            dialogObj.element.classList.remove('dialog-maximized');
            dialogObj.element.querySelector('.e-dlg-
content').classList.add('hide-content');
            dialogObj.position = { X: 'center', Y: 'bottom' };
            dialogObj.dataBind();
            minimizeIcon.classList.add('sf-icon-Restore');
            minimizeIcon.setAttribute('title', 'Restore');
        } else {
            dialogObj.element.classList.remove('dialog-minimized');
            dialogObj.element.querySelector('.e-dlg-
content').classList.remove('hide-content');
            minimizeIcon.classList.add('sf-icon-Minimize');
            minimizeIcon.setAttribute('title', 'Minimize');
            minimizeIcon.classList.remove('sf-icon-Restore');
            dialogObj.position = dialogOldPositions;
            dialogObj.dataBind();
        }
    } else {
        dialogObj.show(false);
        dialogObj.element.classList.remove('dialog-maximized');
        dialogObj.element.classList.add('dialog-minimized');
        dialogObj.element.querySelector('.e-dlg-
content').classList.add('hide-content');
        minimizeIcon.classList.remove('sf-icon-Minimize');
        minimizeIcon.removeAttribute('title');
        dialogObj.position = { X: 'center', Y: 'bottom' };
        dialogObj.dataBind();
        isFullScreen = true;
    }
});

```

Setting max height to the dialog in ##Platform_Name## Dialog control

By default, the maxHeight for the Dialog is calculated based on the target. If the target is not specified externally, the Dialog consider the body as target and will calculate the maxHeight based on it. We have an option to set the maxHeight of the Dialog in the [beforeOpen](#) event.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize Dialog component.
var dialog = new ej.popups.Dialog({
    width: '800px',
    showCloseIcon: true,

          <b>JavaScript:</b><br>
          JavaScript is a high-level, dynamic, untyped, and
          interpreted programming language. It has been standardized in the ECMAScript
          language specification. Alongside HTML and CSS, it is
          one of the three essential technologies of World Wide Web

```

content production; the majority of websites employ it and it **is** supported by all modern Web browsers without plug-ins. JavaScript **is** a prototype-based programming language with first-**class functions**, making it a multi-paradigm language, supporting **object-oriented** , imperative, and functional programming styles.

MVC:

Model-view-controller (MVC) **is** a software architecture pattern which separates the representation of information **from** the user's interaction with it. The model consists of application data, business rules, logic, and functions. A view can be any output representation of data, such **as** a chart or a diagram. Multiple views of the same data are possible, such **as** a bar chart **for** management and a tabular view **for** accountants. The controller mediates input, converting it to commands **for** the model or view. The central ideas behind MVC are code reusability and **in** addition to dividing the application **into** three kinds of components, the MVC design defines the interactions between them.

A controller can send commands to its associated view to change the view's presentation of the model (e.g., by scrolling through a document). It can also send commands to the model to update the model's state (e.g., editing a document).

A model notifies its associated views and controllers when there **is** a change **in** its state. This notification allows the views to produce updated output, and the controllers to change the available **set** of commands. A passive implementation of MVC omits these notifications because the application does not require them or the software platform does not support them.

A view requests **from** the model the information that it needs to generate an output representation to the user.

DocumentEditor

Overview

The Document Editor component is used to create, edit, view, and print Word documents in web applications. All the user interactions and editing operations that run purely in the client-side provides much faster editing experience to the users.

Key Features

- [Opens](#) the native Syncfusion Document Text (*.sfdt) format documents in the client-side.

- [Saves the documents](#) in the client-side as **Syncfusion Document Text (.sfdt) and Word document (.docx)**.
- Supports document elements like text, [image](#), [table](#), fields, [bookmark,shapes](#), [section](#), [header and footer](#).
- Supports the commonly used fields like [hyperlink](#), page number, page count, and table of contents.
- Supports formats like [text](#), [paragraph](#), [bullets and numbering](#), [table](#), [page settings](#), etc.
- Provides support to create, edit, and apply [paragraph and character styles](#).
- Provides support to [find and replace](#) text within the document.
- Supports all the common editing and formatting operations along with [undo and redo](#).
- Provides support to [cut](#), [copy](#), and [paste](#) rich text contents within the component. Also allows pasting simple text to and from other applications.
- Provides support to insert, and edit [form fields](#).
- Provides support to insert, and edit [comments](#).
- Provides support to track the [inserted and deleted content](#).
- Provides support to perform [spell checking](#) for any input text
- Allows user interactions like [zoom](#), [scroll](#), select contents through touch, mouse, and keyboard.
- Provides intuitive UI options like context menu, [dialogs](#), and [navigation pane](#).
- [Localizes](#) all the static text to any desired language.
- Allows to create a lightweight Word viewer using module injection to view and [prints](#) Word documents.
- Provides a [server-side helper library](#) to open the Word documents like DOCX, DOC, WordML, RTF, and Text, by converting it to SFDT file format.

Supported Web platforms

Other platforms

- [Javascript](#)
- [Angular](#)
- [React](#)
- [Vue](#)
- [ASP.NET Core](#)
- [ASP.NET MVC](#)
- [Blazor](#)

Supported platforms for server-side dependencies

You can deploy web APIs for server-side dependencies of Document Editor component in the following platforms.

- [ASP.NET Core](#)
- [ASP.NET MVC](#)
- [Java](#)

To know more about server-side dependencies, refer this [page](#).

Which operations require server-side interaction

- Open file formats other than SFDT

- Paste with formatting
- Restrict editing
- Spellcheck
- Save as file formats other than SFDT and DOCX

Note: If you don't require the above functionalities then you can deploy as pure client-side component without any server-side interactions.

Feature module in ##Platform_Name## Document editor control

Document Editor features are segregated into individual feature-wise modules to enable selective referencing. By default, the Document Editor displays the document in read-only mode. The required modules should be injected to extend its functionality. The following are the selective modules of Document Editor that can be included as required:

- **Print** - Prints the document.
- **SfdtExport** - Exports the document as Syncfusion Document Text (.SFDT) file.
- **Selection** - Selects a portion of the document and copy it to the clipboard.
- **Search** - Searches specific text and navigate between the results.
- **WordExport** - Exports the document as Word Document (.DOCX) file.
- **TextExport** - Exports the document as Text Document (.TXT) file.
- **Editor** - Performs all kind of editing operations.
- **EditorHistory** - Maintains the history of editing operations so that you can perform undo and redo at any time.
- User interface options such as context menu, options pane, image resizer, and dialog are available as individual modules.

In addition to injecting the required modules in your application, enable corresponding properties to extend the functionality for a Document Editor instance.

Refer to the following table.

Module	Dependent modules to be injected for extending the functionality of Document Editor in your application	Property to enable the functionality for a Document Editor instance
--------	---	---

---	---	---
-----	-----	-----

Print	DocumentEditor.Inject(Print)	let documenteditor: DocumentEditor = new DocumentEditor({ enablePrint: true });
-------	------------------------------	---

SfdtExport	DocumentEditor.Inject(SfdtExport)	let documenteditor: DocumentEditor = new DocumentEditor({ enableSfdtExport: true });
------------	-----------------------------------	--

Selection	DocumentEditor.Inject(Selection)	let documenteditor: DocumentEditor = new DocumentEditor({ enableSelection: true });
-----------	----------------------------------	---

Search	DocumentEditor.Inject(Selection, Search)	let documenteditor: DocumentEditor = new DocumentEditor({ enableSearch: true });
--------	--	--

WordExport	DocumentEditor.Inject(SfdtExport, WordExport)	let documenteditor: DocumentEditor = new DocumentEditor({ enableWordExport: true });
------------	---	--

```
|TextExport| DocumentEditor.Inject(SfdtExport, TextExport)|let documenteditor:
DocumentEditor = new DocumentEditor({ enableTextExport: true });|

DocumentEditor({ isReadOnly: false, enableEditor: true });|

|EditorHistory| DocumentEditor.Inject(Selection, Editor, EditorHistory)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableEditorHistory: true });|

|OptionsPane(Find)| DocumentEditor.Inject(Selection, Search, OptionsPane)|let documenteditor:
DocumentEditor = new DocumentEditor({ enableSearch: true, enableOptionsPane: true });|

|OptionsPane(Find and Replace)| DocumentEditor.Inject(Selection, Search, Editor,
OptionsPane)|let documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false,
enableEditor: true, enableSearch: true, enableOptionsPane: true });|

|ContextMenu| DocumentEditor.Inject(Selection, ContextMenu)|let documenteditor:
DocumentEditor = new DocumentEditor({ enableSelection: true, enableContextMenu: true });|

|ImageResizer| DocumentEditor.Inject(Selection, Editor, ImageResizer)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableImageResizer: true });|

|HyperlinkDialog| DocumentEditor.Inject(Selection, Editor, HyperlinkDialog)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableHyperlinkDialog: true });|

|TableDialog| DocumentEditor.Inject(Selection, Editor, TableDialog)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableTableDialog: true });|

|FontDialog| DocumentEditor.Inject(Selection, Editor, FontDialog)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableFontDialog: true });|

|ParagraphDialog| DocumentEditor.Inject(Selection, Editor, ParagraphDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableParagraphDialog: true });|

|BookmarkDialog| DocumentEditor.Inject(Selection, Editor, BookmarkDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableBookmarkDialog: true });|

|PageSetupDialog| DocumentEditor.Inject(Selection, Editor, PageSetupDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enablePageSetupDialog: true });|

|TableOfContentsDialog| DocumentEditor.Inject(Selection, Editor, TableOfContentsDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableTableOfContentsDialog: true });|
```

```
|ListDialog|DocumentEditor.Inject(Selection, Editor, ListDialog)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableListDialog: true });|
```

```
|TablePropertiesDialog|DocumentEditor.Inject(Selection, Editor, TablePropertiesDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableTablePropertiesDialog: true });|
```

```
|CellOptionsDialog|DocumentEditor.Inject(Selection, Editor, CellOptionsDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableTablePropertiesDialog: true });|
```

```
|BordersAndShadingDialog|DocumentEditor.Inject(Selection, Editor,
BordersAndShadingDialog)|let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false, enableEditor: true, enableBordersAndShadingDialog: true });|
```

```
|TableOptionsDialog|DocumentEditor.Inject(Selection, Editor, TableOptionsDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableTableOptionsDialog: true });|
```

```
|StylesDialog|DocumentEditor.Inject(Selection, Editor, StylesDialog,StyleDialog)|let
documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor:
true, enableStyleDialog: true ,enableStylesDialog: true });|
```

```
|StyleDialog|DocumentEditor.Inject(Selection, Editor, StyleDialog)|let documenteditor:
DocumentEditor = new DocumentEditor({ isReadOnly: false, enableEditor: true,
enableStyleDialog: true });|
```

```
|BulletsAndNumberingDialog|DocumentEditor.Inject(Selection, Editor,
BulletsAndNumberingDialog)|let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false, enableEditor: true, enableStyleDialog: true });|
```

[Import in ##Platform_Name## Document editor control](#)

In Document Editor, the documents are stored in its own format called **Syncfusion Document Text (SFDT)**.

The following example shows how to open SFDT data in Document Editor.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({ });
documenteditor.appendTo('#DocumentEditor');
var sfdt = {
  "sections": [
    {
      "blocks": [
        {
          "inlines": [
            {
              "characterFormat": {
                "bold": true,
                "italic": true
              },
              "text": "Hello World"
            }
          ]
        }
      ]
    }
  ]
}
```

```

    }
  ]
},
"headersFooters": {
}
}
];
};
documenteditor.open(JSON.stringify(sfdt));

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

```

Import document from local machine

The following example shows how to import document from local machine.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({ });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('file_upload').setAttribute('accept', '.sfdt');
document.getElementById("import").addEventListener("click", function () {
  document.getElementById('file_upload').click();
});

```

```

});
document.getElementById('file_upload').addEventListener("change", function
(e) {
    if (e.target.files[0]) {
        var file = e.target.files[0];
        if (file.name.substr(file.name.lastIndexOf('.')) === '.sfdt') {
            var fileReader = new FileReader();
            fileReader.onload = function (e) {
                var contents = e.target.result;
                documenteditor.open(contents);
            };
            fileReader.readAsText(file);
            documenteditor.documentName = file.name.substr(0,
file.name.lastIndexOf('.'));
        }
    }
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

```

Convert word documents into SFDT

You can convert word documents into SFDT format using the .NET Standard library [Syncfusion.EJ2.WordEditor.AspNet.Core](#) by the web API service implementation. This library helps you to convert word documents (.dotx,.docx,.docm,.dot,.doc), rich text format documents (.rtf), and text documents (.txt) into SFDT format.

Note: The Syncfusion Document Editor component's document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application. For more information about [why the document pagination \(page-by-page display\) differs from Microsoft Word](#)

Please refer the following example for converting word documents into SFDT.

```
`ts
import { DocumentEditor } from '@syncfusion/ej2-documenteditor';

// Initialize the Document Editor component.
let documenteditor: DocumentEditor = new DocumentEditor();
documenteditor.appendTo('#DocumentEditor');

document.getElementById('file_upload').setAttribute('accept',
'.dotx,.docx,.docm,.dot,.doc,.rtf,.txt,.xml,.sfdt');

//Open file picker.
document.getElementById("import").addEventListener("click", (): void => {
document.getElementById('file_upload').click();
});

document.getElementById('file_upload').addEventListener("change", (e: any): void => {
if (e.target.files[0]) {
//Get the selected file.
let file = e.target.files[0];
if (file.name.substr(file.name.lastIndexOf('.') != '.sfdt') {
loadFile(file);
}
}
});

function loadFile(file: File): void {
let ajax: XMLHttpRequest = new XMLHttpRequest();
ajax.open('POST', 'https://localhost:4000/api/documenteditor/Import', true);
ajax.onreadystatechange = () => {
if (ajax.readyState === 4) {
if (ajax.status === 200 || ajax.status === 304) {
```

```
//Open SFDT text in Document Editor
documenteditor.open(ajax.responseText);
}
}
}

let formData: FormData = new FormData();
formData.append('files', file);
//Send the selected file to web api for converting it into sfdt.
ajax.send(formData);
}
,
```

Here's how to handle the server-side action for converting word document in to SFDT.

```
`c#
[AcceptVerbs("Post")]
public string Import(Microsoft.AspNetCore.Http.IFormCollection data)
{
    if (data.Files.Count == 0)
        return null;

    System.IO.Stream stream = new System.IO.MemoryStream();
    Microsoft.AspNetCore.Http.IFormFile file = data.Files[0];
    int index = file.FileName.LastIndexOf('.');
    string type = index > -1 && index < file.FileName.Length - 1 ?
    file.FileName.Substring(index) : ".docx";
    file.CopyTo(stream);
    stream.Position = 0;

    Syncfusion.EJ2.DocumentEditor.WordDocument document =
    Syncfusion.EJ2.DocumentEditor.WordDocument.Load(stream, GetFormatType(type.ToLower()));
    string sfdt = Newtonsoft.Json.JsonConvert.SerializeObject(document);
    document.Dispose();
    return sfdt;
}

internal static Syncfusion.EJ2.DocumentEditor.FormatType GetFormatType(string format)
{

```

```

if (string.IsNullOrEmpty(format))
throw new System.NotSupportedException("EJ2 DocumentEditor does not support this file format.");
switch (format.ToLower()) {
case ".dotx":
case ".docx":
case ".docm":
case ".dotm":
return Syncfusion.EJ2.DocumentEditor.FormatType.Docx;
case ".dot":
case ".doc":
return Syncfusion.EJ2.DocumentEditor.FormatType.Doc;
case ".rtf":
return Syncfusion.EJ2.DocumentEditor.FormatType.Rtf;
case ".txt":
return Syncfusion.EJ2.DocumentEditor.FormatType.Txt;
case ".xml":
return Syncfusion.EJ2.DocumentEditor.FormatType.WordML;
default:
throw new System.NotSupportedException("EJ2 DocumentEditor does not support this file format.");
}
}
`

```

To know about server-side action, please refer this [page](#).

Compatibility with Microsoft Word

Syncfusion Document Editor is a minimal viable Word document viewer/editor product for web applications. As most compatible Word editor, the product vision is adding valuable feature sets of Microsoft Word, and not to cover 100% feature sets of Microsoft Word desktop application. You can even see the feature sets difference between Microsoft Word desktop and their Word online application. So kindly don't misunderstand this component as a complete replacement for Microsoft Word desktop application and expect 100% feature sets of it.

How Syncfusion accepts the feature request for Document Editor

Syncfusion accepts new feature request as valid based on feature value and technological feasibility, then plan to implement unsupported features incrementally in future releases in a phase-by-phase manner.

How to report the problems in Document Editor

You can report the problems with displaying, or editing Word documents in Document Editor component through [support forum](#), [Direct-Trac](#), or [feedback portal](#). Kindly share the Word document for replicating the problem easily in minimal time. If you have confidential data, you can replace it and attach the document.

Why the document pagination differs from Microsoft Word

For your understanding about the Word document structure and the workflow of Word viewer/editor components, the Word document is a flow document in which content will not be preserved page by page; instead, the content will be preserved sequentially like a HTML file. Only the Word viewer/editor paginates the content of the Word document page by page dynamically, when opened for viewing or editing and this page-wise position information will not be preserved in the document level (it is Word file format specification standard). Syncfusion Document Editor component also does the same.

At present there is a known technical limitation related to slight difference in text size calculated using HTML element based text measuring approach. Even though the text size is calculated with correct font and font size values, the difference lies; it is as low as 0.00XX to 0. XXXX values compared to that of Microsoft Word application's display. Hence the document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application.

How Syncfusion address the document pagination difference compared to Microsoft Word

The following table illustrates the reasons for pagination (page-by-page display) difference compared to Microsoft Word in your documents and how Syncfusion address it.

Root causes	How is it solved?
Any mistake (wrong behavior handled) in lay outing the supported elements and formatting	Customer can report to Syncfusion support and track the status through bug report link. Syncfusion fixes the bugs in next possible weekly patch release and service pack or main releases.
Font missing in deployment environment	Customer can either report to Syncfusion support and get suggestion or solve it on their own by installing the missing fonts in their deployment environment.
Any unsupported elements or formatting present in your document	Customer can report to Syncfusion support and track the status through feature request link. Syncfusion implements unsupported features incrementally in future releases based on feature importance, customer interest, efforts involved, and technological feasibility. Also, suggests alternate approach for possible cases.
Technical limitation related to framework	For example, there is a known case with slight fractional difference in text size measured using HTML and Microsoft Word's display. Customer can report to Syncfusion support and track the status through feature request link. Syncfusion does research about alternate approaches to overcome the technical limitation/behaviors and process it same as a feature.
>Note: Here the challenge is, time schedule for implementation varies based on the alternate solution and its reliability.

Export in ##Platform_Name## Document editor control

Document Editor exports the document into various known file formats in client-side such as Microsoft Word document (.docx), text document (.txt), and its own format called **Syncfusion Document Text (.sfdt)**.

We are providing two types of save APIs as mentioned below.

API name	Purpose
-----	-----
save(filename,FormatType):void	FormatType: Sfdt or Docx or Txt Creates the document with specified file name and format type. Then, the created file is downloaded in the client browser by default.
saveAsBlob(FormatType):Blob	Creates the document in specified format type and returns the created document as Blob. This blob can be uploaded to your required server, database, or file path.

SFDT export

The following example shows how to export documents in Document Editor as Syncfusion document text (.sfdt).

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  enableSfdtExport: true, enableSelection: true, enableEditor: true,
  isReadOnly: false });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('export').addEventListener('click', function () {
  documenteditor.save('sample', 'Sfdt');
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
documenteditor/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div style="display: inline">
      <button id="export" class="e-control e-btn e-
primary">Save</button>
    </div>
```

```

        <div style="width:100%;height: 100%">
            <!--Element which will render as DocumentEditor -->
            <div id="DocumentEditor"></div>
        </div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Word export

The following example shows how to export the document as Word document (.docx).

Note: The Syncfusion Document Editor component's document pagination (page-by-page display) can't be guaranteed for all the Word documents to match the pagination of Microsoft Word application. For more information about [why the document pagination \(page-by-page display\) differs from Microsoft Word](#)

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
enableWordExport: true, enableSelection: true, enableEditor: true,
isReadOnly: false });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('export').addEventListener('click', function () {
    documenteditor.save('sample', 'Docx');
});

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Text export

The following example shows how to export document as text document (.txt).

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
enableTextExport: true, enableSelection: true, enableEditor: true,
isReadOnly: false });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('export').addEventListener('click', function () {
    documenteditor.save('sample', 'Txt');
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
documenteditor/styles/fabric.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div style="display: inline">
            <button id="export" class="e-control e-btn e-
primary">Save</button>
        </div>
        <div style="width:100%;height: 100%">

```

```

        <!--Element which will render as DocumentEditor -->
        <div id="DocumentEditor"></div>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Export as blob

Document Editor also supports API to store the document into a blob. Refer to the following sample to export document into blob in client-side.

```
`ts
```

```
import { DocumentEditor, FormatType, WordExport, SfdtExport } from '@syncfusion/ej2-
documenteditor';
```

```
//Inject require modules for Export.
```

```
DocumentEditor.Inject(WordExport, SfdtExport);
```

```
let documenteditor: DocumentEditor = new DocumentEditor({ enableSfdtExport: true,
enableWordExport: true, enableTextExport: true });
```

```
documenteditor.appendTo('#DocumentEditor');
```

```
documenteditor.open(sfdt);
```

```
document.getElementById('export').addEventListener('click', () => {
```

```
//Export the current document as Blob object.
```

```
documenteditor.saveAsBlob('Docx').then((exportedDocument: Blob) => {
```

```
// The blob can be processed further
```

```
});
```

```
});
```

```
`
```

For instance, to export the document as Rich Text Format file, implement an ASP.NET MVC web API controller using DocIO library by passing the DOCX blob. Refer to the following code example.

```
`c#
```

```
//API controller for the conversion.
```

```
[HttpPost]
```

```
public HttpResponseMessage ExportAsRtf()
```

```
{
```

```
System.Web.HttpPostedFile data = HttpContext.Current.Request.Files[0];
```

```
//Opens document stream
WordDocument wordDocument = new WordDocument(data.InputStream);
MemoryStream stream = new MemoryStream();
//Converts document stream as RTF
wordDocument.Save(stream, FormatType.Rtf);
wordDocument.Close();
stream.Position = 0;
return new HttpResponseMessage() { Content = new StreamContent(stream) };
}
`
```

In client-side, you can consume this web service and save the document as Rich Text Format (.rtf) file. Refer to the following example.

```
`ts
document.getElementById('export').addEventListener('click', () => {
//Expor the document as Blob object.
documenteditor.saveAsBlob('Docx').then((exportedDocument: Blob) => {
// The blob can be processed further
let formData: FormData = new FormData();
formData.append('fileName', 'sample.docx');
formData.append('data', exportedDocument);
saveAsRtf(formData);
});
});
function saveAsRtf(formData: FormData): void {
//Send the blob object to server to process further.
let httpRequest: XMLHttpRequest = new XMLHttpRequest();
httpRequest.open('POST', '/api/DocumentEditor/ExportAsRtf', true);
httpRequest.onreadystatechange = () => {
if (httpRequest.readyState === 4) {
if (httpRequest.status === 200 || httpRequest.status === 304) {
if (!(!navigator.msSaveBlob)) {
navigator.msSaveBlob(httpRequest.response, 'sample.rtf');
} else {
```

```

let downloadLink: HTMLAnchorElement =
document.createElementNS('http://www.w3.org/1999/xhtml', 'a') as HTMLAnchorElement;
download('sample.rtf', 'rtf', httpRequest.response, downloadLink, 'download' in downloadLink);
}
} else {
console.error(httpRequest.response);
}
}
}
httpRequest.responseType = 'blob';
httpRequest.send(formData);
}
//Download the document in client side.
function download(fileName: string, extension: string, buffer: Blob, downloadLink:
HTMLAnchorElement, hasDownloadAttribute: Boolean): void {
if (hasDownloadAttribute) {
downloadLink.download = fileName;
let dataUrl: string = window.URL.createObjectURL(buffer);
downloadLink.href = dataUrl;
let event: MouseEvent = document.createEvent('MouseEvent');
event.initEvent('click', true, true);
downloadLink.dispatchEvent(event);
setTimeout(() : void => {
window.URL.revokeObjectURL(dataUrl);
dataUrl = undefined;
});
} else {
if (extension !== 'docx' && extension !== 'xlsx') {
let url: string = window.URL.createObjectURL(buffer);
let isPopupBlocked: Window = window.open(url, '_blank');
if (!isPopupBlocked) {
window.location.href = url;
}
}
}
}

```

```
}  
}  
,
```

Server Deployment

Word processor server docker image overview in `##Platform_Name##` Document editor control

The Syncfusion **Word Processor (also known as Document Editor)** is a component with editing capabilities like Microsoft Word. It is used to create, edit, view, and print Word documents. It provides all the common word processing abilities, including editing text; formatting contents; resizing images and tables; finding and replacing text; importing, exporting, and printing Word documents; and using bookmarks and tables of contents.

This Docker image is the predefined Docker container of Syncfusion's Word Processor backend. You can deploy it quickly to your infrastructure.

Word Processor is a commercial product, and it requires a valid license to use it in a production environment ([request license or trial key](#)).

The Word Processor is supported in the JavaScript, Angular, React, Vue, ASP.NET Core, ASP.NET MVC, and Blazor platforms.

Prerequisites

Have [Docker](#) installed in your environment:

- On Windows, install [Docker for Windows](#).
- On macOS, install [Docker for Mac](#).

How to deploy Word Processor Docker image

Step 1: Pull the word-processor-server image from Docker Hub.

```
`console
```

```
docker pull syncfusion/word-processor-server
```

```
,
```

Step 2: Create the docker-compose.yml file with the following code in your file system.

```
`yaml
```

```
version: '3.4'
```

```
services:
```

```
word-processor-server:
```

```
image: syncfusion/word-processor-server:latest
```

```
environment:
```

Provide your license key for activation

SYNCFUSIONLICENSEKEY: YOURLICENSEKEY

ports:

- "6002:80"

Step 3: In a terminal tab, navigate to the directory where you've placed the docker-compose.yml file and execute the following.

```
`console
```

```
docker-compose up
```

Now the Word Processor server Docker instance runs in the localhost with the provided port number <http://localhost:6002>. Open this link in a browser and navigate to the Word Processor Web API control <http://localhost:6002/api/documenteditor>. It returns the default get method response.

```
<!DOCTYPE html>
```

```
<html xmlns="http://www.w3.org/1999/xhtml">
```

```
<head>
```

```
<title>Essential JS 2</title>
```

```
<!-- EJ2 Document Editor dependent material theme -->
```

```
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css" rel='nofollow' />
```

```
<link href="resources/buttons/styles/material.css" rel="stylesheet" type="text/css" rel='nofollow' />
```

```
<link href="resources/inputs/styles/material.css" rel="stylesheet" type="text/css" rel='nofollow' />
```

```

```

```
<link href="resources/dropdowns/styles/material.css" rel="stylesheet" type="text/css" rel='nofollow' />
```

```
<!-- EJ2 DocumentEditor material theme -->
```

```
<link href="resources/documenteditor/styles/material.css" rel="stylesheet" type="text/css"
rel='nofollow' />
```

```
<!-- EJ2 Document Editor dependent scripts -->
```

```
<!-- EJ2 Document Editor script -->
```

```
</head>
```

```
<body>
```

```
<!--element which is going to render-->
<div id='DocumentEditor' style='height:620px'>
</div>
<script>
// Initialize DocumentEditorContainer component.
var documenteditorContainer = new ej.documenteditor.DocumentEditorContainer({ enableToolbar: true
});
//Inject require modules.
ej.documenteditor.DocumentEditorContainer.Inject(ej.documenteditor.Toolbar);
documenteditorContainer.serviceUrl = "http://localhost:6002/api/documenteditor/";
//DocumentEditorContainer control rendering starts
documenteditorContainer.appendTo('#DocumentEditor');
</script>
</body>
</html>
`
```

[How to configure spell checker dictionaries path in Docker compose file](#)

Step 1: In the Docker compose file, mount the local directory as a container volume using the following code.

```
`yaml
version: '3.4'
services:
word-processor-server:
image: syncfusion/word-processor-server:latest
environment:
Provide your license key for activation
SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
volumes:
  • ./data:/app/data

ports:
  • "6002:80"
`
```

This YAML definition binds the data folder that is available in the Docker compose file directory.

Step 2: In the data folder, include the dictionary files (.dic, .aff) and JSON file. The JSON file should contain the language based dictionary file configuration in the following format.

```
`yaml
[
{
  "LanguageID": 1036,
  "DictionaryPath": "fr_FR.dic",
  "AffixPath": "fr_FR.aff",
  "PersonalDictPath": "customDict.dic"
},
{
  "LanguageID": 1033,
  "DictionaryPath": "en_US.dic",
  "AffixPath": "en_US.aff",
  "PersonalDictPath": "customDict.dic"
}
]
```

Note: By default, the json file name should be "spellcheck.json". You can also use different file name by mounting the file name to 'SPELLCHECKJSONFILENAME' attribute in Docker compose file as below,

```
`yaml
version: '3.4'
services:
  word-processor-server:
    image: syncfusion/word-processor-server:latest
    environment:
      Provide your license key for activation
      SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
      SPELLCHECKDICTIONARYPATH: data
      SPELLCHECKJSONFILENAME: spellcheck1.json
    volumes:
      • ./data:/app/data
    ports:
```

- "6002:80"

,

Step 3: For handling the personal dictionary, place an empty .dic file (e.g., customDict.dic file) in the data folder.

Step 4: Provide the configured volume path to the environment variable like in the following in the Docker compose file.

```
`yaml
```

```
version: '3.4'
```

```
services:
```

```
word-processor-server:
```

```
image: syncfusion/word-processo -server:latest
```

```
environment:
```

```
Provide your license key for activation
```

```
SYNCFUSIONLICENSEKEY: YOURLICENSEKEY
```

```
SPELLCHECKDICTIONARYPATH: data
```

```
volumes:
```

- ./data:/app/data

```
ports:
```

- "6002:80"

,

How to copy template Word documents to Docker image

You can copy the required template Word documents into docker container while deploying the docker image to server. You can open these Word documents present in the server by passing the document path (name with relative path) to LoadDocument() web API.

Note: Place the word files in the data folder mentioned in the volumes section(i.e., C:/Docker/Data) of the docker-compose.yml file. All the files present in the folder path (C:/Docker/Data) mentioned in the volumes section of 'docker-compose.yml' file will be copied to the respective folder (/app/Data) of docker container. The Word documents copied to docker container can be processed using the 'LoadDocument' web API.

The following code example shows how to use LoadDocument() API in Document Editor.

```
`ts
```

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height: '590px' });
```

```

DocumentEditorContainer.Inject(Toolbar);
container.created = function () {
var dataContext = this;
var uploadDocument = new FormData();
uploadDocument.append('DocumentName', 'Getting Started.docx');
var baseUrl = 'http://localhost:6002/api/documenteditor/LoadDocument';
var httpRequest = new XMLHttpRequest();
httpRequest.open('POST', baseUrl, true);
httpRequest.onreadystatechange = function () {
if (httpRequest.readyState === 4) {
if (httpRequest.status === 200 || httpRequest.status === 304) {
dataContext.container.documentEditor.open(httpRequest.responseText);
}
}
};
httpRequest.send(uploadDocument);
dataContext.container.documentEditor.spellChecker.languageID = 1033;
};
container.appendTo('#container');
`

```

Refer to these getting started pages to create a Word Processor in [Angular](#), [React](#), [Vue](#), [ASP.NET MVC](#), [ASP.NET Core](#), and [Blazor](#).

How to deploy word processor server docker container in azure app service in
 ##Platform_Name## Document editor control

Prerequisites

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

`

az login

`

Step 1: Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named `documenteditorresourcegroup` in the `eastus` location.

,

```
az group create --name documenteditorresourcegroup --location "East US"
```

,

Step 2: Create an Azure App Service plan.

Create an App Service plan in the resource group with the [az appservice plan create](#) command.

The following example creates an App Service plan named `documenteditorappservice` in the Standard pricing tier (`--sku S1`) and in a Linux container (`--is-linux`).

,

```
az appservice plan create --name documenteditorappservice --resource-group
documenteditorresourcegroup --sku S1 --is-linux
```

,

Step 3: Create a Docker Compose app.

Create a multi-container [web app](#) in the `documenteditorappservice` App Service plan with the [az webapp create](#) command. The following command creates the web app using the provided Docker compose file. Please look into the section for getting started with Docker compose to create the Docker compose file for the Document Editor server and use the created Docker compose file here.

,

```
az webapp create --resource-group documenteditorresourcegroup --plan documenteditorappservice --
name documenteditor-server --multicontainer-config-type compose --multicontainer-config-file
documenteditor-server-compose.yml
```

,

Step 4: Browse to the app.

Browse to the deployed app at `http://<app_name>.azurewebsites.net`, i.e. `http://documenteditor-server.azurewebsites.net`. Browse this link and navigate to the Document Editor Web API control `http://documenteditor-server.azurewebsites.net/api/documenteditor`. It returns the default get method response.

For more information about the app container service, please look deeper into the [Microsoft Azure Container Service](#) for a production-ready setup.

How to deploy word processor server docker container in azure kubernetes service in
##Platform_Name## Document editor control

Prerequisites

- Have [Azure account](#) and [Azure CLI](#) setup in your environment.
- Run the following command to open the Azure login page. Sign into your [Microsoft Azure account](#).

,

```
az login
```

```
,
```

Step 1: Create a resource group.

Create a resource group using the [az group create](#) command.

The following example creates a resource group named `documenteditorresourcegroup` in the `eastus` location.

```
,
```

```
az group create --name documenteditorresourcegroup --location "East US"
```

```
,
```

Step 2: Create AKS cluster.

Use the [az aks create](#) command to create an AKS cluster. The following example creates a cluster named `documenteditorcluster` with one node.

```
,
```

```
az aks create --resource-group documenteditorresourcegroup --name documenteditorcluster --node-count 1
```

```
,
```

Step 3: Connect to the cluster.

Install the [kubectl](#) into the workspace using the following command.

```
,
```

```
az aks install-cli
```

```
,
```

To configure `kubectl` to connect to your Kubernetes cluster, use the [az aks get-credentials](#) command. This command downloads credentials and configures the Kubernetes CLI to use them.

```
,
```

```
az aks get-credentials --resource-group documenteditorresourcegroup --name documenteditorcluster
```

```
,
```

Step 4: Create Kubernetes Services and Deployments

[Kubernetes Services](#) and [Deployments](#) can be configured in a file. To run the Document Editor server, you must define a Service and a Deployment `documenteditorserver`. To do this, create the `documenteditor-server.yml` file in the current directory using the following code.

```
`yaml
```

```
apiVersion: apps/v1
```

```
kind: Deployment
```

```
metadata:
```

```
labels:
```

```
app: documenteditorserver
name: documenteditorserver
spec:
  replicas: 1
  selector:
    matchLabels:
      app: documenteditorserver
  strategy: {}
  template:
    metadata:
      labels:
        app: documenteditorserver
    spec:
      containers:
        - image: syncfusion/word-processor-server:latest

name: documenteditorserver
ports:
  - containerPort: 80

env:
  - name: SYNCFUSIONLICENSEKEY
    value: "YOURLICENSEKEY"
  apiVersion: v1
  kind: Service
  metadata:
    labels:
      app: documenteditorserver
      name: documenteditorserver
  spec:
    ports:
      - port: 80
```

```
targetPort: 80
selector:
app: documenteditorserver
type: LoadBalancer
`
```

Step 5: To create all Services and Deployments needed to run the Document Editor server, execute the following.

```
`console
kubectl create -f ./documenteditor-server.yml
`
```

Run the following command to get the Kubernetes cluster deployed service details and copy the external IP address of the Document Editor service.

```
`console
kubectl get all
`
```

Browse the copied external IP address and navigate to the Document Editor Web API control `http://<external-ip>/api/documenteditor`. It returns the default get method response.

For more details about the Azure Kubernetes service, please look deeper into [Microsoft Azure Kubernetes Service](#) for a production-ready setup.

How to publish documenteditor web api application in azure app service from visual studio in `##Platform_Name##` Document editor control

Prerequisites

- Visual Studio 2017 or 2019.
- An [Azure subscription](#).
- The Document Editor Web API controller application from [here](#).

Make sure you build the project using the Build > Build Solution menu command before following the deployment steps.

Publish to Azure App Service

Step 1: In Solution Explorer, right-click the project and click Publish (or use the Build > Publish menu item).

Step 2: If you have previously configured any publishing profiles, the Publish pane appears, in which case select Create new profile.

Step 3: In the Pick a publish target dialog box, select App Service.

Step 4: Select Publish. The Create App Service dialog box appears. Sign in with your Azure account, if necessary, and then the default app service settings populate the fields.

- [Create a storage account](#)

Clicking the Create button will create the following Azure resources

- Hosting Plan - ej2-documenteditor-server202005141...
- App Service - ej2-documenteditor-server20200514102909

[Export...](#) [Create](#) [Cancel](#)

Step 5: Select Create. Visual Studio deploys the app to your Azure App Service, and the web app loads in your browser with the app name at http://<app_name>.azurewebsites.net (i.e. <http://ej2-documenteditor-server20200514102909.azurewebsites.net>).

Step 6: Navigate to Document Editor Web API control <http://ej2-documenteditor-server20200514102909.azurewebsites.net/api/documenteditor>. It returns the default get method response.

For more information about the app container service, please look deeper into the [Microsoft Azure App Service](#) for a production-ready setup.

How to deploy documenteditor java web api in azure in ##Platform_Name## Document editor control

Prerequisites

Have [Azure account](#) and [Azure CLI](#) setup in your environment.

You can get the example [web service project from GitHub](#) and then perform the following steps to create the packages and host in azure app service.

Step 1: Clean the package using following command.

```
`console
mvn clean package
`
```

Step 2: Run the application locally using following command.

```
`console
```

```
mvn spring-boot:run
```

```
,
```

Step 3: Build the package using following command.

```
`console
```

```
mvn package
```

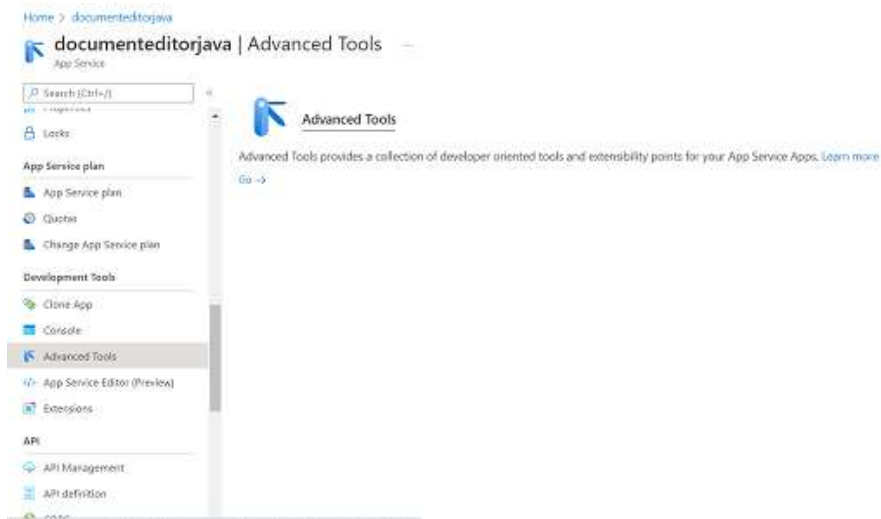

```
,
```

Above package generation command creates the **tomcat-0.0.1-SNAPSHOT.war** in the below location in the sample folder.

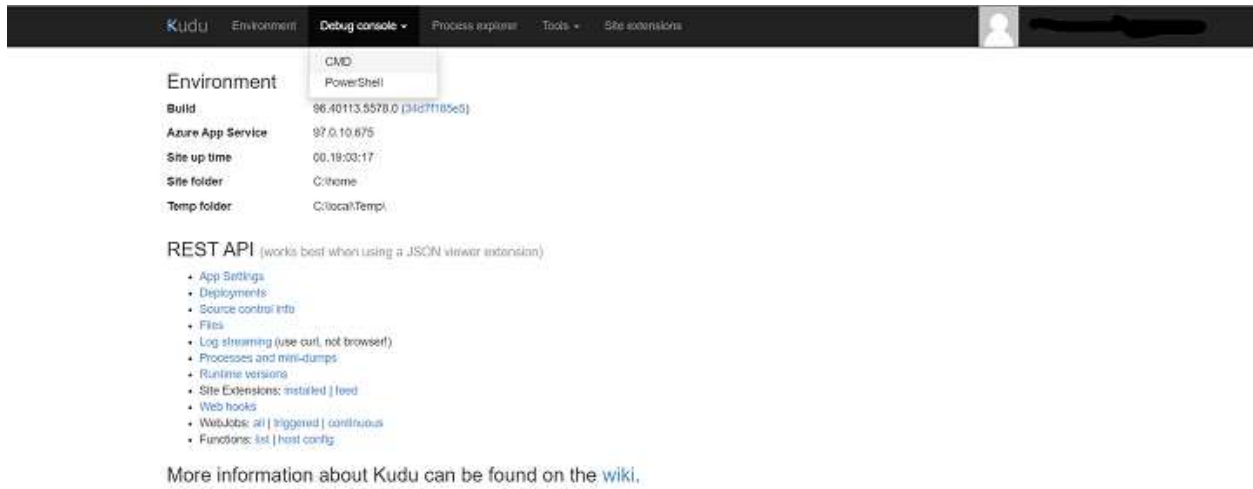

target/tomcat-0.0.1-SNAPSHOT.war

Step 4: Create a Azure app service with Java & Tomcat. For example, create the app services name as **documenteditorjava**.

Step 5: After creating app service, navigate to **Advanced Tools** options under **Development Tools**.

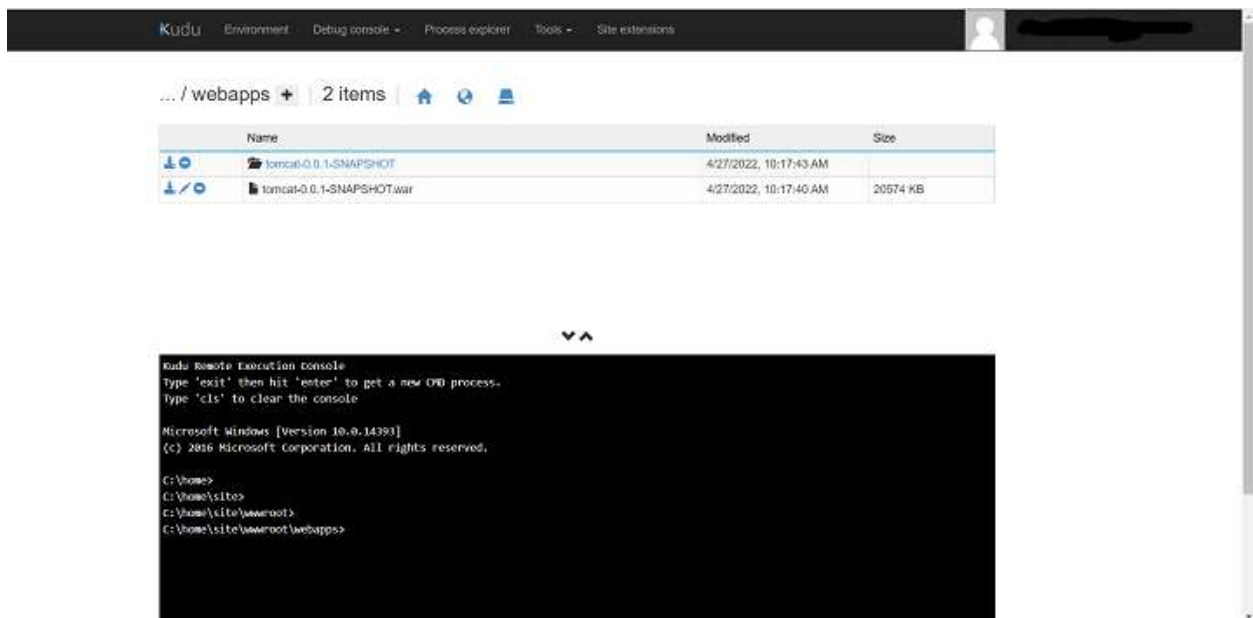

Then, click **Go** and select the **CMD** options under **Debug console**.

Step 6: Once the file manager is opened, please navigate to

site -> wwwroot -> webapps

Step 7: Now, upload the generated war file `tomcat-0.0.1-SNAPSHOT.war`. Uploaded war file gets extracted automatically, it will be uploaded like below:

Step 8: Browse to the app.

Browse to the deployed app at `http://<app_name>.azurewebsites.net`, i.e. `http://documenteditorjava.azurewebsites.net`. Browse this link and it navigates to the Document Editor Web API control `http://documenteditorjava.azurewebsites.net/tomcat-0.0.1-SNAPSHOT`. It returns the default get method response.

Accessibility in Angular Document editor component

The accessibility compliance for the Document editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

Keyboard interaction

Document editor supports [keyboard shortcuts](#).

Ensuring accessibility

The Document editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Document editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Document editor component with accessibility tools.

- [Accessibility in Syncfusion Angular components](#)

Image in ##Platform_Name## Document editor control

Document Editor supports common raster format images like PNG, BMP, JPEG, SVG and GIF. You can insert an image file or online image in the document using the [insertImage\(\)](#) method. Refer to the following sample code.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false,
  enableEditor: true,
  enableSection: true,
  enableImageResizer: true,
  enableEditorHistory: true
});
documenteditor.appendTo('#DocumentEditor');
//Insert Image From URL with alternate text
documenteditor.editor.insertImage('https://cdn.syncfusion.com/content/images/Logo/Logo_Black_72dpi_without.png', 200, 200, 'Syncfusion');
document.getElementById('insert-picture').addEventListener('click', () => {
  var pictureUpload = document.getElementById("insertImageButton");
  pictureUpload.value = '';
  pictureUpload.click();
});
document.getElementById('insertImageButton').addEventListener('change',
onInsertImage);
function onInsertImage(args) {
  if (navigator.userAgent.match('Chrome') ||
  navigator.userAgent.match('Firefox') || navigator.userAgent.match('Edge') ||
  navigator.userAgent.match('MSIE') || navigator.userAgent.match('.NET')) {
    if (args.target.files[0]) {
      var path = args.target.files[0];
      var reader = new FileReader();
      reader.onload = function (frEvent) {
        var base64String = frEvent.target.result;
        var image = document.createElement('img');
        image.addEventListener('load', function () {
          documenteditor.editor.insertImage(base64String,
this.width, this.height);
        })
        image.src = base64String;
      };
      reader.readAsDataURL(path);
    }
    //Safari does not Support FileReader Class
  } else {
    var image = document.createElement('img');
    image.addEventListener('load', function () {
```

```

        documenteditor.editor.insertImage(args.target.value);
    })
    image.src = args.target.value;
}
}

```

INDEX.HTML

```

<script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: 1. Image files will be internally converted to base64 string. Whereas, online images are preserved as URL. N> 2. EMF and WMF images can't be inserted, but these types of images will be preserved in Document Editor when using ASP.NET MVC Web API.

Alternate text

Document Editor expose API to get or set the alternate text of the selected image. Refer to the following sample code.

```
`ts
```

```
documenteditor.selection.imageFormat.alternateText = 'Adventure Cycle';
```

```
,
```

Image resizing

Document Editor provides built-in image resizer that can be injected into your application based on the requirements. This allows you to resize the image by dragging the resizing points using mouse or touch interactions. This resizer appears as follows.

Changing size

Document Editor expose API to get or set the size of the selected image. Refer to the following sample code.

```
`ts
```

```
documenteditor.selection.imageFormat.width = 800;
```

```
documenteditor.selection.imageFormat.height = 800;
```

```
,
```

Note: Images are stored and processed(read/write) as base64 string in DocumentEditor. The online image URL is preserved as a URL in DocumentEditor upon saving.

Text wrapping style

Text wrapping refers to how images fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

Positioning the image

DocumentEditor preserves the position properties of the image and displays the image based on position properties. It does not support modifying the position properties. Whereas the image will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

Shapes in ##Platform_Name## Document editor control

Shapes are drawing objects that include a text box, rectangles, lines, curves, circles, etc. It can be preset or custom geometry. At present, DocumentEditor does not have support to insert shapes. however, if the document contains a shape while importing, it will be preserved properly.

Supported shapes

The DocumentEditor has preservation support for Text box, Rectangle, Rounded Rectangle and Line shapes.

Note: When using ASP.NET MVC service, the unsupported shapes will be converted as image and preserved as image.

Text box Shape

A text box is a rectangular area on the document where you can enter text. When you click in a text box, a flashing cursor will display indicating that you can begin typing. It allows you to enter multiple lines of text with all text formatting.

Adventure Works Cycles, the fictitious company on which the Adventure Works sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal  and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams are located throughout their market base.

Shape Resizer

The DocumentEditor also supports a built-in shape resizer to resize the shapes present in the document. The shape resizer accepts both touch and mouse interactions.

Text wrapping style

Text wrapping refers to how shapes fit with surrounding text in a document. Please [refer to this page](#) for more information about text wrapping styles available in Word documents.

Positioning the shape

DocumentEditor preserves the position properties of the shape and displays the shape based on position properties. It does not support modifying the position properties. Whereas the shape will be automatically moved along with text edited if it is positioned relative to the line or paragraph.

Text wrapping style in ##Platform_Name## Document editor control

Text wrapping refers to how images and shapes are fit with surrounding text in a document. Currently, DocumentEditor has only preservation support for image and textbox shape with below wrapping styles.

In-Line with Text

In this option, the image or shape is placed on the same line surrounding with text like any other word or letter. This image or shape will be automatically moved along with the text while editing, whereas the other options denote that the image or shape stays in a fixed position while the text shifts and wraps around it.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company

manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in

In Front of Text

In this option, the image or shape is placed in front of the text. This can be used to place an image around some text or to add shape to highlight the part in a paragraph.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams and manufacturer and located and shipped in throughout their market base.

Note: Starting from v18.2.0.x, the in front of wrapping styles are supported.

Top and Bottom

In this option, Text wraps above and below the image or shape. No text is to the left or right of the image or shape. This can be used for larger images or shapes that occupy most of the width in a document.

Note: Starting from v19.1.0.x, the top and bottom wrapping style is supported.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company

manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290

Behind

In this option, the image or shape is placed behind the text. This can be used when you need to add a watermark or background image to a document.

Adventure Works Cycles, the fictitious company on which the AdventureWorks sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal and composite bicycles to North American, European and Asian commercial markets. While its base operation is located in Bothell, Washington with 290 employees, several regional sales teams and manufacturer and located and shipped in throughout their market base.

Note: Starting from v19.2.0.x, behind text wrapping styles are supported.

Square

In this option, Text wraps around the image or text box in a square shape.

Note: Tight and Through styles will be preserved as square wrapping style in DocumentEditor which is supported from v19.2.0.x.

Adventure Works Cycles, the fictitious company on which the Adventure Works sample databases are based, is a large, multinational manufacturing company. The company manufactures and sells metal North American, European and While its base operation is with 290 employees, several regional sales teams are located throughout their market base.

Adventure works cycles company.

Bookmark in ##Platform_Name## Document editor control

Bookmark is a powerful tool that helps you to mark a place in the document to find again easily. You can enter many bookmarks in the document and give each one a unique name to identify easily.

Document Editor provides built-in dialog to add, delete, and navigate bookmarks within the document. To add a bookmark, select a portion of text in the document. After that, jump to the location or add links to it within the document using built-in hyperlink dialog. You can also delete bookmarks from a document.

Bookmark names need to begin with a letter. They can include both numbers and letters, but not spaces. To separate the words, use an underscore.

Bookmark names starting with an underscore are called hidden bookmarks. For example, bookmarks generated for table of contents.

Add bookmark

Using [insertBookmark](#) method, Bookmark can be added to the selected text.

```
`c#
```

```
container.documentEditor.editor.insertBookmark("Bookmark1");
```

```
,
```

Select Bookmark

You can select the bookmark in the document using [selectBookmark](#) method by providing Bookmark name to select as shown in the following code snippet.

```
`c#
```

```
container.documentEditor.selection.selectBookmark("Bookmark1", true);
```

```
,
```

Note: Second parameter is optional parameter and it denotes is exclude bookmark start and end from selection. If true, excludes bookmark start and end from selection.

Delete Bookmark

You can delete bookmark in the document using [deleteBookmark](#) method as shown in the following code snippet.

```
`c#
```

```
container.documentEditor.editor.deleteBookmark("Bookmark1");
```

```
,
```

Get Bookmark from document

You can get all the bookmarks in the document using [getBookmarks](#) method as shown in the following code snippet.

```
`c#
container.documentEditor.getBookmarks(false);
`
```

Note: Parameter denotes is include hidden bookmarks. If false, ignore hidden bookmark.

Get Bookmark from selection

You can get bookmarks in current selection in the document using [getBookmarks](#) method as shown in the following code snippet.

```
`c#
container.documentEditor.selection.getBookmarks(false);
`
```

Replace bookmark content

You can replace bookmark content without removing the bookmark start and end for backtracking the bookmark content.

```
`c#
container.documentEditor.selection.selectBookmark("Bookmark1", true);
container.documentEditor.editor.insertText('Hello World')
`
```

You can replace content by removing the bookmark start and end, thus the bookmark content can't be tracked in future.

```
`c#
container.documentEditor.selection.selectBookmark("Bookmark1");
container.documentEditor.editor.insertText('Hello World')
`
```

Show or Hide bookmark

You can show or hide the show square brackets around bookmarked items in Document editor component.

The following example code illustrates how to show or hide square brackets around bookmarked items.

```
`ts
container.documentEditorSettings.showBookmarks = true;
`
```

Bookmark Dialog

The following example shows how to open bookmark dialog in Document Editor.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
enableBookmarkDialog: true, enableSelection: true, enableEditor: true,
isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
    documenteditor.showDialog('Bookmark');
});

```

Link in ##Platform_Name## Document editor control

Document Editor supports hyperlink field. You can link a part of the document content to Internet or file location, mail address, or any text within the document.

Navigate a hyperlink

Document Editor triggers 'requestNavigate' event whenever user clicks Ctrl key or tap a hyperlink within the document. This event provides necessary details about link type, navigation URL, and local URL (if any) as arguments, and allows you to easily customize the hyperlink navigation functionality.

Add the requestNavigate event for DocumentEditor

The following example illustrates how to add requestNavigate event for DocumentEditor.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({ enableSelection:
true });
documenteditor.appendTo('#DocumentEditor');
documenteditor.requestNavigate = (args) => {
    if (args.linkType !== 'Bookmark') {
        var link = args.navigationLink;
        if (args.localReference.length > 0) {
            link += '#' + args.localReference;
        }
        window.open(link);
        args.isHandled = true;
    }
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
documenteditor/styles/fabric.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>

```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="DocumentEditor">

            </div>
        </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Add the requestNavigate event for DocumentEditorContainer component

The following example illustrates how to add requestNavigate event for DocumentEditorContainer component.

`ts

```
import { DocumentEditor, SfddExport, Selection, RequestNavigateEventArgs } from '@syncfusion/ej2-
documenteditor';
```

```
let hostUrl: string =
```

```
'https://ej2services.syncfusion.com/production/web-services/';
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({
```

```
enableToolbar: true,
```

```
height: '590px',
```

```
});
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
container.serviceUrl = hostUrl + 'api/documenteditor/';
```

```
container.appendTo('#container');
```

```
// Add event listener for requestNavigate event to customize hyperlink navigation functionality
```

```
container.documentEditor.requestNavigate = (args: RequestNavigateEventArgs) => {
```

```
if (args.linkType !== 'Bookmark') {
```

```
let link: string = args.navigationLink;
```

```
if (args.localReference.length > 0) {
```

```
link += '#' + args.localReference;
```

```
}
```

```
//Navigate to the selected URL.
```

```

window.open(link);
args.isHandled = true;
}
};
`

```

If the selection is in hyperlink, trigger this event by calling 'navigateHyperlink' method of 'Selection' instance. Refer to the following example.

```

`ts
documenteditor.selection.navigateHyperlink();
`

```

Copy link

Document Editor copies link text of a hyperlink field to the clipboard if the selection is in hyperlink. Refer to the following example.

```

`ts
documenteditor .selection.copyHyperlink();
`

```

Add hyperlink

To create a basic hyperlink in the document, press **ENTER** / **SPACEBAR** / **SHIFT + ENTER** / **TAB** key after typing the address, for instance <http://www.google.com>. Document Editor automatically converts this address to a hyperlink field. The text can be considered as a valid URL if it starts with any of the following.

```

`http://`<br>
`https://`<br>
file:///<br>
www.<br>
mailto:<br>

```

Refer to the following example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({ enableSelection:
true, isReadOnly: false, enableEditor: true });
documenteditor.appendTo('#DocumentEditor');
documenteditor.requestNavigate = (args) => {
  if (args.linkType !== 'Bookmark') {
    var link = args.navigationLink;
    if (args.localReference.length > 0) {
      link += '#' + args.localReference;
    }
    window.open(link);
    args.isHandled = true;
  }
}

```

```
}
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
documenteditor/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="DocumentEditor">

      </div>
    </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Also Document Editor expose API [insertHyperlink\(\)](#) to insert hyperlink.

Refer to the following sample code.

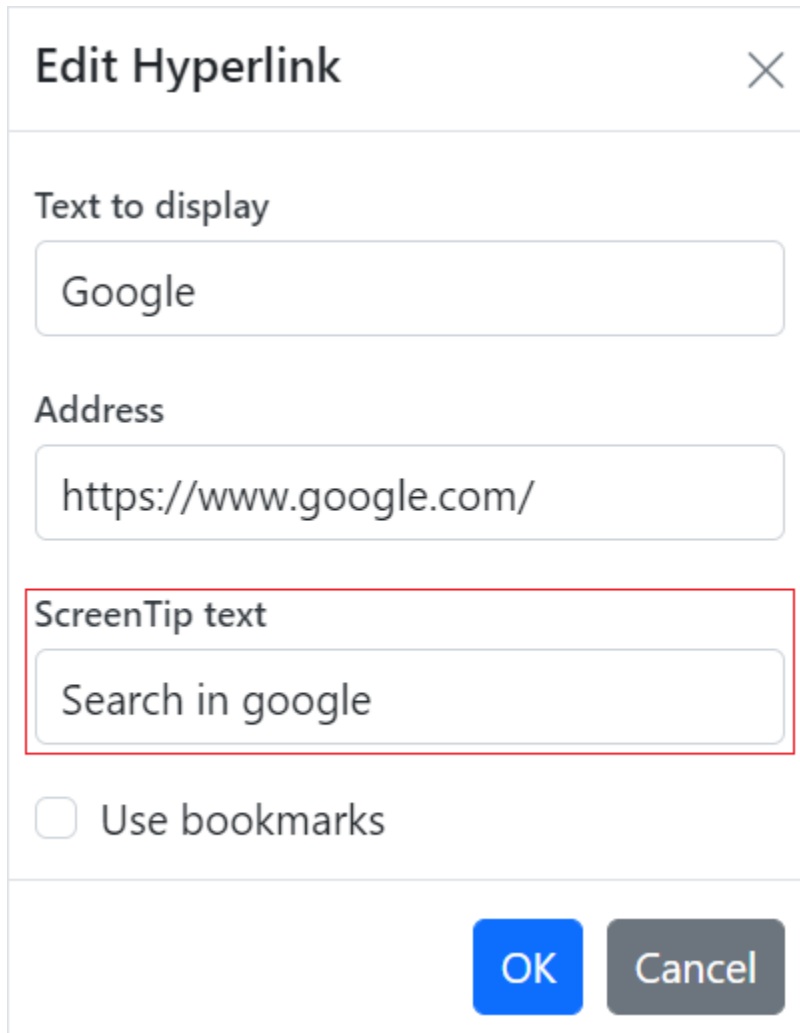

```
`ts
documenteditor.insertHyperlink('https://www.google.com', 'Google');
`
```

Customize screen tip

You can customize the screen tip text for the hyperlink by using below sample code.

```
`ts
documenteditor.insertHyperlink('https://www.google.com', 'Google', '<<Screen tip text>>');
`
```

Screen tip text can be modified through UI by using the [Hyperlink dialog](#)

Remove hyperlink

To remove link from hyperlink in the document, press Backspace key at the end of a hyperlink. By removing the link, it will be converted as plain text. You can use 'removeHyperlink' method of 'Editor' instance if the selection is in hyperlink. Refer to the following example.

`ts

```
documenteditor.editor.removeHyperlink();
```

,

Hyperlink dialog

Document Editor provides dialog support to insert or edit a hyperlink. Refer to the following example.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  enableHyperlinkDialog: true, enableSelection: true, enableEditor: true,
  isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
  documenteditor.showDialog('Hyperlink');
});
```

Table in `##Platform_Name##` Document editor control

Tables are an efficient way to present information. Document Editor can display and edit the tables. You can select and edit tables through keyboard, mouse, or touch interactions. Document Editor exposes a rich set of APIs to perform these operations programmatically.

Create a table

You can create and insert a table at cursor position by specifying the required number of rows and columns.

Refer to the following sample code.

```
`ts
documentedior.editor.insertTable(3,3);
`
```

The maximum size of row and column is limited to 32767 and 63 respectively.

Insert rows

You can add a row (or several rows) above or below the row at cursor position by using the [insertRow](#) method. This method accepts the following parameters:

Parameter	Type	Description
left(optional)	boolean	This is optional and if omitted, it takes the value as false and inserts to the right of column at cursor position.
count(optional)	number	This is optional and if omitted, it takes the value as 1.

Refer to the following sample code.

```
`ts
//Insert a column to the right of the column at cursor position.
documentedior.editor.insertColumn();
//Insert a column to the left of the column at cursor position.
documentedior.editor.insertColumn(false);
//Insert two columns to the left of the column at cursor position.
documentedior.editor.insertColumn(false, 2);
`
```

Select an entire table

If the cursor position is inside a table, you can select the entire table by using the following sample code.

```
`ts
documenteditor.selection.selectTable();
`
```

Select row

You can select the entire row at cursor position by using the following sample code.

```
`ts
documenteditor.selection.selectRow();
`
```

If current selection spans across cells of different rows, all these rows will be selected.

Select column

You can select the entire column at cursor position by using the following sample code.

```
`ts
documenteditor.selection.selectColumn();
`
```

If current selection spans across cells of different columns, all these columns will be selected.

Select cell

You can select the cell at cursor position by using the following sample code.

```
`ts
documenteditor.selection.selectCell();
`
```

Delete table

Document Editor allows you to delete the entire table. You can use the [deleteTable\(\)](#) method of editor instance, if selection is in table. Refer to the following sample code.

```
`ts
documenteditor.editor.deleteTable();
`
```

Delete row

Document Editor allows you to delete the selected number of rows. You can use the [deleteRow\(\)](#) method of editor instance to delete the selected number of rows, if selection is in table. Refer to the following sample code.

```
`ts
documenteditor.editor.deleteRow();
`
```

Delete column

Document Editor allows you to delete the selected number of columns. You can use the [deleteColumn\(\)](#) method of editor instance to delete the selected number of columns, if selection is in table. Refer to the following sample code.

```
`ts
documenteditor.editor.deleteColumn();
`
```

Merge cells

You can merge cells vertically, horizontally, or combination of both to a single cell. To vertically merge the cells, the columns within selection should be even in left and right directions. To horizontally merge the cells, the rows within selection should be even in top and bottom direction.

Refer to the following sample code.

```
`ts
documenteditor.editor.mergeCells()
`
```

Positioning the table

Document Editor preserves the position properties of the table and displays the table based on position properties. It does not support modifying the position properties. Whereas the table will be automatically moved along with text edited if it is positioned relative to the paragraph.

How to work with tables

The following sample demonstrates how to delete the table row or columns, merge cells and how to bind the API with button.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false,
  enableSelection: true,
  enableEditorHistory: true,
  enableEditor: true,
  enableTableDialog: true,
  enableContextMenu: true,
  enableSfdtExport: true,
  height: '370px'
});
function toolbarButtonClick(arg) {
  switch (arg.item.id) {
    case 'table':
      //Insert table API to add table
      documenteditor.editor.insertTable(3, 2);
      break;
    case 'insert_above':
      //Insert the specified number of rows to the table above to the row at
      //cursor position
      documenteditor.editor.insertRow(true, 2);
      break;
    case 'insert below':
```

```

        //Insert the specified number of rows to the table below to the row at
        cursor position
        documenteditor.editor.insertRow();
        break;
    case 'insert_left':
        //Insert the specified number of columns to the table left to the
        column at cursor position
        documenteditor.editor.insertColumn(true, 2);
        break;
    case 'insert_right':
        //Insert the specified number of columns to the table right to the
        column at cursor position
        documenteditor.editor.insertColumn();
        break;
    case 'delete_table':
        //Delete the entire table
        documenteditor.editor.deleteTable();
        break;
    case 'delete_row':
        //Delete the selected number of rows
        documenteditor.editor.deleteRow();
        break;
    case 'delete_column':
        //Delete the selected number of columns
        documenteditor.editor.deleteColumn();

Table of contents in ##Platform_Name## Document editor control

The table of contents in a document is same as the list of chapters at the beginning of a book. It lists each heading in the document and the page number, where that heading starts with various options to customize the appearance.

Inserting table of contents

Document Editor exposes an API to insert table of contents at cursor position programmatically. You can specify the settings for table of contents explicitly. Otherwise, the default settings will be applied.

[TableOfContentsSettings](#) contain the following properties:

- **startLevel:** Specifies the start level for constructing table of contents.
- **endLevel:** Specifies the end level for constructing table of contents.
- **includeHyperlink:** Specifies whether the link for headings is included.
- **includePageNumber:** Specified whether the page number of the headings is included.
- **rightAlign:** Specifies whether the page number is right aligned.
- **tabLeader:** Specifies the tab leader styles such as none, dot, hyphen, and underscore.
- **includeOutlineLevels:** Specifies whether the outline levels are included.

The following code illustrates how to insert table of content in Document Editor.

```
`ts
```

```
let tocSettings: TableOfContentsSettings =
```

```
{
```

```
startLevel: 1, endLevel: 3, includeHyperlink: true, includePageNumber: true, rightAlign: true
```

```
};
```

```
//Insert table of contents in Document Editor.
```

```
editor.editorModule.insertTableOfContents(tocSettings);
```

```
`
```

INDEX.TS

</body></html>
```

Update or edit table of contents

You can update or edit the table of contents using the built-in context menu shown up by right-clicking it. Refer to the following screenshot.

- **Update Field:** Updates the headings in table of contents with same settings by searching the entire document.
- **Edit Field:** Opens the built-in table of contents dialog and allows you to modify its settings.

You can also do it programmatically by using the exposed API. Refer to the following sample code.

```
`ts
let documentEditor: DocumentEditor = new DocumentEditor({ enableEditor: true, isReadOnly: false,
enableSelection: true });
documentEditor.appendTo('#DocumentEditor');
/Open any existing document/
editor.open("");
//Table of contents settings.
let tocSettings: TableOfContentsSettings =
{
startLevel: 1, endLevel: 3, includeHyperlink: true, includePageNumber: true, rightAlign: true
};
//Insert table of contents in Document Editor.
editor.editorModule.insertTableOfContents(tocSettings);
`
```

Same method is used for inserting, updating, and editing table of contents. This will work based on the current element at cursor position and the optional settings parameter. If table of contents is present at cursor position, the update operation will be done based on the optional settings parameter. Otherwise, the insert operation will be done.

Header footer in ##Platform_Name## Document editor control

Document Editor supports headers and footers in its document. Each section in the document can have the following types of headers and footers:

- First page: Used only on the first page of the section.
- Even pages: Used on all even numbered pages in the section.
- Default: Used on all pages of the section, where first or even pages are not applicable or not specified.

You can define this by setting format properties of the corresponding section using the following sample code.

```
`ts
//Defines whether different header footer is required for first page of the section
documenteditor.selection.sectionFormat.differentFirstPage = true;
//Defines whether different header footer is required for odd and even pages in the section
```

```
documenteditor.selection.sectionFormat.differentOddAndEvenPages = true;
```

```
,
```

[Go to header footer region](#)

Double click in header or footer region to move the selection into it. You can also do this by using the following code.

```
`ts
```

```
documenteditor.selection.goToHeader();
```

```
,
```

```
`ts
```

```
documenteditor.selection.goToFooter();
```

```
,
```

[Header and footer distance](#)

You can define the distance of header region content from the top of the page. Refer to the following sample code.

```
`ts
```

```
documenteditor.selection.sectionFormat.headerDistance= 36;
```

```
,
```

Same way, you can define the distance of footer region content from the bottom of the page. Refer to the following sample code.

```
`ts
```

```
documenteditor.selection.sectionFormat.footerDistace=36;
```

```
,
```

[Close header footer region](#)

Move the selection to the document body from header or footer region by double clicking or tapping the document area. You can also perform this by using the following sample code.

```
`ts
```

```
documenteditor.selection.closeHeaderFooter()
```

```
,
```

[Link to previous](#)

Link to previous is enabled by default when document has more than one section. If you're using different headers and footers such as different first page or different odd and even pages, they can't be linked together because they're all separate.

Before setting or getting the link to previous value, use the '[goToHeader](#)' or '[goToFooter](#)' API to move the current selection to the header or footer region.

You can get or set the default header footer link to previous value of a section at cursor position by using the following sample code.

```
container.documentEditor.selection.sectionFormat.oddPageHeader.linkToPrevious = false;
```

```
container.documentEditor.selection.sectionFormat.oddPageFooter.linkToPrevious = false;
`ts
```

In case the document has different header and footer types, such as different first page, odd, and even pages.

// Different first page

```
container.documentEditor.selection.sectionFormat.firstPageHeader.linkToPrevious = false;
```

```
container.documentEditor.selection.sectionFormat.firstPageFooter.linkToPrevious = false;
```

//Even page

```
container.documentEditor.selection.sectionFormat.evenPageHeader.linkToPrevious = false;
```

```
container.documentEditor.selection.sectionFormat.evenPageFooter.linkToPrevious = false;
```

`ts

Note: When there is more than one section in the document, the Link to Previous option becomes available. By default, this feature is disabled state in UI and set to return false for the first section.

- [Working with Section Formatting](#)

Text format in ##Platform_Name## Document editor control

Document Editor supports several formatting options for text like bold, italic, font color, highlight color, and more. This section describes how to modify the formatting for selected text in detail.

Bold

The bold formatting for selected text can be get or set by using the following sample code.

```
`ts
```

```
//Gets the value for bold formatting of selected text.
```

```
let bold : boolean = documenteditor.selection.characterFormat.bold;
```

```
//Sets bold formatting for selected text.
```

```
documenteditor.selection.characterFormat.bold = true;
```

`ts

You can toggle the bold formatting based on existing value at selection. Refer to the following sample code.

```
`ts
```

```
documenteditor.editor.toggleBold();
```

`ts

Italic

The Italic formatting for selected text can be get or set by using the following sample code.

```
`ts
```

```
//Gets the value for italic formatting of selected text.
let italic : boolean = documenteditor.selection.characterFormat.italic;
//Sets italic formatting for selected text.
documenteditor.selection.characterFormat.italic = true|false;
`ts
```

You can toggle the Italic formatting based on existing value at selection. Refer to the following sample code.

```
`ts
documenteditor.editor.toggleItalic();
`ts
```

Underline property

The underline style for selected text can be get or set by using the following sample code.

```
`ts
//Gets the value for underline formatting of selected text.
let underline : Underline = documenteditor.selection.characterFormat.underline;
//Sets underline formatting for selected text.
documenteditor.selection.characterFormat.underline = 'Single' | 'None';
`ts
```

You can toggle the underline style of selected text based on existing value at selection by specifying a value. Refer to the following sample code.

```
`ts
documenteditor.editor.toggleUnderline('Single');
`ts
```

Strikethrough property

The strikethrough style for selected text can be get or set by using the following sample code.

```
`ts
//Gets the value for strikethrough formatting of selected text.
let strikethrough : Strikethrough = documenteditor.selection.characterFormat.strikethrough;
//Sets strikethrough formatting for selected text.
documenteditor.selection.characterFormat.strikethrough = 'Single' | 'Normal';
`ts
```

You can toggle the strikethrough style of selected text based on existing value at selection by specifying a value. Refer to the following sample code.

```
`ts
documenteditor.editor.toggleStrikethrough();
`ts
```

,

Superscript property

The selected text can be made superscript by using the following sample code.

```
`ts
//Gets the value for baselineAlignment formatting of selected text.
let baselineAlignment : BaselineAlignment =
documenteditor.selection.characterFormat.baselineAlignment;
//Sets baselineAlignment formatting for selected text.
documenteditor.selection.characterFormat.baselineAlignment = 'Superscript';
```

,

Toggle the selected text as superscript or normal using the following sample code.

```
`ts
documenteditor.editor.toggleSuperscript();
```

,

Subscript property

The selected text can be made subscript by using the following sample code.

```
`ts
//Gets the value for baselineAlignment formatting of selected text.
let baselineAlignment : BaselineAlignment =
documenteditor.selection.characterFormat.baselineAlignment;
//Sets baselineAlignment formatting for selected text.
documenteditor.selection.characterFormat.baselineAlignment = 'Subscript';
```

,

Toggle the selected text as subscript or normal using the following sample code.

```
`ts
documenteditor.editor.toggleSubscript();
```

,

You can make a subscript or superscript text as normal using the following code.

```
`ts
documenteditor.selection.characterFormat.baselineAlignment = 'Normal';
```

,

Size

The size of selected text can be get or set using the following code.

```
`ts
//Gets the value for fontSize formatting of selected text.
```

```
let fontSize : number = documenteditor.selection.characterFormat.fontSize;
//Sets fontSize formatting for selected text.
documenteditor.selection.characterFormat.fontSize = 32;
`ts
```

Color

The color of selected text can be get or set using the following code.

```
`ts
//Gets the value for fontColor formatting of selected text.
let fontColor : string = documenteditor.selection.characterFormat.fontColor;
//Sets fontColor formatting for selected text.
documenteditor.selection.characterFormat.fontColor = 'Pink';
documenteditor.selection.characterFormat.fontColor = '#FFC0CB';
`ts
```

Font

The font style of selected text can be get or set using the following sample code.

```
`ts
//Gets the value for fontFamily formatting of selected text.
let baselineAlignment : string = documenteditor.selection.characterFormat.fontFamily;
//Sets fontFamily formatting for selected text.
documenteditor.selection.characterFormat.fontFamily = 'Arial';
`ts
```

Highlight color

The highlight color of the selected text can be get or set using the following sample code.

