scripts from the downloaded resources in your application, make sure to place the 'ej2-pdfviewer-lib' assets in the same directory as the 'ej2.min.js' script.

Register Syncfusion Script Manager

Open **~/Views/Shared/_Layout.cshtml** page and register the script manager in the ASP.NET MVC application as follows.

~/ LAYOUT.CSHTML

```
<body>
...
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Note: Add the script manager `EJS().ScriptManager()` at the end of `<body>`.

Add ASP.NET MVC PDF Viewer control

Add the Syncfusion ASP.NET MVC PDF Viewer control in `~/Views/Home/Index.cshtml` page. You can load a PDF file in the PDF Viewer by specifying the document name in the DocumentPath property as below.

~/INDEX.CSHTML

```
@{
    ViewBag.Title = "Home Page";
}
<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
</div>
```

[DocumentPath](#) is the property needed to load a PDF file in the PDF Viewer.

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC PDF Viewer control will be rendered in the default web browser.

Note: [View Sample in GitHub.](#)

Note: You can refer to our [ASP.NET MVC PDF Viewer](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC PDF Viewer example](#) to understand the core features of PDF Viewer.

[Limitation over Server-Backed PDF Viewer to Standalone PDF Viewer control](#)

When comparing a Standalone PDF Viewer to a Server-Backed PDF Viewer control, it's crucial to understand the limitations that the Standalone PDF Viewer may have in comparison. These limitations are important to consider

[PNG Image Support](#)

The Standalone PDF Viewer does not have the capability to utilize PNG format for adding images to handwritten annotations, custom stamp, signature and initial form fields. It's important to be aware that only certain image formats, such as JPEG, are compatible for these purposes.

[Local File Access](#)

- The Standalone PDF Viewer control does not have the capability to directly access and load local physical files from a user's device. As a result, it is not possible to use a documentPath to load a PDF file directly from a local server within the viewer.

- The Standalone PDF Viewer allows users to export annotations and form fields from the viewer, it's important to be aware that the viewer does not support the direct import of annotations and form fields from a locally specified file path. In other words, you can extract annotations and form fields from the viewer, but you cannot reintroduce them into the viewer from external sources by specifying a file path located on your local device.

Note: These limitations are temporary and are expected to be addressed in the near future.

A project template for creating RESTful HTTP services that can reach a broad range of clients including browsers and mobile devices.

Single Page Application
A project template for creating rich client side JavaScript driven HTML5 applications using ASP.NET Web API. Single Page Applications provide a rich user experience which includes client-side interactions using HTML5, CSS3, and JavaScript.

Authentication
None

Add folders & core references

- ☐ Web Forms
- ☒ MVC
- ☐ Web API

Advanced

- ☒ Configure for HTTPS
- ☐ Docker support
(Requires [Docker Desktop](#))
- ☐ Also create a project for unit tests

PdfViewerSample.Tests

Back Create

[ASP.NET MVC PDF Viewer NuGet packages installation](#)

To add .NET PDF Viewer control, the following NuGet packages need to be installed in your ASP.NET MVC application.

- [Syncfusion.EJ2.PdfViewer.AspNet.Mvc5](#)
- [Syncfusion.EJ2.MVC5](#)

Note: If you creating ASP.NET MVC application with MVC4 package, search for [Syncfusion.EJ2.MVC4](#) and then install it.

Add namespace

Add **Syncfusion.EJ2** namespace reference in **Web.config** under **Views** folder.

,

```
<namespaces>
```

```
<add namespace="Syncfusion.EJ2"/>
```

```
</namespaces>
```

,

Add style sheet

The theme is referred using CDN inside the **<head>** of **~/Views/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls styles -->
<link rel="stylesheet" href="https://cdn.syncfusion.com/ej2/{{
site.ej2version }}/fluent.css" />
</head>
```

Note: Checkout the [Themes topic](#) to learn different ways (CDN, NPM package, and [CRG](#)) to refer styles in ASP.NET MVC application, and to have the expected appearance for Syncfusion ASP.NET MVC controls.

Add script reference

Add the required scripts using CDN inside the **<head>** of **~/Views/Shared/_Layout.cshtml** file as follows,

~/ LAYOUT.CSHTML

```
<head>
...
<!-- Syncfusion ASP.NET MVC controls scripts -->
<script src="https://cdn.syncfusion.com/ej2/{{ site.ej2version
}}/dist/ej2.min.js"></script>
</head>
```

Register Syncfusion Script Manager

Open **~/Views/Shared/_Layout.cshtml** page and register the script manager in the ASP.NET MVC application as follows.

~/ LAYOUT.CSHTML

```
<body>
...
```

```
<!-- Syncfusion ASP.NET MVC Script Manager -->
@Html.EJS().ScriptManager()
</body>
```

Note: Add the script manager `EJS().ScriptManager()` at the end of `<body>`.

Add ASP.NET MVC PDF Viewer control

Add the Syncfusion ASP.NET MVC PDF Viewer control in `~/Views/Home/Index.cshtml` page. You can load a PDF file in the PDF Viewer by specifying the document name in the DocumentPath property as below.

~/INDEX.CSHTML

```
@{
    ViewBag.Title = "Home Page";
}
<div>
<div style="height:500px;width:100%;">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/Home/").DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
</div>
```

Add the below code in the `HomeController.cs` file which is placed inside `Controllers` folder.

~/HOMECONTROLLER.CS

```
using Newtonsoft.Json;
using Syncfusion.EJ2.PdfViewer;
using System;
using System.Collections.Generic;
using System.IO;
using System.Linq;
using System.Net;
using System.Net.Http;
using System.Reflection;
using System.Web;
using System.Web.Mvc;
namespace GettingStartedMVC.Controllers
{
    public class HomeController : Controller
    {
        [System.Web.Mvc.HttpPost]
        public ActionResult Load(jsonObjects jsonObject)
        {
            PdfRenderer pdfviewer = new PdfRenderer();
            MemoryStream stream = new MemoryStream();
            var jsonData = JsonConvert.DeserializeObject(jsonObject);
            object jsonResult = new object();
            if (jsonObject != null && jsonData.ContainsKey("document"))
            {
                if (bool.Parse(jsonData["isFileName"]))
                {
                    string documentPath = GetDocumentPath(jsonData["document"]);
```

```

}

```

[ServiceUrl](#) is necessary to communicate with the server which also specifies the path of the controller. Here, PdfViewer is the name of the controller.

[DocumentPath](#) is the property needed to load a PDF file in the PDF Viewer.

Press Ctrl+F5 (Windows) or ⌘+F5 (macOS) to run the app. Then, the Syncfusion ASP.NET MVC PDF Viewer control will be rendered in the default web browser.

Note: We have provided the support to dynamically change the `serviceURL`. So, after changing the `serviceURL` dynamically, you need invoke the `pdfViewer.dataBind()` method to update the `serviceURL` quickly. This will effectively change the `serviceURL` dynamically. Ensure that this step is performed after version 23.1.36.

```
string serviceUrl = VirtualPathUtility.ToAbsolute("~/Home/");  
function load() {  
    var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];  
    pdfViewer.serviceUrl = '@serviceUrl'  
    pdfViewer.documentPath = "https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf";  
    pdfViewer.dataBind();  
    pdfViewer.load(pdfViewer.documentPath, null);  
}
```

Note: [View Sample in GitHub.](#)

Note: You can refer to our [ASP.NET MVC PDF Viewer](#) feature tour page for its groundbreaking feature representations. You can also explore our [ASP.NET MVC PDF Viewer example](#) to understand the core features of PDF Viewer.

Note: When configuring the server-backed PDF viewer, it's essential to understand that there is no need to include the pdfium.js and pdfium.wasm files. Unlike the standalone PDF viewer, which relies on these files for local rendering, the server-backed PDF viewer fetches and renders PDFs directly from the server. Consequently, you can exclude the copy command for deployment process, as they are not required to load and display PDFs in this context.

Feature modules

The PDF Viewer features are segregated into individual feature-wise modules to enable selectively referencing in the application. The required modules should be injected to extend its functionality. The following are the selective modules of PDF Viewer that can be included as required:

The available PdfViewer modules are:

- **Toolbar**:- Built in toolbar for better user interaction.
- **Magnification**:- Perform zooming operation for better viewing experience.
- **Navigation**:- Easy navigation across the PDF pages.
- **LinkAnnotation**:- Easy navigation within and outside of the PDF document.
- **ThumbnailView**:- Easy navigation with in the PDF document.
- **BookmarkView**:- Easy navigation based on the bookmark content of the PDF document.
- **TextSelection**:- Select and copy text from a PDF file.
- **TextSearch**:- Search a text easily across the PDF document.
- **Print**:- Print the entire document or a specific page directly from the browser.
- **Annotation**:- Annotations can be added or edited in the PDF document.

Note: In addition to injecting the required modules in your application, enable corresponding properties to extend the functionality for a PDF Viewer instance.

Refer to the following table.

| Module | Property to enable the functionality for a PDF Viewer instance |
|----------------|--|
| --- | --- |
| Toolbar | <code>@Html.EJS().PdfViewer("container").EnableToolbar(true).Render()</code> |
| Magnification | <code>@Html.EJS().PdfViewer("container").EnableMagnification(true).Render()</code> |
| Navigation | <code>@Html.EJS().PdfViewer("container").EnableNavigation(true).Render()</code> |
| LinkAnnotation | <code>@Html.EJS().PdfViewer("container").EnableHyperlink(true).Render()</code> |
| ThumbnailView | <code>@Html.EJS().PdfViewer("container").EnableThumbnail(true).Render()</code> |
| BookmarkView | <code>@Html.EJS().PdfViewer("container").EnableBookmark(true).Render()</code> |
| TextSelection | <code>@Html.EJS().PdfViewer("container").EnableTextSelection(true).Render()</code> |
| TextSearch | <code>@Html.EJS().PdfViewer("container").EnableTextSearch(true).Render()</code> |

```
|Print|@Html.EJS().PdfViewer("container").EnablePrint(true).Render()|
```

```
|Annotation|@Html.EJS().PdfViewer("container").EnableAnnotation(true).Render()|
```

Open PDF files

Open PDF file from AWS S3

To load a PDF file from AWS S3 in a PDF Viewer, you can follow the steps below

Step 1: Create AWS S3 account

Set up an AWS S3 account by following the instructions on the official AWS site: [AWS Management Console](#). Create an S3 bucket and generate access keys while ensuring secure storage of credentials.

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the HomeController.cs File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Amazon;
using Amazon.S3;
using Amazon.S3.Model;
`
```

2. Modify the `Load()` method to load the PDF files from AWS S3.

```
`csharp
private readonly string _accessKey = "Your Access Key from AWS S3";
private readonly string _secretKey = "Your Secret Key from AWS S3";
private readonly string _bucketName = "Your Bucket name from AWS S3";
[System.Web.Mvc.HttpPost]
public async Task<ActionResult> Load(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    MemoryStream stream = new MemoryStream();
```

```

var jsonData = JsonConvert(jsonObject);
object jsonResult = new object();
if (jsonObject != null && jsonData.ContainsKey("document"))
{
    if (bool.Parse(jsonData["isFileName"]))
    {
        RegionEndpoint bucketRegion = RegionEndpoint.USEast1;
        // Configure the AWS SDK with your access credentials and other settings
        var s3Client = new AmazonS3Client(accessKey, secretKey, bucketRegion);
        string document = jsonData["document"];
        // Specify the document name or retrieve it from a different source
        var response = await s3Client.GetObjectAsync(_bucketName, document);
        Stream responseStream = response.ResponseStream;
        responseStream.CopyTo(stream);
        stream.Seek(0, SeekOrigin.Begin);
    }
    else
    {
        byte[] bytes = Convert.FromBase64String(jsonData["document"]);
        stream = new MemoryStream(bytes);
    }
}
jsonResult = pdfviewer.Load(stream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}
`

```

Note: Replace **Your Access Key from AWS S3**, **Your Secret Key from AWS S3**, and **Your Bucket name from AWS S3** with your actual AWS access key, secret key and bucket name

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from AWS S3. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```

`csharp
@{

```

```

ViewBag.Title = "Home Page";
}
<div>
<div style="height:500px;width:100%;">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`

```

Note: The **AWSSDK.S3** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub](#)

Open PDF file from Azure Blob Storage

To load a PDF file from Azure Blob Storage in a PDF Viewer, you can follow the steps below

Step 1: Create the Azure Blob Storage account

Log in to the Azure Portal. Create a new Storage Account with preferred settings. Note access keys during the setup. Within the Storage Account, create a Blob Container following the steps in this [link](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```

`csharp
using System.IO;
using Azure.Storage.Blobs;
using Azure.Storage.Blobs.Specialized;
`

```

2. Modify the `Load()` method to load the PDF files from Azure Blob Storage.

```

`csharp
private readonly string _connectionString = "Your Connection string from Azure";
private readonly string _containerName = "Your container name in Azure";
public ActionResult Load(jsonObjects jsonObject)
{

```

```

PdfRenderer pdfviewer = new PdfRenderer();
MemoryStream stream = new MemoryStream();
var jsonData = JsonConvert(jsonObject);
object jsonResult = new object();
if (jsonObject != null && jsonData.ContainsKey("document"))
{
    if (bool.Parse(jsonData["isFileName"]))
    {
        // Create a BlobServiceClient object by passing the connection string.
        BlobServiceClient blobServiceClient = new BlobServiceClient(_connectionString);
        // Get a reference to the container
        BlobContainerClient containerClient = blobServiceClient.GetBlobContainerClient(_containerName);
        string fileName = jsonData["document"];
        // Get a reference to the block blob
        BlockBlobClient blockBlobClient = containerClient.GetBlockBlobClient(fileName);
        blockBlobClient.DownloadTo(stream);
    }
    else
    {
        byte[] bytes = Convert.FromBase64String(jsonData["document"]);
        stream = new MemoryStream(bytes);
    }
}
jsonResult = pdfviewer.Load(stream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}
`

```

Note: Replace **Your Connection string from Azure** with the actual connection string for your Azure Blob Storage account and **Your container name in Azure** with the actual container name

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Azure Blob Storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

`csharp

```
@{
    ViewBag.Title = "Home Page";
}

<div>

<div style="height:500px;width:100%;">

@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()

</div>

</div>
,
```

Note: The **Azure.Storage.Blobs** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub.](#)

Open PDF file from Google Cloud Storage

To load a PDF file from Google Cloud Storage in a PDF Viewer, you can follow the steps below

Step 1 Create a Service Account

Open the Google Cloud Console. Navigate to **IAM & Admin > Service accounts**. Click **Create Service Account**. Enter a name, assign roles (e.g., Storage Object Admin), and create a key in JSON format. Download the key file securely. Utilize the downloaded key file in your applications or services for authentication and access to the Google Cloud Storage bucket. For additional details, refer to the [official documentation](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the **HomeController.cs** File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Google.Cloud.Storage.V1;
using Google.Apis.Auth.OAuth2;
,
```

2. Add the following private fields and constructor parameters to the **HomeController.cs** class, In the constructor, assign the values from the configuration to the corresponding fields

```
`csharp
```

```
// The key file is used to authenticate with Google Cloud Storage.
private string keyFilePath = @"path/to/service-account-key.json";
private readonly string _bucketName = "Your Bucket name from Google Cloud Storage";
private readonly StorageClient _storageClient;
public HomeController()
{
    // Load the service account credentials from the key file.
    var credentials = GoogleCredential.FromFile(keyFilePath);
    // Create a storage client with Application Default Credentials
    _storageClient = StorageClient.Create(credentials);
}
`
```

3. Modify the `Load()` method to load the PDF files from Google Cloud Storage bucket.

```
`csharp
public ActionResult Load(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    MemoryStream stream = new MemoryStream();
    var jsonData = JsonConvert.DeserializeObject(jsonObject);
    object jsonResult = new object();
    if (jsonObject != null && jsonData.ContainsKey("document"))
    {
        if (bool.Parse(jsonData["isFileName"]))
        {
            string bucketName = _bucketName;
            string fileName = jsonData["document"];
            _storageClient.DownloadObject(bucketName, fileName, stream);
            stream.Position = 0;
        }
        else
        {
            byte[] bytes = Convert.FromBase64String(jsonData["document"]);
        }
    }
}
```

```

stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}
`

```

Note: Replace **Your Bucket name from Google Cloud Storage** with the actual name of your Google Cloud Storage bucket

Note: Replace **path/to/service-account-key.json** with the actual file path to your service account key JSON file. Make sure to provide the correct path and filename.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Google Cloud Storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```

`csharp
@{
    ViewBag.Title = "Home Page";
}
<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`

```

Note: The **Google.Cloud.Storage.V1** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub](#)

Open PDF file from Google Drive

To load a PDF file from Google Drive in a PDF Viewer, you can follow the steps below

Step 1 Set up Google Drive API

You must set up a project in the Google Developers Console and enable the Google Drive API. Obtain the necessary credentials to access the API. For more information, view the official [link](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Google.Apis.Drive.v3;
using Google.Apis.Auth.OAuth2;
using Google.Apis.Services;
using Google.Apis.Util.Store;
`
```

2. Modify the `Load()` method to load the PDF files from Google Drive.

```
`csharp
// Specify the path to the credentials file
private string credentialsPath = "Your Path to the OAuth 2.0 Client IDs json file";
// Specify the folder ID where you want to upload the PDF on Google Drive
private readonly string folderId = "Your Google Drive Folder ID";
private readonly string ApplicationName = "Your Application Name";
private readonly string tokenjson = "Path to create token.json file";
public async Task<ActionResult> Load(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    MemoryStream stream = new MemoryStream();
    var jsonData = JsonConvert.DeserializeObject(jsonObject);
    object jsonResult = new object();
    if (jsonObject != null && jsonData.ContainsKey("document"))
    {
        if (bool.Parse(jsonData["isFileName"]))
        {
            string objectName = jsonData["document"];
            // Google Drive API setup
            UserCredential credential;
```

```
string[] Scopes = { DriveService.Scope.DriveReadOnly };
// Load the credentials file
using (var streammen = new FileStream(credentialsPath, FileMode.Open, FileAccess.Read))
{
    // The file token.json stores the user's access and refresh tokens, and is created
    // automatically when the authorization flow completes for the first time.
    string tokenPath = tokenjson;
    credential = GoogleWebAuthorizationBroker.AuthorizeAsync(
        GoogleClientSecrets.Load(streammen).Secrets,
        Scopes,
        "user",
        CancellationToken.None,
        new FileDataStore(tokenPath, true)).Result;
}
// Create the Drive service
var service = new DriveService(new BaseClientService.Initializer()
{
    HttpClientInitializer = credential,
    ApplicationName = ApplicationName,
});
FilesResource.ListRequest listRequest = service.Files.List();
listRequest.Q = "mimeType='application/pdf' and '" + folderId + "' in parents and trashed=false";
listRequest.Fields = "files(id, name)";
var files = await listRequest.ExecuteAsync();
// Process the list of files (you can use 'files' to retrieve the list of files)
string fileIdToDownload = null;
foreach (var file in files.Files)
{
    string fileId = file.Id;
    string fileName = file.Name;
    if (fileName == objectName)
    {
        // Save the matching fileId
    }
}
```

```

fileIdToDownload = fileId;
break;
}
}
string fileIds = fileIdToDownload;
var request = service.Files.Get(fileIds);
await request.DownloadAsync(stream);
stream.Position = 0;
}
else
{
byte[] bytes = Convert.FromBase64String(jsonData["document"]);
stream = new MemoryStream(bytes);
}
}
jsonResult = pdfviewer.Load(stream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
}
,

```

Note: Replace **Your Google Drive Folder ID**, **Your Application name**, **tokenPath** and **Your Path to the OAuth 2.0 Client IDs json file** with your actual Google drive folder ID , Your name for your application, Path to the token file to generate and the path for the JSON file.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Google Drive. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```

`csharp
@{
ViewBag.Title = "Home Page";
}
<div>
<div style="height:500px;width:100%;">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>

```

```
</div>
```

Note: The **Google.Apis.Drive.v3** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub](#)

Open PDF file from Box cloud file storage

To load a PDF file from Box cloud file storage in a PDF Viewer, you can follow the steps below

Step 1 Set up a Box developer account and create a Box application

To access Box storage programmatically, you'll need a developer account with Box. Go to the [Box Developer Console](#), sign in or create a new account, and then create a new Box application. This application will provide you with the necessary credentials Client ID and Client Secret to authenticate and access Box APIs. Before accessing files, you need to authenticate your application to access your Box account. Box API supports **OAuth 2.0 authentication** for this purpose.

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the **HomeController.cs** File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using Box.V2;
using Box.V2.Auth;
using Box.V2.Config;
using Box.V2.Models;
`
```

2. Modify the **Load()** method to load the PDF files from Box cloud file storage.

```
`csharp
private readonly string clientId = "YourBoxStorageClientID";
private readonly string clientSecret = "YourBoxStorageClientSecret";
private readonly string accessToken = "YourBoxStorageAccess_Token";
private readonly string folderId = "YourFolder_ID";
[System.Web.Mvc.HttpPost]
public async Task<ActionResult> Load(jsonObjects jsonObject)
{
```

```
PdfRenderer pdfviewer = new PdfRenderer();
MemoryStream stream = new MemoryStream();
var jsonData = JsonConvert(jsonObject);
object jsonResult = new object();
if (jsonObject != null && jsonData.ContainsKey("document"))
{
    if (bool.Parse(jsonData["isFileName"]))
    {
        string objectName = jsonData["document"];
        // Initialize the Box API client with your authentication credentials
        var auth = new OAuthSession(accessToken, "YOURREFRESH_TOKEN", 3600, "bearer");
        var config = new BoxConfigBuilder(clientId, clientSecret, new Uri("http://boxsdk")).Build();
        var client = new BoxClient(config, auth);
        // Download the file from Box storage
        var items = await client.FoldersManager.GetFolderItemsAsync(_folderId, 1000, autoPaginate: true);
        var files = items.Entries.Where(i => i.Type == "file");
        // Filter the files based on the objectName
        var matchingFile = files.FirstOrDefault(file => file.Name == objectName);
        // Fetch the file from Box storage by its name
        var fileStream = await client.FilesManager.DownloadAsync(matchingFile.Id);
        stream = new MemoryStream();
        await fileStream.CopyToAsync(stream);
        // Reset the position to the beginning of the stream
        stream.Position = 0;
    }
    else
    {
        byte[] bytes = Convert.FromBase64String(jsonData["document"]);
        stream = new MemoryStream(bytes);
    }
}
jsonResult = pdfviewer.Load(stream, jsonData);
return Content(JsonConvert.SerializeObject(jsonResult));
```

```
}
`
```