```
`ts
//Gets the value for highlightColor formatting of selected text.
let highlightColor : HighlightColor = documenteditor.selection.characterFormat.highlightColor;
//Sets highlightColor formatting for selected text.
documenteditor.selection.characterFormat.highlightColor = 'Pink';
documenteditor.selection.characterFormat.highlightColor = '#FFC0CB';
`ts
```

Note: 1. Character scaling and spacing present in the input Word document will be preserved in the exported Word document. N> 2. Scaling is implemented using the letterSpacing property, which may present compatibility problems. For more information, please refer to this [link](#)

Toolbar with options for text formatting

Refer to the following example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({ isReadOnly:
false, enableSelection: true, enableEditorHistory: true, enableEditor: true,
enableSfdtExport: true });
function toolbarButtonClick(arg) {
    switch (arg.item.id) {
        case 'bold':
            //Toggles the bold of selected content
            documenteditor.editor.toggleBold();
            break;
        case 'italic':
            //Toggles the Italic of selected content
            documenteditor.editor.toggleItalic();
            break;
        case 'underline':
            //Toggles the underline of selected content
            documenteditor.editor.toggleUnderline('Single');
            break;
        case 'strikethrough':
            //Toggles the strikethrough of selected content
            documenteditor.editor.toggleStrikethrough();
            break;
        case 'subscript':
            //Toggles the subscript of selected content
            documenteditor.editor.toggleSubscript();
            break;
        case 'superscript':
            //Toggles the superscript of selected content
            documenteditor.editor.toggleSuperscript();
            break;
    }
}
//To change the font Style of selected content

Paragraph format in ##Platform_Name## Document editor control

Document Editor supports various paragraph formatting options such as text alignment, indentation, paragraph spacing, and more.

Indentation

You can modify the left or right indentation of selected paragraphs using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.leftIndent = 24;
```

```
documenteditor.selection.paragraphFormat.rightIndent = 24;
```

```
,
```

Special indentation

You can define special indent for first line of the paragraph using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.firstLineIndent = 24;
```

```
,
```

Increase indent

You can increase the left indent of selected paragraphs by a factor of 36 points using the following sample code.

```
`ts
```

```
documenteditor.editor.increaseIndent()
```

```
,
```

Decrease indent

You can decrease the left indent of selected paragraphs by a factor of 36 points using the following sample code.

```
`ts
```

```
documenteditor.editor.decreaseIndent()
```

```
,
```

Text alignment

You can get or set the text alignment of selected paragraphs using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.textAlignment = 'Center' | 'Left' | 'Right' | 'Justify';
```

```
,
```

Note: Starting from v19.4.0.x, the text justification of Document editor component matches alignment of Microsoft Word 2013 and newer versions based on the compatibility mode present in the document. The DOCX document created using Microsoft Word 2013 and newer versions will have the compatibility mode **Word2013** and follows a special behavior in justifying the text. You can retain the text justification behavior like old versions by modifying the compatibility mode as **Word2010**.

```
`ts
```

```
documenteditor.documentSettings.compatibilityMode = 'Word2010';
```

```
,
```

Note: The Document editor component assumes the compatibility mode as **Word2013** by default, if it is not defined for a document.

Microsoft Word 2010 and older versions**Justified**

Giant pandas can digest bamboo is attributed to tiny microbes that live within their digestive system. As they can only digest about 20% of what they eat, the average giant panda consumes around 14 kilograms (30 pounds) of bamboo a day. In comparison, humans eat about 2 kilograms (5 pounds) of food a day

Microsoft Word 2013 and newer versions**Justified**

Giant pandas can digest bamboo is attributed to tiny microbes that live within their digestive system. As they can only digest about 20% of what they eat, the average giant panda consumes around 14 kilograms (30 pounds) of bamboo a day. In comparison, humans eat about 2 kilograms (5 pounds) of food a day

You can toggle the text alignment of selected paragraphs by specifying a value using the following sample code.

```
`ts
```

```
documenteditor.editor.toggleTextAlignment('Center' | 'Left' | 'Right' | 'Justify');
```

```
,
```

Line spacing and its type

You can define the line spacing and its type for selected paragraphs using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.lineSpacingType = 'AtLeast';
```

```
documenteditor.selection.paragraphFormat.lineSpacing = 6;
```

```
,
```

Paragraph spacing

You can define the spacing before or after the paragraph by using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.beforeSpacing = 24;
```

```
documenteditor.selection.paragraphFormat.afterSpacing = 24;
```

```
,
```

You can also set automatic spacing before and after the paragraph by using the following sample code.

```
`ts
```

```
documenteditor.selection.paragraphFormat.spaceBeforeAuto = true;
```

```
documenteditor.selection.paragraphFormat.spaceAfterAuto = true;
```

```
,
```

Note: If auto spacing property is enabled, then value defined in the `beforeSpacing` and `afterSpacing` property will not be considered.

Pagination properties

You can enable or disable the following pagination properties for the paragraphs in a Word document.

- Widow/Orphan control - whether the first and last lines of the paragraph are to remain on the same page as the rest of the paragraph when paginating the document.
- Keep with next - whether the specified paragraph remains on the same page as the paragraph that follows it while paginating the document.
- Keep lines together - whether all lines in the specified paragraphs remain on the same page while paginating the document.

The following example code illustrates how to enable or disable these pagination properties for the selected paragraphs.

```
`ts
documenteditor.selection.paragraphFormat.widowControl = false;
documenteditor.selection.paragraphFormat.keepWithNext = true;
documenteditor.selection.paragraphFormat.keepLinesTogether = true;
`
```

Paragraph Border

You can apply borders to the paragraphs in a Word document. Using borders, decorate the paragraphs to set them apart from other paragraphs in the document.

The following example code illustrates how to apply box border for the selected paragraphs.

```
`ts
// left
documenteditor.selection.paragraphFormat.borders.left.lineStyle = 'Single';
documenteditor.selection.paragraphFormat.borders.left.lineWidth = 3;
documenteditor.selection.paragraphFormat.borders.left.color = "#000000";
//right
documenteditor.selection.paragraphFormat.borders.right.lineStyle = 'Single';
documenteditor.selection.paragraphFormat.borders.right.lineWidth = 3;
documenteditor.selection.paragraphFormat.borders.right.color = "#000000";
//top
documenteditor.selection.paragraphFormat.borders.top.lineStyle = 'Single';
documenteditor.selection.paragraphFormat.borders.top.lineWidth = 3;
documenteditor.selection.paragraphFormat.borders.top.color = "#000000";
//bottom
```

```
documenteditor.selection.paragraphFormat.borders.bottom.lineStyle = 'Single';
documenteditor.selection.paragraphFormat.borders.bottom.lineWidth = 3;
documenteditor.selection.paragraphFormat.borders.bottom.color = "#000000";
`ts
```

Note: At present, the Document editor component displays all the border styles as single line. But you can apply any border style and get the proper display in Microsoft Word app when opening the exported Word document.

Show or Hide Paragraph marks

You can show or hide the hidden formatting symbols like spaces, tab, paragraph marks, and breaks in Document editor component. These marks help identify the start and end of a paragraph and all the hidden formatting symbols in a Word document.

The following example code illustrates how to show or hide paragraph marks.

```
`ts
documenteditor.documentEditorSettings.showHiddenMarks = true;
`ts
```

Toolbar with paragraph formatting options

The following sample demonstrates the paragraph formatting options using a toolbar.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false, enableSelection: true, enableEditorHistory: true,
  enableEditor: true, enableContextMenu: true, enableSfdtExport: true,height:
  '370px'
});
function toolbarButtonClick(arg) {
  switch (arg.item.id) {
    case 'AlignLeft':
      //Toggle the Left alignment for selected or current paragraph
      documenteditor.editor.toggleTextAlignment('Left');
      break;
    case 'AlignRight':
      //Toggle the Right alignment for selected or current paragraph
      documenteditor.editor.toggleTextAlignment('Right');
      break;
    case 'AlignCenter':
      //Toggle the Center alignment for selected or current paragraph
      documenteditor.editor.toggleTextAlignment('Center');
      break;
    case 'Justify':
      //Toggle the Justify alignment for selected or current paragraph
      documenteditor.editor.toggleTextAlignment('Justify');
      break;
    case 'IncreaseIndent':
      //Increase the left indent of selected or current paragraph
      documenteditor.editor.increaseIndent();
      break;
    case 'DecreaseIndent':
      //Decrease the left indent of selected or current paragraph
```

```

        documenteditor.editor.decreaseIndent();
        break;
    case 'ClearFormat':
        documenteditor.editor.clearFormatting();
        break;
    }
}
//Change the line spacing of selected or current paragraph
function lineSpacingAction(args) {
    var text = args.item.text;
    switch (text) {
        case 'Single':
            documenteditor.selection.paragraphFormat.lineSpacing = 1;
            break;
        case '1.15':
            documenteditor.selection.paragraphFormat.lineSpacing = 1.15;
            break;
        case '1.5':
            documenteditor.selection.paragraphFormat.lineSpacing = 1.5;
            break;
        case 'Double':
            documenteditor.selection.paragraphFormat.lineSpacing = 2;
            break;
    }
    setTimeout(function () {
        documenteditor.focusIn();
    }, 30);
}
documenteditor.selectionChange = () => {
    setTimeout(() => {
        onSelectionChange();
    }, 20);
};
// Selection change to retrieve formatting
function onSelectionChange() {
    if (documenteditor.selection) {
        var paragraphFormat = documenteditor.selection.paragraphFormat;
        var toggleBtnId = ['AlignLeft', 'AlignCenter', 'AlignRight', 'Justify'];
        for (var i = 0; i < toggleBtnId.length; i++) {
            var toggleBtn = document.getElementById(
                toggleBtnId[i]
            );
            toggleBtn.classList.remove('e-btn-toggle');
        }
        if (paragraphFormat.textAlignment === 'Left') {
            document.getElementById('AlignLeft').classList.add('e-btn-toggle');
        } else if (paragraphFormat.textAlignment === 'Right') {
            document.getElementById('AlignRight').classList.add('e-btn-toggle');
        } else if (paragraphFormat.textAlignment === 'Center') {
            document
                .getElementById('AlignCenter')
                .classList.add('e-btn-toggle');
        } else {
            document.getElementById('Justify').classList.add('e-btn-toggle');
        }
    }
    // #endregion
}

```

```

}
//Toolbar configuration to add paragraph formatting options
var toolBar = new ej.navigations.Toolbar({
  clicked: toolbarButtonClick,

  },
  {

```

```

        text: 'Double',
    },
];
var dropdown = new ej.splitbuttons.DropDownButton({
    items: items,
    iconCss: 'e-de-ctnr-linespacing e-icons',
    select: lineSpacingAction,
});
dropdown.appendTo('#lineSpacing');
documenteditor.appendTo('#DocumentEditor');

```

List format in ##Platform_Name## Document editor control

Document Editor supports both the single-level and multilevel lists. Lists are used to organize data as step-by-step instructions in documents for easy understanding of key points. You can apply list to the paragraph either using supported APIs.

Create bullet list

Bullets are usually used for unordered lists. To apply bulleted list for selected paragraphs, use the following method of ‘Editor’ instance.

applyBullet(bullet, fontFamily);

Parameter	Type	Description
bullet	string	Bullet character.
fontFamily	string	Bullet font family.

Refer to the following sample code.

```
`ts
```

```
documenteditor.editor.applyBullet('\uf0b7', 'Symbol');
```

```
,
```

Create numbered list

Numbered lists are usually used for ordered lists. To apply numbered list for selected paragraphs, use the following method of ‘Editor’ instance.

applyNumbering(numberFormat,listLevelPattern)

Parameter	Type	Description
numberFormat	string	“%n” representations in ‘numberFormat’ parameter will be replaced by respective list level’s value. “%1” will be displayed as “1”
listLevelPattern(optional)	string	Default value is 'Arabic'.

Refer to the following example.

```
`ts
documenteditor.editor.applyNumbering('%1', 'UpRoman');
`
```

Clear list

You can also clear the list formatting applied for selected paragraphs. Refer to the following sample code.

```
`ts
documenteditor.editor.clearList();
`
```

Working with lists

The following sample demonstrates how to create bullet and numbering lists in Document Editor.

INDEX.JS

```
ej.base.enableRipple(true);
ej.documenteditor.DocumentEditor.Inject(ej.documenteditor.Editor,
ej.documenteditor.Selection,ej.documenteditor.EditorHistory);
var documenteditor = new ej.documenteditor.DocumentEditor({ enableEditor:
true, isReadOnly: false, enableSelection:
true,enableEditorHistory:true,height: '370px'});
function toolbarAction (args){
  switch (args.item.id) {
    case 'Bullets':
      //To create bullet list
      documenteditor.editor.applyBullet('\uf0b7', 'Symbol');
      break;
    case 'Numbering':
      //To create numbering list
      documenteditor.editor.applyNumbering('%1', 'UpRoman');
      break;
    case 'clearlist':
      //To clear list
      documenteditor.editor.clearList();
      break;
  }
};
var toolbar = new ej.navigations.Toolbar({
  clicked: toolbarAction,
  items: [
    {
      prefixIcon: 'e-de-ctnr-bullets e-icons',
      tooltipText: 'Bullets',
      id: 'Bullets',
    },
    {
      prefixIcon: 'e-de-ctnr-numbering e-icons',
      tooltipText: 'Numbering',
      id: 'Numbering',
    },
    {
      text: 'Clear',
    }
  ]
});
```

```

        id: 'clearlist',
        tooltipText: 'Clear List',
    },
],
});
toolbar.appendTo('#toolbar');
documenteditor.appendTo('#DocumentEditor');

```

<body>

    <div id="container">
        <div id="toolbar">
        </div>
        <div style="width:100%;height: 100%">
            <!--Element which will render as DocumentEditor -->
            <div id="DocumentEditor"></div>
        </div>
    </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```
}  
    </script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Editing numbered list

Document Editor restarts the numbering or continue numbering for a numbered list. These options are found in the built-in context menu, if the list value is selected. Refer to the following screenshot.

- [List dialog](#)

Table format in ##Platform_Name## Document editor control

Document Editor customizes the formatting of table, or table cells such as table width, cell margins, cell spacing, background color, and table alignment. This section describes how to customize these formatting for selected cells, rows, or table in detail.

Cell margins

You can customize the cell margins by using the following sample code.

```
`ts  
//To change the left margin  
documenteditor.selection.cellFormat.leftMargin = 5.4;  
//To change the right margin  
documenteditor.selection.cellFormat.rightMargin = 5.4;  
//To change the top margin  
documenteditor.selection.cellFormat.topMargin = 5.4;  
//To change the bottom margin
```

```
documenteditor.selection.cellFormat.bottomMargin = 5.4;
```

```
,
```

You can also define the default cell margins for a table. If the specific cell margin value is not defined explicitly in the cell formatting, the corresponding value will be retrieved from default cells margin of the table. Refer to the following sample code.

```
`ts
```

```
//To change the left margin
```

```
documenteditor.selection.tableFormat.leftMargin = 5.4;
```

```
//To change the right margin
```

```
documenteditor.selection.tableFormat.rightMargin = 5.4;
```

```
//To change the top margin
```

```
documenteditor.selection.tableFormat.topMargin = 5.4;
```

```
//To change the bottom margin
```

```
documenteditor.selection.tableFormat.bottomMargin = 5.4;
```

```
,
```

Background color

You can explicitly set the background color of selected cells using the following sample code.

```
`ts
```

```
documenteditor.selection.cellFormat.background = '#E0E0E0';
```

```
,
```

Refer to the following sample code to customize the background color of the table.

```
`ts
```

```
documenteditor.selection.tableFormat.background = '#E0E0E0';
```

```
,
```

Cell spacing

Refer to the following sample code to customize the spacing between each cell in a table.

```
`ts
```

```
documenteditor.selection.tableFormat.cellSpacing = 2;
```

```
,
```

Cell vertical alignment

The content is aligned within a table cell to 'Top', 'Center', or 'Bottom'. You can customize this property of selected cells. Refer to the following sample code.

```
`ts
```

```
documenteditor.selection.cellFormat.verticalAlignment = 'Bottom';
```

```
,
```

Table alignment

The tables are aligned in Document Editor to 'Left', 'Right', or 'Center'. Refer to the following sample code.

```
`ts
documenteditor.selection.tableFormat.tableAlignment = 'Center';
`
```

Cell width

Set the desired width of table cells that will be considered when the table is layouted. Refer to the following sample code.

```
`ts
import { DocumentEditor, Editor, Selection, SfdtExport } from '@syncfusion/ej2-documenteditor';
//Inject the required module
DocumentEditor.Inject(Editor, Selection, SfdtExport);
let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false,
enableSelection: true,
enableEditor: true,
enableSfdtExport: true
});
documenteditor.appendTo('#DocumentEditor');
documenteditor.editor.insertTable(2, 2);
//To change the width of a cell
documenteditor.selection.cellFormat.preferredWidthType = 'Point';
documenteditor.selection.cellFormat.preferredWidth = 100;
`
```

Table width

You can set the desired width of a table in 'Point 'or 'Percent' type. Refer to the following sample code.

```
`ts
import { DocumentEditor, Editor, Selection, SfdtExport } from '@syncfusion/ej2-documenteditor';
//Inject the required module
DocumentEditor.Inject(Editor, Selection, SfdtExport);
let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false,
enableSelection: true,
enableEditor: true,
```

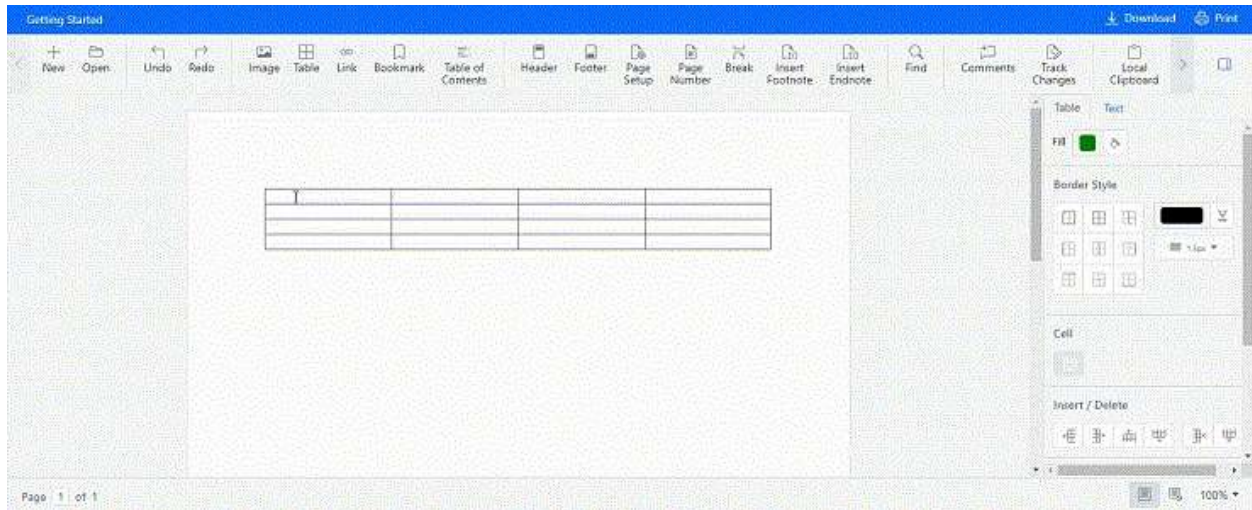

```
enableSfdtExport: true
});
documenteditor.appendTo('#DocumentEditor');
documenteditor.editor.insertTable(2, 2);
//To change the width of a table
documenteditor.selection.tableFormat.preferredWidthType = 'Point';
documenteditor.selection.tableFormat.preferredWidth = 300;
`
```

Apply borders

Document Editor exposes API to customize the borders for table cells by specifying the settings. Refer to the following sample code.

```
`ts
import { DocumentEditor, Editor, Selection, SfdtExport, BorderSettings } from '@syncfusion/ej2-
documenteditor';
//Inject the required module
DocumentEditor.Inject(Editor, Selection, SfdtExport);
let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false,
enableSelection: true,
enableEditor: true,
enableSfdtExport: true
});
documenteditor.appendTo('#DocumentEditor');
documenteditor.editor.insertTable(2, 2);
//To apply border
let borderSettings: BorderSettings = {
type: 'AllBorders',
lineWidth: 12
};
documenteditor.editor.applyBorders(borderSettings);
`
```

Please check below gif which illustrates how to apply border for selected cells through properties pane options - border color, line size and no border:

Working with row formatting

Document Editor allows various row formatting such as height and repeat header.

Row height

You can customize the height of a table row as 'Auto', 'AtLeast', or 'Exactly'. Refer to the following sample code.

```
`ts
```

```
import { DocumentEditor, Editor, Selection, SfdtExport } from '@syncfusion/ej2-documenteditor';
```

```
//Inject the required module
```

```
DocumentEditor.Inject(Editor, Selection, SfdtExport);
```

```
let documenteditor: DocumentEditor = new DocumentEditor({
```

```
  isReadOnly: false,
```

```
  enableSelection: true,
```

```
  enableEditor: true,
```

```
  enableSfdtExport: true
```

```
});
```

```
documenteditor.appendTo('#DocumentEditor');
```

```
documenteditor.editor.insertTable(2, 2);
```

```
//To change row height of first row
```

```
documenteditor.selection.rowFormat.heightType = 'Exactly';
```

```
documenteditor.selection.rowFormat.height = 20;
```

```
,
```

Header row

The header row describes the content of a table. A table can optionally have a header row. Only the first row of a table can be the header row. If the cursor position is at first row of the table, then you can define whether it as header row or not, using the following sample code.

```
`ts
```

```
documenteditor.selection.rowFormat.isHeader = true;
```

```
,
```

Allow row break across pages

This property is valid if a table row does not fit in the current page during table layout. It defines whether a table row can be allowed to break. If the value is false, the entire row will be moved to the start of next page. You can modify this property for selected rows using the following sample code.

```
`ts
```

```
documenteditor.selection.rowFormat.allowRowBreakAcrossPages = false;
```

```
,
```

Title

Document Editor expose API to get or set the table title of the selected table. Refer to the following sample code to set title.

```
`ts
```

```
documenteditor.selection.tableFormat.title = 'Shipping Details';
```

```
,
```

Description

Document Editor expose API to get or set the table description of the selected image. Refer to the following sample code to set description.

```
`ts
```

```
documenteditor.selection.tableFormat.description = 'Freight cost and shipping details';
```

```
,
```

See Also

- [Table properties dialog](#)

Section format in ##Platform_Name## Document editor control

Document Editor supports various section formatting such as page size, page margins, and more.

Page size

You can get or set the size of a section at cursor position by using the following sample code.

```
`ts
```

```
documenteditor.selection.sectionFormat.pageWidth = 500;
```

```
documenteditor.selection.sectionFormat.pageHeight = 600;
```

```
,
```

You can change the orientation of the page by swapping the values of page width and height respectively.

Page margins

Left and right page margin defines the gap between the document content from left and right side of the page respectively. Top and bottom page margins defines the gap between the document content from header and footer of the page respectively.

Refer to the following sample code.

```
`ts
documenteditor.selection.sectionFormat.leftMargin = 10;
documenteditor.selection.sectionFormat.rightMargin = 10;
documenteditor.selection.sectionFormat.bottomMargin = 10;
documenteditor.selection.sectionFormat.topMargin = 10;
`
```

Header distance

You can define the distance of header content from the top of the page by using the following sample code.

```
`ts
documenteditor.selection.sectionFormat.headerDistance = 72;
`
```

Footer distance

You can define the distance of footer content from the bottom of the page by using the following sample code.

```
`ts
documenteditor.selection.sectionFormat.footerDistance = 72;
`
```

Columns

You can define the number of columns, column width, and space between columns for the pages in a section.

The following code example illustrates how to define the two columns layout for the pages in a section.

```
`ts
let column: SelectionColumnFormat = new
SelectionColumnFormat(container.documentEditor.selection);
column.width = 216;
column.space = 36;
container.documentEditor.selection.sectionFormat.columns = [column, column];
container.documentEditor.selection.sectionFormat.lineBetweenColumns = true;
`
```

Breaks

You can insert column break. The following code example illustrates how to insert a column break.

```
`ts
container.documentEditor.editor.insertColumnBreak();
`
```

You can insert next page section break to start the new section on the next page.

The following code example illustrates how to insert a next page section break.

```
`ts
container.documentEditor.editor.insertSectionBreak(SectionBreakType.NewPage);
`
```

You can insert continuous section break to start the new section on the same page.

The following code example illustrates how to insert a continuous section break.

```
`ts
container.documentEditor.editor.insertSectionBreak(SectionBreakType.Continuous);
`
```

- [Page setup dialog](#)
- [Column dialog](#)

Comments in ##Platform_Name## Document editor control

Document Editor allows you to add comments to documents. You can add, navigate and remove comments in code and from the UI.

Add a new comment

Comments can be inserted to the selected text.

```
`ts
//Add new commnt in the document.
documentEditor.editor.insertComment("Test comment");
`
```

Comment navigation

Next and previous comments can be navigated using the below code snippet.

```
`ts
//Navigate to next comment
documentEditor.selection.navigateNextComment();

//Navigate to previous comment
documentEditor.selection.navigatePreviousComment();
`
```

,

Delete comment

Current comment can be deleted using the below code snippet.

```
`ts
//Delete the selected comment.
documentEditor.editor.deleteComment();
,
```

Delete all comment

All the comments in the document can be deleted using the below code snippet.

```
`ts
//Delete all the comments present in the current document.
documentEditor.editor.deleteAllComments();
,
```

Protect the document in comments only mode

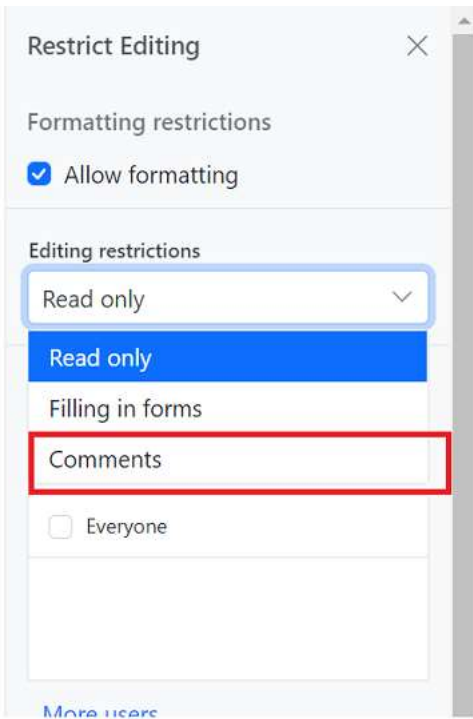

Document Editor provides support for protecting the document with **CommentsOnly** protection. In this protection, user allowed to add or edit comments alone in the document.

Document editor provides an option to protect and unprotect document using [enforceProtection](#) and [stopProtection](#) API.

The following example code illustrates how to enforce and stop protection in Document editor container.

```
`ts
let container: DocumentEditorContainer = new DocumentEditorContainer({
enableToolbar: true,
height: '590px',
});
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl =
'http://localhost:5000/api/documenteditor/';
container.appendTo('#container');
//enforce protection
container.documentEditor.editor.enforceProtection('123', 'CommentsOnly');
//stop the document protection
container.documentEditor.editor.stopProtection('123');
,
```

Comment only protection can be enabled in UI by using [Restrict Editing pane](#)

Note: In enforce Protection method, first parameter denotes password and second parameter denotes protection type. Possible values of protection type are `NoProtection` | `ReadOnly` | `FormFieldsOnly` | `CommentsOnly`. In stop protection method, parameter denotes the password.

Fields in ##Platform_Name## Document editor control

Document Editor has preservation support for all types of fields in an existing word document without any data loss.

Adding Fields

You can add a field to the document by using [insertField](#) method in [Editor](#) module.

The following example code illustrates how to insert merge field programmatically by providing the field code and field result.

```
`ts
let fieldCode: string = 'MERGEFIELD First Name \* MERGEFORMAT ';
let fieldResult: string = '«First Name»';
documenteditor.editor.insertField(fieldCode, fieldResult);
`
```

Note: Document editor does not validate/process the field code/field result. it simply inserts the field with specified field information.

Update fields

Document Editor provides support for updating bookmark cross reference field. The following example code illustrates how to update bookmark cross reference field.

```
`ts
```

//Update all the bookmark cross reference field in the document.

```
documentEditor.updateFields();
```

,

Bookmark cross reference fields can be updated through UI by using update fields option in **Toolbar**.

The following type of fields are automatically updated in Document Editor.

- Numpages
- Section
- Page

Get field info

You can get field code and field result of the current selected field by using [getFieldInfo](#) method in the [Selection](#) module.

```
`ts
```

```
//Gets the field information of the selected field.
```

```
let fieldInfo: FieldInfo = documentEditor.selection.getFieldInfo();
```

,

Note: For nested fields, this method returns combined field code and result.

Set field info

You can modify the field code and field result of the current selected field by using [setFieldInfo](#) method in the [Editor](#) module.

```
`ts
```

```
//Gets the field information for the selected field.
```

```
let fieldInfo: FieldInfo = documentEditor.selection.getFieldInfo();
```

```
//Modify field code
```

```
fieldInfo.code = 'MERGEFIELD First Name \* MERGEFORMAT';
```

```
//Modify field result
```

```
fieldInfo.result = '«First Name»';
```

```
//Modify field code and result of the current selected field.
```

```
documentEditor.editor.setFieldInfo(fieldInfo);
```

,

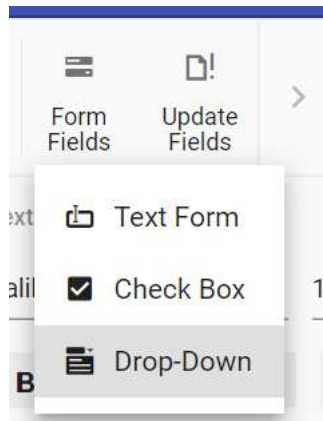

Note: For nested field, entire field gets replaced completely with the specified field information.

- [Mail merge demo](#)
- You can refer to the [Microsoft support article to know more about the list of fields supported in Microsoft Word and its field codes](#)

Form fields in ##Platform_Name## Document editor control

DocumentEditorContainer component provide support for inserting Text, CheckBox, DropDown form fields through in-built toolbar.

Insert form field

Form fields can be inserted using [insertFormField](#) method in editor module.

```
`ts
//Insert Text form field
documentEditor.editor.insertFormField('Text');
//Insert Checkbox form field
documentEditor.editor.insertFormField('CheckBox');
//Insert Drop down form field
documentEditor.editor.insertFormField('Dropdown');
`
```

Get form field names

All the form fields names form current document can be retrieved using [getFormFieldNames\(\)](#).

```
`ts
let formFieldsNames: string[] = documentEditor.getFormFieldNames();
`
```

Get form field properties

Form field properties can be retrieved using [getFormFieldInfo\(\)](#).

```
`ts
```

```
//Get Text form field by using bookmark name.
```

```
let textfieldInfo: TextFormFieldInfo = documentEditor.getFormFieldInfo('Text1') as TextFormFieldInfo;
```

```
//Checkbox form field by using bookmark name.
```

```
let checkboxfieldInfo: CheckBoxFormFieldInfo = documentEditor.getFormFieldInfo('Check1') as
CheckBoxFormFieldInfo;
```

```
//Dropdown form field by using bookmark name.
```

```
let dropdownfieldInfo: DropDownFormFieldInfo = documentEditor.getFormFieldInfo('Drop1') as
DropDownFormFieldInfo;
```

```
,
```

Set form field properties

Form field properties can be modified using [setFormFieldInfo](#).

```
`ts
```

```
// Set text form field properties
```

```
let textfieldInfo: TextFormFieldInfo = documentEditor.getFormFieldInfo('Text1') as TextFormFieldInfo;
```

```
textfieldInfo.defaultValue = "Hello";
```

```
textfieldInfo.format = "Uppercase";
```

```
textfieldInfo.type = "Text";
```

```
textfieldInfo.name = "Text2";
```

```
documentEditor.setFormFieldInfo('Text1', textfieldInfo);
```

```
// Set checkbox form field properties
```

```
let checkboxfieldInfo: CheckBoxFormFieldInfo = documentEditor.getFormFieldInfo('Check1') as
CheckBoxFormFieldInfo;
```

```
checkboxboxfieldInfo.defaultValue = true;
```

```
checkboxboxfieldInfo.name = "Check2";
```

```
documentEditor.setFormFieldInfo('Check1', checkboxfieldInfo);
```

```
// Set checkbox form field properties
```

```
let dropdownfieldInfo: DropDownFormFieldInfo = documentEditor.getFormFieldInfo('Drop1') as
DropDownFormFieldInfo;
```

```
dropdownfieldInfo.dropDownItems = ['One', 'Two', 'Three']
```

```
dropdownfieldInfo.name = "Drop2";
```

```
documentEditor.setFormFieldInfo('Drop1', dropdownfieldInfo);
```

```
,
```

Note:If a form field already exists in the document with the new name specified, the old form field name property will be cleared and it will not be accessible. Ensure the new name is unique.

Export form field data

Data of the all the Form fields in the document can be exported using [exportFormData](#).

```
`ts
```

```
let formFieldDate: FormFieldData[] = documentEditor.exportFormData();
```

```
,
```

Import form field data

Form fields can be prefilled with data using [importFormData](#).

```
`ts
```

```
let textformField: FormFieldData = { fieldName: 'Text1', value: 'Hello World' };
```

```
let checkformField: FormFieldData = { fieldName: 'Check1', value: true };
```

```
let dropdownformField: FormFieldData = { fieldName: 'Drop1', value: 1 };
```

```
//Import form field data
```

```
this.container.documentEditor.importFormData([textformField, checkformField, dropdownformField]);
```

```
,
```

Reset form fields

Reset all the form fields in current document to default value using [resetFormFields](#).

```
`ts
```

```
documentEditor.resetFormFields();
```

```
,
```

Protect the document in form filling mode

Document Editor provides support for protecting the document with **FormFieldsOnly** protection. In this protection, user can only fill form fields in the document.

Document editor provides an option to protect and unprotect document using [enforceProtection](#) and [stopProtection](#) API.

The following example code illustrates how to enforce and stop protection in Document editor container.

```
`ts
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({
```

```
enableToolbar: true,
```

```
height: '590px',
```

```
});
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
container.serviceUrl =
```

```
'https://services.syncfusion.com/js/production/api/documenteditor/';
```

```
container.appendTo('#container');
```

```
//enforce protection
container.documentEditor.editor.enforceProtection('123', 'FormFieldsOnly');
//stop the document protection
container.documentEditor.editor.stopProtection('123');
```

Note: In enforce Protection method, first parameter denotes password and second parameter denotes protection type. Possible values of protection type are NoProtection | ReadOnly | FormFieldsOnly | CommentsOnly. In stop protection method, parameter denotes the password.

Clipboard in ##Platform_Name## Document editor control

Document Editor takes advantage of system clipboard and allows you to copy or move a portion of the document into it in HTML format, so that it can be pasted in any application that supports clipboard.

Copy

Copy a portion of document to system clipboard using built-in context menu of Document Editor. You can also do it programmatically using the following sample code.

```
`ts
documentEditor.selection.copy();
```

Cut

Cut a portion of document to system clipboard using built-in context menu of Document Editor. You can also do it programmatically using the following sample code.

```
`ts
documentEditor.editor.cut();
```

Paste

Due to limitations, you can paste contents from system clipboard in Document Editor only using the 'CTRL + V' keyboard shortcut.

Note: Due to browser limitation of getting content from system clipboard, paste using API and context menu option doesn't work.

Local paste (copy/paste within control)

Document Editor expose API to enable local paste within the control. On enabling this, the following is performed:

- Selected contents will be stored to an internal clipboard in addition to system clipboard.
- Clipboard paste will be overridden, and internally stored data (SFDT data) that has formatted text will be pasted using paste() API in Document editor.

Refer to the following sample code.

```
`ts
```

```
//Initialize the Document Editor.
```

```
let editor: DocumentEditor = new DocumentEditor({ enableEditor: true, isReadOnly: false,
enableSelection: true });
```

```
//Enable the local paste.
```

```
editor.enableLocalPaste = true;
```

```
,
```

By default, **enableLocalPaste** is false.

When local paste is enabled for a Document Editor instance, you can paste contents programmatically if the internal clipboard has stored data during last copy operation. Refer to the following sample code.

```
`ts
```

```
documentEditor.editor.paste();
```

```
,
```

Paste options in context menu

In Document editor, paste options in context menu will be in disabled state if you were try to copy/paste content from outside of Document editor. It gets enabled when **enableLocalPaste** is true and trying to copy/paste content inside Document editor.

Note: Due to browser limitation of getting content from system clipboard, paste using API and context menu option doesn't work. Hence, the paste option is disabled in context menu.

Alternatively, you can use the keyboard shortcuts,

- Cut: Ctrl + X
- Copy: Ctrl + C
- Paste: Ctrl + V

EnableLocalPaste behaviour

|EnableLocalPaste |Paste behavior details|

```
|-----|-----|
```

|True |Allows to paste content that is copied from the same Document Editor component alone and prevents pasting content from system clipboard. Hence the content copied from outside Document Editor component can't be pasted.
Browser limitation of pasting from system clipboard using API and context menu options, will be resolved. So, you can copy and paste content within the Document Editor component using API and context menu options too. |

|False |Allows to paste content from system clipboard. Hence the content copied from both the Document Editor component and outside can be pasted.
Browser limitation of pasting from system clipboard using API and context menu options, will remain as a limitation. |

Note:

- Keyboard shortcut for pasting will work properly in both cases.
- Copying content from Document Editor component and pasting outside will work properly in both cases.

Paste with formatting

Document Editor provides support to paste the system clipboard data with formatting. To enable clipboard paste with formatting options and copy/paste content from outside of Document editor, set the `enableLocalPaste` property in Document Editor to false and use this .NET Standard library [Syncfusion.EJ2.WordEditor.AspNet.Core](#) by the web API service implementation. This library helps you to paste the system clipboard data with formatting.

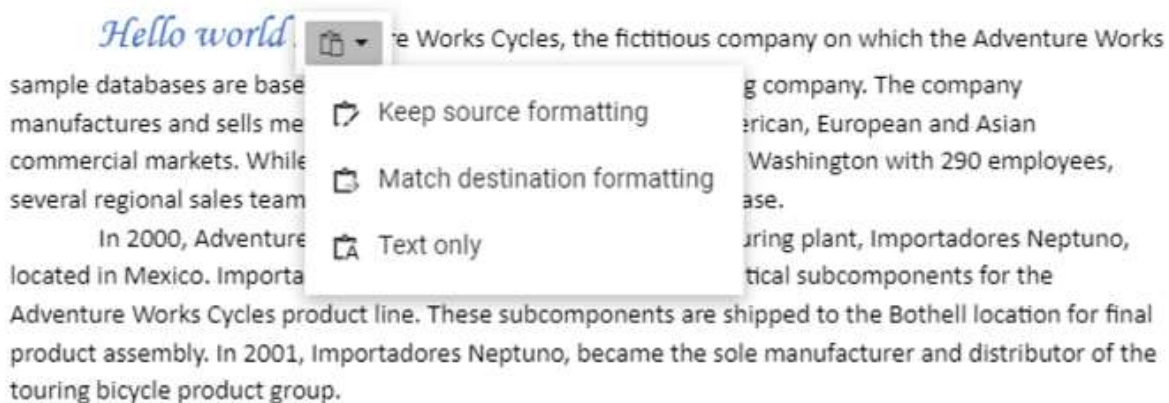

Refer this [page](#) for more details.

You can paste your system clipboard data in the following ways:

- **Keep Source Formatting** This option retains the character styles and direct formatting applied to the copied text. Direct formatting includes characteristics such as font size, italics, or other formatting that is not included in the paragraph style.
- **Match Destination Formatting** This option discards most of the formatting applied directly to the copied text, but it retains the formatting applied for emphasis, such as bold and italic when it is applied to only a portion of the selection. The text takes on the style characteristics of the paragraph where it is pasted. The text also takes on any direct formatting or character style properties of text that immediately precedes the cursor when the text is pasted.
- **Text Only** This option discards all formatting and non-text elements such as pictures or tables. The text takes on the style characteristics of the paragraph where it is pasted and takes on any direct formatting or character style properties of text that immediately precedes the cursor when the text is pasted. Graphical elements are discarded and tables are converted to a series of paragraphs.

This paste option appear as follows.

Collaborative Editing (preview)

Allows multiple users to work on the same document simultaneously. This can be done in real-time, so that collaborators can see the changes as they are made. Collaborative editing can be a great way to improve efficiency, as it allows team members to work together on a document without having to wait for others to finish their changes.

Note: Collaborative editing support is currently in preview mode only and is not yet ready for production environments.

Prerequisites

The following are needed to enable collaborative editing in Document Editor.

- SignalR
- Microsoft SQL Server

How to enable collaborative editing in client side

Step 1: Enable collaborative editing in Document Editor

To enable collaborative editing, inject `CollaborativeEditingHandler` and set the property `enableCollaborativeEditing` to true in the Document Editor, like in the code snippet below.

INDEX.JS

```
// Inject collaborative editing module.
ej.documenteditor.DocumentEditor.Inject(ej.documenteditor.CollaborativeEditingHandler);
ej.documenteditor.DocumentEditorContainer.Inject(ej.documenteditor.Toolbar);
let container = new ej.documenteditor.DocumentEditorContainer({
  enableToolbar: true, height: '590px', });
container.serviceUrl = 'http://localhost:5000/api/documenteditor/';
container.appendTo('#container');
// Enable collaborative editing in Document Editor.
container.documentEditor.enableCollaborativeEditing = true;
```

Step 2: Configure SignalR to send and receive changes

To broadcast the changes made and receive changes from remote users, configure SignalR like below.

INDEX.JS

```
let connectionId = "";
var connection = new signalR.HubConnectionBuilder().withUrl(serviceUrl +
  '/documenteditorhub', {
  skipNegotiation: true,
  transport: signalR.HttpTransportType.WebSockets
}).withAutomaticReconnect().build();
connection.onclose(async () => {
  if (connection.state === signalR.HubConnectionState.Disconnected) {
    alert('Connection lost. Please reload the browser to continue.');
```

```

        connection.send('JoinGroup', { roomName: data.roomName,
currentUser: data.currentUser });
        console.log('server connected!!!');
    });
} catch (err) {
    console.log(err);
    setTimeout(start, 5000);
}
};
// Event handler to handle data received
connection.on('dataReceived', onDataReceived.bind(this));
function onDataReceived(action, data) {
    if (connections) {
        if (action == 'connectionId') {
            connectionId = data;
        } else if (connectionId != data.connectionId) {
            if (action == 'action' || action == 'addUser') {
                // Add user info when new user join the collaborative
editing session.
                titleBar.addUser(data);
            } else if (action == 'removeUser') {
                // Remove user info from title bar once user is
disconnected.
                titleBar.removeUser(data);
            }
        }
        // Apply remote changes to current document.
        connections.applyRemoteAction(action, data);
    }
}
}

```

Step 3: Join SignalR room while opening the document

When opening a document, we need to generate a unique ID for each document. These unique IDs are then used to create rooms using SignalR, which facilitates sending and receiving data from the server.

INDEX.JS

```

function openDocument(responseText, roomName) {
    let data = JSON.parse(responseText);
    // Get collaborative editing module.
    connections =
container.documentEditor.collaborativeEditingHandlerModule;
    // Configure collaborative editing room name in collaborative editing
module
    connections.updateRoomInfo(roomName, data.version, serviceUrl);
    container.documentEditor.open(data.sfdt);
    setTimeout(function () {
        // connect to signalR room with specified name.
        start({ action: 'connect', roomName: roomName, currentUser:
container.currentUser }, null);
    });
}

```

Step 4: Broadcast current editing changes to remote users

Changes made on the client-side need to be sent to the server-side to broadcast them to other connected users. To send the changes made to the server, use the method shown below from the document editor using the `contentChange` event.

INDEX.JS

```
container.contentChange = function (args) {  
    if (connections) {  
        // Send current changes to server to broadcast it to other users.  
        connections.sendActionToServer(args.operations)  
    }  
}
```

How to enable collaborative editing in ASP.NET Core

Step 1: Configure SignalR in ASP.NET Core

We are using Microsoft SignalR to broadcast the changes. Please add the following configuration to your application's `Program.cs` file.

```
`csharp  
using Microsoft.Azure.SignalR;  
  
.....  
  
builder.Services.AddSignalR();  
  
.....  
  
.....  
  
.....  
  
app.MapHub<DocumentEditorHub>("/documenteditorhub");  
  
.....  
  
.....  
  
`
```

Step 2: Configure SignalR hub to create room for collaborative editing session

To manage groups for each document, create a folder named "Hub" and add a file named `DocumentEditorHub.cs` inside it. Add the following code to the file to manage SignalR groups using room names.

Join the group by using unique id of the document by using `JoinGroup` method.

```
`csharp  
  
static Dictionary<string, ActionInfo> userManager = new Dictionary<string, ActionInfo>();  
  
internal static Dictionary<string, List<ActionInfo>> groupManager = new Dictionary<string,  
List<ActionInfo>>();  
  
// Join to the specified room name  
  
public async Task JoinGroup(ActionInfo info)
```

```
{
if (!userManager.ContainsKey(Context.ConnectionId))
{
userManager.Add(Context.ConnectionId, info);
}
info.ConnectionId = Context.ConnectionId;
//Add the current connected use to the specified group
await Groups.AddToGroupAsync(Context.ConnectionId, info.RoomName);
if (groupManager.ContainsKey(info.RoomName))
{
await Clients.Caller.SendAsync("dataReceived", "addUser", groupManager[info.RoomName]);
}
lock (groupManager)
{
if (groupManager.ContainsKey(info.RoomName))
{
groupManager[info.RoomName].Add(info);
}
else
{
List<ActionInfo> actions = new List<ActionInfo>
{
info
};
groupManager.Add(info.RoomName, actions);
}
}
// Notify other users in the group about new user joined the collaborative editing session.
Clients.GroupExcept(info.RoomName, Context.ConnectionId).SendAsync("dataReceived", "addUser",
info);
}
```

Handle user disconnection using SignalR.

```
`csharp
//Handle disconnection from group.
public override Task OnDisconnectedAsync(Exception? e)
{
    string roomName = userManager[Context.ConnectionId].RoomName;
    if (groupManager.ContainsKey(roomName))
    {
        groupManager[roomName].Remove(userManager[Context.ConnectionId]);
        if (groupManager[roomName].Count == 0)
        {
            groupManager.Remove(roomName);
            //If all user disconnected from current room. Auto save the change to source document.
            CollaborativeEditingController.UpdateOperationsToSourceDocument(roomName,
            "<<documentpath>>", false);
        }
    }
    if (userManager.ContainsKey(Context.ConnectionId))
    {
        //Notify other user in the group about user exit the collaborative editing session
        Clients.OthersInGroup(roomName).SendAsync("dataReceived", "removeUser", Context.ConnectionId);
        Groups.RemoveFromGroupAsync(Context.ConnectionId, roomName);
        userManager.Remove(Context.ConnectionId);
    }
    return base.OnDisconnectedAsync(e);
}
`
```

Step 3: Configure Microsoft SQL database connection string in application level

Configure the SQL database that stores temporary data for the collaborative editing session. Provide the SQL database connection string in `appsettings.json` file.

```
`json
.....
"ConnectionStrings": {
    "DocumentEditorDatabase": "<SQL server connection string>"
}
```

.....
 、

Step 4: Configure Web API actions for collaborative editing

Import File

- When opening a document, create a database table to store temporary data for the collaborative editing session.
- If the table already exists, retrieve the records from the table and apply them to the `WordDocument` instance using the `UpdateActions` method before converting it to the SFDT format.

```
`csharp
public string ImportFile([FromBody] FileInfo param)
{
    .....
    .....
    DocumentContent content = new DocumentContent();
    .....
    //Get source document from database/file system/blob storage
    WordDocument document = GetDocumentFromDatabase(param.fileName, param.documentOwner);
    .....
    //Get temporary records from database
    List<ActionInfo> actions = CreatedTable(param.fileName);
    if(actions!=null)
    {
        //Apply temporary data to the document
        document.UpdateActions(actions);
    }
    string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
    content.version = 0;
    content.sfdt = json;
    return Newtonsoft.Json.JsonConvert.SerializeObject(content);
}
、
```

Update editing records to database

Each edit operation made by the user is sent to the server and is pushed to the database. Each operation receives a version number after being inserted into the database.

After inserting the records to the server, the position of the current editing operation must be transformed against any previous editing operations not yet synced with the client using the `TransformOperation` method.

After performing the transformation, the current operation is broadcast to all connected users within the group.

```
`csharp
public async Task<ActionInfo> UpdateAction([FromBody] ActionInfo param)
{
    try
    {
        ActionInfo modifiedAction = AddOperationsToTable(param);
        //After transformation broadcast changes to all users in the group
        await _hubContext.Clients.Group(param.RoomName).SendAsync("dataReceived", "action",
            modifiedAction);
        return modifiedAction;
    }
    catch
    {
        return null;
    }
}

private ActionInfo AddOperationsToTable(ActionInfo action)
{
    int clientVersion = action.Version;
    string tableName = action.RoomName;

    .....

    .....

    .....

    .....

    List<ActionInfo> actions = GetOperationsQueue(tableName);
    foreach (ActionInfo info in actions)
    {
```

```

if (!info.IsTransformed)
{
    CollaborativeEditingHandler.TransformOperation(info, actions);
}
}
action = actions[actions.Count - 1];
action.Version = updateVersion;
//Return the transformed operation to broadcast it to other clients.
return action;
}
,

```

[Add Web API to get previous operation as a backup to get lost operations](#)

On the client side, messages send from server using SignalR may be received in a different order, or some operations may be missed due to network issues. In these cases, we need a backup method to retrieve missing records from the database.

Using the following method, we can retrieve all operations after the last successful client-synced version and return all missing operations to the requesting client.

```

`csharp
public async Task<ActionInfo> UpdateAction([FromBody] ActionInfo param)
{
    try
    {
        ActionInfo modifiedAction = AddOperationsToTable(param);
        //After transformation broadcast changes to all users in the group
        await _hubContext.Clients.Group(param.RoomName).SendAsync("dataReceived", "action",
            modifiedAction);
        return modifiedAction;
    }
    catch
    {
        return null;
    }
}

private ActionInfo AddOperationsToTable(ActionInfo action)
{

```

```

int clientVersion = action.Version;
string tableName = action.RoomName;
.....
.....
.....
.....
List<ActionInfo> actions = GetOperationsQueue(table);
foreach (ActionInfo info in actions)
{
    if (!info.IsTransformed)
    {
        CollaborativeEditingHandler.TransformOperation(info, actions);
    }
}
action = actions[actions.Count - 1];
action.Version = updateVersion;
//Return the transformed operation to broadcast it to other clients.
return action;
}
`

```

Full version of the code discussed about can be found in below GitHub location.

GitHub Example: [Collaborative editing examples](#)

History in ##Platform_Name## Document editor control

Document Editor tracks the history of all editing actions done in the document, which allows undo and redo functionality.

Enable or disable history

Inject the 'EditorHistory' module in your application to provide history preservation functionality for 'DocumentEditor'. Refer to the following code example.

```

`ts
//Inject require modules.
DocumentEditor.Inject(Editor, Selection, EditorHistory);
let editor: DocumentEditor = new DocumentEditor({ enableEditor: true, isReadOnly: false });
//Enable editor history module.
editor.enableEditorHistory = true;

```

,

You can enable or disable history preservation for a Document Editor instance any time using the 'enableEditorHistory' property. Refer to the following sample code.

```
`ts
editor.enableEditorHistory = false;
```

,

Undo and redo

You can perform undo and redo by 'CTRL+Z' and 'CTRL+Y' keyboard shortcuts. Document Editor exposes API to do it programmatically.

To undo the last editing operation in Document Editor, refer to the following sample code.

```
`ts
editor.editorHistory.undo();
```

,

To redo the last undone action, refer to the following code example.

```
`ts
editor.editorHistory.redo();
```

,

Stack size

History of editing actions will be maintained in stack, so that the last item will be reverted first. By default, Document Editor limits the size of undo and redo stacks to 500 each respectively. However, you can customize this limit. Refer to the following sample code.

```
`ts
//Set undo limit.
editor.editorHistory.undoLimit = 400;
//Set redo limit.
editor.editorHistory.redoLimit = 400;
```

,

Find and replace in `##Platform_Name##` Document editor control

The Document Editor component searches a portion of text in the document through a built-in interface called `OptionsPane` or rich APIs. When used in combination with selection performs various operations on the search results like replacing it with some other text, highlighting it, making it bolder, and more.

Options pane

This provides the options to search for a portion of text in the document. After search operation is completed, the search results will be displayed in a list and options to navigate between them. The current occurrence of matched text or all occurrences with another text can be replaced by switching to **Replace** tab. This pane is opened using the keyboard shortcut **CTRL+F**. You can also open it programmatically using the following sample code.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({ enableSelection:
true, enableSearch: true, enableEditor: true, isReadOnly: false,
enableOptionsPane: true });
documenteditor.appendTo('#DocumentEditor');
var sfdt = `{
  "sections": [
    {
      "blocks": [
        {
          "inlines": [
            {
              "characterFormat": {
                "bold": true,
                "italic": true
              },
              "text": "Adventure Works Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company. The company manufactures and sells
metal and composite bicycles to North American, European and Asian
commercial markets. While its base operation is located in Bothell,
Washington with 290 employees, several regional sales teams are located
throughout their market base."
            }
          ]
        }
      ]
    }
  ]
};
documenteditor.open(sfdt);
document.getElementById('showhidepane').addEventListener('click', () => {
  documenteditor.showOptionsPane();
});
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can close the options pane by pressing **Esc** key.

Search

The [Search](#) module of Document Editor exposes the following APIs:

API Name	Type	Description
---	---	---
findAll()	Method	Searches for specified text in the whole document and highlights it with yellow.
searchResults	Property	This is an instance of SearchResults .
find()	Method	Find immediate occurrence of specified text from cursor position in the document and highlights it with yellow.

Find the immediate occurrence in the document

Using [find\(\)](#) method, you can find the immediate occurrence of specified text from current cursor position in the document.

The following example code illustrates how to use find in Document editor.

```
`ts
documenteditor.search.find('Some text', 'None');
`
```

Note: Second parameter is optional parameter and it denotes find Options. Possible values of find options are `'None'` | `'WholeWord'` | `'CaseSensitive'` | `'CaseSensitiveWholeWord'`.

Find all the occurrences in the document

Using [findAll\(\)](#) method, you can find all the occurrences of specified text in the whole document and highlight it with yellow.

The following example code illustrates how to find All the text in the document.

```
`ts
documenteditor.search.findAll('Some text', 'None');
`
```

Note: Second parameter is optional parameter and it denotes find Options. Possible values of find options are `'None'` | `'WholeWord'` | `'CaseSensitive'` | `'CaseSensitiveWholeWord'`.

Search results

The [SearchResults](#) class provides information about the search results after a search operation is completed that can be identified using the [searchResultsChange](#) event. This will expose the following APIs:

API Name	Type	Description
---	---	---
length	Property	Returns the total number of results found on the search.
index	Property	Returns the index of selected search result. You can change the value for this property to move the selection.
replaceAll()	Method	Replaces all the occurrences with specified text.
clear()	Method	Clears the search result.

Replace all the occurrences

Using [replaceAll\(\)](#), you can replace all the occurrences with specified text.

The following example code illustrates how to use replace All in Document editor.

```
`ts
documentEditor.search.findAll('Some text');
// Replace all the searched text with word 'Mike'
documentEditor.search.searchResults.replaceAll("Mike");
`
```

Replace

Using [insertText](#), you can replace the current searched text with specified text and it replace single occurrence.

Note: This [insertText](#) API accepts following control characters

- * New line characters ("\\r", "\\r\\n", "\\n") - Inserts a new paragraph and appends the remaining text to the new paragraph.
- * Line break character ("\\v") - Moves the remaining text to start in new line.
- * Tab character ("\\t") - Allocates a tab space and continue the next character.

The following example code illustrates how to find a text in the document and replace each occurrence of the text one by one programmatically.

```
`ts
container.documentEditor.search.findAll('works');
let searchLength: number = container.documentEditor.search.searchResults.length;
for (let i = 0; i < searchLength; i++) {
// It will move selection to specific searched index,move to each occurrence one by one
container.documentEditor.search.searchResults.index = i;
// Replace it with some text
container.documentEditor.editor.insertText('Hello');
}
container.documentEditor.search.searchResults.clear();
```

SearchResultsChange event

[DocumentEditor](#) exposes the [searchResultsChange](#) event that will be triggered whenever search results are changed. Consider the following scenarios:

- A search operation is completed with some results.
- The results are replaced with some other text, since it will be cleared automatically.
- The results are cleared explicitly.

Refer to the following code example.

```
`ts
documenteditor.searchResultsChange = function() {
};
```

Customize find and replace

Using the exposed APIs, you can customize the find and replace functionality in your application. Refer to the following sample code.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({ enableSelection:
true, enableSearch: true, enableEditor: true, isReadOnly: false });
documenteditor.appendTo('#DocumentEditor');
var sfdt = `{
  "sections": [
    {
      "blocks": [
        {
          "inlines": [
            {
              "characterFormat": {
                "bold": true,
                "italic": true
              },
              "text": "Adventure Works Cycles, the fictitious
company on which the AdventureWorks sample databases are based, is a large,
multinational manufacturing company. The company manufactures and sells
metal and composite bicycles to North American, European and Asian
commercial markets. While its base operation is located in Bothell,
Washington with 290 employees, several regional sales teams are located
throughout their market base."
            }
          ]
        }
      ]
    }
  ]
};
documenteditor.open(sfdt);
document.getElementById('replace_all').addEventListener('click',function ()
{
  var textToFind = (document.getElementById('find_text')).value;
  var textToReplace = (document.getElementById('replace_text')).value;
  if (textToFind !== '') {
    // Find all the occurrences of given text
    documenteditor.searchModule.findAll(textToFind);
    if (documenteditor.searchModule.searchResults.length > 0) {
      // Replace all the occurrences of given text
      documenteditor.searchModule.searchResults.replaceAll(textToReplace);
    }
  }
});
```

```

Keyboard shortcut in ##Platform_Name## Document editor control

Text formatting

The following table lists the default keyboard shortcuts in Document Editor for formatting text:

Key combination	Description
-----	-----
Ctrl + B	Toggles the bold property of selected text.
Ctrl + I	Toggles the italic property of selected text.
Ctrl + U	Toggles the underline property of selected text.
Ctrl + +	Toggles the subscript formatting of selected text.
Ctrl + Shift + +	Toggles the superscript formatting of selected contents.
Ctrl + }	Increases the actual font size of selected text by one point.
Ctrl + {	Decreases the actual font size of selected text by one point.

Paragraph formatting

The following table lists the default keyboard shortcuts for formatting the paragraph:

Key combination	Description
-----	-----
Ctrl + E	Selected paragraphs are center aligned.
Ctrl + J	Selected paragraphs are justified.
Ctrl + L	Selected paragraphs are left aligned.
Ctrl + R	Selected paragraphs are right aligned.
Ctrl + 1	Single line spacing is applied for selected paragraphs.
Ctrl + 5	1.5 line spacing is applied for selected paragraphs.
Ctrl + 2	Double spacing is applied for selected paragraphs.
Ctrl + 0	No spacing is applied before the selected paragraphs.
Ctrl + M	Increases the left indent of selected paragraphs by a factor of 36 points.
Ctrl + Shift + M	Decreases the left indent of selected paragraphs by a factor of 36 points.
Ctrl + *	Show/Hide the hidden characters like spaces, tab, paragraph marks, and breaks.

Clipboard

Key Combination	Description
-----	-----
Ctrl + C	Copies selected contents to the clipboard.
Ctrl + V	Pastes plain text content from the clipboard.
Ctrl + X	Moves selected content to the clipboard.

Keyboard shortcut to navigate around the document

Key Combination	Description
----- -----	
Left arrow	Moves the cursor position one character to the left.
Right arrow	Moves the cursor position one character to the right.
Down arrow	Moves the cursor position down one line.
Up arrow	Moves the cursor position up one line.
Ctrl + Left arrow	Moves the cursor position one word to the left.
Ctrl + Right arrow	Moves the cursor position one word to the right.
Ctrl + Up arrow	Moves the cursor position one paragraph up.
Ctrl + Down arrow	Moves the cursor position one paragraph down.
Tab (in table)	Moves the cursor position one cell to the right.
Shift + Tab (in table)	Moves the cursor position one cell to the left.
Home	Moves the cursor position to the start of a line.
End	Moves the cursor position to the end of a line.
Page up	Moves the cursor position one screen up.
Page down	Moves the cursor position one screen down.
Ctrl + Home	Moves the cursor position to the start of a document.
Ctrl + End	Moves the cursor position to the end of a document.

Keyboard shortcut to extend selection

Key Combination	Description
----- -----	
Shift + Left arrow	Extends selection one character to the left.
Shift + Right arrow	Extends selection one character to the right.
Shift + Down arrow	Extends selection one line downward.
Shift + Up arrow	Extends selection one line upward.
Shift + Home	Extends selection to the start of a line.
Shift + End	Extends Selection to the end of a line.
Ctrl + A	Extends selection to the entire document.
Ctrl + Shift + Left arrow	Extends selection one word to the left.
Ctrl + Shift + Right arrow	Extends selection one word to the right.
Ctrl + Shift + Down arrow	Extends selection to the end of a paragraph.
Ctrl + Shift + Up arrow	Extends selection to the start of a paragraph.
Ctrl + Shift + Home	Extends selection to the start of a document.

|Ctrl + Shift + End| Extends selection to the end of a document. |

Find and Replace

|Key Combination|Description|

|-----|-----|

|Ctrl + F| Opens options pane. |

|Ctrl + H| Opens replace tab in options pane. |

Create, Save and Print document

|Key Combination|Description|

|-----|-----|

|Ctrl + N| Opens empty document. |

|Ctrl + S| Saves the document in SFDt format. |

|Ctrl + P| Prints the document. |

Edit Operation

|Key Combination|Description|

|-----|-----|

|Backspace | Deletes one character to the left. |

|Delete | Deletes one character to the right. |

|Ctrl + Z | Undo last performed action. |

|Ctrl + Y | Redo last undo action. |

Insert special characters

|Key Combination|Description|

|-----|-----|

|Ctrl + Enter | Inserts page break. |

|Shift + Enter | Inserts line break. |

Dialog

|Key Combination|Description|

|-----|-----|

|Ctrl + F| Opens options pane. |

|Ctrl + D| Opens font dialog. |

|Ctrl + K| Opens hyperlink dialog. |

Scrolling zooming in ##Platform_Name## Document editor control

The Document Editor renders the document as page by page. You can scroll through the pages by mouse wheel or touch interactions. You can also scroll through the page by using 'scrollToPage()' method of Document Editor instance. Refer to the following code example.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false
});
documenteditor.appendTo('#DocumentEditor');
onLoadDefault();
documenteditor.scrollToPage(2);
function onLoadDefault() {
  var defaultDocument = {
    "sections": [
      {
        "blocks": [
          {
            "paragraphFormat": {
              "styleName": "Normal"
            },
            "inlines": [
              {
                "text": "First page"
              }
            ]
          }
        ],
        "headersFooters": {},
      },
      {
        "blocks": [
          {
            "paragraphFormat": {
              "styleName": "Normal"
            },
            "inlines": [
              {
                "text": "Second page"
              }
            ]
          }
        ],
        "headersFooters": {},
      }
    ],
    "characterFormat": {},
    "paragraphFormat": {},
    "background": {
      "color": "#FFFFFF"
    },
    "styles": [
      {
        "type": "Paragraph",
        "name": "Normal",
```

```

        "next": "Normal"
    },
    {
        "type": "Character",
        "name": "Default Paragraph Font"
    }
]
}
documenteditor.open(JSON.stringify(defaultDocument));
documenteditor.focusIn();
}

```

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="DocumentEditor">
    </div>
    <div id="page-fit-type-div"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Calling this method brings the specified page into view but doesn't move selection. Hence this method will work by default. That is, it works even if selection is not enabled.

In case, if you wish to move the selection to any page in Document Editor and bring it into view, you can use 'goToPage()' method of selection instance. Refer to the following code example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false, serviceUrl:
  'https://services.syncfusion.com/js/production/api/documenteditor/'
});
documenteditor.enableAllModules();
documenteditor.appendTo('#DocumentEditor');
onLoadDefaultDocument();
documenteditor.viewer.selection.goToPage(3);
function onLoadDefaultDocument() {
  var defaultDocument = {
    "sections": [
      {
        "blocks": [
          {
            "paragraphFormat": {
              "styleName": "Normal"
            },
            "inlines": [
              {
                "text": "First page"
              }
            ]
          }
        ],
        "headersFooters": {},
      },
      {
        "blocks": [
          {
            "paragraphFormat": {
              "styleName": "Normal"
            },
            "inlines": [
              {
                "text": "Second page"
              }
            ]
          }
        ],
        "headersFooters": {},
      },
    ],
  }
}

```

```

        "blocks": [
            {
                "paragraphFormat": {
                    "styleName": "Normal"
                },
                "inlines": [
                    {
                        "text": "Third page"
                    }
                ]
            }
        ],
        "headersFooters": {},
    }
],
"characterFormat": {},
"paragraphFormat": {},

    <div id="container">
        <div id="DocumentEditor">
        </div>
        <div id="page-fit-type-div"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Zooming

You can scale the contents in Document Editor ranging from 10% to 500% of the actual size. You can achieve this using mouse or touch interactions. You can also use 'zoomFactor' property of Document Editor instance. The value can be specified in a range from 0.1 to 5. Refer to the following code example.

`ts

```

import { DocumentEditor } from '@syncfusion/ej2-documenteditor';

//Initialize the Document Editor module.

let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false, serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
});

// Enable all the built in modules.
documenteditor.enableAllModules();
documenteditor.appendTo('#DocumentEditor');

//set zoom factor.
documenteditor.zoomFactor = 3;

```

Page Fit Type

Apart from specifying the zoom factor as value, the Document Editor provides option to specify page fit options such as fit to full page or fit to page width. You can set this option using 'fitPage' method of Document Editor instance. Refer to the following code example.

```
`ts
import { DocumentEditor } from '@syncfusion/ej2-documenteditor';

//Initialize the Document Editor module.

let documenteditor: DocumentEditor = new DocumentEditor({
isReadOnly: false, serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
});

// Enable all the built in modules.
documenteditor.enableAllModules();

documenteditor.appendTo('#DocumentEditor');

//Set zoom factor to fit page width.
documenteditor.fitPage('FitPageWidth');
```

Zoom option using UI

The following code example shows how to provide zoom options in Document Editor.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false, serviceUrl:
  'https://services.syncfusion.com/js/production/api/documenteditor/'
});
documenteditor.enableAllModules();
documenteditor.appendTo('#DocumentEditor');
var statusBarDiv = document.getElementById('page-fit-type-div');
var startPage = 1;
var label = document.createElement('label');
label.styles = 'margin-top: 6px;margin-right: 2px';
label.textContent = 'Page ';
statusBarDiv.appendChild(label);
var pageNumberLabel = document.createElement('label');
pageNumberLabel.id = 'documenteditor_page_no';
pageNumberLabel.style= 'text-transform:capitalize;white-
space:pre;overflow:hidden;user-select:none;cursor:text;height:17px;max-
width:150px';
var editablePageNumber = document.createElement('div');
pageNumberLabel.id= 'editablePageNumber';
pageNumberLabel.style= 'border: 1px solid #F1F1F1;display: inline-
flex;height: 17px;padding: 0px 4px';
pageNumberLabel.className= 'single-line e-de-pagenu-ber-text';
editablePageNumber.appendChild(pageNumberLabel);
updatePageNumber();
```

```
statusBarDiv.appendChild(editablePageNumber);
editablePageNumber.setAttribute('title', 'The current page number in the
document. Click or tap to navigate specific page.');
```

```
var label1 = document.createElement('label');
label1.id = 'documenteditor_pagecount';
label1.styles = 'margin-left:2px;varter-spacing: 1.05px;';
label1.textContent = 'of';
statusBarDiv.appendChild(label1);
var pageCount = document.createElement('label');
pageCount.id = 'documenteditor_pagecount'
pageCount.style = 'margin-left:6px;varter-spacing: 1.05px;';
updatePageCount();
statusBarDiv.appendChild(pageCount);
var editorPageCount = undefined;
var zoom;
var zoomBtn = document.createElement('button');
zoomBtn.id= 'documenteditor-zoom';
zoomBtn.className = 'e-de-statusbar-zoom';
statusBarDiv.appendChild(zoomBtn);
zoomBtn.setAttribute('title', 'Zoom level. Click or tap to open the Zoom
options.');
```

```
var items = [
  {
    text: '200%',
  },
  {
    text: '175%',
  },
  {
    text: '150%',
  },
  {
    text: '125%',
  },
  {
    text: '100%',
  },
  {
    text: '75%',
  },
  {
    text: '50%',
  },
  {
    text: '25%',
  },
  {
    separator: true
  },
  {
    text: 'Fit one page'
  },
  {
    text: 'Fit page width',
  },
];
```

```

zoom = new ej.splitbuttons.DropDownButton({ content: '100%', items: items,
select: onZoom }, zoomBtn);
editablePageNumber.addEventListener('click',
updateDocumentEditorPageNumber);
editablePageNumber.addEventListener('keydown', onKeyDown);
editablePageNumber.addEventListener('blur', onBlur);
documenteditor.viewChange = function (e) {
    updatePageNumberOnViewChange(e);

Print in ##Platform_Name## Document editor control

To print the document, use the [print](#) method from Document Editor instance.

Refer to the following example for showing a document and print it.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
    enablePrint: true
});
documenteditor.appendTo('#DocumentEditor');
var sfdt = {
    "sections": [
        {
            "blocks": [
                {
                    "inlines": [
                        {
                            "characterFormat": {
                                "bold": true,
                                "italic": true
                            },
                            "text": "Hello World"
                        }
                    ]
                }
            ]
        },
        {
            "headersFooters": {
            }
        }
    ]
};
documenteditor.open(JSON.stringify(sfdt));
var printButton = new ej.buttons.Button();
```

```
printButton.appendTo('#print');
document.getElementById('print').addEventListener('click',function (){
    documenteditor.print();
});
```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Improve print quality

Document editor provides an option to improve the print quality using [printDevicePixelRatio](#) in Document editor settings. Document editor using canvas approach to render content. Then, canvas are converted to image and it process for print. Using printDevicePixelRatio API, you can increase the image quality based on your requirement.

The following example code illustrates how to improve the print quality in Document editor container.

```
`ts
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px',
documentEditorSettings: {
  printDevicePixelRatio: 2
}
```

```
});
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
`
```

Note: By default, printDevicePixelRatio value is 1

Print using window object

You can print the document in Document Editor by passing the window instance. This is useful to implement print in third party frameworks such as electron, where the window instance will not be available. Refer to the following example.

```
`ts
import { DocumentEditor, Print } from '@syncfusion/ej2-documenteditor';
DocumentEditor.Inject(Print);
let documenteditor: DocumentEditor = new DocumentEditor({
  enablePrint: true, height: '370px'
});
documenteditor.appendTo('#DocumentEditor');
documenteditor.print(window);
`
```

Page setup

Some of the print options cannot be configured using JavaScript. Refer to the following links to learn more about the browser page setup:

- [Chrome](#)
- [Firefox](#)

However, you can customize margins, paper, and layout options by modifying the section format properties using page setup dialog

```
`ts
import { DocumentEditor, Print, PageSetupDialog, Editor, Selection, EditorHistory } from
 '@syncfusion/ej2-documenteditor';
DocumentEditor.Inject(Print, PageSetupDialog, Editor, Selection, EditorHistory);
let documenteditor: DocumentEditor = new DocumentEditor({
  isReadOnly: false,
  enablePrint: true,
  enablePageSetupDialog: true,
  enableEditor: true,
`
```

```

enableSelection: true,
enableEditorHistory: true,
height: '370px'
});
documenteditor.appendTo('#DocumentEditor');
documenteditor.showPageSetupDialog();
`

```

By customizing margins, papers, and layouts, the layout of the document will be changed in Document Editor. To modify these options during print operation, serialize the document as SFDT using the [serialize](#) method in Document Editor instance and open the SFDT data in another instance of Document Editor in separate window.

The following example shows how to customize layout options only for printing.

INDEX.JS

```

var documenteditor1 = new ej.documenteditor.DocumentEditor({
  isReadOnly: false,
  enablePrint: true,
  enableEditor: true,
  enableSelection: true,
  enableEditorHistory: true,
  enableSfdtExport: true
});
documenteditor1.appendTo('#DocumentEditor');
var documenteditor2 = new ej.documenteditor.DocumentEditor({
  isReadOnly: false,
  enablePrint: true,
  enableEditor: true,
  enableSelection: true,
  enableEditorHistory: true,
  enableSfdtExport: true
});
documenteditor2.appendTo('#DocumentEditor2');
var printButton = new ej.buttons.Button();
printButton.appendTo('#print');
document.getElementById('print').addEventListener('click', function () {
  var sfdtData = documenteditor1.serialize();
  documenteditor2.open(sfdtData);
  //Set A5 paper size
  documenteditor2.selection.sectionFormat.pageWidth = 419.55;
  documenteditor2.selection.sectionFormat.pageHeight = 595.30;
  documenteditor2.print();
});

```

Dialog in ##Platform_Name## Document editor control

Document Editor provides dialog support to major operations such as insert or edit hyperlink, formatting text, paragraph, style, list and table properties.

Font Dialog

Font dialog allows you to modify all text properties for selected contents at once such as bold, italic, underline, font size, font color, strikethrough, subscript and superscript.

Refer to the following example.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
enableFontDialog: true, enableSelection: true, enableEditor: true,
isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
    documenteditor.showDialog('Font');
});
```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Paragraph dialog

This dialog allows modifying the paragraph formatting for selection at once such as text alignment, indentation, and spacing.

To open this dialog, refer to the following example.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  enableParagraphDialog: true, enableSelection: true, enableEditor: true,
  isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
  documenteditor.showDialog('Paragraph');
});
```

Table of contents dialog

This dialog allows creating and inserting table of contents at cursor position. If the table of contents already exists at cursor position, you can customize its properties.

To open this dialog, refer to the following example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
enableTableOfContentsDialog: true, enableSelection: true, enableEditor:
true, isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
    documenteditor.showDialog('TableOfContents');
});

```

Styles Dialog

This dialog allows managing the styles in a document. It will display all the styles in the document with options to modify the properties of the existing style or create new style with the help of 'Style dialog'. Refer to the following example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
  enableStyleDialog: true, enableStylesDialog: true, enableSelection: true,
  enableEditor: true, isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
  documenteditor.showDialog('Styles');
});

```

Column dialog

This dialog allows the end user to customize the number of columns, column width, and space between columns for the pages in a section.

To open this dialog, refer to the following example.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({
enablePageSetupDialog: true, enableSelection: true, enableEditor: true,
isReadOnly: false, enableEditorHistory: true });
documenteditor.appendTo('#DocumentEditor');
document.getElementById('dialog').addEventListener('click', function () {
    documenteditor.showDialog('PageSetup');
});

```

INDEX.HTML

```

Chart in ##Platform_Name## Document editor control

Document Editor provides chart preservation support. Using Document Editor, you can see the chart reports from your Word document.

The following example shows chart preservation in Document Editor.

INDEX.JS

```

var documenteditor = new ej.documenteditor.DocumentEditor({ isReadOnly:
false, serviceUrl:
'https://services.syncfusion.com/js/production/api/documenteditor/' });
documenteditor.acceptTab = true;
documenteditor.enableAllModules();
documenteditor.pageOutline = '#E0E0E0';
documenteditor.appendTo('#DocumentEditor');

```

```

Supported Chart Types

The following chart types are supported in Document Editor

- Scatter_Markers
- Bubble
- Area
- Area_Stacked
- AreaStacked100
- Bar_Clustered
- Bar_Stacked
- BarStacked100
- Column_Clustered
- Column_Stacked
- ColumnStacked100
- Pie
- Doughnut
- Line
- Line_Markers
- LineMarkersStacked
- LineMarkersStacked_100
- Line_Stacked
- LineStacked100

Content control in ##Platform_Name## Document editor control

Document Editor provides content control preservation support (i.e.) Content control present in the input document is preserved upon saving.

Content controls can be categorized based on its occurrence in a document as follows,

InlineContentControl: Among inline content inside, as a child of a paragraph.

BlockContentControl: Among paragraphs and tables, as a child of a Body, HeaderFooter.

Types of Content Controls

- Rich Text
- Plain Text
- Check Box
- Date picker
- Drop-Down List and Combo Box
- Picture

Note: Content control with custom XML mapping of file type WordML is converted as normal Rich Text Content Control to provide lossless round-tripping upon saving.

Restrict editing in ##Platform_Name## Document editor control

Document Editor provides support to restrict editing. When the protected document includes range permission, then unique user or user group only authorized to edit separate text area.

Set current user

You can use the [currentUser](#) property to authorize the current document user by name, email, or user group name.

The following code shows how to set currentUser

```
`ts
documentEditor.currentUser = 'engineer@mycompany.com';
`
```

Highlighting the text area

You can highlight the editable region of the current user using the [userColor](#) property.

The following code shows how to set userColor.

```
`ts
documentEditor.userColor = '#fff000';
`
```

Restrict Editing Pane

Restrict Editing Pane provides the following options to manage the document:

- To apply formatting restrictions to the current document, select the allow formatting check box.
- To apply editing restrictions to the current document, select the read only check box.
- To add users to the current document, select more users option and add user from the popup dialog.
- To include range permission to the current document, select parts of the document and choose users who are allowed to freely edit them from the listed check box.
- To apply the chosen editing restrictions, click the **YES, START ENFORCING PROTECTION** button. A dialog box displays asking for a password to protect.
- To stop protection, select **STOP PROTECTION** button. A dialog box displays asking for a password to stop protection.

The following code shows Restrict Editing Pane. To unprotect the document, use password '123'.

Spell check in ##Platform_Name## Document editor control

Document Editor supports performing spell checking for any input text. You can perform spell checking for the text in Document Editor and it will provide suggestions for the mis-spelled words through dialog and in context menu. Document editor's spell checker is compatible with [hunspell dictionary files](#).

`ts

```
import { DocumentEditorContainer, Toolbar, SpellChecker } from '@syncfusion/ej2-documenteditor';
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({
```

```
    enableToolbar: true, enableSpellCheck: true
```

```
});
```

```
container.appendTo('#container');
```

```
//Accessing spell checker.
```

```
let spellChecker: SpellChecker = container.documentEditor.spellChecker;
```

```
//Set language id to map dictionary in server side.;
spellChecker.languageID = 1033;
spellChecker.removeUnderline = false;
//Allow suggestion for miss spelled word/
spellChecker.allowSpellCheckAndSuggestion = true;
`ts
```

Note: Document Editor requires server-side dependencies for spell check configuration.

Refer to the [Document Editor Web API service projects from GitHub](#) link for configuring spell checker in server-side. To know about server-side dependencies, please refer this [page](#).

Features

- Supports context menu suggestions.
- Provides built-in options to Ignore, Ignore All, Change, Change All for error words in spell checker dialog.

Enable SpellCheck

To enable spell check in DocumentEditor, set [enableSpellCheck](#) property as `true` and then configure SpellCheckSettings.

Disable SpellCheck

To disable spell check in DocumentEditor, set [enableSpellCheck](#) property as `false` or remove [enableSpellCheck](#) property initialization code. The default value of this property is false.

Spell check settings

Remove Underline

By default, mis-spelled words are marked with squiggly line. You can also disable this behavior by enabling the [removeUnderline](#) API and now, the squiggly lines will never be rendered for mis-spelled words.

```
`ts
documentEditor.spellChecker.removeUnderline = false;
`ts
```

AllowSpellCheckAndSuggestion

By default, on performing spell check in Document Editor, both spelling and suggestions of the mis-spelled words will be retrieved, and this mis-spelled words can be corrected through context menu suggestions. You can modify this behavior using the [allowSpellCheckAndSuggestion](#) API, which will perform only spell check.

```
`ts
documentEditor.spellChecker.allowSpellCheckAndSuggestion = false;
`ts
```

LanguageID

Document Editor provides multi-language spell check support. You can add as many languages (dictionaries) in the server-side and to use that language for spell checking in Document Editor, it must be matched with [languageID](#) you pass in the Document Editor.

```
`ts
```

```
documentEditor.spellChecker.languageID = 1033; //LCID of "en-us";
```

```
,
```

EnableOptimizedSpellCheck

Document Editor provides option to spellcheck page by page when loading the documents. The default value of this property is false, so when opening the document spellcheck web API will be called for each word in the document. To optimize the frequency of spellcheck web API calls, you can enable this property.

The following code example illustrates how to enable optimized spell checking.

```
`ts
```

```
documentEditor.spellChecker.enableOptimizedSpellCheck = true;
```

```
,
```

Spell check dictionary cache

Starting from **v20.1.0.xx**, we have optimized the performance and memory usage of spell checker by adding a static method to initialize the dictionaries with specified cache count.

By default, the spell checker holds only one language dictionary in memory. If you want to hold multiple dictionaries in memory, you need to set the cache limit by using **InitializeDictionaries** method as in the below example.

```
`c#
```

```
List<DictionaryData> spellDictCollection = new List<DictionaryData>();
```

```
string personalDictPath = string.Empty;
```

```
int cacheCount = 2;
```

```
// Initialize dictionaries
```

```
SpellChecker.InitializeDictionaries(spellDictCollection, personalDictPath, cacheCount);
```

```
,
```

If dictionaries are initialized using **InitializeDictionaries** method, then we should use default constructor of the **SpellChecker** to check spelling and get suggestion as in the below example code, it will prevent reinitialization of already loaded dictionaries.

```
`c#
```

```
public string SpellCheck([FromBody] SpellCheckJsonData spellChecker)
```

```
{
```

```
try {
```

```
SpellChecker spellCheck = new SpellChecker();
```

```
spellCheck.GetSuggestions(spellChecker.LanguageID, spellChecker.TexttoCheck,
spellChecker.CheckSpelling, spellChecker.CheckSuggestion, spellChecker.AddWord);
return Newtonsoft.Json.JsonConvert.SerializeObject(spellCheck);
}
catch
{
return "{\"SpellCollection\":[],\"HasSpellingError\":false,\"Suggestions\":null}";
}
}
,
```

Previously on every `SpellChecker.GetSuggestion()` method call, the `.aff` and dictionary data will be parsed to generate suggestion for miss spelled word. But, starting from v20.1.0.xx, the `.aff` and dictionary data will be parsed only for the first time alone while calling `SpellChecker.GetSuggestion()` method.

Add new root word and possible words to dictionary

If you find any root word is missing in the dictionary file, then you can add that new root word and the rule to form the possible words to dictionary file using `AddNewWord` API in the server-side Spell check library.

Note:

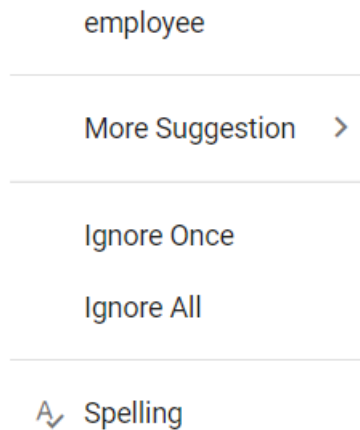

1. The rules are framed automatically using the root word, the possible words and affix file.
2. If you pass null for the parameters `affPath` and `possibleWords`, then it will add a single root word to dictionary.
3. This API is included starting from v20.2.0.xx.

The following code example demonstrates how to add a new root word to the dictionary along with the rule to form the possible words.

```
`c#
SpellChecker spellChecker = new SpellChecker();
// Adds the specified new root word to the dictionary along with the rule to form the possible words.
spellChecker.AddNewWord("en.dic","en.aff", "construct", new string[] { "constructs", "reconstruct",
"constructed", "constructive" });
,
```

Context menu

Right click on error word to open the context menu with spell check options. Please see below screenshot for your reference.

Suggestions

Context menu shows the suggestions for mis-spelled words. By clicking on the required word from suggestion, the error word gets replaced automatically.

Add To Dictionary

Using this option, you can add the current word to the dictionary. So that the spell checker does not consider that word as error in future.

Ignore Once and Ignore All

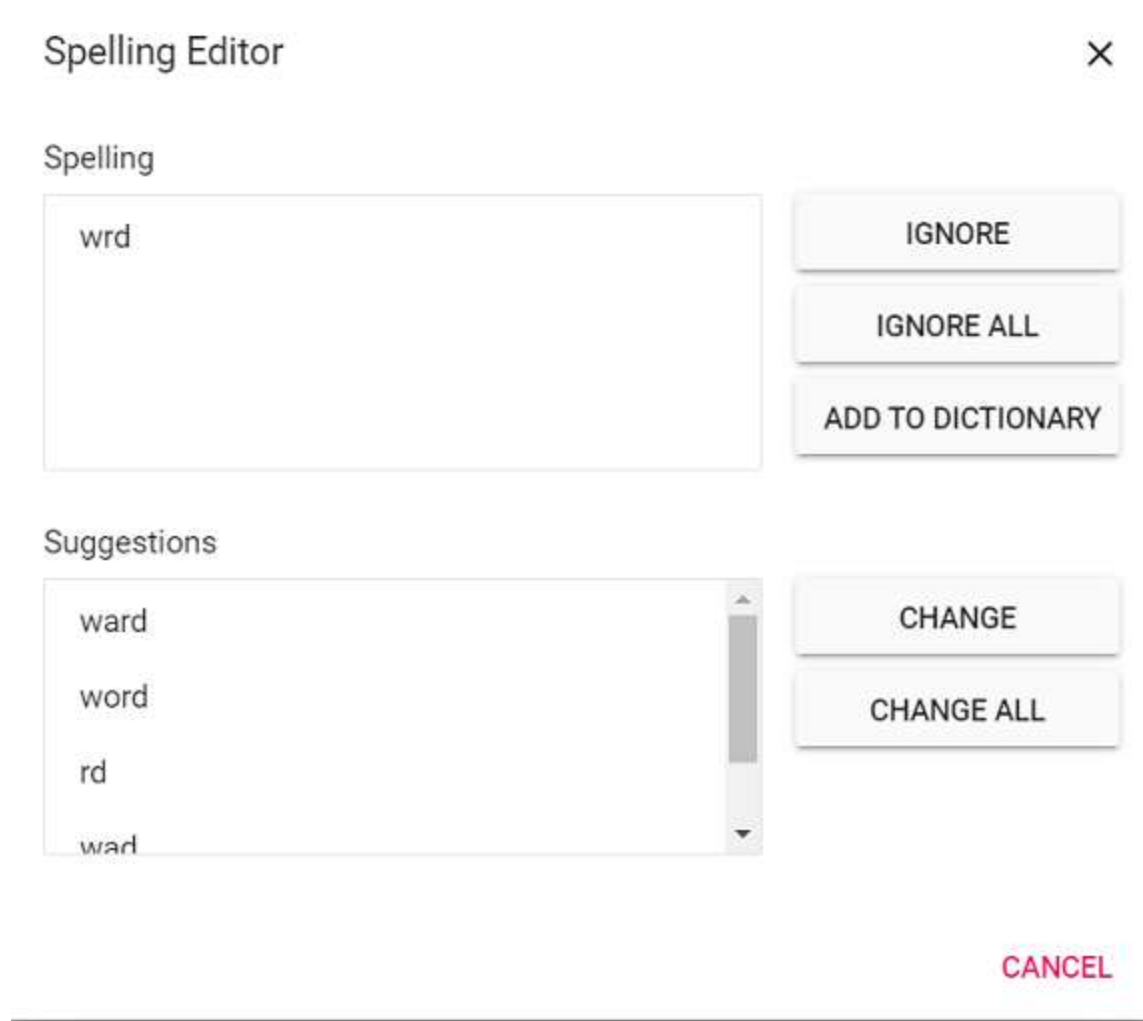

If you do not wish to add the word to dictionary and do not want to show error, use Ignore Once or Ignore All options.

Ignore: ignore only the current occurrence of a word from error.

Ignore All: ignore all occurrence of a word from error in the entire document.

Spelling

Using this option, you can open spell check dialog. Please see below screenshot for your reference.

Global local in ##Platform_Name## Document editor control

Localization

The [Localization](#) library allows you to localize default text content of the DocumentEditor. The Document Editor component has static text on some features (like find & replace, context-menu, dialogs) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the locale value and translation object. Please refer the sample link [RTL](#)

Note: Please refer the [Locale](#).

[Notes in ##Platform_Name## Document editor control](#)

DocumentEditorContainer component provides support for inserting footnotes and endnotes through the in-built toolbar. Refer to the following screenshot.

The Footnotes and endnotes are both ways of adding extra bits of information to your writing outside of the main text. You can use footnotes and endnotes to add side comments to your work or to place other publications like books, articles, or websites.

Insert footnotes

Document Editor exposes an API to insert footnotes at cursor position programmatically or can be inserted to the end of selected text.

```
`ts
```

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```
//Inject require modules.
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({
```

```
enableToolbar: true,
```

```
serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
```

```
});
```

```
container.appendTo('#DocumentEditor');
```

```
//Insert footnote in current selection.
```

```
container.documentEditor.editor.insertFootnote();
```

```
,
```

Insert endnotes

Document Editor exposes an API to insert endnotes at cursor position programmatically or can be inserted to the end of selected text.

```
`ts
```

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```
//Inject require modules.
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({
```

```
enableToolbar: true,
```

```
serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
```

```
});
```

```
container.appendTo('#DocumentEditor');
```

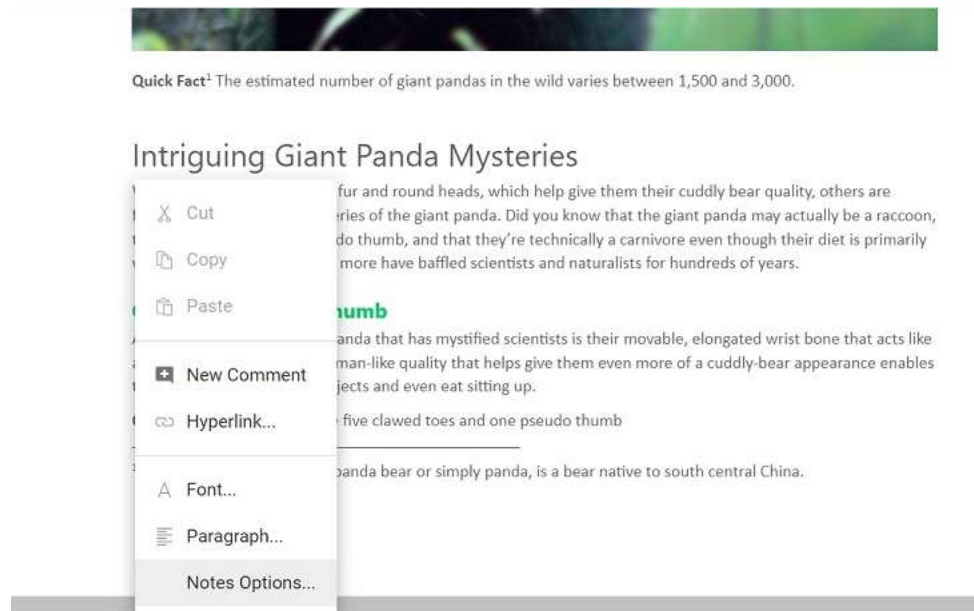

```
//Insert endnote in current selection.
```

```
container.documentEditor.editor.insertEndnote();
```

```
,
```

Update or edit footnotes and endnotes

You can update or edit the footnotes and endnotes using the built-in context menu shown up by right-clicking it. The footnote endnote dialog box popup and you can customize the number format and start at. Refer to the following screenshot.

How To

Override the keyboard shortcuts in `##Platform_Name##` Document editor control

Document Editor triggers the [keyDown](#) event every time when any key is entered and provides an instance of [DocumentEditorKeyDownEventArgs](#). You can use the [isHandled](#) property to override the keyboard shortcut behavior.

Preventing default keyboard shortcut

The following code shows how to prevent the **CTRL + C** keyboard shortcut for copying selected content in Document Editor.

INDEX.TS

```
import { DocumentEditor, Selection, Editor, DocumentEditorKeyDownEventArgs }
from '@syncfusion/ej2-documenteditor';
//Inject require modules.
DocumentEditor.Inject(Selection, Editor)
//Initialize Document Editor.
let documentEditor: DocumentEditor = new DocumentEditor({ enableEditor:
true, isReadOnly: false, height: '370px' });
documentEditor.appendTo('#DocumentEditor');
//Prevent keyboard shortcut inside `keyDown` event.
documentEditor.keyDown = function (args: DocumentEditorKeyDownEventArgs) {
    let keyCode: number = args.event.which || args.event.keyCode;
    let isCtrlKey: boolean = (args.event.ctrlKey || args.event.metaKey) ?
true : ((keyCode === 17) ? true : false);
    //67 is the character code for 'C'
    if (isCtrlKey && keyCode === 67) {
        //To prevent copy operation set isHandled to true
        args.isHandled = true;
    }
}
```

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Override or define the keyboard shortcut

Override or define a new keyboard shortcut behavior instead of preventing the keyboard shortcut.

For example, **Ctrl + S** keyboard shortcut saves the document in SFDT format by default, and there is no behavior for **Ctrl + Alt + S**. The following code demonstrates how to override the **Ctrl + S** shortcut to save a document in DOCX format and define **Ctrl + Alt + S** to save the document in SFDT format.

INDEX.TS

```
import { DocumentEditor, Selection, Editor, DocumentEditorKeyDownEventArgs,
SfdtExport, WordExport } from '@syncfusion/ej2-documenteditor';
//Inject require modules.
DocumentEditor.Inject(Selection, Editor, SfdtExport, WordExport);
//Initialize Document Editor.
let documentEditor: DocumentEditor = new DocumentEditor({ height: '370px',
enableEditor: true, enableSfdtExport: true, enableWordExport: true,
isReadOnly: false });
documentEditor.appendTo('#DocumentEditor');
//Override keyboard shortcut inside `keyDown` event.
documentEditor.keyDown = function (args: DocumentEditorKeyDownEventArgs) {
    let keyCode: number = args.event.which || args.event.keyCode;
    let isCtrlKey: boolean = (args.event.ctrlKey || args.event.metaKey) ?
true : ((keyCode === 17) ? true : false);
    let isAltKey: boolean = args.event.altKey ? args.event.altKey :
((keyCode === 18) ? true : false);
    //83 is the character code for 'S'
    if (isCtrlKey && !isAltKey && keyCode === 83) {
        //To prevent default save operation, set the isHandled property to
true
        args.isHandled = true;
        documentEditor.save('sample', 'Docx');
        args.event.preventDefault();
    } else if (isCtrlKey && isAltKey && keyCode === 83) {
        documentEditor.save('sample', 'Sfdt');
    }
}
```

Customize context menu in ##Platform_Name## Document editor control

How to customize context menu in Document Editor

Document Editor allows you to add custom option in context menu. It can be achieved by using the [addCustomMenu\(\)](#) method and custom action is defined using the [customContextMenuSelect](#)

Add Custom Option

The following code shows how to add custom option in context menu.

```
`ts
```

```

let documentEditor: DocumentEditor = new DocumentEditor({
isReadOnly: false, serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
});
documentEditor.enableAllModules();
documentEditor.appendTo('#DocumentEditor');
//Creating custom menu items
let menuItems: MenuItemModel[] = [
{
text: 'Search In Google',
id: 'searchingoogle',
iconCss: 'e-icons e-de-ctnr-find'
}
];

```

```
//Adding custom options
documentEditor.contextMenu.addCustomMenu(menuItems, false);
//To handle contextmenu select event
documentEditor.customContextMenuSelect = (args: CustomContextMenuEventArgs): void => {
  let item: string = args.id;
  let id: string = documentEditor.element.id;
  switch (item) {
    case id + 'searchingoogle':
      let searchContent: string = documentEditor.selection.text;
      if (!documentEditor.selection.isEmpty && /\S/.test(searchContent)) {
        window.open('http://google.com/search?q=' + searchContent);
      }
      break;
  }
};
`
```

[Customize custom option in context menu](#)

Document Editor allows you to customize the added custom option and also to hide/show default context menu.

[Hide default context menu items](#)

The following code shows how to hide default context menu and add custom option in context menu.

```
`ts
let documentEditor: DocumentEditor = new DocumentEditor({
  isReadOnly: false, serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
});
documentEditor.enableAllModules();
documentEditor.appendTo('#DocumentEditor');
//Creating custom menu items
let menuItems: MenuItemModel[] = [
  {
    text: 'Search In Google',
    id: 'searchingoogle',
    iconCss: 'e-icons e-de-ctnr-find'
  }
];
```

//Adding custom options

```
documentEditor.contextMenu.addCustomMenu(menuItems, true);
```

,

[Customize added context menu items](#)

The following code shows how to hide/show added custom option in context menu using the [customContextMenuBeforeOpen](#).

`ts

```
let documentEditor: DocumentEditor = new DocumentEditor({
  isReadOnly: false, serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/'
});
```

```
documentEditor.enableAllModules();
```

```
documentEditor.appendTo('#DocumentEditor');
```

//Creating custom menu items

```
let menuItems: MenuItemModel[] = [
```

```
{
```

```
  text: 'Search In Google',
```

```
  id: 'searchingoogle',
```

```
  iconCss: 'e-icons e-de-ctnr-find'
```

```
});
```

//Adding custom options

```
documentEditor.contextMenu.addCustomMenu(menuItems, false);
```

//To show/hide custom menu item

```
documentEditor.customContextMenuBeforeOpen = (args:
  BeforeOpenCloseCustomContentMenuEventArgs): void => {
```

```
  let search: HTMLElement = document.getElementById(args.ids[0]);
```

```
  search.style.display = 'none';
```

```
  let searchContent: string = documentEditor.selection.text;
```

```
  if ((!documentEditor.selection.isEmpty) && (/S/.test(searchContent))) {
```

```
    search.style.display = 'block';
```

```
  }
```

```
};
```

//To handle contextmenu select event

```
documentEditor.customContextMenuSelect = (args: CustomContentMenuEventArgs): void => {
```

```
  let item: string = args.id;
```

```

let id: string = documentEditor.element.id;
switch (item) {
case id + 'searchingoogle':
let searchContent: string = documentEditor.selection.text;
if (!documentEditor.selection.isEmpty && /\S/.test(searchContent)) {
window.open('http://google.com/search?q=' + searchContent);
}
break;
}
};

```

The following is the output of custom context menu with customization.

Customize tool bar in ##Platform_Name## Document editor control

How to customize existing toolbar in DocumentEditorContainer

DocumentEditorContainer allows you to customize(add, show, hide, enable, and disable) existing items in a toolbar.

- Add - New items can be defined by [CustomToolbarItemModel](#) and with existing items in [toolbarItems](#) property. Newly added item click action can be defined in [toolbarclick](#).
- Show, Hide - Existing items can be shown or hidden using the [toolbarItems](#) property. Pre-defined toolbar items are available with [ToolbarItem](#).
- Enable, Disable - Toolbar items can be enabled or disable using [enableItems](#)

```
`ts
```

```
let toolItem: CustomToolbarItemModel = {
    prefixIcon: "e-de-ctnr-lock",
    tooltipText: "Disable Image",
    text: "Disable Image",
    id: "Custom"
};

//Initialize Document Editor Container component with custom toolbar item.
let container: DocumentEditorContainer = new DocumentEditorContainer({
    toolbarItems: [toolItem, 'Undo', 'Redo', 'Separator', 'Image', 'Table', 'Hyperlink', 'Bookmark',
    'Comments', 'TableOfContents', 'Separator', 'Header', 'Footer', 'PageSetup', 'PageNumber', 'Break',
    'Separator', 'Find', 'Separator', 'LocalClipboard', 'RestrictEditing']
});
```

```
//To handle custom toolbar click event.
container.toolbarClick = (args: ClickEventArgs): void => {
  switch (args.item.id) {
    case 'Custom':
      //Disable image toolbar item.
      container.toolbar.enableItems(4, false);
      break;
  }
};
`
```

Note: Default value of `toolbarItems` is ['New', 'Open', 'Separator', 'Undo', 'Redo', 'Separator', 'Image', 'Table', 'Hyperlink', 'Bookmark', 'TableOfContents', 'Separator', 'Header', 'Footer', 'PageSetup', 'PageNumber', 'Break', 'InsertFootnote', 'InsertEndnote', 'Separator', 'Find', 'Separator', 'Comments', 'TrackChanges', 'Separator', 'LocalClipboard', 'RestrictEditing', 'Separator', 'FormFields', 'UpdateFields'].

Change document view in `##Platform_Name##` Document editor control

How to change the document view in DocumentEditor component

DocumentEditor allows you to change the view to web layout and print using the [layoutType](#) property with the supported [LayoutType](#).

```
`ts
let docEdit: DocumentEditor = new DocumentEditor({ layoutType: 'Continuous'});
`
```

Note: Default value of [layoutType](#) in DocumentEditor component is [Pages](#).

How to change the document view in DocumentEditorContainer component

DocumentEditorContainer component allows you to change the view to web layout and print using the [layoutType](#) property with the supported [LayoutType](#).

```
`ts
let container: DocumentEditorContainer = new DocumentEditorContainer({ layoutType: "Continuous" });
`
```

Note: Default value of [layoutType](#) in DocumentEditorContainer component is [Pages](#).

Open default document in `##Platform_Name##` Document editor control

In this article, we are going to see how to open a default document when DocumentEditor & DocumentEditorContainer is initialized.

Opening a default document in DocumentEditor

By default, Document Editor will open blank document. You can use [open](#) API in Document Editor to open the sfdt content.

Document editor have [created](#) event which gets triggered once Document editor control created. So, if you want to open the document by default, you can use [open](#) and [created](#) API.

The following example illustrates how to open the default SFDT content once Document editor control gets created.

INDEX.JS

```
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false, serviceUrl:
  'https://services.syncfusion.com/js/production/api/documenteditor/'
});
documenteditor.enableAllModules();

```

Note: You can use the [restrictEditing](#) in DocumentEditorContainer and [isReadOnly](#) in DocumentEditor based on your requirement to change component to read only mode.

Open document by address in ##Platform_Name## Document editor control

How to open a document from URL in DocumentEditor

In this article, we are going to see how to open a document from URL in DocumentEditor

please refer below example for client-side code

```
`ts
```

```
//Initialize Document Editor Container component.
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer();
```

```
container.appendTo('#DocumentEditorContainer');
```

```
document.getElementById('import').addEventListener('click', () => {
```

```
let http: XMLHttpRequest = new XMLHttpRequest();
```

```
//add your url in which you want to open document inside the ""
```

```
let content = { fileUrl: "" };
```

```
let baseUrl: string = "/api/documenteditor/ImportFileURL";
http.open("POST", baseUrl, true);
http.setRequestHeader("Content-Type", "application/json;charset=UTF-8");
http.onreadystatechange = () => {
    if (http.readyState === 4) {
        if (http.status === 200 || http.status === 304) {
            //open the SFDT text in Document Editor
            container.documentEditor.open(http.responseText);
        }
    }
};
http.send(JSON.stringify(content));
});
`
```

please refer below example for server-side code

```
`c#
[AcceptVerbs("Post")]
public string ImportFileURL([FromBody]FileUrlInfo param)
{
    try {
        using(WebClient client = new WebClient())
        {
            MemoryStream stream = new MemoryStream(client.DownloadData(param.fileUrl));
            WordDocument document = WordDocument.Load(stream, FormatType.Docx);
            string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
            document.Dispose();
            stream.Dispose();
            return json;
        }
    }
    catch (Exception) {
        return "";
    }
}
```

```

}
public class FileInfo {
public string fileUrl { get; set; }
public string Content { get; set; }
}
`

```

Deploy document editor component for mobile in `##Platform_Name##` Document editor control
[Document editor component for Mobile](#)

At present, Document editor component is not responsive for mobile, and we haven't ensured the editing functionalities in mobile browsers. Whereas it works properly as a document viewer in mobile browsers.

Hence, it is recommended to switch the Document editor component as read-only in mobile browsers. Also, invoke [fitPage](#) method with [FitPageWidth](#) parameter in document change event, such as to display one full page by adjusting the zoom factor.

The following example code illustrates how to deploy Document Editor component for Mobile.

```

`ts
//Initialize Document Editor Container component.
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);
let container: DocumentEditorContainer = new DocumentEditorContainer({
enableToolbar: true, height: '590px'
});
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#DocumentEditor');
//To detect the device
let isMobileDevice: bool = /Android|Windows Phone|webOS/i.test(navigator.userAgent);
container.documentChange = () => {
if (isMobileDevice) {
container.restrictEditing = true;
setTimeout(() => {
container.documentEditor.fitPage("FitPageWidth");
}, 50);
}
else {
container.restrictEditing = false;
}
}

```

```

}
}
`

```

You can download the complete working example from this [GitHub location](#)

Note: You can use the [restrictEditing](#) in DocumentEditorContainer and [isReadOnly](#) in DocumentEditor based on your requirement to change component to read only mode.

Disable optimized text measuring in `Platform_Name` Document editor control

Starting from v19.3.0.x, the accuracy of text size measurements in Document editor is improved such as to match Microsoft Word pagination for most Word documents. This improvement is included as default behavior along with an optional API [enableOptimizedTextMeasuring](#) in Document editor settings.

If you want the Document editor component to retain the document pagination (display page-by-page) behavior like v19.2.0.x and older versions. Then you can disable this optimized text measuring improvement, by setting `false` to [enableOptimizedTextMeasuring](#) property of JavaScript Document Editor component.

Disable optimized text measuring in `DocumentEditorContainer` instance

The following example code illustrates how to disable optimized text measuring improvement in `DocumentEditorContainer` instance.

```

`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

// Disable optimized text measuring improvement
container.documentEditorSettings = { enableOptimizedTextMeasuring: false };
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
`

```

Disable optimized text measuring in `DocumentEditor` instance

The following example code illustrates how to disable optimized text measuring improvement in `DocumentEditor` instance.

```

`ts
import { DocumentEditor } from '@syncfusion/ej2-documenteditor';

let documenteditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, height: '370px',
serviceUrl: 'https://services.syncfusion.com/js/production/api/documenteditor/' });

documenteditor.enableAllModules();

// Disable optimized text measuring improvement
documenteditor.documentEditorSettings = { enableOptimizedTextMeasuring: false };

```

```
documenteditor.appendTo('#DocumentEditor');
`
```

Get the selected content in `##Platform_Name##` Document editor control

You can get the selected content from the JavaScript Document Editor component as plain text and SFDT (rich text).

Get the selected content as plain text

You can use [text](#) API to get the selected content as plain text from JavaScript Document Editor component.

The following example code illustrates how to add search in google option in context menu for the selected text.

```
`ts
import { DocumentEditorContainer, Toolbar, CustomContentMenuEventArgs } from '@syncfusion/ej2-
documenteditor';

import { MenuItemModel } from '@syncfusion/ej2-navigations';

DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';

container.appendTo('#container');

//Creating custom menu items
let menuItems: MenuItemModel[] = [
{
text: 'Search In Google',
id: 'searchingoogle',
iconCss: 'e-icons e-de-ctnr-find'
}
];

//Adding custom options
container.documentEditor.contextMenu.addCustomMenu(menuItems, false);

//To handle contextmenu select event
container.documentEditor.customContextMenuSelect = (args: CustomContentMenuEventArgs): void =>
{
let item: string = args.id;
let id: string = container.documentEditor.element.id;
switch (item) {
case id + 'searchingoogle':
// To get the selected content as plain text
```

```
let searchContent: string = container.documentEditor.selection.text;
if (!container.documentEditor.selection.isEmpty && /\S/.test(searchContent)) {
window.open('http://google.com/search?q=' + searchContent);
}
break;
}
};
`
```

You can add the following custom options using this API,

- Save or export the selected text as text file.
- Search the selected text in Google or other search engines.
- Show synonyms for the selected word in context menu and replace with selected synonym using the setter method of same API.

Get the selected content as SFDT (rich text)

You can use [sfdt](#) API to get the selected content as plain text from JavaScript Document Editor component.

The following example code illustrates how to get the content of a bookmark and export it as SFDT.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');
// To select all the content in document
container.documentEditor.selection.selectAll();
// Insert bookmark to selected content
container.documentEditor.editor.insertBookmark('Bookmark1');
//Select the bookmark
container.documentEditor.selection.selectBookmark('Bookmark1');
// To get the selected content as sfdt
let selectedContent: string = container.documentEditor.selection.sfdt;
```

```
// Insert the sfdt content in cursor position using paste API
container.documentEditor.editor.paste(selectedContent);
`ts
```

You can add the following custom options using this API,

- Save or export the selected content as SFDT file.
- Get the content of a bookmark in Word document as SFDT by selecting a bookmark using [selectbookmark](#) API.
- Create template content that can be inserted to multiple documents in cursor position using [paste](#) API.

Set default format in document editor in `##Platform_Name##` Document editor control

You can set the default character format, paragraph format and section format in Document editor.

Set the default character format

You can use [setDefaultCharacterFormat](#) method to set the default character format. For example, Document editor default font size is 11 and you can change it as any valid value.

The following example code illustrates how to change the default font size in Document editor.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let container: DocumentEditorContainer = new DocumentEditorContainer({ height: "590px" });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
DocumentEditorContainer.Inject(Toolbar);
// Default font size set as 20
container.setDefaultCharacterFormat({ fontSize: 20 });
container.appendTo('#container');
`ts
```

Similarly, you can change the required [CharacterFormatProperties](#) default value.

The following example code illustrates how to change other character format default value in Document editor.

```
`ts
import { CharacterFormatProperties, DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let container: DocumentEditorContainer = new DocumentEditorContainer({ height: "590px" });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
DocumentEditorContainer.Inject(Toolbar);
// Set default value
let defaultCharacterFormat: CharacterFormatProperties = {
```

```

bold: false,
italic: false,
baselineAlignment: 'Normal',
underline: 'None',
fontColor: "#000000",
fontFamily: 'Algerian',
fontSize: 12
};
container.setDefaultCharacterFormat(defaultCharacterFormat);
container.appendTo('#container');
`

```

Set the default paragraph format

You can use [setDefaultParagraphFormat](#) API to set the default paragraph format. You can change the required [ParagraphFormatProperties](#) default value.

The following example code illustrates how to change the paragraph format(before spacing, line spacing etc.,) default value in Document editor.

```

`ts
import { ParagraphFormatProperties, DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-
documenteditor';

let container: DocumentEditorContainer = new DocumentEditorContainer({ height: "590px" });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
DocumentEditorContainer.Inject(Toolbar);

let defaultParagraphFormat: ParagraphFormatProperties = {
beforeSpacing: 8,
lineSpacing: 1.5,
leftIndent: 24,
textAlignment: "Center"
};

container.setDefaultParagraphFormat(defaultParagraphFormat);
container.appendTo('#container');
`

```

Set the default section format

You can use [setDefaultSectionFormat](#) API to set the default section format. You can change the required [SectionFormatProperties](#) default value.

The following example code illustrates how to change the section format(header and footer distance, page width and height, etc.,) default value in Document editor.

```
`ts
import { SectionFormatProperties, DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-
documenteditor';

let container: DocumentEditorContainer = new DocumentEditorContainer({ height: "590px" });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
DocumentEditorContainer.Inject(Toolbar);

let defaultSectionFormat: SectionFormatProperties = {
  pageWidth: 500,
  pageHeight: 800,
  headerDistance: 56,
  footerDistance: 48,
  leftMargin: 12,
  rightMargin: 12,
  topMargin: 0,
  bottomMargin: 0
};

container.setDefaultSectionFormat(defaultSectionFormat);
container.appendTo('#container');
```

Show hide spinner in ##Platform_Name## Document editor control

Using [spinner](#) component, you can show/hide spinner while opening document in DocumentEditor .

Example code snippet to show/hide spinner

```
`ts
// showSpinner() will make the spinner visible
showSpinner(document.getElementById('container'));

// hideSpinner() method used hide spinner
hideSpinner(document.getElementById('container'));
```

Refer to the following example.

INDEX.JS

```
ej.documenteditor.DocumentEditorContainer.Inject(ej.documenteditor.Toolbar);
var container = new ej.documenteditor.DocumentEditorContainer({
  enableToolbar: true, height:"400"
```

```

});
ej.popups.createSpinner({
    // Specify the target for the spinner to show
    target: document.getElementById('container')
});
document.getElementById('import').addEventListener('click',function(){
    // load your default document here
    var data=
    '{"sections":[{"sectionFormat":{"pageWidth":612,"pageHeight":792,"leftMargin":72,"rightMargin":72,"topMargin":72,"bottomMargin":72,"differentFirstPage":false,"differentOddAndEvenPages":false,"headerDistance":36,"footerDistance":36,"bidi":false},"blocks":[{"paragraphFormat":{"afterSpacing":30,"styleName":"Heading 1","listFormat":{},"characterFormat":{},"inlines":[{"characterFormat":{},"text":"Adventure Works Cycles"}]}]}],"headersFooters":{"header":{"blocks":[{"paragraphFormat":{"listFormat":{},"characterFormat":{},"inlines":[]}}],"footer":{"blocks":[{"paragraphFormat":{"listFormat":{},"characterFormat":{},"inlines":[]}}]}],"characterFormat":{"bold":false,"italic":false,"fontSize":11,"fontFamily":"Calibri","underline":"None","strikethrough":"None","baselineAlignment":"Normal","highlightColor":"NoColor","fontColor":"empty","fontSizeBidi":11,"fontFamilyBidi":"Calibri","allCaps":false},"paragraphFormat":{"leftIndent":0,"rightIndent":0,"firstLineIndent":0,"textAlignment":"Left","beforeSpacing":0,"afterSpacing":0,"lineSpacing":1.0791666507720947,"lineSpacingType":"Multiple","listFormat":{},"bidi":false},"defaultTabWidth":36,"trackChanges":false,"enforcement":false,"hashValue":"","saltValue":"","formatting":false,"protectionType":"NoProtection","dontUseHTMLParagraphAutoSpacing":false,"formFieldShading":true,"styles":[{"name":"Normal","type":"Paragraph","paragraphFormat":{"lineSpacing":1.149999976158142,"lineSpacingType":"Multiple","listFormat":{},"characterFormat":{"fontFamily":"Calibri"},"next":"Normal"},{"name":"Default Paragraph Font","type":"Character","characterFormat":{"fontSize":16,"fontFamily":"Calibri Light","fontColor":"#2F5496"},"basedOn":"Default Paragraph Font"},{"name":"Heading 1","type":"Paragraph","paragraphFormat":{"beforeSpacing":12,"afterSpacing":0,"outlineLevel":"Level1","listFormat":{},"characterFormat":{"fontSize":16,"fontFamily":"Calibri Light","fontColor":"#2F5496"},"basedOn":"Normal","link":"Heading 1 Char","next":"Normal"},{"name":"Heading 2 Char","type":"Character","characterFormat":{"fontSize":13,"fontFamily":"Calibri Light","fontColor":"#2F5496"},"basedOn":"Default Paragraph Font"},{"name":"Heading 2","type":"Paragraph","paragraphFormat":{"beforeSpacing":2,"afterSpacing":6,"outlineLevel":"Level2","listFormat":{},"characterFormat":{"fontSize":13,"fontFamily":"Calibri Light","fontColor":"#2F5496"},"basedOn":"Normal","link":"Heading 2 Char","next":"Normal"},{"name":"Heading 3","type":"Paragraph","paragraphFormat":{"leftIndent":0,"rightIndent":0,"firstLineIndent":0,"textAlignment":"Left","beforeSpacing":2,"afterSpacing":0,"lineSpacing":1.0791666507720947,"lineSpacingType":"Multiple","outlineLevel":"Level3","listFormat":{},"characterFormat":{"fontSize":12,"fontFamily":"Calibri Light","fontColor":"#1F3763"},"basedOn":"Normal","link":"Heading 3 Char","next":"Normal"},{"name":"Heading 3 Char","type":"Character","characterFormat":{"fontSize":12,"fontFamily":"Calibri Light","fontColor":"#1F3763"},"basedOn":"Default Paragraph Font"},{"name":"Heading 4","type":"Paragraph","paragraphFormat":{"leftIndent":0,"rightIndent":0,"fir

</body></html>

```

Note: In above example, we have used setInterval to hide spinner, just for demo purpose.

Resize document editor in `##Platform_Name##` Document editor control

In this article, we are going to see how to change height and width of DocumentEditor.

Change height of Document Editor

DocumentEditorContainer initially render with default height. You can change height of documenteditor using [height](#) property, the value which is in pixel.

The following example code illustrates how to change height of Document Editor.

```
`ts
```

```

let container: DocumentEditorContainer = new DocumentEditorContainer({
enableToolbar: true, height: "590px"
});
container.appendTo('#DocumentEditor');
`

```

Similarly, you can use [height](#) property for DocumentEditor also.

Change width of Document Editor

DocumentEditorContainer initially render with default width. You can change width of documenteditor using [width](#) property, the value which is in percent.

The following example code illustrates how to change width of Document Editor.

```
`ts
let container: DocumentEditorContainer = new DocumentEditorContainer({
enableToolbar: true, width: "100%"
});
container.appendTo('#DocumentEditor');
```

Similarly, you can use [width](#) property for DocumentEditor also.

Resize Document Editor

Using [resize](#) method, you change height and width of Document editor.

The following example code illustrates how to fit Document Editor to browser window size.

```
`ts
import {
DocumentEditorContainer,
Toolbar,
} from '@syncfusion/ej2-documenteditor';

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

DocumentEditorContainer.Inject(Toolbar);

container.serviceUrl =
'https://services.syncfusion.com/js/production/api/documenteditor/';

container.created = (): void => {
setInterval(() => {
updateDocumentEditorSize();
}, 100);

//Adds event listener for browser window resize event.
window.addEventListener('resize', onWindowResize);
};

container.appendTo('#container');

function onWindowResize() {

//Resizes the document editor component to fit full browser window automatically whenever the
browser resized.
```

```

updateDocumentEditorSize();
}
function updateDocumentEditorSize() {
//Resizes the document editor component to fit full browser window.
var windowWidth = window.innerWidth;
var windowHeight = window.innerHeight;
container.resize(windowWidth, windowHeight);
}
`

```

Export document as pdf in ##Platform_Name## Document editor control

In this article, we are going to see how to export the document as Pdf format. You can export the document as Pdf in following ways:

Export the document as pdf in client-side

Use [pdf export component](#) in application level to export the document as pdf using [exportasimage](#) API. Here, all pages will be converted to image and inserted as pdf pages(works like print as PDF).

Note:

- You can install the pdf export packages from this [link](#).
- There is one limitation we can't search the text because we are exporting the pdf as image.

The following example code illustrates how to export the document as pdf in client-side.

```

`ts
import {
DocumentEditorContainer,
ImageFormat,
Toolbar,
} from '@syncfusion/ej2-documenteditor';
import {
PdfBitmap,
PdfDocument,
PdfPageOrientation,
PdfPageSettings,
PdfSection,
SizeF,
} from '@syncfusion/ej2-pdf-export';
let container: DocumentEditorContainer = new DocumentEditorContainer({

```

```

enableToolbar: true,
height: '590px',
});
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl =
'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
document.getElementById('export').addEventListener('click', function () {
let obj = this;
let pdfdocument: PdfDocument = new PdfDocument();
let count: number = container.documentEditor.pageCount;
container.documentEditor.documentEditorSettings.printDevicePixelRatio = 2;
let loadedPage = 0;
for (let i = 1; i <= count; i++) {
setTimeout(() => {
let format: ImageFormat = 'image/jpeg' as ImageFormat;
// Getting pages as image
let image = container.documentEditor.exportAsImage(i, format);
image.onload = function () {
let imageHeight = parseInt(
image.style.height.toString().replace('px', ''
);
let imageWidth = parseInt(
image.style.width.toString().replace('px', ''
);
let section: PdfSection = pdfdocument.sections.add() as PdfSection;
let settings: PdfPageSettings = new PdfPageSettings(0);
if (imageWidth > imageHeight) {
settings.orientation = PdfPageOrientation.Landscape;
}
settings.size = new SizeF(imageWidth, imageHeight);
(section as PdfSection).setPageSettings(settings);
let page = section.pages.add();

```

```

let graphics = page.graphics;
let imageStr = image.src.replace('data:image/jpeg;base64,', '');
let pdfImage = new PdfBitmap(imageStr);
graphics.drawImage(pdfImage, 0, 0, imageWidth, imageHeight);
loadedPage++;
if (loadedPage == count) {
// Exporting the document as pdf
pdfdocument.save(
(container.documentEditor.documentName === ''
? 'sample'
: container.documentEditor.documentName) + '.pdf'
);
}
};
}, 500);
}
});
`

```

Export document as pdf in server-side using Syncfusion DocIO

With the help of [Syncfusion DocIO](#), you can export the document as Pdf in server-side. Here, you can search the text.

The following way illustrates how to convert the document as Pdf:

- Using [serialize](#) API, convert the document as Sfdt and send it to server-side.

The following example code illustrates how to convert the document to sfdt and pass it to server-side.

```

`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let container: DocumentEditorContainer = new DocumentEditorContainer({
enableToolbar: true,
height: '590px',
});
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl =
'https://services.syncfusion.com/js/production/api/documenteditor/';

```

```

container.appendTo('#container');
document.getElementById('export').addEventListener('click', function () {
let http: XMLHttpRequest = new XMLHttpRequest();
// Replace your running web service Url here
http.open('POST', 'http://localhost:62869/api/documenteditor/ExportPdf');
http.setRequestHeader('Content-Type', 'application/json;charset=UTF-8');
http.responseType = 'json';
//Serialize document content as SFDt.
let sfdt: any = { content: container.documentEditor.serialize() };
//Send the sfdt content to server side.
http.send(JSON.stringify(sfdt));
});
`

```

- Using Save API in server-side, you can convert the sfdt to stream.
- Finally, convert the stream to Pdf using [Syncfusion.DocIO.Renderer.Net.Core](#) library.

The following example code illustrates how to process the sfdt in server-side.

```

`c#
[AcceptVerbs("Post")]
[HttpPost]
[EnableCors("AllowAllOrigins")]
[Route("ExportPdf")]
public void ExportPdf([FromBody]SaveParameter data)
{
// Converts the sfdt to stream
Stream document = WordDocument.Save(data.content, FormatType.Docx);
Syncfusion.DocIO.DLS.WordDocument doc = new Syncfusion.DocIO.DLS.WordDocument(document,
Syncfusion.DocIO.FormatType.Docx);
//Instantiation of DocIO.Renderer for Word to PDF conversion
DocIO.Renderer render = new DocIO.Renderer();
//Converts Word document into PDF document
PdfDocument pdfDocument = render.ConvertToPDF(doc);
// Saves the document to server machine file system, you can customize here to save into databases or
file servers based on requirement.

```

```
FileStream fileStream = new FileStream("sample.pdf", FileMode.OpenOrCreate, FileAccess.ReadWrite);  
//Saves the PDF file  
pdfDocument.Save(fileStream);  
pdfDocument.Close();  
fileStream.Close();  
document.Close();  
}  
`
```

Get the complete working sample in this [link](#).

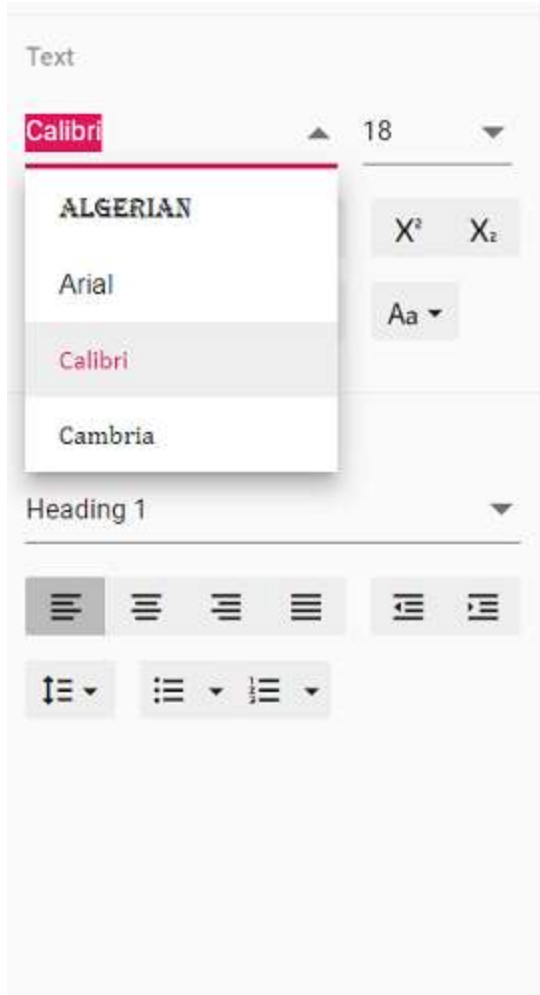

Customize font family drop down in `##Platform_Name## Document editor control`
Document editor provides an options to customize the font family drop down list values using [fontfamilies](#) in Document editor settings. Fonts which are added in fontFamilies of [documentEditorSettings](#) will be displayed on font drop down list of text properties pane and font dialog.

Similarly, you can use [documentEditorSettings](#) property for DocumentEditor also.

The following example code illustrates how to change the font families in Document editor container.

```
`ts  
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true,height:  
'590px',  
// Add required font families to list it in font drop down  
documentEditorSettings: {  
fontFamilies: ['Algerian', 'Arial', 'Calibri', 'Windings'],  
}  
});  
DocumentEditorContainer.Inject(Toolbar);  
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';  
container.appendTo('#container');  
`
```

Output will be like below:

Auto save document in document editor in `##Platform_Name##` Document editor control

In this article, we are going to see how to autosave the document in AWS S3. You can automatically save the edited content in regular intervals of time. It helps reduce the risk of data loss by saving an open document automatically at customized intervals.

The following example illustrates how to auto save the document in AWS S3.

- In the client-side, using content change event, we can automatically save the edited content in regular intervals of time. Based on `contentChanged` boolean, the document send as Docx format to server-side using [saveAsBlob](#) method.

```
`ts
import {
  DocumentEditorContainer,
  Toolbar,
} from '@syncfusion/ej2-documenteditor';
```

```

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });
let contentChanged: boolean = false;
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.created = function () {
  setInterval(() => {
    if (contentChanged) {
      //You can save the document as below
      container.documentEditor.saveAsBlob('Docx').then((blob: Blob) => {
        console.log('Saved sucessfully');
        let exportedDocument: Blob = blob;
        //Now, save the document where ever you want.
        let formData: FormData = new FormData();
        formData.append('fileName', 'sample.docx');
        formData.append('data', exportedDocument);
        / tslint:disable /
        var req = new XMLHttpRequest();
        // Replace your running Url here
        req.open(
          'POST',
          'http://localhost:62869/api/documenteditor/SaveToS3',
          true
        );
        req.onreadystatechange = () => {
          if (req.readyState === 4) {
            if (req.status === 200 || req.status === 304) {
              console.log('Saved sucessfully');
            }
          }
        };
        req.send(formData);
      });
    }
  });
}

```

```

contentChanged = false;
}
}, 1000);
};
container.appendTo('#container');
container.contentChange = (): void => {
contentChanged = true;
};
`c#

```

- In server-side, configure the access key and secret key in `web.config` file and register profile in `startup.cs`.

In `web.config`, add key like below format:

```

`c#
<appSettings>
<add key="AWSProfileName" value="sync_development" />
<add key="AWSAccessKey" value="" />
<add key="AWSSecretKey" value="" />
</appSettings>
`c#

```

In `startup.cs`, register profile in below format:

```

`c#
Amazon.Util.ProfileManager.RegisterProfile("sync_development", "", "");
`c#

```

- In server-side, Receives the stream content from client-side and process it to save the document in aws s3. Add Web API in controller file like below to save the document in aws s3.

```

`c#
[AcceptVerbs("Post")]
[HttpPost]
[EnableCors("AllowAllOrigins")]
[Route("SaveToS3")]
public string SaveToS3()
{

```

```

IFormFile file = HttpContext.Request.Form.Files[0];
Stream stream = new MemoryStream();
file.CopyTo(stream);
UploadFileStreamToS3(stream, "documenteditor", "", "GettingStarted.docx");
stream.Close();
return "Sucess";
}

public bool UploadFileStreamToS3(System.IO.Stream localFilePath, string bucketName, string
subDirectoryInBucket, string fileNameInS3)
{
    AWSCredentials credentials = new StoredProfileAWSCredentials("sync_development");
    IAmazonS3 client = new AmazonS3Client(credentials, Amazon.RegionEndpoint.USEast1);
    TransferUtility utility = new TransferUtility(client);
    TransferUtilityUploadRequest request = new TransferUtilityUploadRequest();
    if (subDirectoryInBucket == "" || subDirectoryInBucket == null)
    {
        request.BucketName = bucketName; //no subdirectory just bucket name
    }
    else
    {
        // subdirectory and bucket name
        request.BucketName = bucketName + @"/" + subDirectoryInBucket;
    }
    request.Key = fileNameInS3; //file name up in S3
    request.InputStream = localFilePath;
    utility.Upload(request); //commencing the transfer
    return true; //indicate that the file was sent
}

```

Get the complete working sample in this [link](#).

Retrieve the bookmark content as text in `##Platform_Name##` Document editor control

You can get the bookmark or whole document content from the JavaScript Document Editor component as plain text and SFDT (rich text).

Get the bookmark content as plain text

You can [selectBookmark](#) API to navigate to the bookmark and use [text](#) API to get the bookmark content as plain text from JavaScript Document Editor component.

The following example code illustrates how to get the bookmark content as plain text.

`ts

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To select all the content in document
container.documentEditor.selection.selectAll();

// Insert bookmark to selected content
container.documentEditor.editor.insertBookmark('Bookmark1');

// Provide your bookmark name to navigate to specific bookmark
container.documentEditor.selection.selectBookmark('Bookmark1');

// To get the selected content as text
let selectedContent: string = container.documentEditor.selection.text;
`
```

To get the bookmark content as SFDT (rich text), please check this [link](#)

[Get the whole document content as text](#)

You can use [text](#) API to get the whole document content as plain text from JavaScript Document Editor component.

The following example code illustrates how to get the whole document content as plain text.

`ts

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To select all the content in document
```

```
container.documentEditor.selection.selectAll();
```

```
// To get the content as text
```

```
let selectedContent: string = container.documentEditor.selection.text;
```

```
,
```

Get the whole document content as SFDT(rich text)

You can use [serialize](#) API to get the whole document content as SFDT string from JavaScript Document Editor component.

The following example code illustrates how to get the whole document content as SFDT.

```
`ts
```

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height: '590px' });
```

```
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
```

```
container.appendTo('#container');
```

```
// To insert text in cursor position
```

```
container.documentEditor.editor.insertText('Document editor');
```

```
// To get the content as SFDT
```

```
let selectedContent: string = container.documentEditor.serialize();
```

```
,
```

Get the header content as text

You can use [goToHeader](#) API to navigate the selection to the header and then use [text](#) API to get the content as plain text.

The following example code illustrates how to get the header content as plain text.

```
`ts
```

```
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```
DocumentEditorContainer.Inject(Toolbar);
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height: '590px' });
```

```
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
```

```
container.appendTo('#container');
```

```
// To navigate the selection to header
```

```
container.documentEditor.selection.goToHeader();
```

```
// To insert text in cursor position
```

```
container.documentEditor.editor.insertText('Document editor');
```

```
// To select all the content in document
container.documentEditor.selection.selectAll();

// To get the selected content as text
let selectedContent: string = container.documentEditor.selection.text;
`
```

Similarly, you can use [goToFooter](#) API to navigate the selection to the footer and then use [text](#) API to get the content as plain text.

Get current word in ##Platform_Name## Document editor control

You can get the current word or paragraph content from the JavaScript Document Editor component as plain text and SFDT (rich text).

Select and get the word in current cursor position

You can use [selectCurrentWord](#) API in selection module to select the current word at cursor position and use [text](#) API to get the selected content as plain text from JavaScript Document Editor component.

The following example code illustrates how to select and get the current word as plain text.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';

DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To select the current word in document
container.documentEditor.selection.selectCurrentWord();

// To get the selected content as text
let selectedContent: string = container.documentEditor.selection.text;
`
```

To get the bookmark content as SFDT (rich text), please check this [link](#)

Select and get the paragraph in current cursor position

You can use [selectParagraph](#) API in selection module to select the current paragraph at cursor position and use [text](#) API or [sfdt](#) API to get the selected content as plain text or SFDT from JavaScript Document Editor component.

The following example code illustrates how to select and get the current paragraph as SFDT.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
```

```

DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To select the current paragraph in document
container.documentEditor.selection.selectParagraph();

// To get the selected content as SFDT
let selectedContent: string = container.documentEditor.selection.sfdt;
`

```

Insert page number and navigate to page in ##Platform_Name## Document editor control

You can insert page number and navigate to specific page in JavaScript Document Editor component by following ways.

Insert page number

You can use [insertPageNumber](#) API in editor module to insert the page number in current cursor position. By default, Page number will insert in Arabic number style. You can change it, by providing the number style in parameter.

Note: Currently, Documenteditor have options to insert page number at current cursor position.

The following example code illustrates how to insert page number in header.

```

`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';

DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To move the selection to header
container.documentEditor.selection.goToHeader();

// Insert page number in the current cursor position
container.documentEditor.editor.insertPageNumber();
`

```

Also, you use [insertField](#) API in Editor module to insert the Page number in current position

```
`ts
//Current page number
container.documentEditor.editor.insertField('PAGE * MERGEFORMAT', '1');
`
```

Get page count

You can use [pageCount](#) API to gets the total number of pages in Document.

The following example code illustrates how to get the number of pages in Document.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert text in cursor position
container.documentEditor.editor.insertText('Document editor');

// To get the total number of pages
let pageCount : number=container.documentEditor.pageCount;
`
```

Navigate to specific page

You can use [goToPage](#) API in Selection module to move selection to the start of the specified page number.

The following example code illustrates how to move selection to specific page.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To move selection to page number 2
container.documentEditor.selection.goToPage(2);
`
```

Move selection to specific position in `##Platform_Name##` Document editor control
Using [select](#) API in selection module, You can set cursor position to anywhere in the document.

Selects content based on start and end hierarchical index

Hierarchical index will be in below format.

`sectionIndex;blockIndex;offset`

The following code snippet illustrate how to select using hierarchical index.

```
`ts
// Selection will occur between provided start and end offset
documentEdContainerIns.documentEditor.editor.insertText("Welcome");
// The below code will select the letters "We" from inserted text "Welcome"
documentEdContainerIns.documentEditor.selection.select("0;0;0", "0;0;2");
`
```

The following table illustrates about Hierarchical index in detail.

Element	Hierarchical Format	Explanation
Move selection to Paragraph	sectionIndex;blockIndex;offset	 Ex: 0;0;0 It moves the cursor to the start of paragraph.
Move selection to Table	sectionIndex;tableIndex;rowIndex;cellIndex;blockIndex;offset	 Ex: 0;0;0;1;0 It moves the cursor to the second paragraph which is inside first row and cell of table.
Move selection to header	pageIndex;H;sectionIndex;blockIndex;offset	 Ex: 1;H;0;0;0 It moves cursor to the header in second page.
Move selection to Footer	pageIndex;F;sectionIndex;blockIndex;offset	 Ex: 1;F;0;0;0 It moves cursor to the footer in second page.

Get the selection start and end hierarchical index

Using [startOffset](#), you can get start hierarchical index which denotes the start index of current selection. Similarly, using [endOffset](#), you can get end hierarchical index which denotes the end index of current selection.

The following code snippet illustrate how to get the selection start and end offset on selection changes in document.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let hostUrl: string = 'https://ej2services.syncfusion.com/production/web-services/';
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height: '590px' });
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = hostUrl + 'api/documenteditor/';
```

```
container.appendTo('#container');
// Event gets triggered on selection change in document
container.selectionChange = (): void => {
//Get the start index of current selection
let startOffset:string = container.documentEditor.selection.startOffset;
//Get the end index of current selection
let endOffset:string = container.documentEditor.selection.endOffset;
};
`
```

Document editor have [selectionChange](#) event which is triggered whenever the selection changes in Document.

Selects the content based on left and top position

Here, you can specify the [selection settings](#) to select the content based on left and top position.

x denotes the left position and y denotes the top position and extend denotes whether to extend or update selection.

Please check below code sample for reference.

```
`ts
Container.documentEditor.selection.select({ x: 188.4814208984375 , y: 662.00005, extend: true });
`
```

Disable header and footer edit in document editor in `##Platform_Name##` Document editor control

Disable header and footer edit in DocumentEditorContainer instance

You can use [restrictEditing](#) property to disable header and footer editing based on selection context type.

RestrictEditing allows you to restrict the document modification and makes the Document read only mode. So, by using this property, and if selection inside header or footer, you can set this property as true.

The following example code illustrates how to header and footer edit in `DocumentEditorContainer` instance.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let hostUrl: string = 'https://ej2services.syncfusion.com/production/web-services/';
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height: '590px' });
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = hostUrl + 'api/documenteditor/';
`
```

```

container.appendTo('#container');
container.selectionChange = (): void => {
// Check whether selection is in header
if (container.documentEditor.selection.contextType.indexOf('Header') > -1 ||
// Check whether selection is in Footer
container.documentEditor.selection.contextType.indexOf('Footer') > -1) {
// Change the document to read only mode
container.restrictEditing = true;
} else {
// Change the document to editable mode
container.restrictEditing = false;
}
};
`

```

Otherwise, you can disable clicking inside Header or Footer by using [closeHeaderFooter](#) API in selection module.

The following example code illustrates how to close header and footer when selection is inside header or footer in `DocumentEditorContainer` instance.

```

`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
let hostUrl: string = 'https://ej2services.syncfusion.com/production/web-services/';
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = hostUrl + 'api/documenteditor/';
container.appendTo('#container');
container.selectionChange = (): void => {
// Check whether selection is in header
if (container.documentEditor.selection.contextType.indexOf('Header') > -1 ||
// Check whether selection is in Footer
container.documentEditor.selection.contextType.indexOf('Footer') > -1) {
// Close header Footer
container.documentEditor.selection.closeHeaderFooter();
}
}
`

```

```
};  
`
```

Disable header and footer edit in DocumentEditor instance

Like `restrictEditing`, you can use [isReadOnly](#) property in Document editor to disable header and footer edit.

The following example code illustrates how to header and footer edit in `DocumentEditor` instance.

```
`ts  
import { DocumentEditor } from '@syncfusion/ej2-documenteditor';  
let hostUrl: string = 'https://services.syncfusion.com/js/production/';  
let documentEditor: DocumentEditor = new DocumentEditor({ isReadOnly: false, height: '590px' });  
documentEditor.enableAllModules();  
documentEditor.serviceUrl = hostUrl + 'api/documenteditor/';  
documentEditor.appendTo('#documentEditor');  
documentEditor.selectionChange = (): void => {  
    // Check whether selection is in header  
    if (documentEditor.selection.contextType.indexOf('Header') > -1 ||  
    // Check whether selection is in Footer  
    documentEditor.selection.contextType.indexOf('Footer') > -1) {  
        // Change the document to read only mode  
        documentEditor.isReadOnly = true;  
    } else {  
        // Change the document to editable mode  
        documentEditor.isReadOnly = false;  
    }  
};  
`
```

Insert text in current position in ##Platform_Name## Document editor control

You can insert the text, paragraph and rich-text content in JavaScript Document Editor component.

Insert text in current cursor position

You can use [insertText](#) API in editor module to insert the text in current cursor position.

The following example illustrates how to add the text in current selection.

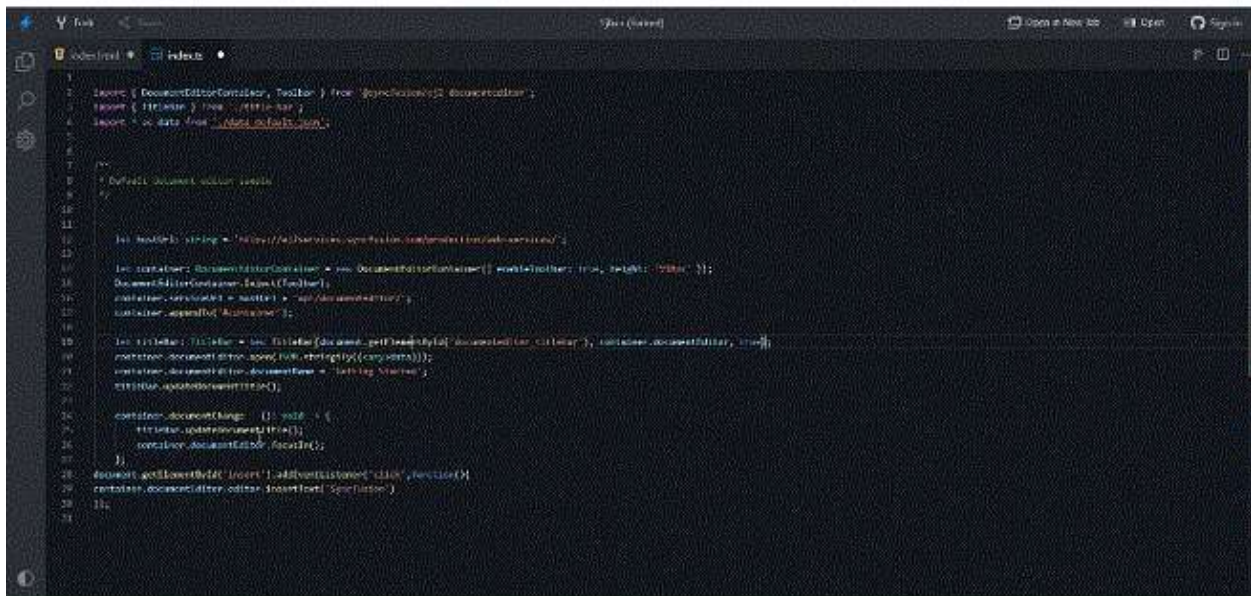

```
`ts  
let hostUrl: string = 'https://ej2services.syncfusion.com/production/web-services/';  
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:  
'590px' });
```

```

DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = hostUrl + 'api/documenteditor/';
container.appendTo('#container');
document.getElementById('insert').addEventListener('click',function(){
// It will insert the provided text in current selection
container.documentEditor.editor.insertText('SynCFusion');
});

```

Please check below gif which illustrates how to insert text in current cursor position on button click:

Insert paragraph in current cursor position

To insert new paragraph at current selection, you can use [insertText](#) API with parameter as `\r\n` or `\n`.

The following example code illustrates how to add the new paragraph in current selection.

```

`ts
// It will add the new paragraph in current selection
container.documentEditor.editor.insertText('\n');

```

Insert the rich-text content

To insert the HTML content, you have to convert the HTML content to SFDT Format using [web service](#). Then use [paste](#) API to insert the sfdt at current cursor position.

Note: Html string should be wellformatted html. [DocIO](#) support only wellformatted XHTML.

The following example illustrates how to insert the HTML content at current cursor position.

- Send the HTML content to server side for SFDT conversion. Refer to the following example to send the HTML content to server side and inserting it in current cursor position.

```
`ts
import {
  DocumentEditorContainer,
  Toolbar,
} from '@syncfusion/ej2-documenteditor';

let hostUrl: string =
'https://ej2services.syncfusion.com/production/web-services/';

let container: DocumentEditorContainer = new DocumentEditorContainer({
  enableToolbar: true,
  height: '590px',
});

DocumentEditorContainer.Inject(Toolbar);

container.serviceUrl = hostUrl + 'api/documenteditor/';

container.appendTo('#container');

let htmltags: string =
"<?xml version='1.0' encoding='utf - 8'?><!DOCTYPE html PUBLIC '-//W3C//DTD XHTML 1.0 Strict//EN'http://www.w3.org/TR/xhtml1/DTD/xhtml1-strict.dtd><html xmlns='http://www.w3.org/1999/xhtml' xml:lang='en' lang='en'><body><h1>The img element</h1><img src='https://www.w3schools.com/images/lamp.jpg' alt='Lamp Image' width='500' height='600'/></body></html>";

document.getElementById('export').addEventListener('click', () => {
  let http: XMLHttpRequest = new XMLHttpRequest();
  http.open('POST', 'http://localhost:5000/api/documenteditor/LoadString');
  http.setRequestHeader('Content-Type', 'application/json;charset=UTF-8');
  http.responseType = 'json';
  http.onreadystatechange = function () {
    if (http.readyState === 4) {
      if (http.status === 200 || http.status === 304) {
        // Insert the sfdt content in cursor position using paste API
        container.documentEditor.editor.paste(http.response);
      }
    }
  };
});
```

```

    } else {
    alert('failed;');
    }
    }
};

let htmlContent: any = { content: htmltags };
http.send(JSON.stringify(htmlContent));
});
`

```

- Please refer the following code example for server-side web implementation for HTML conversion using DocumentEditor.

```

`c#
//API controller for the conversion.
[HttpPost]
public string LoadString([FromBody]InputParameter data)
{
// You can also load HTML file/string from server side.
Syncfusion.EJ2.DocumentEditor.WordDocument document =
Syncfusion.EJ2.DocumentEditor.WordDocument.LoadString(data.content, FormatType.Html); // Convert
the HTML to SFDT format.

string json = Newtonsoft.Json.JsonConvert.SerializeObject(document);
document.Dispose();
return json;
}

public class InputParameter
{
public string content {get; set; }
}
`

```

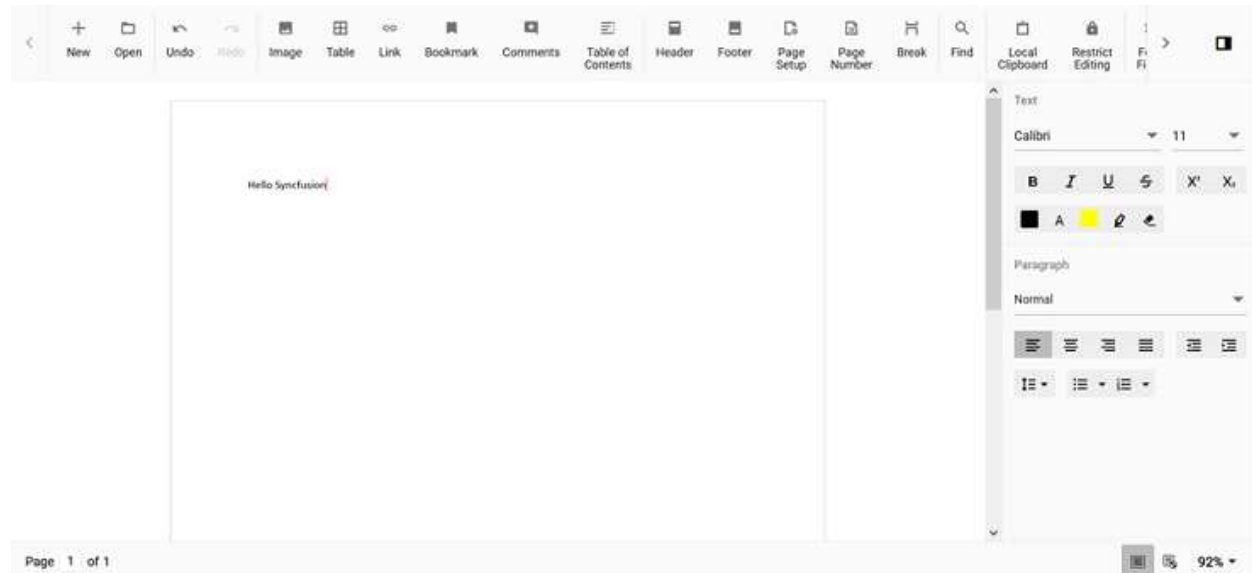

Note: The above example illustrates inserting HTML content. Similarly, you can insert any rich-text content by converting any of the supported file formats (DOCX, DOC, WordML, HTML, RTF) to SFDT.

[Change the cursor color in document editor in ##Platform_Name## Document editor control](#)
Document Editor default cursor color is black. The user can change the color by overriding the css property using class name. The Document editor cursor css have a class named `e-de-blink-cursor`.

Please refer the below code snippet to change the cursor color to red.

```
,
.e-de-blink-cursor {
border-left: 1px solid red!important;
}
,
```

Output will be like below:

Hide tool bar and properties pane in `##Platform_Name##` Document editor control

Document editor container provides the main document view area along with the built-in toolbar and properties pane.

Document editor provides just the main document view area. Here, the user can compose, view, and edit the Word documents. You may prefer to use this component when you want to design your own UI options for your application.

Hide the properties pane

By default, Document editor container has built-in properties pane which contains options for formatting text, table, image and header and footer. You can use [showPropertiesPane](#) API in [DocumentEditorContainer](#) to hide the properties pane.

The following example code illustrates how to hide the properties pane.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';
DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px', showPropertiesPane:false });
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
```

```
container.appendTo('#container');
`
```

Note: Positioning and customizing the properties pane in Document editor container is not possible. Instead, you can hide the existing properties pane and create your own pane using public API's.

Hide the toolbar

You can use [enableToolbar](#) API in [DocumentEditorContainer](#) to hide the existing toolbar.

The following example code illustrates how to hide the existing toolbar.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: false, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
`
```

See Also

- [How to customize the toolbar](#)

Insert text or image in table programmatically in `##Platform_Name##` Document editor control
Using Document editor API's, you can insert [text](#) or [image](#) in [table](#) programmatically based on your requirement.

Use [selection](#) API's to navigate between rows and cells.

The following example illustrates how to create 2*2 table and then add text and image programmatically.