Note: replace **YourBoxStorageAccessToken** with your actual box access token, and **YourFolderID** with the ID of the folder in your box storage where you want to perform specific operations. Remember to use your valid box API credentials, as **YourBoxStorageClientID and YourBoxStorageClientSecret** are placeholders for your application's API key and secret.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Box cloud file storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```
`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`
```

Note: The **Box.V2.Core** NuGet package must be installed in your application to use the previous code example.

Note: Replace `PDF_Succinctly.pdf` with the actual document name that you want to load from Box cloud file storage. Make sure to pass the document name from the box folder to the `documentPath` property of the PDF viewer component

[View sample in GitHub](#)

[Save PDF files](#)

[Save PDF file to AWS S3](#)

To save a PDF file to AWS S3 bucket, you can follow the steps below

Step 1: Create AWS S3 account

Set up an AWS S3 account by following the instructions on the official AWS site: [AWS Management Console](#). Create an S3 bucket and generate access keys while ensuring secure storage of credentials.

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Amazon;
using Amazon.S3;
using Amazon.S3.Model
`
```

3. Modify the `Download()` method to save the downloaded PDF files to AWS S3 container

```
`csharp
private readonly string _accessKey = "Your Access Key from AWS S3";
private readonly string _secretKey = "Your Secret Key from AWS S3";
private readonly string _bucketName = "Your Bucket name from AWS S3";
[System.Web.Mvc.HttpPost]
public ActionResult Download(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    var jsonData = JsonConverter(jsonObject);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
    RegionEndpoint bucketRegion = RegionEndpoint.USEast1;
    // Configure the AWS SDK with your access credentials and other settings
    var s3Client = new AmazonS3Client(accessKey, secretKey, bucketRegion);
    string bucketName = _bucketName;
    string documentName = jsonData["documentId"];
    string result = Path.GetFileNameWithoutExtension(documentName);
    byte[] bytes = Convert.FromBase64String(documentBase.Split(',')[1]);
    using (MemoryStream stream = new MemoryStream(bytes))
    {
        var request = new PutObjectRequest
        {
            BucketName = bucketName,
            Key = result + "_downloaded.pdf",
            InputStream = stream,

```

```
};
// Upload the PDF document to AWS S3
var response = s3Client.PutObjectAsync(request).Result;
}
return Content(documentBase);
}
`
```

Note: Replace **Your Access Key from AWS S3**, **Your Secret Key from AWS S3**, and **Your Bucket name from AWS S3** with your actual AWS access key, secret key and bucket name

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from AWS S3. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```
`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`
```

Note: The **AWSSDK.S3** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub](#)

Save PDF file to Azure Blob Storage

To save a PDF file to Azure Blob Storage, you can follow the steps below

Step 1: Create the Azure Blob Storage account

Log in to the Azure Portal. Create a new Storage Account with preferred settings. Note access keys during the setup. Within the Storage Account, create a Blob Container following the steps in this [link](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Azure.Storage.Blobs;
using Azure.Storage.Blobs.Specialized;
`
```

3. Modify the `Download()` method to save the downloaded PDF files to Azure Blob Storage container

```
`csharp
private readonly string _connectionString = "Your Connection string from Azure";
private readonly string _containerName = "Your container name in Azure";
public ActionResult Download(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    var jsonData = JsonConvert.SerializeObject(jsonObject);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
    string document = jsonData["documentId"];
    // Create a BlobServiceClient object by passing the connection string.
    BlobServiceClient blobServiceClient = new BlobServiceClient(_connectionString);
    // Get a reference to the container
    BlobContainerClient containerClient = blobServiceClient.GetBlobContainerClient(_containerName);
    string result = Path.GetFileNameWithoutExtension(document);
    // Get a reference to the blob
    BlobClient blobClient = containerClient.GetBlobClient(result + "_download.pdf");
    // Convert the document base64 string to bytes
    byte[] bytes = Convert.FromBase64String(documentBase.Split(',')[1]);
    // Upload the document to Azure Blob Storage
    using (MemoryStream stream = new MemoryStream(bytes))
    {
        blobClient.Upload(stream, true);
    }
}
```

```
return Content(documentBase);
}
`
```

Note: Replace **Your Connection string from Azure** with the actual connection string for your Azure Blob Storage account and **Your container name in Azure** with the actual container name

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Azure Blob Storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```
`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`
```

Note: The **Azure.Storage.Blobs** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub.](#)

Save PDF file to Google Cloud Storage

To save a PDF file to Google Cloud Storage, you can follow the steps below

Step 1 Create a Service Account

Open the Google Cloud Console. Navigate to **IAM & Admin > Service accounts**. Click **Create Service Account**. Enter a name, assign roles (e.g., Storage Object Admin), and create a key in JSON format. Download the key file securely. Utilize the downloaded key file in your applications or services for authentication and access to the Google Cloud Storage bucket. For additional details, refer to the [official documentation](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Google.Cloud.Storage.V1;
using Google.Apis.Auth.OAuth2;
`
```

2. Add the following private fields and constructor parameters to the `HomeController.cs` class, In the constructor, assign the values from the configuration to the corresponding fields

```
`csharp
// The key file is used to authenticate with Google Cloud Storage.
private string keyFilePath = @"path/to/service-account-key.json";
private readonly string _bucketName = "Your Bucket name from Google Cloud Storage";
private readonly StorageClient _storageClient;
public HomeController()
{
    // Load the service account credentials from the key file.
    var credentials = GoogleCredential.FromFile(keyFilePath);
    // Create a storage client with Application Default Credentials
    _storageClient = StorageClient.Create(credentials);
}
`
```

3. Modify the `Download()` method to save the downloaded PDF files to Google Cloud Storage bucket

```
`csharp
public ActionResult Download(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    var jsonData = JsonConverter(jsonObject);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
    string bucketName = _bucketName;
    string fileName = jsonData["documentId"];
    // Convert the base64 string back to bytes
    string result = Path.GetFileNameWithoutExtension(fileName);
}
```

```
byte[] documentBytes = Convert.FromBase64String(documentBase.Split(',')[1]);
// Upload the document to Google Cloud Storage
using (var memoryStream = new MemoryStream(documentBytes))
{
    storageClient.UploadObject(bucketName, result + "downloaded.pdf", null, memoryStream);
}
return Content(documentBase);
}
```

Note: Replace **Your Bucket name from Google Cloud Storage** with the actual name of your Google Cloud Storage bucket

Note: Replace **path/to/service-account-key.json** with the actual file path to your service account key JSON file. Make sure to provide the correct path and filename.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Google Cloud Storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```
`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
```

Note: The **Google.Cloud.Storage.V1** NuGet package must be installed in your application to use the previous code example.

[View sample in GitHub](#)

Save PDF file to Google Drive

To save a PDF file to Google Drive, you can follow the steps below

Step 1 Set up Google Drive API

You must set up a project in the Google Developers Console and enable the Google Drive API. Obtain the necessary credentials to access the API. For more information, view the official [link](#).

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using System.IO;
using Google.Apis.Drive.v3;
using Google.Apis.Auth.OAuth2;
using Google.Apis.Services;
using Google.Apis.Util.Store;
`
```

3. Modify the `Download()` method to save the downloaded PDF files to Google Drive bucket

```
`csharp
// Specify the path to the credentials file
private string credentialsPath = "Your Path to the OAuth 2.0 Client IDs json file";
// Specify the folder ID where you want to upload the PDF on Google Drive
private readonly string folderId = "Your Google Drive Folder ID";
private readonly string ApplicationName = "Your Application Name";
private readonly string tokenjson = "Path to create token.json file";
public async Task<ActionResult> Download(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    var jsonData = JsonConverter(jsonObject);
    string[] Scopes = { DriveService.Scope.DriveFile };
    // Download the PDF document
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
    byte[] documentBytes = Convert.FromBase64String(documentBase.Split(',')[1]);
    string documentId = jsonData["documentId"];
    string result = Path.GetFileNameWithoutExtension(documentId);
}
```

```
string fileName = result + "_downloaded.pdf";
UserCredential credential;
using (var streammen = new FileStream(credentialsPath, FileMode.Open, FileAccess.Read))
{
    // The file token.json stores the user's access and refresh tokens and is created
    // automatically when the authorization flow completes for the first time.
    string tokenPath = tokenjson;
    credential = await GoogleWebAuthorizationBroker.AuthorizeAsync(
        GoogleClientSecrets.Load(streammen).Secrets,
        Scopes,
        "user",
        CancellationToken.None,
        new FileDataStore(tokenPath, true));
}
// Create the Drive API service
var service = new DriveService(new BaseClientService.Initializer()
{
    HttpClientInitializer = credential,
    ApplicationName = ApplicationName,
});
// Create file metadata
var fileMetadata = new Google.Apis.Drive.v3.Data.File()
{
    Name = fileName,
    Parents = new List<string> { folderId }
};
FilesResource.CreateMediaUpload request;
// Upload the file to Google Drive
using (var stream = new MemoryStream(documentBytes))
{
    request = service.Files.Create(fileMetadata, stream, "application/pdf");
    request.Fields = "id";
    var uploadedFile = await request.UploadAsync();
}
```

```

}
return Content(documentBase);
}
`

```

Note: Replace **Your Google Drive Folder ID**, **Your Application name**, **tokenPath** and **Your Path to the OAuth 2.0 Client IDs json file** with your actual Google drive folder ID , Your name for your application, Path to the token file to generate and the path for the JSON file.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Google Drive. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```

`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`

```

Note: The **Google.Apis.Drive.v3** NuGet package must be installed in your application to use the previous code example.

Save PDF file to Box cloud file storage

To save a PDF file to Box cloud file storage, you can follow the steps below

Step 1 Set up a Box developer account and create a Box application

To access Box storage programmatically, you'll need a developer account with Box. Go to the [Box Developer Console](#), sign in or create a new account, and then create a new Box application. This application will provide you with the necessary credentials Client ID and Client Secret to authenticate and access Box APIs. Before accessing files, you need to authenticate your application to access your Box account. Box API supports **OAuth 2.0 authentication** for this purpose.

Step 2: Create PDF Viewer Sample in ASP.NET MVC

Follow instructions provided in the Syncfusion PDF Viewer Getting Started [Guide](#) to create a simple PDF Viewer sample in ASP.NET MVC.

Step 3: Modify the `HomeController.cs` File in the Project

1. Import the required namespaces at the top of the file.

```
`csharp
using Box.V2;
using Box.V2.Auth;
using Box.V2.Config;
using Box.V2.Models;
`
```

3. Modify the `Download()` method to save the downloaded PDF files to Box cloud file storage folder.

```
`csharp
private readonly string clientId = "YourBoxStorageClientID";
private readonly string clientSecret = "YourBoxStorageClientSecret";
private readonly string accessToken = "YourBoxStorageAccess_Token";
private readonly string folderId = "YourFolder_ID";
public async Task<ActionResult> Download(jsonObjects jsonObject)
{
    PdfRenderer pdfviewer = new PdfRenderer();
    var jsonData = JsonConvert.DeserializeObject(jsonObject);
    string documentBase = pdfviewer.GetDocumentAsBase64(jsonData);
    byte[] documentBytes = Convert.FromBase64String(documentBase.Split(',')[1]);
    string documentId = jsonData["documentId"];
    string result = Path.GetFileNameWithoutExtension(documentId);
    string fileName = result + "_downloaded.pdf";
    // Initialize the Box API client with your authentication credentials
    var auth = new OAuthSession(accessToken, "YOURREFRESH_TOKEN", 3600, "bearer");
    var config = new BoxConfigBuilder(clientId, clientSecret, new Uri("http://boxsdk")).Build();
    var client = new BoxClient(config, auth);
    var fileRequest = new BoxFileRequest
    {
        Name = fileName,
        Parent = new BoxFolderRequest { Id = folderId },
    };
}
```

```

using (var stream = new MemoryStream(documentBytes))
{
    var boxFile = await client.FilesManager.UploadAsync(fileRequest, stream);
}
return Content(documentBase);
}
`

```

Note: replace **YourBoxStorageAccessToken** with your actual box access token, and **YourFolderID** with the ID of the folder in your box storage where you want to perform specific operations. Remember to use your valid box API credentials, as **YourBoxStorageClientID and YourBoxStorageClientSecret** are placeholders for your application's API key and secret.

Step 4: Set the PDF Viewer Properties in ASP.NET MVC PDF viewer component

Set the `documentPath` property of the PDF viewer component to the desired name of the PDF file you wish to load from Box cloud file storage. Ensure that you correctly pass the document name from the files available in your azure container to the `documentPath` property.

```

`csharp
@{
    ViewBag.Title = "Home Page";
}

<div>
<div style="height:500px;width:100%;">
    @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/Home/")).DocumentPath("PDF_Succinctly.pdf").Render()
</div>
</div>
`

```

Note: The **Box.V2.Core** NuGet package must be installed in your application to use the previous code example.

Note: Replace `PDF_Succinctly.pdf` with the actual document name that you want to load from Box cloud file storage. Make sure to pass the document name from the box folder to the `documentPath` property of the PDF viewer component

Accessibility in Syncfusion PDF Viewer components

The PDF Viewer component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the PDF Viewer component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support] | |

| [Section 508 Support] | |

| [Screen Reader Support] | |

| [Right-To-Left Support] | |

| [Color Contrast] | |

| [Mobile Device Support] | |

| [Keyboard Navigation Support] | |

| [Accessibility Checker Validation] | |

| [Axe-core Accessibility Validation] | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

[WAI-ARIA](#) (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the PDF Viewer component:

| Attributes | Purpose |

| --- | --- |

| **aria-disabled** | Indicates whether the PDF Viewer component is in a disabled state or not. |

| **aria-expanded** | Indicates whether the suggestion list has expanded or not. |

| **aria-readonly** | Indicates the readonly state of the PDF Viewer element. |

| **aria-haspopup** | Indicates whether the PDF Viewer input element has a suggestion list or not. |

| **aria-label** | Indicates the breadcrumb item text. |

| **aria-labelledby** | Provides a label for the PDF Viewer. Typically, the "aria-labelledby" attribute will contain the id of the element used as the PDF Viewer's title. |

| **aria-describedby** | This attribute points to the PDF Viewer element describing the one it's set on. |

| **aria-orientation** | Indicates whether the PDF Viewer element is oriented horizontally or vertically. |

| **aria-valuetext** | Returns the current text of the PDF Viewer. |

| **aria-valuemax** | Indicates the Maximum value of the PDF Viewer. |

| **aria-valuemin** | Indicates the Minimum value of the PDF Viewer. |

| **aria-valuenow** | Indicates the current value of the PDF Viewer. |

| **aria-controls** | Attribute is set to the button and it points to the corresponding content. |

Keyboard interaction

The PDF Viewer component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press (Windows)** | **Press (Macintosh)** | **To do this** |

| --- | --- | --- |

|| **Shortcuts for page navigation** |

Ensuring accessibility

The PDF Viewer component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the PDF Viewer component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the PDF Viewer component with accessibility tools.

Note: Follow the steps provided in the [link](#) to create a simple PDF Viewer sample.

Built-in toolbar

The PDF Viewer comes with a powerful built-in toolbar to execute important actions such as page navigation, text search, view mode, download print, bookmark and thumbnails.

The following table shows built-in toolbar items and its actions:-

| Option | Description |
|--------|-------------|
|--------|-------------|

| | |
|-----|-----|
| --- | --- |
|-----|-----|

| | |
|------------|---|
| OpenOption | This option provides an action to load the PDF documents to the PDF Viewer. |
|------------|---|

| | |
|--------------------|--|
| PageNavigationTool | This option provides an action to navigate the pages in the PDF Viewer. It contains GoToFirstPage, GoToLastPage, GotoPage, GoToNext, and GoToLast tools. |
|--------------------|--|

| | |
|-------------------|---|
| MagnificationTool | This option provides an action to magnify the pages either with predefined or user defined zoom factors in the PDF Viewer. Contains ZoomIn, ZoomOut, Zoom, FitPage and FitWidth tools |
|-------------------|---|

| | |
|---------|---|
| PanTool | This option provides an action for panning the pages in the PDF Viewer. |
|---------|---|

| | |
|---------------|--|
| SelectionTool | This option provides an action to enable/disable the text selection in the PDF Viewer. |
|---------------|--|

| | |
|--------------|---|
| SearchOption | This option provides an action to search a word in the PDF documents. |
|--------------|---|

| | |
|-------------|--|
| PrintOption | This option provides an action to print the PDF document being loaded in the PDF Viewer. |
|-------------|--|

| | |
|----------------|--|
| DownloadOption | This Download option provides an action to download the PDF document that has been loaded in the PDF Viewer. |
|----------------|--|

| | |
|--------------|---|
| UndoRedoTool | This tool provides options to undo and redo the annotation actions performed in the PDF Viewer. |
|--------------|---|

| AnnotationEditTool | This tool provides options to enable or disable the edit mode of annotation in the PDF Viewer. |

Show/Hide the default toolbar

The PDF Viewer has an option to show or hide the complete default toolbar. You can achieve this by using the following two ways.,

- **Show/Hide toolbar using enableToolbar API as in the following code snippet.**

STANDALONE

```
`html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableToolbar(false).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
`
```

SERVER-BACKED

```
`html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnableToolbar(false).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
`
```

- **Show/Hide toolbar using showToolbar as in the following code snippet.**

```
`html
<button id="viewer" onclick="enableToolbar()">EnableToolbar</button>
<script>
function enableToolbar() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.toolbar.showToolbar(true);
}
</script>
`
```

Show/Hide the default toolbaritem

The PDF Viewer has an option to show or hide these grouped items in the default toolbar.

- **Show/Hide toolbaritem using toolbarSettings as in the following code snippet.**

STANDALONE

```

<<<html
<button id="viewer" onclick="enableToolBarItem()">EnableToolBarItem</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableToolBar(true).ToolBarSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerToolBarSettings { ShowTooltip = true,
ToolBarItems = "OpenOption"
}).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
<script>
function enableToolBarItem() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.toolbar.showToolBarItem(new Array("DownloadOption"), true);
}
</script>
<<<

```

SERVER-BACKED

```

<<<html
<button id="viewer" onclick="enableToolBarItem()">EnableToolBarItem</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).EnableToolBar(false).ToolBarSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerToolBarSettings{ ShowTooltip = true,
ToolBarItem = "OpenOption"
}).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
<script>
function enableToolBarItem() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.toolbar.showToolBarItem(new Array("DownloadOption"), true);
}
</script>
<<<

```

Navigation in PDF Viewer component

The ASP.NET Core PDF Viewer supports different internal and external navigations.

ToolBar page navigation option

The default toolbar of PDF Viewer contains the following navigation options:

- **Go to page:-** Navigates to the specific page of a PDF document.
- **Show next page:-** Navigates to next page of a PDF document.
- **Show previous page:-** Navigates to the previous page of a PDF document.
- **Show first page:-** Navigates to the first page of a PDF document.

- **Show last page:-** Navigates to the last page of a PDF document.

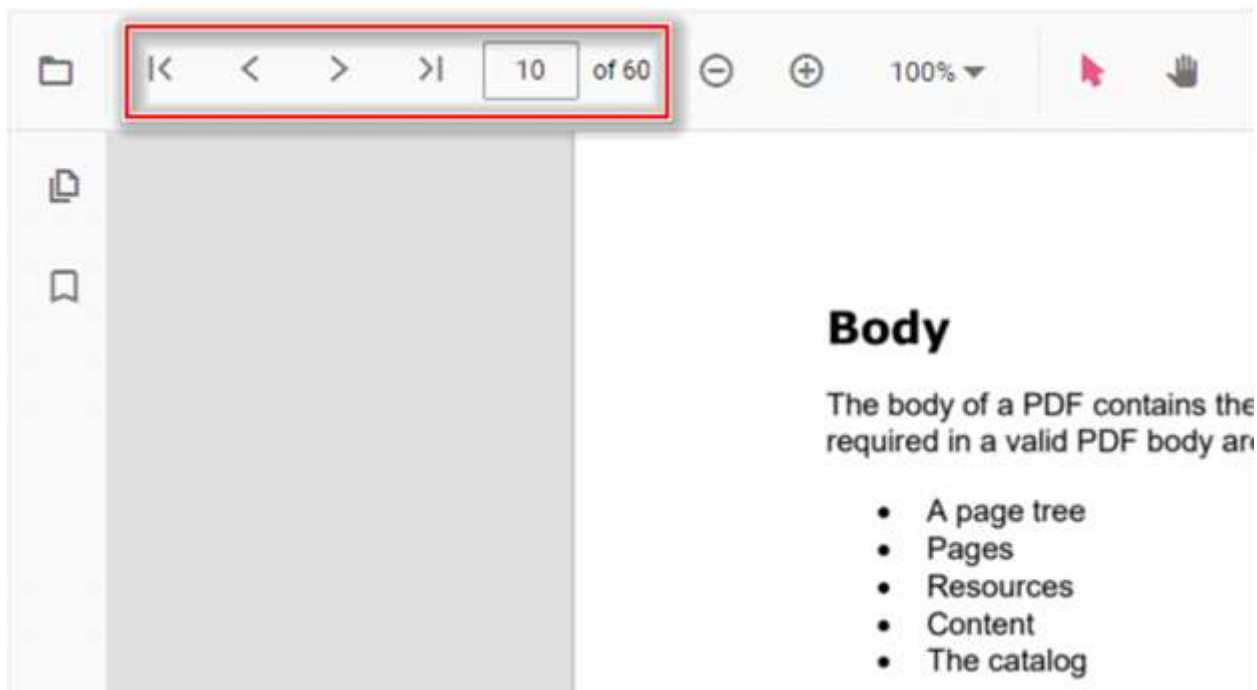

You can enable/disable page navigation option in PDF Viewer using the following code snippet.

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableNavigation(true).DocumentPath("http
s://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).EnableNavigation(true).DocumentPath("https://cdn.syncfu
sion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

Bookmark navigation

The bookmarks saved in PDF files are loaded and made ready for easy navigation.

You can enable/disable bookmark navigation by using the following code snippet.,

STANDALONE