```
`ts
import { DocumentEditorContainer, Toolbar } from '@syncfusion/ej2-documenteditor';

DocumentEditorContainer.Inject(Toolbar);

let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px' });

container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');

// To insert the table in cursor position
container.documentEditor.editor.insertTable(2,2);

// To insert the image at table first cell
container.documentEditor.editor.insertImage("data:image/png;base64,iVBORw0KGgoAAAANSUHEUgAA
AAUAAAFCAyAAACNbybIAAAAHIEQVQI12P4
//8/w38GIAXDIBKE0DHxgljNBAAO9TXL0Y4OHwAAAABJRU5ErkJggg==");
```

```
// To move the cursor to next cell
moveCursorToNextCell();

// To insert the image at table second cell
container.documentEditor.editor.insertImage("data:image/png;base64,iVBORw0KGgoAAAANSUhEUgAA
AAUAAAAFCAYAAACNbyblAAAAHEIEQVQI12P4
//8/w38GIAXDIBKE0DHxgljNBAAO9TXL0Y4OHwAAAABJRU5ErkJggg==");

// To move the cursor to next row
moveCursorToNextRow();

// To insert text in cursor position
container.documentEditor.editor.insertText('Text');

// To move the cursor to next cell
moveCursorToNextCell();

// To insert text in cursor position
container.documentEditor.editor.insertText('Text');

function moveCursorToNextCell() {
// To get current selection start offset
var startOffset=container.documentEditor.selection.startOffset;

// Increasing cell index to consider next cell
var cellIndex= parseInt(startOffset.substring(6, 7)) + 1;

// Changing start offset
startOffset = startOffset.substring(0, 6) + cellIndex.toString() + startOffset.substring(7,
startOffset.length);

// Navigating selection using select method
container.documentEditor.selection.select(startOffset, startOffset);
}

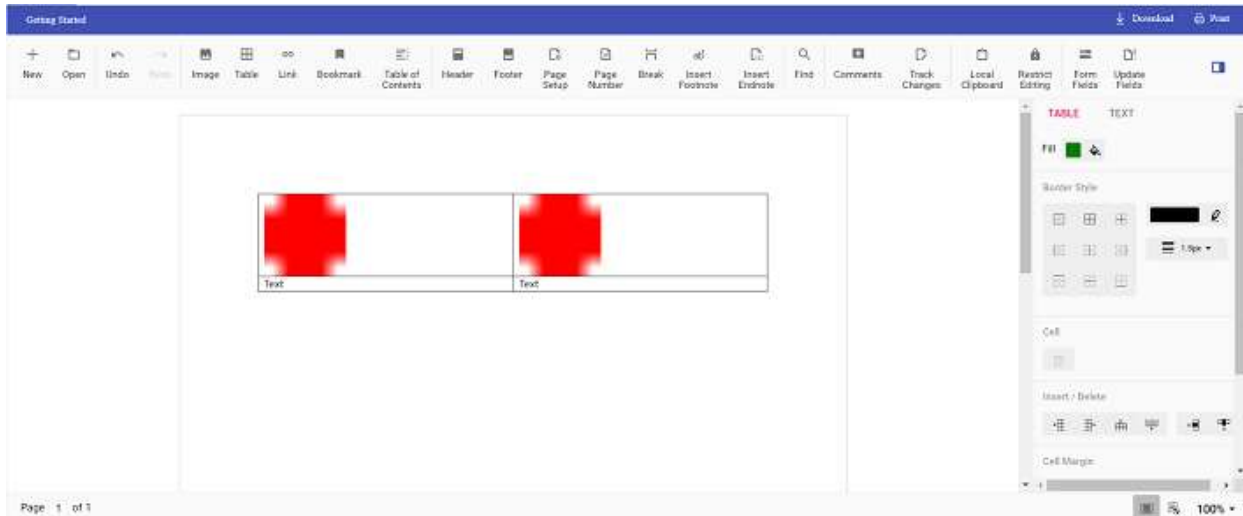

function moveCursorToNextRow() {
// To get current selection start offset
var startOffset=container.documentEditor.selection.startOffset;

// Increasing row index to consider next row
var rowIndex= parseInt(startOffset.substring(4, 5)) + 1;
var cellIndex= parseInt(startOffset.substring(6,7)) != 0? parseInt(startOffset.substring(6,7)) - 1:0;

// Changing start offset
startOffset = startOffset.substring(0, 4) + rowIndex.toString() + startOffset.substring(5, 6) + cellIndex +
startOffset.substring(7, startOffset.length);
```

```
// Navigating selection using select method
container.documentEditor.selection.select(startOffset, startOffset);
}
,
```

The output will be like below.

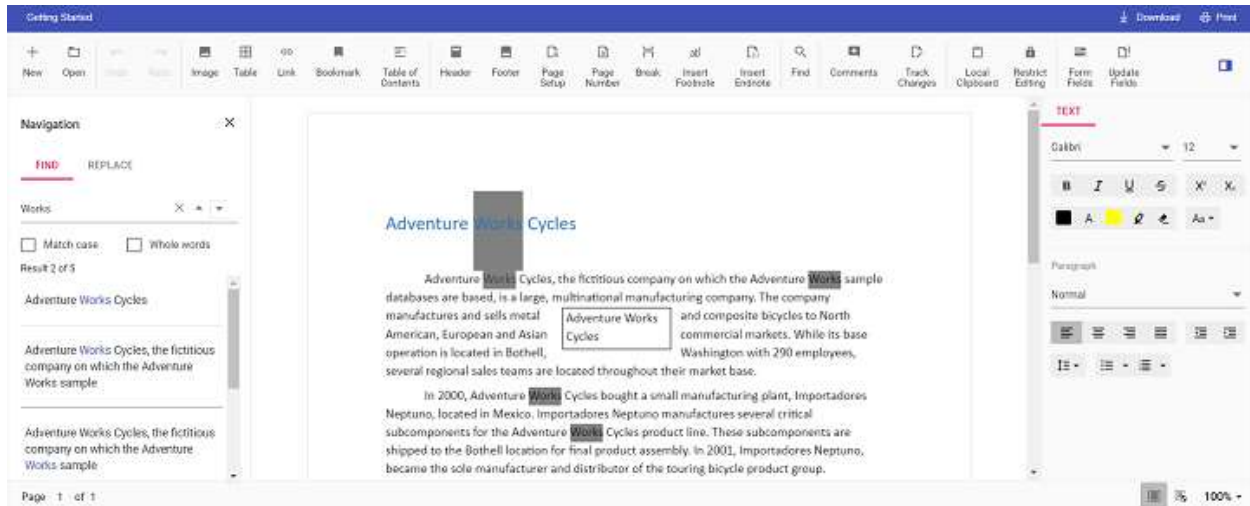

Change the default search highlight color in `##Platform_Name##` Document editor control. Document editor provides an options to change the default search highlight color using [searchHighlightColor](#) in Document editor settings. The highlight color which is given in [documentEditorSettings](#) will be highlighted on the searched text. By default, search highlight color is yellow.

Similarly, you can use [documentEditorSettings](#) property for DocumentEditor also.

The following example code illustrates how to change the default search highlight color.

```
`ts
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true,height:
'590px',
// Add required search highlight color
documentEditorSettings: {
searchHighlightColor: 'Grey',
}
});
DocumentEditorContainer.Inject(Toolbar);
container.serviceUrl = 'https://services.syncfusion.com/js/production/api/documenteditor/';
container.appendTo('#container');
,
```

Output will be like below:

Disable auto focus in `##Platform_Name##` Document editor control

Document Editor gets focused automatically when the page loads. If you want the Document editor not to be focused automatically it can be customized.

The following example illustrates to disable the auto focus in DocumentEditorContainer.

```
`ts
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px', enableAutoFocus: false});
```

```
,
```

Note: Default value of [enableAutoFocus](#) property is `true`.

The following example illustrates to disable the auto focus in DocumentEditor.

```
`ts
```

```
let editor: DocumentEditor = new DocumentEditor({ height: '590px', enableAutoFocus: false});
```

```
,
```

Note: Default value of [enableAutoFocus](#) property is `true`.

Disable drag and drop in `##Platform_Name##` Document editor control

Document Editor provides support to drag and drop contents within the component and it can be customized(enable and disable) using [allowDragAndDrop](#) property in Document editor settings.

The following example illustrates to disable the drag and drop option in DocumentEditorContainer.

```
`ts
```

```
let container: DocumentEditorContainer = new DocumentEditorContainer({ enableToolbar: true, height:
'590px', documentEditorSettings: { allowDragAndDrop: false } });
```

```
,
```

Note: Default value of [allowDragAndDrop](#) property is `true`.

The following example illustrates to disable the drag and drop option in DocumentEditor.

`ts

```
let editor: DocumentEditor = new DocumentEditor({ height: '590px', documentEditorSettings: {
allowDragAndDrop: false } });
```

,

Note: Default value of [allowDragAndDrop](#) property is `true`.

Enable ruler

How to enable ruler in Document Editor component

Using ruler we can refer to setting specific margins, tab stops, or indentations within a document to ensure consistent formatting in Document Editor.

The following example illustrates how to enable ruler in Document Editor

INDEX.JS

```
//Initialize Document Editor component.
var documenteditor = new ej.documenteditor.DocumentEditor({
  isReadOnly: false, height: '370px', serviceUrl:
  'https://services.syncfusion.com/js/production/api/documenteditor/',
  documentEditorSettings: { showRuler: true }
});
//Enable all built in modules.
documenteditor.enableAllModules();
document.getElementById('container_ruler_button').addEventListener('click',
  function () {
    documenteditor.documentEditorSettings.showRuler =
    !documenteditor.documentEditorSettings.showRuler;
  });
//Render Document Editor component.
documenteditor.appendTo('#DocumentEditor');
```

How to enable ruler in Document Editor Container component

Using ruler we can refer to setting specific margins, tab stops, or indentations within a document to ensure consistent formatting in Document Editor Container.

The following example illustrates how to enable ruler in Document Editor Container.

INDEX.JS

```

//Initialize Document Editor Container component.
var documenteditorcontainer = new
ej.documenteditor.DocumentEditorContainer({
    height: '590px', documentEditorSettings: { showRuler: true }
});
//Inject require modules.
ej.documenteditor.DocumentEditorContainer.Inject(
    ej.documenteditor.Toolbar
);
document.getElementById('container_ruler_button').addEventListener('click',
    function () {
        container.documentEditorSettings.showRuler =
!container.documentEditorSettings.showRuler;
    });
//Render Document Editor Container component.
documenteditorcontainer.appendTo("#DocumentEditor");

```

DropDown Menu

Icons in ##Platform_Name## Drop down button control

DropDownButton icons

DropDownButton can have an icon to provide the visual representation of the action. To place the icon on a DropdownButton, set the [iconCss](#) property to `e-icons` with the required icon CSS. By default, the

icon is positioned to the left side of the DropDownButton. You can customize the icon's position using the [iconPosition](#) property.

In the following example, the DropDownButton with default iconPosition and iconPosition as **Top** is showcased:

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'Edit'
  },
  {
    text: 'Delete'
  },
  {
    text: 'Mark as Read'
  },
  {
    text: 'Like Message'
  }
];
//To position the icon to the left of the text on a DropDownButton.
var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'ddb-icons e-
message', items: items, '#iconbutton'});
var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'ddb-icons e-
message', items: items, iconPosition: 'Top', '#iconpstn'});
```

INDEX.HTML

}
```

Icon only DropDownButton

Icon only DropDownButton can be achieved by using [iconCss](#) property and to hide drop down arrow

e-caret-hide class is added using [cssClass](#) property.

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'New tab'
  },
  {
    text: 'New window'
  },
  {
    text: 'New incognito window'
  },
  {
    separator: true
  },
  {
    text: 'Print'
  },
  {
    text: 'Cast'
  },
  {
    text: 'Find'
  }
];
var options = {
  items: items,
  iconCss: 'e-icons e-menu',
  cssClass: 'e-caret-hide'
};
var drpDownBtn = new ej.splitbuttons.DropDownButton(options);
drpDownBtn.appendTo('#icononly');
```

INDEX.HTML

```

  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.e-menu::before {
  content: '\e984';
}

```

The Essential JS 2 provides a set of icons that can be loaded by applying `e-icons` class name to the element. You can also use third party icons on the DropDownButton using the `iconCss` property.

DropDownButton with sprite image

Sprite images can be loaded in DropDownButton instead of font icons using `iconCss` property.

In this following example, `e-image` class is added with background url of the sprite image along with X and Y positions. The `width` and

`height` of the element set as `32px`.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize action items.
var items = [
  {
    text: 'Display Settings'
  },
  {
    text: 'System Settings'
  },
  {
    text: 'Additional Settings'
  }
];
// Initialize DropDownButton options.
var options = {
  items: items,
  cssClass: 'e-caret-hide',
  iconCss: 'e-image'
};
// To initialize the DropDownButton with sprite image.
var drpDownBtn = new ej.splitbuttons.DropDownButton(options, '#icononly');
```

INDEX.HTML

```

    <div id="container">
        <button id="icononly"></button>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-icon.e-image {
    background: url(./spritesheet.png) -384px -48px;
    width: 32px;
    height: 32px;
}

```

Vertical button

Vertical button in DropDownButton can be achieved by adding `e-vertical` class using [cssClass](#) property.

The following example illustrates how to provide vertical support in DropDownButton component.

INDEX.JS

```

ej.base.enableRipple(true);
var items = [
    {
        text: 'Edit'
    },
    {
        text: 'Delete'
    },
    {
        text: 'Mark as Read'
    },
    {
        text: 'Like Message'
    }
]

```

```

    }];
    //To position the icon to the left of the text on a DropDownButton.
    var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'ddb-icons e-
message', items: items, cssClass: 'e-vertical', iconPosition: 'Top'},
    '#iconbutton');

```

INDEX.HTML

```

Popup items in ##Platform_Name## Drop down button control

Icons

The popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for edit, delete, mark as read and like message menu items are added using the iconCss property.

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'Edit',
    iconCss: 'ddb-icons e-edit'
  },
  {
    text: 'Delete',
    iconCss: 'ddb-icons e-delete'
  },
  {
    text: 'Mark as Read',
    iconCss: 'ddb-icons e-read'
  },
  {
    text: 'Like Message',
    iconCss: 'ddb-icons e-like'
  }
];
//To position the icon to the left of the text on a DropDownButton.
var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'ddb-icons e-
message', items: items}, '#iconbutton');
```

Navigations

Actions in DropDownButton can be used to navigate to the other web page when action item is clicked. This can be achieved by providing link to the action item using `url` property.

In the following sample, navigation URL for Flipkart, Amazon, and Snapdeal action items are added using the `url` property:

INDEX.JS

```

ej.base.enableRipple(true);
var items = [

```

```

    {
        text: 'Flipkart',
        iconCss: 'e-cart-icon e-link',
        url: 'https://www.google.co.in/search?q=flipkart'
    },
    {
        text: 'Amazon',
        iconCss: 'e-cart-icon e-link',
        url: 'https://www.google.co.in/search?q=amazon'
    },
    {
        text: 'Snapdeal',
        iconCss: 'e-cart-icon e-link',
        url: 'https://www.google.co.in/search?q=snapdeal'
    }
    ]];
var menuOptions = {
    items: items,
    iconCss: 'e-cart-icon e-shopping',
    beforeItemRender: (function (args) {
        args.element.getElementsByTagName('a')[0].setAttribute('target',
'_blank');
    })
};
var drpDownBtn = new ej.splitbuttons.DropDownButton(menuOptions, '#action');
```

INDEX.HTML

```

Template

Item templating

Popup items can be customized using the [beforeItemRender](#) event. The item render event triggers while rendering each popup action item. The event argument will be used to identify the action item and customize based on the requirement.

The following popup template is customized using [beforeItemRender](#) event by appending [span](#) and [div](#) element on each [li](#) rendering:

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'Edit'
  },
  {
    text: 'Cut'
  }
];
var ddbOption = {
  iconCss: 'e-ddb-icons e-paste',
  cssClass: 'e-vertical',
  items: items,
  iconPosition: 'Top',
  beforeItemRender: itemRender
}
var drpDownBtn = new ej.splitbuttons.DropDownButton(ddbOption,
'#iconbutton');
function itemRender(args) {
  if (args.item.text === 'Edit') {
    args.element.innerHTML = '<span></span><div><b>Paste  
Text</b><div>Provides option to paste only the<br>selected  
text.</div></div>';
    args.element.style.height = '80px';
    var span = args.element.children[0];
    span.setAttribute('class', 'e-cm-icons e-pastetext e-align');
    var div = args.element.children[1];
    div.setAttribute('class', 'e-div-align');
```

```

    } else {
        args.element.innerHTML = '<span></span><div><b>Paste
Special</b><div>Provides options to paste formulas,<br> values, comments,
validations etc...</div></div>';
        args.element.style.height = '80px';
        var span = args.element.children[0];
        span.setAttribute('class', 'e-cm-icons e-pastespecial e-align');
        var div = args.element.children[1];
        div.setAttribute('class', 'e-div-align');
    }
}

```

Popup templating

The whole popup can be customized as per the requirement and it can be customized by handling it in [target](#) property.

In the following sample, the whole popup item is customized as table template by giving **div** as target and it can be achieved

using **target** property.

INDEX.JS

```

ej.base.enableRipple(true);
var menuOptions = {
  target: '#target',
  iconCss: 'e-icons e-table',
  iconPosition: 'Top',
  cssClass: 'e-vertical'
};
var drpDownBtn = new ej.splitbuttons.DropDownButton(menuOptions, '#action');

```

INDEX.HTML

```

```

Separator

The Separators are the horizontal lines that are used to separate the popup items. You cannot select the separators. You can enable separators to group the popup items using the `separator` property.

In the following sample, cut, copy, and paste popup items are grouped using the `separator` property:

INDEX.JS

```

ej.base.enableRipple(true);
var items = [
    {
        text: 'Cut',
        iconCss: 'e-db-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-db-icons e-paste'
    },
    {
        separator: true
    },
    {
        text: 'Font',
        iconCss: 'e-db-icons e-font'
    },
    {

```

```

        text: 'Paragraph',
        iconCss: 'e-db-icons e-paragraph'
    }];
    var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'e-icons e-edit', items: items}, '#element');
```

INDEX.HTML

Accessibility in ##Platform_Name## Drop down button control

The Drop down button component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Drop down button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

```
.post .post-content img {  
display: inline-block;  
margin: 0.5em 0;  
}  
</style>  
  
<div> - All  
features of the component meet the requirement.</div>  
  
<div> - Some features of the component do not meet the requirement.</div>  
  
<div> - The  
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Drop down button component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the Drop down button component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Drop down button component as **button**, Drop down button popup as **menu**, and the dropdown popup action items as **menuitem**. |

| **aria-haspopup** | Indicates the availability of the popup element. |

| **aria-expanded** | Indicates whether the popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Dropdown button component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Drop down button component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | Closes the popup. |

| **Enter** | Opens the popup, or activates the highlighted item and closes the popup. |

| **Space** | Opens the popup. |

| **Up** | Navigates up or to the previous action item. |

| Alt + Up Arrow | Closes the popup. |

| Alt + Down Arrow | Opens the popup. |

Ensuring accessibility

The Drop down component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Drop down button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Drop down button component with accessibility tools.

How To

Change caret icon in ##Platform_Name## Drop down button control

Dropdown arrow can be customized on popup open and close. It can be handled in [beforeOpen](#) and [beforeClose](#) event.

In the following example, the up arrow is updated on popup close and down arrow is updated on popup open using [beforeOpen](#) and [beforeClose](#) event by adding and removing [e-caret-up](#) class.

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'Cut'
  },
  {
    text: 'Copy'
  },
  {
    text: 'Paste'
  }
];
var options = {
  items: items,
  beforeClose: function() {
    drpDownBtn.cssClass = '';
  },
  beforeOpen: function() {
    drpDownBtn.cssClass = 'e-caret-up';
  }
};
var drpDownBtn = new ej.splitbuttons.DropDownButton(options);
drpDownBtn.appendTo('#arrow');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    transform: rotate(0deg);
    transition: transform 200ms ease-in-out;
}
.e-caret-up .e-caret {
    transform: rotate(180deg);
}
button {
    margin: 25px 5px 20px 20px;
}

```

Create dropdownbutton with rounded corner in `##Platform_Name##` Drop down button control DropDownButton with rounded corner can be achieved by adding `border-radius` CSS property to button element.

In the following example, `e-round-corner` class is defined with `5px border-radius` property and added that class to button element using `cssClass` property.

INDEX.JS

```
ej.base.enableRipple(true);
//Initialize action items.
var items = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
// initialize DropDownButton component
var drpDownBtn = new ej.splitbuttons.DropDownButton({items: items, cssClass:
'e-round-corner'});
// Render initialized DropDownButton.
drpDownBtn.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 DropDownButton</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

splitbuttons/styles/material.css" rel="stylesheet">
    <link href="styles.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <button id="element">Clipboard</button>
    </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-round-corner {
    border-radius: 5px;
}
```

Create right to left dropdownbutton in ##Platform_Name## Drop down button control
DropDownButton component has RTL support. This can be achieved by setting [enableRtl](#) as true.

The following example illustrates how to enable right-to-left support in DropDownButton component.

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
    {
        text: 'Edit'
    },
    {
        text: 'Delete'
    },
    {
        text: 'Mark as Read'
    },
    {
        text: 'Like Message'
    }
];
//To position the icon to the left of the text on a DropDownButton.
var drpDownBtn = new ej.splitbuttons.DropDownButton({iconCss: 'ddb-icons e-message', items: items, enableRtl: true}, '#iconbutton');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 DropDownButton</title>
```

```

<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">

Customize icon and width in ##Platform Name## Drop down button control

Width of the DropDownButton can be customized by setting required width to the dropdown element.

The following UI can be achieved by setting `iconPosition` as `Top`, width as `85px` and size of the font icon as `40px` by adding `e-custom` class.

INDEX.JS

```
ej.base.enableRipple(true);
var items = [
  {
    text: 'Find'
  },
  {
    text: 'Replace'
  }
];
```

```

    },
    {
        text: 'Go To'
    },
    {
        text: 'Go To Special'
    }
  ]];
// To initialize DropDownButton with `e-custom` class.
var drpDownBtn = new ej.splitbuttons.DropDownButton({
  iconCss: 'e-icons e-search',
  cssClass: 'e-custom',
  items: items,
  iconPosition: 'Top'
}, '#iconbutton'
);

```

Group popup items with listview component in `##Platform_Name##` Drop down button control Header in popup items is possible in DropDownButton by templating entire popup with ListView. Create ListView with id `#listview` and provide it as a [target](#) for DropDownButton.

In the following example, ListView element is given as `target` to DropDownButton and header can be achieved by [groupBy](#) property.

INDEX.JS

```

ej.base.enableRipple(true);
var ddbOption = {
  target: '#listview',
  iconCss: 'e-icons e-down',
  cssClass: 'e-caret-hide'
};
var drpDownBtn = new ej.splitbuttons.DropDownButton(ddbOption);
drpDownBtn.appendTo('#element');
var dataSource = [

```

```

    { class: 'data', text: 'Print', id: 'data1', category: 'Customize Quick
Access Toolbar' },
    { class: 'data', text: 'Save As', id: 'data2', category: 'Customize
Quick Access Toolbar' },
    { class: 'data', text: 'Update Folder', id: 'data3', category:
'Customize Quick Access Toolbar' },
    { class: 'data', text: 'Reply', id: 'data4', category: 'Customize Quick
Access Toolbar' },
    { class: 'data', text: 'Reply All', id: 'data4', category: 'Customize
Quick Access Toolbar' },
    { class: 'data', text: 'Forward', id: 'data4', category: 'Customize
Quick Access Toolbar' },
    { class: 'data', text: 'Delete', id: 'data4', category: 'Customize Quick
Access Toolbar' },
    { class: 'data', text: 'Undo', id: 'data4', category: 'Customize Quick
Access Toolbar' },
];
//Initialize ListView component
var listViewInstance = new ej.lists.ListView({
    dataSource: dataSource,
    //map the appropriate columns to fields property
    fields: { text: 'text', groupBy: 'category' },
    showCheckBox: true
});
//Render initialized ListView
listviewInstance.appendTo("#listview");

```

Hide dropdown arrow in ##Platform_Name## Drop down button control

You can hide the dropdown arrow from the DropDownButton by adding class `e-caret-hide` to DropDownButton element using [cssClass](#) property.

INDEX.JS

```

ej.base.enableRipple(true);
var items = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
var drpDownBtn = new ej.splitbuttons.DropDownButton({items: items});
drpDownBtn.appendTo('#hide');

```

```
drpDownBtn.element.classList.add('e-caret-hide');
```

Open a dialog on popup item click in `##Platform_Name##` Drop down button control

This section explains about how to open a dialog on DropDownButton popup item click. This can be achieved by handling dialog open in [select](#) event of the DropDownButton.

In the following example, Dialog will open while selecting **Other Folder...** item.

INDEX.JS

```
ej.base.enableRipple(true);
var dialog = new ej.popups.Dialog({
  content: "Move Items To `Web Team`,",
  header: 'Move Items',
  buttons: [{
    buttonModel: {
      isPrimary: true,
      content: 'OK',
      cssClass: 'e-flat'
    },
    click: function () {
      this.hide();
    }
  }],
  width: '250px',
  visible: false,
  position: {X: 100, Y: 100}
});
dialog.appendTo('#dialog');
var items = [
  {
    text: 'Archive'
  },
  {
    text: 'Inbox'
  },
  {
    text: 'HR Portal'
  },
  {
    separator: true
  },
  {
    text: 'Other Folder...'
  },
  {
    text: 'Copy to Folder'
  }
];
var ddbOption = {
  iconCss: 'ddb-icons e-folder',
  cssClass: 'e-vertical',
  items: items,
  iconPosition: 'Top',
  select: select
};
//To position the icon to the left of the text on a DropDownButton.
var drpDownBtn = new ej.splitbuttons.DropDownButton(ddbOption,
'#iconbutton');
function select (args) {
```

```

    if (args.item.text === 'Other Folder...') {
        dialog.show();
    }
}

```

INDEX.HTML

```

Position popup open in ##Platform_Name## Drop down button control

Popup open position can be changed according to the requirement. Popup open position can be changed in [open](#) event by setting **top** and **left** for the popup element.

In the following example, the **top** position of the popup element is changed in **open** event.

INDEX.JS

```

ej.base.enableRipple(true);
//Initialize action items.
var items = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
// initialize DropDownButton component
var drpDownBtn = new ej.splitbuttons.DropDownButton({
    items: items,
    cssClass: 'e-caret-up',
    open: onOpen
});
// Render initialized DropDownButton.
drpDownBtn.appendTo('#element');
function onOpen(args) {
    args.element.parentElement.style.top =
drpDownBtn.element.getBoundingClientRect().top -
args.element.parentElement.offsetHeight + 'px';
}

```

INDEX.HTML

```

```

Underline a character in the item text in ##Platform_Name## Drop down button control

Underline a particular character in a text can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

In the following example, `C` is underlined in the text `Copy`.

INDEX.JS

```

ej.base.enableRipple(true);
var items = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
var ddbOption = {
    items: items,
    beforeItemRender: itemRender
}
var drpDownBtn = new ej.splitbuttons.DropDownButton(ddbOption);
drpDownBtn.appendTo('#element');
function itemRender(args) {
    if (args.item.text === 'Copy') {

```

```
        args.element.innerHTML = '<u>C</u>opy';  
    }  
}
```

INDEX.HTML

}
```

DropDownList

Tags in ##Platform_Name## Drop down list control

The DropDownList can be initialized on three different tags as described in below. Though it is initialized in different tags, the UI appearance and built-in features behave in the same way.

Select element

When a DropDownList is initialized on SELECT element, the list items can be assigned through the option tag of the HTML select element.

- The nested items are wrapped and grouped based on the tag that is available

within the `<select>` element, by default.

- You can preselect the option by setting the `selected` attribute to an option tag.

INDEX.JS

```
// initialize DropDownList component
let ddlObject = new ej.dropdowns.DropDownList({
  placeholder: "Select a vegetable",
  popupHeight: "200px"
});
// render initialized DropDownList
ddlObject.appendTo('#selectElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>

</body></html>

```

Input element

The DropDownList has also be rendered through `<input>` element with an array of either simple or complex data that is set through the [dataSource](#) property. It can retrieve data from local data sources as well as remote data services.

Detailed information about the data binding with an example is available in: [Data Binding to DropDownList](#)

Data binding in ##Platform_Name## Drop down list control

The DropDownList loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of `array` or `DataManager`.

The DropDownList also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

Fields	Type	Description
text	string	Specifies the display text of each list item.
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

When binding complex data to the DropDownList, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of simple data

The DropDownList has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

INDEX.JS

```
var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize DropDownList component
var listObj = new ej.dropdowns.DropDownList({
  dataSource: sportsData,
  // set placeholder to DropDownList input element
  placeholder: "Select games"});
listObj.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <input type="text" tabindex="1" id="ddlelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

2. Array of JSON data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.JS

```
let sportsData = [
  { Id: 'Game1', Game: 'Badminton' },
  { Id: 'Game2', Game: 'Basketball' },
  { Id: 'Game3', Game: 'Cricket' },
  { Id: 'Game4', Game: 'Football' },
  { Id: 'Game5', Game: 'Golf' },
  { Id: 'Game6', Game: 'Hockey' },
  { Id: 'Game7', Game: 'Rugby' },
  { Id: 'Game8', Game: 'Snooker' }
];

// initialize DropDownList component
var listObj = new ej.dropdowns.DropDownList({
  //set the data to dataSource property
  dataSource: sportsData,
  // maps the appropriate column to fields property
  fields: { value: 'Game' },
  // set placeholder to DropDownList input element
  placeholder: "Find a game"});
listObj.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <br>
    <input type="text" id="ddlelement">
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

3. Array of Complex data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, `Code.Id` column and `Country.Name` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.JS

```

let countriesData = [
    { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
    { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
    { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
    { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
    { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
    { Country: { Name: 'France' }, Code: { Id: 'FR' } }
];
// initialize DropDownList component
var listObj = new ej.dropdowns.DropDownList({
    //set the data to dataSource property
    dataSource: countriesData,
    // maps the appropriate column to fields property
    fields: { value: 'Country.Name' },
    // set placeholder to DropDownList input element
    placeholder: "Find a country"});
listObj.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <div id="container" style="margin:0 auto; width:250px;">
        <br>
        <input type="text" id="ddlelement">
    </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding remote data

The DropDownList supports retrieval of data from remote data services with the help of **DataManager** component. The [Query](#) property is used to fetch data from the database and bind it to the DropDownList.

The following sample displays the first 6 contacts from “Customers” table of the **Northwind** Data Service.

INDEX.JS

```

//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().from('Employees').select(['FirstName',
    'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName' },
    //set the placeholder to DropDownList input
    placeholder: "Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending'
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

Templates in ##Platform_Name## Drop down list control

The DropDownList has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the DropDownList can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

INDEX.JS

```
//initiates the component
```

```

var ddlObject = new ej.dropdowns.DropDownList({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new ej.data.Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
  //map the appropriate columns to fields property
  fields: { value: 'FirstName' },
  //set the placeholder to DropDownList input
  placeholder: "Select an employee",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to itemTemplate property
  itemTemplate: "<span><span class='name'>${FirstName}</span><span class
='city'>${City}</span></span>"
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
  </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Value template

The currently selected value that is displayed by default on the DropDownList input element can be customized using the [valueTemplate](#) property.

In the following sample, the selected value is displayed as a combined text of both **FirstName** and **City** in the DropDownList input, which is separated by a hyphen.

INDEX.JS

```
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new ej.data.Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
  //map the appropriate columns to fields property
  fields: { value: 'FirstName' },
  //set the placeholder to DropDownList input
  placeholder: "Select an employee",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to itemTemplate property
  itemTemplate: "<span><span class='name'>${FirstName}</span><span class
='city'>${City}</span></span>",
  //set the value to valueTemplate property
  valueTemplate: "<span>${FirstName} - ${City}</span>"
});
//render the component
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

INDEX.JS

```

var groupPredicate = new ej.data.Predicate('City',
'equal','london').or('City','equal','seattle');
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(6).where(groupPredicate),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName', groupBy: 'City'},
    //set the placeholder to DropDownList input
    placeholder:"Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the value to groupTemplate
    groupTemplate: "<strong>${City}</strong>"
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Header template

The header element is shown statically at the top of the popup list items within the DropDownList, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

INDEX.JS

```

//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Footer template

The DropDownList has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the DropDownList.

INDEX.JS

```
var sportsData = [ "Basketball", "Cricket", "Football", "Golf"];
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: sportsData ,
    //set the placeholder to DropDownList input
    placeholder:"Select games",
    //set the value to footer template
    footerTemplate:"<span class='foot'> Total list items: "+
sportsData.length + "</span>"
});

//render the component
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

No records template

The DropDownList is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

INDEX.JS

```
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
  //bind the data manager instance to dataSource property
  dataSource: [],
  //set the placeholder to DropDownList input
  placeholder: "Select an item",
  //set the value to noRecords template
  noRecordsTemplate: "<span class='norecord'> NO DATA AVAILABLE</span>"
});
//render the component
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the DropDownList displays the notification.

INDEX.JS

```
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    // Here, use the wrong url to display the action failure
    template
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new
ej.data.Query().from('Employees').select(['FirstName']).take(6),
  //map the appropriate columns to fields property
  fields: { text: 'FirstName', value: 'EmployeeID' },
  //set the placeholder to DropDownList input
  placeholder: "Select an employee",
  //set the value to action failure template
  actionFailureTemplate: "<span class='action-failure'> Data fetch get
fails</span>"
});
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```

Grouping in ##Platform_Name## Drop down list control

The DropDownList supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

INDEX.JS

```

var vegetableData = [
  { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
  { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
  { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
  { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
  { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
  { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
  { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
  { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
  { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
  { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
  { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
];
//initiate the DropDownList
var vegetables = new ej.dropdowns.DropDownList({
  //set the grouped data to dataSource property
  dataSource: vegetableData,
  // map the groupBy field with Category column
  fields: { groupBy: 'Category', value: 'Vegetable' },
  // set the placeholder to the DropDownList input
  placeholder: "Find a vegetable"
});
//render the DropDownList component
vegetables.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

HTML select

The DropDownList also supports grouping of list items under specific groups by initiating the `<select>` element using `optgroup`. The nested items are wrapped based on the `<optgroup>` tag that is presents in the `<select>` element

```

<select id="selectElement">
  <optgroup label="Beans">
    <option value="1">Chickpea</option>
    <option value="2">Green bean</option>
    <option value="3">Horse gram</option>
  </optgroup>
  <optgroup label="Leafy and Salad">

```

```
<option value="4">Spinach</option>
<option value="5" selected="selected">Cabbage</option>
<option value="6">Wheat grass</option>
</optgroup>
</select>
,
```

INDEX.JS

```
// initialize DropDownList component
let ddlObject = new ej.dropdowns.DropDownList({
  placeholder: "Select a vegetable",
  popupHeight: "200px"
});
// render initialized DropDownList
ddlObject.appendTo('#selectElement');
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers.

- [Group Template support to DropDownList.](#)
- [How to disable the fixed group header](#)

Filtering in ##Platform_Name## Drop down list control

The DropDownList has built-in support to filter data items when [allowFiltering](#) is enabled. The filter operation starts as soon as you start typing characters in the search box.

To display filtered items in the popup, filter the required data and return it to the DropDownList via [updateData](#) method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the DropDownList through the `updateData` method in `filtering` event.

INDEX.JS

```

//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODATAV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to DropDownList input
    placeholder: "Find a customer",
    //set the filterType to searching operation
    filterType: 'StartsWith',
    //sort the resulted items
    sortOrder: 'Ascending'
});
//render the component

```

```
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <br>
    <input type="text" id="ddlelement">
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the DropDownList. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

INDEX.JS

```
//initiates the component
var searchData = new ej.data.DataManager({
  url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true
```

```

});
var ddlObject = new ej.dropdowns.DropDownList({
  dataSource: searchData,
  query: new ej.data.Query().select(['ContactName',
  'CustomerID']).take(7),
  // map the appropriate column
  fields: { text: 'ContactName', value: 'CustomerID' },
  // set placeholder to DropDownList input element
  placeholder: "Select customers",
  //sort the resulted items
  sortOrder: 'Ascending',
  // set true to allowFiltering for enable filtering supports
  allowFiltering: true,
  //bind the filtering event handler
  filtering: (e) => {
    // load overall data when search key empty.
    if(e.text == '') e.updateData(searchData);
    else{
      // restrict the remote request until search key contains 3
characters.
      if (e.text.length < 3) { return; }
      var query = new ej.data.Query().select(['ContactName',
  'CustomerID']);
      query = (e.text !== '') ? query.where('ContactName', 'startswith',
e.text, true) : query;
      e.updateData(searchData, query);
    }
  }
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

INDEX.JS

```

//initiates the component
var searchData = new ej.data.DataManager({
  url:
  'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true
});
var ddlObject = new ej.dropdowns.DropDownList({
  dataSource: searchData,
  query: new ej.data.Query().select(['ContactName',
  'CustomerID']).take(7),
  // map the appropriate column
  fields: { text: 'ContactName', value: 'CustomerID' },
  // set placeholder to DropDownList input element
  placeholder: "Select customers",
  //sort the resulted items
  sortOrder: 'Ascending',
  // set true to allow filtering for enable filtering supports
  allowFiltering: true,
  //bind the filtering event handler
  filtering: (e) => {
    // load overall data when search key empty.
    if(e.text == '') e.updateData(searchData);
    else{
      var query = new ej.data.Query().select(['ContactName',
      'CustomerID']);
      query = (e.text !== '') ? query.where('ContactName', 'startswith',
      e.text, true) : query;
      e.updateData(searchData, query);
    }
  }
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <br>
    <input type="text" id="ddlelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the **where** clause.

The following example shows how to perform case-sensitive filter.

INDEX.JS

```

//initiates the component
var searchData = new ej.data.DataManager({
  url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true
});
var ddlObject = new ej.dropdowns.DropDownList({
  dataSource: searchData,
  query: new ej.data.Query().select(['ContactName',
    'CustomerID']).take(7),

```

```

// map the appropriate column
fields: { text: 'ContactName', value: 'CustomerID' },
// set placeholder to DropDownList input element
placeholder: "Select customers",
//sort the resulted items
sortOrder: 'Ascending',
// set true to allowFiltering for enable filtering supports
allowFiltering: true,
//bind the filtering event handler
filtering: (e) => {
    // load overall data when search key empty.
    if(e.text == '') e.updateData(searchData);
    else{
        var query = new ej.data.Query().select(['ContactName',
'CustomerID']);
        query = (e.text !== '') ? query.where('ContactName', 'startswith',
e.text, true) : query;
        e.updateData(searchData, query);
    }
};
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Diacritics Filtering

The DropDownList supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for DropDownList.

INDEX.JS

```

// create local data
var data = [
    'Aeróbics',
    'Aeróbics en Agua',
    'Aerografía',
    'Aeromodelaje',
    'Águilas',
    'Ajedrez',
    'Ala Delta',
    'Álbumes de Música',
    'Alusivos',
    'Análisis de Escritura a Mano'];
// initialize DropDownList component
var ddlObj = new ej.dropdowns.DropDownList({
    //set the local data to dataSource property
    dataSource: data,
    // set the placeholder to DropDownList input element
    placeholder: 'Select a value',
    // enabled the ignoreAccent property for ignore the diacritics
    ignoreAccent: true,
    // set true for enable the filtering support.
    allowFiltering: true,
    filterBarPlaceholder: 'e.g: aero'
});
ddlObj.appendTo('#ddlelement');

```

INDEX.HTML

```

Virtualization in DropDown List

Dropdown list virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a dropdown list activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the DropDownList component. When a key is typed, the focus is moved to the respective element, and the value is updated in the component in the open popup state. In the closed popup state, the respective value is updated in the component based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the enableVirtualization property is enabled, the `skip` and `take` properties provided by the user within the Query class at the initial state or during the `actionBegin` or `actionComplete` events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

Binding local data

The DropDownList can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the `actionBegin` event occurs before the data retrieval starts. Once the data retrieval is successful, the `actionComplete` event is triggered, indicating that the data fetch process is complete.

In the following example, `id` column and `text` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.JS

```
var records = [];
for (var i = 1; i <= 150; i++) {
    var item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the dataSource property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'id', text: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: false,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding Remote data

The DropDownList supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the **actionBegin** and **actionComplete** events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the **actionBegin** and **actionComplete** events at that time as well.

The following sample displays the OrderId from the **Orders** Data Service.

INDEX.JS

```

//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data source property
    dataSource: new ej.data.DataManager({
        url: 'https://ej2services.syncfusion.com/js/development/api/orders',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //map the appropriate columns to fields property
    fields: { text: 'OrderID', value: 'OrderID' },
    //set the placeholder to DropDownList input
    placeholder: "Select an ID ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping with Virtualization

The DropDownList component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding on virtualization.

The following sample shows the example for Grouping with Virtualization.

INDEX.JS

```

var records = [];
for (var i = 1; i <= 150; i++) {
  var dropdownsItem = {};
  dropdownsItem.id = 'id' + i;
  dropdownsItem.text = "Item ".concat(i);
  var randomAutoGroup = Math.floor(Math.random() * 4) + 1;

```

```

switch (randomAutoGroup) {
    case 1:
        dropdownsItem.group = 'Group D';
        break;
    case 2:
        dropdownsItem.group = 'Group C';
        break;
    case 3:
        dropdownsItem.group = 'Group B';
        break;
    case 4:
        dropdownsItem.group = 'Group A';
        break;
    default:
        break;
}
records.push(dropdownsItem);
}
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { groupBy: 'group', text: 'text', value: 'id' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Filtering with Virtualization

The DropDownList component supports Filtering with Virtualization. The DropDownList includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

INDEX.JS

```

var records = [];
for (var i = 1; i <= 150; i++) {
    var item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'id', text: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: '200px'
});

```

```
//render the component
ddlObject.appendTo('#ddlelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DropDownList</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Localization in ##Platform_Name## Drop down list control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#)

and [actionFailureTemplate](#) properties according to the culture currently assigned to the DropDownList.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the DropDownList and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

INDEX.JS

```
//bind the data manager instance to dataSource property
var customerData = new ej.data.DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true
});
var ddlObj = new ej.dropdowns.DropDownList({
  dataSource: customerData,
  // set locale culture to DropDownList
  locale: 'fr-BE',
  // map appropriate column
  fields: { text: 'ContactName', value: 'CustomerID' },
  // take 0 item to showcase noRecordsTemplate property.
  query: new ej.data.Query().select(['ContactName',
    'CustomerID']).take(0),
  // set placeholder to DropDownList input element
  placeholder: 'Sélectionnez un éléments'
});
ddlObj.appendTo('#ddlelement');
ej.base.L10n.load({
  'fr-BE': {
    'dropdowns': {
      'noRecordsTemplate': "Aucun enregistrement trouvé",
      'actionFailureTemplate': "Modèle d'échec d'action"
    }
  }
});
```

Style in ##Platform_Name## Drop down list control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

```

.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
color: #ab3243;
background: #32a5ab;
}

```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```

.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon:hover {
color: #bb233d;
font-size: 13px;
}

```

```
}
,
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
,
```

```
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-input-focus::after {
```

```
background: #c000ff;
```

```
}
```

```
,
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
,
```

```
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
```

```
border-color: #b1bd15;
```

```
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
```

```
}
```

```
,
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
,
```

```
.e-input-group.e-control-wrapper .e-input[disabled] {
```

```
-webkit-text-fill-color: #0d9133;
```

```
}
```

```
,
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
,
```

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::after {
```

```
background-color: #2319b8;
```

```

}
.e-ddl.e-lib.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top {
color: #2319b8;
}
、

```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```

、
.e-ddl.e-input-group input.e-input::placeholder {
color: red;
}
、

```

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```

、
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
background-color: #1f9c99;
color: #2319b8;
}
、

```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```

、
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
、

```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.JS

```

var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize DropDownList component
var listObj = new ej.dropdowns.DropDownList({
  dataSource: sportsData,
  // set placeholder to DropDownList input element
  placeholder: "Select games"});
listObj.appendTo('#ddlelement');

```

Accessibility in `##Platform_Name##` Drop down list control

The DropDownList component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The DropDownList component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DropDownList component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The DropDownList component uses the **Listbox** role, and each list item has an **option** role. The following **ARIA attributes** denote the DropDownList state.

| **Properties** | **Functionalities** |

| --- | --- |

| aria-haspopup | Indicates whether the DropDownList input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the DropDownList element. |

| aria-disabled | Indicates whether the DropDownList component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

Keyboard interaction

You can use the following key shortcuts to access the DropDownList without interruptions.

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Arrow Down | Selects the first item in the DropDownList when no item selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item, and when it is in an open state the popup list closes. Otherwise, toggles the popup list. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Opens the popup list. |

| Alt + Up | Closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Selects the first item. |

| End | Selects the last item. |

In the below sample, focus the DropDownList component using alt+t keys.

INDEX.JS

```
var gameList = [
    { id: 'Game1', game: 'Badminton' },
    { id: 'Game2', game: 'Basketball' },
```

```

        { id: 'Game3', game: 'Cricket' },
        { id: 'Game4', game: 'Football' },
        { id: 'Game5', game: 'Golf' },
        { id: 'Game6', game: 'Hockey' },
        { id: 'Game7', game: 'Rugby' },
        { id: 'Game8', game: 'Snooker' },
        { id: 'Game9', game: 'Tennis' },
    ];
    // initialize DropDownList component
    var ddlObject = new ej.dropdowns.DropDownList({
        //set the data to dataSource property
        dataSource: gameList,
        //map to column to fields
        fields: { text: 'game', value: 'id' },
        // set placeholder to DropDownList input element
        placeholder: "Select games",
        // set the popup list height
        popupHeight: '200px'
    });
    // render initialized DropDownList
    ddlObject.appendTo('#ddlelement');
    document.onkeyup = function (e) {
        if (e.altKey && e.keyCode === 84 /* t */) {
            // press alt+t to focus the control.
            ddlObject.focusIn();
        }
    };
};

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Ensuring accessibility

The DropDownList component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DropDownList component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DropDownList component with accessibility tools.

How To

Add item in ##Platform_Name## Drop down list control

You can add item in between based on item [index](#). If you add new item without item index, item will be added as last item in list.

The following example demonstrate how to add item in between in DropDownList.

INDEX.JS

```

var sportsData = [
  { Id: 'game1', Game: 'Badminton' },
  { Id: 'game2', Game: 'Football' },
  { Id: 'game3', Game: 'Tennis' }
];
//initiate the DropDownList
var dropDownListObject = new ej.dropdowns.DropDownList({
  // bind the sports Data to datasource property
  dataSource: sportsData,
  // maps the appropriate column to fields property
  fields: { text: 'Game', value: 'Id' },
  //set the placeholder to DropDownList input
  placeholder: "Select a game"
});
//render the component
dropDownListObject.appendTo('#ddlelement');

// add item at first
document.getElementById('first').onclick = () => {
  dropDownListObject.addItem({ Id: 'game0', Game: 'Hockey' }, 0);
};
// add item in between
document.getElementById('between').onclick = () => {
  dropDownListObject.addItem({ Id: 'game4', Game: 'Golf' }, 2);
};

```

```
// add item at last
document.getElementById('last').onclick = () => {
    dropDownListObject.addItem({ Id: 'game5', Game: 'Cricket' });
};
```

INDEX.HTML

```

```

Cascading in ##Platform_Name## Drop down list control

The cascading DropDownList is a series of DropDownList, where the value of one DropDownList depends upon another's value. This can be configured by using the [change](#) event of the parent DropDownList. Within that change event handler, data has to be loaded to the child DropDownList based on the selected value of the parent DropDownList.

The following example, shows the cascade behavior of country, state, and city DropDownList. Here, the [dataBind](#) method is used to reflect the property changes immediately to the DropDownList.

INDEX.JS

```
//define the country DropDownList data
var countryData = [
    { CountryName: 'Australia', CountryId: '2' },
    { CountryName: 'United States', CountryId: '1' }
];
//define the state DropDownList data
var stateData = [
    { StateName: 'New York', CountryId: '1', StateId: '101' },
    { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
    { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
];
//define the city DropDownList data
var cityData = [
    { CityName: 'Albany', StateId: '101', CityId: 201 },
    { CityName: 'Beacon ', StateId: '101', CityId: 202 },
    { CityName: 'Emporia', StateId: '102', CityId: 206 },
    { CityName: 'Hampton ', StateId: '102', CityId: 205 },
    { CityName: 'Hobart', StateId: '105', CityId: 213 },
    { CityName: 'Launceston ', StateId: '105', CityId: 214 }
];
//initiates the country DropDownList
var countryObj = new ej.dropdowns.DropDownList({
    //set the data to dataSource property
    dataSource: countryData,
    fields: { value: 'CountryId', text: 'CountryName' },
    //bind the change event handler
    change: () => {
        //Query the data source based on country DropDownList selected value
        stateObj.query = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
        // enable the state DropDownList
        stateObj.enabled = true;
        //clear the existing selection.
        stateObj.text = null;
        // bind the property changes to state DropDownList
        stateObj.dataBind();
        //clear the existing selection in city DropDownList
        cityObj.text = null;
        //disabe the city DropDownList
        cityObj.enabled = false;
        //bind the property cahnges to City DropDownList
        cityObj.dataBind();
    },
    placeholder: 'Select a country',
});
```

```

//render the country DropDownList
countryObj.appendTo('#countries');
//initiates the state DropDownList
var stateObj = new ej.dropdowns.DropDownList({
    dataSource: stateData,
    fields: { value: 'StateId', text: 'StateName' },
    // set disable state by default to prevent user interact.
    enabled: false,
    change: () => {
        // Query the data source based on state DropDownList selected value
        cityObj.query = new ej.data.Query().where('StateId', 'equal',
stateObj.value);
        // enable the city DropDownList
        cityObj.enabled = true;
        //clear the existing selection
        cityObj.text = null;
        // bind the property change to city DropDownList
        cityObj.dataBind();
    },
    placeholder: 'Select a state',
});
//render the state DropDownList
stateObj.appendTo('#states');
//initiates the city DropDownList
var cityObj = new ej.dropdowns.DropDownList({
    dataSource: cityData,
    fields: { text: 'CityName', value: 'CityId' },
    // disable the DropDownList by default to prevent the user interact.
    enabled: false,
    placeholder: 'Select a city',
});
//render the city DropDownList
cityObj.appendTo('#cities');

```

Clear item in ##Platform_Name## Drop down list control

You can clear the selected item in the below two different ways.

By clicking on the **clear icon** which is shown in DropDownList element, you can clear the selected item in DropDownList through **interaction**. By using [showClearButton](#) property, you can enable the clear icon in DropDownList element.

Through **programmatic** you can set **null** value to anyone of the index, text or value property to clear the selected item in DropDownList.

The following example demonstrate about how to clear the selected item in DropDownList.

INDEX.JS

```

var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize DropDownList component
var dropDownListObject = new ej.dropdowns.DropDownList({
  //set the data to dataSource property
  dataSource: sportsData,
  // set placeholder to DropDownList input element
  placeholder: "Select a game",
  //enable the clear icon
  showClearButton: true
});
// render initialized DropDownList
dropDownListObject.appendTo('#ddelement');

// Set null value to value property for clear the selected item
document.getElementById('btn').onclick = () => {
  dropDownListObject.value = null;
};

```

INDEX.HTML

Close popup in ##Platform_Name## Drop down list control

By using the `hidePopup` method in DropDownList, you can close the popup on scroll when triggered the windows scroll event.

The following example demonstrate about how to close the popup on scroll.

INDEX.JS

```

var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize DropDownList component
var dropDownListObject = new ej.dropdowns.DropDownList({
    //set the data to dataSource property
    dataSource: sportsData,
    // set placeholder to DropDownList input element
    placeholder: "Select a game"
});
// render initialized DropDownList
dropDownListObject.appendTo('#ddlelement');

```

```
// bind the onscroll event to window
window.onscroll = () => {
    dropDownListObject.hidePopup();
};
```

INDEX.HTML

```

Group header in ##Platform_Name## Drop down list control

The following example demonstrate about how to disable the Fixed group header in DropDownList through CSS by using `visibility` attribute.

INDEX.JS

```
var vegetableData = [
  { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
  { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
```

```

    { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
    { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
    { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
    { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
    { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
    { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
    { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
    { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
    { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
  ];
  //initiate the DropDownList
  var vegetables = new ej.dropdowns.DropDownList({
    //set the grouped data to dataSource property
    dataSource: vegetableData,
    // map the groupBy field with Category column
    fields: { groupBy: 'Category', text: 'Vegetable', value: 'Id' },
    // set the placeholder to the DropDownList input
    placeholder: "Select a vegetable",
    // Set the popup list height
    popupHeight: '200px'
  });
  //render the DropDownList component
  vegetables.appendTo('#ddlelement');

```

Highlight filtering in ##Platform_Name## Drop down list control

By using the **highlightSearch** method, you can highlight the matched character in DropDownList filtering.

The following example demonstrates about how to highlight the matched character in filtering.

INDEX.JS

```

//bind the data manager instance to dataSource property
var data=new ej.data.DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
});
//initiates the component
var customers = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource : data,
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName'},
    //set the placeholder to DropDownList input
    placeholder: "Select a name",
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //bind the filtering event handler
    filtering: (e) => {
        // take text for highlight the character in list items.
        let text = e.text;
        let query = new ej.data.Query().select(['ContactName',
        'CustomerID']);
        //frame the query based on search string with filter type.
        query = (e.text !== '') ? query.where('ContactName', 'startswith',
        e.text, true) : query;
        //pass the filter data source, filter query to updateData method.
        e.updateData(data, query);
        setTimeout(() => {
            let popupElement = document.getElementById('ddlelement_popup');
            // get the list from popup element
            let lists = popupElement.querySelector('ul');
            // pass the element, text, ignore case and filter type as
            argument to highlightSearch method.
            ej.dropdowns.highlightSearch(lists, text, true, 'StartsWith');
        }, 300);
    }
});
//render the component
customers.appendTo('#ddlelement');

```

INDEX.HTML

```

Icons support in ##Platform_Name## Drop down list control

You can render **icons** to the list items by mapping the [iconCss](#) field. This `iconCss` field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with `iconCss` field.

INDEX.JS

```

var sortFormatData = [
  { Class: 'asc-sort', Type: 'Sort A to Z', Id: '1' },
  { Class: 'dsc-sort', Type: 'Sort Z to A ', Id: '2' },
  { Class: 'filter', Type: 'Filter', Id: '3' },
  { Class: 'clear', Type: 'Clear', Id: '4' }
];
//initiates the component
var sortFormat = new ej.dropdowns.DropDownList({
  //set the data to dataSource property
  dataSource: sortFormatData,
  // map the icon column to iconCSS field.

```

```

    fields: { value: 'Type', iconCss: 'Class' },
    // set placeholder to DropDownList input element
    placeholder: 'Find a format'
  });
  sortFormat.appendTo('#ddlelement');

```

INDEX.HTML

```

```

Incremental search in ##Platform_Name## Drop down list control

DropDownList supports incremental search, by default. You can search the list item by focusing the DropDownList and typing the characters in it. The closely matched items are selected sequentially.

If the same key is searched once again, the next matched item is selected.

Modify data in ##Platform_Name## Drop down list control

When binding the remote data source, by using the [actionComplete](#) event, you can modify the result data before passing it to DropDownList.

The following sample demonstrate how to modify the result data.

INDEX.JS

```

var ddlObject = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName'},
    //set the placeholder to DropDownList input
    placeholder: "Find a customer",
    //sort the resulted items
    actionComplete: function (e) {
        // initially result contains 6 items
        console.log("Before modified the result: " + e.result.length);
        // remove first 2 items from result.
        e.result.splice(0, 2);
        // now displays the result count is 4.
        console.log("After modified the result: " + e.result.length);
    }
});
//render the component
ddlObject.appendTo('#ddlelement');

```

INDEX.HTML

```

```

Multiple cascading in ##Platform_Name## Drop down list control

The following example demonstrate about how to preselect the list items in multiple cascading DropDownList.

INDEX.JS

```

var countryData = [
    { CountryName: 'United States', CountryId: '1' },
    { CountryName: 'Australia', CountryId: '2' }
];
//define the state DropDownList data
var stateData = [
    { StateName: 'New York', CountryId: '1', StateId: '101' },
    { StateName: 'Virginia ', CountryId: '1', StateId: '102' },
    { StateName: 'Tasmania ', CountryId: '2', StateId: '105' }
];
//define the city DropDownList data
var cityData = [
    { CityName: 'Albany', StateId: '101', CityId: 201 },
    { CityName: 'Beacon ', StateId: '101', CityId: 202 },
    { CityName: 'Hampton ', StateId: '102', CityId: 205 },
    { CityName: 'Emporia', StateId: '102', CityId: 206 },
    { CityName: 'Hobart', StateId: '105', CityId: 213 },
    { CityName: 'Launceston ', StateId: '105', CityId: 214 }
];
//initiates the country DropDownList
var countryObj = new ej.dropdowns.DropDownList({
    dataSource: countryData,
    // map the appropriate the column to fields property
    fields: { value: 'CountryId', text: 'CountryName' },
    //bind the change event handler
    change: countryChange,
    index: 1,
    // set the placeholder to the DropDownList input
    placeholder: 'Select a country',
});
//render the country DropDownList
countryObj.appendTo('#countries');
//initiates the state DropDownList
var stateObj = new ej.dropdowns.DropDownList({
    dataSource: stateData,
    // map the appropriate the column to fields property
    fields: { value: 'StateId', text: 'StateName' },
    // set disable state by default to prevent user interact.
    enabled: false,

```

```

        //bind the change event handler
        change: stateChange,
        // set the placeholder to the DropDownList input
        placeholder: 'Select a state',
    });
    //render the state DropDownList
    stateObj.appendTo('#states');
    //initiates the city DropDownList
    var cityObj = new ej.dropdowns.DropDownList({
        dataSource: cityData,
        // map the appropriate the column to fields property
        fields: { text: 'CityName', value: 'CityId' },
        // disable the DropDownList by default to prevent the user interact.
        enabled: false,
        // set the placeholder to the DropDownList input
        placeholder: 'Select a city',
    });
    //render the city DropDownList
    cityObj.appendTo('#cities');
    // initially change event not triggered, so manually call the corresponding
    function
    countryChange();
    // preselect an item from filtered state DropDownList
    stateObj.index = 0;
    stateObj.dataBind();
    // initially change event not triggered, so manually call the corresponding
    function
    stateChange();
    // preselect an item from filtered city DropDownList
    cityObj.index = 0;
    cityObj.dataBind();
    function stateChange() {
        // Query the data source based on state DropDownList selected value
        cityObj.query = new ej.data.Query().where('StateId', 'equal',
stateObj.value);
        // enable the city DropDownList
        cityObj.enabled = true;
        //clear the existing selection
        cityObj.text = null;
        // bind the property change to city DropDownList
        cityObj.dataBind();
    }
    function countryChange() {
        //Query the data source based on country DropDownList selected value
        stateObj.query = new ej.data.Query().where('CountryId', 'equal',
countryObj.value);
        // enable the state DropDownList
        stateObj.enabled = true;
        //clear the existing selection.
        stateObj.text = null;
        // bind the property changes to state DropDownList
        stateObj.dataBind();
        //clear the existing selection in city DropDownList
        cityObj.text = null;
        //disabe the city DropDownList
        cityObj.enabled = false;
        //bind the property cahnges to City DropDownList

```

```
cityObj.dataBind();
}
```

Remote data bind in ##Platform_Name## Drop down list control

Before component rendering, you can get the total items count by using [actionComplete](#) event with its result arguments. After rendering this component, you can get the total items count by using [getItems](#) method.

The following example demonstrate how to get the total items count.

INDEX.JS

```

var customers = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName'},
    //set the placeholder to DropDownList input
    placeholder: "Find a customer",
    //sort the resulted items
    aactionComplete: function (e) {
        // get total items count
        console.log("Total items count: " + e.result.length);
        let element = document.createElement('p');
        element.innerText = "Total items count: " + e.result.length;
        document.getElementById('event').append(element);
    }
});
//render the component
customers.appendTo('#ddlelement');
document.getElementById('btn').onclick = () => {
    // get items count using getItems method
    console.log("Total items count: " + customers.getItems().length);
    let element = document.createElement('p');
    element.innerText = "Total items count: " + customers.getItems().length;
    document.getElementById('event').append(element);
};

```

    <div id="container" style="margin:0 auto; width:250px;">
        <br>
        <input type="text" id="ddlelement">
        <div style="margin: 50px">
            <button id="btn" class="e-btn e-control"> Get items</button>
        </div>
        <p id="event"> </p>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Remove item in ##Platform_Name## Drop down list control

The following example demonstrate about how to remove an item from DropDownList.

INDEX.JS

```

var sportsData = [
    { Id: 'game1', Game: 'Badminton' },
    { Id: 'game2', Game: 'Football' },
    { Id: 'game3', Game: 'Tennis' }
];
//initiate the DropDownList
var dropDownListObject = new ej.dropdowns.DropDownList({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'Game', value: 'Id' },
    //set the placeholder to DropDownList input
    placeholder: "Select a game"
});
//render the componen
dropDownListObject.appendTo('#ddlelement');

document.getElementById('first').onclick = () => {
    // create DropDownList object
    var obj = document.getElementById('ddlelement');
    if (obj.ej2_instances[0].list) {
        // Remove the selected value if 0th index selected
        if (dropDownListObject.index === 0) {
            dropDownListObject.value = null;
            dropDownListObject.dataBind();
        }
        // remove first item in list
        (obj.ej2_instances[0].list.querySelectorAll('li')[0]).remove();
        if (!obj.ej2_instances[0].list.querySelectorAll('li')[0]) {
            dropDownListObject.dataSource = [];
            // enable the nodata template when no data source is empty.
            obj.ej2_instances[0].list.classList.add('e-nodata');
        }
    }
}

```

```

    }
    else {
        // remove first item in list
        dropDownListObject.dataSource.splice(0, 1);
    }
};

```

Search on filtering in ##Platform_Name## Drop down list control

The following example demonstrates about how to set limit the search result on filtering.

INDEX.JS

```

var data=new ej.data.DataManager({
  url:
  'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',

```

```

        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    });
var customers = new ej.dropdowns.DropDownList({
    //bind the data manager instance to dataSource property
    dataSource : data,
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName'},
    //set the placeholder to DropDownList input
    placeholder: "Select a name",
    // sort the resulted items
    sortOrder: 'Ascending',
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    // bind the filtering event handler
    filtering: (e) => {
        // set limit as 4 to search result
        let query = new ej.data.Query().select(['ContactName']).take(6);
        query = (e.text !== '') ? query.where('ContactName', 'startswith',
e.text, true) : query;
        e.updateData(data, query);
    }
});
//render the component
customers.appendTo('#ddlelement');

```

INDEX.HTML

```

Tooltip in ##Platform_Name## Drop down list control

You can achieve this behavior by using **ej2-tooltip** component. When the mouse hover on the DropDownList option that tooltip display some details related to hovered list item.

INDEX.JS

```

//Initialize DropDownList component
var listObj = new ej.dropdowns.DropDownList({
    // define the array of JSON data
    dataSource: [
        { id: '1', text: 'Australia', content: 'National sports is Cricket' },
        { id: '2', text: 'Bhutan', content: 'National sports is Archery' },
        { id: '3', text: 'China', content: 'National sports is Table Tennis' },
        { id: '4', text: 'Cuba', content: 'National sports is Baseball' },
        { id: '5', text: 'India', content: 'National sports is Hockey' },
        { id: '6', text: 'Spain', content: 'National sports is Football' },
        { id: '7', text: 'United States', content: 'National sports is Baseball' }
    ],
    // map the appropriate column to fields property
    fields: { text: 'text', tooltip: 'id' },
    // set the placeholder to the DropDownList input
    placeholder: 'Select a country',
    // bind the DropDownList close event
    close: () => { tooltip.close(); }
});
listObj.appendTo('#ddltooltip');
//Initialize Tooltip component
var tooltip = new ej.popups.Tooltip({
    // default content of tooltip
    content: 'Loading...',
    // set target element to tooltip
    target: '.e-list-item',
    // set position of tooltip
    position: 'top center',
    // bind beforeRender event
    beforeRender: onBeforeRender
});
tooltip.appendTo('body');
function onBeforeRender(args) {
    // get the target element
    var listElement = document.getElementById('ddltooltip');
    var result = listElement.ej2_instances[0].dataSource;
    var i;
    for (i = 0; i < result.length; i++) {

```

```

        if (result[i].text === args.target.textContent) {
            this.content = result[i].content;
            this.dataBind();
            break;
        }
    }
}

```

INDEX.HTML

Value change in ##Platform_Name## Drop down list control

You can check about whether value change happened by manual or programmatic by using [change](#) event argument that argument name is `isInteracted`.

The following example demonstrate, how to check whether value change happened by manual or programmatic.

INDEX.JS

```

var sportsData = [
    { Id: 'game1', Game: 'Badminton' },
    { Id: 'game2', Game: 'Football' },
    { Id: 'game3', Game: 'Tennis' }
];
//initiate the DropDownList
var dropDownListObject = new ej.dropdowns.DropDownList({
    // bind the sports Data to datasource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { text: 'Game', value: 'Id' },
    //set the placeholder to DropDownList input
    placeholder: "Select a game",
    // bind change event handler
    change: onChange
});
//render the component
dropDownListObject.appendTo('#ddlelement');

// Set value dynamically
document.getElementById('btn').onclick = () => {
    dropDownListObject.value = 'game3';
};
function onChange(args) {
    var element = document.createElement('p');
    if (args.isInteracted) {
        element.innerText = 'Changes happened by Interaction';
    }
    else {
        element.innerText = 'Changes happened by programmatic';
    }
    document.getElementById('event').append(element);
}

```

Value support in ##Platform_Name## Drop down list control

yes, value for each list items should be unique.

Achieve virtual scrolling in ##Platform_Name## Drop down list control

The Virtual Scrolling is used to display a large amount of data without buffering the entire load of a huge database record in the DropDownList, that is, when scrolling, the request is sent and fetch some amount of data from the server dynamically. Using the `scroll` event, get the data and generate the list add to popup using the `addItem` method.

Refer to the following code sample for virtual scrolling.

INDEX.JS

```

var data = new ej.data.DataManager({
  url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
  crossDomain: true
});
//initiates the component
let ddlObject = new ej.dropdowns.DropDownList({
  // bind the DataManager instance to dataSource property
  dataSource: data,
  // bind the Query instance to query property
  query: new
ej.data.Query().from('Customers').select('ContactName').take(7),
  // map the appropriate columns to fields property
  fields: { text: 'ContactName', value: 'ContactName' },
  // set the placeholder to DropDownList input element
  placeholder: 'Select a customer',
  // sort the resulted items
  sortOrder: 'Ascending',
  // set the height of the popup element
  popupHeight: '200px',

  actionComplete: function (e) {
    let operator = new
ej.data.Query().from('Customers').select('ContactName');
    let start = 7;
    let end = 12;

```

```

        let listElement = this.list;
        listElement.addEventListener('scroll', () => {
            if ((listElement.scrollTop + listElement.offsetHeight >=
listElement.scrollHeight)) {
                let filterQuery = operator.clone();
                data.executeQuery(filterQuery.range(start,
end)).then((event) => {
                    start = end;
                    end += 5;
                    ddlObject.addItem(event.result);
                }).catch((e) => {
                });
            }
        })
    });
    ddlObject.appendTo('#atcelement');

```

INDEX.HTML

```

Dropdown Tree

Data binding in ##Platform_Name## Drop down tree control

The Dropdown Tree control provides an option to load the data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and `DataManager`. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adaptors.

Dropdown Tree has `load on demand` (Lazy load) option. It reduces the bandwidth size when consuming the huge data. By default, the `loadOnDemand` is set to false. By enabling this property, it loads first level items initially, and when parent item is expanded, loads the child items based on the `parentValue/child` member.

Local data

To bind local data to the Dropdown Tree, you can assign a JavaScript object array to the `dataSource` property.

The Dropdown Tree control requires three fields (Value, text, and `parentValue`) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the `DataManager`. It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

Hierarchical data

Dropdown Tree can be populated with the hierarchical data source that contains nested array of JSON objects. You can directly map the hierarchical data and the field members with corresponding key values from the hierarchical data to the `fields` property.

In the following example, **code**, **name**, and **countries** columns from the hierarchical data have been mapped to **value**, **text**, and **child** fields, respectively.

INDEX.JS

```
ej.base.enableRipple(true);
//define the nested array of JSON objects
var continents = [
  {
    code: 'AF', name: 'Africa', countries: [
      { code: 'NGA', name: 'Nigeria' },
      { code: 'EGY', name: 'Egypt' },
      { code: 'ZAF', name: 'South Africa' }
    ]
  },
  {
    code: 'AS', name: 'Asia', expanded: true, countries: [
      { code: 'CHN', name: 'China' },
      { code: 'IND', name: 'India', selected: true },
      { code: 'JPN', name: 'Japan' }
    ]
  }
],
```

```

{
  code: 'EU', name: 'Europe', countries: [
    { code: 'DNK', name: 'Denmark' },
    { code: 'FIN', name: 'Finland' },
    { code: 'AUT', name: 'Austria' }
  ]
},
{
  code: 'NA', name: 'North America', countries: [
    { code: 'USA', name: 'United States of America' },
    { code: 'CUB', name: 'Cuba' },
    { code: 'MEX', name: 'Mexico' }
  ]
},
{
  code: 'SA', name: 'South America', countries: [
    { code: 'BRA', name: 'Brazil' },
    { code: 'COL', name: 'Colombia' },
    { code: 'ARG', name: 'Argentina' }
  ]
},
{
  code: 'OC', name: 'Oceania', countries: [
    { code: 'AUS', name: 'Australia' },
    { code: 'NZL', name: 'New Zealand' },
    { code: 'WSM', name: 'Samoa' }
  ]
},
{
  code: 'AN', name: 'Antarctica', countries: [
    { code: 'BVT', name: 'Bouvet Island' },
    { code: 'ATF', name: 'French Southern Lands' }
  ]
},
];
var DropDownTreeObj = new ej.dropdowns.DropDownTree({
  fields: { dataSource: continents, value: 'code', text: 'name', child:
'countries' }
});
DropDownTreeObj.appendTo('#ddltreeelement');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Self-referential data

Dropdown Tree can be populated from the self-referential data structure that contains array of JSON objects with `parentValue` mapping.

You can directly assign the self-referential data and map all the field members with corresponding key values from self-referential data to the `fields` property.

To render the root level items, specify the `parentValue` as null or no need to specify the `parentValue` in the `dataSource`.

In the following example, `id`, `pid`, `hasChild`, and `name` columns from self-referential data have been mapped to `value`, `parentValue`, `hasChildren`, and `text` fields, respectively.

INDEX.JS

```

ej.base.enableRipple(true);
var localData = [
    { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
    { id: 2, pid: 1, name: 'Hot Singles' },
    { id: 3, pid: 1, name: 'Rising Artists' },
    { id: 4, pid: 1, name: 'Live Music' },
    { id: 6, pid: 1, name: 'Best of 2017 So Far' },
    { id: 7, name: 'Sales and Events', hasChild: true },
    { id: 8, pid: 7, name: '100 Albums - $5 Each' },
    { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
    { id: 10, pid: 7, name: 'CD Deals' },
    { id: 11, name: 'Categories', hasChild: true },
    { id: 12, pid: 11, name: 'Songs' },
    { id: 13, pid: 11, name: 'Bestselling Albums' },

```

```

    { id: 14, pid: 11, name: 'New Releases' },
    { id: 15, pid: 11, name: 'Bestselling Songs' },
    { id: 16, name: 'MP3 Albums', hasChild: true },
    { id: 17, pid: 16, name: 'Rock' },
    { id: 18, pid: 16, name: 'Gospel' },
    { id: 19, pid: 16, name: 'Latin Music' },
    { id: 20, pid: 16, name: 'Jazz' },
    { id: 21, name: 'More in Music', hasChild: true },

Remote data

Dropdown Tree can also be populated from a remote data service with the help of the **DataManager** control and **Query** property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

You can assign service data as an instance of **DataManager** to the **dataSource**. To interact with remote data source, you must provide the endpoint url.

The **DataManager** that acts as an interface between the service endpoint and the Dropdown Tree requires the following information to interact with service endpoint properly.

- **DataManager->url**: Defines the service endpoint to fetch data.
- **DataManager->adaptor**: Defines the adaptor option. By default, **ODataAdaptor** is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The **@syncfusion/ej2-data** package provides some pre-defined adaptors designed to interact with service endpoints. They are,

- **UrlAdaptor**: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from the remote services. The **EmployeeID**, **FirstName**, and **EmployeeID**

columns from the Employees table have been mapped to **value**, **text**, and **hasChildren** fields respectively for first level items.

The **OrderID**, **EmployeeID**, and **ShipName** columns from the orders table have been mapped to **value**, **parentValue**, and **text** fields respectively for second level items.

INDEX.JS

```
ej.base.enableRipple(true);
var data = new ej.data.DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true,
});
```

```

var query = new
ej.data.Query().from('Employees').select('EmployeeID,FirstName,Title').take(
5);
var query1 = new
ej.data.Query().from('Orders').select('OrderID,EmployeeID,ShipName').take(5)
;
var DropDownTreeObj = new ej.dropdowns.DropDownTree({
    fields: { dataSource: data, query: query, value: 'EmployeeID', text:
'FirstName', hasChildren: 'EmployeeID', tooltip: 'Title',
        child: { dataSource: data, query: query1, value: 'OrderID',
parentValue: 'EmployeeID', text: 'ShipName' }
    }
});
DropDownTreeObj.appendTo('#ddltreeelement');

```

Templates in ##Platform_Name## Drop down tree control

The Dropdown Tree provides support to customize each list item, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the Dropdown Tree can be customized with the help of [itemTemplate](#) property.

In the following sample, the Dropdown Tree list items are customized with employee information such as **name** and **job** using the **itemTemplate** property.

The template expression should be provided inside the `${...}` interpolation syntax.

INDEX.JS

```

var data = [
    { "id": 1, "name": "Steven Buchanan", "job": "General Manager",
      "hasChild": true, "expanded": true },
    { "id": 2, "pid": 1, "name": "Laura Callahan", "job": "Product Manager",
      "hasChild": true },
    { "id": 3, "pid": 2, "name": "Andrew Fuller", "job": "Team Lead",
      "hasChild": true },
    { "id": 4, "pid": 3, "name": "Anne Dodsworth", "job": "Developer" },
    { "id": 10, "pid": 3, "name": "Lilly", "job": "Developer", "status":
      "online" },
    { "id": 5, "pid": 1, "name": "Nancy Davolio", "job": "Product Manager",
      "hasChild": true },

```

```

    { "id": 6, "pid": 5, "name": "Michael Suyama", "job": "Team Lead",
      "hasChild": true },
    { "id": 7, "pid": 6, "name": "Robert King", "job": "Developer " },
    { "id": 11, "pid": 6, "name": "Mary", "job": "Developer " },
    { "id": 9, "pid": 1, "name": "Janet Leverling", "job": "HR" }
  ];
  var ddtreeObj = new ej.dropdowns.DropDownTree({
    fields: { dataSource: data, text: 'name', value: 'id', parentValue:
      'pid', hasChildren: 'hasChild' },
    itemTemplate: '#itemTemplate',
    width: '100%',
    cssClass: 'custom',
    placeholder: 'Select an employee',
    popupHeight: '250px'
  });
  ddtreeObj.appendTo('#template');

```

Action failure template

The Dropdown Tree provides an option to custom design the popup list content using [actionFailureTemplate](#) property, when the data fetch request fails at the remote server.

In the following sample, when the data fetch request fails, the Dropdown Tree displays the notification.

INDEX.JS

```

var data = new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svs',
    adaptor: new ej.data.ODataV4Adaptor,
    crossDomain: true,
});
var query = new
ej.data.Query().from('Employees').select('EmployeeID,FirstName,Title').take(
5);
var query1 = new
ej.data.Query().from('Orders').select('OrderID,EmployeeID,ShipName').take(5)
;
var ddTreeObj = new ej.dropdowns.DropDownTree({
    fields: {
        dataSource: data, query: query, value: 'EmployeeID', text:
'FirstName', hasChildren: 'EmployeeID',
        child: { dataSource: data, query: query1, value: 'OrderID',
parentValue: 'EmployeeID', text: 'ShipName' }
    },
    width: '100%',
    actionFailureTemplate: "<span class='action-failure'> Data fetch request
fails</span>",
    placeholder: 'Select an employee',
    popupHeight: '250px'
});
ddTreeObj.appendTo('#template');

```

Custom template to show selected items in input

In Dropdown Tree, while selecting more than one items via checkbox or multi selection support, all the selected items will be displayed in the input. Instead of displaying all the selected item text, the custom template can be displayed by setting the the [mode](#) property as **Custom** and [customTemplate](#) property.

When the **mode** property is set as **Custom**, the Dropdown Tree displays the default template value **(\${value.length} item(s) selected)** like **1 item(s) selected** or **2 item(s) selected**. The default template can be customized by setting **customTemplate** property.

In the following sample, the Dropdown Tree is rendered with default value of the **customTemplate** property like “1 item(s) selected or 2 item(s) selected”.

INDEX.JS

```

Checkbox in ##Platform_Name## Drop down tree control

The Dropdown Tree control allows you to check more than one item from the tree without affecting the UI's appearance by enabling the `showCheckBox` property. When this property is enabled, checkbox appears before each item text in the popup.