```
```html
<div style="width:100%;height:600px">
```

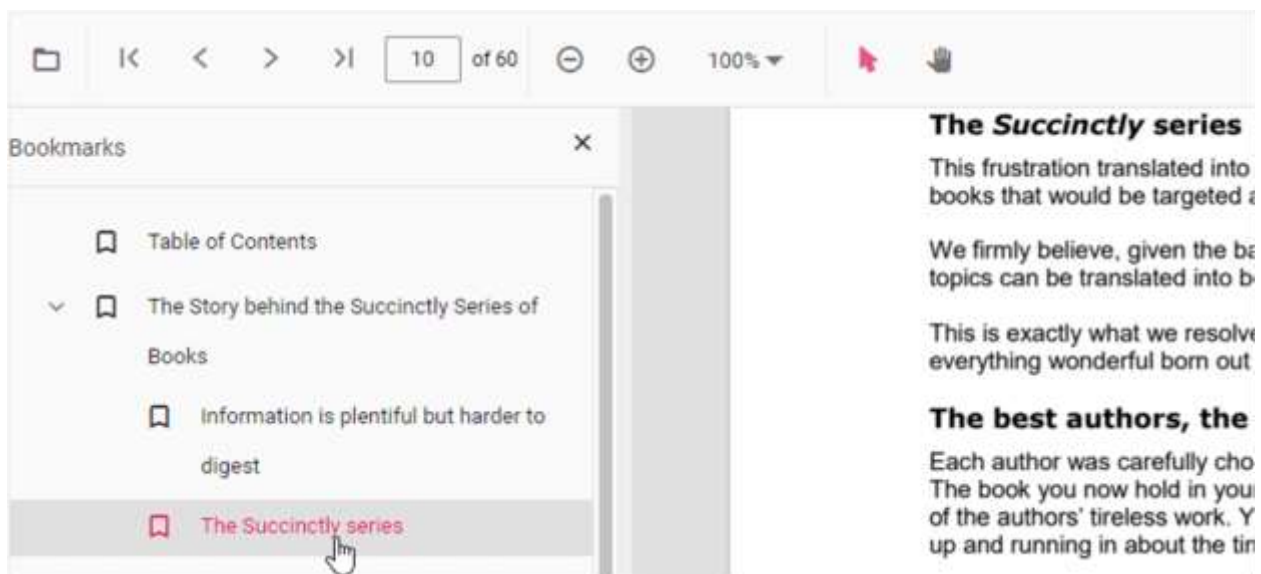

```
@Html.EJS().PdfViewer("pdfviewer").EnableBookmark(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```

```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).EnableBookmark(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```

```

Thumbnail navigation

Thumbnails is the miniature representation of actual pages in PDF files. This feature displays thumbnails of the pages and allows navigation.

You can enable/disable thumbnail navigation by using the following code snippet.,

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableThumbnail(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```

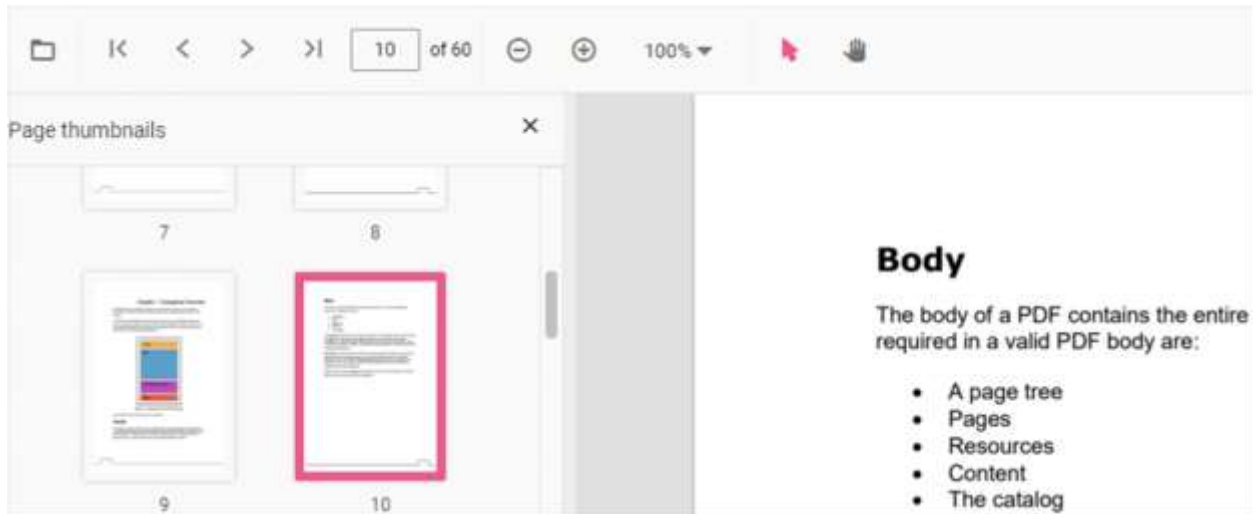

```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">

```

```
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
 "~/api/PdfViewer/") .EnableThumbnail(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
....
```

### Hyperlink navigation

Hyperlink navigation features enables navigation to the URLs (website links) in a PDF file.

### Table of content navigation

Table of contents navigation allows users to navigate to different parts of a PDF file that are listed in the table of contents section.

You can enable/disable link navigation by using the following code snippet.,

#### **STANDALONE**

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableHyperlink(true).DocumentPath("https
://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```

```

<\/div>

```

SERVER-BACKED

```

<\/div>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/") ).EnableHyperlink(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
<\/div>

```

You can change the open state of the hyperlink in the PDF Viewer by using the following code snippet.,

STANDALONE

```

<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").HyperlinkOpenState(Syncfusion.EJ2.PdfViewer.LinkTarget.NewTab).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
<\/div>

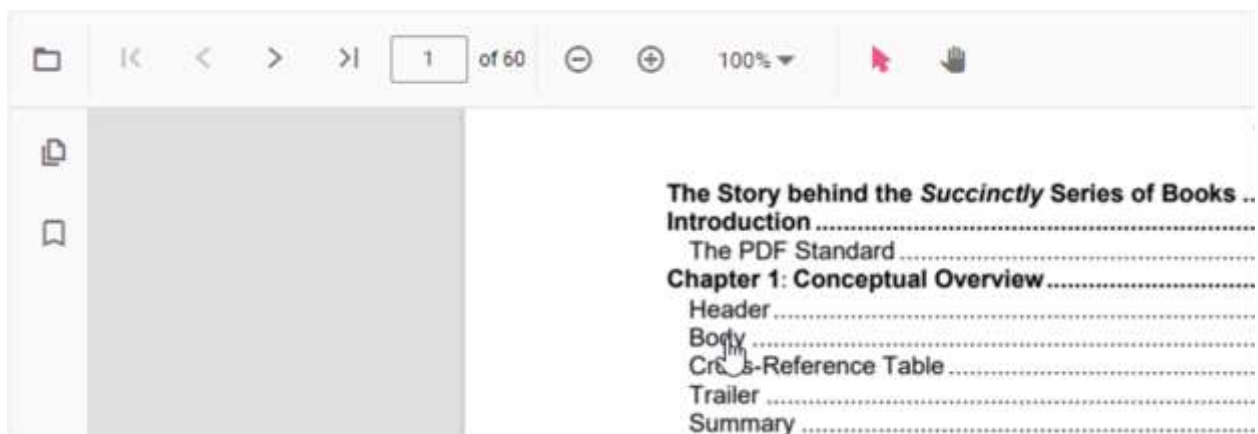

```

SERVER-BACKED

```

<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/") ).HyperlinkOpenState(Syncfusion.EJ2.PdfViewer.LinkTarget.NewTab).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
<\/div>

```

- [Feature Modules](#)

Magnification

The magnification tools of the PDF viewer contains ZoomIn,ZoomOut,Zoom,FitPage, and FitWidth tools in the default toolbar. The PDF Viewer also has an option to show or hide the magnification tools in the default toolbar.

The following code snippet describes how to enable the magnification in PDF Viewer.

STANDALONE

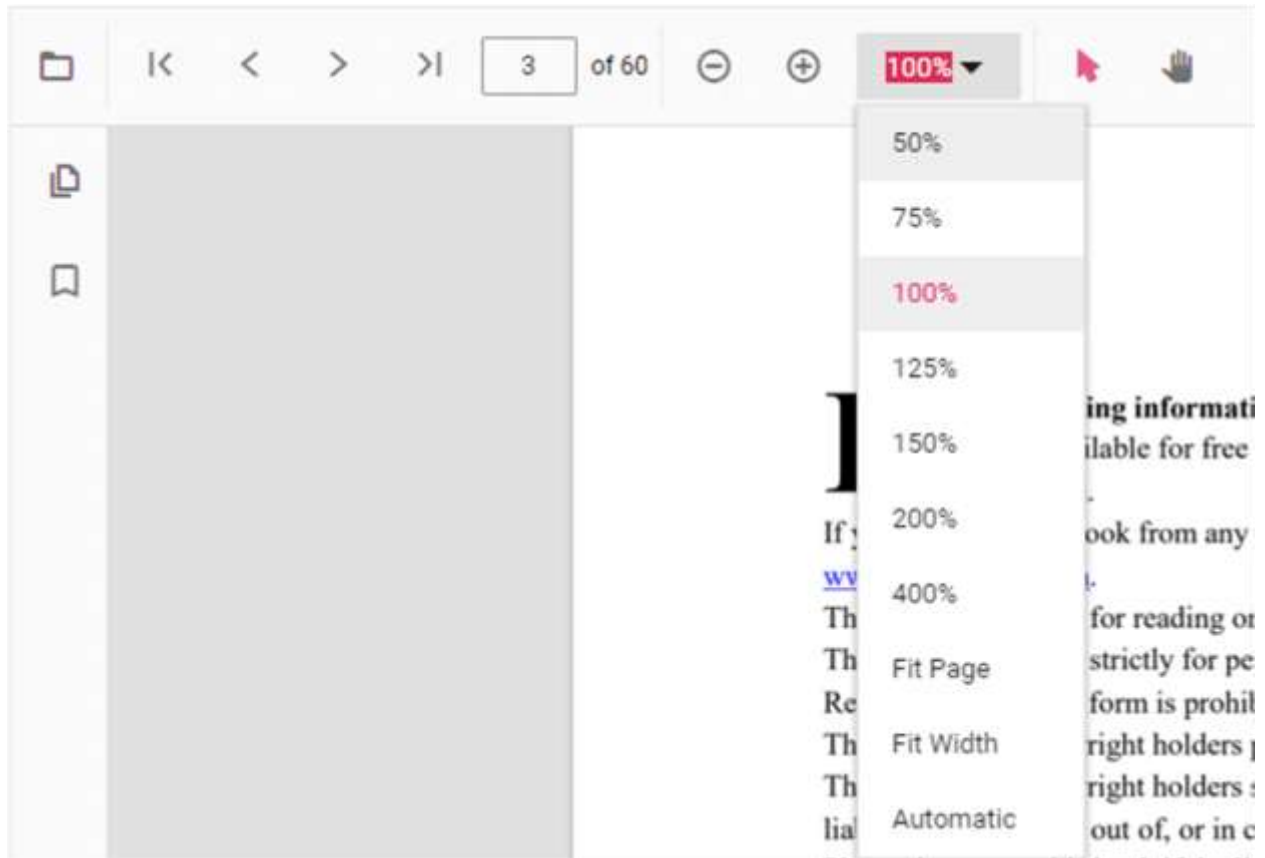

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableMagnification(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnableMagnification(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

The following magnification options are available in the default toolbar of PDF Viewer:-

- **ZoomIn**:- perform Zoom in from current zoom value of PDF pages.
- **ZoomOut**:- perform Zoom out from current zoom value of PDF pages.
- **Zoom**:- Zoom to specific zoom value of PDF pages.
- **FitPage**:- Fits the page width with-in the available view port size.
- **FitWidth**:- Fits the view port width based on the page content size.
- **Auto**:- Fits the page content with-in the viewport on resizing action.

Note: PDF Viewer can support the zoom value ranges from 50 to 400.

Text Search

The Text Search option in PDF Viewer is used to find and highlight the text content from the document. You can enable/disable the text search using the following code snippet.

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableTextSearch(true).DocumentPath("http
s://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
```

```
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
 "~/api/PdfViewer/")).EnableTextSearch(true).DocumentPath("https://cdn.syncfu
 sion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
....
```

## Annotation

Text Markup Annotation in the ASP.NET MVC PDF Viewer component

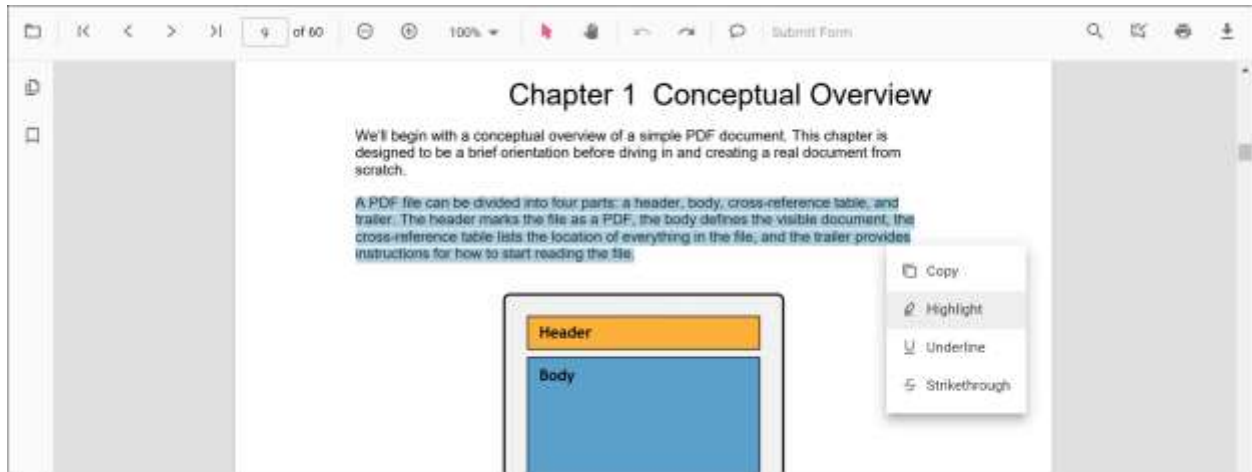

The PDF Viewer control provides the options to add, edit, and delete text markup annotations such as highlight, underline, and strikethrough annotations in the PDF document.

*Highlight a text*

There are two ways to highlight a text in the PDF document:

1. Using the context menu
  - Select a text in the PDF document and right-click it.
  - Select **Highlight** option in the context menu that appears.

<!-- markdownlint-disable MD029 -->

2. Using the annotation toolbar
  - Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
  - Select the **Highlight** button in the annotation toolbar. It enables the highlight mode.
  - Select the text and the highlight annotation will be added.
  - You can also select the text and apply the highlight annotation using the **Highlight** button.

In the pan mode, if the highlight mode is entered, the PDF Viewer control will switch to text select mode to enable the text selection for highlighting the text.

Refer to the following code sample to switch to the highlight mode.

**STANDALONE**

```

```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Highlight</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Highlight');
}
</script>
```

```

**SERVER-BACKED**

```

```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Highlight</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Highlight');
}
</script>
```

```

Refer to the following code sample to switch back to normal mode from the highlight mode.

**STANDALONE**

```

```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Highlight</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Highlight');
}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}

```

```
}
</script>
...

```

SERVER-BACKED

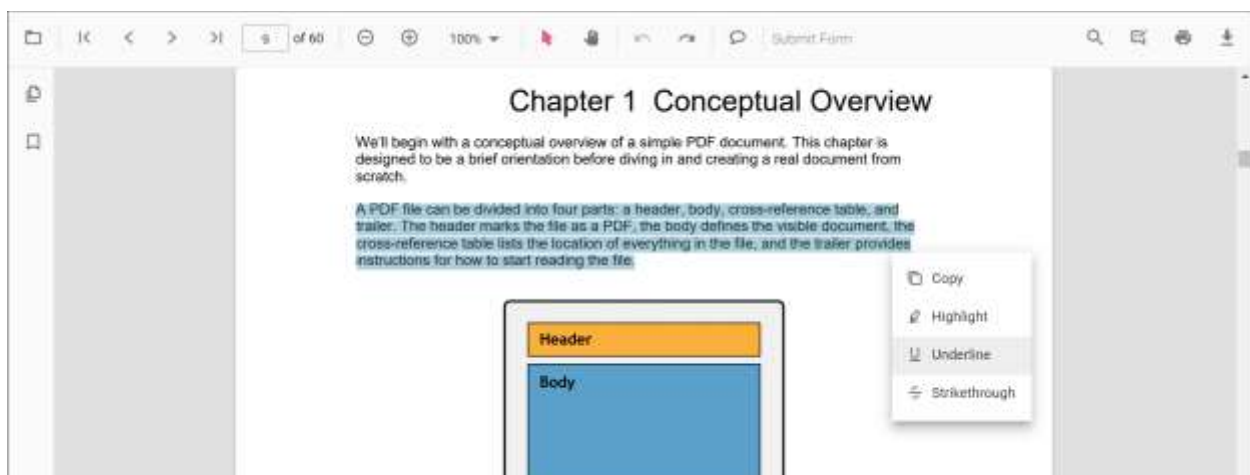

```
```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Highlight</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Highlight');
}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}
</script>
...

```

### Underline a text

There are two ways to underline a text in the PDF document:

1. Using the context menu
  - o Select a text in the PDF document and right-click it.
  - o Select the **Underline** option in the context menu that appears.

```
<!-- markdownlint-disable MD029 -->
```

## 2. Using the annotation toolbar

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Select the **Underline** button in the annotation toolbar. It enables the underline mode.
- Select the text and the underline annotation will be added.
- You can also select the text and apply the underline annotation using the **Underline** button.

In the pan mode, if the underline mode is entered, the PDF Viewer control will switch to text select mode to enable the text selection for underlining the text.

Refer to the following code sample to switch to the underline mode.

### STANDALONE

```

```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Underline</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Underline');
}
</script>
```

```

### SERVER-BACKED

```

```html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Underline</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()

```

```

</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Underline');
}
</script>
````

```

Refer to the following code sample to switch back to normal mode from the underline mode.

### **STANDALONE**

```

````html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Underline</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Underline');
}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}
</script>
````

```

### **SERVER-BACKED**

```

````html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Underline</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Underline');
}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}
</script>

```

Strikethrough a text

There are two ways to strikethrough a text in the PDF document:

1. Using the context menu
 - Select a text in the PDF document and right-click it.
 - Select the **Strikethrough** option in the context menu that appears.

<!-- markdownlint-disable MD029 -->

2. Using the annotation toolbar
 - Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
 - Select the **Strikethrough** button in the annotation toolbar. It enables the strikethrough mode.
 - Select the text and the strikethrough annotation will be added.
 - You can also select the text and apply the strikethrough annotation using the **Strikethrough** button.

In the pan mode, if the strikethrough mode is entered, the PDF Viewer control will switch to text select mode to enable the text selection for striking through the text.

Refer to the following code sample to switch to the strikethrough mode.

STANDALONE

```

` ``html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Strikethrough</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Strikethrough');
}
</script>
` ``

```

SERVER-BACKED

```

` ``html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Strikethrough</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Strikethrough');
}
</script>
` ``

```

Refer to the following code sample to switch back to normal mode from the strikethrough mode.

STANDALONE

```

` ``html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Strikethrough</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Strikethrough');
}

```

```

}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}
</script>
` ``

```

SERVER-BACKED

```

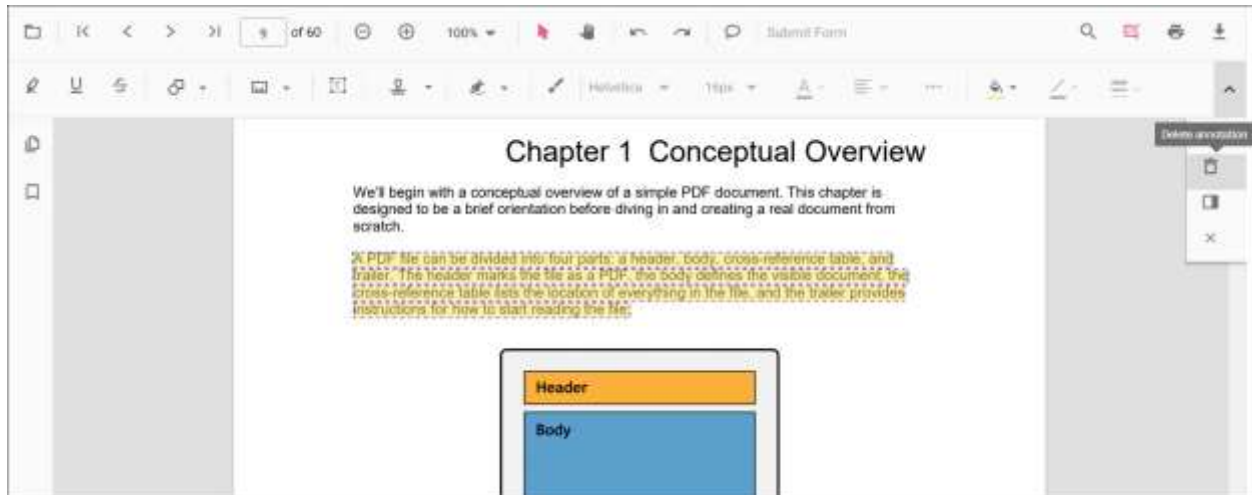

` ``html
<!--Element to set text markup annotation mode-->
<button id="set" onclick="addAnnot()">Strikethrough</button>
<!--Element to set normal mode-->
<button id="setNone" onclick="setNone()">Normal Mode</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Strikethrough');
}
function setNone() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('None');
}
</script>
` ``

```

Deleting a text markup annotation

The selected annotation can be deleted in the following ways:

1. Using the Delete key
 - Select the annotation to be deleted.
 - Click the Delete key in the keyboard. The selected annotation will be deleted.
2. Using the annotation toolbar
 - Select the annotation to be deleted.
 - Click the **Delete Annotation** button in the annotation toolbar. The selected annotation will be deleted.

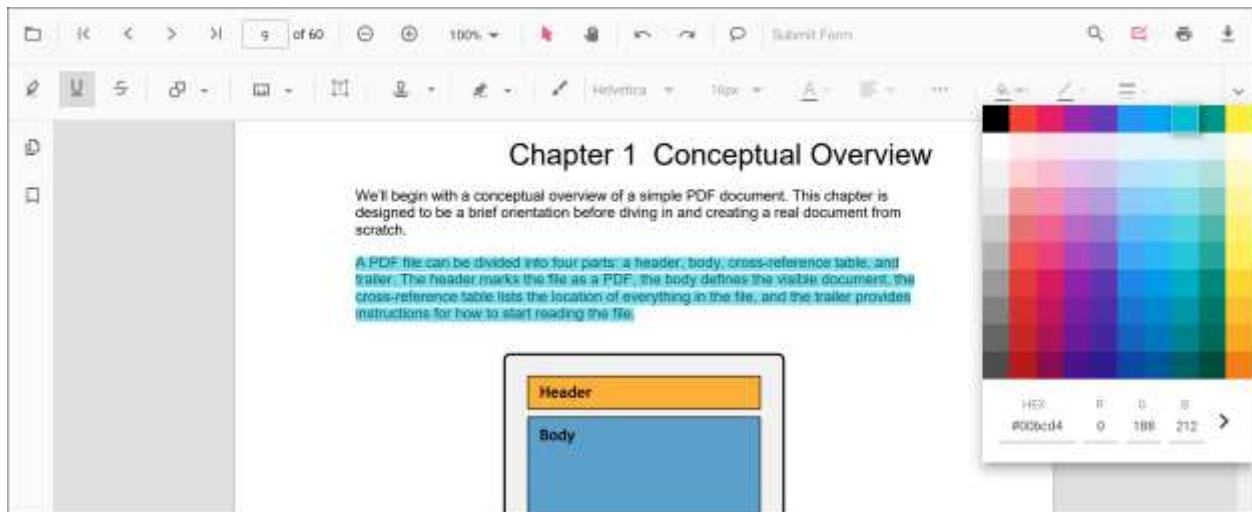

Editing the properties of the text markup annotation

The color and the opacity of the text markup annotation can be edited using the Edit Color tool and the Edit Opacity tool in the annotation toolbar.

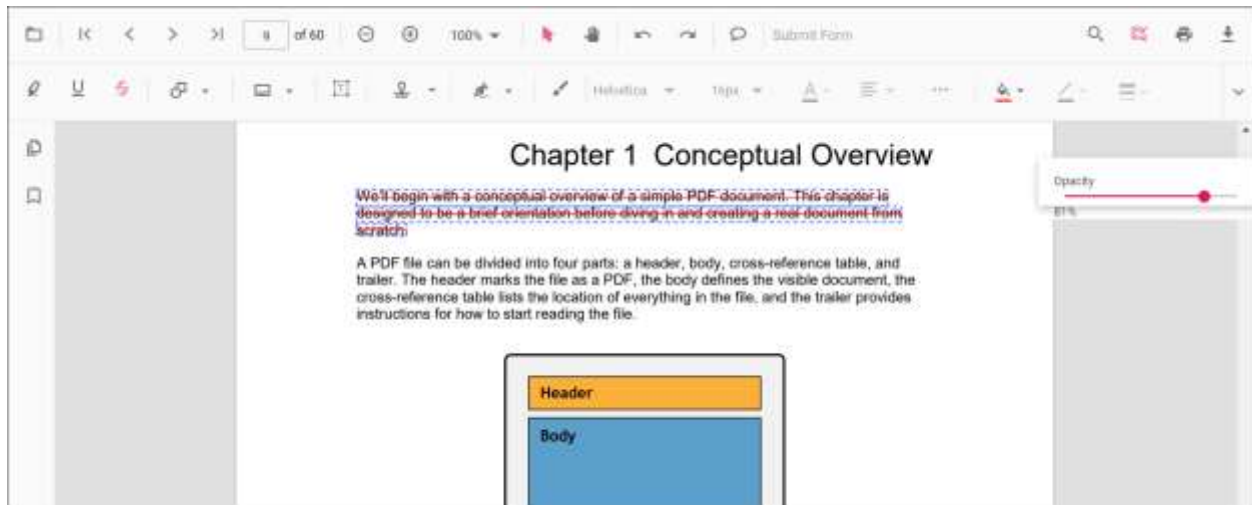

Editing color

The color of the annotation can be edited using the color palette provided in the Edit Color tool.

Editing opacity

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

Setting default properties during the control initialization

The properties of the text markup annotation can be set before creating the control using the `highlightSettings`, `underlineSettings`, and `strikethroughSettings`.

Note: After editing the default color and opacity using the Edit Color tool and Edit Opacity tool, they will be changed to the selected values.

Refer to the following code sample to set the default annotation settings.

STANDALONE

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").HighlightSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerHighlightSettings{Author = "Guest User",
Color = "#ffff00", Opacity = 0.9 }).UnderlineSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerUnderlineSettings{ Author = "Guest User",
Color = "#00ffff", Opacity = 0.9 }).StrikethroughSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerStrikethroughSettings{ Author = "Guest
User", Color = "#ff00ff", Opacity = 0.9, }).Render()
</div>
<<<

```

SERVER-BACKED

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").HighlightSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerHighlightSettings{Author = "Guest User",
Color = "#ffff00", Opacity = 0.9 }).UnderlineSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerUnderlineSettings{ Author = "Guest User",
Color = "#00ffff", Opacity = 0.9 }).StrikethroughSettings(new
Syncfusion.EJ2.PdfViewer.PdfViewerStrikethroughSettings{ Author = "Guest
User", Color = "#ff00ff", Opacity = 0.9, }).Render()
</div>
<<<

```

Performing undo and redo

The PDF Viewer performs undo and redo for the changes made in the PDF document. In the text markup annotation, undo and redo actions are provided for:

- Inclusion of the text markup annotations.
- Deletion of the text markup annotations.
- Change of either color or opacity of the text markup annotations.

The undo and redo actions can be done by the following ways:

1. Using the keyboard shortcuts:

After performing a text markup annotation action, you can undo it by using the Ctrl + Z shortcut and redo by using the Ctrl + Y shortcut.

2. Using toolbar:

The undo and redo can be done using the **Undo** tool and **Redo** tool provided in the toolbar.

Refer to the following code sample for calling undo and redo actions from the client-side.

STANDALONE

```

```html
<!--Element to call undo-->
<button id="undo" onclick="Undo()">Undo</button>
<!--Element to call redo-->

Saving the text markup annotation

When you click the download tool in the toolbar, the text markup annotations will be saved in the PDF document. This action will not affect the original document.

Printing the text markup annotation

When the print tool is selected in the toolbar, the PDF document will be printed along with the text markup annotations added to the pages. This action will not affect the original document.

Disabling text markup annotation

The PDF Viewer control provides an option to disable the text markup annotation feature. The code sample for disabling the feature is as follows.

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableTextMarkupAnnotation(false).Documen

```

Shape Annotation in the ASP.NET MVC PDF Viewer component

The PDF Viewer control provides the options to add, edit, and delete the shape annotations. The shape annotation types supported in the PDF Viewer control are:

- Line
- Arrow

- Rectangle
- Circle
- Polygon

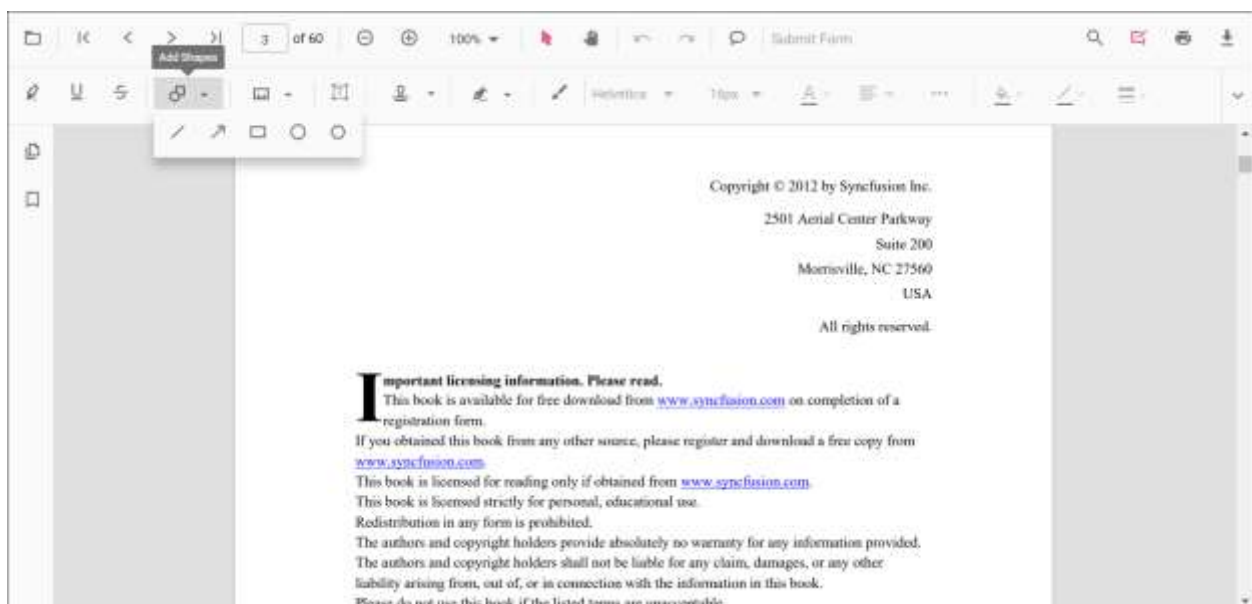

Adding a shape annotation to the PDF document

Shape annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Shape Annotation** drop-down button. A drop-down pop-up will appear and shows the shape annotations to be added.
- Select the shape types to be added to the page in the drop-down pop-up. It enables the selected shape annotation mode.
- You can add the shapes over the pages of the PDF document.

In the pan mode, if the shape annotation mode is entered, the PDF Viewer control will switch to text select mode.

Refer to the following code sample to switch to the circle annotation mode.

STANDALONE

```

```

Editing the properties of the shape annotation

The fill color, stroke color, thickness, and opacity of the shape annotation can be edited using the Edit color tool, Edit stroke color tool, Edit thickness tool, and Edit opacity tool in the annotation toolbar.

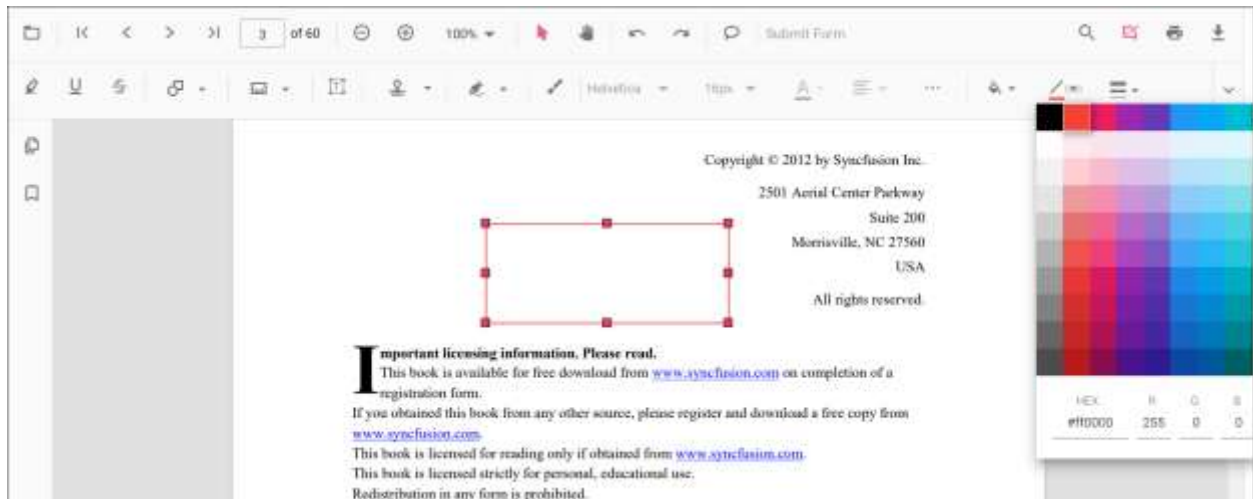

Editing fill color

The fill color of the annotation can be edited using the color palette provided in the Edit Color tool.

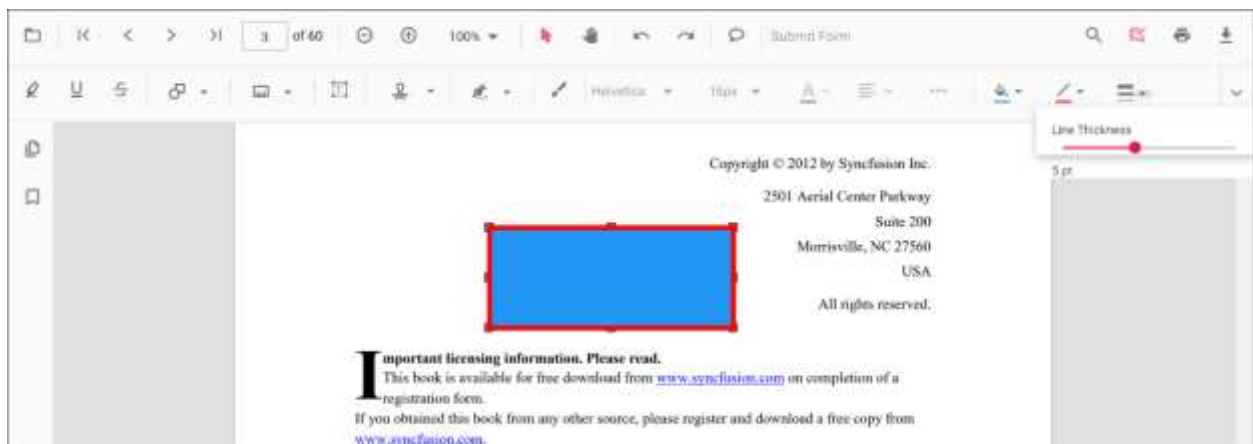

Editing stroke color

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.

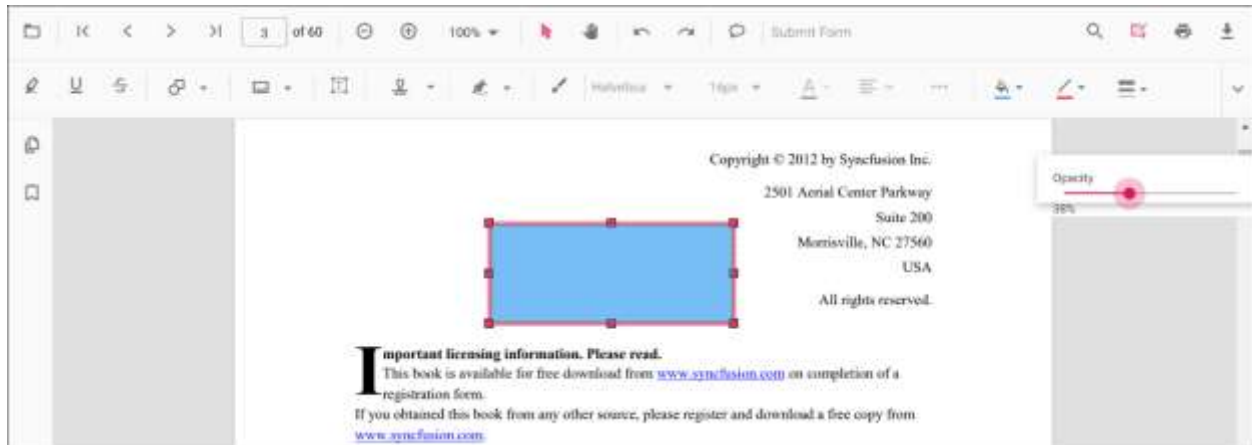

Editing thickness

The thickness of the border of the annotation can be edited using the range slider provided in the Edit Thickness tool.

Editing opacity

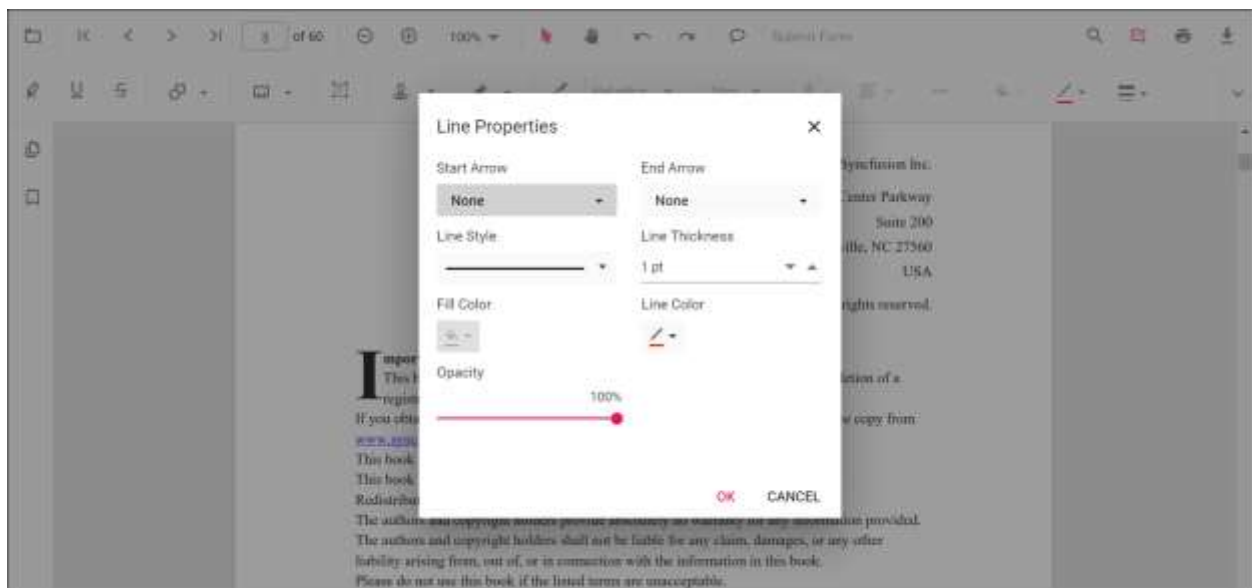

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

Editing the line properties

The properties of the line shapes such as line and arrow annotations can be edited using the Line Properties window. It can be opened by selecting the Properties option in the context menu that appears on right-clicking the line and arrow annotations.

Refer to the following code sample to set the default annotation settings.

Setting default properties during the control initialization

The properties of the shape annotations can be set before creating the control using LineSettings, ArrowSettings, RectangleSettings, CircleSettings, and PolygonSettings.

Stamp Annotation in the ASP.NET MVC PDF Viewer component

The PDF Viewer control provides options to add, edit, delete, and rotate the following stamp annotation in the PDF documents:

- Dynamic
- Sign Here
- Standard Business
- Custom Stamp

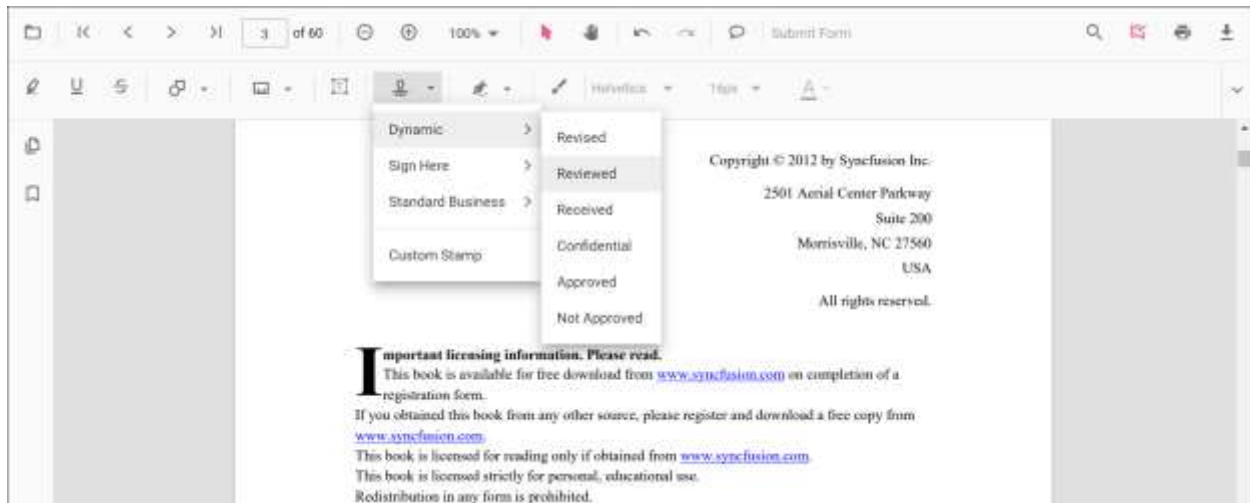

Adding stamp annotations to the PDF document

The stamp annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Stamp Annotation** drop-down button. A drop-down pop-up will appear and shows the stamp annotations to be added.