In the following example, the `showCheckBox` property is enabled.

INDEX.JS

```

var localData = [
  { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
  { id: 2, pid: 1, name: 'Hot Singles' },
  { id: 3, pid: 1, name: 'Rising Artists' },
  { id: 4, pid: 1, name: 'Live Music' },
  { id: 6, pid: 1, name: 'Best of 2017 So Far' },
  { id: 7, name: 'Sales and Events', hasChild: true },
  { id: 8, pid: 7, name: '100 Albums - $5 Each' },
  { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
  { id: 10, pid: 7, name: 'CD Deals' },
  { id: 11, name: 'Categories', hasChild: true },
  { id: 12, pid: 11, name: 'Songs' },
  { id: 13, pid: 11, name: 'Bestselling Albums' },
  { id: 14, pid: 11, name: 'New Releases' },
  { id: 15, pid: 11, name: 'Bestselling Songs' },
  { id: 16, name: 'MP3 Albums', hasChild: true },
  { id: 17, pid: 16, name: 'Rock' },
  { id: 18, pid: 16, name: 'Gospel' },
  { id: 19, pid: 16, name: 'Latin Music' },
  { id: 20, pid: 16, name: 'Jazz' },
  { id: 21, name: 'More in Music', hasChild: true },
  { id: 22, pid: 21, name: 'Music Trade-In' },
  { id: 23, pid: 21, name: 'Redeem a Gift Card' },
  { id: 24, pid: 21, name: 'Band T-Shirts' },
];
var DropDownTreeObj = new ej.dropdowns.DropDownTree({
  fields: { dataSource: localData, value: 'id', parentValue: 'pid', text:
'name', hasChildren: 'hasChild' },
  showCheckBox: true
});
DropDownTreeObj.appendTo('#ddltreeelement');

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Auto Check

By default, the checkbox state of the parent and child items in the Dropdown Tree will not be dependent over each other. If you need dependent checked state, then enable the `autoCheck` property which is a member of `treeSettings` property.

- If one or more child items are not in the checked state, then the parent item will be in the intermediate state.
- If all the child items are checked, then the parent item will also be in the checked state.
- If a parent item is checked, then all the child items will also be changed to the checked state.

In the following example, the `autoCheck` property is enabled.

INDEX.JS

```

var localData = [
    { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
    { id: 2, pid: 1, name: 'Hot Singles' },
    { id: 3, pid: 1, name: 'Rising Artists' },
    { id: 4, pid: 1, name: 'Live Music' },
    { id: 5, pid: 1, name: 'Best of 2017 So Far' },
    { id: 7, name: 'Sales and Events', hasChild: true },
    { id: 8, pid: 7, name: '100 Albums - $5 Each' },
    { id: 9, pid: 7, name: 'Hip-Hop and R&B Sale' },
    { id: 10, pid: 7, name: 'CD Deals' },
    { id: 11, name: 'Categories', hasChild: true },

</body></html>

```

Select All

The Dropdown Tree control has in-built support to select all the tree items using Select All options in the header.

When the `showSelectAll` property is set to true, a checkbox will be displayed in the popup header that allows you to select or deselect all the tree items in the popup.

By default, `Select All` and `unSelect All` text values will be showcased along with the checkbox in the popup header to indicate the action to be performed on checking or unchecking the checkbox. You can customize these name attributes by using `selectAllText` and `unSelectAllText` properties respectively.

INDEX.JS

```
var localData = [
  { id: 1, name: 'Discover Music', hasChild: true, expanded: true },
  { id: 2, pid: 1, name: 'Hot Singles' },

Localization in ##Platform_Name## Drop down tree control

The [Localization](#) library allows you to localize default text content of the Dropdown Tree and it can be localized to any culture by defining the texts and messages of the Dropdown Tree in the corresponding culture. The default locale of the Dropdown Tree is en (English). The following table represents the default texts and messages of the Dropdown Tree in en culture.

|KEY|Text/Message|

|----|----|

|noRecordsTemplate|No records found|

|actionFailureTemplate|Request failed|

|overflowCountTemplate|+\${count} more..|

|totalCountTemplate|\${count} selected|

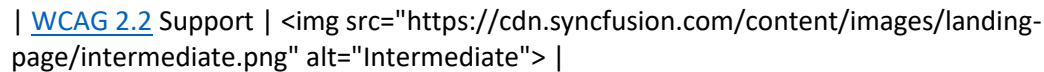

Accessibility in ##Platform_Name## Dropdown Tree component

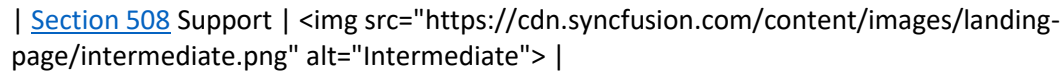

The Dropdown Tree component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

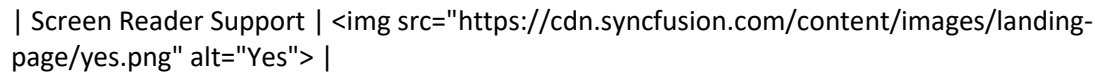

The accessibility compliance for the Dropdown Tree component is outlined below.

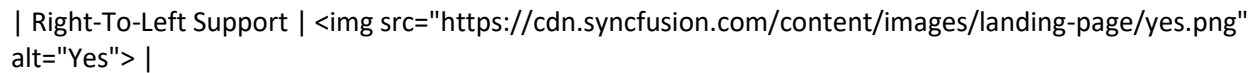

| Accessibility Criteria | Compatibility |

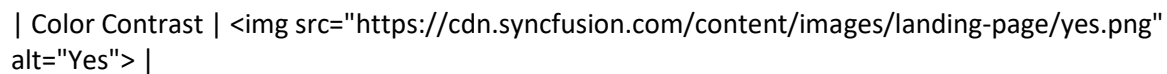

| -- | -- |

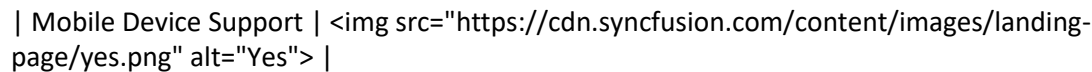

| [WCAG 2.2](#) Support |  |

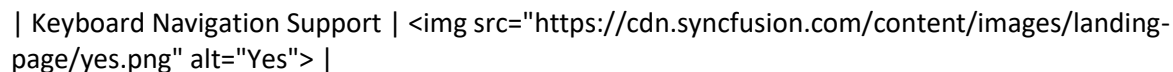

| [Section 508](#) Support |  |

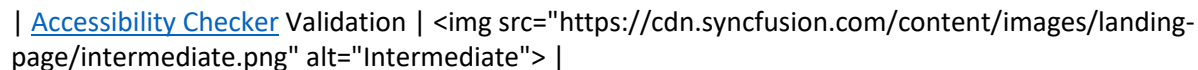

| Screen Reader Support |  |

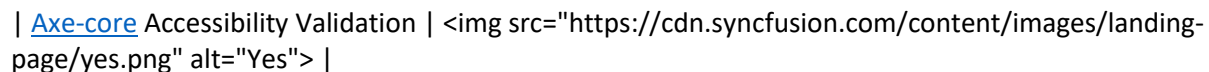

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

[WAI-ARIA attributes](#)

The Dropdown Tree component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dropdown Tree component:

| Attributes | Purpose |

--- ---	
role=listbox	All list items are contained within the element.
aria-disabled	Indicates element is perceivable but disabled.
aria-owns	This attribute contains the ID of the popup list to indicate popup as a child element.
aria-haspopup	Indicates whether the Dropdown Tree input element has a popup list or not.
aria-expanded	Indicates the state of the popup list for Dropdown Tree and the parent node's expansion status for TreeView.
aria-activedescendent	This attribute holds the ID of the active list item to focus its descendant child element.
aria-labelledby	This attribute points to the element(s) labeling the element it's applied to.
aria-describedby	This attribute points to the element(s) describing the one it's set on.
role=tree	All tree nodes are contained within the element.
role=treeitem	Specifies the role of each tree node in a selectable TreeView and its containment within the tree.
role=group	Specifies the role of each parent node container in the TreeView.
role=checkbox	Indicates checkbox control along with treeitem element.
aria-multiselectable	Indicates whether the TreeView enables multiple selection or not.
aria-selected	Indicates the selected node.
aria-level	Indicates the level of node in TreeView.
aria-checked	Indicates the current checked state of TreeView checkbox.
aria-label	Indicates the contextual message for the TreeView checkbox and Dropdown Tree.
aria-activedescendant	Identifies the currently active element when focusing on the TreeView.

Keyboard interaction

The Dropdown Tree component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Dropdown Tree component.

Interaction Keys	Description

Alt + Down	Opens the popup.
Alt + Up	Closes the popup.
Esc(Escape)	Closes the popup when it is in an open state.
Arrow Up	Goes to the previous item in the popup.
Arrow Down	Goes to the next item in the popup.

| Arrow Right | Expands the current item in the popup. |

| Arrow Left | Collapses the current item in the popup. |

| Home | Goes to the first item in the popup. |

| End | Goes to the last item in the popup. |

| Enter | Selects the focused item in the popup. |

| Space | Checks the current item in the popup. |

Ensuring accessibility

The Dropdown Tree component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dropdown Tree component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dropdown Tree component with accessibility tools.

FileManager

User interface in ##Platform_Name## File manager control

The file manager UI is comprised of several sections like view, toolbar, breadcrumb, context menu, and so on. The UI of the file manager is enhanced with injectable modules like **Details View** for browsing files and folders in a grid, **Navigation Pane** for folder navigation, and **Toolbar** for file operations. The file manager with all feature modules have the following sections in its UI.

- [Toolbar](#) (For direct access to file operations)
- [Navigation Pane](#) (For easy navigation between folders)
- [Breadcrumb](#) (For parent folder navigations)
- [View](#) (For browsing files and folders using large icon view or details view)
- [Context Menu](#) (For accessing file operations)

The basic file manager is a light weight component with all the basic functions. The basic file manager have the following sections in its UI to browse files and folders and manage them with file operations.

- [Breadcrumb](#) (For parent folder navigations)
- [View](#) (Large Icons view for browsing files and folders)
- [Context Menu](#) (For accessing file operations)

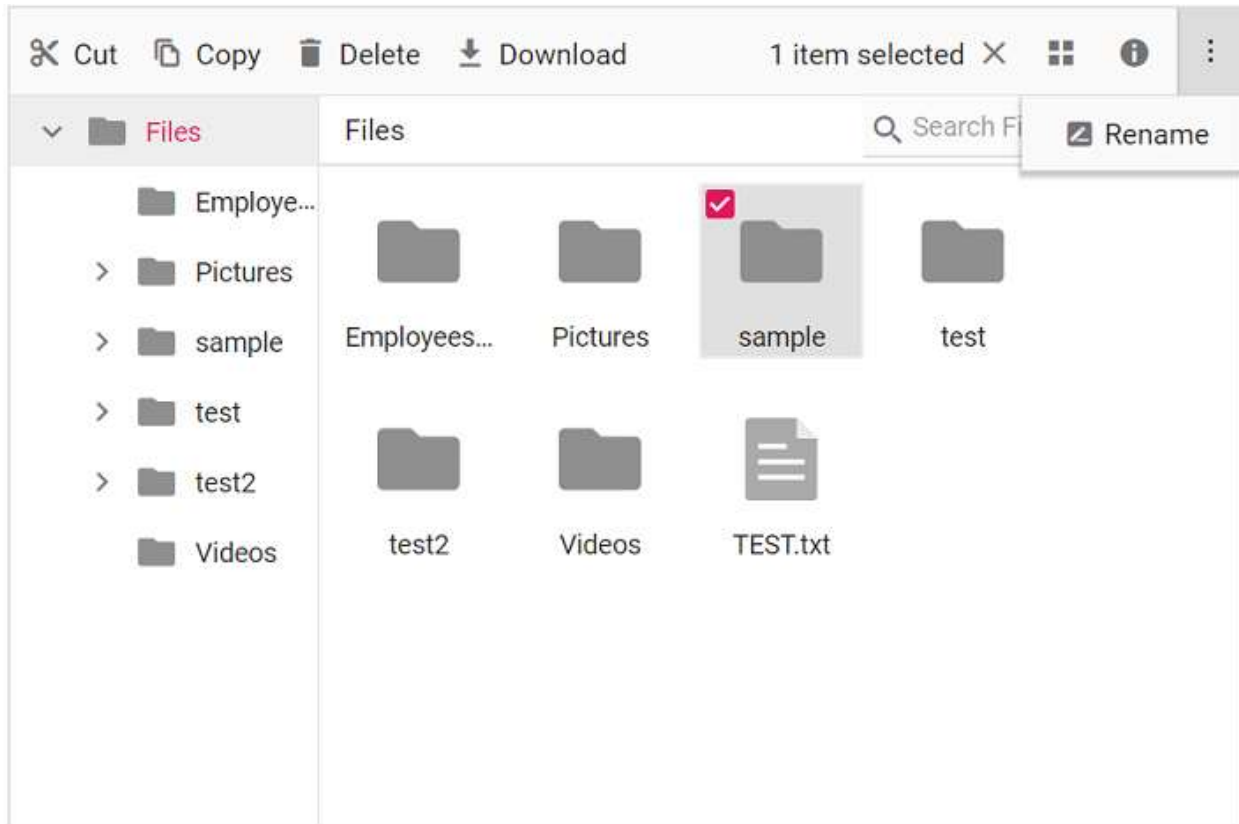

Toolbar

The **Toolbar** provides easy access to the file operations using different buttons and it is presented at the top of the file manager.

If the toolbar items exceed the size of the toolbar, then the exceeding toolbar size will be moved to toolbar popup with a dropdown button at the end of toolbar.

**Refer [Toolbar](#) section in file operations to know more about the buttons present in toolbar*.*

Files and folders navigation

The file manager provides navigation between files and folders using the following two options.

- [Navigation Pane](#)
- [Breadcrumb](#)

Navigation pane

The navigation pane is an injectable module so, it should be injected before rendering the file manager to use its functionality.

It displays the folder hierarchy of the file system and provides easy navigation to the desired folder. Using [navigationPaneSettings](#) minimum and maximum width of the navigation pane can be changed. The navigation pane can be shown or hidden using the `visible` option in the [navigationPaneSettings](#).

BreadCrumb

The file manager provides breadcrumb for navigating to the parent folders. The breadcrumb the in file manager is responsible for resizing.

Whenever the path length exceeds the breadcrumb length, a dropdown button will be added at the starting of the breadcrumb to hold the parent folders adjacent to root.

View

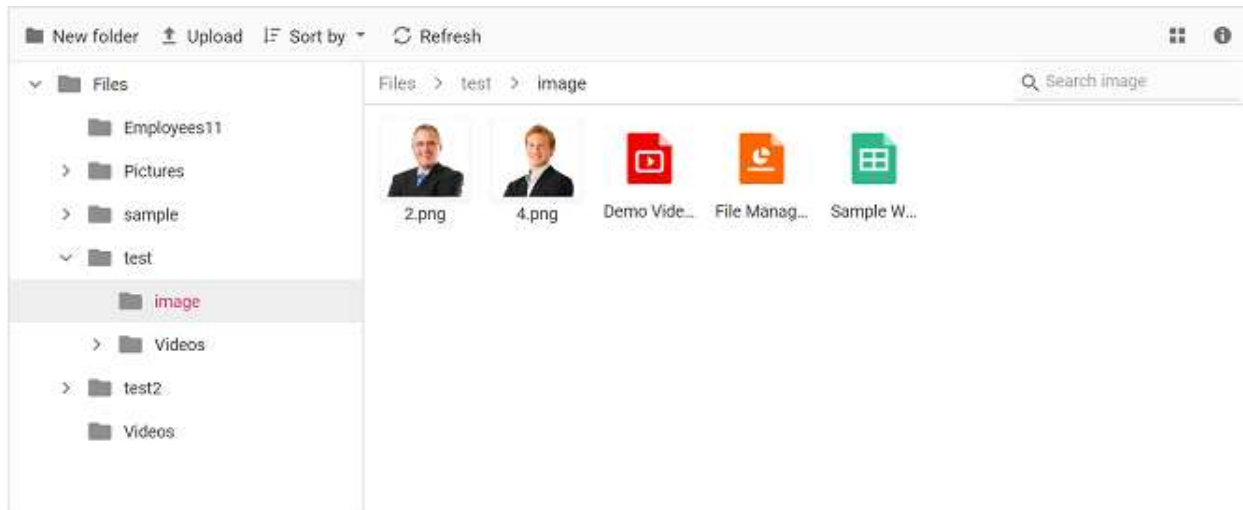

View is the section where the files and folders are displayed for the user to browse. The file manager has two types of views to display the files and folders.

- [Large Icons View](#)
- [Details View](#)

The **large icons view** is the default starting view in the file manager. The view can be changed by using the [toolbar](#) view button or by using the view menu in [context menu](#). The [view](#) API can also be used to change the initial view of the file manager.

Large icons view

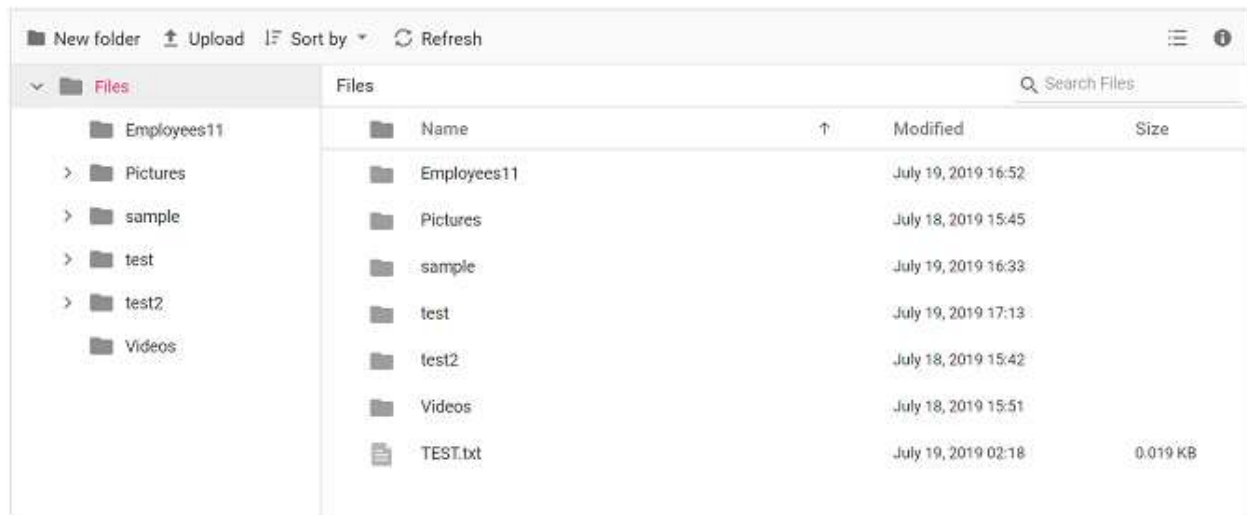

In the large icons view, the thumbnail icons will be shown in a larger size, which displays the data in a form that best suits their content. For image and video type files, a **preview** will be displayed. Extension thumbnails will be displayed for other type files.

Details view

Details view is an injectable module in the file manager so, it should be injected before rendering the file manager to avail its functionality. In the details view, the files are displayed in a sorted list order. This

file list comprises of several columns of information about the files such as **Name**, **Date Modified**, **Type**, and **Size**. Each file has its own small icon representing the file type. Additional columns can be added using [detailsViewSettings](#) API. The details view allows you to perform sorting using column header.

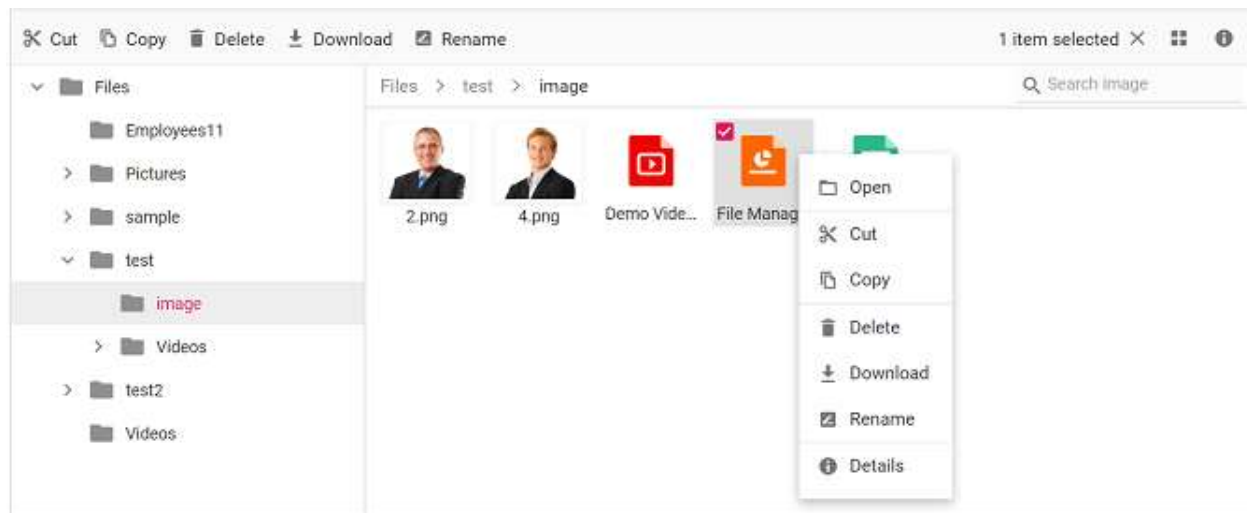

Context menu

The context menu appears on user interaction such as right-click. The file manager is provided with context menu support to perform list of file operations with the files and folders. Context menu appears with varying menu items based on the targets such as file, folder (including navigation pane folders), and layout (empty area in view).

Context menu can be customized using the [contextMenuSettings](#), [menuOpen](#), and [menuClick](#) events.

**Refer [Context Menu](#) section in file operations to know more about the menu items present in context menu*.*

File operations in ##Platform_Name## File manager control

The file manager component is used to browse, manage, and organize the files and folders in a file system through a web application. All basic file operations like creating a new folder, uploading and downloading of files in the file system, and deleting and renaming of existing files and folders are

available in the file manager component. Additionally, previewing of image files is also provided in the file manager component.

The following table represents the basic operations available in the file manager and their corresponding functions.

Operation Name	Function
read	Read the details of files or folders available in the given path from the file system, to display the files for the user to browse the content.
create	Creates a new folder in the current path of the file system.
delete	Removes the file or folder from the file server.
rename	Rename the selected file or folder in the file system.
search	Searches for items matching the search string in the current and child directories.
details	Gets the detail of the selected item(s) from the file server.
copy	Copy the selected file or folder in the file system.
move	Cut the selected file or folder in the file server.
upload	Upload files to the current path or directory in the file system.
download	Downloads the file from the server and the multiple files can be downloaded as ZIP files.

The *CreateFolder*, *Remove*, and *Rename* actions will be reflected in the file manager only after the successful response from the server.

Folder Upload support

To perform the directory(folder) upload in File Manager, set [directoryUpload](#) as true within the uploadSettings property. The directory upload feature is supported for the following file service providers:

- Physical file service provider.
- Azure file service provider.
- NodeJS file service provider.
- Amazon file service provider.

In the following example, directory upload is enabled/disabled on DropDownButton selection.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// Initialize the FileManager component
var fileObject = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
});
fileObject.appendTo('#file');
```

```

var items = [{ text: 'Folder' }, { text: 'Files' }];
var drpDownBtn = new ej.splitbuttons.DropDownButton({
    items: items,
    select: function (args) {
        if (args.item.text === 'Folder') {
            fileObject.uploadSettings.directoryUpload = true;
        } else {
            fileObject.uploadSettings.directoryUpload = false;
        }
        setTimeout(function () {
            var uploadBtn = document.querySelector('.e-file-select-wrap
button');
            uploadBtn.click();
        }, 100);
    }
}, '#file_tb_upload');
document.getElementById('file_tb_upload').onclick = function (args) {
    args.stopPropagation();
};

```

</body></html>
```

Physical file service provider

To achieve the directory upload in the physical file service provider, use the below code snippet in `IActionResult Upload` method in the `Controllers/FileManagerController.cs` file.

```
`ts
[Route("Upload")]
public IActionResult Upload(string path, IList<IFormFile> uploadFiles, string action)
{
    FileManagerResponse uploadResponse;
    foreach (var file in uploadFiles)
    {
        var folders = (file.FileName).Split('/');
        // checking the folder upload
        if (folders.Length > 1)
        {
            for (var i = 0; i < folders.Length - 1; i++)
            {
                string newDirectoryPath = Path.Combine(this.basePath + path, folders[i]);
                if (!Directory.Exists(newDirectoryPath))
                {
                    this.operation.ToCamelCase(this.operation.Create(path, folders[i]));
                }
                path += folders[i] + "/";
            }
        }
        uploadResponse = operation.Upload(path, uploadFiles, action, null);
        if (uploadResponse.Error != null)
```

```

{
Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = Convert.ToInt32(uploadResponse.Error.Code);
Response.HttpContext.Features.Get<IHttpResponseFeature>().ReasonPhrase =
uploadResponse.Error.Message;
}
return Content("");
}
`

```

Refer to the [GitHub](#) for more details

And also add the below code snippet in `FileManagerResponse Upload` method in `Models/PhysicalFileProvider.cs` file.

```

`ts
string[] folders = name.Split('/');
string fileName = folders[folders.Length - 1];
var fullName = Path.Combine((this.contentRootPath + path), fileName);
`

```

Refer to the [GitHub](#) for more details.

Azure file service provider

For Azure file service provider, no customizations are needed for directory upload with server side and this will work with the below default upload method code.

Refer to the [GitHub](#) for more details.

NodeJS file service provider

To perform the directory upload in the NodeJS file service provider, use the below code snippet in `app.post` method in the `filesystem-server.js` file.

```

`ts
var folders = (req.body.filename).split('/');
var filepath = req.body.path;
var uploadedFileName = folders[folders.length - 1];
// checking the folder upload
if (folders.length > 1)
{
for (var i = 0; i < folders.length - 1; i++)
{

```

```

var newDirectoryPath = path.join(contentRootPath + filepath, folders[i]);
if (!fs.existsSync(newDirectoryPath)) {
  fs.mkdirSync(newDirectoryPath);
  (async () => {
    await FileManagerDirectoryContent(req, res, newDirectoryPath).then(data => {
      response = { files: data };
      response = JSON.stringify(response);
    });
  })();
}
filepath += folders[i] + "/";
}

fs.rename('./' + uploadedFileName, path.join(contentRootPath, filepath + uploadedFileName), function
(err) {
  if (err) {
    if (err.code !== 'EBUSY') {
      errorValue.message = err.message;
      errorValue.code = err.code;
    }
  }
});
}
`

```

Refer to the [GitHub](#) for more details.

Amazon file service provider

To perform the directory upload in the Amazon file service provider, use the below code snippet in `IActionResult AmazonS3Upload` method in the `Controllers/AmazonS3ProviderController.cs` file.

```

`ts
foreach (var file in uploadFiles)
{
  var folders = (file.FileName).Split('/');
  // checking the folder upload
  if (folders.Length > 1)
  {

```

```

for (var i = 0; i < folders.Length - 1; i++)
{
    if (!this.operation.checkFileExist(path, folders[i]))
    {
        this.operation.ToCamelCase(this.operation.Create(path, folders[i], dataObject));
    }
    path += folders[i] + "/";
}
}
}
,

```

Refer to the [GitHub](#) for more details.

And also add the below code snippet in `AsyncUpload` method in `Models/AmazonS3FileProvider.cs` file.

```

`ts
string[] folders = file.FileName.Split('/');
string name = folders[folders.Length - 1];
,

```

Refer to the [GitHub](#) for more details.

File operation request and response Parameters

The default parameters available in file operation request from the file manager and the corresponding response parameters required by the file manager are listed as follows.

Read

The following table represents the request parameters of *read* operations.

Parameter	Type	Default	Explanation
---- ---- ---- ----			
action	String	read	Name of the file operation.
path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

**Refer [File request and response contents](#) for the contents of data*.*

Example:

```

`ts
{

```

```
action: "read",
path: "/",
showHiddenItems: false,
data: []
},
,
```

The following table represents the response parameters of *read* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of files and folders present in given path or directory.
error	ErrorDetails	-	Error Details

**Refer [File request and response contents](#) for the contents of cwd, files, and error*.*

Example:

```
`ts
{
  cwd:
  {
    name:"Download",
    size:0,
    dateModified:"2019-02-28T03:48:19.8319708+00:00",
    dateCreated:"2019-02-27T17:36:15.812193+00:00",
    hasChild:false,
    isFile:false,
    type:"",
    filterPath:"//Download//"
  },
  files:[
  {
    name:"Sample Work Sheet.xlsx",
    size:6172,
    dateModified:"2019-02-27T17:23:50.9651206+00:00",
    dateCreated:"2019-02-27T17:36:15.8151955+00:00",
```

```
hasChild:false,
isFile:true,
type:".xlsx",
filterPath:"//Download//"
}
],
error:null,
details:null
}
、
```

Create

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

Refer [File request and response contents](#) for the contents of data

Example:

```
`ts
{
  action: "create",
  data: [
    {
      dateCreated: "2019-02-27T17:36:15.6571949+00:00",
      dateModified: "2019-03-12T10:17:31.8505975+00:00",
      filterPath: "/",
      hasChild: true,
      isFile: false,
      name: files,
      nodeId: "fe_tree",
      size: 0,
```

```
type: ""
}
],
name: "Hello",
path: "/"
}
`
```

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the created folder
error	ErrorDetails	-	Error Details

**Refer [File request and response contents](#) for the contents of files and error*.*

Example:

```
`ts
{
  cwd: null,
  files: [
    {
      dateCreated: "2019-03-15T10:25:05.3596171+00:00",
      dateModified: "2019-03-15T10:25:05.3596171+00:00",
      filterPath: null,
      hasChild: false,
      isFile: false,
      name: "New",
      size: 0,
      type: ""
    }
  ],
  details: null,
  error: null
}
`
```

Rename

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	rename	Name of the file operation.
path	String	-	Relative path in which the item is located.
name	String	-	Current name of the item to be renamed.
newname	String	-	New name for the item.
data	FileManagerDirectoryContent	-	Details of the item to be renamed.

**Refer [File request and response contents](#) for the contents of data*.*

Example:

```
`ts
{
  action: "rename",
  data: [
    {
      dateCreated: "2019-03-20T05:22:34.621Z",
      dateModified: "2019-03-20T08:45:56.000Z",
      filterPath: "/Pictures/Nature/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "seaviews.jpg",
      size: 95866,
      type: ".jpg"
    }
  ],
  newname: "seaview.jpg",
  name: "seaviews.jpg",
  path: "/Pictures/Nature/"
}
```

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the renamed item.
error	ErrorDetails	-	Error Details

**Refer [File request and response contents](#) for the contents of files and error*.*

Example:

```
`ts
{
  cwd:null,
  files:[
    {
      name:"seaview.jpg",
      size:95866,
      dateModified:"2019-03-20T08:45:56+00:00",
      dateCreated:"2019-03-20T05:22:34.6214847+00:00",
      hasChild:false,
      isFile:true,
      type:".jpg",
      filterPath:"//Pictures//Nature//seaview.jpg"
    }
  ],
  error:null,
  details:null
}
```

Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	FileManagerDirectoryContent	-	Details of the item to be deleted.

**Refer [File request and response contents](#) for the contents of data*.*

Example:

```
`ts
{
  action: "delete",
  path: "/Hello/",
  names: ["New"],
  data: []
}
```

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details about the deleted item(s).
error	ErrorDetails	-	Error Details

**Refer [File request and response contents](#) for the contents of files and error*.*

Example:

```
`ts
{
  cwd: null,
  details: null,
  error: null,
  files: [
    {
      dateCreated: "2019-03-15T10:13:30.346309+00:00",
      dateModified: "2019-03-15T10:13:30.346309+00:00",
      filterPath: "/Hello/folder",
      hasChild: true,
      isFile: false,
      name: "folder",
      size: 0,
      type: ""
    }
  ]
}
```

```
]
}
`
```

Details

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.
data	FileManagerDirectoryContent	-	Details of the selected item.

**Refer [File request and response contents](#) for the contents of data*.*

Example:

```
`ts
{
  action: "details",
  path: "/FileContents/",
  names: ["All Files"],
  data: []
}
`
```

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
details	FileManagerDirectoryContent	-	Details of the requested item(s).
error	ErrorDetails	-	Error Details

**Refer [File request and response contents](#) for the contents of details and error*.*

Example:

```
`ts
{
  cwd:null,
  files:null,
  error:null,
}
```

details:

```
{
  name:"All Files",
  location:"//Files//FileContents//All Files",
  isFile:false,
  size:"679.8 KB",
  created:"3/8/2019 10:18:37 AM",
  modified:"3/8/2019 10:18:39 AM",
  multipleFiles:false
}
}
```

[Search](#)

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.
data	FileManagerDirectoryContent	-	Details of the searched item.

Example:

```
`ts
{
  action: "search",
  path: "/",
  searchString: "nature",
  showHiddenItems: false,
  caseSensitive: false,
  data: []
}
```

The following table represents the response parameters of *search* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Files and folders in the searched directory that matches the search input.
error	ErrorDetails	-	Error Details

Refer [File request and response contents](#) for the contents of cwd, files and error.

Example:

```
`ts
{
  cwd:
  {
    name:files,
    size:0,
    dateModified:"2019-03-15T10:07:00.8658158+00:00",
    dateCreated:"2019-02-27T17:36:15.6571949+00:00",
    hasChild:true,
    isFile:false,
    type:"",
    filterPath:"/"
  },
  files:[
    {
      name:"Nature",
      size:0,
      dateModified:"2019-03-08T10:18:42.9937708+00:00",
      dateCreated:"2019-03-08T10:18:42.5907729+00:00",
      hasChild:true,
      isFile:false,
      type:"",
      filterPath:"//FileContents//Nature"
    }
  ]
}
```

```
],  
error:null,  
details:null  
}  
`
```

Copy

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

Example:

```
`ts  
{  
  action: "copy",  
  path: "/",  
  names: ["6.png"],  
  renameFiles: ["6.png"],  
  targetPath: "/Videos/"  
}  
`
```

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of copied files or folders
error	ErrorDetails	-	Error Details

Refer [File request and response contents](#) for the contents of cwd, files and error.

Example:

```
`ts
{
  cwd:null,
  files:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"justin.mp4",
      size:0,
      previousName:"album.mp4",
      dateModified:"2019-06-21T06:58:32+00:00",
      dateCreated:"2019-06-24T04:22:14.6245618+00:00",
      hasChild:false,
      isFile:true,
      type:".mp4",
      id:null,
      filterPath:"/"
    }
  ],
  error:null,
  details:null
}
```

Move

The following table represents the request parameters of *move* operations.

Parameter	Type	Default	Explanation
-----	-----	-----	-----
action	String	move	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be moved.
targetPath	String	-	Relative path where the items to be pasted are located.

|data|FileManagerDirectoryContent|-|Details of the moved item.|

|renameFiles|String[]|-|Details of the renamed item.|

Example:

```
`ts
{
  action: "move",
  path: "/",
  names: ["6.png"],
  renameFiles: ["6.png"],
  targetPath: "/Videos/"
}
```

The following table represents the response parameters of *copy* operations.

|Parameter|Type|Default|Explanation|

|----|----|----|----|

|cwd|FileManagerDirectoryContent|-|Path (Current Working Directory) details.|

|files|FileManagerDirectoryContent[]|-|Details of cut files or folders|

|error|ErrorDetails|-|Error Details|

Refer [File request and response contents](#) for the contents of cwd, files and error.

Example:

```
`ts
{
  cwd:null,
  files:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"justin biber.mp4",
      size:0,
      previousName:"justin biber.mp4",
      dateModified:"2019-06-21T06:58:32+00:00",
    }
  ]
}
```

```
dateCreated:"2019-06-24T04:26:49.2690476+00:00",
hasChild:false,
isFile:true,
type:".mp4",
id:null,
filterPath:"//Videos//"
},
error:null,
details:null
},
`
```

Upload

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	<code>IList<IFormFile></code>	-	File that are uploaded.

Example:

```
`ts
uploadFiles: (binary),
path: /,
action: Save,
data: {
path:null,
action:null,
newName:null,
names:null,
name:"Downloads",
size:0,
previousName:null,
dateModified:"2019-07-22T11:23:46.7153977 00:00",
```

```
dateCreated:"2019-07-22T11:26:13.9047229 00:00",
hasChild:false,
isFile:false,
type:"",
id:null,
filterPath:"/",
targetPath:null,
renameFiles:null,
uploadFiles:null,
caseSensitive:false,
searchString:null,
showHiddenItems:false,
fmiconClass:null,
fmid:"fetree1",
fmpld:null,
fmselected:false,
fmicon:null,
data:null,
targetData:null,
permission:null
}
`
```

The upload response is an empty string.

[Download](#)

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
action	String	download	Name of the file operation
path	String	-	Relative path to location where the files to download are present.
names	String[]	-	Name list of the items to be downloaded.
data	FileManagerDirectoryContent	-	Details of the download item.

Example:

```
`ts
```

```
{
  action:"download",
  path:"/",
  names:["1.png"],
  data:[
    {
      path:null,
      action:null,
      newName:null,
      names:null,
      name:"1.png",
      size:49792,
      previousName:null,
      dateModified:"2019-07-22T12:15:45.0972405+00:00",
      dateCreated:"2019-07-22T12:15:45.0816042+00:00",
      hasChild:false,
      isFile:true,
      type:".png",
      id:null,
      filterPath:"/",
      targetPath:null,
      renameFiles:null,
      uploadFiles:null,
      caseSensitive:false,
      searchString:null,
      showHiddenItems:false,
      fmiconClass:"e-fe-image",
      fmid:null,
      fmpId:null,
      fmselected:false,
      fmicon:null,
      data:null,
      targetData:null,
```

```

permission:null,
fmcreated:"2019-07-22T12:15:45.081Z",
fmmodified:"2019-07-22T12:15:45.097Z",
fmimageUrl:"https://ej2-aspcore-service.azurewebsites.net/api/FileManager/GetImage?path=/1.png",
fmimageAttr:
{
  alt:"1.png"
},
fmhtmlAttr:
{
  class:"e-large-icon",
  title:"1.png"
}
]
}
,

```

Downloads the requested items from the file server in response.

[GetImage](#)

The following table represents the request parameters of *GetImage* operations.

Parameter	Type	Default	Explanation
path	String	-	Relative path to the image file

Return the image as a file stream in response.

The request from the file manager can be customized using the `beforeSend` event. Additional information can be passed to the file manager in file operation response and can be used in customization.

[File request and response contents](#)

The following table represents the contents of *data*, *cwd*, and *files* in the file manager request and response.

Parameter	Type	Default	Explanation
name	String	-	File name
dateCreated	String	-	Date in which file was created (UTC Date string).
dateModified	String	-	Date in which file was last modified (UTC Date string).

filterPath	String	-	Relative path to the file or folder.
hasChild	Boolean	-	Defines this folder has any child folder or not.
isFile	Boolean	-	Say whether the item is file or folder.
size	Number	-	File size
type	String	-	File extension

The following table represents the contents of *error* in the file manager request and response.

Parameter	Type	Default	Explanation
code	String		Error code
message	String		Error message
fileExists	String[]		List of duplicate file names

The following table represents the contents of *details* in the file manager request and response.

Parameter	Type	Default	Explanation
name	String		File name
dateCreated	String		Date in which file was created (UTC Date string).
dateModified	String		Date in which file was last modified (UTC Date string).
filterPath	String		Relative path to the file or folder.
hasChild	Boolean		Defines this folder has any child folder or not.
isFile	Boolean		Say whether the item is file or folder.
size	Number		File size
type	String		File extension
multipleFiles	Boolean		Say whether the details are about single file or multiple files.

Action Buttons

The file manager has several menu buttons to access the file operations. The list of menu buttons available in the file manager is given in the following table.

Menu Button	Behaviour
SortBy	Opens the sub menu to choose the sorting order and sorting parameter.
View	Opens the sub menu to choose the View.
Open	Navigates to the selected folder. Opens the preview for image files.
Refresh	Initiates the read operation for the current directory and displays the updated directory content.
NewFolder	Opens the new folder dialog box to receive the name for the new folder.

|Rename| Opens the rename dialog box to receive the new name for the selected item.|

|Delete| Opens the delete dialog box to confirm the removal of the selected items from the file system.|

|Upload| Opens the upload box to select the items to upload to the file system.|

|Download| Downloads the selected item(s).|

|Details| Get details about the selected items and display them in details dialog box.|

|SelectAll| Selects all the files and folders displayed in the view section.|

The action menu buttons are present in the toolbar and context menu. The toolbar contains the buttons based on the selected items count, while the context menu will appear with a list based on the target.

Toolbar

The toolbar can be divided into two sections as right and left. Whenever the toolbar buttons exceed the size, the buttons present in the left section of the toolbar will be moved to the toolbar popup.

The following table provides the toolbar buttons that appear based on the selection.

<!-- markdownlint-disable MD033 -->

Selected Items Count	Left section	Right section
0 (none of the item)	<i>SortBy</i> Refresh <i>NewFolder</i> Upload	<i>View</i> Details
1 (single item selected)	<i>Delete</i> Download* Rename	<i>Selected items count</i> View* Details
>1 (multiple selection)	<i>Delete</i> Download	<i>Selected items count</i> View* Details

Context menu

The following table provides the default context menu item and the corresponding target areas.

<!-- markdownlint-disable MD033 -->

Menu Name	Menu Items	Target
Layout	<i>SortBy</i> View <i>Refresh</i> <i>NewFolder</i> Upload Details* Select all	<i>Empty space in the view section (details view and large icon view area)</i> . Empty folder content.
Folders	<i>Open</i> Delete <i>Rename</i> Downloads* Details	* Folders in treeview, details view, and large icon view.
Files	<i>Open</i> Delete <i>Rename</i> Downloads* Details	* Files in details view and large icon view.

Views in ##Platform_Name## File manager control

View is the section where the files and folders are displayed for the user to browse. The [view](#) API can also be used to change the initial view of the file manager.

The file manager has two types of [views](#) to display the files and folders.

- [Largelcons View](#)

- [Details View](#)

LargeIcons View

By Default, File Manager is rendered with largeicons view. The following example demonstrate this.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';  
// inject feature modules of the file manager  
ej.filemanager.FileManager.Inject(ej.filemanager.Toolbar,ej.filemanager.NavigationPane);  
// initialize File Manager component  
var filemanagerInstance = new ej.filemanager.FileManager({  
  ajaxSettings: {  
    url: hostUrl + 'api/FileManager/FileOperations',  
    getImageUrl: hostUrl + 'api/FileManager/GetImage',  
    uploadUrl: hostUrl + 'api/FileManager/Upload',  
    downloadUrl: hostUrl + 'api/FileManager/Download'  
  },  
});  
// render initialized File Manager  
filemanagerInstance.appendTo('#filemanager');
```

INDEX.HTML

```

<body>

    <div id="filemanager"></div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Details View

Details view is an injectable module in the file manager so, it should be injected before rendering the file manager to avail its functionality. The default appearance of the file manager can be changed from largeicons to details view by using the [view](#) property. The following example demonstrate the file manager with details view.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
    // Initial view of File Manager is set to details view
    view: "Details"
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 File Manager</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 File Manager
Component">

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization in ##Platform_Name## File manager control

The file manager component allows customizing its functionalities like, context menu, searching, uploading, toolbar using APIs. Given below are some of the functionalities that can be customized in the File Manager,

- [Context menu customization](#)
- [Details view customization](#)
- [Navigation pane customization](#)
- [Show/Hide file extension](#)
- [Show/Hide hidden items](#)
- [Show/Hide thumbnail images in large icons view](#)
- [Toolbar customization](#)
- [Upload customization](#)
- [Tooltip customization](#)

Context menu customization

The context menu settings like, items to be displayed on files, folders and layout click and visibility can be customized using [contextMenuSettings](#) property.

INDEX.JS

```

var baseUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: baseUrl + 'api/FileManager/FileOperations',
    getImageUrl: baseUrl + 'api/FileManager/GetImage',
    uploadUrl: baseUrl + 'api/FileManager/Upload',
    downloadUrl: baseUrl + 'api/FileManager/Download'
  },
  // Context Menu settings customization
  contextMenuSettings: { file: ['Open', '|', 'Details'], folder: ['Open',
'|', 'Details'], layout: ['SortBy', 'View', 'Refresh', '|', 'Details', '|'],
visible: true}
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 File Manager</title>
  <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Details view customization

The details view settings like, column width, header text, template for each field can be customized using [detailsViewSettings](#) property.

INDEX.JS

```

var baseUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: baseUrl + 'api/FileManager/FileOperations',
        getImageUrl: baseUrl + 'api/FileManager/GetImage',
        uploadUrl: baseUrl + 'api/FileManager/Upload',
        downloadUrl: baseUrl + 'api/FileManager/Download'
    },
    // Initial view of File Manager is set to details view
    view: "Details",
    // Details View settings customization
    detailsViewSettings: {
        columns: [
            {field: 'name', headerText: 'File Name', minWidth: 120, width:
'auto', customAttributes: { class: 'e-fe-grid-name' },template: '${name}'},
            {field: 'size', headerText: 'File Size',minWidth: 50, width:
'110', template: '${size}'},
            { field: '_fm_modified', headerText: 'Date Modified',minWidth:
50, width: '190'}
        ]
    }
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');

```

Show/Hide file extension

The file extensions are displayed in the File Manager by default. This can be hidden by disabling the [showFileExtension](#) property.

In File Manager [fileLoad](#) and [fileOpen](#) events are triggered before the file/folder is rendered and before the file/folder is opened respectively. These events can be utilized to perform operations before a file/folder is rendered or opened.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component

```

Multiple selection in ##Platform_Name## File manager control

The file manager allows you to select multiple files by enabling the [allowMultiSelection](#) property (enabled by default). The multiple selection can be done by pressing the **Ctrl** key or **Shift** key and selecting the files. The check box can also be used to do multiple selection. **Ctrl + A** can be used to select all files in the current directory. The [fileSelect](#) event will be triggered when the items of file manager control is selected or unselected.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
    allowMultiSelection:true, // allowMultiSelection is true by default.
    // File Manager's file select event
    fileSelect: onFileSelect
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
// File Manager's file select event function

```

```
function onFileSelect(args) {  
    console.log(args.fileDetails.name + " has been " + args.action + "ed");  
}
```

if(ele) {  
    ele.style.visibility = "visible";  
}  
</script>  
<script src="index.js" type="text/javascript"></script>  
</body></html>
```

Note: The File Manager has support to select files and folders initially or dynamically by specifying their names in [selectedItems](#) property.

Drag and drop in ##Platform_Name## File manager control

The file manager allows files or folders to be moved from one folder to another by using the [allowDragAndDrop](#) property. It also supports uploading a file by dragging it from Windows Explorer to FileManager control. You can enable or disable this support by using the [allowDragAndDrop](#) property of file manager.

The event triggered in drag and drop support are

- [fileDragStart](#) - Triggers when the file/folder dragging is started.
- [fileDragging](#) - Triggers while dragging the file/folder.
- [fileDragStop](#) - Triggers when the file/folder is about to be dropped at the target.
- [fileDropped](#) - Triggers when the file/folder is dropped.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  allowDragAndDrop:true, // allowDragAndDrop is true by default.
  // File Manager's file drag start event
  fileDragStart: onFileDragStart,
  // File Manager's file dragging event
  fileDragging: onFileDragging,
  // File Manager's file drag stop event
  fileDragStop: onFileDragStop,
  // File Manager's file drag stop event
  fileDropped: onFileDropped
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
// File Manager's file drag start event function
function onFileDragStart(args) {
  console.log("File drag start");

```

File system provider in ##Platform_Name## File manager control

The file system provider allows the File Manager component to manage the files and folders in a physical or cloud-based file system. It provides the methods for performing various file actions like creating a new folder, copying and moving of files or folders, deleting, uploading, and downloading the files or folders in the file system.

The following file providers are added in Syncfusion EJ2 File Manager component.

- [ASP.NET Core file system provider](#)
- [ASP.NET MVC 5 file system provider](#)
- [ASP.NET Core Azure cloud file system Provider](#)
- [ASP.NET MVC 5 Azure cloud file system Provider](#)
- [ASP.NET Core Amazon S3 cloud file provider](#)
- [ASP.NET MVC Amazon S3 cloud file provider](#)
- [File Transfer Protocol file system provider](#)
- [SQL database file system provider](#)
- [NodeJS file system provider](#)
- [Google Drive file system provider](#)
- [Firebase Realtime Database file system provider](#)
- [IBM Cloud Object Storage provider](#)

ASP.NET Core file system provider

The ASP.NET Core file system provider allows the users to access and manage the physical file system. To get started, clone the [ej2-aspcore-file-provider](#) using the following command.

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-aspcore-file-provider ej2-aspcore-file-provider
cd ej2-aspcore-file-provider
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, set the root directory of the physical file system in the FileManager controller.

After setting the root directory of the file system, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager ASP.NET Core service.
let filemanagerInstance: FileManager = new FileManager({
  ajaxSettings: {
    // Replace the hosted port number in the place of "{port}"
    url: hostUrl + "api/FileManager/FileOperations",
    downloadUrl: hostUrl + "api/FileManager/Download",
    uploadUrl: hostUrl + "api/FileManager/Upload",
    getImageUrl: hostUrl + "api/FileManager/GetImage"
  }
});
filemanagerInstance.appendTo('#filemanager');
```

Note: To learn more about the file actions that can be performed with ASP.NET Core file system provider, refer to this [link](#)

ASP.NET MVC 5 file system provider

The ASP.NET MVC 5 file system provider allows the users to access and manage the physical file system. To get started, clone the [ej2-aspmvc-file-provider](#) using the following command.

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-aspmvc-file-provider ej2-aspmvc-file-provider
cd ej2-aspmvc-file-provider
`
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, set the root directory of the physical file system in the FileManager controller using the Root Folder method.

After setting the root directory of the file system, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the physical file system.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager ASP.NET MVC service.
let filemanagerInstance: FileManager = new FileManager({
  ajaxSettings: {
    // Replace the hosted port number in the place of "{port}"
    url: hostUrl + "FileManager/FileOperations",
    downloadUrl: hostUrl + "FileManager/Download",
    uploadUrl: hostUrl + "FileManager/Upload",
    getImageUrl: hostUrl + "FileManager/GetImage"
  }
});
filemanagerInstance.appendTo('#filemanager');
`
```

Note: To learn more about the file actions that can be performed with ASP.NET MVC 5 file system provider, refer to this [link](#)

ASP.NET Core Azure cloud file system provider

In ASP.NET Core, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, clone the [azure-aspcore-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/azure-aspcore-file-provider azure-aspcore-file-provider
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`ts
void RegisterAzure(string accountName, string accountKey, string blobName)
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the **setBlobContainer** method as follows.

```
`ts
void setBlobContainer(string blobPath, string filePath)
```

Note: Also, assign the same *blobPath URL* and *filePath URL* in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager Azure cloud file system service.
let filemanagerInstance: FileManager = new FileManager({
  ajaxSettings: {
    // Replace the hosted port number in the place of "{port}"
    url: hostUrl + "api/AzureProvider/AzureFileOperations",
    downloadUrl: hostUrl + "api/AzureProvider/AzureDownload",
    uploadUrl: hostUrl + "api/AzureProvider/AzureUpload",
    getImageUrl: hostUrl + "api/AzureProvider/AzureGetImage"
  }
});
filemanagerInstance.appendTo('#filemanager');
```

NuGet: Additionally, we have created a [NuGet](#) package of **ASP.NET Core Azure file system provider**.

Please, use the following command to install the NuGet package in an application.

```
`ts
dotnet add package Syncfusion.EJ2.FileManager.AzureFileProvider.AspNet.Core
```

Note: To learn more about the file actions that can be performed with ASP.NET Core Azure Cloud File System Provider, refer to this [link](#)

ASP.NET MVC Azure cloud file system provider

In ASP.NET MVC, Azure file system provider allows the users to access and manage the blobs in the Azure blob storage. To get started, clone the [ej2-azure-aspmvc-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-azure-aspmvc-file-provider ej2-azure-aspmvc-file-provider
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. Now, register the Azure storage by passing details like name, password, and blob name to the Register Azure method in the FileManager controller.

```
`ts
void RegisterAzure(string accountName, string accountKey, string blobName)
```

Then, set the blob container and the root blob directory by passing the corresponding URLs as parameters in the **setBlobContainer** method as follows.

```
`ts
void setBlobContainer(string blobPath, string filePath)
```

Note: Also, assign the same *blobPath URL* and *filePath URL* in [AzureFileOperations](#) and [AzureUpload](#) methods in the FileManager controller to determine the original path of the Azure blob.

After setting the blob container references, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Azure blob storage.

```
`ts
let hostUrl = 'http://localhost:{port}';
// Initializing File Manager Azure cloud file system service.
let filemanagerInstance: FileManager = new FileManager({
  ajaxSettings: {
    // Replace the hosted port number in the place of "{port}"
    url: hostUrl + "AzureProvider/AzureFileOperations",
    downloadUrl: hostUrl + "AzureProvider/AzureDownload",
    uploadUrl: hostUrl + "AzureProvider/AzureUpload",
```

```

getImageUrl: hostUrl + "AzureProvider/AzureGetImage"
}
});
filemanagerInstance.appendTo('#filemanager');
`

```

Note: To learn more about the file actions that can be performed with ASP.NET MVC Azure Cloud File System Provider, refer to this [link](#)

ASP.NET Core Amazon S3 cloud file provider

In ASP.NET Core, Amazon **S3** (*Simple Storage Service*) cloud file provider allows the users to access and manage a server hosted file system as collection of objects stored in the Amazon S3 Bucket. To get started, clone the [amazon-s3-aspcore-file-provider](#) using the following command

```

`ts
git clone https://github.com/SyncfusionExamples/amazon-s3-aspcore-file-provider.git amazon-s3-aspcore-file-provider.git
`

```

Note: To learn more about creating and configuring an Amazon S3 bucket, refer to this [link](#).

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register Amazon S3 client account details like *awsAccessKeyId*, *awsSecretKeyId* and *awsRegion* details in

RegisterAmazonS3 method in the FileManager controller to perform the file operations.

```

`ts
void RegisterAmazonS3(string bucketName, string awsAccessKeyId, string awsSecretAccessKey, string bucketRegion)
`

```

After registering the Amazon client account details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Amazon **S3** (*Simple Storage Service*) bucket's objects storage.

```

`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager with Amazon S3 service configuration.
let filemanagerInstance: FileManager = new FileManager({
// Replace the hosted port number in the place of "{port}"
ajaxSettings: {
url: hostUrl + "api/AmazonS3Provider/AmazonS3FileOperations",
downloadUrl: hostUrl + "api/AmazonS3Provider/AmazonS3Download",
uploadUrl: hostUrl + "api/AmazonS3Provider/AmazonS3Upload",

```

```
getImageUrl: hostUrl + "api/AmazonS3Provider/AmazonS3GetImage"
}
});
filemanagerInstance.appendTo('#filemanager');
`ts
```

Note: To learn more about the file actions that can be performed with Amazon S3 Cloud File provider, refer to this [link](#)

ASP.NET MVC Amazon S3 cloud file provider

In ASP.NET MVC, Amazon **S3** (*Simple Storage Service*) cloud file provider allows the users to access and manage a server hosted files as collection of objects stored in the Amazon S3 Bucket. To get started, clone the [ej2-amazon-s3-aspmvc-file-provider](#) using the following command

```
`ts
git clone https://github.com/SyncfusionExamples/ej2-amazon-s3-aspmvc-file-provider.git ej2-amazon-
s3-aspmvc-file-provider.git
`
```

Note: To learn more about creating and configuring an Amazon S3 bucket, refer to this [link](#).

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register Amazon S3 client account details like *awsAccessKeyId*, *awsSecretKeyId* and *awsRegion* details in

RegisterAmazonS3 method in the FileManager controller to perform the file operations.

```
`ts
void RegisterAmazonS3(string bucketName, string awsAccessKeyId, string awsSecretAccessKey, string
bucketRegion)
`
```

After registering the Amazon client account details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the Amazon **S3** (*Simple Storage Service*) bucket's objects storage.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager with Amazon S3 service configuration.
let filemanagerInstance: FileManager = new FileManager({
// Replace the hosted port number in the place of "{port}"
ajaxSettings: {
url: hostUrl + "FileManager/FileOperations",
downloadUrl: hostUrl + "FileManager/Download",
uploadUrl: hostUrl + "FileManager/Upload",
```

```

getImageUrl: hostUrl + "FileManager/GetImage"
}
});
filemanagerInstance.appendTo('#filemanager');
`

```

Note: To learn more about the file actions that can be performed with ASP.NET MVC Amazon S3 Cloud File Provider, refer to this [link](#)

File Transfer Protocol file system provider

In ASP.NET Core, File Transfer Protocol file system provider allows the users to access to the hosted file system as collection of objects stored in the file storage using File Transfer Protocol. To get started, clone the [ftp-aspcore-file-provider](#) using the following command

```

`ts
git clone https://github.com/SyncfusionExamples/ftp-aspcore-file-provider.git ftp-aspcore-file-
provider.git
`

```

After cloning, open the project in Visual Studio and restore the NuGet packages. Now, register File Transfer Protocol details like *hostName*, *userName* and *password* in **SetFTPConnection** method in the FileManager controller to perform the file operations.

```

`ts
void SetFTPConnection(string hostName, string userName, string password)
`

```

After registering the File Transfer Protocol details, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the FTP's objects storage.

```

`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager with file transfer protocol service configuration.
let filemanagerInstance: FileManager = new FileManager({
// Replace the hosted port number in the place of "{port}"
ajaxSettings: {
url: hostUrl + "api/FTPProvider/FTPFileOperations",
downloadUrl: hostUrl + "api/FTPProvider/FTPDownload",
uploadUrl: hostUrl + "api/FTPProvider/FTPUpload",
getImageUrl: hostUrl + "api/FTPProvider/FTPGetImage"
}
});

```

```
filemanagerInstance.appendTo('#filemanager');
```

Note: To learn more about the file actions that can be performed with File Transfer Protocol file system provider, refer to this [link](#)

SQL database file system provider

In ASP.NET Core, SQL database file system provider in ASP.NET Core allows the users to manage the file system being maintained in a SQL database table. Unlike the other file system providers, the SQL database file system provider works on ID basis. Here, each file and folder have a unique ID based on which all the file operations will be performed. To get started, clone the [sql-server-database-aspcore-file-provider](#) using the following command.

```
`ts
```

```
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
```

After cloning, just open the project in Visual Studio and restore the NuGet packages. To establish the SQL server connection with the database file (for eg: FileManager.mdf), specify the connection string in the web config file as follows.

```
`ts
```

```
<add name="FileExplorerConnection" connectionString="Data
Source=(LocalDB)\v11.0;AttachDbFilename=|DataDirectory|\FileManager.mdf;Integrated
Security=True;Trusted_Connection=true" />
```

Then, make an entry for the connection string in `appsettings.json` file as follows.

```
`ts
```

```
"ConnectionStrings": {
  "FileManagerConnection": "Data
Source=(LocalDB)\MSSQLLocalDB;AttachDbFilename=|DataDirectory|\\App_Data\\FileManager.mdf;In
tegrated Security=True;Connect Timeout=30"
}
```

Now, to configure the database connection, set the connection name, table name and root folder ID value by passing these values to the SetSQLConnection method.

```
`ts
```

```
void SetSQLConnection(string name, string tableName, string tableID)
```

Refer to this [FileManager.mdf](#), to learn about the pre-defined file system SQL database for the EJ2 File Manager.

After configuring the connection, just build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods allows to manage the files in the SQL database table.

```
`ts
```

```
let hostUrl = 'http://localhost:{port}/';  
// Initializing File Manager with SQL Server Database service configuration.  
let filemanagerInstance: FileManager = new FileManager({  
  ajaxSettings: {  
    // Replace the hosted port number in the place of "{port}"  
    url: hostUrl + "api/SQLProvider/SQLFileOperations",  
    downloadUrl: hostUrl + "api/SQLProvider/SQLDownload",  
    uploadUrl: hostUrl + "api/SQLProvider/SQLUpload",  
    getImageUrl: hostUrl + "api/SQLProvider/SQLGetImage"  
  }  
});  
filemanagerInstance.appendTo('#filemanager');
```

Note: To learn more about the file actions that can be performed with SQL database file system provider, refer to this [link](#)

NodeJS file system provider

The NodeJS file system provider allows the users to manage the files and folders in a physical file system. It provides methods for performing all basic file operations like creating a folder, copy, move, delete, and download files and folders in the file system. We can use of the NodeJS file system provider either by installing the [ej2-filemanager-node-filesystem](#) package or by cloning the [file system provider](#) from the GitHub.

Using ej2-filemanager-node-filesystem package

- Install the ej2-filemanager-node-filesystem package by running the below command.

```
`ts
```

```
npm install @syncfusion/ej2-filemanager-node-filesystem
```

- After installing the package, navigate to the ej2-filemanager-node-filesystem package folder within the node-modules.
- Run the command **npm install** command.

Cloning the ej2-filemanager-node-filesystem from GitHub

- Clone the ej2-filemanager-node-filesystem using the following command.

```
`ts
```

```
git clone https://github.com/SyncfusionExamples/ej2-filemanager-node-filesystem.git node-filesystem-provider
```

```
`
```

- After cloning, open the root folder and run the command **npm install** command.

After installing the packages, set the root folder directory of the physical file system in the package JSON under scripts sections as follows.

```
`ts
```

```
"start": "node filesystem-server.js -d D:/Projects"
```

```
`
```

Note: By default, the root directory will be configured to set **C:/Users** as the root directory.

To set the port in which the project to be hosted and the root directory of the file system. Run the following command.

```
`ts
```

```
set PORT=3000 && node filesystem-server.js -d D:/Projects
```

```
`
```

Note: By default, the service will run **8090** port.

Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate file operation methods in the filesystem-server.js file will allow to manage the physical file system with NodeJS file system provider.

```
`ts
```

```
let hostUrl = 'http://localhost:{port}';
```

```
// Initializing File Manager with NodeJS service.
```

```
let filemanagerInstance: FileManager = new FileManager({
```

```
// Replace the hosted port number in the place of "{port}"
```

```
  ajaxSettings: {
```

```
    url: hostUrl,
```

```
    downloadUrl: hostUrl + "Download",
```

```
    uploadUrl: hostUrl + "Upload",
```

```
    getImageUrl: hostUrl + "GetImage"
```

```
  }
```

```
});
filemanagerInstance.appendTo('#filemanager');
`
```

Note: To learn more about the file actions that can be performed with NodeJS file system provider, refer to this [link](#)

Google Drive file system provider

In ASP.NET Core, Google Drive file system provider in ASP.NET Core allows the users to manage the files and folders in a Google Drive account. The Google Drive file system provider works on ID basis where each file and folder have a unique ID. To get started, clone the [google-drive-aspcore-file-provider](#) using the following command.

```
`ts
git clone https://github.com/SyncfusionExamples/google-drive-aspcore-file-provider google-drive-aspcore-file-provider
cd google-drive-aspcore-file-provider
`
```

After generating the client secret data, copy the JSON data to the following specified JSON files in the cloned location.

- EJ2GoogleDriveFileProvider > credentials > client_secret.json
- GoogleOAuth2.0Base > credentials > client_secret.json

After updating the credentials, just build and run the project. Now, the project will be hosted in <http://localhost:{port}>, and it will ask to log on to the Gmail account created for the client secret credentials. Then, provide permission to access the Google Drive files by clicking the allow access button in the page. Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate controller methods will allow to manage the files from the Google Drive.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager with Google drive service configuration.
let filemanagerInstance: FileManager = new FileManager({
  ajaxSettings: {
    // Replace the hosted port number in the place of "{port}"
    url: hostUrl + "api/GoogleDriveProvider/GoogleDriveFileOperations",
    downloadUrl: hostUrl + "api/GoogleDriveProvider/GoogleDriveDownload",
    uploadUrl: hostUrl + "api/GoogleDriveProvider/GoogleDriveUpload",
    getImageUrl: hostUrl + "api/GoogleDriveProvider/GoogleDriveGetImage"
  }
});
```

```
filemanagerInstance.appendTo('#filemanager');
```

,

Note: To learn more about the file actions that can be performed with Google drive file system provider, refer to this [link](#)

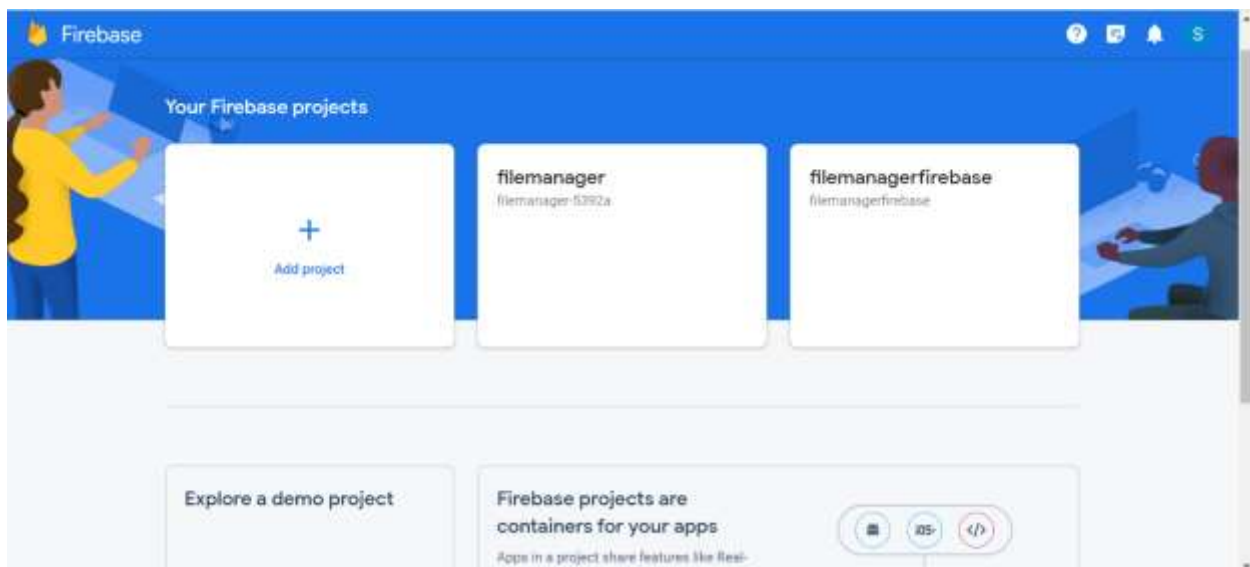

Firebase Realtime Database file system provider

The [Firebase Realtime Database](#) file system provider in **ASP.NET Core** provides the efficient way to store the File Manager file system in a cloud database as JSON representation.

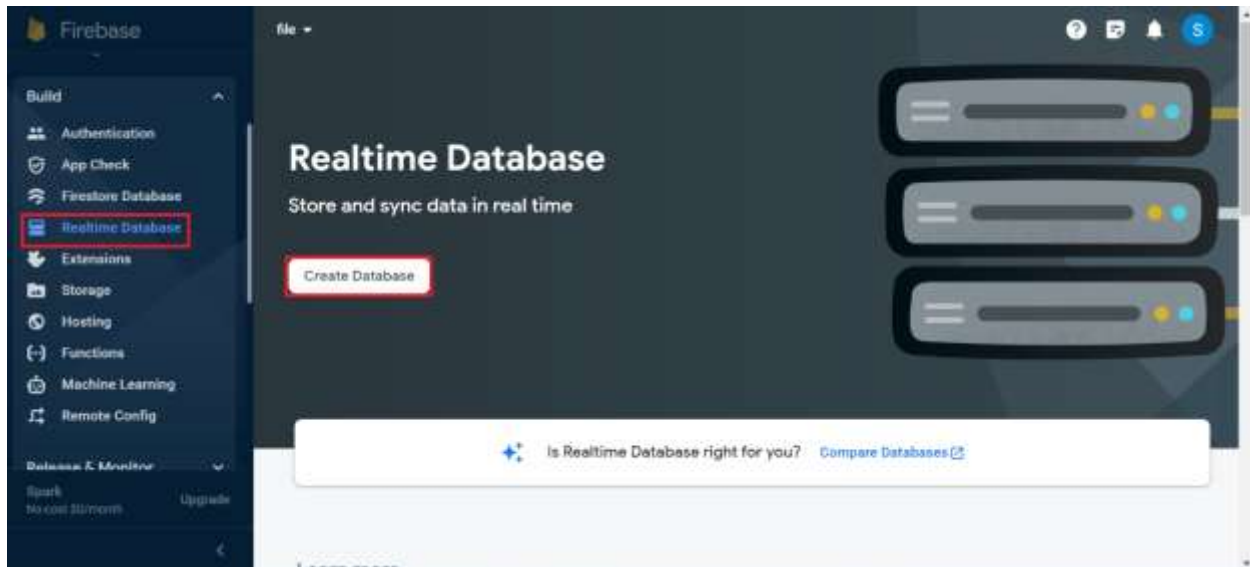

Generate Secret access key from service account

Follow the given steps to generate the secret access key:

- To access the Firebase console, please click on this [link](#). Once you have accessed the console, you can create a new project by filling in the necessary fields and clicking on the relevant buttons.

- Within the Firebase console, navigate to the **Build** tab. Under this tab, select the option for **Realtime Database**. From there, you can create a new database by clicking on the **Create Database** button.

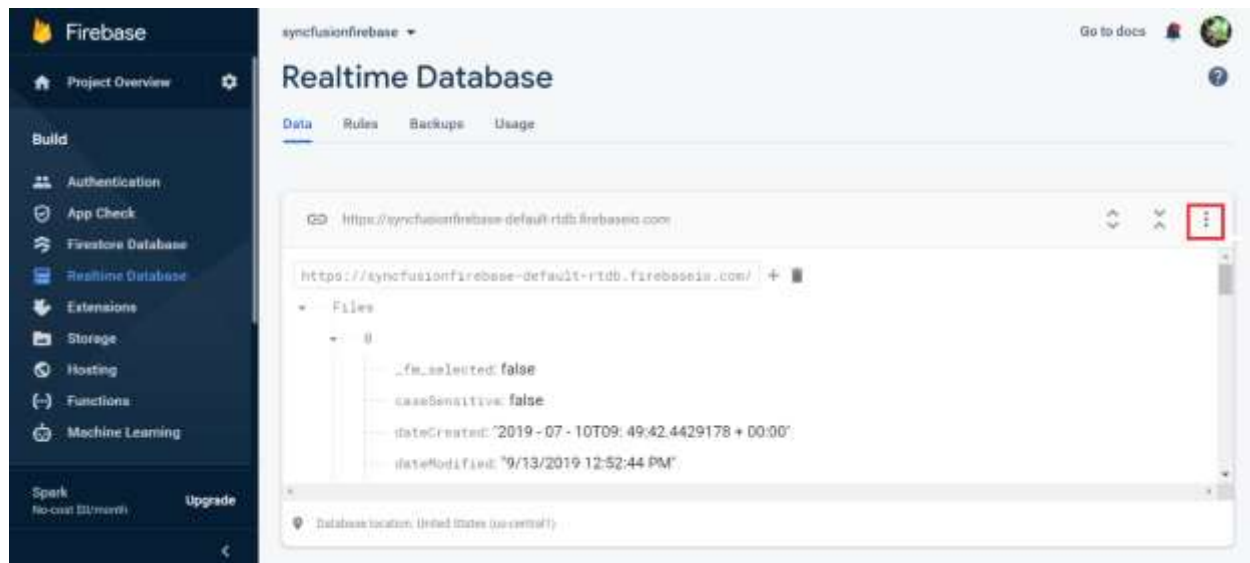

- To get started, create a root node and add any desired children to it. Please refer to the following code snippet for guidance on the structure of the JSON:

```
{
  "Files" : [ {
    "caseSensitive" : false,
    "dateCreated" : "8/22/2019 5:17:55 PM",
    "dateModified" : "8/22/2019 5:17:55 PM",
    "filterId" : "0/",
    "filterPath" : "/",
    "hasChild" : false,
    "id" : "5",
    "isFile" : false,
    "isRoot" : true,
    "name" : "Music",
    "parentId" : "0",
    "selected" : false,
    "showHiddenItems" : false,
    "size" : 0,
    "type" : "folder"
  },
  {
```

```
"caseSensitive" : false,
"dateCreated" : "8/22/2019 5:18:03 PM",
"dateModified" : "8/22/2019 5:18:03 PM",
"filterId" : "0/",
"filterPath" : "/",
"hasChild" : false,
"id" : "6",
"isFile" : false,
"isRoot" : true,
"name" : "videos",
"parentId" : "0",
"selected" : false,
"showHiddenItems" : false,
"size" : 0,
"type" : ""
}}
}
`
```

Here, the `Files` denotes the `rootNode` and the subsequent object refers to the children of the root node. `rootNode` will be taken as the root folder of the file system loaded which will be loaded in File Manager component.

- To import a JSON file into the Firebase Realtime Database, navigate to the **Data** tab and click on the action icon shown in the accompanying image. From there, select the **Import JSON** option and upload the JSON file that was created using the code provided above.

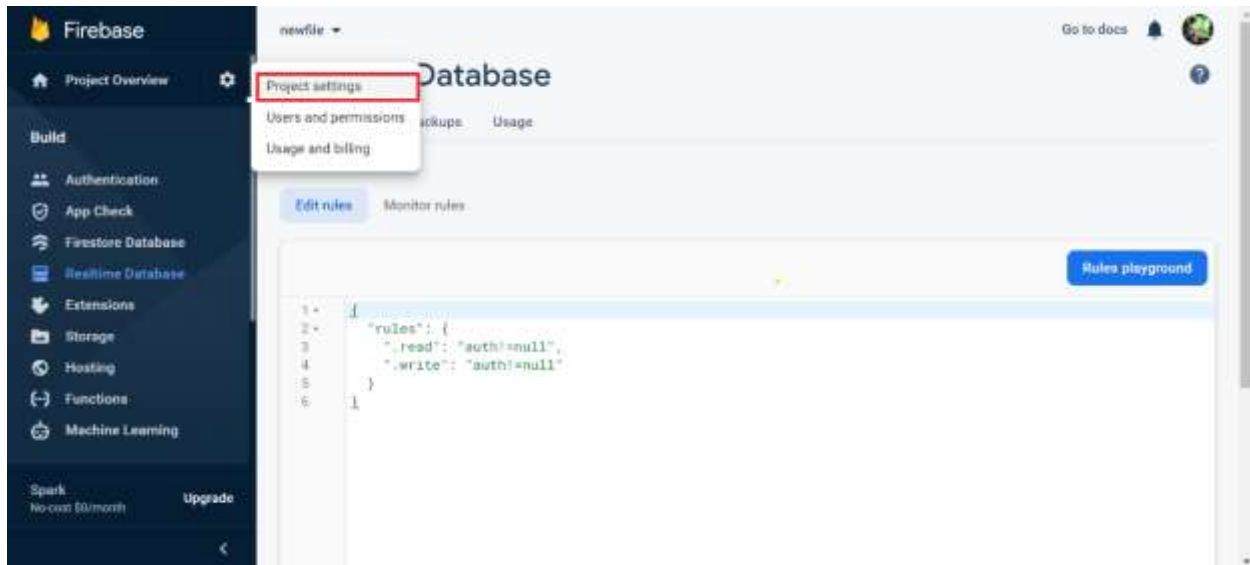

- To interact with the Firebase Realtime Database through your application, it is necessary to grant read and write permissions by defining appropriate rules in the Firebase project's **Rules tab**, as shown in the following code snippet. Once you have specified the rules, you can publish them by clicking the **Publish** button to enable the necessary authentication.