- Select the annotation type to be added to the page in the pop-up.

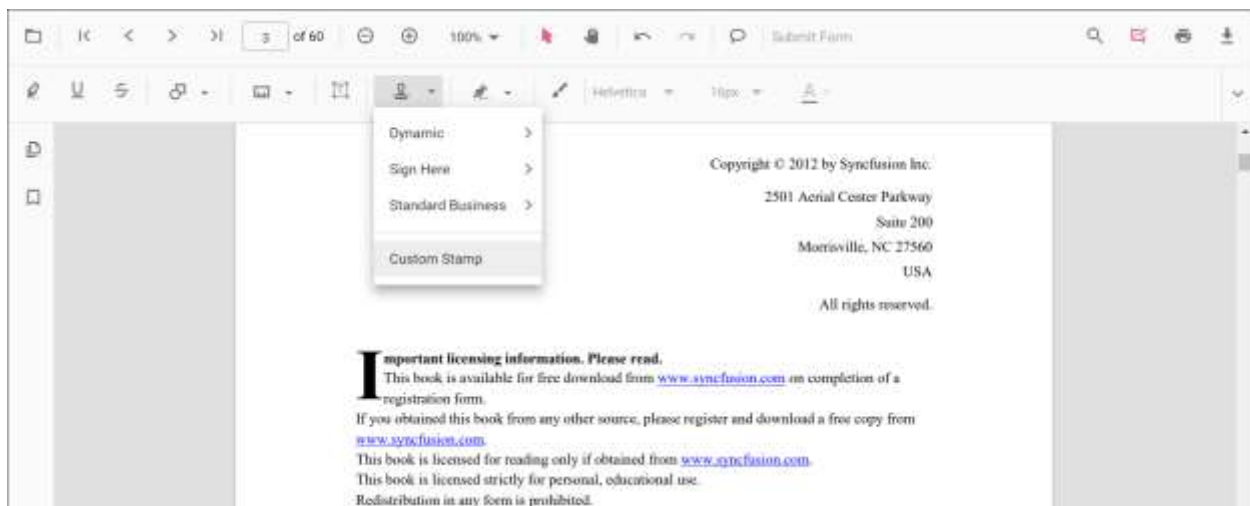

- You can add the annotation over the pages of the PDF document.

In the pan mode, if the stamp annotation mode is entered, the PDF Viewer control will switch to text select mode.

Adding custom stamp to the PDF document

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the **Stamp Annotation** drop-down button. A drop-down pop-up will appear and shows the stamp annotations to be added.
- Click the Custom Stamp button.

- The file explorer dialog will appear, choose the image and then add the image to the PDF page.

Note: The JPG and JPEG image format is only supported in the custom stamp annotations.

Setting default properties during control initialization

The properties of the stamp annotation can be set before creating the control using the StampSettings.

After editing the default opacity using the Edit Opacity tool, they will be changed to the selected values. Refer to the following code sample to set the default sticky note annotation settings.

STANDALONE

```

Sticky Notes Annotation in the ASP.NET MVC PDF Viewer component

The PDF Viewer control provides the options to add, edit, and delete the sticky note annotations in the PDF document.

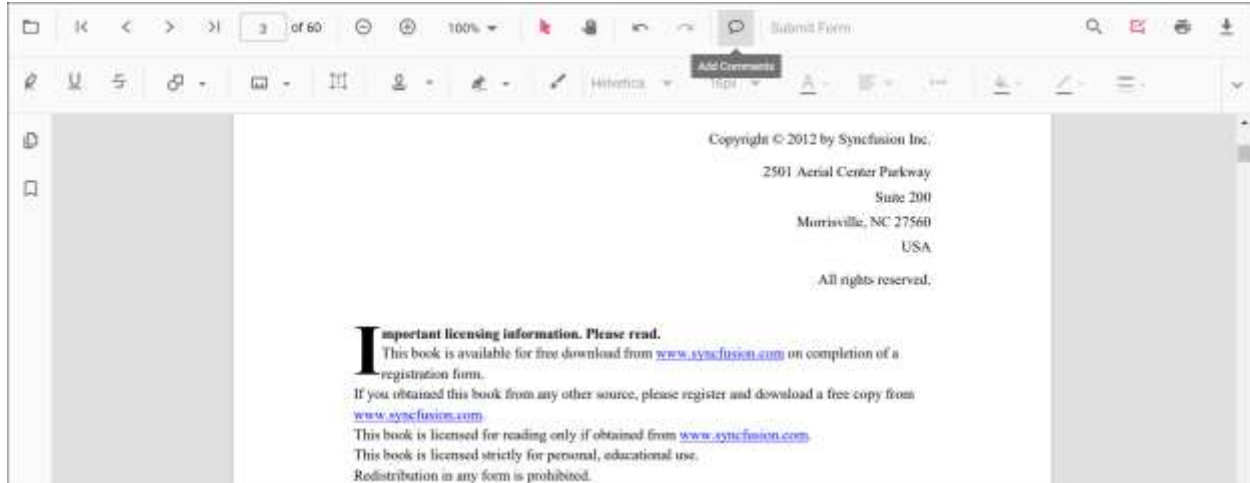

Adding a sticky note annotation to the PDF document

Sticky note annotations can be added to the PDF document using the annotation toolbar.

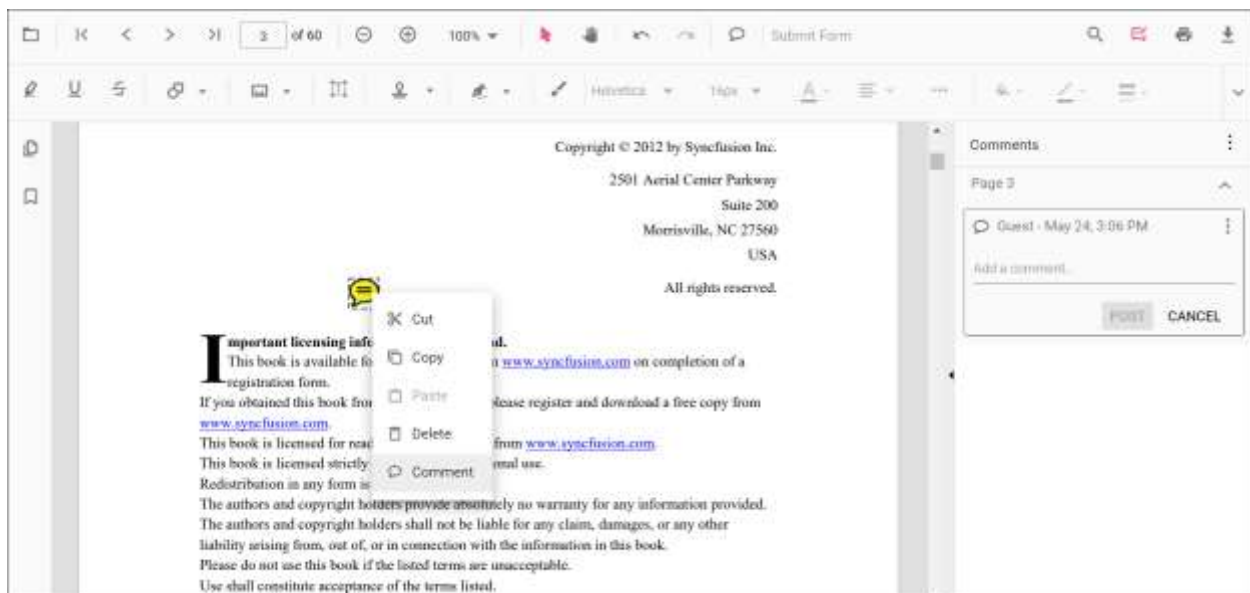

- Click the **Comments** button in the PDF Viewer toolbar. A toolbar appears below it.
- Click the position where you want to add sticky note annotation in the PDF document.

- Sticky note annotation will be added in the clicked positions.

Annotation comments can be added to the PDF document using the comment panel.

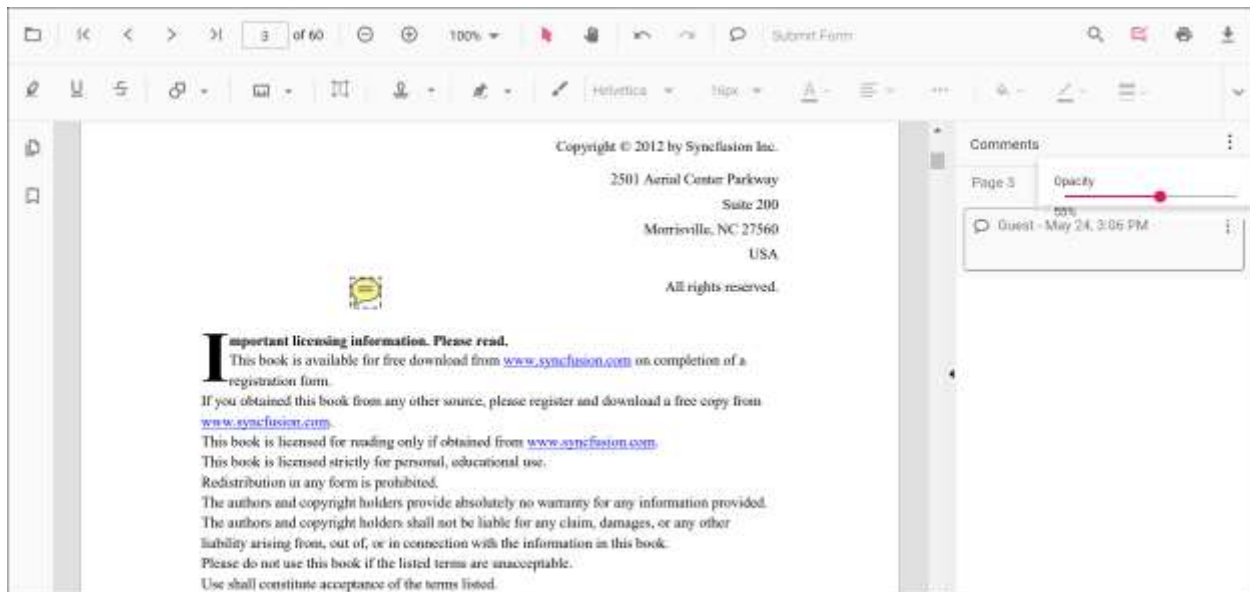

- Select a Sticky note annotation in the PDF document and right-click it.
- Select the Comment option in the context menu that appears.
- Now, you can add Comments, Reply, and Status using the Comment Panel.
- Now, you can add Comments, Reply, and Status using the Comment Panel.

Editing the properties of the sticky note annotation

Editing opacity

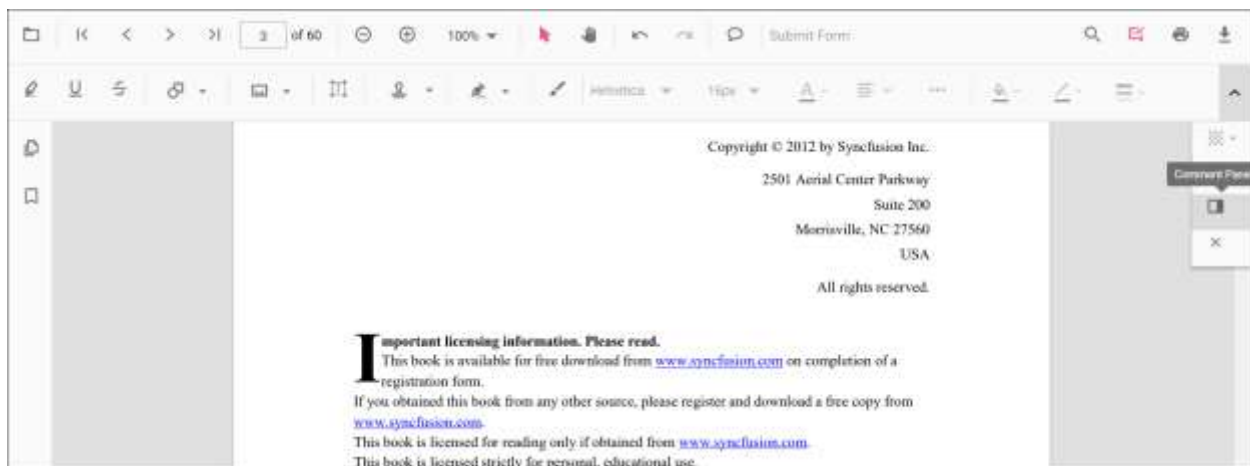

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

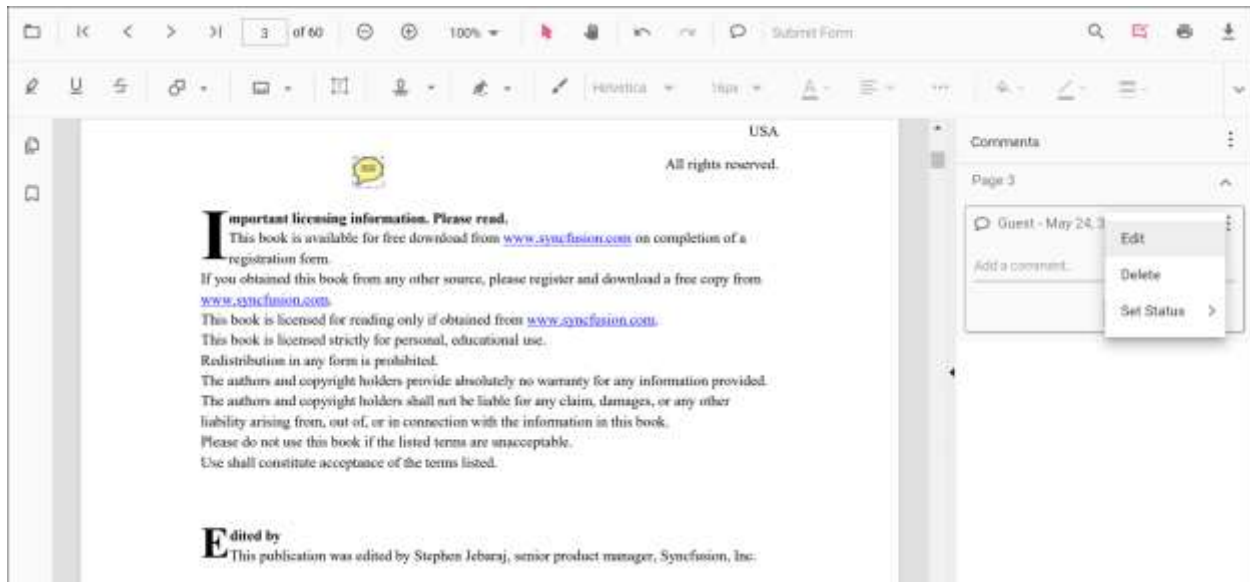

Editing comments

The comment, comment reply, and comment status of the annotation can be edited using the Comment Panel.

- Open the comment panel using the Comment Panel button showing in the annotation toolbar.

You can modify or delete the comments or comments replay and it's status using the menu option provided in the comment panel.

Setting default properties during the control initialization

The properties of the sticky note annotation can be set before creating the control using the `StickyNotesSettings`.

After editing the default opacity using the Edit Opacity tool, they will be changed to the selected values. Refer to the following code sample to set the default sticky note annotation settings.

STANDALONE

Measurement Annotation in the ASP.NET MVC PDF Viewer component

The PDF Viewer provides the options to add measurement annotations. You can measure the page annotations with the help of measurement annotation. The supported measurement annotations in the PDF Viewer control are:

- Distance
- Perimeter
- Area
- Radius
- Volume

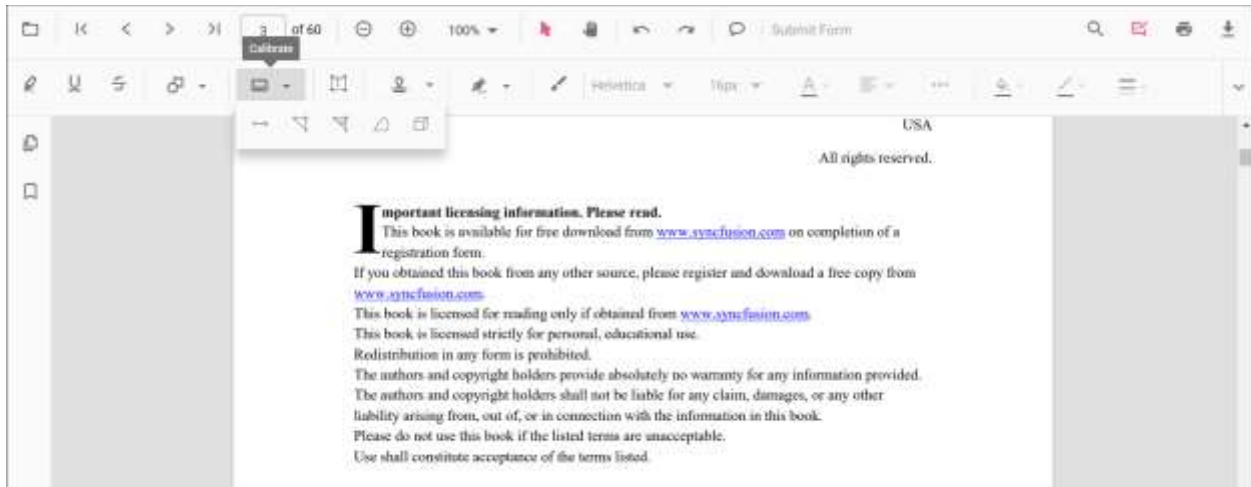

Adding a measurement annotation to the PDF document

The measurement annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.

- Click the **Measurement Annotation** dropdown button. A dropdown pop-up will appear and shows the measurement annotations to be added.
- Select the measurement type to be added to the page in the dropdown pop-up. It enables the selected measurement annotation mode.
- You can measure and add the annotation over the pages of the PDF document.

In the pan mode, if the measurement annotation mode is entered, the PDF Viewer control will switch to text select mode.

Refer to the following code sample to switch to the distance annotation mode.

STANDALONE

```

<html>
<!--Element to set measurement annotation mode-->

Editing the properties of free text annotation

The font family, font size, font styles, font color, text alignment, fill color, the border stroke color, border thickness, and opacity of the free text annotation can be edited using the Font Family tool, Font Size tool, Font Color tool, Text Align tool, Font Style tool, Edit Color tool, Edit Stroke Color tool, Edit Thickness tool, and Edit Opacity tool in the annotation toolbar.

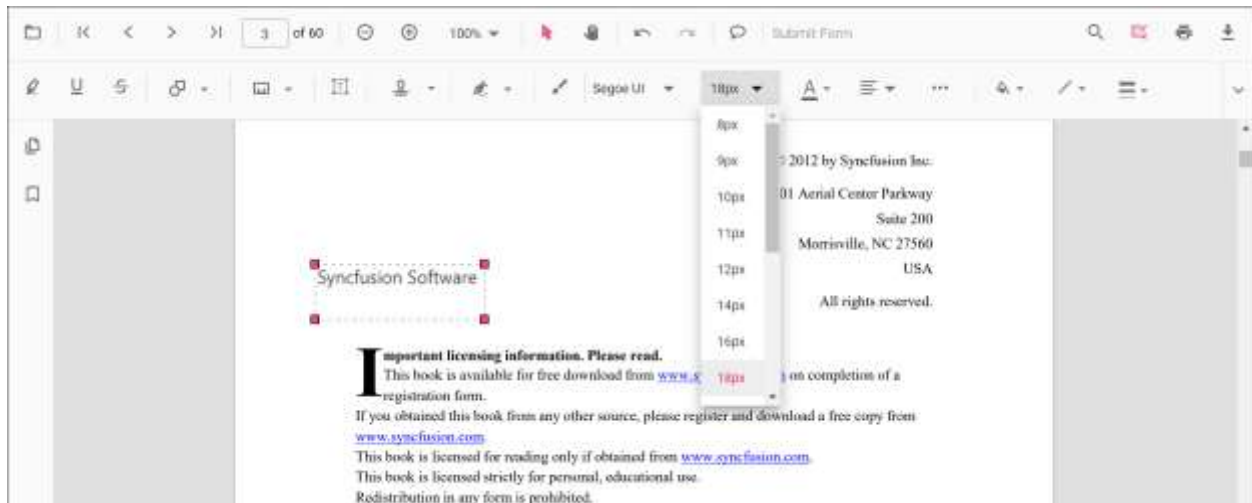

Editing font family

The font family of the annotation can be edited by selecting the desired font in the Font Family tool.

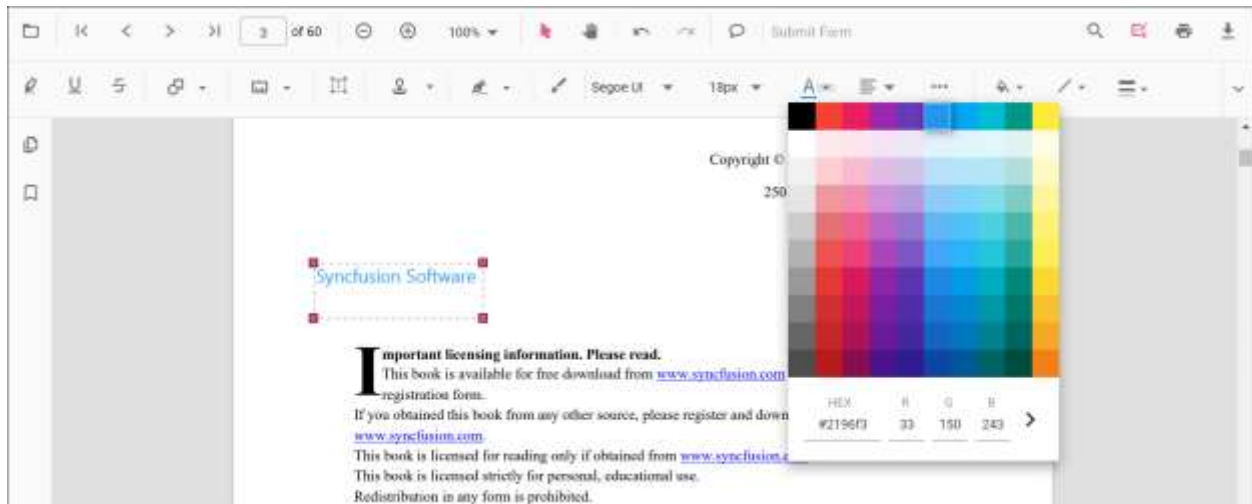

Editing font size

The font size of the annotation can be edited by selecting the desired size in the Font Size tool.