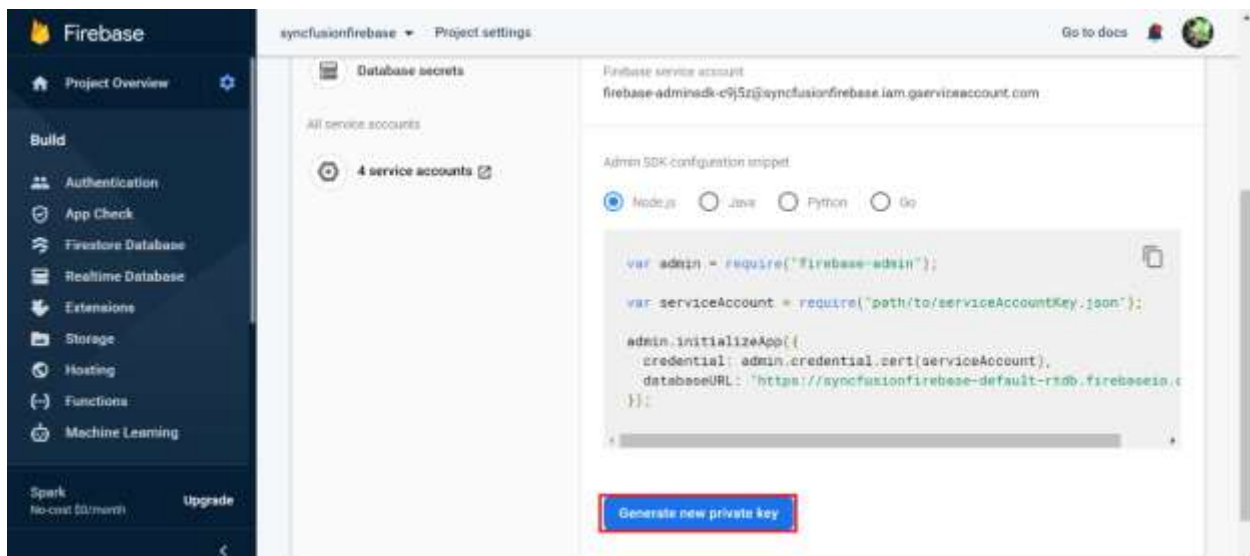

```
{
/ Visit https://firebase.google.com/docs/database/security to learn more about security rules. /
"rules": {
".read": "auth!=null",
".write": "auth!=null"
}
}
```

Note: By default, rules of a Firebase project will be **false**. To read and write the data, configure the **Rules** as given in the following code snippet in the *Rules* tab in the Firebase Realtime Database project.

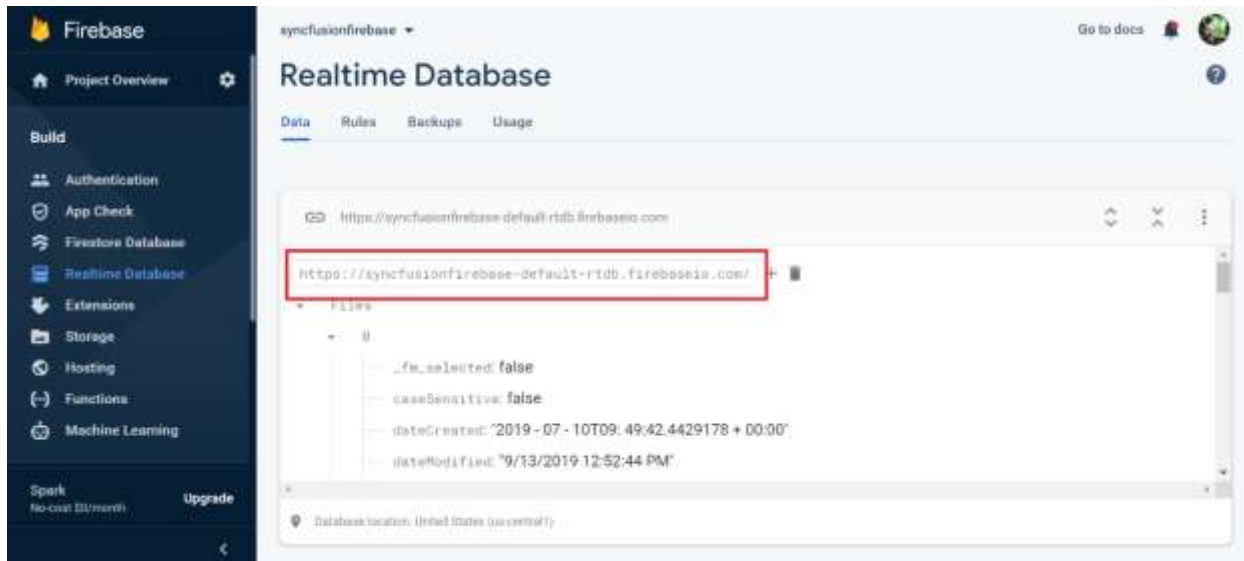

- Navigate to the project settings as instructed and then click on the **Service Account** tab.

- To obtain the access key JSON file, simply click on the **Generate new private key** button and then confirm by clicking the **Generate key** button in the pop-up window that appears.

- Next, you will need to clone the [firebase-realtime-database-apscore-file-provider](#) repository. Once cloned, simply open the project in Visual Studio and restore the NuGet package.
- Once you have generated the secret key, you will need to replace the JSON in the `access_key.json` file in the Firebase Realtime Database provider project with the newly generated key. This will enable authentication and allow you to perform read and write operations.
- In the **Data** tab, locate the project API URL and then paste it into the below mentioned section.

Register the Firebase Realtime Database by assigning *Firebase Realtime Database REST API link*, *rootNode*, and *serviceAccountKeyPath* parameters in the `RegisterFirebaseRealtimeDB` method of class `FirebaseRealtimeDBFileProvider` in the controller part of the ASP.NET Core application.

```
this.operation.RegisterFirebaseRealtimeDB(string apiUrl, string rootNode, string serviceAccountKeyPath)
、
```

Example:

```
this.operation.RegisterFirebaseRealtimeDB("{copy your API URL here}", "Files",
hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json");
、
```

In the above code,

- `{copy your API URL here}` denotes Firebase Realtime Database REST API link.
- `Files` denotes newly created root node in Firebase Realtime Database.
- `hostingEnvironment.ContentRootPath + "\\FirebaseRealtimeDBHelper\\access_key.json` denotes service account key path which has authentication key for the Firebase Realtime Database data.

After configuring the Firebase Realtime Database service link, build and run the project. Now, the project will be hosted in `http://localhost:{port}` and just mapping the **ajaxSettings** property of the File Manager component to the appropriate controller methods allows to manage the files in the Firebase Realtime Database.

```
import { Component } from '@angular/core';
@Component({
selector: 'app-root',
styleUrls: ['app/app.component.css'],
templateUrl: 'app/app.component.html'
```

```

})
export class AppComponent {
  public ajaxSettings: object;
  public hostUrl: string = 'http://localhost:{port}/';
  public ngOnInit(): void {
    // Initializing File Manager with Firebase Realtime Database service.
    this.ajaxSettings = {
      // Replace the hosted port number in the place of "{port}"
      url = this.hostUrl + "api/FirebaseProvider/FirebaseRealtimeFileOperations",
      downloadUrl = this.hostUrl + "api/FirebaseProvider/FirebaseRealtimeDownload",
      uploadUrl = this.hostUrl + "api/FirebaseProvider/FirebaseRealtimeUpload",
      getImageUrl = this.hostUrl + "api/FirebaseProvider/FirebaseRealtimeGetImage"
    };
  }
}

```

> **Note:** To learn more about the file actions that can be performed with Firebase Realtime Database file system provider, refer to this [link](#)

IBM Cloud Object Storage file provider

The IBM Cloud Object Storage file provider module allows you work with the IBM Cloud Object Storage. It also provides the methods for performing various file actions such as creating a new folder, renaming files, and deleting files. The IBM Cloud Object Storage file provider serves the file provider support for the File Manager component with the IBM Cloud Object Storage. We can make use of IBM Cloud Object Storage file provider by installing the [ej2-filemanager-ibm-cos-node-file-provider](#) npm package or by cloning the [file provider](#) from the GitHub.

Using ej2-filemanager-ibm-cos-node-file-provider npm package

- Install the ej2-filemanager-ibm-cos-node-file-provider npm package by running the below command.

`ts

```
npm install @syncfusion/ej2-filemanager-ibm-cos-node-file-provider
```

- After installing the package, navigate to the ej2-filemanager-ibm-cos-node-file-provider package folder within the node-modules.
- Run the **npm install** command to install the dependent packages for file provider.

Cloning the filemanager-ibm-cos-node-file-provider from GitHub

- Clone the filemanager-ibm-cos-node-file-provider using the following command.

```
`ts
git clone https://github.com/SyncfusionExamples/filemanager-ibm-cos-node-file-provider.git
`
```

- After cloning, open the root folder and run the command **npm install** command.

To set the port in which the project to be hosted. Run the following command.

```
`ts
set PORT=3000 && node index.js
`
```

Note: By default, the service will run 8090 port.

Now, just mapping the **ajaxSettings** property of the FileManager component to the appropriate file operation methods in the index.js file will allow to manage the IBM Cloud Object Storage.

```
`ts
let hostUrl = 'http://localhost:{port}/';
// Initializing File Manager with IBM COS service.
let filemanagerInstance: FileManager = new FileManager({
// Replace the hosted port number in the place of "{port}"
ajaxSettings: {
url: hostUrl,
downloadUrl: hostUrl + "Download",
uploadUrl: hostUrl + "Upload",
getImageUrl: hostUrl + "GetImage"
}
});
filemanagerInstance.appendTo('#filemanager');
`
```

Note: To learn more about the file actions that can be performed with IBM Cloud Object Storage file provider, refer to this [link](#)

Localization in ##Platform_Name## File manager control

The file manager can be localized to any culture by defining the texts and messages of the file manager in the corresponding culture. The default locale of the file manager is **en** (English). The following table represents the default texts and messages of the file manager in **en** culture.

KEY	Text/Message
NewFolder	New folder
Upload	Upload
Delete	Delete
Rename	Rename
Download	Download
Cut	Cut
Copy	Copy
Paste	Paste
SortBy	Sort by

Virtualization in ##Platform_Name## File manager control

File Manager's UI virtualization allows you for the dynamic loading of a large number of directories and files in both the detailsView and largeIconsView without degrading its performance.

Module Injection

To use UI virtualization, you must import the `virtualization` module from the `ej2-filemanager` package and inject it using the `FileManager.Inject()` function.

```
`ts
```

```
import { FileManager, Virtualization } from '@syncfusion/ej2-filemanager';
```

```
FileManager.Inject(Virtualization);
```

```
,
```

Enable Virtualization

In order to enable `virtualization`, you must set the `enableVirtualization` property to true.

In the instance below, a sizable collection of files can be found in the folders **Documents** and **Text Documents**.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.Toolbar,ej.filemanager.NavigationPane,ej.filemanager.enableVirtualization);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
    view: 'Details',
    enableVirtualization: true,
    beforeSend: function(args) {
        args.ajaxSettings.beforeSend = function (args) {
            args.httpRequest.setRequestHeader('Authorization',
'FileBrowser');
        };
    },
    beforeImageLoad: function(args) {
        args.imageUrl = args.imageUrl + '&rootName=' + 'FileBrowser';
    },

```

```

        beforeDownload: function(args) {
            args.data.rootFolderName = 'FileBrowser';
        },
    });
    // render initialized File Manager
    filemanagerInstance.appendTo('#filemanager');

```

INDEX.HTML

```

Limitations for Virtualization

- Programmatic selection using the **selectAll** method is not supported with virtual scrolling.
- The keyboard shortcut **CTRL+A** will only select the files and directories that are currently visible within the viewport, rather than selecting all files and directories in the entire directory tree.
- Selected file items are not maintained while scrolling, considering the performance of the component.

Accessibility in ##Platform_Name## File Manager component

The File Manager component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the File Manager component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The File Manager component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the File Manager component:

| Attributes | Purpose |

| --- | --- |

| **role** | Used to convey a significant and contextual message to the user. |

| **aria-disabled** | Indicates whether the File Manager component is in disabled state. |

| **aria-haspopup** | Indicates whether the toolbar item has a popup list or not. |

| **aria-orientation** | Indicates whether the File Manager element is oriented horizontally or vertically. |

| **aria-expanded** | Indicates whether the Treeview node has been expanded. |

| **aria-owns** | Contains the ID of the suggestion list to indicate popup as a child element. |

| **aria-activedescendent** | Holds the ID of the active list item to focus its descendant child element. |

| **aria-level** | Specifies the level of the element in Treeview Structure. |

| **aria-selected** | Indicates whether a particular node is in selected state. |

| **aria-placeholder** | Represents a hint (word or phrase) to the user about what to enter in the text field. |

| **aria-label** | Provides an accessible name for the element. |

| **aria-checked** | Indicates whether the checkbox is in checked state. |

| **aria-labelledby** | Provides a label for the dialog. Typically, the "aria-labelledby" attribute will contain the id of the element used as the dialog's title. |

| **aria-describedby** | This attribute points to the Dialog element describing the one it's set on. |

| **aria-modal** | Indicates whether an element is a modal when display. |

| **aria-colcount** | Specifies the number of columns in full table. |

| **aria-colindexnt** | Defines the number of columns within a table in details view. |

| **aria-rowspan** | Defines the number of rows a cell spanned within a table in details view. |

| **aria-colspan** | Defines the number of columns a cell spanned within a table in details view. |

| **aria-sort** | Indicates whether items in the table are sorted in ascending or descending order. |

| **aria-grabbed** | When the folder/file item is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held.
|

| **aria-busy** | This attribute is set to false when table content is loaded. |

| **aria-multiselectable** | Defines more than one item has been selected. |

Keyboard interaction

The File Manager component followed the **keyboard interaction** guidelines, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the File Manager component.

| **Press** | **To do this** |

| --- | --- |

| **Page Down** | Scrolls down to the next folder or file and selects the first item when files are loaded. |

| **Page Up** | Scrolls up to previous folder and select the first item when files are loaded. |

| **Enter** | Selects the focused item and navigate through the child elements. |

| **Tab** | Focuses on the first element of toolbar and navigates through the next tab indexed element. |

| **Esc(Escape)** | Closes the image when it is in open state. |

| **Alt+N** | Creates a new folder dialog. |

| **F5** | Refresh the file manager element. |

| **Home** | Navigate through the first element of details view or large icons view. |

| **End** | Navigate through the last element of details view or large icons view. |

| **Move Left** | Scrolls left to the previous folder and select the first item when files are loaded |

| **Move Right** | Scrolls right to the previous folder and select the first item when files are loaded
|

| **Alt+Enter** | Shows the get details info for selected folder. |

| **Shift+Right** | Allows multiselection. Select the file or folder at the right of the previously selected folder. |

| **Shift+Left** | Allows multiselection. Select the file or folder at the left of the previously selected folder. |

| **Shift+Down** | Allows multiselection. Select the file or folder till the focused index. |

| **Shift+Delete** | Permanently deletes the selected file or folder in the file manager element. |

| **Delete** | Deletes the selected file or folder in the file manager element. |

| **Shift+Up** | Allows multiselection. Select the file or folder till the focused index. |

Ctrl+C	Copies the selected file or folder in the file manager element.	
Ctrl+V	Pastes the copied/cut file or folder in the file manager element.	
Ctrl+X	Cuts the selected file or folder in the file manager element.	
Ctrl+A	Select all the files or folders in the details view or large icons view.	
F2	Creates a rename dialog for a selected file or folder in the file manager element.	
Shift+F10	Opens the context menu for the selected file or folder in the file manager element.	
Ctrl+D	Downloads the list of selected files or folders in the file manager element.	
Ctrl+Shift+1	Changes the file manager layout to details view.	
Ctrl+Shift+2	Changes the file manager layout to details view.	

Ensuring accessibility

The File Manager component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the File Manager component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the File Manager component with accessibility tools.

Access control in ##Platform_Name## File manager control

The FileManager allows you to define access permissions for folders and files using a set of access rules to user(s).

- [Access Rules](#)
- [Permissions](#)

Access Rules

The FileAccessController allows you to define security permissions for folders and files using a set of folder or file access rules.

To set up access rules for folders (including their files and sub-folders) and individual files, use the SetRules() method in the controller. The following table represents the AccessRule properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
---	---	---	---
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.

WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.
Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

The following syntax represents the access Rules for Administrator using file or folder.

```
`ts
```

```
//Adminstrator
```

```
//Access Rules for File
```

```
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write =  
Permission.Allow, Copy = Permission.Allow, Download = Permission.Allow, IsFile = true },
```

```
// Access Rules for folder
```

```
new AccessRule { Path = "*", Role = "Administrator", Read = Permission.Allow, Write = Permission.Allow,  
Copy = Permission.Allow, WriteContents = Permission.Allow, Upload = Permission.Allow, Download =  
Permission.Deny, IsFile = false },
```

```
,
```

The following syntax represent the access Rules for Default user using file or folder.

```
`ts
```

```
//Default User
```

```
//Access Rules for File
```

```
new AccessRule { Path = "/", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,  
Copy = Permission.Deny, Download = Permission.Deny, IsFile = true },
```

```
// Access Rules for folder
```

```
new AccessRule { Path = "*", Role = "Default User", Read = Permission.Deny, Write = Permission.Deny,  
Copy = Permission.Deny, WriteContents = Permission.Deny, Upload = Permission.Deny, Download =  
Permission.Deny, IsFile = false },
```

```
,
```

Permissions

It helps to explain how to apply security permission to file manager file or folder using access rules. The following table represent the value that determines the permission.

Value	Description
-------	-------------

---	---
-----	-----

Allow	Allows you to do read, write, copy, and download operations.
-------	--

Deny	Denies you to do read, write, copy, and download operations.
------	--

Use the **Role** property to apply created roles to the file manager. After that, the file manager displays folder or file and allow permission based on assigned roles.

The following syntax represent how to apply permission based on assigned roles

Permission denied for administrator to write a file or folder.

```
`ts
// For file
new AccessRule { Path = "/", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = true},
// For folder
new AccessRule { Path = "*", Role = "Administrator", Read = Permission.Allow, Write = Permission.Deny,
IsFile = false},
`
```

The following syntax represent how to allow or deny permission based on file or folder access rule.

Permission denied for writing except for particular file or folder.

```
`ts
// Deny writing for particular folder
new AccessRule { Path = "/Documents", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Allow, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
// Deny writing for particular file
new AccessRule { Path = "/Pictures/Employees/Adam.png", Role = "Document Manager", Read =
Permission.Allow, Write = Permission.Deny, Copy = Permission.Deny, Download = Permission.Deny,
IsFile = true },
`
```

Permission denied for writing and uploading in root folder.

```
`ts
// Folder Rule
new AccessRule { Path = "/", Role = "Document Manager", Read = Permission.Allow, Write =
Permission.Deny, Copy = Permission.Deny, WriteContents = Permission.Deny, Upload =
Permission.Deny, Download = Permission.Deny, IsFile = false },
`
```

The following example demonstrate the file manager rendered with access control support.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
```

```

var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManagerAccess/FileOperations',
    uploadUrl: hostUrl + 'api/FileManagerAccess/Upload',
    downloadUrl: hostUrl + 'api/FileManagerAccess/Download',
    getImageUrl: hostUrl + 'api/FileManagerAccess/GetImage'
  },
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');

```

How To

Adding custom item to context menu in `##Platform_Name##` File manager control

The context menu can be customized using the [contextMenuSettings](#), [menuOpen](#), and [menuClick](#) events.

The following example shows adding a custom item in the context menu.

The [contextMenuSettings](#) is used to add new menu item. The [menuOpen](#) event is used to add the icon to the new menu item. The [menuClick](#) event is used to add an event handler to the new menu item.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  // Custom menu item added to context menu
  contextMenuSettings: {
    file: ["Custom", "Open", "|", "Delete", "Download", "Rename", "|",
"Details"],
    folder: ["Custom", "Open", "|", "Delete", "Download", "Rename", "|",
"Details"],
    layout: ["Custom", "SortBy", "View", "Refresh", "|", "NewFolder",
"Upload", "|", "Details", "|", "SelectAll"],
    visible: true
  },
  menuOpen: menuOpen,
  menuClick: menuClick
});
// Icon added to custom menu item
function menuOpen(args) {
  for(let i = 0; i<args.items.length; i++) {
    if(args.items[i].id === this.element.id + '_cm_custom') {
      args.items[i].iconCss = 'e-icons e-fe-tick';
    }
  }
}
// event for custom menu item
function menuClick(args) {
  if (args.item.text === 'Custom') {
    alert('You have clicked custom menu item')
  }
}
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');

</body></html>

```

Adding custom item to toolbar in ##Platform_Name## File manager control

You can modify the items displayed in the toolbar by utilizing the [toolbarItems](#) API. To display both default and customized items, it's essential to assign a unique **name** to each item. Additionally, you have the flexibility to alter the default items by adjusting properties such as **tooltipText**, **iconCss**, **Text**, **suffixIcon** and more. This level of customization allows you to tailor the toolbar to your specific requirements and design preferences. The names used in the code example below serve as unique identifiers for default toolbar items, while custom items can be assigned any unique name value to distinguish them from the defaults.

For instance, here's an example of how to add a custom checkbox to the toolbar using the **template** property. Here we have modified the default **New Folder** item and added a custom toolbar item for selection.

INDEX.JS

```
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  //Custom item added along with default item
  toolbarItems: [{ text: 'Create folder' , name: 'NewFolder', prefixIcon:
'e-plus', tooltipText: 'Create folder' },
  { name: 'Upload' },
  { name: 'SortBy' },
  { name: 'Refresh' },
  { name: 'Cut' },
  { name: 'Copy' },
  { name: 'Paste' },
  { name: 'Delete' },
  { name: 'Download' },
  { name: 'Rename' },
  { template: '<input id="checkbox" type="checkbox"/>', name: 'Select' },
  { name: 'Selection' },
  { name: 'View' },
  { name: 'Details' }]
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
// Render Checkbox in template
var checkbox = new ej.buttons.CheckBox({ label: 'Select All', checked:
false, change: onChange }, '#checkbox');
// on checkbox change select all or clear selection
function onChange(args) {
  if (args.checked) {
    filemanagerInstance.selectAll();
    checkbox.label = 'Unselect All';
  }
  else {
    filemanagerInstance.clearSelection();
    checkbox.label = 'Select All';
  }
}
```

```

Enable/disable toolbar item in ##Platform_Name## File manager control

The toolbar items can be enabled/disabled by specifying the items in [enableToolbarItems](#) or [disableToolbarItems](#) methods respectively.

The following example shows enabling and disabling toolbar items on button click.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView, ej.filemanager.
Toolbar, ej.filemanager.NavigationPane);
// initialize File Manager component

```

```

var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  height: "330px"
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
// Click event for enable button
document.getElementById("enable").onclick = function(args) {
  // Enable new folder toolbar item
  filemanagerInstance.enableToolbarItems(["newfolder"]);
}
// Click event for disable button
document.getElementById("disable").onclick = function(args) {
  // Disable new folder toolbar item
  filemanagerInstance.disableToolbarItems(["newfolder"]);
}

```

```

Customize custom thumbnail in ##Platform_Name## File manager control

The default appearance of the file manager can customize with your own icon by using [showThumbnail](#) property.

The following example demonstrate how to add a custom icon in largeicons view.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
    showThumbnail: false,
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');

```

INDEX.HTML

```

```

Nested items in ##Platform_Name## File manager control

FileManager can be rendered inside the other components like Tab, Dialog, and more.

- [Adding file manager inside the dialog](#)
- [Adding file manager inside the tab](#)

Adding file manager inside the dialog

The following example shows the file manager component rendered inside the dialog. Click the browse button in the Uploader element to open the File Manager inside the Dialog control.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// Initialize the Uploader component
var uploadObject = new ej.inputs.Uploader({});
uploadObject.appendTo('#fileupload');
// Initialize the Button component
var btnObj = new ej.buttons.Button({});
btnObj.appendTo('#openBtn');

```

```

// Initialize the Dialog component
var dialogObj = new ej.popups.Dialog({
  header: 'Select a file',
  showCloseIcon: true,
  closeOnEscape: false,
  width: '850px',
  visible: false,
  target: document.getElementById('target'),
  animationSettings: { effect: 'None' },
  open: dialogOpen,
  close: dialogClose
});
dialogObj.appendTo('#dialog');
var contextmenuItems = ['Open', '|', 'Cut', 'Copy', 'Delete', 'Rename', '|',
'Details'];
// Initialize the FileManager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  allowMultiSelection: false,
  toolbarSettings: {
    items: ['NewFolder', 'Upload', 'Delete', 'Cut', 'Copy', 'Rename',
'SortBy', 'Refresh', 'Selection', 'View', 'Details']],
  contextMenuSettings: {
    file: contextmenuItems,
    folder: contextmenuItems
  },
  fileOpen : onFileOpen
});
filemanagerInstance.appendTo('#filemanager');
document.getElementById('openBtn').onclick = function() {
  dialogObj.show();
  dialogOpen();
  filemanagerInstance.path = '/';
  filemanagerInstance.selectedItems = [];
  filemanagerInstance.refresh();
};
// 'Uploader' will be shown, if Dialog is closed
function dialogClose() {
  document.getElementById('container').style.display = 'block';
}
// 'Uploader' will be hidden, if Dialog is opened
function dialogOpen() {
  document.getElementById('container').style.display = 'none';
}
// File Manager's fileOpen event function
function onFileOpen(args) {
  var file = args.fileDetails;
  if (file.isFile) {
    args.cancel = true;
    if (file.size <= 0 ) { file.size = 10000; }
    uploadObject.files = [{name: file.name, size: file.size, type:
file.type }];
  }
}

```

```
        dialogObj.hide();  
    }  
}
```

</body></html>

```

Adding file manager inside the tab

The following example demonstrate that the file manager component is placed inside the content area of tab element.

INDEX.JS

```

var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
//Initialize Tab component
var tabObj = new ej.navigations.Tab({
    heightAdjustMode: 'None',
    height: 320,
    showCloseButton: true,
    selecting: onSelect
});
//Render initialized Tab component
tabObj.appendTo('#tab_orientation');
// initialize File Manager component
var fileObject = new ej.filemanager.FileManager({
    ajaxSettings: {
        url: hostUrl + 'api/FileManager/FileOperations',
        getImageUrl: hostUrl + 'api/FileManager/GetImage',
        uploadUrl: hostUrl + 'api/FileManager/Upload',
        downloadUrl: hostUrl + 'api/FileManager/Download'
    },
});
// render initialized FileManager
fileObject.appendTo('#filemanager');
function onSelect() {
    fileObject.refreshLayout();
}

```

INDEX.HTML

```

Change the localization content in ##Platform_Name## File manager control

The example below shows how to modify the file manager component localization content. The upload text of the file manager component can be changed in the following example.

INDEX.JS

```
//Defining texts and messages corresponding to German culture
ej.base.L10n.load({
  'en': {
    'filemanager': {
      // Change the File Upload text.
      "File-Upload": "Files to Upload",
      // Change the Empty folder text.
      "Folder-Empty": "Empty Folder",
    }
  }
})
var hostUrl = 'https://ej2-aspcore-service.azurewebsites.net/';
// inject feature modules of the file manager
ej.filemanager.FileManager.Inject(ej.filemanager.DetailsView,ej.filemanager.
Toolbar,ej.filemanager.NavigationPane);
// initialize File Manager component
var filemanagerInstance = new ej.filemanager.FileManager({
  ajaxSettings: {
    url: hostUrl + 'api/FileManager/FileOperations',
    getImageUrl: hostUrl + 'api/FileManager/GetImage',
    uploadUrl: hostUrl + 'api/FileManager/Upload',
    downloadUrl: hostUrl + 'api/FileManager/Download'
  },
  //defining the locale for File Manager
  locale: 'en'
});
// render initialized File Manager
filemanagerInstance.appendTo('#filemanager');
```

INDEX.HTML

Create the custom file provider using NodeJS

Here we manipulate the Azure Blob Storage to supply the necessary data for the File Manager. We achieve this by utilizing NodeJS to fetch the required data from the Azure blob storage.

NodeJS acts as the bridge between the File Manager component and Azure Blob Storage, allowing seamless communication and data retrieval. Through this integration, the File Manager can access and interact with the data stored in Azure Blob Storage, enabling smooth file management operations.

Prerequisites

- Valid Azure blob storage account. (accountName, accountKey, endpointSuffix)
- Node version 14 above.

Introduction to Azure Blob Storage

Azure Blob Storage is a cloud-based object storage service provided by Microsoft Azure. It is designed to store and manage unstructured data, also known as "blobs" in the cloud. Blobs can be any type of data, such as images, videos, documents, backups, logs, and more.

Key concepts of Azure Blob Storage

Containers: In Azure Blob Storage, data is organized into containers. Containers are logical units that can hold one or more blobs. Think of them as directories or folders that help organize the data.

Blobs: Blobs are the actual data objects stored in Azure Blob Storage.

By understanding the fundamental concepts and use cases of Azure Blob Storage, you will be well-prepared to proceed with setting up and interacting with it using NodeJS in the custom File Provider.

[Create NodeJS project](#)

Following the steps to create the NodeJS project.

Create a new directory for your project and run the following command to initialize a new NodeJS project. This will create a package.json file.

```
`ts
npm init
`
```

Install the following packages.

- express
- @azure/storage-blob
- archiver
- body-parser
- cors
- esm
- multer

Open your text editor or integrated development environment (IDE) and create the index.js file start writing your NodeJS code. This file will serve as the entry point of your application.

```
`ts
const express = require('express');
const app = express();
const port = 3000;
app.get('/', (req, res) => {
res.send('Hello, NodeJS!');
});
app.listen(port, () => {
console.log(Server running on http://localhost:${port});
});
`
```

To start your NodeJS application, simply run the following command in your terminal, pointing to the entry point file:

```
`ts
node index.js
`
```

Initialize container client

We need to first get the BlobServiceClient. By using the connection string, we can obtain the BlobServiceClient. So, format the connection string as shown below.

```
`ts
Const connectionString =
DefaultEndpointsProtocol=https;AccountName=${accountName};AccountKey=${accountKey};E
ndpointSuffix=${EndpointSuffix};
`
```

We can obtain the BlobServiceClient and the **containerClient** using this connection String and the BlobServiceClient. the **containerName** is the container from your Azure blob storage account that you need to access.

```
`ts
import { BlobServiceClient } from "@azure/storage-blob";
const blobServiceClient = BlobServiceClient.fromConnectionString(connectionString);
const containerClient = blobServiceClient.getContainerClient(containerName);
`
```

File actions

Need to provide the following action to creating a new folder, copying and moving of files or folders, deleting, uploading, and downloading the files or folders in the file system

Read

Specify the directory name that needs to be accessed.

```
`ts
const directoryName = 'Files';
`
```

Create the **app.post** method with URL **‘/fileManager’**.

To identify the action by use this condition **req.body.action === ‘read’**

The following table represents the request parameters of **read** operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	read	Name of the file operation.
path	String	-	Relative path from which the data has to be read.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

Example for request:

```
`ts
{
```

```
action: "read",
path: "/Videos/",
showHiddenItems: false,
data: [
0:{
name:"Videos",
size:0,
dateModified:"2023-09-14T14:28:27.000Z",
dateCreated: "2023-09-14T11:16:57.000Z",
hasChild:true,
isFile:false,
type:"Directory",
filterPath:"/",
fmicon: "e-fe-folder",
fmiconClass: "e-fe-folder",
fmid: "fetree0",
fmmodified: "September 14, 2023 19:58"
}
]
}
```

The following table represents the response parameters of **read** operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of files and folders present in given path or directory.
error	ErrorDetails	-	Error Details

The following table represents the contents of **FileManagerDirectoryContent** in the file manager request and response.

Parameter	Type	Default	Explanation	Is required
----	----	----	----	----
name	String	-	File name	Yes

dateCreated	String	-	Date in which file was created (UTC Date string).	Yes
dateModified	String	-	Date in which file was last modified (UTC Date string).	Yes
filterPath	String	-	Relative path to the file or folder.	Yes
hasChild	Boolean	-	Defines this folder has any child folder or not.	Yes
isFile	Boolean	-	Say whether the item is file or folder.	Yes
size	Number	-	File size	Yes
type	String	-	File extension	Yes
permission	[AccessRules](#)	-	File extension	Optional
caseSensitive	Boolean	-	Defines search is case sensitive or not.	Optional
action	String	read	Name of the file operation.	Optional
names	String[]	-	Name list of the items to be downloaded.	Optional
data	FileManagerDirectoryContent	-	Details of the download item.	Optional
uploadFiles	IList<IFormFile>	-	File that are uploaded.	Optional
newName	String	-	New name for the item.	Optional
searchString	String	-	String to be searched in the directory.	Optional
targetPath	String	-	Relative path where the items to be pasted are located.	Optional
targetData	FileManagerDirectoryContent	-	Details of the copied item.	Optional
renameFiles	String[]	-	Details of the renamed item.	Optional

The following table represents the **AccessRules** properties available for file and folder:

Properties	Applicable for file	Applicable for folder	Description
---	---	---	---
Copy	Yes	Yes	Allows access to copy a file or folder.
Read	Yes	Yes	Allows access to read a file or folder.
Write	Yes	Yes	Allows permission to write a file or folder.
WriteContents	No	Yes	Allows permission to write the content of folder.
Download	Yes	Yes	Allows permission to download a file or folder.
Upload	No	Yes	Allows permission to upload to the folder.
Path	Yes	Yes	Specifies the path to apply the rules, which are defined.
Role	Yes	Yes	Specifies the role to which the rule is applied.
IsFile	Yes	Yes	Specifies whether the rule is specified for folder or file.

Example for response:

`ts

```
{
  cwd:
  {
    filterPath: "/",
    hasChild: true,
    name: "Videos",
    size: 0,
    type: "File Folder"
  },
  files:[
    0:{
      dateCreated: "2023-09-14T11:16:57.000Z"
      dateModified: "2023-09-14T11:16:57.000Z"
      filterPath: "/Videos/"
      hasChild: false
      isFile: true
      name: "about.txt"
      size: 29
      type: ".txt"
    }
  ],
  error:null
},
```

[Get image](#)

Create the **app.get** method with URL **‘/fileManager/GetImage’**.

The following table represents the request parameters of **GetImage** operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

----	----	----	----
------	------	------	------

path	String	-	Relative path to the image file
------	--------	---	---------------------------------

The req.query.path contains the exact path of the images. For example: **"/Jack.png"**.

Download the blob (image) from Azure Blob Storage using the blobClient and stores the result in the downloadResponse variable.

Pipe the `readableStreamBody` from the blob to the `res` response. It means the image data will be streamed from the Azure Blob Storage directly to the client's browser when the image URL is accessed.

Handle the exception if the image is not available in the given path.

Download

Create the **`app.post`** method with URL **`'/fileManager/Download'`**.

The following table represents the request parameters of *download* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	download	Name of the file operation
path	String	-	Relative path to location where the files to download are present.
names	String[]	-	Name list of the items to be downloaded.
data	FileManagerDirectoryContent	-	Details of the download item.

Example for request:

```
`ts
{
  action: 'download',
  path: '/Downloads/Testing/',
  names: [ 'About.txt' ],
  data: [
    0:{
      name: 'About.txt',
      type: '.txt',
      isFile: true,
      size: 29,
      dateModified: '2023-09-14T06:03:52.000Z',
      hasChild: false,
      filterPath: '/Downloads/Testing/',
      fmcreated: null,
      fmmodified: 'September 14, 2023 11:33',
      fmiconClass: 'e-fe-txt',
      fmicon: 'e-fe-txt'
    }
  ]
}
```

The **req.body.downloadInput** must be parsed to get the **downloadObj**. Download the blob from Azure Blob Storage using the blobClient.

Download the blob from Azure Blob Storage using the blobClient and Pipe the readableStreamBody to the response object.

Create the archive file to download the multiple Files, Folders and single folders, then pipe the archive to the response.

Upload

Create the **app.post** method with URL **'/fileManager/Upload'**.

The following table represents the request parameters of *Upload* operations.

Parameter	Type	Default	Explanation
action	String	Save	Name of the file operation.
path	String	-	Relative path to the location where the file has to be uploaded.
uploadFiles	IList<IFormFile>	-	File that are uploaded.

Example for request:

```
`ts
{
  path: '/Pictures/',
  action: 'save',
  data: [
    0:{
      name: 'Pictures',
      type: 'File Folder',
      isFile: true,
      size: 0,
      dateModified: '2023-09-14T06:03:52.000Z',
      hasChild: true,
      filterPath: '',
      fmid: 'fetree1',
    }
  ],
  filename: 'bird (2).jpg'
}
```

Multer is a popular middleware used to handle file uploads in Express-based web applications. Create the Multer config to store the upload files in buffer.

```
`ts
const multerConfig = {
  storage: memoryStorage()
};
`
```

Need to handle the 3 cases here.

- Save
- Keep Both (action name will be **keepboth**)
- Replace (action name will be **replace**)

Create the **getBlockBlobClient** with the **req.body.filename**. If the blob does not exist, then upload the data to that blob. If the blob already exists, then create an error message containing "File Already Exists" and send the response.

Create a new folder

The following table represents the request parameters of *create* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	create	Name of the file operation.
path	String	-	Relative path in which the folder has to be created.
name	String	-	Name of the folder to be created.
data	FileManagerDirectoryContent	-	Details about the current path (directory).

Example for request:

```
`ts
action: "create",
data: [
  0:{
    filterPath: "/",
    hasChild: true,
    isFile: false,
    name: "files",
    nodeId: "fe_tree",
    size: 0,
```

```
type: ""
}
],
name: "Hello",
path: "/test/"
,
```

Check the existence of the folder, If the folder exists then send the error message containing “Folder already exists”. If it does not exist, then create the folder. Create the folder by creating the file in that folder’s path.

The following table represents the response parameters of *create* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details of the created folder
error	ErrorDetails	-	Error Details

Example for response:

```
`ts
{
  cwd: null,
  files: [
    0:{
      dateCreated: "2023-09-14T10:52:25.000Z",
      dateModified: "2023-09-14T10:52:25.000Z",
      filterPath: null,
      hasChild: false,
      isFile: false,
      name: "New",
      size: 0,
      type: "Directory"
    }
  ],
  details: null,
  error: null
},
```

Rename

The following table represents the request parameters of *rename* operations.

Parameter	Type	Default	Explanation
	----	----	----
action	String	rename	Name of the file operation.
path	String	-	Relative path in which the item is located.
name	String	-	Current name of the item to be renamed.
newName	String	-	New name for the item.
data	FileManagerDirectoryContent	-	Details of the item to be renamed.

Example for request:

```
`ts
{
  action: "rename",
  data: [
    0:{
      dateCreated: "2023-09-14T10:41:17.000Z",
      filterPath: "/Pictures/Nature/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "seaviews.jpg",
      size: 95866,
      type: ".jpg"
    }
  ],
  newName: "seaview.jpg",
  name: "seaviews.jpg",
  path: "/Pictures/Nature/"
}
```

Renaming can be done by copy the folder or file from the source blob instance to target blob instance. If the file exists, then send the error message as response.

The following table represents the response parameters of *rename* operations.

Parameter	Type	Default	Explanation
-----------	------	---------	-------------

```
|----|----|----|----|
|files|FileManagerDirectoryContent[]|-|Details of the renamed item.|
|error|ErrorDetails|-|Error Details|
```

Example for response:

```
`ts
{
  cwd:null,
  files:[
    0:{
      name:"seaview.jpg",
      size:95866,
      dateModified:"2023-09-14T11:16:57.000Z",
      dateCreated:"2023-09-14T10:41:17.000Z",
      hasChild:false,
      isFile:true,
      type:".jpg",
      filterPath:"/Pictures/Nature/"
    }
  ],
  error:null,
  details:null
}
```

Delete

The following table represents the request parameters of *delete* operations.

Parameter	Type	Default	Explanation
action	String	delete	Name of the file operation.
path	String	-	Relative path where the items to be deleted are located.
names	String[]	-	List of the items to be deleted.
data	FileManagerDirectoryContent	-	Details of the item to be deleted.

Example for request:

```
`ts
```

```
{
  action: "delete",
  path: "/",
  names: ["bird.jpg"],
  data: [
    0:{
      dateModified: "2023-09-14T09:12:53.000Z",
      filterPath: "/",
      hasChild: false,
      iconClass: "e-fe-image",
      isFile: true,
      name: "bird.jpg",
      size: 102182,
      type: ".jpg"
    }
  ]
}
```

To delete the file, directly get the file instance and delete the file. To delete the folder, we need to get all files inside that folder and delete all those files.

Handle the null exception if file or folder is not available.

The following table represents the response parameters of *delete* operations.

Parameter	Type	Default	Explanation
files	FileManagerDirectoryContent[]	-	Details about the deleted item(s).
error	ErrorDetails	-	Error Details

Example for response:

```
`ts
{
  cwd: null,
  details: null,
  error: null,
  files: [
```

```
0:{
  dateModified: "2023-09-14T09:12:53.000Z",
  filterPath: "/",
  hasChild: false,
  iconClass: "e-fe-image",
  isFile: true,
  name: "bird.jpg",
  size: 102182,
  type: ".jpg"
}
]
```

Details

The following table represents the request parameters of *details* operations.

Parameter	Type	Default	Explanation
action	String	details	Name of the file operation.
path	String	-	Relative path where the items are located.
names	String[]	-	List of the items to get details.
data	FileManagerDirectoryContent	-	Details of the selected item.

Example:

```
`ts
{
  action: "details",
  path: "/FileContents/",
  names: ["bird.jpg"],
  data: [
    0:{
      dateModified: "2023-09-14T09:12:53.000Z",
      filterPath: "/",
      hasChild: false,
      iconClass: "e-fe-image",
```

```
isFile: true,  
name: "bird.jpg",  
size: 102182,  
type: ".jpg"  
}  
]  
}  
,
```

To get the file and folder details, iterate the **req.body.names** to get the details of files and folders. If the data is file, then get the file instance and get the properties using the **getProperties** method. If the data is Folder, then get the blobs details under that folder using **listBlobsFlat** method. Get the required properties and send final response. Handled the null exception if the file or folder is not available.

The following table represents the response parameters of *details* operations.

Parameter	Type	Default	Explanation
----	----	----	----
details	FileManagerDirectoryContent	-	Details of the requested item(s).
error	ErrorDetails	-	Error Details

Example:

```
`ts  
{  
  cwd:null,  
  files:null,  
  error:null,  
  details:  
  {  
    created: "2023-09-15T06:04:12.000Z"  
    isFile: true  
    location: "Files/bird.jpg"  
    modified: "2023-09-15T06:04:12.000Z"  
    multipleFiles: false  
    name: "bird.jpg"  
    size: "100.0 KB"  
  }  
}
```

Search

The following table represents the request parameters of *search* operations.

Parameter	Type	Default	Explanation
action	String	search	Name of the file operation.
path	String	-	Relative path to the directory where the files should be searched.
showHiddenItems	Boolean	-	Defines show or hide the hidden items.
caseSensitive	Boolean	-	Defines search is case sensitive or not.
searchString	String	-	String to be searched in the directory.
data	FileManagerDirectoryContent	-	Details of the searched item.

Example for request:

```
`ts
{
  action: "search",
  path: "/asia/",
  searchString: "nature",
  showHiddenItems: false,
  caseSensitive: false,
  data: [
    0:{
      filterPath: "/",
      hasChild: true,
      name: "asia",
      size: 0,
      type: "File Folder",
      fmid: "fetree1"
    }
  ]
}
```

Replace the '*' in the **req.body.searchString** and assign the result to new variable. Get all blobs under this directory and check that path contains the search string

The following table represents the response parameters of *search* operations.

|Parameter|Type|Default|Explanation|

|----|----|----|----|

|cwd|[FileManagerDirectoryContent](#)|-|Path (Current Working Directory) details.|

|files|FileManagerDirectoryContent[]|-|Files and folders in the searched directory that matches the search input.|

|error|[ErrorDetails](#)|-|Error Details|

Example for response:

```
`ts
{
  cwd:
  {
    name:"asia",
    size:0,
    dateModified:"2023-09-14T14:28:27.000Z",
    dateCreated:"2023-09-14T11:16:57.000Z",
    hasChild:true,
    isFile:false,
    type:"File Folder",
    filterPath:"/"
  },
  files:[
    0: {
      dateModified: "2023-09-15T06:22:00.000Z",
      filterPath: "/asia/",
      hasChild: false,
      isFile: true,
      name: "about.txt",
      size: 42,
      type: ".txt"
    }
  ],
  error:null,
  details:null
```

```
}  
、
```

Copy and move

The following table represents the request parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
action	String	copy	Name of the file operation.
path	String	-	Relative path to the directory where the files should be copied.
names	String[]	-	List of files to be copied.
targetPath	String	-	Relative path where the items to be pasted are located.
data	FileManagerDirectoryContent	-	Details of the copied item.
targetData	FileManagerDirectoryContent	-	Details of the copied item.
renameFiles	String[]	-	Details of the renamed item.

Example for request:

```
`ts  
{  
  action: "copy",  
  path: "/",  
  names: ["bird.jpg"],  
  renameFiles: [],  
  targetPath: "/asia/",  
  targetData: {  
    filterPath: "/",  
    hasChild: true,  
    name: "asia",  
    size: 0,  
    type: "File Folder",  
    fmid: "fetree1",  
  },  
  data: [  
    0:{  
      dateCreated: "2023-09-15T06:04:12.000Z",  
      dateModified: "2023-09-15T06:04:12.000Z",
```

```
filterPath: "/",
hasChild: false,
isFile: true,
name: "bird.jpg",
size: 102182,
type: ".jpg",
fmcreated: "September 15, 2023 11:34",
fmhtmlAttr: {class: "e-large-icon", title: "bird.jpg"},
fmiconClass: "e-fe-image",
fmimageAttr: {alt: "bird.jpg"},
fmimageUrl: "http://localhost:3000/GetImage?path=%2Fbird.jpg&time=1694760243307",
fmmodified: "September 15, 2023 11:34",
}
]
}
`
```

Action name will be **move** for move action.

The following table represents the response parameters of *copy* operations.

Parameter	Type	Default	Explanation
----	----	----	----
cwd	FileManagerDirectoryContent	-	Path (Current Working Directory) details.
files	FileManagerDirectoryContent[]	-	Details of copied files or folders
error	ErrorDetails	-	Error Details

Example for response:

```
`ts
{
  cwd:null,
  files:[
    0:{
      dateCreated: "2023-09-15T06:55:03.000Z"
      dateModified: "2023-09-15T06:55:03.000Z"
      filterPath: "/asia/"
      hasChild: false
```

```

isFile: true
name: "bird.jpg"
previousName: null
size: 102182
type: ".jpg"
}
],
error:null,
details:null
}
,

```

Need to handle two cases.

- Directory copy and move.
- File copy and move.

Create the **isRename** variable to store the is request is rename or not. If the **isRename** is false then check the existence of the folders, and if folder is existing, then send the error message. If **isRename** is true, then don't check the existence of the folder.

To move or copy the folders you need to get all the blobs from that folder and create the new path for each blob and copy the data from the old path to the new path. To move or copy the files copy the data from the source blob client to target client. If the action is move then delete the old blob.

Note: To get the complete project, refer to this [link](#)

Floating Action Button

Form validator

Validation rules in `##Platform_Name##` Form validator control

Default Rules

The **FormValidator** has following default validation rules, which are used to validate the form.

Rules	Description	Example
-----	-----	-----
required	The form input element must have any input values	a or 1 or -
email	The form input element must have valid email format values	<form@syncfusion.com>
url	The form input element must have valid url format values	http://syncfusion.com/
date	The form input element must have valid date format values	05/15/2017
dateISO	The form input element must have valid dateISO format values	2017-05-15

| **number** | The form input element must have valid **number** format values | 1.0 or 1 |

| **digits** | The form input element must have valid **digits** values | 1 |

| **maxLength** | Input value must have less than or equal to **maxLength** character length | if
maxLength: 5, **check** is valid and **checking** is invalid |

| **minLength** | Input value must have greater than or equal to **minLength** character length | if
minLength: 5, **testing** is valid and **test** is invalid |

| **rangeLength** | Input value must have value between **rangeLength** character length | if
rangeLength: [4,5], **test** is valid and **key** is invalid |

| **range** | Input value must have value between **range** number | if **range**: [4,5], **4** is valid and **6** is
invalid |

| **max** | Input value must have less than or equal to **max** number | if **max**: 3, **3** is valid and **4** is invalid |

| **min** | Input value must have greater than or equal to **min** number | if **min**: 4, **5** is valid and **2** is invalid
|

Error messages in ##Platform_Name## Form validator control

The **FormValidator** provides default error messages for all default validation rules.

It is tabulated as follows

Rules	message
-----	-----
required	This field is required.
email	Please enter a valid email address.
url	Please enter a valid URL.
date	Please enter a valid date.
dateIso	Please enter a valid date (ISO).
number	Please enter a valid number.
digit	Please enter only digits.
maxLength	Please enter no more than {0} characters.
minLength	Please enter at least {0} characters.
rangeLength	Please enter a value between {0} and {1} characters long.
range	Please enter a value between {0} and {1}.
max	Please enter a value less than or equal to {0}.
min	Please enter a value greater than or equal to {0}.
regex	Please enter a correct value.

Customizing Error Messages

The default error message for a rule can be customizable by defining it along with concern rule object as follows.

INDEX.JS

```
var customFn = (args) => {
    return args['value'].length >= 5;
};
var options = {
    rules: {
        'user': { required: true },
        'password': { minLength: [customFn, 'Need atleast 5 letters'] }
    }
};
var formObject = new ej.inputs.FormValidator('#form-element', options);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Form Validator</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <form id="form-element" class="form-horizontal">
      <div class="form-group">
        <label class="col-sm-3 control-label" for="user">User
Name</label>
        <div class="col-sm-6">
          <input type="text" id="required" name="user"
class="form-control">
        </div>
      </div>
      <div class="form-group">
        <label class="col-sm-3 control-label"
for="password">Password</label>
        <div class="col-sm-6">
          <input type="password" id="number" name="password"
class="form-control">
```

```

        </div>
    </div>
</form>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

INDEX.CSS

```

#container {
    visibility: hidden;
    padding: 10px;
}
#loader {
    color: #008cff;
    height: 40px;
    width: 30%;
    position: absolute;
    top: 45%;
    left: 45%;
}

```

Customizing Error Placement

The `FormValidator` has an event [customPlacement](#) which can be used to place the error message from default position to desired custom location.

INDEX.JS

```

var options = {
    rules: {
        'user': { required: [true, 'User Name: required'] },
        'password': { minLength: [5, 'Password: need atleast 5 characters'] }
    },
    customPlacement: (inputElement, error) => {
        document.getElementById('error').appendChild(error);
    }
};
var formObject = new ej.inputs.FormValidator('#form-element', options);

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Form Validator</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

class="form-control">
                </div>
            </div>
            <div class="form-group">
                <div class="col-sm-3 control-label"></div>
                <div class="col-sm-6">
                    <div id="error"></div>
                </div>
            </div>
        </form>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

INDEX.CSS

```

#container {
    visibility: hidden;
    padding: 10px;
}
#loader {

```

```

    color: #008cff;
    height: 40px;
    width: 30%;
    position: absolute;
    top: 45%;
    left: 45%;
}
#error {
    width: 100%;
    height: 70px;
    border: 1px solid red;
    padding: 10px;
}

```

Localization in ##Platform_Name## Form validator control

The [Localization](#) library allows users to localize the default error message contents of the `formValidator` to different cultures using the `locale` property.

The `FormValidator` provides default error messages for all default validation rules. It is tabulated as follows:

Rules	message
required	This field is required.
email	Please enter a valid email address.
url	Please enter a valid URL.
date	Please enter a valid date.
dateIso	Please enter a valid date (ISO).
number	Please enter a valid number.
digit	Please enter only digits.
maxLength	Please enter no more than {0} characters.
minLength	Please enter at least {0} characters.
rangeLength	Please enter a value between {0} and {1} characters long.
range	Please enter a value between {0} and {1}.
max	Please enter a value less than or equal to {0}.
min	Please enter a value greater than or equal to {0}.
regex	Please enter a correct value.

Loading translations

To load translation object in your application use `load` function of `L10n` class.

The following example demonstrates the `FormValidator` in `Arabic` culture with error message for email.

INDEX.JS

```

var L10n = ej.base.L10n;
L10n.load({
  'ar-AR': {
    'formValidator': {
      "required": "هذه الخانة مطلوبه",
      "email": "أدخل بريد إلكتروني صالح",
      "url": "أدخل رابط صحيح من فضلك",
      "date": "أرجوك ادخل تاريخ صحيح",
      "dateIso": "الرجاء إدخال تاريخ صالح (ISO)",
      "creditcard": "يرجى إدخال رقم بطاقة صالح",
      "number": "من فضلك أدخل رقما صالحا",
      "digits": "الرجاء إدخال الأرقام فقط",
      "maxLength": "الرجاء إدخال ما لا يزيد عن {0} حرف",
      "minLength": "الرجاء إدخال أحرف {0} على الأقل",
      "rangeLength": "يرجى إدخال قيمة بين {0} و {1} من الأحرف",
      "range": "يرجى إدخال قيمة بين {0} و {1}",
      "max": "الرجاء إدخال قيمة أقل من أو تساوي {0}",
      "min": "الرجاء إدخال قيمة أكبر من أو تساوي {0}",
      "regex": "يرجى إدخال قيمة صحيحة",
      "tel": "يرجى إدخال رقم هاتف صالح",
      "pattern": "الرجاء إدخال قيمة نمط صحيح",
      "equalTo": "يرجى إدخال نص مطابقة صحيح"
    }
  }
});
var options = {
  rules: {
    email: { email: true },
  },
  locale: "ar-AR"
}
var formObject = new ej.inputs.FormValidator('#form-element', options);

```

Gantt

Module in ##Platform_Name## Gantt control

The modules that are available in Gantt are as follows.

Module	Description
-----	-----
Sort	Inject this module to use sorting feature.

[Filter](#)	Inject this module to use filtering feature.
[Reorder](#)	Inject this module to use reorder feature.
[ExcelExport](#)	Inject this module to use excel export feature.
[PdfExport](#)	Inject this module to use PDF export feature.
[RowDD](#)	Inject this module to use row drag and drop feature.
[Resize](#)	Inject this module to use resize feature.
[Toolbar](#)	Inject this module to use toolbar feature.
[Edit](#)	Inject this module is use editing feature.
[Selection](#)	Inject this module to use selection feature.
[DayMarkers](#)	Inject this module to use event markers.
[ContextMenu](#)	Inject this module to use context menu feature.
[ColumnMenu](#)	Inject this module to use column menu feature.
[VirtualScroll](#)	Inject this module to use virtual scroll feature.
[CriticalPath](#)	Inject this module to use critical path feature.

These modules should be injected into the Gantt using the **Gantt.Inject** method.

Data binding in ##Platform_Name## Gantt control

The Gantt control uses **DataManager** for binding the data source, which supports both RESTful JSON data services and local JavaScript object array. The [dataSource](#) property can be assigned either with the instance of **DataManager** or JavaScript object array collection. The Gantt control supports binding two types of data:

- Local data
- Remote data

Local data

To bind local data to Gantt, you can assign a JavaScript object array to the [dataSource](#) property. The local data source can also be provided as an instance of the **DataManager**.

In local data binding, the data source for rendering the Gantt control is retrieved from the same application locally.

The following are the two types of data binding possible with the Gantt control:

- Hierarchical data binding.
- Self-referential data binding (Flat data).

Hierarchical data binding

The [child](#) property is used to map the child records in hierarchical data.

The following code example shows how to bind the hierarchical local data into the Gantt control.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">

</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Self-referential data binding (Flat data)

The Gantt control can be bound with self-referential data by mapping the data source field values to the [id](#) and [parentID](#) properties.

- ID field: This field contains unique values used to identify each individual task and it is mapped to the [id](#) property.
- Parent ID field: This field contains values that indicate parent tasks and it is mapped to the [parentID](#) property.

INDEX.JS

```

var SelfReferenceData = [
    { TaskID: 1, TaskName: 'Project Initiation', StartDate: new
Date('04/02/2019'), EndDate: new Date('04/21/2019') },
    { TaskID: 2, TaskName: 'Identify Site location', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, ParentId: 1 },
    { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, ParentId: 1 },
    { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, ParentId: 1 },
    { TaskID: 5, TaskName: 'Project Estimation', StartDate: new
Date('04/02/2019'), EndDate: new Date('04/21/2019') },
    { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, ParentId: 5 },
    { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, ParentId: 5 },
    { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, ParentId: 5 }
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: SelfReferenceData,
    height: '450px',

```

```

        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            parentID: 'ParentId'
        }
    });
    ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Remote data

To bind remote data to the Gantt component, assign service data as an instance of **DataManager** to the [dataSource](#) property.

INDEX.JS

```

var hostUrl = 'https://ej2services.syncfusion.com/production/web-services/';
var GanttData = new ej.data.DataManager({
    url: hostUrl + 'api/GanttData',
    adaptor: new ej.data.WebApiAdaptor(),
    crossDomain: true
});
```

```

});
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskId',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        dependency: 'Predecessor',
        child: 'SubTasks'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

URL Adaptor

Please refer the [link](#) to create the ADO.NET Entity Data Model in Visual studio,

We can define data source for Gantt as instance of DataManager using url property of DataManager. Please Check the below code snippet to assign data source to Gantt.

```
`ts
```

```

import { Gantt } from '@syncfusion/ej2-gantt';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
let dataSource: DataManager = new DataManager({
url: '/Home/UrlDatasource',
adaptor: new UrlAdaptor
});
let gantt: Gantt = new Gantt({
dataSource: dataSource,
height: '450px',
treeColumnIndex: 1,
taskFields: {
id: 'TaskId',
name: 'TaskName',
startDate: 'StartDate',
progress: 'Progress',
duration: 'Duration',
dependency: 'Predecessor',
child: 'SubTasks'
}
});
gantt.appendTo('#Gantt');
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
List<GanttData>DataList = db.GanttDatas.ToList();
var count = DataList.Count();
return Json(new { result = DataList, count = count });
}
`

```

Load child on demand

To render child records on demand, assign a remote service URL in the instance of DataManager to the `url` property. To interact with the remote data source, provide the endpoint URL and also define the [hasChildMapping](#) property in taskFields of Gantt Chart.

The `hasChildMapping` property maps the field name in the data source, which denotes whether the current record holds any child records. This is useful internally to show expand icon while binding child data on demand.

When [loadChildOnDemand](#) is disabled, all the root nodes are rendered in a collapsed state at initial load. On expanding the root node, the child nodes will be loaded from the remote server.

When `enableVirtualization` is enabled and `loadChildOnDemand` is disabled, only the current viewport root nodes are rendered in a collapsed state.

When a root node is expanded, its child nodes are rendered and maintained in a collection locally, such that on consecutive expand/collapse actions on the root node, the child nodes are loaded locally instead of from the remote server.

When the `loadChildOnDemand` is enabled, parent records are rendered in an expanded state.

`ts

```
import { Gantt, VirtualScroll, Selection } from '@syncfusion/ej2-gantt';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import './App.css';

Gantt.Inject(Selection, VirtualScroll);

let dataSource: DataManager = new DataManager({
  url: 'https://ej2services.syncfusion.com/js/development/api/GanttLoadOnDemand',
  adaptor: new WebApiAdaptor,
  crossDomain: true
});

let gantt: Gantt = new Gantt({
  dataSource: dataSource,
  loadChildOnDemand: false,
  taskFields: {
    id: 'taskId',
    name: 'taskName',
    startDate: 'startDate',
    endDate: 'endDate',
    duration: 'duration',
    progress: 'progress',
```

```
hasChildMapping: 'isParent',
parentID: 'parentID'
},
columns: [
{ field: 'taskId', headerText: 'Task ID' },
{ field: 'taskName', headerText: 'Task Name', allowReordering: false },
{ field: 'startDate', headerText: 'Start Date', allowSorting: false },
{ field: 'duration', headerText: 'Duration', allowEditing: false },
{ field: 'progress', headerText: 'Progress', allowFiltering: false },
],
allowSelection: true,
enableVirtualization: true,
splitterSettings: {
columnIndex: 3,
},
tooltipSettings: {
showTooltip: true
},
highlightWeekends: true,
timelineSettings: {
showTooltip: true,
topTier: {
unit: 'Week',
format: 'dd/MM/yyyy'
},
bottomTier: {
unit: 'Day',
count: 1
}
},
treeColumnIndex: 1,
taskbarHeight: 20,
rowHeight: 40,
```

```

height: '460px',
projectStartDate: new Date('01/02/2000'),
projectEndDate: new Date('12/01/2002'),
});
ganttt.appendTo('#Gantt');
`

```

The following code example describes handling of Load on demand at server end.

```

`ts
public object Get()
{
    DataOperations operation = new DataOperations();

});
}
}
}
return tree;
}
}
,

```

Limitations

- Filtering, sorting and searching are not supported in load on demand.
- Only Self-Referential type data is supported with remote data binding in Gantt Chart.
- Load-on-demand supports only the validated data source

Sending additional parameters to the server

We can pass additional parameters using [addParams](#) method of [Query](#) class.

In server side we have inherited and shown the additional parameter value in Syncfusion DataManager class itself. We pass an additional parameter in load time using [load](#) event. We can also pass additional parameter to the CRUD model. Please Check the below code snippet to send additional parameter to Gantt.

```

`ts
import { Gantt, Edit, Toolbar } from '@syncfusion/ej2-gantt';
import { DataManager, UrlAdaptor, Query } from '@syncfusion/ej2-data';
Gantt.Inject(Edit, Toolbar);
let dataSource: DataManager = new DataManager({
url: 'http://localhost:50039/Home/UrlDatasource',
adaptor: new UrlAdaptor,
batchUrl: 'http://localhost:50039/Home/BatchSave',

```

```

});
let gantt: Gantt = new Gantt({
  dataSource: dataSource,
  height: '450px',
  treeColumnIndex: 1,
  taskFields: {
    id: 'taskID',
    name: 'taskName',
    startDate: 'startDate',
    endDate: 'endDate',
    duration: 'duration',
    progress: 'progress',
    parentID: 'parentID',
  },
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
  },
  toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll', 'CollapseAll'],
  load: function (args) {
    this.query = new Query().addParams('ej2Gantt', "test");
  }
});
gantt.appendTo('#Gantt');
`ts
namespace URLAdaptor.Controllers
{
  public class HomeController : Controller
  {
    ...///
    //inherit the class to show age as property of DataManager

```

```

public class Test : DataManagerRequest
{
    public string ej2Gantt { get; set; }
}

public ActionResult UrlDatasource([FromBody]Test dm)
{
    if (DataList == null)
    {
        ProjectData datasource = new ProjectData();
        DataList = datasource.GetUrlDataSource();
    }
    var count = DataList.Count();
    return Json(new { result = DataList, count = count }, JsonRequestBehavior.AllowGet);
}

...///

public class ICRUDModel<T> where T : class
{
    public object key { get; set; }
    public T value { get; set; }
    public List<T> added { get; set; }
    public List<T> changed { get; set; }
    public List<T> deleted { get; set; }
    public IDictionary<string, object> @params { get; set; }
}

...///
}
}
,

```

You can find the full sample from [here](#).

Handling HTTP error

During server interaction from the Gantt, some server-side exceptions may occur, and you can acquire those error messages or exception details in client-side using the [actionFailure](#) event.

The argument passed to the `actionFailure` event contains the error details returned from the server.

INDEX.JS

```

var dataSource = new ej.data.DataManager({
    url: 'http://some.com/invalidUrl',
});
var gantt = new ej.gantt.Gantt({
    dataSource: dataSource,
    height: '450px',
    treeColumnIndex: 1,
    taskFields: {
        id: 'taskID',
        name: 'taskName',
        startDate: 'startDate',
        endDate: 'endDate',
        duration: 'duration',
        progress: 'progress',
        parentID: 'parentID',
    },
    actionFailure: (e) => {
        let span = document.createElement('span');
        gantt.element.parentNode.insertBefore(span, gantt.element);
        span.style.color = '#FF0000';
        span.innerHTML = 'Server exception: 404 Not found';
    },
});
gantt.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Binding with Ajax

You can use Gantt [dataSource](#) property to bind the data source to Gantt from external Ajax request. In the below code we have fetched the data source from the server with the help of Ajax request and provided that to `dataSource` property by using [onSuccess](#) event of the Ajax.

INDEX.JS

```
var gantt = new ej.gantt.Gantt({
  height: '450px',
  treeColumnIndex: 1,
  taskFields: {
    id: 'TaskId',
    name: 'TaskName',
    startDate: 'StartDate',
    progress: 'Progress',
    duration: 'Duration',
    dependency: 'Predecessor',
    child: 'SubTasks'
  },
  projectStartDate: new Date('02/24/2019'),
  projectEndDate: new Date('07/20/2019')
});

gantt.appendTo('#Gantt');
let button = document.createElement('button');
button.textContent = 'Bind Data';
gantt.element.parentNode.insertBefore(button, gantt.element);
button.addEventListener("click", function(e) {
  let ajax = new
ej.base.Ajax("https://ej2services.syncfusion.com/production/web-
services/api/GanttData", "GET");
  gantt.showSpinner();
  ajax.send();
  ajax.onSuccess = function (data) {
    gantt.hideSpinner();
    gantt.dataSource = (JSON.parse(data)).Items;
  };
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

Split task

The **Split-task** feature allows you to split a task or interrupt the work during planned or unforeseen circumstances. We can split the task either in load time or dynamically, by defining the segments either in hierarchical or self-referential way.

Hierarchical

To split a task at load time in hierarchical way, we need to define the segment details in datasource and this field should be mapped by using the [taskFields.segments](#) property.

```
`ts
```

```
[
{
```

```
TaskID: 1, TaskName: 'Identify Site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress:
50,
```

```
Segments: [
```

```
{ StartDate: new Date("04/02/2019"), Duration: 2 },
```

```
{ StartDate: new Date("04/04/2019"), Duration: 2 }
```

```
]
```

```
}
```

```
]
```

```
,
```

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
```

```

        dataSource: GanttData,
        height: "450px",
        taskFields: {
            id: "TaskID",
            name: "TaskName",
            startDate: "StartDate",
            endDate: "EndDate",
            duration: "Duration",
            progress: "Progress",
            child: "subtasks",
            segments: "Segments"
        },
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Self-referential

We can also define segment details as a flat data and this collection can be mapped by using [segmentData](#) property. The segment id field of this collection is mapped by using the [taskFields.segmentId](#) property.

`ts

```
taskFields: {
segmentId: "segmentId"
},
segmentData: [
{ segmentId: 1, StartDate: new Date("02/04/2019"), Duration: 2 },
{ segmentId: 1, StartDate: new Date("02/05/2019"), Duration: 5 },
{ segmentId: 4, StartDate: new Date("04/02/2019"), Duration: 2 },
{ segmentId: 4, StartDate: new Date("04/04/2019"), Duration: 2 }
],
`
```

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: SplitTaskData,
  height: "450px",
  taskFields: {
    id: "TaskID",
    name: "TaskName",
    startDate: "StartDate",
    endDate: "EndDate",
    duration: "Duration",
    progress: "Progress",
    child: "subtasks",
    segmentId: "segmentId"
  },
  segmentData: [
    { segmentId: 2, StartDate: new Date("04/02/2019"), Duration: 2 },
    { segmentId: 2, StartDate: new Date("04/04/2019"), Duration: 2 },
    { segmentId: 4, StartDate: new Date("04/02/2019"), Duration: 2 },
    { segmentId: 4, StartDate: new Date("04/04/2019"), Duration: 2 }
  ],
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: Segment id field contains id of a task which should be splitted at load time.

Limitations

Gantt has the support for both Hierarchical and Self-Referential data binding. When rendering the Gantt control with SQL database, we suggest you to use the Self-Referential data binding to maintain the parent-child relation. Because the complex json structure is very difficult to manage it in SQL tables, we need to write a complex queries and we have to write a complex algorithm to find out the proper record details while updating/deleting the inner level task in Gantt data source. We cannot implement both data binding for Gantt control and this is not a recommended way. If both child and parentID are mapped, the records will not render properly because, when task id of a record defined in the hierarchy structure is assigned to parent id of another record, in such case the records will not properly render. As the self-referential will search the record with particular id in flat data only, not in the inner level of records. If we map the parentID field, it will be prioritized and Gantt will be rendered based on the parentID values.

Immutable in ##Platform_Name## Gantt control

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    enableImmutableMode: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },

```

```

        toolbar: ['Add', 'Edit', 'Delete', 'Update',
        'Cancel', 'Indent', 'Outdent'],
        editSettings: {
            allowAdding: true,
            allowEditing: true,
            allowDeleting: true,
            allowTaskbarEditing: true,
            showDeleteConfirmDialog: true
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
    rel="stylesheet" type="text/css">

    <style>
        .e-gantt .e-gantt-chart .e-custom-holiday {
            background-color: #e82869;
        }
    </style>
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Limitations

The following features are not supported in the immutable mode:

- Column reorder
- Virtualization

Virtual scroll in ##Platform_Name## Gantt control

Virtual Scroll support in Gantt allows you to load large amount of data without performance degradation. To enable Virtual Scrolling, you need to inject `VirtualScroll` module in Gantt.

Row virtualization

Row virtualization allows you to load and render a large number of tasks in Gantt with effective performance. In this mode, all tasks are fetched initially from the datasource and rendered in the DOM within a compact viewport area.

The number of records displayed in the Gantt is determined by the height.

This mode can be enable by setting the `enableVirtualization` property to `true`.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: virtualData,
  treeColumnIndex: 1,
  height: '450px',
  allowSelection: true,
  highlightWeekends: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    parentID: 'parentID'
  },
  enableVirtualization: true,
  columns: [
    { field: 'TaskID' },
    { field: 'TaskName' },
    { field: 'StartDate' },
    { field: 'Duration' },
    { field: 'Progress' }
  ],
  labelSettings: {
    taskLabel: 'Progress'
  },
  gridLines: 'Both',
  splitterSettings: {
    columnIndex: 2
  },
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```

<title>EJ2 Gantt</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript Gantt Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Timeline virtualization

Timeline virtualization allows you to load a data source having large timespan with high performance. Initially, it renders the timeline with thrice the width of the gantt element, while other timeline cells render on-demand during horizontal scrolling.

This mode can be enable by setting the [enableTimelineVirtualization](#) property to `true`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: virtualData,
    treeColumnIndex: 1,
    height: '450px',
    allowSelection: true,
    highlightWeekends: true,
    taskFields: {
        id: 'TaskID',

Get filtered data when virtual scrolling is enabled

While enabling virtual scroll you can get the filtered or sorted record count using `filteredResult` from the `filterModule` of the treegrid inside the `actionComplete` event.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection,ej.gantt.Sort,ej.gantt.Filter);
var filteredCount = 0;
var datasetCount;
var ganttChart = new ej.gantt.Gantt({
    dataSource: virtualData,
    treeColumnIndex: 1,
    height: '450px',
    allowSelection: true,
    highlightWeekends: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        parentID: 'parentID'
    },
    enableVirtualization: true,
    allowSorting: true,
    allowFiltering: true,
    actionComplete: function (args) {
        if (args.requestType == 'filtering') {
            if (args.rows != null) {
                filteredCount =
                    ganttChart.treeGrid.filterModule.filteredResult.length;
                var combinedMessage = `Dataset Count: ${datasetCount}
Filtered Count: ${filteredCount}`;
                var countElement = document.getElementById('count-
element');
                if (countElement) {
                    countElement.textContent = combinedMessage;
                }
            }
        }
    },
    created: function() {
        datasetCount = ganttChart.flatData.length;
        var combinedMessage = `Dataset Count: ${datasetCount} Filtered
Count: ${filteredCount}`;
        var countElement = document.getElementById('count-element');
        if (countElement) {
            countElement.textContent = combinedMessage;
        }
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName' },
        { field: 'StartDate' },
    ],
});
```

```

```

Limitations for virtual vcroll

- Due to the element height limitation in browsers, the maximum number of records loaded is limited by the browser capacity.
- Cell selection will not be persisted.

- The number of records rendered will be determined by the `height` property.
- It is necessary to mention the height of the Gantt in pixels when enabling Virtual Scrolling.
- Virtual Scroll does not support Multi Taskbar support in Resource View.

Selection

Selection in `##Platform_Name##` Gantt control

Selection provides an option to highlight a row or a cell. It can be done using arrow keys or by scrolling down the mouse. To disable selection in the Gantt control, set the [allowSelection](#) to false.

To select data, inject the [Selection](#) module into the Gantt control.

The Gantt control supports two types of selection that can be set by using the [selectionSettings.type](#) property. They are:

- **Single:** Sets a single value by default and allows only selection of a single row or a cell.
- **Multiple:** Allows you to select multiple rows or cells. To perform the multi-selection, press and hold the CTRL key and click the desired rows or cells.