Editing font color

The font color of the annotation can be edited using the color palette provided in the Font Color tool.

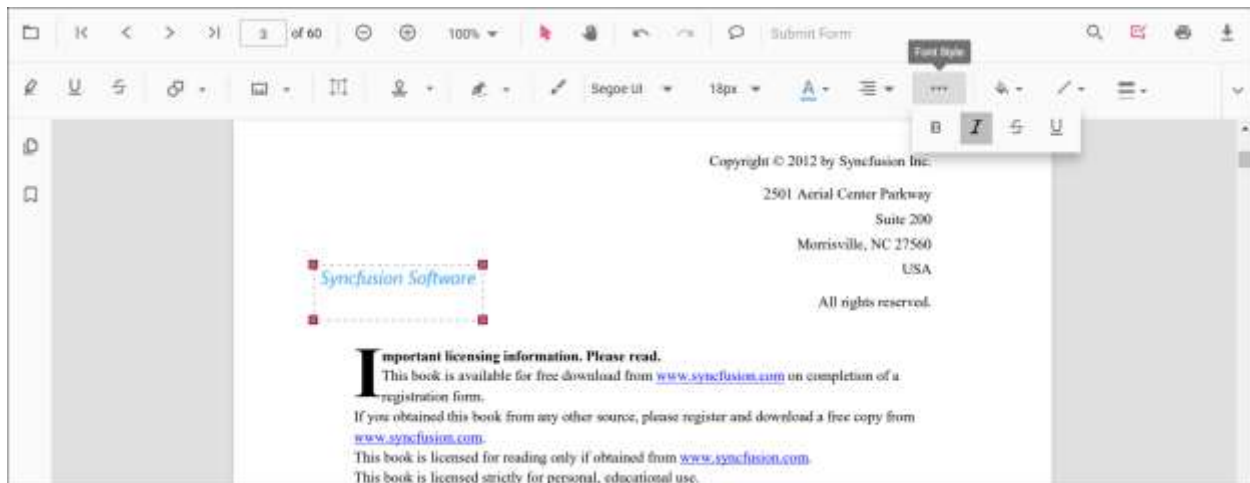

Editing the text alignment

The text in the annotation can be aligned by selecting the desired styles in the drop-down pop-up in the Text Align tool.

Editing text styles

The style of the text in the annotation can be edited by selecting the desired styles in the drop-down pop-up in the Font Style tool.

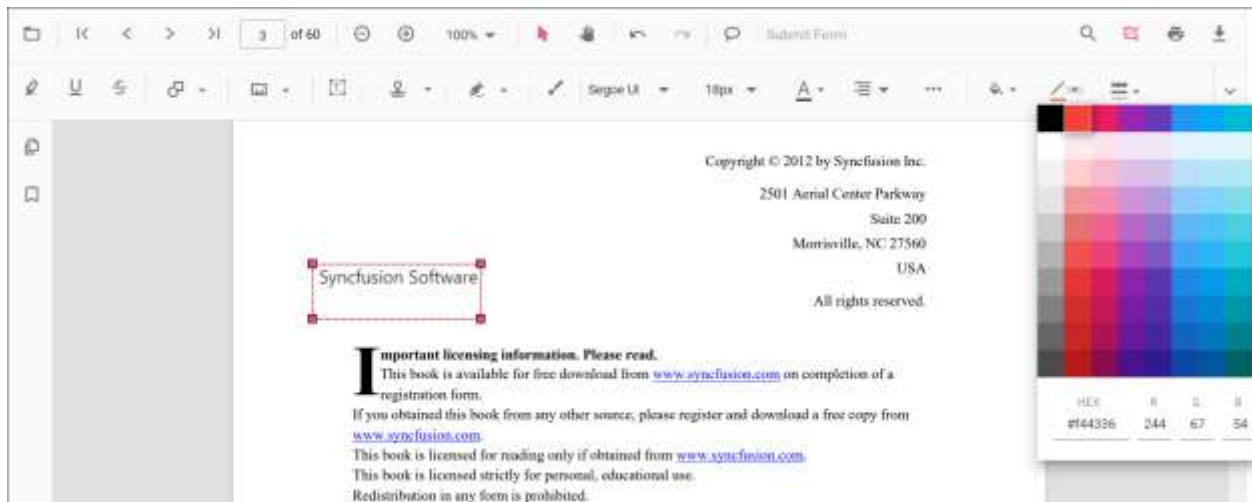

Editing fill color

The fill color of the annotation can be edited using the color palette provided in the Edit Color tool.

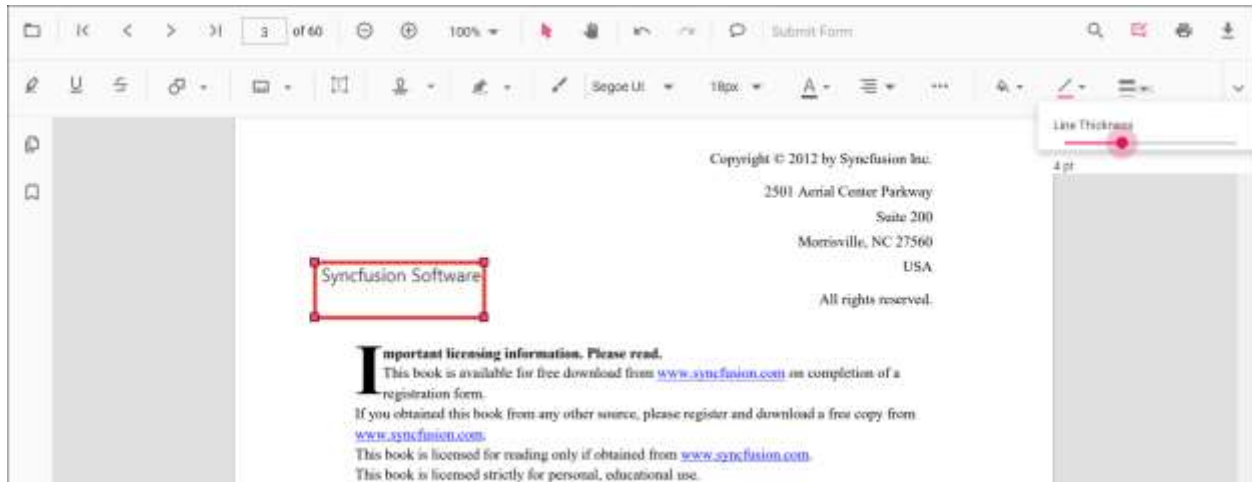

Editing stroke color

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.

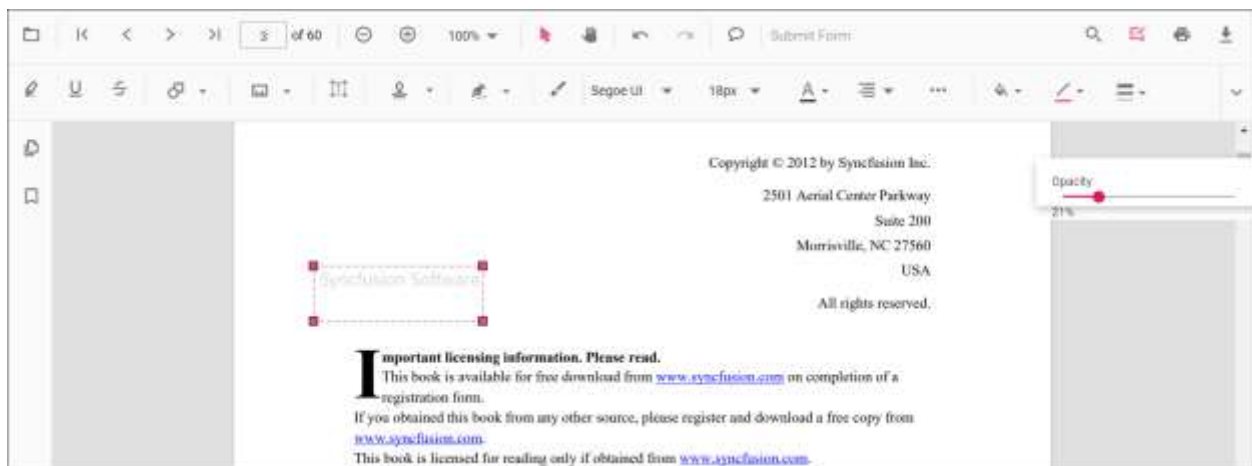

Editing thickness

The border thickness of the annotation can be edited using the range slider provided in the Edit Thickness tool.

Editing opacity

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

Setting default properties during control initialization

The properties of the free text annotation can be set before creating the control using the FreeTextSettings.

After editing the default values, they will be changed to the selected values.

Refer to the following code sample to set the default free text annotation settings.

STANDALONE

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.synCFusion.com/
content/pdf/pdf-succinctly.pdf").FreeTextSettings(new

```

### Comments in the ASP.NET MVC PDF Viewer component

The PDF Viewer control provides options to add, edit, and delete the comments to the following annotation in the PDF documents:

- Shape annotation
- Stamp annotation
- Sticky note annotation
- Measurement annotation
- Text markup annotation
- Free text annotation
- Ink annotation

### Adding a comment to the annotation

Annotation comment, comment replies, and status can be added to the PDF document using the comment panel.

### Comment panel

Annotation comments can be added to the PDF using the comment panel. The comment panel can be opened in the following ways:

1. Using the annotation menu
  - Click the Edit Annotation button in the PDF Viewer toolbar. A toolbar appears below it.
  - Click the Comment Panel button. A comment panel will appear.
2. Using Context menu
  - Select annotation in the PDF document and right-click it.
  - Select the comment option in the context menu that appears.
3. Using the Mouse click
  - Select annotation in the PDF document and double click it, a comment panel will appear.

If the comment panel is already in the open state, you can select the annotations and add annotation comments using the comment panel.

### Adding comments

- Select annotation in the PDF document and click it.
- The selected annotation comment container is highlighted in the comment panel.
- Now, you can add comment and comment replies using the comment panel.

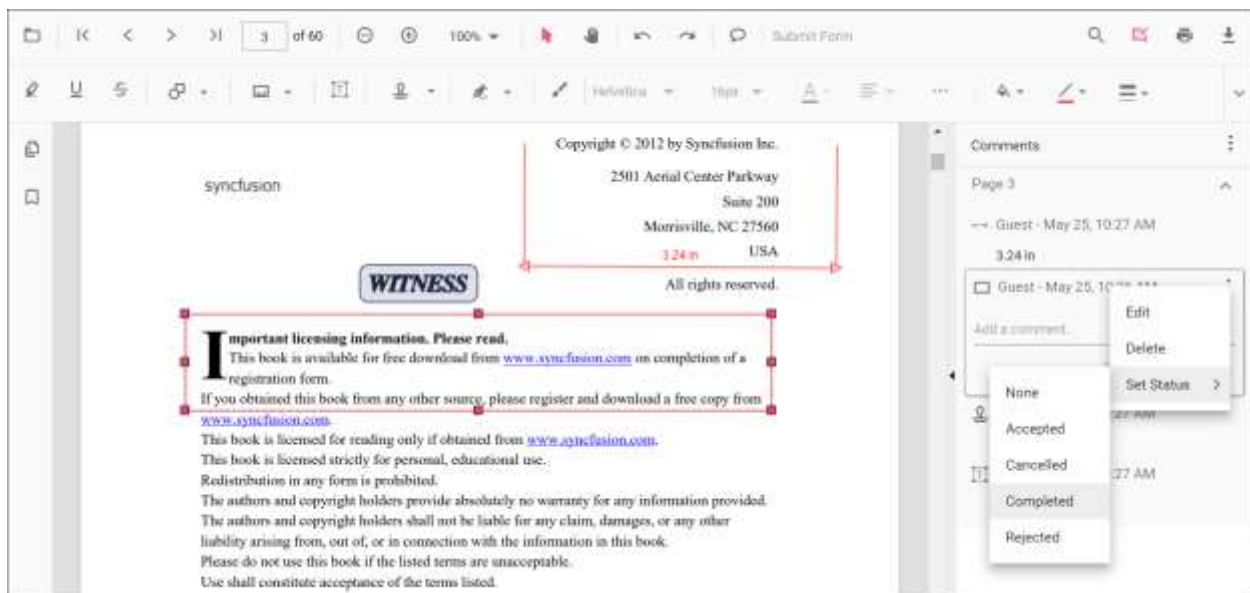

### Adding Comment Replies

- The PDF Viewer control provides an option to add multiple replies to the comment.
- After adding the annotation comment, you can add a reply to the comment.

### Adding Comment or Reply Status

- Select the Annotation Comments in the comment panel.
- Click the more options button showing in the Comments or reply container.
- Select the Set Status option in the context menu that appears.
- Select the status of the annotation comment in the context menu that appears.

### Editing the comments and comments replies of the annotations

The comment, comment replies, and status of the annotation can be edited using the comment panel.

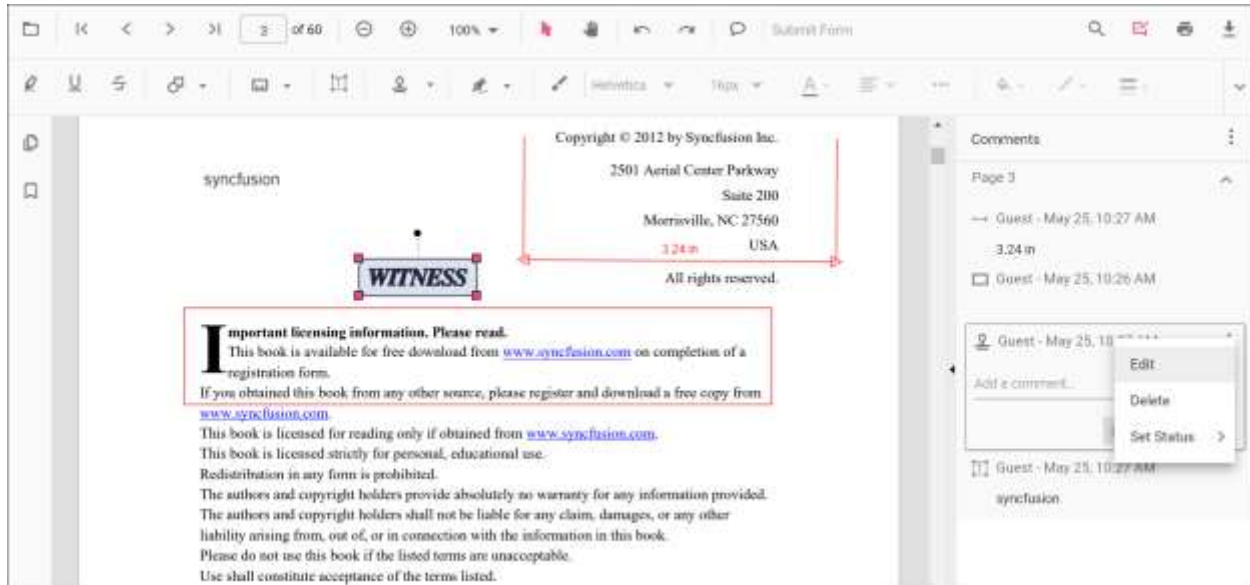

### Editing the Comment or Comment Replies

The annotation comment and comment replies can be edited in the following ways:

1. Using the Context menu
  - Select the Annotation Comments in the comment panel.
  - Click the More options button showing in the Comments or reply container.
  - Select the Edit option in the context menu that appears.
  - Now, an editable text box appears. You can change the content of the annotation comment or comment reply.
2. Using the Mouse Click
  - Select the annotation comments in the comment panel.
  - Double click the comment or comment reply content.
  - Now, an editable text box appears. You can change the content of the annotation comment or comment reply.

### Editing Comment or Reply Status

- Select the Annotation Comments in the comment panel.
- Click the more options button showing in the Comments or reply container.
- Select the Set Status option in the context menu that appears.
- Select the status of the annotation comment in the context menu that appears.
- Status 'None' is the default state. If the status is set to 'None,' the comments or reply does not appear.

### Delete Comment or Comment Replies

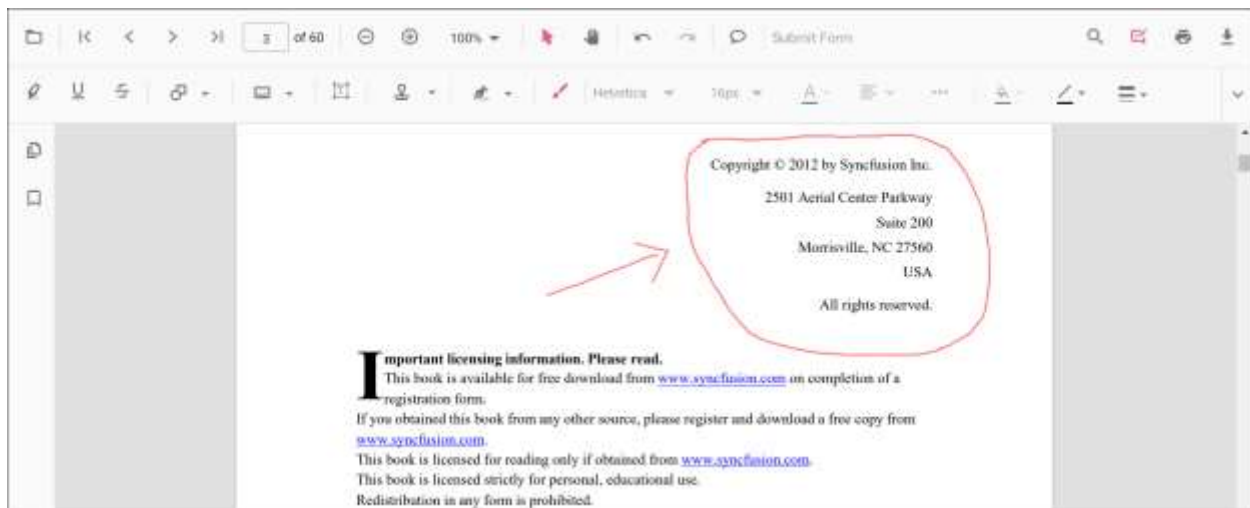

- Select the Annotation Comments in the comment panel.
- Click the more options button shown in the Comments or reply container.
- Select the Delete option in the context menu that appears.

**Note:** The annotation will be deleted on deleting the comment using comment panel.

## Ink Annotation in the ASP.NET MVC PDF Viewer component

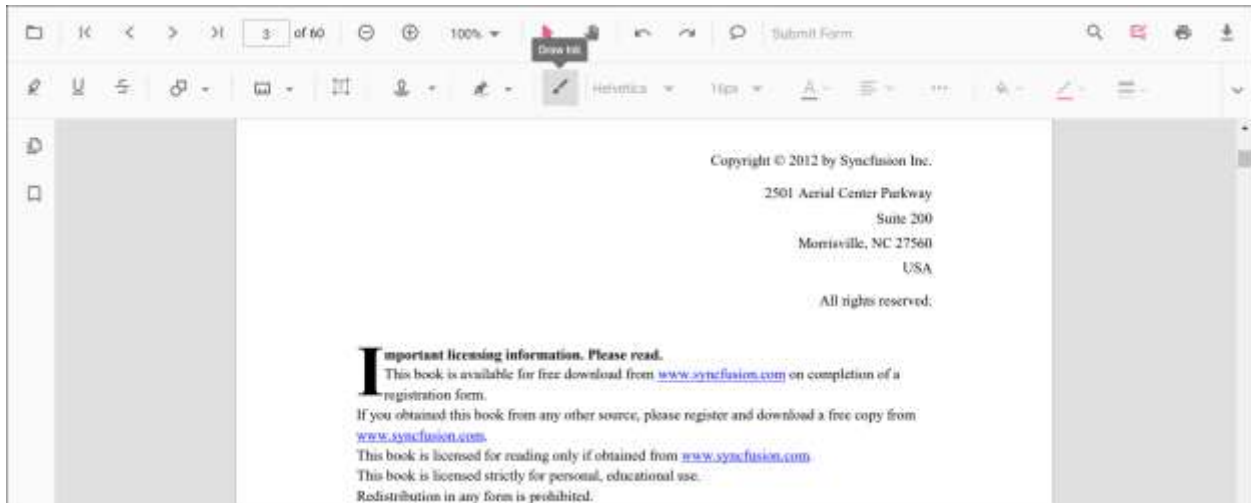

The PDF Viewer control provides the options to add, edit, and delete the ink annotations.

### Adding an ink annotation to the PDF document

The ink annotations can be added to the PDF document using the annotation toolbar.

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Select the **Draw Ink** button in the annotation toolbar. It enables the ink annotation mode.
- You can draw anything over the pages of the PDF document.

Refer to the following code sample to switch to the ink annotation mode.

### **STANDALONE**

```

```html
<!--Element to set ink annotation mode-->
<button id="set" onclick="addAnnot()">Draw Ink</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Ink');
}
</script>
```

```

### **SERVER-BACKED**

```

```html
<!--Element to set ink annotation mode-->
<button id="set" onclick="addAnnot()">Draw Ink</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
function addAnnot() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.annotation.setAnnotationMode('Ink');
}
</script>
```

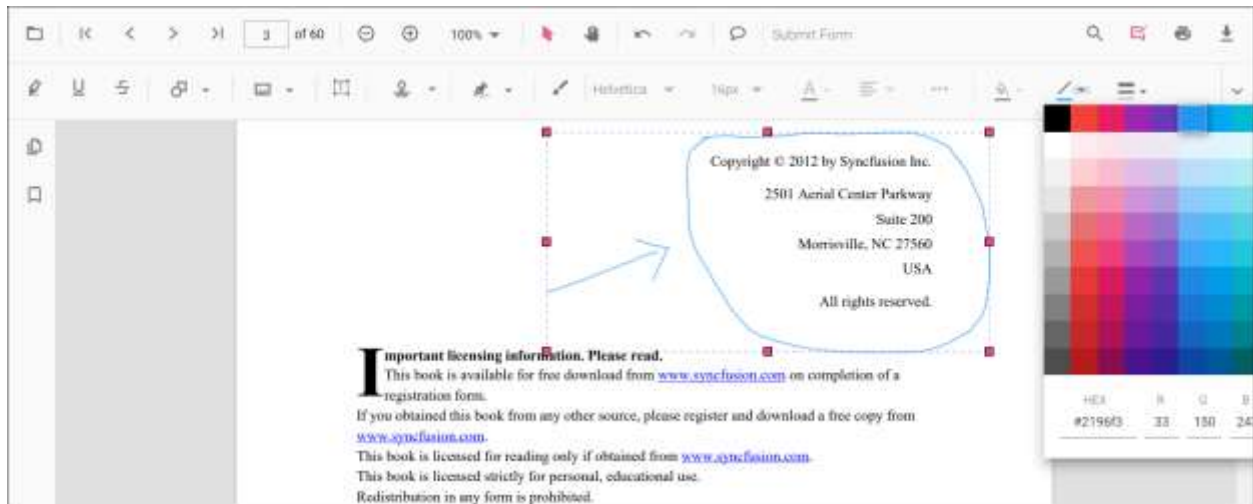

```

### *Editing the properties of the ink annotation*

The stroke color, thickness, and opacity of the ink annotation can be edited using the Edit stroke color tool, Edit thickness tool, and Edit opacity tool in the annotation toolbar.

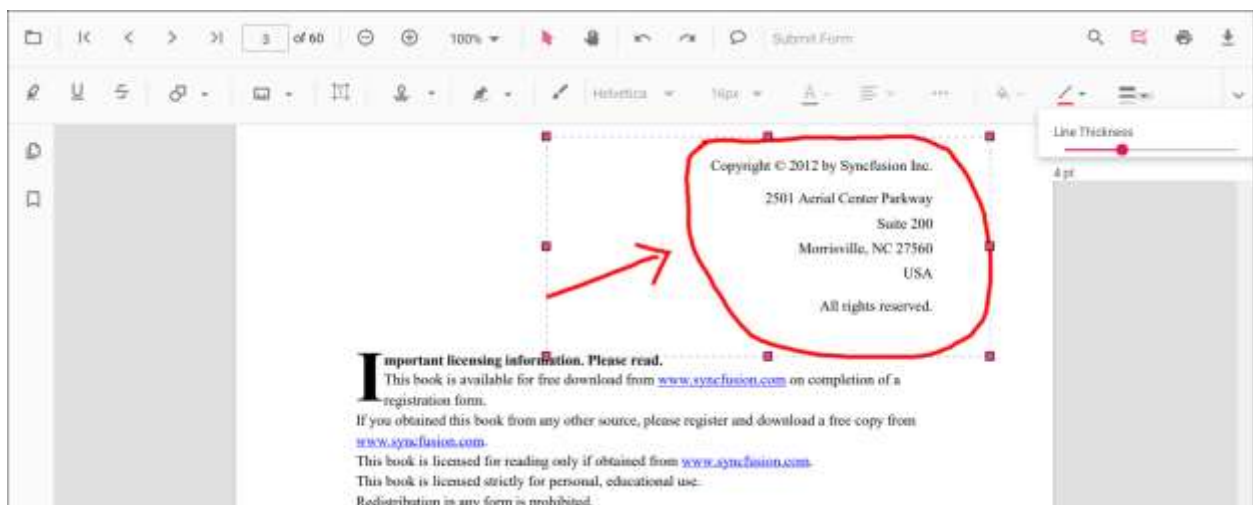

#### *Editing stroke color*

The stroke color of the annotation can be edited using the color palette provided in the Edit Stroke Color tool.

#### *Editing thickness*

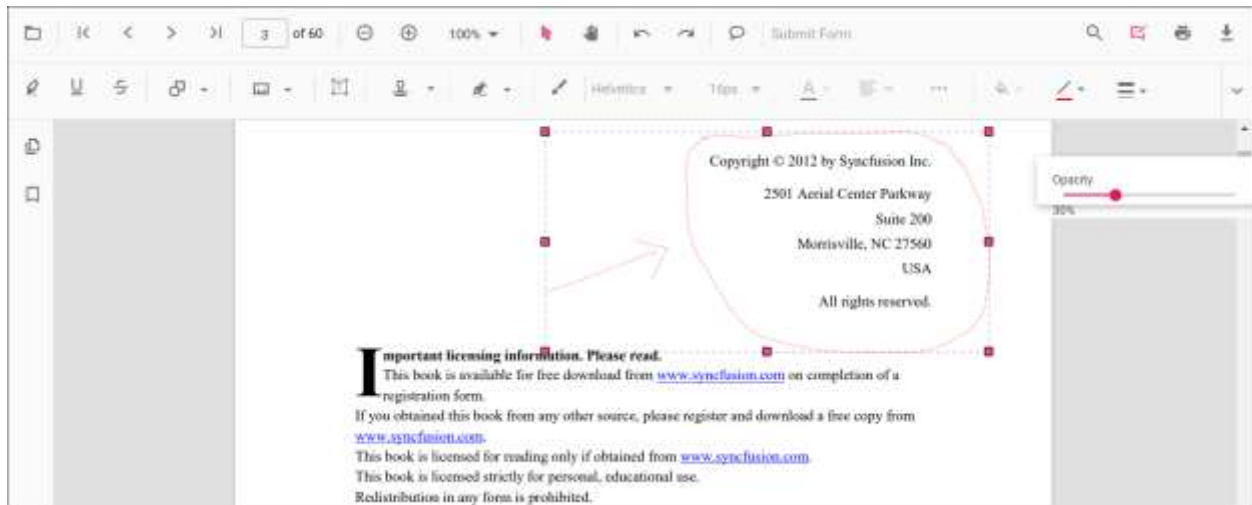

The thickness of the border of the annotation can be edited using the range slider provided in the Edit Thickness tool.

#### *Editing opacity*

The opacity of the annotation can be edited using the range slider provided in the Edit Opacity tool.

## Form Filling

PDF Viewer component allows you to display the form fields available in the PDF document. By using this, you can edit and download the form fields.

The form fields displayed in the PDF Viewer are:

- Text box
- Password box
- Combo box
- Check box
- Radio Button
- Signature Field
- List box

![FormFilling](../../pdfviewer/images/formfilling.png)

## Disabling form fields

The PDF Viewer control provides an option to disable the form fields feature. The code sample for disabling the form fields is as follows.

### STANDALONE

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnableFormFields(false).DocumentPath("http://cdn.syncfusion.com/content/pdf/form-filling-document.pdf").Render()
</div>
<<<

```

### SERVER-BACKED

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).EnableFormFields(false).DocumentPath("https://cdn.syncfusion.com/content/pdf/form-filling-document.pdf").Render()
</div>

```

### How to draw handwritten signature in the signature field

Signature can be added to the Signature field by using the following steps:

- Click the Signature Field in the PDF document. The signature panel will appear.

```
![SignatureField](../../pdfviewer/images/signaturefield.png)
```

- Draw the signature in the signature panel.

```
![SignaturePanel](../../pdfviewer/images/signature.png)
```

- Click the **CREATE** button, the drawn signature will be added in the signature field.

```
![Signature](../../pdfviewer/images/sign.png)
```

### Delete the signature inside the signature field

You can also delete the signature in the signature field by using Delete Option in the annotation toolbar.

```
![DeleteSign](../../pdfviewer/images/deletesign.png)
```

### Import and export form fields

The PDF Viewer control provides the support to import and export form fields using a JSON object in the PDF document.

#### Importing form fields using PDF Viewer API

You can import the form fields using JSON file or JSON object in code behind like the below code sample.

```
`html
<button id="viewer" onclick="OnImportFormFieldsClick()">Import FormFields</button>
<div style="width:100%;height:600px">
 @Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/form-filling-document.pdf").Render()
</div>
<script>
function OnImportFormFieldsClick() {
 var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
 //The json file has been placed inside the App_Data folder.;
 pdfViewer.importFormFields("D:/PDFViewer/Examples/mvc/sample/App_Data/ImportFormFields.json");
}
</script>
```

**Note:** The JSON file for importing the form fields should be placed in the desired location and the path should be provided correctly.

### Exporting form fields from the PDF document using PDF Viewer API

You can export the form fields as JSON file in code behind as the following code sample.

#### **STANDALONE**

```

<<<html
<button id="viewer" onclick="OnExportFormFieldsClick()">Export
FormFields</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/form-filling-document.pdf").Render()
</div>
<script>
function OnExportFormFieldsClick() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.exportFormFields(null, 'Json');
}
</script>
>>>

```

#### **SERVER-BACKED**

```

<<<html
<button id="viewer" onclick="OnExportFormFieldsClick()">Export
FormFields</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/form-
filling-document.pdf").Render()
</div>
<script>
function OnExportFormFieldsClick() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.exportFormFields(null, 'Json');
}
</script>
>>>

```

### Handwritten Signature

The PDF Viewer control supports adding handwritten signatures to a PDF document. The handwritten signature reduces the paper work of reviewing the content and verifies it digitally.

The following code snippet describes how to disable the handwritten signature in PDF Viewer.

#### **STANDALONE**

```

<<<html
@Html.EJS().PdfViewer("pdfviewer").EnableHandwrittenSignature(false).Documen
tPath("https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf").Render()
>>>

```

#### **SERVER-BACKED**

```

<<<html
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).EnableHandwrittenSignature(false).DocumentPath("https://cdn
.syncfusion.com/content/pdf/pdf-succinctly.pdf").Render()
<<<

```

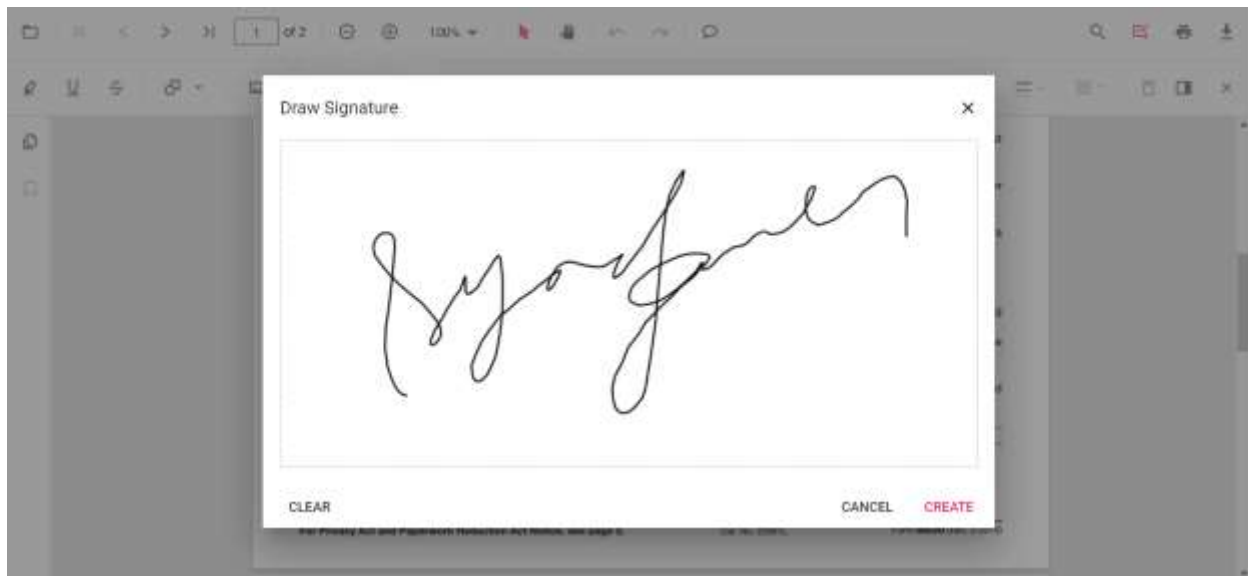

### Adding a handwritten signature to the PDF document

The handwritten signature can be added to the PDF document using the annotation toolbar.

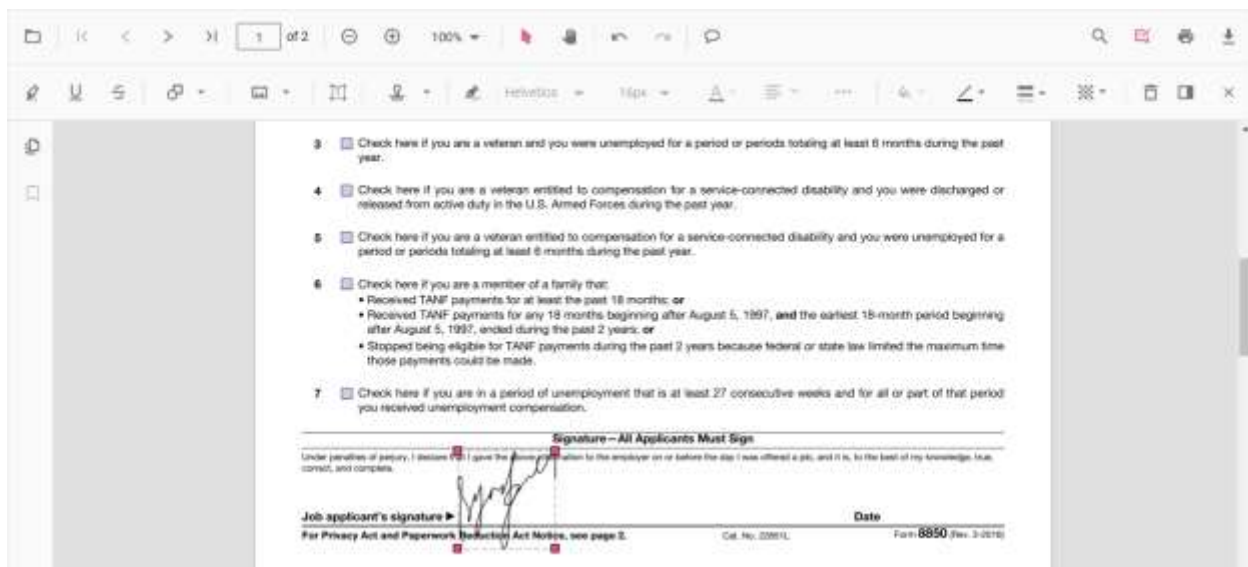

- Click the **Edit Annotation** button in the PDF Viewer toolbar. A toolbar appears below it.
- Select the **HandWritten Signature** button in the annotation toolbar. The signature panel will appear.

The screenshot shows a PDF viewer interface with a toolbar at the top. The main content is a form titled "8850 Pre-Screening Notice and Certification Request for the Work Opportunity Credit". The form is from the Department of the Treasury, Internal Revenue Service, and is dated Rev. March 2016. It includes a "Job applicant: Fill in the lines below and check any boxes that apply. Complete only this side." section with fields for name, social security number, street address, city/town/state/ZIP code, county, and telephone number. Below these fields are two numbered checkboxes for eligibility criteria.

- Draw the signature in the signature panel.

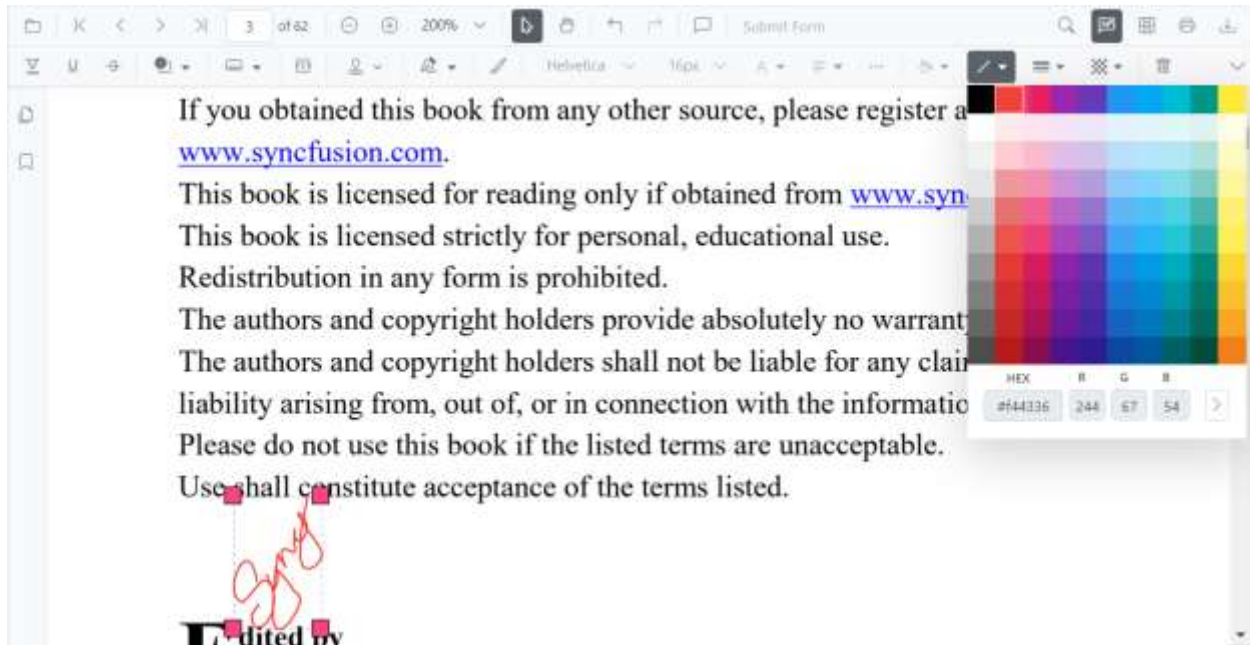

- Then click **Create** button and move the signature using the mouse and place them in the desired location.

### Editing the properties of handwritten signature

The stroke color, border thickness, and opacity of the handwritten signature can be edited using the edit stroke color tool, edit thickness tool, and edit opacity tool in the annotation toolbar.

Refer to the following code snippet to set the default handwritten signature settings.

```
`html
```

```
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute("~/PdfViewer/")).HandWrittenSignatureSettings(new Syncfusion.EJ2.PdfViewer.PdfViewerHandWrittenSignatureSettings { Opacity = 1, Thickness = 2 }).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-succinctly.pdf").Render()
```

## Interaction Mode in PDF Viewer component

The PDF Viewer provides interaction mode for easy interaction with the loaded PDF document. Selection mode and panning mode are the two interaction modes.

### Selection mode

In this mode, the text selection can be performed in the PDF document loaded in PDF Viewer. The panning and scrolling of the pages by touch cannot be performed in this mode. It allows users to select and copy text from the PDF files. This is helpful for copying and sharing text content. You can enable/disable the text selection using the following code snippet.

### STANDALONE

```
```html
<div style="width:100%;height:600px">
  @Html.EJS().PdfViewer("pdfviewer").EnableTextSelection(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
```
```

**SERVER-BACKED**

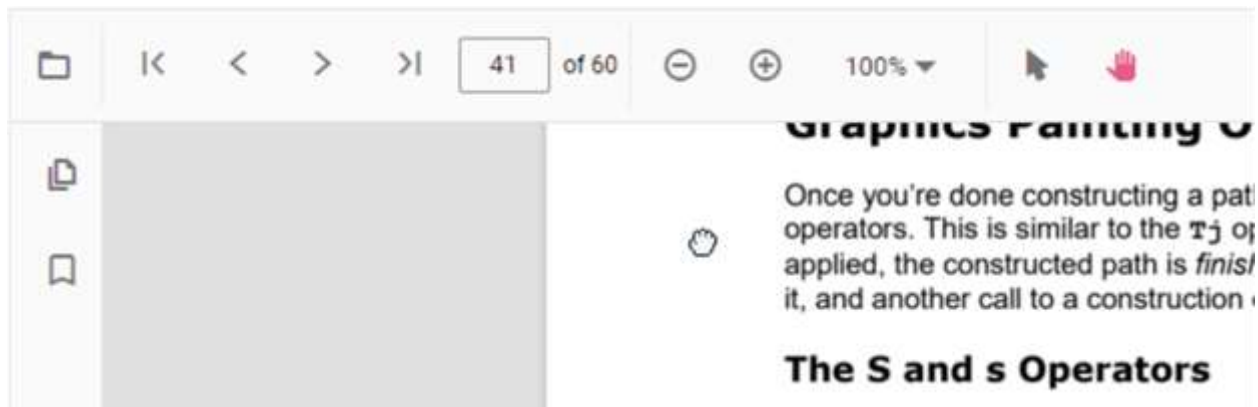

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).EnableTextSelection(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<<<

```

**Panning Mode**

In this mode, the panning and scrolling of the pages by touch can be performed in the PDF document loaded in the PDF Viewer, but the text selection cannot be performed.

You can switch the interaction mode of PDF Viewer by using the following code snippet.,

**STANDALONE**

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").InteractionMode(Syncfusion.EJ2.PdfViewer.
InteractionMode.Pan).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<<<

```

**SERVER-BACKED**

```

<<<html
<div style="width:100%;height:600px">

```

```
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).InteractionMode(Syncfusion.EJ2.PdfViewer.InteractionMod
e.Pan).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
```
```

Form Designer

Create form fields programmatically

The PDF Viewer control provides the option to add, edit and delete the Form Fields. The Form Fields type supported by the PDF Viewer Control are:

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Add a form field to PDF document programmatically

Using addFormField method, the form fields can be added to the PDF document programmatically. We need to pass two parameters in this method. They are Form Field Type and Properties of Form Field Type. To add form field programmatically, Use the following code.