Selection mode

The Gantt control supports three types of selection modes that can be set by using the [selectionSettings.mode](#). They are:

- **Row:** Allows you to select only rows, and the row value is set by default.
- **Cell:** Allows you to select only cells.
- **Both:** Allows you to select rows and cells at the same time.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  selectionSettings: {
    mode: 'Both'
  }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Toggle selection

The toggle selection allows you to select and deselect a specific row or cell. To enable toggle selection, set the `enableToggle` property of the `selectionSettings` to `true`. If you click the selected row or cell, then it will be deselected and vice versa. By default, the `enableToggle` property is set to `false`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple',
        enableToggle: true
    }
});
ganttChart.appendTo('#Gantt');
var toggleBtn = new ej.buttons.Button();
toggleBtn.appendTo('#toggle');

```

```
document.getElementById('toggle').addEventListener('click', () => {
    gantt.selectionSettings.enableToggle = false;
});
```

INDEX.HTML

</body></html>
```

Clear selection

You can clear the selected cells and selected rows by using a method called [clearSelection](#). The following code example demonstrates how to clear the selected rows in Gantt Chart.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  }
});
```

```

    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple',
    }
});
gantChart.appendTo('#Gantt');
var selBtn= new ej.buttons.Button();
selBtn.appendTo('#selectRows');
let clrBtn = new ej.buttons.Button();
clrBtn.appendTo('#clearSelection');
document.getElementById('selectRows').addEventListener('click', () => {
    gantChart.selectionModule.selectRows([1,2,3]); // passing the
    record index as array collection
});
document.getElementById('clearSelection').addEventListener('click', () => {
    gantChart.clearSelection(); // Clear the selected rows
});

```

INDEX.HTML

```

Get selected row indexes and records

You can get the selected row indexes by using the [getSelectedRowIndexes](#) method. And by using [getSelectedRecords](#) method, you can get the selected record details.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  selectionSettings: {
    mode: 'Row',
    type: 'Multiple'
  },
  rowSelected: rowSelected
});
ganttChart.appendTo('#Gantt');
function rowSelected(args) {
  var selectedrowindex =
ganttChart.selectionModule.getSelectedRowIndexes(); // get the selected row
indexes.
  alert(selectedrowindex); // to alert the selected row indexes.
  var selectedrecords = ganttChart.selectionModule.getSelectedRecords();
// get the selected records.
  console.log(selectedrecords); // to print the selected records in
console window.
}
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>

```

Multiple Selection based on condition

You can select multiple rows based on condition by using the [selectRows](#) method.

In the following code, the rows which contains **TaskId** value as 3 and 4 are selected at initial rendering.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple'
    },
    dataBound: function(args) {
        var rowIndexes = [];
        ganttChart.treeGrid.grid.dataSource.forEach((data, index) => {
            if (data.TaskID === 3 || data.TaskID === 4) {
                rowIndexes.push(index);
            }
        });
        ganttChart.selectRows(rowIndexes);
    }
});
ganttChart.appendTo('#Gantt');

```

Row selection in ##Platform_Name## Gantt control

The row selection in the Gantt control can be enabled or disabled using the [allowSelection](#) property. You can get the selected row object using the [getSelectedRecords](#) method. The following code example shows how to disable the row selection in Gantt.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  allowSelection: false
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Row selection is the default type of Gantt selection mode.

Selecting a row on initial load

You can select a row at the time of loading by setting the index of the row to the [selectedRowIndex](#) property. Find the following code example for details.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  selectedRowIndex: 3,
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <div id="container">
    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Selecting a row dynamically

You can also select a row dynamically using the [selectRow](#) method. The following code demonstrates how to select a row dynamically by clicking the custom button.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  }
});
ganttChart.appendTo('#Gantt');
var selectBtn= new ej.buttons.Button();
selectBtn.appendTo('#selectRow');
document.getElementById('selectRow').addEventListener('click', () => {

```

```
ganttChart.selectionModule.selectRow(2); // passing the record index to
select the row
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Multiple row selection

You can select multiple rows by setting the [selectionSettings.type](#) property to `multiple`. You can select more than one row by holding down the CTRL key while selecting multiple rows. The following code example explains how to enable multiple selection in Gantt.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
```

```

        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple'
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

Selecting multiple rows dynamically

You can also select rows dynamically using the [selectRows](#) method. The following code demonstrates how to select rows dynamically by clicking the custom button.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Row',
        type: 'Multiple',
    }
});
gantChart.appendTo('#Gantt');
var selBtn= new ej.buttons.Button();
selBtn.appendTo('#selectRows');
document.getElementById('selectRows').addEventListener('click', () => {
    gantChart.selectionModule.selectRows([1,2,3]); // passing the
    record index as array collection
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>

    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize row selection action

While selecting a row in Gantt, the [rowSelecting](#) and [rowSelected](#) events will be triggered. The [rowSelecting](#) event will be triggered on initialization of row selection, and you can get the previously

selected row and current selecting row's information, which is used to prevent selection of a particular row. The [rowSelected](#) event will be triggered on completion of row selection action, and you can get the current selected row's information through this event. The following code example demonstrates how to prevent the selection of a row using the [rowSelecting](#) event.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    rowSelecting: function(args) {
        if (args.data.TaskID==4) {
            args.cancel=true;
        }
    },
    selectionSettings: {
        mode: 'Row'
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
```

```

if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In the Gantt control, when you click an already selected row, selection will be cleared. While deselecting a row in Gantt, the [rowDeselecting](#) and [rowDeselected](#) events will occur. The [rowDeselecting](#) event will occur on initialization of deselecting row, and you can get the current deselecting row's information to prevent the deselection of particular row. The [rowDeselected](#) event will occur on completion of row deselection action, and you can get the current deselected row's information.

Cell selection in ##Platform_Name## Gantt control

You can select a cell in the Gantt control by setting the [selectionSettings.mode](#) property to cell. You can get the selected cell information using the [getSelectedRowCellIndexes](#) method. This method returns the result as an object collection, which has [cellIndexes](#) and [rowIndex](#) information of the selected cells.

Find the code example below to enable the cell selection in Gantt.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Cell'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Selecting multiple cells

You can select multiple cells by setting the [selectionSettings.type](#) property to multiple and the [selectionSettings.mode](#) property to cell. Multiple cells can be selected by holding the CTRL key and selecting the cells. The following code example demonstrates how to select multiple cells.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Cell',
        type: 'Multiple'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Selecting a cell dynamically

You can select a cell dynamically using the [selectCell](#) method. Refer to the following code example for details.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    selectionSettings: {
        mode: 'Cell'
    }
});
ganttChart.appendTo('#Gantt');
var cellBtn= new ej.buttons.Button();
cellBtn.appendTo('#selectCell');
document.getElementById('selectCell').addEventListener('click', () => {
    ganttChart.selectionModule.selectCell({ cellIndex: 1, rowIndex: 1
});
});

```

INDEX.HTML

```

Customize cell selection action

While selecting a cell in Gantt, the [cellSelecting](#) and [cellSelected](#) event will be triggered. The [cellSelecting](#) event will be triggered on initialization of cell selection action, and you can get the current selecting cell information to prevent the selection of a particular cell in a particular row. The [cellSelected](#) event will be triggered on completion of cell selection action, and you can get the current selected cell's information. The following code example demonstrates how to prevent the selection of the cell using the [cellSelecting](#) event.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    cellSelecting: function(args) {
        if (args.data.TaskID==4 && args.cellIndex.cellIndex==1) {

```

```

        args.cancel=true;
    }
    },
    selectionSettings: {
        mode: 'Cell'
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>
```

Filtering

Filtering in ##Platform_Name## Gantt control

Filtering allows you to view specific or related records based on filter criteria. This can be done in the Gantt control by using the filter menu support and toolbar search support. To enable filtering in the Gantt control, set the [allowFiltering](#) to true. Menu filtering support can be configured using the [filterSettings](#) property and toolbar searching can be configured using the [searchSettings](#) property.

To use filter, inject the [Filter](#) module into the Gantt control.

Filter hierarchy modes

The Gantt supports a set of filtering modes with the [filterSettings.hierarchyMode](#) property. The following are the types of filter hierarchy modes available in the Gantt control:

- **Parent:** This is the default filter hierarchy mode in Gantt. The filtered records are displayed with its parent records. If the filtered records do not have any parent record, then only the filtered records will be displayed.
- **Child:** Displays the filtered records with its child record. If the filtered records do not have any child record, then only the filtered records will be displayed.
- **Both:** Displays the filtered records with its both parent and child records. If the filtered records do not have any parent and child records, then only the filtered records will be displayed.
- **None:** Displays only the filtered records.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowFiltering: true
});
ganttChart.appendTo('#Gantt');
var dropDownMode = new ej.dropdowns.DropDownList({
    dataSource: [
        { id: 'Parent', mode: 'Parent' },
        { id: 'Child', mode: 'Child' },
        { id: 'Both', mode: 'Both' },
        { id: 'None', mode: 'None' },
    ],
    fields: { text: 'mode', value: 'id' },
    value: 'Parent',
    change: function (e) {
        var mode = e.value;
        ganttChart.filterSettings.hierarchyMode = mode;
        ganttChart.clearFiltering();
    }
});
dropDownMode.appendTo('#mode');
```

INDEX.HTML

</body></html>

```

Initial filter

To apply the filter at initial rendering, set the filter to `predicate` object in the `filterSettings.columns` property.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    filterSettings: {
        columns: [{ field: 'TaskName', matchCase: false, operator:
'startswith', predicate: 'and', value: 'Identify' },
        { field: 'TaskID', matchCase: false, operator: 'equal',
predicate: 'and', value: 2 } ]
    },
    allowFiltering: true
});

```

```
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Filter operators

The filter operator for a column can be defined in the `filterSettings.columns.operator` property.

The available operators and its supported data types are:

Operator	Description	Supported Types
startswith	Checks whether the value begins with the specified value.	String
endswith	Checks whether the value ends with the specified value.	String
contains	Checks whether the value contains the specified value.	String
equal	Checks whether the value is equal to the specified value.	String | Number | Boolean | Date
notequal	Checks for the values that are not equal to the specified value.	String | Number | Boolean | Date
greaterthan	Checks whether the value is greater than the specified value.	Number | Date

greaterthanorequal | Checks whether the value is greater than or equal to the specified value. | Number | Date

lessthan | Checks whether the value is less than the specified value. | Number | Date

lessthanorequal | Checks whether the value is less than or equal to the specified value. | Number | Date

By default, the `filterSettings.columns.operator` value is **equal**

Diacritics

By default, the Gantt control ignores the diacritic characters while filtering. To include diacritic characters, set the `filterSettings.ignoreAccent` to true.

In the following sample, type **Perform** in the **TaskName** column to filter diacritic characters.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter);
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            {TaskID: 2, TaskName: 'Identify site location', StartDate: new
Date('04/02/2019'), Duration: 0, Progress: 50 },
            {TaskID: 3, TaskName: 'Perform soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            {TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 0, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            {TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50, resources:
[4]},
            {TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50},
            {TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0, Progress: 50 }
        ]
    }
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
```

```

        progress: 'Progress',
        child: 'subtasks'
    },
    filterSettings: {
        ignoreAccent: true
    },
    allowFiltering: true
});
gantChart.appendTo('#Gantt');
```

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Filtering a specific column by method

You can filter the columns dynamically by using the [filterByColumn](#) method.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
```

```

        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowFiltering: true
});
gantChart.appendTo('#Gantt');
var filterBtn= new ej.buttons.Button();
filterBtn.appendTo('#filter');
document.getElementById('filter').addEventListener('click', function() {
    gantChart.filterByColumn('TaskName','startswith','Iden');
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">

        <button id="filter">Filter TaskName column</button>
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Clear filtered columns

You can clear all the filtering condition done in the Gantt control by using the [clearFiltering](#) method.

The following code snippet explains the above behavior.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowFiltering: true,
    filterSettings: {
        columns: [{ field: 'TaskName', matchCase: false, operator:
'startswith', predicate: 'and', value: 'Identify' },
        { field: 'Progress', matchCase: false, operator: 'equal',
predicate: 'and', value: 50 }]}
    });
ganttChart.appendTo('#Gantt');
var filterBtn = new ej.buttons.Button();
filterBtn.appendTo('#clearFilter');
document.getElementById('clearFilter').addEventListener('click', function()
{
    ganttChart.clearFiltering();
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"

type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <button id="clearFilter">Clear Filter</button>
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');

```

```

if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Filter menu in ##Platform_Name## Gantt control

The Gantt control provides the menu filtering support for each column. You can enable the filter menu by setting the [allowFiltering](#) to `true`. The filter menu UI will be rendered based on its column type, which allows you to filter data. You can filter the records with different operators.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    filterSettings: {
        type: 'Menu'
    },
    allowFiltering: true
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

```

```

    <div id="container">
        <div id="Gantt"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The [allowFiltering](#) property should be set to **true** to enable the filter menu.

Setting the [columns.allowFiltering](#) property to **false** prevents rendering filter menu for a particular column.

Custom component in filter menu

The [column.filter.ui](#) is used to add custom filter components to a particular column.

To implement custom filter ui, define the following functions:

- **create**: Creates custom component.
- **write**: Wire events for custom component.
- **read**: Read the filter value from custom component.

In the following sample, dropdown is used as custom component in the TaskName column.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName', filter: {
            ui: {
                create: function(args) {
                    var db = new
ej.data.DataManager(ganttChart.treeGrid.grid.dataSource);
                    var flValInput = ej.base.createElement('input', {
className: 'flm-input' });
                    args.target.appendChild(flValInput);
                    this.dropInstance = new ej.dropdowns.DropDownList({
                        dataSource: new
ej.data.DataManager(ganttChart.treeGrid.grid.dataSource),

```

```

        fields: { text: 'TaskName', value: 'TaskName' },
        placeholder: 'Select a value',
        popupHeight: '200px'
    });
    this.dropInstance.appendTo(flValInput);
},
write: function(args){
    this.dropInstance.value = args.filteredValue;
},
read: function(args) {
    args.fltrObj.filterByColumn(args.column.field,
args.operator, this.dropInstance.value);
}
}
},
{ field: 'StartDate' },
{ field: 'Duration' }
],
allowFiltering: true
});
gantChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Excel like filter in ##Platform_Name## Gantt control

You can enable Excel like filter by defining [filterSettings.type](#) as **Excel**. The excel menu contains an option such as Sorting, Clear filter, Sub menu for advanced filtering.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  filterSettings: {
    type: 'Menu'
  },
  allowFiltering: true
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Searching in ##Platform_Name## Gantt control

You can search records in the Gantt control by using the [search](#) method with search key as a parameter. The Gantt control provides an option to integrate the search text box in the toolbar by adding the search item to the [toolbar](#) property.

To search records, inject the **Filter** module into the Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbar: ['Search']
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>

```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Initial search

In the Gantt control, you can load a task with some search criteria and this can be done by using the [searchSettings](#) property. To apply search at initial rendering, set the value for [fields](#), [operator](#), [key](#), and [ignoreCase](#) in the [searchSettings](#) property.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbar: ['Search'],
    searchSettings: { fields: ['TaskName'], operator:
'contains', key: 'List', ignoreCase: true }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
```

```

    <div id="container">
      <div id="Gantt"></div>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, Gantt searches all the bound column values. To customize this behavior, define the [searchSettings.fields](#) property.

Search operators

The search operator can be defined in the [searchSettings.operator](#) property to configure specific searching.

The following operators are supported in searching:

Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with the specified value.

contains | Checks whether a value contains the specified value.

equal | Checks whether a value is equal to the specified value.

notEqual | Checks for the values that are not equal to the specified value.

By default, the [searchSettings.operator](#) value is `contains`.

Search by external button

To search the Gantt records from an external button, invoke the [search](#) method.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  allowFiltering: true
});
ganttChart.appendTo('#Gantt');
var searchBtn= new ej.buttons.Button();
searchBtn.appendTo('#search');

```

```
document.getElementById('search').addEventListener('click', function() {
    var searchText = document.getElementsByClassName('searchtext')[0].value;
    ganttChart.search(searchText);
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: You should set the [allowFiltering](#) property to `true` for searching the content externally.

Search specific columns

By default, the Gantt control searches all the columns. You can search specific columns by defining the specific column's field names in the [searchSettings.fields](#) property.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
```

```

        dataSource: GanttData,
        height: '450px',
        columns: [
            { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
            { field: 'TaskName', headerText: 'Task Name', width: '200' },
            { field: 'StartDate', headerText: 'Start Date', width: '150' },
            { field: 'Duration', headerText: 'Duration', width: '150' },
            { field: 'Progress', headerText: 'Progress', width: '150' },
        ],
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        toolbar: ['Search'],
        searchSettings: { fields: ['TaskName', 'Duration']}
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

}
    </script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

In above sample, you can search only **TaskName** and **Duration** column values.

Clear search by external button

You can set [searchSettings.key](#) property as **empty** string, to clear the searched Gantt records from external button.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width:
'100' },
    { field: 'TaskName', headerText: 'Task Name', width: '250' },
    { field: 'StartDate', headerText: 'Start Date', width: '150' },
    { field: 'Duration', headerText: 'Duration', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
  ],
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  toolbar: ['Search'],
  searchSettings: { fields: ['TaskName'], operator: 'contains', key:
'Perform', ignoreCase: true },
});
ganttChart.appendTo('#Gantt');
var clearBtn= new ej.buttons.Button();
clearBtn.appendTo('#changeByPosition');
document.getElementById('clear').addEventListener('click', function() {
  ganttChart.searchSettings.key='';
});
```

INDEX.HTML

```

```

Task dependency in ##Platform_Name## Gantt control

Task dependency or task relationship can be established between two tasks in Gantt. This dependency affects the project schedule. If you change the predecessor of a task, it will affect the successor task, which will affect the next task, and so on. Relationship can be established between parent-parent tasks, child-child tasks, parent-child and child-parent task.

In Gantt, you can enable or disable the parent predecessor using [allowParentDependency](#) property.

By default, the `allowParentDependency` property will be `true`.

Task relationship types

Task relationships are categorized into four types based on the start and finish dates of the task.

Start to Start (SS)

You cannot start a task until the dependent task also starts.

Start to Finish (SF)

You cannot finish a task until the dependent task is started.

Finish to Start (FS)

You cannot start a task until the dependent task is completed.

Finish to Finish (FF)

You cannot finish a task until the dependent task is completed.

Define task relationship

Task relationship is defined in the data source as a string value, and this value is mapped to the Gantt control by using the [taskFields.dependency](#) property. The following code example demonstrates how to enable the predecessor in the Gantt control.

INDEX.JS

```
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
```

```

        name: 'TaskName',
        startDate: 'StartDate',
        dependency: 'Predecessor',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    }
    });
    ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Predecessor offset with duration units

In the Gantt control, the predecessor offset can be defined with the following duration units:

- Day
- Hour
- Minute

You can define an offset with various offset duration units for predecessors by using the following code example.

INDEX.JS

```

var ganttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"2FS+2days", Progress: 50 },
            { TaskID: 5, TaskName: 'Clear the building
site', StartDate: new Date('04/04/2019'), Duration: 2, Progress: 30,
Predecessor: '4FF+960m'}
        ]
    },
    {
        TaskID: 6,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 7, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 9, TaskName: 'Estimation approval', StartDate: new
Date('04/06/2019'), Duration: 0,Predecessor:"7SS+16h", Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: ganttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        dependency: 'Predecessor',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'Predecessor', headerText: 'Dedependency', width:
'150'},
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date',
width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
    ]
});

```

```

        { field: 'Progress', headerText: 'Progress', width: '150' }
    ];
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Disabling automatic dependency offset updates

By default, the dependency offsets are automatically updated in the Gantt chart whenever a task's start or end date is changed. However, if you want to disable this feature, you can do so by disabling the [updateOffsetOnTaskbarEdit](#) property. Once this property is disabled, you can only update the offset value by editing the predecessor column cell or the offset column in the dependency tab of the edit dialog.

INDEX.JS

```

var ganttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
```

```

        { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"2FS+2days", Progress: 50 },
        { TaskID: 5, TaskName: 'Clear the building
site', StartDate: new Date('04/04/2019'), Duration: 2, Progress: 30,
Predecessor: '4FF+960m'}
    ]
},
{
    TaskID: 6,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 7, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 9, TaskName: 'Estimation approval', StartDate: new

Validate predecessor links on editing

In Gantt, task relationship link can be broken by editing the start date, end date and duration value of task. When the task relationship broken on any edit action. This can be handled in Gantt in two ways.

- Using actionBegin event
- Using predecessor validation dialog

Using actionBegin event

When the task relationship link is broken on any edit action, then the [actionBegin](#) event will be triggered with `requestType` argument as `validateLinkedTask`. You can validate the editing action within the `actionBegin` event using the `validateMode` event argument. The `validateMode` event argument has the following properties:

Argument	Default value	Description
<code>args.validateMode.respectLink</code>	<code>false</code>	In this validation mode, the predecessor links get high priority. With this mode enabled, when the successor task is moved before the predecessor task's end date, the editing will be reverted, and dates will be validated based on the dependency links.
<code>args.validateMode.removeLink</code>	<code>false</code>	In this validation mode, the taskbar editing gets high priority. For inappropriate task dates, the dependency links will be removed and tasks will be moved to the edited date.

`args.validateMode.preserveLinkWithEditing | true` | In this validation mode, the taskbar editing will be considered along with the dependency links. This relationship will be maintained by updating the offset value of predecessors.

By default, the `preserveLinkWithEditing` validation mode will be enabled, so the predecessors are updated with offset values.

The following sample explains enabling the `respectLink` validation mode while editing the linked tasks in the [actionBegin](#) event.

INDEX.JS

```
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Predecessor: "2FS", Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0, Predecessor: "6SS", Progress: 50 }
        ]
    }
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        dependency: 'Predecessor',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    editSettings: {
        allowTaskbarEditing: true
    }
});
```

```

        },
        actionBegin: function (args) {
            if (args.requestType == "validateLinkedTask") {
                args.validateMode.respectLink = true;
            }
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Using validation dialog

When disabling all the validation modes in the [actionBegin](#) event, a validation pop-up will be displayed prompting users to select the validation mode to validate taskbar editing.

This validation pop-up will display different options based on the successor task's start date after editing.

If you move the successor task that starts after the predecessor task's end date, then a dialog will be rendered with the following options:

- Cancel, Keep the existing link.

- Remove the link and move the task to start on edited date.
- Move the task to start on edited date and keep the link.

If you move the successor task that starts before the predecessor task's end date, then a dialog will be rendered with the following options:

- Cancel, Keep the existing link.
- Remove the link and move the task to start on edited date.

The following code example shows how to enable the predecessor validation dialog in Gantt.

INDEX.JS

```
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        dependency: 'Predecessor',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
});
```

```

    },
    editSettings:{
        allowTaskbarEditing:true
    },
    actionBegin:function(args){
        if (args.requestType == "validateLinkedTask") {
            args.validateMode.preserveLinkWithEditing = false;
        }
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Sorting in ##Platform_Name## Gantt control

Sorting enables you to sort data in the ascending or descending order. To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable sorting in the Gantt control, set the [allowSorting](#) property to true. Sorting options can be configured through the [sortSettings](#) property.

To sort, inject the [Sort](#) module into the Gantt control.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Sort);
var editingData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: editingData,
    height: '450px',
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    allowSorting: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

* Gantt columns are sorted in the ascending order. If you click the already sorted column, the sort direction toggles.

* To disable sorting for a particular column, set the [columns.allowSorting](#) property to false.

Sorting column on Gantt initialization

The Gantt control can be rendered with sorted columns initially, and this can be achieved by using the [sortSettings](#) property. You can add columns that are sorted initially in the [sortSettings.columns](#) collection defined with [field](#) and [direction](#) properties. The following code example shows how to add the sorted column to Gantt initialization.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Sort);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',

```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    sortSettings: { columns: [{ field: 'TaskID', direction:
'Ascending' }, { field: 'TaskName', direction: 'Ascending' }] },
    allowSorting: true
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Sorting column dynamically

Columns in the Gantt control can be sorted dynamically using the [sortColumn](#) method. The following code example demonstrates how to invoke the [sortColumn](#) method by clicking the custom button.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Sort);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
```

```

        allowSorting: true,
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        }
    });
    ganttChart.appendTo('#Gantt');
    var sortBtn= new ej.buttons.Button();
    sortBtn.appendTo('#sortColumn');
    document.getElementById('sortColumn').addEventListener('click', () => {
        var ganttObj= document.getElementById('Gantt').ej2_instances[0];
        ganttObj.sortModule.sortColumn('TaskName', "Descending", false)
    });

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <button id="sortColumn">Sort TaskName Column</button>

    <div id="container">
        <div id="Gantt"></div>
    </div>
    <script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Clear all the sorted columns dynamically

In the Gantt control, you can clear all the sorted columns and return to previous position using the [clearSorting](#) public method. The following code snippet shows how to clear all the sorted columns by clicking the custom button.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Sort);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    sortSettings: { columns: [{ field: 'TaskID', direction:
'Ascending' }, { field: 'TaskName', direction: 'Ascending' }] },
    allowSorting: true
});
ganttChart.appendTo('#Gantt');
var clrBtn= new ej.buttons.Button();
clrBtn.appendTo('#clearSorting');
document.getElementById('clearSorting').addEventListener('click', () => {
    ganttChart.clearSorting();
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <button id="clearSorting">Clear Sorting</button>

    <div id="container">
        <div id="Gantt"></div>
    </div>
</body>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Sorting events

During the sort action, the Gantt control triggers two events. The [actionBegin](#) event triggers before the sort action starts, and the [actionComplete](#) event triggers after the sort action is completed.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Sort);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowSorting: true,
    actionBegin: actionHandler,
    actionComplete: actionHandler
});
ganttChart.appendTo('#Gantt');
function actionHandler(args) {
    alert(args.requestType + ' ' + args.type); //custom Action
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

```

```

    <div id="container">
      <div id="Gantt"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The `args.requestType` is the current action name. For example, for sorting the `args.requestType`, value is **sorting**.

Sorting Custom Columns

In Gantt, you can sort custom columns of different types like string, numeric, etc., By adding the custom column in the column collection,

you can perform initial sort using the `sortSettings` or you can also sort the column dynamically by a button click.

The following code snippets explains how to achieve this.

INDEX.JS

```

var GanttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
      { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50, /*CustomColumn:
'BCustomColumn'*/ CustomColumn: '2' },
      { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, /*CustomColumn:
'BCustomColumn'*/ CustomColumn: '3' },
      { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50, /*CustomColumn:
'BCustomColumn'*/ CustomColumn: '4' },
    ]
  },
  {
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
      { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50,
/*CustomColumn: 'BCustomColumn'*/ CustomColumn: '6' },
    ]
  }
]

```

```

        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, /*CustomColumn:
'BCustomColumn'*/ CustomColumn: '1' },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, /*CustomColumn:
'BCustomColumn'*/ CustomColumn: '5' }
    ]
},
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    allowSorting: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        { field: 'Progress', headerText: 'Progress' },
        { field: 'TaskName', headerText: 'Task Name' },
        { field: 'StartDate', headerText: 'Start Date' },
        { field: 'Duration', headerText: 'Duration' },
        { field: 'CustomColumn', headerText: 'CustomColumn' }
    ]
});
ganttChart.appendTo('#Gantt');
var sortBtn= new ej.buttons.Button();
sortBtn.appendTo('#sortColumn');
document.getElementById('sortColumn').addEventListener('click', () => {
    var ganttObj= document.getElementById('Gantt').ej2_instances[0];
    ganttObj.sortModule.sortColumn('CustomColumn', "Ascending", false)
});

```

INDEX.HTML

```

Baseline in ##Platform_Name## Gantt control

The baseline feature enables users to view the deviation between the planned dates and actual dates of the tasks in a project. Baseline dates or planned dates of a task may or may not be same as the actual task dates. The baseline can be enabled by setting the [renderBaseline](#) property to true and the baseline color can be changed using the [baselineColor](#) property. To render the baseline, you should map the baseline start and end date values from the data source. This can be done using the [baselineStartDate](#) and [baselineEndDate](#) properties. The following code example shows how to enable a baseline in the Gantt control.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site
location',BaselineStartDate: new Date('04/02/2019'),BaselineEndDate: new
Date('04/06/2019'), StartDate: new Date('04/02/2019'), Duration: 0,
Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil
test',BaselineStartDate: new Date('04/04/2019'),BaselineEndDate: new
Date('04/09/2019'), StartDate: new Date('04/02/2019'), Duration: 4,
Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test
approval',BaselineStartDate: new Date('04/08/2019'),BaselineEndDate: new
Date('04/12/2019'), StartDate: new Date('04/02/2019'), Duration: 4,
Progress: 50 },
        ]
    },

Timeline

Timeline in ##Platform_Name## Gantt control

In the Gantt control, timeline is used to represent the project duration as individual cells with defined unit and formats.

Timeline view modes

Gantt contains the following in-built timeline view modes:

- Hour
- Day
- Week
- Month
- Year

Timescale mode in Gantt can be defined by using [timelineViewMode](#) property and also we can define timescale mode of top tier and bottom tier by using [topTier.unit](#) and [bottomTier.unit](#) properties.

Week timeline mode

In the **Week** timeline mode, the upper part of the schedule header displays the weeks, whereas the bottom half of the header displays the days. Refer to the following code example.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: WeekData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineViewMode: 'Week'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Hour timeline mode

An **Hour** timeline mode tracks the tasks in minutes scale. In this mode, the upper schedule header displays hour scale and the lower schedule header displays its corresponding minutes.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: HourData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
});
```

```

        timelineSettings: {
            timelineViewMode: 'Hour'
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

Week start day customization

In the Gantt control, you can customize the week start day using the [weekStartDay](#) property. By default, the [weekStartDay](#) is set to 0, which specifies the Sunday as a start day of the week. But, you can customize the week start day by using the following code example.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',

```

```

        progress: 'Progress',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineViewMode: 'Week',
        weekStartDay: 3
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize automatic timescale update action

In the Gantt control, the schedule timeline will be automatically updated when the tasks date values are updated beyond the project start date and end date ranges. This can be enabled or disabled using the [updateTimescaleView](#) property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
```

```

        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
            duration: 'Duration',
        progress: 'Progress',
            child: 'subtasks'
    },
    timelineSettings: {
        updateTimescaleView: false
    },
    editSettings: {
        allowEditing: true,
        allowTaskbarEditing: true
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Top tier and bottom tier in ##Platform_Name## Gantt control

Gantt control contains two tier layout in timeline, we can customize the top tier and bottom tier using [topTier](#) and [bottomTier](#) properties. Timeline tier's unit can be defined by using [unit](#) property and [format](#) property was used to define date format of timeline cell and [count](#) property was used to define how

many unit will be combined as single cell and [formatter](#) property was used to define custom method to format the date value of timeline cell.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  timelineSettings: {
    topTier: {
      format: 'MMM',
      unit: 'Month'
    },
    bottomTier: {
      unit: 'Day'
    }
  }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Combining timeline cells

In Gantt, timeline cells in top tier and bottom tier can be combined with number of timeline units, this can be achieved by using [topTier.count](#) and [bottomTier.count](#) properties. Please refer the below sample.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: Data,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    timelineSettings: {
        timelineUnitSize: 100,
        topTier: {
            unit: 'Year'
        },
        bottomTier: {
            unit: 'Month',
            count: 6
        }
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>

```

```

<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Format value of timeline cell

In the Gantt control, you can format the value of top and bottom timeline cells using the standard date format string or the custom formatter method. This can be done using the [topTier.format](#), [topTier.formatter](#), [bottomTier.format](#) and [bottomTier.formatter](#) properties. The following example shows how to use the formatter method for timeline cells.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: Data,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    timelineSettings: {
        topTier: {
            unit: 'Month',
            count: 3,
            formatter: (date) => {
                var month = date.getMonth();
                if (month >= 0 && month <=2) {
                    return 'Q1';
                } else if (month >= 3 && month <=5) {
                    return 'Q2';
                } else if (month >= 6 && month <=8) {
                    return 'Q3';
                } else {
                    return 'Q4';
                }
            }
        },
        bottomTier: {
            unit: 'Month',
            format: 'MMM'
        }
    }
},

```

```

        projectStartDate: new Date('01/04/2019'),
        projectEndDate: new Date('12/30/2019')
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Timeline cell width

In the Gantt control, you can define the width value of timeline cell using the [timelineSettings.timelineUnitSize](#) property. This value will be set to the bottom timeline cell, and the width value of top timeline cell will be calculated automatically based on bottom tier cell width using the [topTier.unit](#) and [timelineSettings.timelineUnitSize](#) properties. Refer to the following example.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,

Zooming in ##Platform_Name## Gantt control

The zooming support provides options to increase or decrease the width of timeline cells and also provides options to change the timeline units dynamically. This support enables you to view the tasks in a project clearly from minute to decade timespan. To enable the zooming features, define the **ZoomIn**, **ZoomOut**, and **ZoomToFit** items to toolbar items collections, and this action can be performed on external actions such as button click using the [zoomIn](#), [zoomOut](#), and [fitToProject](#) built-in methods. The following zooming options are available to view the project:

Zoom in

This support is used to increase the timeline width and timeline unit from years to minutes timespan. When the **ZoomIn** icon was clicked, the timeline cell width is increased when the cell size exceeds the specified range and the timeline unit is changed based on the current zoom levels.

Zoom out

This support is used to increase the timeline width and timeline unit from minutes to years timespan. When the **ZoomOut** icon was clicked, the timeline cell width is decreased when the cell size falls behind the specified range and the timeline view mode is changed based on the current zooming levels.

Zoom to fit

This support is used to view all the tasks available in a project within available area on the chart part of Gantt. When users click the **ZoomToFit** icon, then all the tasks are rendered within the available chart container width.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },
  toolbar: ['ZoomIn', 'ZoomOut', 'ZoomToFit'],
  labelSettings: {
    leftLabel: 'TaskName'
  },
  projectStartDate: new Date('03/24/2019'),
  projectEndDate: new Date('04/28/2019')
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>

</body></html>

```

Customizing zooming levels

In Gantt, the zoom in and zoom out actions are performed based on the predefined zooming levels in the `zoomingLevels` property. You can customize the zooming actions by defining the required zooming collection to the `zoomingLevels` property.

INDEX.JS

```

var customZoomingLevels = [{
    topTier: { unit: 'Month', format: 'MMM, yy', count: 1 },
    bottomTier: { unit: 'Week', format: 'dd', count: 1 },
    timelineUnitSize: 33, level: 0,
    timelineViewMode: 'Month', weekStartDay: 0,
    updateTimescaleView: true, weekendBackground: null, showTooltip: true
},
{
    topTier: { unit: 'Month', format: 'MMM, yyyy', count: 1 },
    bottomTier: { unit: 'Week', format: 'dd MMM', count: 1 },
    timelineUnitSize: 66, level: 1,
    timelineViewMode: 'Month', weekStartDay: 0,
    updateTimescaleView: true, weekendBackground: null, showTooltip: true
},
{
    topTier: { unit: 'Month', format: 'MMM, yyyy', count: 1 },
    bottomTier: { unit: 'Week', format: 'dd MMM', count: 1 },
    timelineUnitSize: 99, level: 2,
    timelineViewMode: 'Month', weekStartDay: 0,
    updateTimescaleView: true, weekendBackground: null, showTooltip: true
},
{
    topTier: { unit: 'Week', format: 'MMM dd, yyyy', count: 1 },
    bottomTier: { unit: 'Day', format: 'd', count: 1 },
    timelineUnitSize: 33, level: 3,
    timelineViewMode: 'Week', weekStartDay: 0,
    updateTimescaleView: true, weekendBackground: null, showTooltip: true
},
{
    topTier: { unit: 'Week', format: 'MMM dd, yyyy', count: 1 },

```

```

        bottomTier: { unit: 'Day', format: 'd', count: 1 },
        timelineUnitSize: 66, level: 4,
        timelineViewMode: 'Week', weekStartDay: 0,
        updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
    {
        topTier: { unit: 'Day', format: 'E dd yyyy', count: 1 },
        bottomTier: { unit: 'Hour', format: 'hh a', count: 12 },
        timelineUnitSize: 66, level: 5,
        timelineViewMode: 'Day', weekStartDay: 0,
        updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
    {
        topTier: { unit: 'Day', format: 'E dd yyyy', count: 1 },
        bottomTier: { unit: 'Hour', format: 'hh a', count: 6 },
        timelineUnitSize: 99, level: 6,
        timelineViewMode: 'Day', weekStartDay: 0,
        updateTimescaleView: true, weekendBackground: null, showTooltip: true
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    toolbar: ['ZoomIn', 'ZoomOut', 'ZoomToFit'],
    labelSettings: {
        leftLabel: 'TaskName'
    },
    dataBound: function() {
        ganttChart.zoomingLevels = customZoomingLevels;
    },
    projectStartDate: new Date('03/24/2019'),
    projectEndDate: new Date('04/28/2019')
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Zoom action by methods

You can perform the various zoom actions dynamically or on external click action using the following methods:

- Zoom in - [zoomIn](#)
- Zoom out - [zoomOut](#)
- Fit to project - [fitToProject](#)

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    labelSettings: {
        leftLabel: 'TaskName'
    },
    projectStartDate: new Date('03/24/2019'),
    projectEndDate: new Date('04/28/2019')
});
ganttChart.appendTo('#Gantt');
var zoomInBtn= new ej.buttons.Button();
zoomInBtn.appendTo('#zoomIn');
document.getElementById('zoomIn').addEventListener('click', function() {
    ganttChart.zoomIn();

```

```

});
var zoomOutBtn= new ej.buttons.Button();
zoomInBtn.appendTo('#zoomOut');
document.getElementById('zoomOut').addEventListener('click', function() {
    ganttChart.zoomOut();
});
var fitToBtn= new ej.buttons.Button();
zoomInBtn.appendTo('#fitToProject');

```

Timezone in ##Platform_Name## Gantt control

The Gantt uses the current system time zone by default. If it needs to follow some other user-specified time zone, then the `timezone` property must be used.

Understanding date manipulation in JavaScript

The `new Date()` in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return a value such as `Wed Dec 12, 2018, 05:23:27 GMT+0530 (India Standard Time)` which indicates that the current date is December 12, 2018, and the current time is 5.23 AM on browsers following the IST timezone.

Display same time everywhere with no time difference

Setting `timezone` to UTC for Gantt will display the same time as in the database for all the users in different time zone.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
    dataSource: [
        { taskID: 1, taskName: 'Project Schedule', startDate:
new Date('02/04/2019 08:00'), endDate: new Date('03/10/2019') },
        { taskID: 2, taskName: 'Planning', startDate: new
Date('02/04/2019 08:00'), endDate: new Date('02/10/2019'), parentID: 1 },
        { taskID: 3, taskName: 'Plan timeline', startDate: new
Date('02/04/2019 08:00'), endDate: new Date('02/10/2019'), duration: 6,

CRUD operations with timezone

CRUD operations can be performed with timezone and the Gantt is rendered based on the timezone specified in the load time. All the editing actions will be done based on the user timezone, but on

database save action, we have reversed this conversion to local time and provided data to client-side events for better understanding. Refer to the following code example.

INDEX.JS

```
var gantt = new ej.gantt.Gantt({
  dataSource: [
    {
      taskID: 1,
      taskName: 'Project Schedule',
      startDate: new Date('02/04/2019 08:00'),
      endDate: new Date('03/10/2019')
    },
    {
      taskID: 2,
      taskName: 'Planning',
      startDate: new Date('02/04/2019 08:00'),
      endDate: new Date('02/10/2019'),
      parentID: 1
    },
    {
      taskID: 3,
      taskName: 'Plan timeline',
      startDate: new Date('02/04/2019 08:00'),
      endDate: new Date('02/10/2019'),
      duration: 6,
      progress: '60',
      parentID: 2
    },
    {
      taskID: 4,
      taskName: 'Plan budget',
      startDate: new Date('02/04/2019 08:00'),
      endDate: new Date('02/10/2019'),
      duration: 6,
      progress: '90',
      parentID: 2
    },
    {
      taskID: 5,
      taskName: 'Allocate resources',
      startDate: new Date('02/04/2019 08:00'),
      endDate: new Date('02/10/2019'),
      duration: 6,
      progress: '75',
      parentID: 2
    },
    {
      taskID: 6,
      taskName: 'Planning complete',
      startDate: new Date('02/06/2019 08:00'),
      endDate: new Date('02/10/2019'),
      duration: 0,
      predecessor: '3FS,4FS,5FS',
      parentID: 2
    }
  ]
});
```

```

</body></html>

```

Timezone methods

offset

This method is used to calculate the difference between the passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **number**

```

`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let timeZoneOffset: number = timezone.offset(date,"Europe/Paris");
console.log(timeZoneOffset); //-60
`

```

convert

This method is used to convert the passed date from one timezone to another.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
fromOffset	number/string	Timezone from which date needs to be converted.
toOffset	number/string	Timezone to which date needs to be converted.

Returns **Date**

```

`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.convert(date, "Europe/Paris", "Asia/Tokya");
let convertedDate1: Date = timezone.convert(date, 60, -360);
console.log(convertedDate); //2018-12-05T08:55:11.000Z
`

```

```
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
```

```
,
```

[remove](#)

This method is used to remove the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC as date object.
Timezone	String	Timezone.

Returns **Date**

```
`ts
```

```
// Assume your local timezone as IST/UTC+05:30
```

```
let timezone: Timezone = new Timezone();
```

```
let date: Date = new Date(2018,11,5,15,25,11);
```

```
let convertedDate: Date = timezone.remove(date, "Europe/Paris");
```

```
console.log(convertedDate); //2018-12-05T14:25:11.000Z
```

```
,
```

[Event markers in ##Platform_Name## Gantt control](#)

The event markers in the Gantt control is used to highlight the important events in a project. Event markers can be initialized by using the [eventMarkers](#) property, and you can define date and label for the event markers using the [day](#) and [label](#) properties. You can also customize it using the [cssClass](#) properties. The following code example shows how to add event markers in the Gantt control.

To highlight the days, inject the [DayMarkers](#) module into the Gantt control.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  eventMarkers: [
    {
      day: '04/10/2019',
      cssClass: 'e-custom-event-marker',
      label: 'Project approval and kick-off'
    }
  ]
});
```

```
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <style>
    .e-gantt .e-gantt-chart .e-custom-event-marker {
      width: 1px;
      border-left: 2px green dotted;
    }
  </style>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Displaying eventMarkers in stacked manner

When [eventMarkers](#) are given in consecutive dates and zoomToFit is performed, they may overlap. To avoid this, you can update the position of the eventMarkers in the [dataBound](#) and [actionComplete](#) events so that they are not overlapped and are visible to read.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.DayMarkers,ej.gantt.Toolbar);
function updateEventMarker() {
  document.getElementsByClassName('e-span-label')[1].style.top = '100px';
  document.getElementsByClassName('e-gantt-right-arrow')[1].style.top =
    '110px';
}
```

```

}
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks',
  },
  eventMarkers: [
    {
      day: new Date('04/02/2019'),
    },
    {
      day: new Date('04/09/2019'),
      label: 'Research phase research phase research phase',
    },
    {
      day: new Date('04/10/2019'),
      label: 'Design phase',
    },
    {
      day: new Date('05/23/2019'),
      label: 'Production phase',
    },
    {
      day: new Date('06/20/2019'),
      label: 'Sales and marketing phase',
    },
  ],
  toolbar: ['ZoomIn', 'ZoomOut', 'ZoomToFit'],
  dataBound: function () {
    updateEventMarker();
    ganttChart.fitToProject();
  },
  actionComplete: function () {
    updateEventMarker();
  },
  projectStartDate: new Date('03/24/2019'),
  projectEndDate: new Date('07/06/2019')
});
ganttChart.appendTo('#Gantt');

```

Label positions in ##Platform_Name## gantt control

The EJ2 Gantt chart offers powerful features for customizing various labels position within the chart, enabling users to present relevant project information clearly. In EJ2 Gantt chart, [labelSettings](#) feature provides three key options for label customization: [rightLabel](#), [taskLabel](#), and [leftLabel](#). Label positions can be initialized by using the [labelSettings](#) property.

The following code example shows how to add label positions in the gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: GanttData,
  resources: resourceCollection,
  viewType: 'ResourceView',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    resourceInfo: 'resources',
    work: 'work',

```

```

        child: 'subtasks'
    },
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName',
        unit: 'resourceUnit',
        group: 'resourceGroup'
    },
    columns: [
        { field: 'TaskID', visible: false },
        { field: 'TaskName', headerText: 'Name', width: 250 },
        { field: 'work', headerText: 'Work' },
        { field: 'Progress' },
        { field: 'resourceGroup', headerText: 'Group' },
        { field: 'StartDate' },
        { field: 'Duration' },
    ],
    labelSettings: {
        rightLabel: 'resources',
        leftLabel: 'TaskName',
        taskLabel: '${Progress}%'
    },
    splitterSettings: {
        columnIndex: 3
    },
    height: '450px',
    projectStartDate: new Date('03/22/2019'),
    projectEndDate: new Date('05/18/2019')
});
gantt.appendTo('#Gantt');

```

INDEX.HTML

Managing event marker overlapping in ##Platform_Name## gantt control

In the EJ2 Gantt control, it is possible to customize multiple [eventMarkers](#) for the same date. However, by default, in such scenarios, these markers may overlap each other, resulting in visual clutter. To manage this, the following sample code demonstrates how to utilize the Gantt dataBound function to obtain label and arrow classes. It performs a loop action to fulfill the current requirement and to avoid overlapping. For further clarification, the code snippet below illustrates the flow of its implementation.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    eventMarkers: [
        {
            day: '04/10/2019',
            cssClass: 'e-custom-event-marker',
            label: 'Project approval and kick-off'
        },
        {
            day: '04/10/2019',
            cssClass: 'e-custom-event-marker',
            label: 'Project approval and kick-off'
        }
    ],
    dataBound() {
        var labeltop = 100;
        var rightarrow = 110;
        for (var i = 0; i < this.eventMarkers.length; i++) {
            document.getElementsByClassName('e-span-label')[i].style.top =
            labeltop + 'px';
            document.getElementsByClassName('e-gantt-right-
            arrow')[i].style.top = rightarrow + 'px';
            labeltop = labeltop + 35;
            rightarrow = rightarrow + 35;
        }
    },
    projectStartDate: new Date('03/24/2019'),

```

```

        projectEndDate: new Date('07/06/2019')
    });
    ganttChart.appendTo('#Gantt');

```

```

Work in ##Platform_Name## Gantt control

The work is the total hours required to complete a task. Work can be mapped from the data source field using the property [taskFields.work](#). Work can be measured in Hour, Day, Minute. By default, work is measured in Hour and it can be changed, by using the property [workUnit](#).

Note: When the work field is mapped from the data source, the default task type will be FixedWork.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({

```

```

dataSource: GanttData,
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    resourceInfo: 'resources',
    work: 'work',
    child: 'subtasks'
},

</body></html>

```

Task type

The work, duration and resource unit fields of a task depends upon each other and will change automatically on editing any one of these fields. But we can also set these field's values as constant using the [taskType](#) property. **FixedUnit** is the default [taskType](#). The following values can be set to the [taskType](#) property,

- **FixedDuration** - Duration task field will remain constant while updating resource unit or work field.
- **FixedWork** - Work field will remain constant while updating resource unit or duration fields.
- **FixedUnit** - Resource units will remain constant while updating duration or work field.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    taskFields: {

Following table explains how the work, duration and resource unit fields will gets updated on changing any of the fields

Task Type | Changes in Duration | Changes in work | Changes in Resource Units

Fixed Duration | Work field updates | Resource unit updates | Work field updates

Fixed Work | Resource unit updates. Note: For manually scheduled task work will update. | Duration field updates. Note: For manually scheduled task resource unit updates. | Duration will update. Note: For manually scheduled task work field updates.

Fixed Unit | Work field updates | Duration field updates. Note: For manually scheduled task resource unit updates. | Duration will update. Note: For manually scheduled task work field updates.

Note: 1. Fixed Unit is the default taskType in Gantt. 2. The above calculations are not applicable for Milestones.

Resources in ##Platform_Name## Gantt control

In Gantt, the resources are represented by staff, equipment and materials etc. In Gantt control you can show or allocate the resources (human resources) for each task.

Resource collection

The resource collection contains details about resources that are used in the project. Resources are JSON object that contains id, name, unit and group of the resources and this collection is mapped to the Gantt control using the [resources](#) property. These resource fields are mapped to the Gantt control using the [resourceFields](#) property.

Resource fields | Description

[id](#) | This field is used to assign resources to the tasks.

[name](#) | This field is used to map the resource names. These names are displayed as one of Gantt columns and also can display as labels using the [labelSettings](#) property.

[unit](#) | It indicates the amount of work that can be done by a resource for the task in a day.

[group](#) | This field is used to group the resources and the tasks assigned to that particular resource into category.

The following code snippets shows resource collection and how it assigned to Gantt control.

```
`ts
```

```
let projectResources: object[] = resources: [
  { resourceid: 1, resourceName: 'Martin Tamer', resourceGroup: 'Planning Team', resourceUnit: 50},
  { resourceid: 2, resourceName: 'Rose Fuller', resourceGroup: 'Testing Team', resourceUnit: 70 },
  { resourceid: 3, resourceName: 'Margaret Buchanan', resourceGroup: 'Approval Team' },
  { resourceid: 4, resourceName: 'Fuller King', resourceGroup: 'Development Team' },
  { resourceid: 5, resourceName: 'Davolio Fuller', resourceGroup: 'Approval Team' },
  { resourceid: 6, resourceName: 'Van Jack', resourceGroup: 'Development Team', resourceUnit: 40 },
];
let gantt: Gantt = new Gantt({
```

```
resourceFields: {
id: 'resourceId', //resource Id Mapping
name: 'resourceName', //resource Name mapping
unit: 'resourceUnit', //resource Unit mapping
group: 'resourceGroup' //resource Group mapping
},
resources: projectResources //resource collection dataSource
});
gantt.appendTo('#Gantt');
```

Assign resource

We can assign resources for a task at initial load, using the resource id value of the resources as a collection. This collection is mapped from the dataSource to the Gantt control using the [resourceInfo](#) property.

Resources are assigned to tasks in following ways.

Assign resource alone

If the unit is not specified for specific resource, the amount of work done will be consider as 100% by default. In such cases, the resource unit will not be displayed in Gantt UI.

```
`ts
{ TaskID: 2, TaskName: 'Identify site location', StartDate: new Date('04/02/2019'), Duration: 4, Progress:
50, resources: [1] },
```

Assign resource with unit

We can assign the quantity of work done by the resources for the specific task as like below code snippet.

```
`ts
{ TaskID: 3, TaskName: 'Perform soil test', StartDate: new Date('03/29/2019'), Duration: 4,
resources: [{resourceId: 2, resourceUnit: 70}, {resourceId: 1, resourceUnit: 70}] },
```

When resource unit is defined in resource collection, the amount of work done by that particular resource will be same for all the tasks.

The following code snippet shows how to assign the resource for each task and map to Gantt control.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
```

```

        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        resourceInfo: 'resources',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID', visible: false },
        { field: 'TaskName', headerText: 'Task Name', width: '180' },
        { field: 'resources', headerText: 'Resources', width: '160' },
        { field: 'Duration', width: '100' },
    ],
    labelSettings: {
        rightLabel: 'resources'
    },
    height: '450px',
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName',
        unit: 'resourceUnit',
        group: 'resourceGroup'
    },
    resources: ProjectResources,
    splitterSettings: {
        columnIndex: 5.1
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Add/Edit resource collection

By using cell/ dialog edit option, we can add/remove the multiple resources for a particular task. Resource Unit can be change for a each task on resource tab in the edit dialog by double click on the unit cell.

Resource view in ##Platform_Name## Gantt control

The resource breakdown view is used to visualize the tasks assigned to each resource in hierarchy manner. Resources are displayed as parents and all the tasks assigned to each resource are displayed as its child records. It can be initialized by setting the [viewType](#) property to **ResourceView**.

Unassigned task

A task not assigned to any one of the resource are termed as unassigned tasks. The unassigned tasks are grouped with a name as **Unassigned Task** and displayed at the bottom of Gantt data collection . It is validated at load time during Gantt record creation by default based on a task **resourceInfo** mapping property in the Gantt chart data source. If the resource is assigned to the unassigned grouped tasks, the task will be moved as child to the respective resource.

Resource task

A task assigned to one or more resources are termed as resource task and it is added as child task to the respective resource. Already assigned task can also be shared or moved with other resources by adding a resource name to the task or removing resource name from the task by cell or dialog editing.

Note: Currently there is no support for unscheduled task in Resource view Gantt.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: GanttData,
  resources: resourceCollection,
  viewType: 'ResourceView',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    resourceInfo: 'resources',
    work: 'work',
    child: 'subtasks'
  },
  resourceFields: {
    id: 'resourceId',
    name: 'resourceName',
    unit: 'resourceUnit',
    group: 'resourceGroup'
  },
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
  columns: [
    { field: 'TaskID', visible: false },
    { field: 'TaskName', headerText: 'Name', width: 250 },
    { field: 'work', headerText: 'Work' },
    { field: 'Progress' },
  ]
});
```

```

        { field: 'resourceGroup', headerText: 'Group' },
        { field: 'StartDate' },
        { field: 'Duration' },
    ],
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
'CollapseAll'],
    labelSettings: {

```

Resource OverAllocation

When a resource is assigned too much of work to complete within a day of resource's available time then it is called as overallocation.

The available working time of resources for completing the task in a day will be calculated based on the `dayWorkingTime` property and `resource unit`.

The range of overallocation dates can be highlighted by a square bracket. It can be enabled by setting the `showOverallocation` property as `true`. The following code example demonstrates how to hide or show the over allocation by clicking the custom button.

Note: By default, the `showOverAllocation` property value is `false`.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: overAllocationData,
  resources: resources,
  viewType: 'ResourceView',
  showOverAllocation: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    resourceInfo: 'resources',
    work: 'work',
    child: 'subtasks'
  },
  resourceFields: {
    id: 'resourceId',
    name: 'resourceName',
    unit: 'resourceUnit',
    group: 'resourceGroup'
  },
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
  columns: [
    { field: 'TaskID', visible: false },
    { field: 'TaskName', headerText: 'Name', width: 250 },
    { field: 'work', headerText: 'Work' },
    { field: 'Progress' },
    { field: 'resourceGroup', headerText: 'Group' },
    { field: 'StartDate' },
    { field: 'Duration' },
  ],
  toolbarClick: function (args) {
    if (args.item.id === 'showhidebar') {
```

```

        gantt.showOverAllocation = gantt.showOverAllocation ? false
: true;
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
'CollapseAll',
    { text: 'Show/Hide Overallocation', tooltipText: 'Show/Hide
Overallocation', id: 'showhidebar' }],
    labelSettings: {
        rightLabel: 'resources',
        taskLabel: 'Progress'
    },
    projectStartDate: new Date('03/28/2019'),
    projectEndDate: new Date('05/18/2019')
});
gantt.appendTo('#Gantt');

```

INDEX.HTML

```

Resource Multi Taskbar

To visualize multiple tasks assigned to each resource in a row when the records are in the collapsed state. It can be enabled by settings the `enableMultiTaskbar` property value as `true`.

The collapse or expand action of a resource record can be achieved only by using the tree grid side arrow icon. Because it will be disabled on chart side action for this support.

When a resource has multiple tasks scheduled on the same date, then the tasks will be overlapped one another. Taskbar editing is also possible to change the task scheduling on the collapsed state.

Note: By default, the `enableMultiTaskbar` property value is `false`.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: overAllocationData,
  resources: resources,
  viewType: 'ResourceView',
  showOverAllocation: true,
  enableMultiTaskbar: true,
  collapseAllParentTasks: true,
  taskFields: {

Enable taskbar drag and drop

In Gantt, you can enable taskbar drag and drop between resources by using the [allowTaskbarDragAndDrop](#) property. This allows you to move a taskbar from one resource to another vertically, making it easier to schedule tasks and manage resources.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: overAllocationData,
  resources: resources,
  viewType: 'ResourceView',
  showOverAllocation: true,
  allowTaskbarOverlap: false,
```

```

enableMultiTaskbar: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    endDate: 'EndDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    resourceInfo: 'resources',
    work: 'work',
    expandState: 'isExpand',
    child: 'subtasks'
  },
  resourceFields: {
    id: 'resourceId',
    name: 'resourceName',
    unit: 'resourceUnit',
    group: 'resourceGroup'
  },
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
  columns: [
    { field: 'TaskID' },
    { field: 'TaskName', headerText: 'Name', width: 250 },
    { field: 'work', headerText: 'Work' },
    { field: 'Progress' },
    { field: 'resourceGroup', headerText: 'Group' },
    { field: 'StartDate' },
    { field: 'Duration' },
  ],
  toolbar: ['ExpandAll', 'CollapseAll'],
  labelSettings: {
    rightLabel: 'resources',
    taskLabel: 'TaskName'
  },
  projectStartDate: new Date('03/28/2019'),
  projectEndDate: new Date('05/18/2019')
});
gantt.appendTo('#Gantt');

```

INDEX.HTML

```

```

Disable taskbar overlap

In Gantt, you can disable taskbar overlap between resource tasks using the [allowTaskbarOverlap](#) property. This prevents the taskbars for different tasks from overlapping on the same row, making it easier to distinguish between the different tasks and manage resources effectively.

When `allowTaskbarOverlap` is set to false, the resources are displayed in a single row and the row height will be extended to occupy the tasks of the resource when it is in a collapsed state. This view allows you to easily identify any overallocation of tasks for a resource in a project.

It's important to note that when `allowTaskbarOverlap` is disabled, task dependencies or relationships cannot be established between tasks that are rendered in multiple lines for the same resource. If you need to establish dependencies between tasks for the same resource, you may want to consider enabling taskbar overlap.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
    dataSource: overAllocationData,
    resources: resources,
    viewType: 'ResourceView',
    showOverAllocation: true,
    allowTaskbarDragAndDrop: true,
    enableMultiTaskbar: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
    }
});

```

```

        progress: 'Progress',
        dependency: 'Predecessor',
        resourceInfo: 'resources',
        work: 'work',
        expandState: 'isExpand',
        child: 'subtasks'
    },
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName',
        unit: 'resourceUnit',
        group: 'resourceGroup'
    },
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName', headerText: 'Name', width: 250 },
        { field: 'work', headerText: 'Work' },
        { field: 'Progress' },
        { field: 'resourceGroup', headerText: 'Group' },
        { field: 'StartDate' },
        { field: 'Duration' }
    ],
    toolbar: ['ExpandAll', 'CollapseAll'],
    labelSettings: {
        rightLabel: 'resources',
        taskLabel: 'TaskName'
    },

Holidays in ##Platform_Name## Gantt control

Non-working days in a project can be displayed in the Gantt control using the [holidays](#) property. Each holiday can be defined with the following properties:

- [from](#): Defines start date of the holiday(s).
- [to](#): Defines end date of the holiday(s).
- [label](#): Defines the description or label for the holiday.
- [cssClass](#): Formats the holidays label in the Gantt chart.

To highlight the holidays, inject the [DayMarkers](#) module into the Gantt control.

The following code example shows how to display the non-working days in the Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    holidays: [{
        from: "04/04/2019",
        to: "04/05/2019",
        label: " Public holidays",
        cssClass: "e-custom-holiday"
    },
    {
        from: "04/12/2019",
        to: "04/12/2019",

```

```

        label: " Public holiday",
        cssClass:"e-custom-holiday"

    }]
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Tooltip in ##Platform_Name## Gantt control

The Gantt control has a support to display a tooltip for various UI elements like taskbar, timeline cells, and grid cells

Enable tooltip

In the Gantt control, you can enable or disable the mouse hover tooltip for the following UI elements using the [tooltipSettings.showTooltip](#) property:

- Taskbar
- Connector line
- Baseline
- Event marker

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);

The default value of the [tooltipSettings.showTooltip](#) property is true.

Timeline cells tooltip

In the Gantt control, you can enable or disable the mouse hover tooltip of timeline cells using the [timelineSettings.showTooltip](#) property. The default value of this property is true. The following code example shows how to enable the timeline cells tooltip in Gantt.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  timelineSettings: {
    showTooltip: true
  }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Cell tooltip

You can enable or disable the Grid cell tooltip using the [columns.clipMode](#) property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150',
clipMode: 'EllipsisWithTooltip' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width:
'150', clipMode: 'Clip' },
        { field: 'Progress', headerText: 'Progress', width: '150' }
    ]
});
ganttChart.appendTo('#Gantt');

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Clip mode

The clip mode provides options to display its overflow cell content and it can be defined by the [columns.clipMode](#) property.

The following are three types of `clipMode`:

- **Clip**: Truncates the cell content when it overflows its area.
- **Ellipsis**: Displays ellipsis when content of the cell overflows its area.
- **EllipsisWithTooltip**: Displays ellipsis when content of the cell overflows its area; it displays the tooltip content when hover over ellipsis.

NOTE

By default, all the column's [clipMode](#) property is defined as **EllipsisWithTooltip**.

Tooltip template

Taskbar tooltip

The default tooltip in the Gantt control can be customized using the [tooltipSettings.taskbar](#) property. You can map the template script element's ID value or template string directly to this property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  tooltipSettings: {
    showTooltip: true,
    taskbar: '#taskbarTooltip'
  }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Connector line tooltip

The default connector line tooltip in the Gantt control can be customized using the [tooltipSettings.connectorLine](#) property. You can map the value to this property as template script element ID or template string format. The following code example shows how to use the [tooltipSettings.connectorLine](#) property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },

```

```

        tooltipSettings: {
            showTooltip: true,
            connectorLine: '#dependencyLineTooltip'
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Taskbar editing tooltip

The taskbar editing tooltip can be customized using the [tooltipSettings.editing](#) property. The following code example shows how to customize the taskbar editing tooltip in Gantt.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {

```

```

        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true,
        allowTaskbarEditing: true
    },
    tooltipSettings: {
        showTooltip: true,
        editing: '#editingTooltip'
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Baseline tooltip

A baseline tooltip can be customized using the [tooltipSettings.baseline](#) property. The following code example shows how to customize the baseline tooltip in Gantt.

INDEX.JS

```
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', BaselineStartDate: new Date('04/02/2019'), BaselineEndDate: new Date('04/02/2019'), StartDate: new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new Date('04/02/2019'), BaselineStartDate: new Date('04/04/2019'), BaselineEndDate: new Date('04/09/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new Date('04/02/2019'), BaselineStartDate: new Date('04/08/2019'), BaselineEndDate: new Date('04/12/2019'), Duration: 4, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation', BaselineStartDate: new Date('04/04/2019'), BaselineEndDate: new Date('04/08/2019'), StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new Date('04/04/2019'), BaselineStartDate: new Date('04/02/2019'), BaselineEndDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new Date('04/02/2019'), BaselineStartDate: new Date('04/02/2019'), BaselineEndDate: new Date('04/08/2019'), Duration: 0, Progress: 50 }
        ]
    }
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
```

```

        baselineStartDate:"BaselineStartDate",
        baselineEndDate:"BaselineEndDate",
        progress: 'Progress',
        child: 'subtasks'
    },
    tooltipSettings: {
        showTooltip: true,
        baseline: '#baselineTooltip'
    },
    renderBaseline:true,
    baselineColor:'red'
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

```

Appearance customization in ##Platform_Name## Gantt control

Taskbar customization

Taskbar Height

Height of child taskbars and parent taskbars can be customized by using [taskbarHeight](#) property. The following code example shows how to use the property.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    taskbarHeight: 50,
    rowHeight: 60
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

NOTE

The [taskbarHeight](#) value should be lower than the [rowHeight](#) property value and these properties accept only pixel values.

Conditional formatting

The default taskbar UI can be replaced with custom templates using the [queryTaskbarInfo](#) event. The following code example shows customizing the taskbar UI based on task progress values in the Gantt control.

INDEX.JS

```
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 70 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 80},
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 70 }
        ]
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
});
```

```

        queryTaskbarInfo: function(args) {
            if (args.data.Progress == 50) {
                args.progressBarBgColor = "red";
            } else if (args.data.Progress == 70) {
                args.progressBarBgColor = "yellow";
            } else if (args.data.Progress == 80) {
                args.progressBarBgColor = "lightgreen";
            }
        }
    });
    ganttChart.appendTo('#Gantt');

```

Taskbar template

You can design your own taskbars to view the tasks in Gantt by using [taskbarTemplate](#) property. And it is possible to map the template script element's ID value to this property. It is also possible to customize the parent taskbars and milestones with custom templates by using [parentTaskbarTemplate](#) and [milestoneTemplate](#) properties.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({

```

```

        dataSource: GanttData,
        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        rowHeight: 60,
        milestoneTemplate: '#MilestoneTemplate',
        parentTaskbarTemplate: '#ParentTaskbarTemplate',
        taskbarTemplate: '#TaskbarTemplate'
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

Task labels

The Gantt control maps any data source fields to task labels using the [labelSettings.leftLabel](#), [labelSettings.rightLabel](#), and [labelSettings.taskLabel](#) properties. You can customize the task labels with templates.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  labelSettings: {
```

```

        leftLabel: 'TaskID',
        rightLabel: 'Task Name: ${taskData.TaskName}',
        taskLabel: '${Progress}%'
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Connector lines

The width and background color of connector lines in Gantt can be customized using the [connectorLineWidth](#) and [connectorLineBackground](#) properties. The following code example shows how to use these properties.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
```

```

        { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'),Predecessor:"3SS", Duration: 4, Progress: 50 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'),Predecessor:"7FS", Duration: 3, Progress: 50 }
    ]
},
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        dependency: 'Predecessor',
        progress: 'Progress',
        child: 'subtasks'
    },
    connectorLineBackground: "red",
    connectorLineWidth: 3
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Customize rows and cells

While rendering the TreeGrid part in Gantt, the [rowDataBound](#) and [queryCellInfo](#) events trigger for every row and cell. Using these events, you can customize the rows and cells. The following code example shows how to customize the cell and row elements using these events.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 80 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 60 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0, Progress: 50 }
        ]
    },
];

```

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        dependency: 'Predecessor',
        progress: 'Progress',
        child: 'subtasks'
    },

</body></html>

```

Grid lines

In the Gantt control, you can show or hide the grid lines in the TreeGrid side and chart side by using the [gridLines](#) property.

The following options are available in the Gantt control for rendering the grid lines:

- Horizontal: The horizontal grid lines alone will be visible.
- Vertical: The vertical grid lines alone will be visible.
- Both: Both the horizontal and vertical grid lines will be visible on the TreeGrid and chart sides.
- None: Gridlines will not be visible on TreeGrid and chart sides.

By default, the [gridLines](#) property is set to **Horizontal** type.

The following code example shows how to change the gridlines rendering mode in the Gantt control.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    gridLines: 'Both'
});
ganttChart.appendTo('#Gantt');

```

Splitter

In the Gantt control, the Splitter separates the TreeGrid section from the Chart section. You can change the position of the Splitter when loading the Gantt control using the [splitterSettings](#) property. By splitting the TreeGrid from the chart, the width of the TreeGrid and chart sections will vary in the control. The [splitterSettings.position](#) property denotes the percentage of the TreeGrid section's width to be rendered and this property supports both pixels and percentage values. You can define the splitter position as column index value using the [splitterSettings.columnIndex](#) property. You can also define the splitter position with built-in splitter view modes by using the [splitterSettings.view](#) property. The following list is the possible values for this property:

- **Default:** Shows Grid side and Gantt side.
- **Grid:** Shows Grid side alone in Gantt.
- **Chart:** Shows chart side alone in Gantt.

INDEX.JS

```

var ganttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
    }
]

```

```

        isParent:true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor:"2FS", Progress:
80,isParent:false },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4],isParent:false },

Change splitter position dynamically

In Gantt, we can change the splitter position dynamically by using [setSplitterPosition](#) method. We can change the splitter position by passing value and type parameter to [setSplitterPosition](#) method. Type parameter will accept one of the following values 'position', 'columnIndex', 'viewType'. The following code example shows how to use this method.

INDEX.JS

```

var ganttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    isParent: true,
    subtasks: [
      { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50, isParent: false },
      { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5], isParent: false },
      { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor: "2FS", Progress:
80, isParent: false },
    ]
  },
  {
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),

```

```

        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit:'day',
resources: [4, 8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"6SS", DurationUnit:'minute',
Progress: 70, resources: [12, 5],isParent:false }
        ]
    }
};
var ganttChart = new ej.gantt.Gantt({

Duration unit in ##Platform_Name## Gantt control

Duration units

In Gantt, the task's duration value can be measured by the following duration units,

- Day
- Hour
- Minute

In Gantt, we can define duration unit for whole project by using [durationUnit](#) property, when we defines the value for this property, this unit will be applied for all task which don't has duration unit value. And

each task in the project can be defined with different duration units and the duration unit of a task can be defined by the following ways,

- Using [taskFields.durationUnit](#) property, to map the duration unit data source field.
- Defining the duration unit value along with the duration field in the data source.

Mapping the duration unit field

The below code snippet explains the mapping of duration unit data source field to the Gantt control using the [taskFields.durationUnit](#) property.

INDEX.JS

```
var ganttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 2, DurationUnit:'day', Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 12,DurationUnit:'hour', Progress: 70 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 240,DurationUnit:'minute', Progress: 80 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, DurationUnit:'hour',
Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50, DurationUnit:'day' },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 480, DurationUnit:'minute', Progress: 70 }
        ]
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: ganttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        durationUnit: 'DurationUnit',
        child: 'subtasks'
    },
    splitterSettings: {
```

```

        columnIndex: 4
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

NOTE

The default value of the [durationUnit](#) property is `day`.

Defining duration unit along with duration field

Duration units for the tasks can also be defined along with the duration values, the below code snippet explains the duration unit for a task along with duration value,

INDEX.JS

```

var ganttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    isParent: true,
    subtasks: [
```

```

        { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: '3days', Progress: 50 },
        { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: '12hours', Progress: 70 },
        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: '1800minutes', Progress: 80 },
    ]
},
{
    TaskID: 5,
    TaskName: 'Project Estimation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    isParent:true,
    subtasks: [
        { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: '12hours',Progress: 50 },
        { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: '3days', Progress: 50 },
        { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: '480minutes', Progress: 70 }
    ]
},
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: ganttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings:{
        columnIndex:4
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

NOTE:

The edit type of the duration column in Gantt is string, to support editing the duration field along with duration units.

Task scheduling in ##Platform_Name## Gantt control

The Gantt provides support for automatic and manual task scheduling modes. It is used to indicate whether the start date and end date of all the tasks will be automatically validated or not. [taskMode](#) is the property used to change the schedule mode of a task.

The Gantt control supports three types of mode. They are:

- **Auto**: All the tasks are automatically validate.
- **Manual**: All the tasks are manually validate by the user.
- **Custom**: Both Auto and Manual tasks are render by mapped from data source.

Note: The default value of [taskMode](#) is **Auto**.

Automatically Scheduled Tasks

When the [taskMode](#) property is set as **Auto**, the start date and end date of all the tasks in the project will be automatically validated. That is, dates are validated based on various factors such as working time, holidays, weekends and predecessors.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        endDate: 'EndDate',

```

```

        dependency: 'Predecessor',
        child: 'Children',
    },
    height: '450px',
    taskMode : 'Auto',
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
'CollapseAll', 'Search'],
    treeColumnIndex: 1,
    editSettings: {
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
    });
ganttt.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>

    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Manually Scheduled Tasks

When the [taskMode](#) property is set as **Manual**, the start date and end date of all the tasks in the project will be same as given in the data source. That is, dates are not validated based on various factors such as

dependencies between tasks, holidays, weekends, working time. We can restrict this mode in predecessor validation alone. That is, we can automatically validate the dates based on predecessor values by enabling the [validateManualTasksOnLinking](#) property.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar,ej.gantt.Selection);
var gantt = new ej.gantt.Gantt({
  dataSource: GanttData,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    endDate: 'EndDate',
    dependency: 'Predecessor',
    child: 'Children',
  },
  height: '450px',
  taskMode : 'Manual',
  toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
  'CollapseAll', 'Search'],
  treeColumnIndex: 1,
  editSettings: {
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
});
gantt.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>

```

Unscheduled Tasks

Unscheduled tasks are planned for a project without any definite schedule dates. The Gantt control supports rendering the unscheduled tasks. You can create or update the tasks with anyone of start date, end date, and duration values or none. You can enable or disable the unscheduled tasks by using the [allowUnscheduledTasks](#) property. The following images represent the various types of unscheduled tasks in Gantt.

Taskbar state | Auto | Manual

Note: A milestone is a task that has no start and end dates, but it has a duration value of zero

[Define unscheduled tasks in data source](#)

You can define the various types of unscheduled tasks in the data source as follows

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', Duration:
3, Progress: 50},
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', EndDate: new
Date('04/08/2019'), Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), EndDate: new Date('04/08/2019'), Progress:
50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', Duration:
0, Progress: 50}
        ]
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true,
        allowTaskbarEditing: true
    },
    allowUnscheduledTasks: true
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Gantt</title>

```

```

<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript Gantt Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

NOTE

If the [allowUnscheduledTasks](#) property is set to false, then the Gantt control automatically calculates the scheduled date values with a default value of duration 1 and the project start date is considered as the start date for the task.

Working Time Range

In the Gantt control, working hours in a day for a project can be defined by using the [dayWorkingTime](#) property. Based on the working hours, automatic date scheduling and duration validations for a task are performed.

The following code snippet explains how to define the working time range for the project in Gantt.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.DayMarkers);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },

```

```

        highlightWeekends: true,
        dayWorkingTime: [
            { from: 9,
              to: 18 }
        ],
        timelineSettings: {
            timelineViewMode: 'Day'
        },
        splitterSettings: {
            columnIndex: 0
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

NOTE

- * Individual tasks can lie between any time within the defined working time range of the project.
- * The [dayWorkingTime](#) property is used to define the working time for the whole project.

Weekend/Non-working days

Non-working days/weekend are used to represent the non-productive days in a project. You can define the non-working days in a week using the [workWeek](#) property in Gantt.

INDEX.JS

```
var ganttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent: true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50, isParent: false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5], isParent: false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor: "2FS", Progress:
80, isParent: false },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent: true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4], isParent: false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit: 'day',
resources: [4, 8], isParent: false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 4, Predecessor: "6SS", DurationUnit: 'minute',
Progress: 70, resources: [12, 5], isParent: false },
        ]
    },
];
var ganttChart = new ej.gantt.Gantt({
    dataSource: ganttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    workWeek: ["Sunday", "Monday", "Tuesday", "Wednesday", "Thursday"],
    highlightWeekends: true
});
```

```
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

By default, Saturdays and Sundays are considered as non-working days/weekend in a project.

In the Gantt control, you can make weekend as working day by setting the [includeWeekend](#) property to `true`.

Critical path in ##Platform_Name## Gantt control

The critical path in a project is indicated by a single task or a series of tasks. If a task in critical path is delayed, the entire project will be delayed. A task is considered to be critical if any delay to this task would affect the project end date.

The critical path can be enabled in Gantt by using the built-in toolbar button or [enableCriticalPath](#) property.

The following code example shows how to display the critical path in the Gantt control:

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit, ej.gantt.Toolbar,
ej.gantt.CriticalPath);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
```

```

height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
},
enableCriticalPath: true,
editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
},
toolbar: ['CriticalPath'],
});
gantChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <style>
        .e-gantt .e-gantt-chart .e-custom-holiday {
            background-color:#e82869;
        }
    </style>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize taskbar in critical path

The taskbar in critical path can be customized by using [queryTaskbarInfo](#) event and [isCritical](#) property of row [data](#) in the event argument.

The following code example shows how to customize the critical path taskbar in the Gantt control:

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit, ej.gantt.Toolbar,
ej.gantt.CriticalPath);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
  },
  enableCriticalPath: true,
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
  toolbar: ['CriticalPath'],
  queryTaskbarInfo(args) {
    if (args.data.isCritical && !args.data.hasChildRecords) {
      args.taskbarBgColor = 'rgb(242, 210, 189)';
      args.progressBarBgColor = 'rgb(201, 169, 166)';
    }
  }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Rows in ##Platform_Name## Gantt control

Row represents a task information from the data source, and it is possible to perform the following actions in Gantt rows.

Row height

It is possible to change the height of the row in Gantt by setting row height in pixels to the [rowHeight](#) property. The following code example explains how to change the row height in Gantt at load time.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    rowHeight: 60
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Expand/Collapse Row

In Gantt parent tasks are expanded/collapsed by using expand/collapse icons, expand all/collapse all toolbar items and by using public methods. By default all tasks in Gantt was rendered in expanded state but we can change this status in Gantt.