STANDALONE

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/form-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()
</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
}
</script>
```
```

SERVER-BACKED

```

```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/fo
rm-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()
</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
}
</script>
```

```

Edit/Update form field programmatically

Using updateFormField method, Form Field can be updated programmatically. We should get the Form Field object/Id from FormFieldCollections property that you would like to edit and pass it as a parameter to updateFormField method. The second parameter should be the properties that you would like to update for Form Field programmatically. We have updated the value and background Color properties of Textbox Form Field.

STANDALONE

```

```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/form-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()
</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.addFormField("Textbox", { name: "Textfield",
bounds: { X: 300, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.updateFormField(pdfviewer.formFieldCollections[0],
{ backgroundColor: 'red' });
}
</script>
```

```

SERVER-BACKED

```

```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/fo
rm-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()

```

```

</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.addFormField("Textbox", { name: "Textfield",
bounds: { X: 300, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.updateFormField(pdfviewer.formFieldCollections[0],
{ backgroundColor: 'red' });
}
</script>
```

```

Delete form field programmatically

Using deleteFormField method, the form field can be deleted programmatically. We should retrieve the Form Field object/Id from FormFieldCollections property that you would like to delete and pass it as a parameter to deleteFormField method. To delete a Form Field programmatically, use the following code.

STANDALONE

```

```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/form-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()
</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.addFormField("Textbox", { name: "Textfield",
bounds: { X: 300, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.deleteFormField(pdfviewer.formFieldCollections[0])
;
}
</script>
```

```

SERVER-BACKED

```

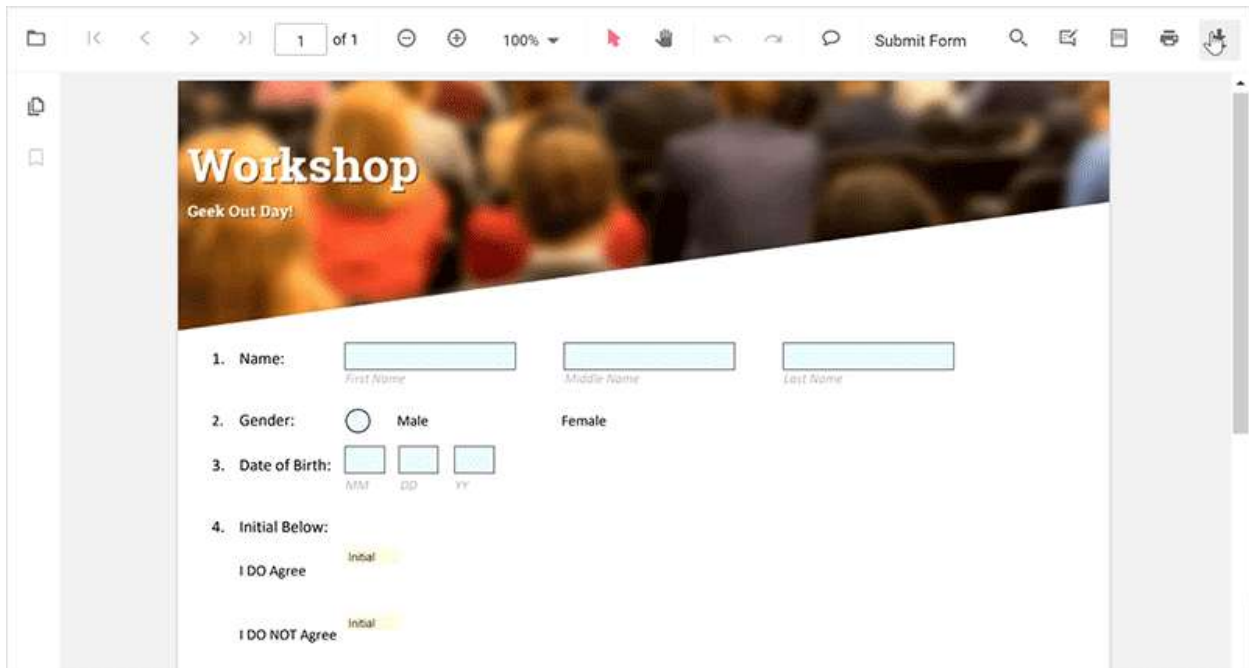

```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/fo
rm-
designer.pdf").DocumentLoad("documentLoad").DownloadEnd("documentLoad").Rend
er()
</div>
<script>
function documentLoad() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];

```

```
viewer.formDesignerModule.addFormField("Textbox", { name: "Textbox", bounds:
{ X: 146, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.addFormField("Textbox", { name: "Textfield",
bounds: { X: 300, Y: 229, Width: 150, Height: 24 } });
viewer.formDesignerModule.deleteFormField(pdfviewer.formFieldCollections[0])
;
}
</script>
....
```

### *Saving the form fields*

When the download icon is selected on the toolbar, the Form Fields will be saved in the PDF document and this action will not affect the original document. Refer the below GIF for further reference.

You can invoke download action using following code snippet.

### **STANDALONE**

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentLoad("download").EnableDownload(t
true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-
succinctly.pdf").Render()
</div>
<script>
function download() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.download();
}
</script>
....
```

SERVER-BACKED

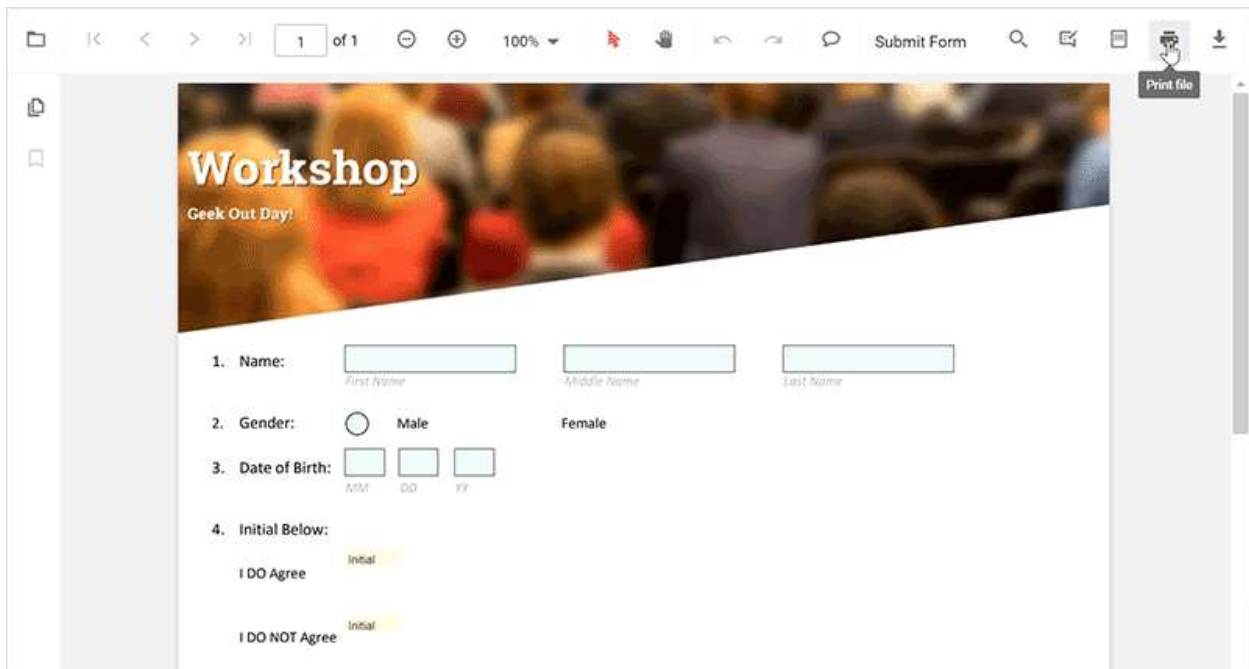

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentLoad("download").ServiceUrl(VirtualPathUtility.ToAbsolute("~/api/PdfViewer/")).EnableDownload(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function download() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.download();
}
</script>
<<<

```

Printing the form fields

When the print icon is selected on the toolbar, the PDF document will be printed along with the Form Fields added to the pages and this action will not affect the original document. Refer the below GIF for further reference.

You can invoke print action using the following code snippet.,

STANDALONE

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").EnablePrint(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function print() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.print.print();
}

```

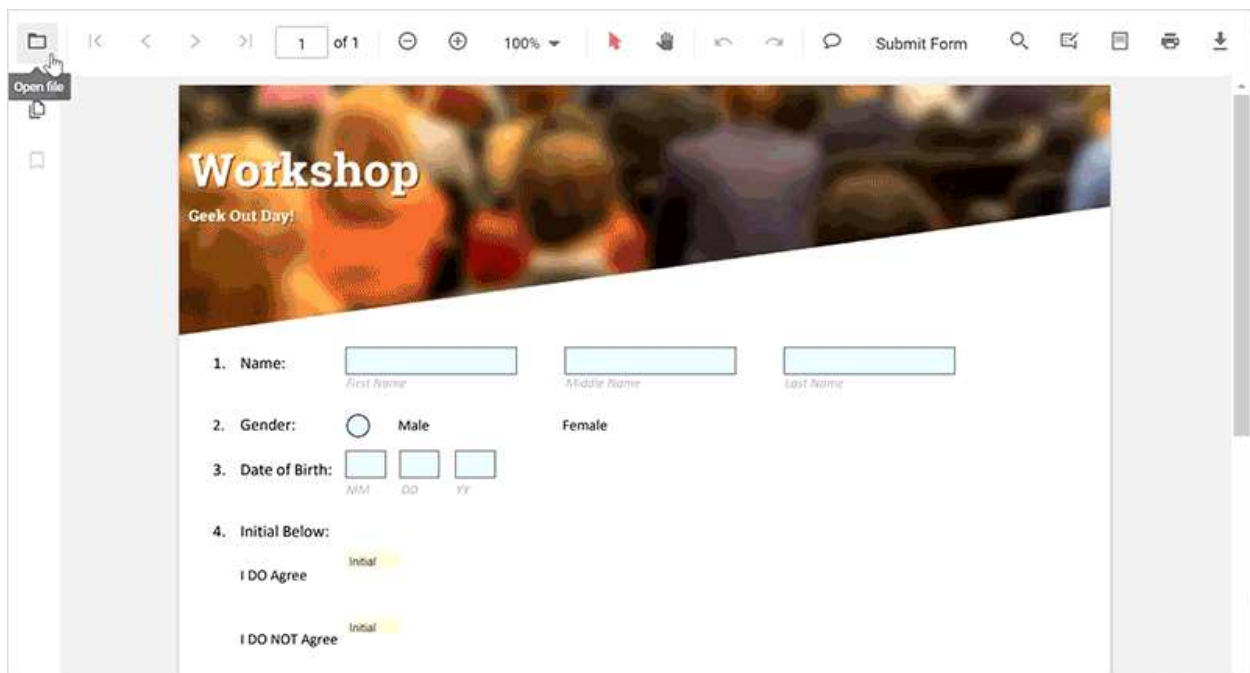

```
</script>
```

SERVER-BACKED

```
```html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/api/PdfViewer/")).EnablePrint(true).DocumentPath("https://cdn.syncfusion.
com/content/pdf/hive-succinctly.pdf").Render()
</div>
<script>
function print() {
var pdfViewer = document.getElementById('pdfviewer').ej2_instances[0];
pdfViewer.print.print();
}
</script>
```
```

Open the existing PDF document

We can open the already saved PDF document contains Form Fields in it by clicking the open icon in the toolbar. Refer the below GIF for further reference.

Validate form fields

The form fields in the PDF Document will be validated when the `enableFormFieldsValidation` is set to true and hook the `validateFormFields`. The `validateFormFields` will be triggered when the PDF document is downloaded or printed with the non-filled form fields. The non-filled fields will be obtained in the `nonFillableFields` property of the event arguments of `validateFormFields`.

Add the following code snippet to validate the form fields,

STANDALONE

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ValidateFormFields("validateFormFields").
EnableFormFieldsValidation(true).DocumentPath("https://cdn.syncfusion.com/co
ntent/pdf/form-filling-document.pdf").Render()
</div>
<script>
function validateFormFields(args) {
var nonfilledFormFields = args.nonFillableFields;
}
</script>
<<<

```

SERVER-BACKED

```

<<<html
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).ValidateFormFields("validateFormFields").EnableFormFieldsVa
lidation(true).DocumentPath("https://cdn.syncfusion.com/content/pdf/form-
filling-document.pdf").Render()
</div>
<script>
function validateFormFields(args) {
var nonfilledFormFields = args.nonFillableFields;
}
</script>
<<<

```

Export and import form fields

The PDF Viewer control provides the support to export and import the form field data in the following formats using the `importFormFields`, `exportFormFields`, and `exportFormFieldsAsObject` methods.

- FDF
- XFDF
- JSON

Export and import as FDF

Using the `exportFormFields` method, the form field data can be exported in the specified data format. This method accepts two parameters:

- The first one must be the destination path for the exported data. If the path is not specified, it will ask for the location while exporting.
- The second parameter should be the format type of the form data.

The following code explains how to export the form field data as FDF.

STANDALONE

```

<<<html
<button id="exportFdf" onclick="exportFdf()">Export FDF</button>
<button id="importFdf" onclick="importFdf()">Import FDF</button>

```

```

<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export FDF button click.
function exportFdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Fdf);
}
// Event triggers on Import FDF button click.
function importFdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Fdf);
}
</script>

```

SERVER-BACKED

```

```html
<button id="exportFdf" onclick="exportFdf()">Export FDF</button>
<button id="importFdf" onclick="importFdf()">Import FDF</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export FDF button click.
function exportFdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Fdf);
}
// Event triggers on Import FDF button click.
function importFdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Fdf);
}
</script>
```

```

Export and import as XFDF

The following code explains how to export the form field data as XFDF.

STANDALONE

```

```html
<button id="exportXfdf" onclick="exportXfdf()">Export XFDF</button>
<button id="importXfdf" onclick="importXfdf()">Import XFDF</button>

```

```

<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export XFDF button click.
function exportXfdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Xfdf);
}
// Event triggers on Import XFDF button click.
function importXfdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Xfdf);
}
</script>

```

### **SERVER-BACKED**

```

```html
<button id="exportXfdf" onclick="exportXfdf()">Export XFDF</button>
<button id="importXfdf" onclick="importXfdf()">Import XFDF</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export XFDF button click.
function exportXfdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Xfdf);
}
// Event triggers on Import XFDF button click.
function importXfdf() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Xfdf);
}
</script>
```

```

### Export and import as JSON

The following code explains how to export the form field data as JSON.

### **STANDALONE**

```

```html
<button id="exportJson" onclick="exportJson()">Export JSON</button>
<button id="importJson" onclick="importJson()">Import JSON</button>

```

```

<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export JSON button click.
function exportJson() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Json);
}
// Event triggers on Import JSON button click.
function importJson() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Json);
}
</script>

```

SERVER-BACKED

```

<<<html
<button id="exportJson" onclick="exportJson()">Export JSON</button>
<button id="importJson" onclick="importJson()">Import JSON</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
// Event triggers on Export JSON button click.
function exportJson() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// Data must be the desired path for the exported document.
viewer.exportFormFields('Data', FormFieldDataFormat.Json);
}
// Event triggers on Import JSON button click.
function importJson() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
// The file for importing the form fields should be placed in the desired
location, and the path should be provided correctly.
viewer.importFormFields('File', FormFieldDataFormat.Json);
}
</script>

```

Export and import as Object

The PDF Viewer control supports exporting the form field data as an object, and the exported data will be imported into the current PDF document from the object.

The following code shows how to export the form field data as an object and import the form field data from that object into the current PDF document via a button click.

STANDALONE

```

<html>
<button id="exportDataAsObject" onclick="exportDataAsObject()">Export
Object</button>
<button id="importData" onclick="importData()">Import Data</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>

Form Field Properties

Form field properties in Syncfusion PDF Viewer allow you to customize and interact with form fields embedded within PDF documents. This documentation provides an overview of the form field properties supported by the Syncfusion PDF Viewer and explains how to use them effectively.

- Textbox
- Password
- CheckBox
- RadioButton
- ListBox
- DropDown
- SignatureField
- InitialField

Signature and initial fields settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the signature field properties on a button click.

STANDALONE

```

<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Initial',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Initial',
thickness: 4
});
}
</script>

```

SERVER-BACKED

```

<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Initial',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Initial',
thickness: 4
});
}
</script>

```

The following code example explains how to update the properties of the signature field added to the document from the form designer toolbar.

```

<script type="text/javascript">
window.onload = function () {

```

```

var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.signatureFieldSettings = {
// Set the name of the form field element.
name: 'Signature',
// Specify whether the signature field is in read-only or read-write mode.
isReadOnly: false,
// Set the visibility of the form field.
visibility: 'visible',
// Specify whether the field is mandatory or not.
isRequired: false,
// Specify whether to print the signature field.
isPrint: true,
// Set the text to be displayed as a tooltip.
tooltip: 'Signature',
// Set the thickness of the signature field. To hide the borders, set the value to 0 (zero).
thickness: 4,
// Specify the properties of the signature indicator in the signature field.
signatureIndicatorSettings: {
opacity: 1,
backgroundColor: '#daeaf7ff',
height: 50,
fontSize: 15,
text: 'Signature Field',
color: 'white'
}
}
}
</script>

```

The following code example explains how to update the properties of the initial field added to the document from the form designer toolbar.

```
<script type="text/javascript">
window.onload = function () {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
viewer.initialFieldSettings = {
// Set the name of the form field element.
name: 'Initial',
// Specify whether the initial field is in read-only or read-write mode.
isReadOnly: false,
// Set the visibility of the form field.
visibility: 'visible',
// Specify whether the field is mandatory or not.
isRequired: false,
// Specify whether to print the initial field.
isPrint: true,
// Set the text to be displayed as tooltip.
tooltip: 'Initial',
// Set the thickness of the initial field. To hide the borders, set the value to 0 (zero).
thickness: 4,
// Specify the properties of the initial indicator in the initial field.
initialIndicatorSettings: {
opacity: 1,
backgroundColor: '#daeaf7ff',
height: 50,
fontSize: 15,
text: 'Initial Field',
color: 'white'
},
}
}
</script>
```

Textbox field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the Textbox field properties on a button click.

STANDALONE

```
<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Textbox',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Textbox',
thickness: 4,
value: 'Textbox',
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: '#daeaf7ff',
alignment: 'Left',
maxLength: 0,
isMultiline: false,
bounds: { X: 146, Y: 229, Width: 150, Height: 24 }
});
}
</script>
```

SERVER-BACKED

```
<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>

// Set the font color of the textbox field.
color: 'black',
// Set the border color of the textbox field.
borderColor: 'black',
// Set the background color of the textbox field.
backgroundColor: '#daeaf7ff',
// Set the alignment of the text.
alignment: 'Left',
// Set the maximum character length.
maxLength: 0,
// Allows multiline input in the text field. FALSE, by default.
isMultiline: false
}
}
</script>
```

[Password field settings](#)

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the Password field properties on a button click.

STANDALONE

```

<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("PDF_Succinctly.pdf").Render
()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'Password',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'Password',
thickness: 4,
value: 'Password',
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: '#daeaf7ff',
alignment: 'Left',
maxLength: 0,
bounds: { X: 148, Y: 229, Width: 150, Height: 24 }
});
}
</script>

```
// Specify the font style
fontStyle: 'None',
// Set the font color of the Password field.
color: 'black',
// Set the border color of the Password field.
borderColor: 'black',
// Set the background color of the Password field.
backgroundColor: '#daeaf7ff',
// Set the alignment of the text.
alignment: 'Left',
// Set the maximum character length.
maxLength: 0,
}
}
</script>
```

CheckBox field settings

Using the `updateFormField` method, the form fields can be updated programmatically.

The following code example explains how to update the CheckBox field properties on a button click.

STANDALONE

```
<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").DocumentPath("https://cdn.syncfusion.com/
content/pdf/pdf-succinctly.pdf").Render()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'CheckBox',
isReadOnly: true,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'CheckBox',
thickness: 4,
```

```

isChecked: true,
backgroundColor: '#daeaf7ff',
borderColor: 'black',
value: 'CheckBox'
});
}
</script>

```

SERVER-BACKED

```

<button id="updateProperties" onclick="updateProperties()">Update
Properties</button>

Properties</button>
<div style="width:100%;height:600px">
@Html.EJS().PdfViewer("pdfviewer").ServiceUrl(VirtualPathUtility.ToAbsolute(
"~/PdfViewer/")).DocumentPath("https://cdn.syncfusion.com/content/pdf/pdf-
succinctly.pdf").Render()
</div>
<script>
// Event triggers on Update Properties button click.
function updateProperties() {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
```

```

var formField = viewer.retrieveFormFields();
const customOptions = [
{ itemName: 'item1', itemValue: 'item1' },
{ itemName: 'item2', itemValue: 'item2' },
{ itemName: 'item3', itemValue: 'item3' }
];
var formField = viewer.retrieveFormFields();
viewer.formDesignerModule.updateFormField(formField[0], {
name: 'DropDown',
isReadOnly: false,
visibility: 'visible',
isRequired: false,
isPrint: true,
tooltip: 'DropDown',
thickness: 4,
fontFamily: 'Courier',
fontSize: 10,
fontStyle: 'None',
color: 'black',
borderColor: 'black',
backgroundColor: '#daeaf7ff',
alignment: 'Left',
options: customOptions,
});
}
</script>

```

The following code example explains how to update the properties of the dropdown field added to the document from the form designer toolbar.

```

<script type="text/javascript">
window.onload = function () {
var viewer = document.getElementById('pdfviewer').ej2_instances[0];
const customOptions = [
{ itemName: 'item1', itemValue: 'item1' },
{ itemName: 'item2', itemValue: 'item2' },
{ itemName: 'item3', itemValue: 'item3' }
];
viewer.DropDownFieldSettings = {
// Set the name of the form field element.
name: 'DropDown',
// Specify whether the DropDown field is in read-only or read-write mode.
isReadOnly: false,
// Set the visibility of the form field.
visibility: 'visible',

```

```
// Specify whether the field is mandatory or not.
isRequired: false,