Collapse all tasks at Gantt load

All tasks available in Gantt was rendered in collapsed state by setting [collapseAllParentTasks](#) property as `true`. The following code example shows how to use this property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  collapseAllParentTasks: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  }
});

```

```
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

```

Define expand/collapse status of tasks

In Gantt, we can render some tasks in collapsed state and some tasks in expanded state, this can done by defining expand status of the task in data source. This value was mapped to Gantt control by using [expandState](#) property. The following code example shows how to use this property.

INDEX.JS

```
var GanttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
    isExpand: true,
    subtasks: [
      { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
      { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
```

```

        { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
    ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isExpand: false,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        expandState: 'isExpand',
        child: 'subtasks'
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Customize expand/collapse action

On expand action [expanding](#) and [expanded](#) event will be triggered with current expanding row's information. Similarly on collapse action [collapsing](#) and [collapsed](#) event will be triggered. Using this events and it's arguments we can customize the expand/collapse action. The following code example shows how to prevent the particular row from expand/collapse action using [expanding](#) and [collapsing](#) event.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    collapsing: function(args) {
        if (args.data.TaskID==1)
            args.cancel=true;
    },
    expanding: function(args) {
        if (args.data.TaskID==5)
            args.cancel=true;
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Drag and drop

You can dynamically rearrange the rows in the Gantt control by using the `allowRowDragAndDrop` property. Using this property, row drag and drop can be enabled or disabled in Gantt. Using this feature, rows can be dropped at above and below as a sibling or child to the existing rows

To use row drag and drop feature, inject the `RowDD` and `Edit` module in Gantt.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: projectNewData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    allowRowDragAndDrop: true
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple row drag and drop

Gantt also supports dragging multiple rows at a time and drop them on any rows above, below, or at child positions. In Gantt, you can enable the multiple drag and drop by setting the `selectionSettings.type` to `Multiple` and you should enable the `allowRowDragAndDrop` property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: projectNewData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    selectionSettings: {
        type: 'Multiple'
    },
    allowRowDragAndDrop: true
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Taskbar drag and drop between rows

The Gantt feature empowers users to efficiently reorganize records by seamlessly moving taskbar and rearranging their positions through a simple drag-and-drop action. Using this feature, rows can be dropped at above and below as a sibling or child to the existing rows.

This mode can be enable by setting the [allowTaskbarDragAndDrop](#) property to `true`.

To use row drag and drop feature, inject the `RowDD` and `Edit` module in Gantt.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: projectNewData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  }
});

```

```

    },
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
    allowTaskbarDragAndDrop: true,
    allowRowDragAndDrop: true
});
gantChart.appendTo('#Gantt');

```

INDEX.HTML

```

```

Drag and drop events

We provide various events to customize the row drag and drop action, the following table explains about the available events and its details.

Event Name | Description

rowDragStartHelper | Triggers when clicking the drag icon or Gantt row.

rowDragStart |Triggers when drag action starts in Gantt.

rowDrag |Triggers while dragging the Gantt row.

rowDrop |Triggers when a drag row was dropped on the target row.

Customize row drag and drop action

In Gantt, the **rowDragStartHelper** and **rowDrop** events are triggered on row drag and drop action. Using this event, you can prevent dragging of particular record, validate the drop position, and cancel the drop action based on the target record and dragged record. The following topics explains about this.

Prevent dragging of particular record

You can prevent drag action of the particular record by setting the **cancel** property to **true**, which is available in the **rowDragStartHelper** event argument based on our requirement. In the following sample, drag action was restricted for first parent record and its child records.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: projectNewData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },
  rowDragStartHelper: function(args){
    var record = args.data[0] ? args.data[0] : args.data;
    var taskId = record.ganttProperties.taskId;
    if (taskId <= 4) {
      args.cancel = true;
    }
  },
  allowRowDragAndDrop: true
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Validating drop position

You can prevent drop action based on the drop position and target record, by this, you can prevent dropping particular task on a specific task or specific position. This can be achieved by setting the `cancel` property to `true`, which is available in the `rowDrop` event argument.

In the following sample, we have prevented the drop action based on the position. In this sample, you cannot drop row as child in any of the available rows.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: projectNewData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    rowDrop: function(args) {
        if (args.dropPosition == "middleSegment") {
            args.cancel = true;
        }
    },
    allowRowDragAndDrop: true
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript Gantt Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Prevent reordering a row as child to another row

You can prevent the default behavior of dropping rows as children to the target by setting the **cancel** property to **true** in [rowDrop](#) event argument. You can also change the drop position after cancelling using [reorderRows](#) method.

In the below example drop action is cancelled and dropped above to target row.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: projectNewData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    },
    allowRowDragAndDrop: true,
    rowDrop : function (args) {
        if (args.dropPosition == 'middleSegment') {
            args.cancel = true;
            ganttChart.reorderRows([args.fromIndex], args.dropIndex,
'above');

```

```

    }
  }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Perform row drag and drop action programmatically

Gantt provides option to perform row drag and drop action programmatically by using the `reorderRows` method, this method can be used for any external actions like button click. The following arguments are used to specify the positions to drag and drop a row:

- `fromIndexes`: Index value of source(dragging) row.
- `toIndex`: Value of target index.
- `position`: Drop positions such as above, below, or child.

The following code example shows how to drag and drop a row on button click action.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: projectNewData,
```

```

        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            dependency: 'Predecessor',
            child: 'subtasks'
        },
        allowRowDragAndDrop: true
    });
    ganttChart.appendTo('#Gantt');
    var dragBtn= new ej.buttons.Button();
    dragBtn.appendTo('#dynamicDrag');
    document.getElementById('dynamicDrag').addEventListener('click', function()
    {
        ganttChart.reorderRows([1,2,3], 4, 'child');
    });

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

```

Customize rows

You can customize the appearance of a row in grid side, by using the [rowDataBound](#) event and in chart side by using [queryTaskbarInfo](#) event

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  rowDataBound: function(args) {
    if (args.data['TaskID'] == 4) {
      args.row.style.background = 'cyan';
    }
  },
  queryTaskbarInfo: function(args) {
    if (args.data['TaskID'] == 4) {
      args.rowElement.style.background = 'cyan';
    }
  }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
</body>
</html>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Styling alternate rows

You can change the background colour of alternative rows in Gantt chart, by overriding the class as shown below.

```

,
.e-altrow, tr.e-chart-row:nth-child(even) {
background-color: #f2f2f2;
}
,

```

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>

```

Row spanning

Gantt chart has an option to span row cells. You can achieve this using [rowSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Soil test approval** cell is spanned to two rows in the **TaskName** column.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    gridLines: 'Both',
    queryCellInfo: function(args) {
        if (args.data['TaskID'] == 4 && args.column.field ===
'TaskName') {
            args.rowSpan = 2;
        }
    },
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">

        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Scrolling in ##Platform_Name## Gantt control

The scrollbar will be displayed in the gantt when content exceeds the element **width** or **height**. The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the gantt exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid pane size.
- The [height](#) and [width](#) are used to set the gantt height and width, respectively.

The default value for **height** and **width** is **auto**.

Set width and height

We can even set pixel values to width and height of gantt container using [width](#) and [height](#) properties.

INDEX.JS

```

var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '350px',
    width: '600px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',

```

```

        progress: 'Progress',
        child: 'subtasks',
    },
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
});
gantt.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-
scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Responsive with the parent container

Specify the [width](#) and [height](#) as **100%** to make the gantt element fill its parent container.

Setting the **height** to **100%** requires the gantt parent element to have explicit height. Also, the component will be responsive when the parent container is resized.

INDEX.JS

```

var gantt = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '100%',
  width: '100%',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
  },
  editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
  },
});
gantt.appendTo('#Gantt');

```

INDEX.HTML

```

```

Scroll To Date method

In the Gantt control, When We use the [scrollToDate](#) method, it will scroll the timeline horizontally to the date that we specified in the method's argument.

The following code examples show how the scroll To Date method works in Gantt:

INDEX.JS

```

var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        dependency: 'Predecessor',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings: {
        position: "50%"
    },
    projectStartDate: new Date('04/01/2019'),
    projectEndDate: new Date('05/30/2019'),
});
gantt.appendTo('#Gantt');
var scrollBtn= new ej.buttons.Button();
scrollBtn.appendTo('#scroll');
document.getElementById('scroll').addEventListener('click', function() {
    gantt.scrollToDate('05/27/2019');
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Set the vertical scroll position

In the Gantt control, you can set the vertical scroller position dynamically by clicking the custom button using the [setScrollTop](#) method.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: ganttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings: {
    position: "50%"
  }
});
ganttChart.appendTo('#Gantt');
var scrollBtn= new ej.buttons.Button();
scrollBtn.appendTo('#scrollTop');
document.getElementById('scrollTop').addEventListener('click', function() {
  ganttChart.ganttChartModule.scrollObject.setScrollTop(300);
});

```

```
});
```

INDEX.HTML

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Managing Tasks

Managing tasks in ##Platform_Name## Gantt control

The Gantt component has options to dynamically insert, delete, and update tasks in the project. The primary key column is necessary to manage the tasks and perform CRUD operations in Gantt. To define the primary key, set the [columns.isPrimaryKey](#) property to `true` in the particular column.

To use CRUD, inject the [Edit](#) module into the Gantt control.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true,
        mode: 'Dialog'
    }
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Read-only Gantt

In Gantt, all create, update, delete operations can be disabled by set `readOnly` property as `true`. The following sample demonstrates, render Gantt chart as read only.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
```

```

        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        toolbar:
[ 'Add', 'Cancel', 'CollapseAll', 'Delete', 'Edit', 'ExpandAll', 'NextTimeSpan', 'PrevTimeSpan', 'Search', 'Update', 'Indent', 'Outdent'],
        enableContextMenu: true,
        editSettings: {
            allowEditing: true,
            allowAdding: true,
            allowDeleting: true,
            allowTaskbarEditing: true
        },
        allowSorting: true,
        allowResizing: true,
        readOnly: true
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <style>
        .e-gantt-chart .e-preventEdit .e-right-resize-gripper,
        .e-gantt-chart .e-preventEdit .e-left-resize-gripper,
        .e-gantt-chart .e-preventEdit .e-progress-resize-gripper,
        .e-gantt-chart .e-preventEdit .e-left-connectorpoint-outer-div,
        .e-gantt-chart .e-preventEdit .e-right-connectorpoint-outer-div {
            display: none;
        }
    </style>

```

<div id="container">
  <div id="Gantt"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Troubleshoot: Editing works only when primary key column is defined

Editing feature requires a primary key column for CRUD operations. While defining columns in Gantt using the [columns](#) property, it is mandatory that any one of the columns, must be a primary column. By default, the [id](#) column will be the primary key column. If [id](#) column is not defined, we need to enable [isPrimaryKey](#) for any one of the columns defined in the [columns](#) property.

Open new task dialog with default values

You can set default values when new task dialog opens using [actionBegin](#) event when `requestType` is `beforeOpenAddDialog`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowAdding: true
  },
  actionBegin : function (args) {
    if (args.requestType == 'beforeOpenAddDialog') {
      args.rowData.TaskName = 'Gantt';
      args.rowData.Progress = 70;
      args.rowData.ganttProperties.taskName = 'Gantt';
      args.rowData.ganttProperties.progress = 70;
    }
  },
  toolbar: ['Add']
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

<title>EJ2 Gantt</title>

</body></html>

```

Adding new tasks in ##Platform_Name## Gantt control

Tasks can be dynamically added to the Gantt project by enabling the [editSettings.allowAdding](#) property.

Toolbar

A row can be added to the Gantt component from the toolbar while the [editSettings.allowAdding](#) property is set to true. On clicking the toolbar add icon, you should provide the task information in the add dialog.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowAdding: true
    },

```

```

        toolbar: ['Add']

    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, the new row will be added to the top most row in the Gantt control.

Context menu

A row can also be added above, below or child of the selected row by using context menu support. For this, we need to enable the property [enableContextMenu](#) and inject the [ContextMenu](#) module into the Gantt control.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {

```

Using method

You can add rows to the Gantt control dynamically using the [addRecord](#) method and you can define the add position of the default new record by using the [rowPosition](#) property. You can also pass the `rowIndex` as an additional parameter.

- Top of all the rows.
- Bottom to all the existing rows.
- Above the selected row.
- Below the selected row.

- As child to the selected row.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings:{
        allowAdding:true
    }
});
ganttChart.appendTo('#Gantt');
var addBtn= new ej.buttons.Button();
addBtn.appendTo('#addRow');
document.getElementById('addRow').addEventListener('click', function() {
    var record={ TaskID: 10,
        TaskName: 'New Added Record',
        StartDate: new Date('04/02/2019'),
        Duration: 3,
        Progress: 50
    };
    ganttChart.editModule.addRecord(record,'Below',2);
});

```

Editing tasks in ##Platform_Name## Gantt control

The editing feature can be enabled in the Gantt control by enabling the [editSettings.allowEditing](#) and [editSettings.allowTaskbarEditing](#) properties.

The following editing options are available to update the tasks in the Gantt chart:

- Cell
- Dialog
- Taskbar
- Dependency links

Cell editing

By setting the edit mode to auto using the [editSettings.mode](#) property, the tasks can be edited through TreeGrid cells by double-clicking.

Note: If the [Edit](#) module is not injected, you cannot edit the tasks through TreeGrid cells.

The following code example shows you how to enable the cell editing in Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true,
        mode: 'Auto'
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: When the edit mode is set to **Auto**, on performing double-click action on TreeGrid side, the cells will be changed to editable mode and on performing double-click action on chart side, the edit dialog will appear for editing the task details.

Dialog editing

Modify the task details through the edit dialog by setting the edit [mode](#) to **Dialog**.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowEditing: true,
    mode: 'Dialog'
  }
});

```

```

    }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Limiting data fields in general tab

In the Gantt dialog, you can make only specific data source fields visible for editing by using the [addDialogFields](#) and [editDialogFields](#) properties. The data fields are defined with [type](#) and [fields](#) properties.

Note: You can also define the custom fields in the add/edit dialog General tab using the [fields](#) property.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar);

Validation in ##Platform_Name## Gantt control

Column validation

Column validation validates the editing and adding data and it display errors for invalid fields before saving data. This is effective in both inline and dialog editing.

Gantt uses [Form Validator](#) component for column validation. You can set [validation rules](#) by defining the [columns.validationRules](#). The value cannot be saved unless the validation rule get satisfied.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Selection,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',

Custom validation

You can define your own custom validation rules for the specific columns by using callback function to it's [validation rule](#).

In the below demo, custom validation applied for **TaskName** column.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Selection,ej.gantt.Toolbar);
var customFn = function(args) {
  return args['value'].length >= 8;
};
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',

```

```

        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel'],
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName', validationRules: { required: true,
minLength: [customFn, 'Value should be greater than 8 letters'] } },
        { field: 'StartDate', editType: 'datetimepickeredit', edit: {
params: { format: 'M/d/y hh:mm a' } },
        format: { format: 'M/d/y hh:mm a', type: 'dateTime' },
validationRules: { required: true, date: true } },
        { field: 'Duration', validationRules: { required: true } },
        { field: 'Progress', validationRules: { required: true } }
    ],
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Dependency and resource grid validation

Validation rules can also be implemented for the dependency and resource grid in the add or edit dialog by employing the event [actionBegin](#).

Within the actionBegin event, validationRules can be configured for columns in the grid of the dependency and resource tabs using the requestType `beforeOpenEditDialog` or `beforeOpenAddDialog`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Selection,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        dependency: 'Predecessor',
        progress: 'Progress',
        child: 'subtasks',
        resourceInfo: 'resources'
    },
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName'
    },
    resources: editingResources,
    actionBegin: function(args) {
        if (args.requestType == "beforeOpenEditDialog" ||
args.requestType == "beforeOpenAddDialog") {
            args.Dependency.columns[3].validationRules = { required:
true }

            args.Resources.columns[2].allowEditing = true
            args.Resources.columns[2].validationRules = { required: true
}
        }
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel'],
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName', validationRules: { required: true } },
        { field: 'StartDate', editType: 'datetimepickeredit', edit: {
params: { format: 'M/d/y hh:mm a' } },
format: { format: 'M/d/y hh:mm a', type: 'dateTime' },
validationRules: { required: true, date: true } },
        { field: 'Duration', validationRules: { required: true } },
        { field: 'Progress', validationRules: { required: true } }
    ],

```

```

        editSettings: {
            allowAdding: true,
            allowEditing: true,
            allowDeleting: true,
            allowTaskbarEditing: true,
            showDeleteConfirmDialog: true
        }
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

Deleting tasks in ##Platform_Name## Gantt control

A task delete option in the Gantt control can be enabled by enabling the [editSettings.allowDeleting](#) property. Tasks can be deleted by clicking the delete toolbar item or using the `deleteRow` method. You can call this method dynamically on any custom actions like button click. The following code example shows how to enable the delete option in the Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,

```

```

        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        editSettings: {
            allowDeleting: true
        }
    });
    ganttChart.appendTo('#Gantt');
    var delBtn= new ej.buttons.Button();
    delBtn.appendTo('#deleteRecord');
    document.getElementById('deleteRecord').addEventListener('click', () => {
        ganttChart.editModule.deleteRow();
    });

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <button id="deleteRecord">Delete Record</button>

    <div id="container">
        <div id="Gantt"></div>
    </div>
    <script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

NOTE: You should select any one of the rows in the Gantt control to perform task delete action.

You should set the [allowDeleting](#) value to `true` to delete the record dynamically.

Delete confirmation message

Delete confirmation message is used to get the confirmation from users before deleting a task. This confirmation message can be enabled by setting the [editSettings.showDeleteConfirmDialog](#) property to `true`.

The following code snippet explains how to enable the delete confirmation message in Gantt.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  toolbar: ['Delete'],
  editSettings: {
    allowDeleting: true,
    showDeleteConfirmDialog: true
  }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

Task bar editing in ##Platform_Name## Gantt control

Modify the task details through user interaction such as resizing and dragging the taskbar by enabling the [allowTaskbarEditing](#) property.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowTaskbarEditing: true
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Prevent editing for specific tasks

On taskbar edit action, the [taskbarEditing](#) event will be triggered. You can prevent the taskbar from editing using the [taskbarEditing](#) event. This can be done by setting cancel property of [taskbarEditing](#) event argument to true. And we can hide the taskbar editing indicators like taskbar resizer, progress resizer and connector points by using [queryTaskbarInfo](#) event. The following code example shows how to achieve this.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    taskbarEditing: function (args) {
        if (args.data.TaskID == 4) // We can't edit Task Id 4
            args.cancel = true;
    },
    queryTaskbarInfo: function (args) {
        if (args.data.TaskID == 6) {
            args.taskbarElement.className += ' e-preventEdit' // Taskbar
            editing indicators are hidden
        }
    },
    editSettings: {
        allowTaskbarEditing: true
    }
})

```

```
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">

```

Task dependencies

In the Gantt control, you can update the dependencies between the tasks and link the tasks interactively. The task dependencies can be mapped from the data source using the [dependency](#) property.

You can update the task dependencies using the following ways:

- Mouse interactions: Using connector points in the taskbar, you can perform drag and drop action to create task dependency links.
- Edit dialog: Create or remove the task dependencies using the **Dependency** tab in the edit dialog.
- Cell editing: Create or remove the task links using cell editing.

The following code example demonstrates how to enable task dependency editing in the Gantt chart using the [editSettings](#) property.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit);
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 0, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 0,Predecessor:"6SS", Progress: 50 }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height:'450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks'
    }
});
```

```

    },
    editSettings: {
      allowEditing: true,
      allowTaskbarEditing: true,
      mode: 'Auto'
    }
  });
  ganttChart.appendTo('#Gantt');

```

Note: When the edit mode is set to **Auto**, on performing double-click action on TreeGrid side, the cells will be changed to editable mode and on performing double-click action on chart side, the edit dialog will appear for editing the task details.

Update task values using method

Tasks' value can be dynamically updated by using the [updateRecordById](#) method. You can call this method on any custom action. The following code example shows how to use this method to update a task.

NOTE: Using the [updateRecordById](#) method, you cannot update the task ID value.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowEditing: true
  }
});
ganttChart.appendTo('#Gantt');
var updateBtn= new ej.buttons.Button();
updateBtn.appendTo('#updateRecord');
document.getElementById('updateRecord').addEventListener('click', () => {
  var data={
    TaskID: 3,
    TaskName: 'Updated by index value',
  
```

```

        StartDate: new Date('04/02/2019'),
        Duration: 4,
        Progress: 50
    };
    ganttChart.updateRecordByID(data);
});

```

Cell edit type and its params

The [columns.editType](#) is used to define the edit type for any particular column.

You can set the [columns.editType](#) based on data type of the column.

Also, you can customize the behavior of the editor component through the [columns.edit.params](#).

The following table describes cell edit type component and their corresponding edit params of the column.

Edit Type | Component | Example

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar);

```

```
function durationFormat(field, data, column) {
    return data[field];
}
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        { field: 'TaskName', headerText: 'Task Name' },
        { field: 'StartDate', headerText: 'Start Date' },
        { field: 'Duration', headerText: 'Duration', editType: 'numericedit',
        edit: { params: { min: 1 } }, valueAccessor: durationFormat },
        { field: 'Progress', headerText: 'Progress', edit: { params: {
        showSpinButton: false } } }
    ],
});
ganttChart.appendTo('#Gantt');
```

```

Cell Edit Template

The cell edit template is used to create a custom component for a particular column by invoking the following functions:

- **create** - It is used to create the element at the time of initialization.
- **write** - It is used to create the custom component or assign default value at the time of editing.
- **read** - It is used to read the value from the component at the time of save.
- **destroy** - It is used to destroy the component.

INDEX.JS

```

var elem;
var dropdownlistObj;
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    editSettings: {
        allowEditing: true
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        {
            field: 'TaskName', headerText: 'Task Name',
            edit: {
                create: function() {
                    elem = document.createElement('input');
                    return elem;
                },
                read: function() {
                    return dropdownlistObj.value;
                },
                destroy: function() {
                    dropdownlistObj.destroy();
                },
                write: function(args) {
                    dropdownlistObj = new ej.dropdowns.DropDownList({
                        dataSource: ganttChart.treeGrid.grid.dataSource,
                        fields: { value: 'TaskName' },
                        value: args.rowData[args.column.field],

```

```

        floatLabelType: 'Auto',
    });
    dropdownlistObj.appendTo(elem);
    }
    },
    { field: 'StartDate', headerText: 'Start Date' },
    { field: 'Duration', headerText: 'Duration' },
    { field: 'Progress', headerText: 'Progress' },
],
});
gantChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Disable editing for particular column

You can disable editing for particular columns, by using the [columns.allowEditing](#) property.

In the following demo, editing is disabled for the **TaskName** column.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,

```

```

height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
},
editSettings: {
    allowEditing: true
},
toolbar: ['Edit'],
columns: [
    { field: 'TaskID', headerText: 'Task ID' },
    { field: 'TaskName', headerText: 'Task Name', allowEditing: false },
    { field: 'StartDate', headerText: 'Start Date' },
    { field: 'Duration', headerText: 'Duration' },
    { field: 'Progress', headerText: 'Progress' },
],
});
gantChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In dent and out dent in ##Platform_Name## Gantt control

Indent and Outdent of a task are used to update the level of task in the hierarchical order of the task. It can be performed by enabling the [editSettings.allowEditing](#) property.

Indent - Selected task can be indented to the level of task to the hierarchical order. It can be performed by using in-built context menu or toolbar items. It can also be invoked by using the `indent` method dynamically on any action like external button click. The following code example shows how to enable indent option in the Gantt chart.

Outdent - Selected task can be outdented to the level of task from the hierarchical order. It can be performed by using in-built context menu or toolbar items. It can also be invoked by using the `outdent` method dynamically on any action like external button click. The following code example shows how to enable outdent option in the Gantt chart.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbar: ['Indent', 'Outdent'],
    editSettings: {
        allowEditing: true
    }
});
var ind= new ej.buttons.Button();
ind.appendTo('#indent');
var out= new ej.buttons.Button();
out.appendTo('#outdent');
document.getElementById('indent').addEventListener('click', function() {
    ganttChart.indent();
});
document.getElementById('outdent').addEventListener('click', function() {
    ganttChart.outdent();
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Splitting and merging tasks in ##Platform_Name## Gantt control

Splitting task at load time

To split task at load time, we can define segment details in both hierarchical and self-referential way.

Refer below link for more details.

- [Split task at load time](#)

Split task dynamically

The task can be splitted dynamically, either by using the context menu or dialog.

- **Dialog:** Segments tab is rendered in add/edit dialog, when the [taskFields.segments](#) or [taskFields.segmentId](#) property is mapped. Using this tab, we can split the task based on the original start and end date of a particular task.
- **Context menu:** When the [taskFields.segments](#) or [taskFields.segmentId](#) property is mapped and the [enableContextMenu](#) property is enabled, Split Task item will be included in the context menu.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Edit, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: "450px",
  taskFields: {

```

```

        id: "TaskID",
        name: "TaskName",
        startDate: "StartDate",
        endDate: "EndDate",
        duration: "Duration",
        progress: "Progress",
        child: "subtasks",
        segments: "Segments"
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
'CollapseAll'],
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
    enableContextMenu: true
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Merge tasks

The splitted tasks can be merged either by using the **Merge Task** item of the Context menu or by using the dialog. We can also merge the tasks, by simply dragging the segments together in the UI.

Limitations of Split tasks

1. Parent and milestone tasks cannot be split into segments.
2. The task must have a width greater than the timeline unit cell in order to be split.
3. Split task is not supported in the **Resource view**.

Maintaining data in server in ##Platform_Name## Gantt control

All the modified data in Gantt control can be maintained in the database using RESTful web services.

All the CRUD operations in the gantt are done through DataManager. The DataManager has an option to bind all the CRUD related data in server-side.

In the below section, we have explained how to get the edited data details on the server-side using the **UrlAdaptor**.

URL Adaptor

Please refer the [link](#) to create the **ADO.NET** Entity Data Model in Visual studio,

We can define data source for Gantt as instance of DataManager using **url** property of DataManager. Please Check the below code snippet to assign data source to Gantt.

```
`ts
import { Gantt } from '@syncfusion/ej2-gantt';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
let dataSource: DataManager = new DataManager({
url: '/Home/UrlDatasource',
adaptor: new UrlAdaptor
});
let gantt: Gantt = new Gantt({
dataSource: dataSource,
height: '450px',
treeColumnIndex: 1,
taskFields: {
id: 'TaskId',
name: 'TaskName',
startDate: 'StartDate',
progress: 'Progress',
duration: 'Duration',
dependency: 'Predecessor',
```

```

child: 'SubTasks'
}
});
gantt.appendTo('#Gantt');
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult UrlDatasource(DataManagerRequest dm)
{
List<GanttData>DataList = db.GanttDatas.ToList();
var count = DataList.Count();
return Json(new { result = DataList, count = count });
}
`

```

We can also do CRUD operations over Gantt data and save the changes to database. By using **BatchUrl** property of **DataManager**, we can communicate with the controller method to update the data source on CRUD operation. In gantt CRUD actions on task are dependent with other tasks. For example on editing the child record on chart side, corresponding parent item also will get affect and predecessor dependency task as well get affected. So in Gantt all the CRUD operations are considered to be batch editing where you will get all the affected records as collection. Please check the below code snippet to assign controller method to this property.

```

`ts
import { Gantt } from '@syncfusion/ej2-gantt';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
let dataSource: DataManager = new DataManager({
url: '/Home/UrlDatasource',
adaptor: new UrlAdaptor,
batchUrl: "Home/BatchSave"
});
let gantt: Gantt = new Gantt({
dataSource: dataSource,
height: '450px',
treeColumnIndex: 1,
taskFields: {
id: 'TaskId',

```

```

name: 'TaskName',
startDate: 'StartDate',
progress: 'Progress',
duration: 'Duration',
dependency: 'Predecessor',
child: 'SubTasks'
}
});
ganttt.appendTo('#Gantt');
`ts
public class ICRUDModel<T> where T : class
{
public object key { get; set; }
public T value { get; set; }
public List<T> added { get; set; }
public List<T> changed { get; set; }
public List<T> deleted { get; set; }
}
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
List<GanttData> uAdded = new List<GanttData>();
List<GanttData> uChanged = new List<GanttData>();
List<GanttData> uDeleted = new List<GanttData>();
//...
return Json(new { addedRecords = uAdded, changedRecords = uChanged, deletedRecords = uDeleted });
}
`

```

This server method will be triggered for all the CRUD operations like adding, editing and deleting actions. We can handle those each operations separately inside this method with corresponding data received in this method argument. Also, when using the `UrlAdaptor`, you need to return the data as JSON from the controller action and the JSON object must contain a property as result with dataSource as its value and one more property count with the dataSource total records count as its value.

Insert action

Using the `added` argument of the `BatchUrl` method we can insert the newly added row to database and return the same to client side. please find the below code example for details.

```
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uAdded = new List<GanttData>();
    //Performing insert operation
    if (data.added != null && data.added.Count() > 0)
    {
        foreach (var rec in data.added)
        {
            uAdded.Add(this.Create(rec));
        }
    }
    return Json(new { addedRecords = uAdded });
    //...
}

public GanttData Create(GanttData value)
{
    db.GanttDatas.Add(value);
    db.SaveChanges();
    return value;
}
`
```

Editing action

Using the `changed` argument of the `BatchUrl` method we can update the modified records to database and return the same to client side. please find the below code example for details.

```
`ts
GanttDataSourceEntities db = new GanttDataSourceEntities();
public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uChanged = new List<GanttData>();
```

```
//Performing update operation
if (data.changed != null && data.changed.Count() > 0)
{
    foreach (var rec in data.changed)
    {
        uChanged.Add(this.Edit(rec));
    }
}
return Json(new { changedRecords = uChanged });
//...
}

public GanttData Edit(GanttData value)
{
    GanttData result = db.GanttDatas.Where(currentData => currentData.TaskId ==
value.TaskId).FirstOrDefault();
    if (result != null)
    {
        result.TaskId = value.TaskId;
        result.TaskName = value.TaskName;
        result.StartDate = value.StartDate;
        result.EndDate = value.EndDate;
        result.Duration = value.Duration;
        result.Progress = value.Progress;
        result.Predecessor = value.Predecessor;
        db.SaveChanges();
        return result;
    }
    else
    {
        return null;
    }
}
```

Delete action

Using the `deleted` argument of the `BatchUrl` method we can remove the deleted records from database and return the same to client side. on deleting the record we need to remove its corresponding child records as well if it exist from the data base. please find the below code example for details.

```
`ts

GanttDataSourceEntities db = new GanttDataSourceEntities();

public ActionResult BatchSave([FromBody]ICRUDModel<GanttData> data)
{
    List<GanttData> uDeleted = new List<GanttData>();
    //Performing delete operation
    if (data.deleted != null && data.deleted.Count() > 0)
    {
        foreach (var rec in data.deleted)
        {
            uDeleted.Add(this.Delete(rec.TaskId));
        }
    }
    return Json(new { deletedRecords = uDeleted });
}

public GanttData Delete(string value)
{
    var result = db.GanttDatas.Where(currentData => currentData.TaskId == value).FirstOrDefault();
    db.GanttDatas.Remove(result);
    RemoveChildRecords(value);
    db.SaveChanges();
    return result;
}

public void RemoveChildRecords(string key)
{
    var childList = db.GanttDatas.Where(x => x.ParentId == key).ToList();
    foreach (var item in childList)
    {
        db.GanttDatas.Remove(item);
    }
}
```

```

RemoveChildRecords(item.TaskId);
}
}
,

```

Columns

Columns in ##Platform_Name## Gantt control

The column displays information from a bound data source, and you can edit the values of column to update the task details through TreeGrid. The operations such as sorting, filtering, and searching can be performed based on column definitions. To display a Gantt column, the [field](#) property should be mapped from the data source to the column.

If the column [field](#) is not specified in the data source, the column values will be empty.

The [treeColumnIndex](#) property is used to define the expander column in the Gantt control to expand and collapse the child rows.

Defining columns

Using the [columns](#) property, you can define the columns in Gantt. If the columns are not defined, then the default columns will be rendered based on the mapped data source fields in the [taskFields](#) property. Refer to the following code example for defining the columns in Gantt along with their widths.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Format

To format the cell values based on a specific culture, use the [columns.format](#) property. The Gantt control uses the [Internationalization](#) library to format **number** and **date** values.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',

```

```

        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    {
        rowHeight: 50,
        splitterSettings: {
            columnIndex: 3
        },
        height: '450px',
        columns: [
            { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
            { field: 'Progress', headerText: 'Progress', width:
'150', format: 'C' },
            { field: 'TaskName', headerText: 'Task Name', width: '150' },
            { field: 'StartDate', headerText: 'Start Date',
width: '150' },
            { field: 'Duration', headerText: 'Duration', width: '150' }
        ]
    }
]);
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

By default, the number and date values are formatted in **en-US** culture.

Number formatting

The number or integer values can be formatted using the following format strings.

Format | Description | Remarks

{ type:'date', format:'dd/MM/yyyy' } | 04/07/2019

{ type:'date', format:'dd.MM.yyyy' } | 04.07.2019

{ type:'date', skeleton:'short' } | 7/4/19

{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/2019 12:00 AM

{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/2019 12:00:00 AM

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  taskFields: {

```

Column reordering in ##Platform_Name## Gantt control

The column reordering can be done by dragging a column header from one index to another index within the TreeGrid. To enable reordering, set the [allowReordering](#) property to true.

To use the column reordering feature, inject the **Reorder** module to the Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Reorder);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    allowReordering: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    height: '450px',
    splitterSettings: {
        columnIndex: 5
    }
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

<meta name="description" content="Typescript Gantt Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can disable the reordering of a particular column by setting the [columns.allowReordering](#) property to `false`.

Reorder multiple columns

Multiple columns can be reordered at a time by using the [reorderColumns](#) method.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Reorder);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  allowReordering: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings: {
    position: '100%'
  },
  height: '450px',
  columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
    { field: 'TaskName', headerText: 'Task Name', width: '150' },

```

```

        { field: 'StartDate', headerText: 'Start Date', width: '150'
    },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' }
    ]

    });
ganttChart.appendTo('#Gantt');
var reorderMultipleCols = new ej.buttons.Button();
reorderMultipleCols.appendTo('#reorderMultipleCols');
document.getElementById('reorderMultipleCols').addEventListener('click',
function() {
    ganttChart.reorderColumns(['TaskID', 'TaskName'], 'Progress');
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <button id="reorderMultipleCols">Reorder Task ID and Task Name to
Last</button>
        <div id="Gantt"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Reorder Events

During the reorder action, the gantt component triggers the below three events.

1. The [columnDragStart](#) event triggers when column header element drag (move) starts.

2. The [columnDrag](#) event triggers when column header element is dragged (moved) continuously.
3. The [columnDrop](#) event triggers when a column header element is dropped on the target column.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Reorder);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    allowReordering: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings: {
        columnIndex: 4
    },
    height: '450px',
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' }
    ],
    columnDragStart: function() {
        alert('ResizeStart event is Triggered');
    },
    columnDrag: function() {
        alert('Resizing event is Triggered');
    },
    columnDrop: function() {
        alert('ResizeStop event is Triggered');
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Column resizing in ##Platform_Name## Gantt control

The column width can be resized by clicking and dragging the right edge of the column header. While dragging, the width of the column will be resized immediately. Each column can be auto resized by double-clicking the right edge of the column header to fit the width of that column based on the widest cell content. To resize the column, set the [allowResizing](#) property to true. The following code example shows how to enable the column resize feature in the Gantt control.

To resize the column, inject the **Resize** module into the Gantt control.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Resize);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    allowResizing: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings:{
        columnIndex:4
    },
    height:'450px'
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Gantt</title>

```

```

<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript Gantt Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can disable resizing for a particular column by setting the [columns.allowResizing](#) to `false`.

Defining minimum and maximum column width

The column resizing can be restricted between minimum and maximum widths by defining the [columns->minWidth](#) and [columns->maxWidth](#) properties.

In the following example, the minimum and maximum widths are defined for the `Duration`, and `Task Name` columns.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Resize);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    allowResizing: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings:{
        columnIndex:5
    },

```

```

        height: '450px',
        columns: [
            { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
            { field: 'TaskName', headerText: 'Task Name', width:
'200', minWidth: '150' ,maxWidth: '250' },
            { field: 'StartDate', headerText: 'Start Date',
width: '150' },
            { field: 'Duration', headerText: 'Duration', width:
'100', minWidth: '50' ,maxWidth: '200' },
            { field: 'Progress', headerText: 'Progress', width: '150' }
        ]
    });
    ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>

Column menu in ##Platform_Name## Gantt control

The column menu has options to integrate features like sorting, filtering, and autofit. It will show a menu with the integrated feature when users click the Multiple icon of the column. To enable the column menu, you should set the [showColumnMenu](#) property to true.

The default items are displayed in the following table:

Item	Description
----- -----	
SortAscending	Sort the current column in ascending order.
SortDescending	Sort the current column in descending order.
AutoFit	Auto fit the current column.
AutoFitAll	Auto fit all columns.
Filter	Show the filter option as given in the <code>filterSettings.type</code> property.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Sort, ej.gantt.Resize);
var GanttData = [
  {
    TaskID: 1,
    TaskName: 'Project initiation',
    StartDate: new Date('04/02/2019'),

</body></html>

```

You can disable the column menu for a particular column by setting the `columns.showColumnMenu` to `false`.

Column menu events

During the resizing action, the gantt component triggers the below two events.

1. The [columnMenuOpen](#) event triggers before the column menu opens.
2. The [columnMenuClick](#) event triggers when the user clicks the column menu of the gantt.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Sort, ej.gantt.Resize);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  showColumnMenu: true,
  allowFiltering: true,
  allowResizing: true,
  allowSorting: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings: {
    position: '100%'
  },
  columnMenuOpen: function() {
    alert('columnMenuOpen event is Triggered');
  },
  columnMenuClick: function() {
    alert('columnMenuClick event is Triggered');
  },
  columns: [
    { field: 'TaskID', headerText: 'Task ID' },
    { field: 'Progress', headerText: 'Progress' },
    { field: 'TaskName', headerText: 'Task Name' },
    { field: 'StartDate', headerText: 'Start Date' },
    { field: 'Duration', headerText: 'Duration' }
  ],

```

```
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">

Custom Column Menu Item

Custom column menu items can be added by defining the [columnMenuItems](#). Actions for this customized items can be defined in the [columnMenuClick](#) event.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Sort, ej.gantt.Resize);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  showColumnMenu: true,
  allowFiltering: true,
  allowResizing: true,
  allowSorting: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
```

```

        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columnMenuItems: [{text: 'Clear Sorting', id: 'ganttclearsorting'}],
    columnMenuClick: function(args) {
        if (args.item.id === 'ganttclearsorting') {
            ganttChart.clearSorting();
        }
    },
    splitterSettings: {
        position: '75%'
    },
    sortSettings: {
        columns: [{direction: "Ascending", field: "TaskID"}]
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        { field: 'Progress', headerText: 'Progress' },
        { field: 'TaskName', headerText: 'Task Name' },
        { field: 'StartDate', headerText: 'Start Date' },
        { field: 'Duration', headerText: 'Duration' }
    ],
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Customize menu items for particular columns

Sometimes, you have a scenario that to hide an item from column menu for particular columns. In that case, you need to define the [columnMenuOpenEventArgs.hide](#) as true in the [columnMenuOpen](#) event.

The following sample, **Filter** item was hidden in column menu when opens for the **Task Name** column.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Filter, ej.gantt.Sort, ej.gantt.Resize);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  showColumnMenu: true,
  allowFiltering: true,
  allowResizing: true,
  allowSorting: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings: {
    position: '100%'
  },
  columns: [
    { field: 'TaskID', headerText: 'Task ID' },
    { field: 'Progress', headerText: 'Progress' },
    { field: 'TaskName', headerText: 'Task Name' },
    { field: 'StartDate', headerText: 'Start Date' },
    { field: 'Duration', headerText: 'Duration' }
  ],
  columnMenuOpen: function (args) {
    for (var item of args.items) {
      if (item.text === 'Filter' && args.column.field === 'TaskName')
      {
        item.hide = true;
      } else {
        item.hide = false;
      }
    }
  },
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Responsive columns in ##Platform_Name## Gantt control

You can toggle the column visibility based on media queries, which are defined in the [hideAtMedia](#). The [hideAtMedia](#) accepts valid [Media Queries](#).

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    splitterSettings: {
        position: '75%'
    },
    height: '450px',
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left',
width: '100' },
        { field: 'TaskName', headerText: 'Task Name', width:
'200',hideAtMedia: '(min-width: 700px)' },
        { field: 'StartDate', headerText: 'Start Date',
width: '150' },

```

```

        { field: 'Duration', headerText: 'Duration', width: '100',
hideAtMedia: '(max-width: 500px)' },
        { field: 'Progress', headerText: 'Progress', width: '150' }
    ]

});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Change tree/expander column

The tree/expander column is a column in the Gantt control, that has icons to expand or collapse the parent records. You can define the tree column index in the Gantt control by using the [treeColumnIndex](#) property and the default value of this property is 0. The following code example shows how to use this property.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
```

```

                startDate: 'StartDate',
                duration: 'Duration',
                progress: 'Progress',
                child: 'subtasks'
            },
            splitterSettings: {
                columnIndex: 3
            },
            height: '450px',
            treeColumnIndex: 2
        });
        ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

<body>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Show or Hide columns dynamically

You can show or hide gantt columns dynamically using external buttons by invoking the [showColumn](#) or [hideColumn](#) method.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({

```

```

        dataSource: GanttData,
        height: '450px',
        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        editSettings: {
            allowEditing: true
        },
        splitterSettings: {
            position: '75%'
        },

Check box columns in ##Platform_Name## Gantt control

To render boolean values as checkbox in columns, you need to set [displayAsCheckBox](#) property as **true**.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
        verified: 'verified'
    },
    splitterSettings: {
        columnIndex: 5
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID' },
        { field: 'Progress', headerText: 'Progress' },
        { field: 'TaskName', headerText: 'Task Name' },
        { field: 'StartDate', headerText: 'Start Date' },
        { field: 'verified', headerText: 'Verified', width: 150,
displayAsCheckBox: true, type: 'boolean' },
        { field: 'Duration', headerText: 'Duration' }
    ]
});
ganttChart.appendTo('#Gantt');

```

Controlling Grid actions

You can enable or disable gantt action for a particular column by setting the [allowFiltering](#), [allowSorting](#), [allowReordering](#), and [allowEditing](#) properties.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  allowFiltering: true,
  allowSorting: true,
  allowReordering: true,
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
  },
  editSettings: {
    allowEditing: true
  },
  splitterSettings: {
    position: '75%'
  },
  columns: [
    { field: 'TaskID', headerText: 'Task ID' },

```

```

    { field: 'Progress', headerText: 'Progress', allowReordering: false
  },
    { field: 'TaskName', headerText: 'Task Name', allowSorting: false },
    { field: 'StartDate', headerText: 'Start Date', allowEditing: false
  },
    { field: 'Duration', headerText: 'Duration', allowFiltering: false }
  ]
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

</body></html>
```

Column type

Column type can be specified using the `columns.type` property. It specifies the type of data the column binds.

If the `format` is defined for a column, the column uses `type` to select the appropriate format option [number](#) or [date](#).

Gantt column supports the following types:

- string

- number
- boolean
- date
- date time

If the `type` is not defined, it will be determined from the first record of the [dataSource](#).

In case if the first record of the [dataSource](#) is null/blank value for a column then it is necessary to define the `type` for that column.

Column spanning in ##Platform_Name## Gantt control

The gantt has option to span the adjacent cells. You need to define the [colSpan](#) attribute to span cells in the [QueryCellInfo](#) event.

In the following demo, **Work 1** cells have been spanned.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Toolbar,ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    work1: 'work1',
    work2: 'work2',
    progress: 'Progress',
    child: 'subtasks'
  },
  splitterSettings: {
    columnIndex: 5
  },
  gridLines: 'Both',
  columns: [
    { field: 'TaskID', headerText: 'Task ID' },
    { field: 'TaskName', headerText: 'Task Name' },
    { field: 'work1', headerText: 'Work 1' },
    { field: 'work2', headerText: 'Work 2' },
    { field: 'StartDate', headerText: 'Start Date' },
    { field: 'Duration', headerText: 'Duration' },
    { field: 'Progress', headerText: 'Progress' }
  ],
  queryCellInfo: function (args) {
    switch (args.data.TaskID) {
      case 1:
        if ((args.column.field == 'work1') &&
          (args.data.taskData.work1 == 'support')) {
          args.colSpan = 2;
        }
        break;
      case 2:
        if ((args.column.field == 'work1') &&
          (args.data.taskData.work1 == 'support')) {
```

```

        args.colSpan = 2;
    }
    break;
    case 3:
        if ((args.column.field == 'work1') &&
            (args.data.taskData.work1 == 'support')) {
            args.colSpan = 2;
        }
        break;
    case 4:
        if ((args.column.field == 'work1') &&
            (args.data.taskData.work1 == 'support')) {
            args.colSpan = 2;
        }
        break;
    case 5:
        if ((args.column.field == 'work1') &&
            (args.data.taskData.work1 == 'support')) {
            args.colSpan = 2;
        }
        break;
    case 7:
        if ((args.column.field == 'work1') &&
            (args.data.taskData.work1 == 'support')) {
            args.colSpan = 2;
        }
        break;
    }
}
});
gantChart.appendTo('#Gantt');
```

INDEX.HTML

State persistence in ##Platform_Name## Gantt control

State persistence refers to the Gantt's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser. State persistence stores gantt's model object in the local storage when the [enablePersistence](#) is defined as true.

Get or set localStorage value

If the [enablePersistence](#) property is set to true, the gantt property value is saved in the `window.localStorage` for reference. You can get/set the localStorage value by using the `getItem/setItem` method in the `window.localStorage`.

```
`ts
```

```
//get the Gantt model.
```

```
let value: string = window.localStorage.getItem('ganttGantt'); //"ganttGantt" is component name +
component id.
```

```
let model: Object = JSON.parse(model);
```

```
,
```

```
`ts
```

```
//set the Gantt model.
```

```
window.localStorage.setItem('ganttGantt', JSON.stringify(model)); //"ganttGantt" is component name +
component id.
```

```
,
```

Prevent columns from persisting

When the [enablePersistence](#) property is set to true, the Gantt properties such as [Filtering](#), [Sorting](#), and [Columns](#) will persist. You can use the `addOnPersist` method to prevent these Gantt properties from persisting.

The following example demonstrates how to prevent Gantt columns from persisting. In the [dataBound](#) event of the Gantt, you can override the `addOnPersist` method and remove the columns from the key list given for persistence.

Note: When the `enablePersistence` property is set to true, the Gantt features such as column template, column formatter, header text, and value accessor will not persist.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,

```

```

height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks',
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
120 },
    { field: 'TaskName', headerText: 'Task Name', width: 150},
    { field: 'StartDate', headerText: 'StartDate', width: 150 },
    { field: 'Duration', headerText: 'Duration', width: 150},
],
enablePersistence: true,
editSettings: {
    allowAdding: true,
    allowEditing: true,
    allowDeleting: true,
    allowTaskbarEditing: true,
    showDeleteConfirmDialog: true
},
dataBound: dataBound
});
gantChart.appendTo('#Gantt');
function dataBound(args) {
    var cloned = this.addOnPersist;
    this.addOnPersist = function (key) {
        key = key.filter(function (item) { return item !== "columns"; });
        return cloned.call(this, key);
    };
}
document.getElementById('add').onclick = function () {
    var obj = { field: "Progress", headerText: 'Progress', width: 100 };
    gantChart.columns.push(obj);
    gantChart.treeGrid.refreshColumns();
};
document.getElementById('remove').onclick = function () {
    gantChart.columns.pop();
    gantChart.treeGrid.refreshColumns();
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

        <button id="add">Add columns</button>
        <button id="remove">Remove columns</button>
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Persist the header template and header Text

By default, the Gantt properties such as column template, header text, header template, column formatter, and value accessor will not persist when [enablePersistence](#) is set to true. Because the column template and header text can be customized at the application level.

If you wish to restore all these column properties, then you can achieve it by cloning the gantt's columns property using JavaScript Object's assign method and storing this along with the persist data manually. While restoring the settings, this column object must be assigned to the gantt's columns property to restore the column settings as demonstrated in the following sample.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
    },
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Right', width:
120 },
        { field: 'TaskName', headerText: 'Task Name', width: 150,
headerTemplate: '#customertemplate' },
        { field: 'StartDate', headerText: 'StartDate', width: 150 },
        { field: 'Duration', headerText: 'Duration', width: 150},
    ]
});

```

```

        { field: 'Progress', headerText: 'Progress', width: 150 },
    ],
    enablePersistence: true,
    editSettings: {
        allowAdding: true,
        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true,
        showDeleteConfirmDialog: true
    },
});
gantChart.appendTo('#Gantt');
var savedProperties;
document.getElementById('restore').onclick = function () {
    savedProperties = JSON.parse(gantChart.getPersistData());
    var gridColumnState = Object.assign([], gantChart.ganttColumns);
    savedProperties.columns.forEach(function (col) {
        var headerText = gridColumnState.find(function (colColumnsState) {
            return colColumnsState.field === col.field; })['headerText'];
        var colTemplate = gridColumnState.find(function (colColumnsState) {
            return colColumnsState.field === col.field; })['template'];
        var headerTemplate = gridColumnState.find(function
        (colColumnsState) { return colColumnsState.field === col.field;
        })['headerTemplate'];
        col.headerText = 'Text Changed';
        col.template = colTemplate;
        col.headerTemplate = headerTemplate;
    });
    console.log(savedProperties);
    gantChart.treeGrid.setProperties(savedProperties);
};

```

Tool bar in ##Platform_Name## Gantt control

The Gantt control provides the toolbar support to handle Gantt actions. The [toolbar](#) property accepts the collection of built-in toolbar items and `ItemModel` objects for custom toolbar items.

Built-in toolbar items

Built-in toolbar items execute standard actions of the Gantt control, and these items can be added to toolbar by defining the [toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items	Actions
-----	-----
Add	Adds a new record.
Cancel	Cancels the edit state.
CollapseAll	Collapses all the rows.
Delete	Deletes the selected record.
Edit	Edits the selected record.
Indent	Indent the selected record to one level.
Outdent	Outdent the selected record to one level.
ExpandAll	Expands all the rows.
NextTimeSpan	Navigate the Gantt timeline to next time span.
PrevTimeSpan	Navigate the Gantt timeline to previous time span.

| Search | Searches the records by the given key. |

| Update | Updates the edited record. |

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbar:
    ['Add','Cancel','CollapseAll','Delete','Edit','ExpandAll','NextTimeSpan','PreviousTimeSpan','Search','Update','Indent','Outdent'],
    editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true
    }
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* The [toolbar](#) has options to define both built-in and custom toolbar items.

Custom toolbar items

Custom toolbar items can be added to the toolbar by defining the [toolbar](#) property as a collection of `ItemModels`.

Actions for this customized toolbar items are defined in the [toolbarClick](#) event.

By default, the custom toolbar items are at left position. You can change the position by using the `align` property. In the following sample, the `Quick Filter` toolbar item is positioned at right.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'toolbarfilter') {
        ganttChart.filterByColumn('TaskName', 'startswith', 'Identify');
    }
};
ej.gantt.Gantt.Inject(ej.gantt.Filter,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbarClick: clickHandler,
    toolbar: [{text: 'Quick Filter', tooltipText: 'Quick
Filter', id: 'toolbarfilter', align:'Right', prefixIcon: 'e-quickfilter'}],
    allowFiltering:true
});
ganttChart.appendTo('#Gantt');

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* The [toolbar](#) has options to define both built-in and custom toolbar items.

* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

Built-in and custom items in toolbar

The Gantt control has an option to use both built-in and custom toolbar items at the same time.

In the following example, the **ExpandAll** and **CollapseAll** are built-in toolbar items and **Test** is the custom toolbar item.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.text === 'Test') {
        alert("Custom toolbar click...");
    }
};
ej.gantt.Gantt.Inject(ej.gantt.Filter,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    toolbarClick: clickHandler,
    toolbar: ['ExpandAll', 'CollapseAll', { text: 'Test',
tooltipText: 'Test',id: 'Test' }]
});
ganttChart.appendTo('#Gantt');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable/disable toolbar items

You can enable or disable the toolbar items by using the `enableItems` method.

INDEX.JS

```

var clickHandler = function(args){
  if (args.item.text === 'QuickFilter') {
    ganttChart.filterByColumn('TaskName', 'startswith', 'Identify');
  }
  if (args.item.text === 'ClearFilter') {
    ganttChart.clearFiltering();
  }
};
ej.gantt.Gantt.Inject(ej.gantt.Filter,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',

```

```

        progress: 'Progress',
        child: 'subtasks'
    },
    toolbarClick: clickHandler,
    toolbar: ['QuickFilter', 'ClearFilter'],
    allowFiltering: true
});
ganttChart.appendTo('#Gantt');
var enable = new ej.buttons.Button({}, '#enable');
var disable = new ej.buttons.Button({}, '#disable');
enable.element.onclick = function() {
    ganttChart.toolbarModule.enableItems([ganttChart.element.id +
    '_QuickFilter', ganttChart.element.id + '_ClearFilter'], true); // enable
    toolbar items.
};
disable.element.onclick = function() {
    ganttChart.toolbarModule.enableItems([ganttChart.element.id +
    '_QuickFilter', ganttChart.element.id + '_ClearFilter'], false); // disable
    toolbar items.
};

```

INDEX.HTML

```

```

Add input elements to toolbar

In the Gantt toolbar, you can add EJ2 editor elements like numeric text box, drop-down list, and date picker controls. The following code snippets demonstrates how to add EJ2 editors to the Gantt toolbar.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  toolbar: [{ type: 'Input', template: new ej.inputs.NumericTextBox({
    format: 'c2', value:1, width:150 }) }]
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Context menu in ##Platform_Name## Gantt control

The Gantt control allows you to perform quick actions by using context menu. When right-clicking the context menu, the context menu options are shown. To enable this feature, set the [enableContextMenu](#) to true. The default context menu options are enabled using the [editSettings](#) property. The context menu options can be customized using the [contextMenuItems](#) property.

To use the context menu, inject the [ContextMenu](#) module into the Gantt control.

The default items are listed in the following table.

Items	Description
AutoFit	Auto-fits the current column.
AutoFitAll	Auto-fits all columns.
SortAscending	Sorts the current column in ascending order.
SortDescending	Sorts the current column in descending order.
TaskInformation	Edits the current task.
Add	Adds a new row to the Gantt.
Indent	Indent the selected record to one level.
Outdent	Outdent the selected record to one level.
DeleteTask	Deletes the current task.
Save	Saves the edited task.
Cancel	Cancels the edited task.
DeleteDependency	Deletes the current dependency task link.
Convert	Converts current task to milestone or vice-versa.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    dependency: 'Predecessor',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  allowSorting: true,
  allowResizing: true,
  editSettings: {
    allowAdding: true,
```

```

        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true
    },
    enableContextMenu: true
});
gantChart.appendTo('#ContextMenu');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Custom context menu items

The custom context menu items can be added by defining the [contextMenuItems](#) as a collection of [contextMenuItemModel](#). Actions for the customized items can be defined in the [contextMenuClick](#) event and the visibility of customized items can be defined in the [contextMenuOpen](#) event.

To create custom context menu items for header area, define the target property as `.e-gridheader`.

The following sample shows context menu item for parent rows to expand or collapse child rows in the content area and a context menu item to hide columns in the header area.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
```

```

        dataSource: GanttData,
        height: '450px',
        taskFields: {

            'Convert',
            { text: 'Collapse the Row', target: '.e-content', id:
            'collapserow' },
            { text: 'Expand the Row', target: '.e-content', id: 'expandrow'
        },
        { text: 'Hide Column', target: '.e-gridheader', id:
        'hidecols' }
    ],
    contextMenuClick: function (args) {
        var record = args.rowData;
        if (args.item.id === 'collapserow') {
            ganttChart.collapseByID(Number(record.ganttProperties.taskId));
        }
        if (args.item.id === 'expandrow') {
            ganttChart.expandByID(Number(record.ganttProperties.taskId));
        }
        if (args.item.id === 'hidecols') {
            ganttChart.hideColumn(args.column.headerText);
        }
    },
    contextMenuOpen: function (args) {
        var record = args.rowData;
        if (args.type !== 'Header') {
            if (!record.hasChildRecords) {
                args.hideItems.push('Collapse the Row');
                args.hideItems.push('Expand the Row');
            } else {
                if (record.expanded) {
                    args.hideItems.push("Expand the Row");
                } else {
                    args.hideItems.push("Collapse the Row");
                }
            }
        }
    }
}

```

```

    }
  }
});
gantChart.appendTo('#CustomContextMenu');
```

INDEX.HTML

</body></html>
```

You can show an specific item in context menu for header/content area in the Gantt control by defining the **target** property.

Excel Export

Excel export in ##Platform_Name## Gantt control

Gantt supports client-side exporting, which allows you to export its data to the Excel and CSV formats. Use the [excelExport](#) and [csvExport](#) methods for exporting. To enable Excel export in the Gantt, set the [allowExcelExport](#) to true.

To export data to Excel and CSV, inject the **ExcelExport** module in Gantt.

INDEX.JS

```

var clickHandler = function(args) {
  if (args.item.id === 'GanttExport_excelexport') {
```

```

        ganttChart.excelExport();
    } else if (args.item.id === 'GanttExport_csvexport') {
        ganttChart.csvExport();
    }
};
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport, ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowExcelExport: true,
    toolbar: ['ExcelExport', 'CsvExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

Custom data source in ##Platform_Name## Gantt control

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`.

INDEX.JS

```
var clickHandler = function(args){
    if (args.item.id === 'GanttExport_excelexport') {
        var excelExportProperties = {
            dataSource: [GanttData[1]]
        };
        ganttChart.excelExport(excelExportProperties);
    }
};
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```

Multiple gantt exporting in ##Platform_Name## Gantt control

In Gantt, the Excel export provides support to export multiple Gantt data in new sheet or same sheet.

Same sheet

The Excel export provides support to export multiple Gantt data in the same sheet. To export in same sheet, define `multipleExport.type` as `AppendToSheet` in `ExcelExportProperties`. You can also provide blank rows between exported multiple Gantt data. These blank rows count can be defined using `multipleExport.blankRows`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var firstGantt = new ej.gantt.Gantt({
    dataSource: [GanttData[0]],
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    allowExcelExport: true,
    projectStartDate: new Date('03/31/2019'),
    projectEndDate: new Date('04/14/2019'),
    height:280,
    toolbar: ['ExcelExport']
});
firstGantt.appendTo('#GanttExport1');
var secondGantt = new ej.gantt.Gantt({
    dataSource: [GanttData[1]],
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    height:250,
    allowExcelExport: true

```

```

});
secondGantt.appendTo('#GanttExport2');
firstGantt.toolbarClick = function(args) {
    if (args.item.id === 'GanttExport1_excelexport') {
        var appendExcelExportProperties = {
            multipleExport: { type: 'AppendToSheet', blankRows: 2 }
        };
        var firstGanttExport=
firstGantt.excelExport(appendExcelExportProperties, true);
        firstGanttExport.then(function(fData) {
            secondGantt.excelExport(appendExcelExportProperties, false,
fData);
        });
    }
}
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

<body>

    <div id="container">
        <div id="GanttExport1"></div>
        <div id="GanttExport2" style="margin-top:10px"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, `multipleExport.blankRows` value is 5.

New sheet

The Excel exporting provides support to export multiple Gantt in new sheet. To export in new sheet, define `multipleExport.type` as `NewSheet` in `ExcelExportProperties`.

INDEX.JS

```

ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var firstGantt = new ej.gantt.Gantt({
  dataSource: [GanttData[0]],
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  treeColumnIndex: 1,
  allowExcelExport: true,
  projectStartDate: new Date('03/31/2019'),
  projectEndDate: new Date('04/14/2019'),

Customize the Excel export

Gantt Excel export allows the users to customize the exported document based on requirement.

Export hidden columns

In Gantt, the Excel export provides an option to export hidden columns by defining `includeHiddenColumn` as `true`.

INDEX.JS

```

var clickHandler = function(args){
  if (args.item.id === 'GanttExport_excelexport') {
    var excelExportProperties = {
      includeHiddenColumn: true
    };
    ganttChart.excelExport(excelExportProperties);
  }
  else if (args.item.id === 'GanttExport_csvexport') {
    var excelExportProperties = {
      includeHiddenColumn: true
    };
    ganttChart.csvExport(excelExportProperties);
  }
};
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {

```

```

        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    allowExcelExport: true,
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width:
'100' },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width:
'150', visible: false },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    toolbar: ['ExcelExport', 'CsvExport'],
    toolbarClick: clickHandler
});
gantChart.appendTo('#GanttExport');

```

INDEX.HTML

```

```

Show or hide columns on exported Excel

In Gantt, while exporting, you can show a hidden column or hide a visible column using the [toolbarClick](#) and [excelExportComplete](#) events.

In the `toolbarClick` event, using the `args.item.id` property, you can show or hide columns by setting the `column.visible` property to `true` or `false` respectively.

Similarly, in the `excelExportComplete` event, you can revert the columns visibility back to the previous state.

INDEX.JS

```
var clickHandler = function(args){
    let columns = ganttChart.treeGrid.grid.columns;
    if (args.item.id === 'GanttExport_excelexport') {
        columns[0].visible = true;
        columns[3].visible = false;
        ganttChart.excelExport();
    }
    else if (args.item.id === 'GanttExport_csvexport') {
        columns[0].visible = true;
        columns[3].visible = false;
        ganttChart.csvExport();
    }
};
var exportComplete = function(args){
    let columns = ganttChart.treeGrid.grid.columns;
    columns[0].visible = false;
    columns[3].visible = true;
};
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    allowExcelExport: true,
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width:
'100',visible: false },
        { field: 'TaskName', headerText: 'Task Name', width: '150' },
        { field: 'StartDate', headerText: 'Start Date', width: '150' },
        { field: 'Duration', headerText: 'Duration', width: '150' },
        { field: 'Progress', headerText: 'Progress', width: '150' },
    ],
    toolbar: ['ExcelExport', 'CsvExport'],
    toolbarClick: clickHandler,
    excelExportComplete: exportComplete
});
```

```
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Cell formatting during export

In Gantt, you can customize the TreeGrid cells in the exported document using the [excelQueryCellInfo](#) event. In this event, you can format the TreeGrid cells of exported Excel and CSV documents based on the required condition.

In the following sample, the background color has been customized for **TaskID** column in the exported Excel using the **args.style** and **backColor** properties.

INDEX.JS

```
var clickHandler = function(args){
  if (args.item.id === 'GanttExport_excelexport') {
    ganttChart.excelExport();
  }
};
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
```

```

height: '450px',
taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
},
treeColumnIndex: 1,
allowExcelExport: true,
toolbar: ['ExcelExport'],
labelSettings:{
    taskLabel: '${Progress}%'
},
splitterSettings: {
    columnIndex: 3
},
columns: [
    { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left', width:
'100',visible:false },
    { field: 'TaskName', headerText: 'Task Name', width: '150' },
    { field: 'Progress', headerText: 'Progress', width: '150' },
    { field: 'StartDate', headerText: 'Start Date', width: '150' },
    { field: 'Duration', headerText: 'Duration', width: '150' }
],
excelQueryCellInfo: function(args) {
    if(args.column.field == 'Progress'){
        if(args.value > 80) {
            args.style = { backgroundColor: '#A569BD' };
        }
        else if(args.value < 20) {
            args.style = { backgroundColor: '#F08080' };
        }
    }
},
queryTaskbarInfo: function(args) {
    if (args.data.Progress > 80) {
        args.progressBarBgColor = "#6C3483";
        args.taskbarBgColor = args.taskbarBorderColor = "#A569BD";
    } else if (args.data.Progress < 20) {
        args.progressBarBgColor = "#CD5C5C";
        args.taskbarBgColor = args.taskbarBorderColor = "#F08080";
    }
},
queryCellInfo: function(args) {
    if(args.column.field == 'Progress'){
        if(args.data.Progress > 80) {
            args.cell.style.backgroundColor = '#A569BD';
        }
        else if(args.data.Progress < 20) {
            args.cell.style.backgroundColor = '#F08080';
        }
    }
},
toolbarClick: clickHandler
});

```

```
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Theme

The Excel export also provides an option to include custom theme for exported Excel document.

To apply theme in exported Excel, define the **theme** in **ExcelExportProperties**.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.ExcelExport,ej.gantt.Toolbar);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  treeColumnIndex: 1,
```

```

        allowExcelExport: true,
        toolbar: ['ExcelExport'],
    });
    ganttChart.appendTo('#GanttExport');
    ganttChart.toolbarClick = (args) => {
        if (args['item'].id === 'GanttExport_excelexport') {
            let excelExportProperties = {
                theme: {
                    header: { fontName: 'Segoe UI', fontColor: '#666666' },
                    record: { fontName: 'Segoe UI', fontColor: '#666666' },
                    caption: { fontName: 'Segoe UI', fontColor: '#666666' }
                }
            };
            ganttChart.excelExport(excelExportProperties);
        }
    }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

Pdf Export

Pdf export in ##Platform_Name## Gantt control

PDF Export

PDF export allows exporting Gantt data to PDF document. You need to use the [pdfExport](#) method for exporting. To enable PDF export in the Gantt, set the [allowPdfExport](#) to true.

To export data to PDF document, inject the PdfExport module in Gantt.

INDEX.JS

```
var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        ganttChart.pdfExport();
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```

Indicators in PDF exporting

The PDF export functionality allows users to export Gantt charts enriched with dynamic indicators and accompanying images.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        ganttChart.pdfExport();
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
        indicators: 'Indicators'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

Exporting Gantt data as a blob object

In Gantt, you can export the Gantt chart data as a blob object, which allows you to preview or modify the data before exporting it.

To export the Gantt chart data as a blob object, follow these steps:

step 1: pdfExport fourth argument set as **true**.

step 2: Then , pdfExpComplete return as blob object.

INDEX.JS

```

/**
 * Exporting Blob data
 */
let excelExpComplete = (args) => {
    //This event will be triggered when excel exporting.
    args.promise.then((e) => {
        //In this `then` function, we can get blob data through the arguments
        //after promise resolved.
        exportBlob(e.blobData);
    });
};

let pdfExpComplete = (args) => {
    //This event will be triggered when pdf exporting.
    args.promise.then((e) => {
        //In this `then` function, we can get blob data through the arguments
        //after promise resolved.
        exportBlob(e.blobData);
    });
};

let exportBlob = (blob) => {
    let a = document.createElement('a');
    document.body.appendChild(a);
    a.style.display = 'none';
    let url = window.URL.createObjectURL(blob);
    a.href = url;
    a.download = 'Export';

```

```

a.click();
window.URL.revokeObjectURL(url);
document.body.removeChild(a);
}
const clickHandler = (args) => {
if (args.item.id === 'GanttExport_pdfexport') {
    gantt.pdfExport(null, null, null, true);
}
if (args.item.id === 'GanttExport_excelexport') {
    gantt.excelExport(null, null, null, true);
}
};

var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    allowExcelExport: true,
    excelExportComplete: excelExpComplete,
    pdfExportComplete: pdfExpComplete,
    toolbar: ['PdfExport', 'ExcelExport'],
    toolbarClick: clickHandler
});
gantt.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Single page exporting in gantt

In Gantt, we have provided support to export the Gantt component where each rows are auto-fit to the PDF document page width by setting [isFitToWidth](#) as true in `fitToWidthSettings` of `PdfExportProperties`.

Also, we can customize the chart width and grid width in exported file using [chartWidth](#) and [gridWidth](#) by defining it as percentage in string.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            fitToWidthSettings: {
                isFitToWidth: true,
            }
        };
        ganttChart.pdfExport(exportProperties);
    }
};

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    dateFormat: 'MMM dd, y',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        dependency: 'Predecessor',
        child: 'subtasks',
    },
    columns: [
        { field: 'TaskID', width: 80 },
        { field: 'TaskName', width: 250 },
        { field: 'StartDate' },
        { field: 'EndDate' },
        { field: 'Duration' },
        { field: 'Predecessor' },
        { field: 'resources' },
        { field: 'Progress' }
    ]
});

```

```

    ],
    splitterSettings: {
        columnIndex: 2
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler,
    allowSelection: true,
    gridLines: 'Both',
    height: '450px',
    treeColumnIndex: 1,
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName'
    },
    highlightWeekends: true,
    timelineSettings: {
        topTier: {
            unit: 'Week',
            format: 'MMM dd, y',
        },
        bottomTier: {
            unit: 'Day',
        },
    },
    labelSettings: {
        leftLabel: 'TaskName',
        rightLabel: 'resources'
    },
    projectStartDate: new Date('03/25/2019'),
    projectEndDate: new Date('07/28/2019')
});
gantChart.appendTo('#GanttExport');

```

INDEX.HTML

```

```

Exporting with column template

The PDF export functionality allows to export Grid columns that include images, hyperlinks, and custom text to an PDF document using [pdfQueryCellInfo](#) event.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

Note: PDF Export supports base64 string to export the images.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            enableFooter: false
        };
        ganttChart.pdfExport(exportProperties);
    }
};
function pdfQueryCellInfo(args) {
    if (args.column.headerText === 'Resources') {
        {
            args.image = { height: 40, width: 40, base64:
args.data.taskData.resourcesImage };
        }
    }
    if (args.column.headerText === 'Email ID') {
        args.hyperLink = {
            target: 'mailto:' + args.data.taskData.EmailId,
            displayText: args.data.taskData.EmailId
        };
    }
}
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        resourceInfo: 'resources',

```

```

        dependency: 'Predecessor',
        child: 'subtasks'
    },
    allowPdfExport: true,
    columns: [
        { field: 'TaskID', headerText: 'Task ID', textAlign: 'Left' },
        { field: 'TaskName', headerText: 'Task Name', width: '250' },
        { field: 'resources', headerText: 'Resources', width: '250',
template: '#columnTemplate' },
        {field: 'EmailId', headerText: 'Email ID', template: '#template2',

Multiple gantt exporting in ##Platform_Name## Gantt control

PDF export provides an option for exporting multiple Gantt to same file. In this exported document, each Gantt will be exported to a new page of the document in same file.

INDEX.JS

```

var firstGantt = new ej.gantt.Gantt({
    dataSource: [GanttData[0]],
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    allowExcelExport: true,
    projectStartDate: new Date('03/31/2019'),
    projectEndDate: new Date('04/14/2019'),
    height: 280,
    toolbar: ['ExcelExport']
});
firstGantt.appendTo('#GanttExport1');
var secondGantt = new ej.gantt.Gantt({
    dataSource: [GanttData[1]],
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    treeColumnIndex: 1,
    height: 250,
    allowExcelExport: true
});
secondGantt.appendTo('#GanttExport2');

```

```

firstGantt.toolbarClick = function(args) {
    if (args.item.id === 'GanttExport1_pdfexport') {
        var appendExcelExportProperties = {
            multipleExport: { type: 'AppendToSheet', blankRows: 2 }
        };
        var firstGanttExport= firstGantt.pdfExport({}, true);
        firstGanttPdfExport.then(function(pdfData) {
            secondGantt.pdfExport({}, false, pdfData);
        });
    }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>

```

To customize PDF export

PDF export provides an option to customize the mapping of Gantt to exported PDF document.

File name for exported document

You can assign a file name for the exported document by defining the `fileName` property in `pdfExportProperties`.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            fileName:"new.pdf"
        };
        ganttChart.pdfExport(exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">

if(ele) {
    ele.style.visibility = "visible";
}
</script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

How to change page orientation

Page orientation can be changed to **Portrait** (Default Landscape) for the exported document using the property `pdfExportProperties.pageOrientation`.

INDEX.JS

```
var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            pageOrientation: 'Portrait'
        };
        ganttChart.pdfExport(exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

[How to change page size](#)

Page size can be customized for the exported document using the `pdfExportProperties.pageSize`.

The supported page sizes are:

- Letter
- Note
- Legal
- A0
- A1
- A2
- A3
- A5
- A6
- A7
- A8
- A9
- B0
- B1
- B2
- B3
- B4
- B5
- Archa
- Archb
- Archc
- Archd
- Arche
- Flsa
- HalfLetter
- Letter11x17
- Ledger

INDEX.JS

```
var clickHandler = function(args){
  if (args.item.id === 'GanttExport_pdfexport') {
```

```

        var exportProperties = {
            pageSize: 'A0'
        };
        ganttChart.pdfExport(exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({

<body>

    <div id="container">
        <div id="GanttExport"></div>
    </div>

    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Export current view data

PDF export provides an option to export the current view data into PDF. To export current view data alone, define the `exportType` to `CurrentViewData`.

INDEX.JS

```
var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            exportType: 'CurrentViewData'
        };
        ganttChart.pdfExport(exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    allowFiltering: true,
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable footer

By default, we render the default footer for a PDF file, this can be enabled or disabled by using the `enableFooter` property.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            enableFooter: false
        };
        ganttChart.pdfExport(exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Export hidden columns

PDF export provides an option to export hidden columns of Gantt by defining the `includeHiddenColumn` to `true`.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            includeHiddenColumn: true
        };
        ganttChart.pdfExport(exportProperties);
    }
};

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID'},
        { field: 'TaskName', visible: false},
        { field: 'StartDate'},
        { field: 'Duration'},
        { field: 'Progress'}
    ],
    allowPdfExport: true,
    toolbar: ['PdfExport'],

```

```

        toolbarClick: clickHandler
    });
    ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Export predecessor lines

By using `showPredecessorLines`, you can hide or show predecessor lines in the exported PDF document.

INDEX.JS

```

var clickHandler = function(args){
  if (args.item.id === 'GanttExport_pdfexport') {
    var exportProperties = {
      showPredecessorLines: true
    };
    ganttChart.pdfExport(exportProperties);
  }
};
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',

```

```

        taskFields: {
            id: 'TaskID',
            name: 'TaskName',
            startDate: 'StartDate',
            duration: 'Duration',
            progress: 'Progress',
            child: 'subtasks'
        },
        allowPdfExport: true,
        toolbar: ['PdfExport'],
        toolbarClick: clickHandler
    });
    ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="GanttExport"></div>
    </div>

    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Show or hide columns on exported PDF

You can show a hidden column or hide a visible column while exporting the Gantt using the [toolbarClick](#) and [beforePdfExport](#) events.

You can show or hide columns by setting the `column.visible` property to `true` or `false` respectively.

In the following example, there is a hidden column **Duration** in the Gantt. While exporting, we have changed **Duration** to visible column and **StartDate** to hidden column.

INDEX.JS

```
var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var obj = document.getElementById('GanttExport').ej2_instances[0];
        obj.treeGrid.columns[2].visible = false;
        ganttChart.pdfExport();
    }
};
var beforePdfExport = function(args){
    var obj = document.getElementById('GanttExport').ej2_instances[0];
    obj.treeGrid.columns[3].visible = true;
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName' },
        { field: 'StartDate' },
        { field: 'Duration', visible: false },
        { field: 'Progress' }
    ],
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler,
    beforePdfExport: beforePdfExport
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Gantt Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="GanttExport"></div>
    </div>

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Conditional cell formatting

TreeGrid cells in the exported PDF can be customized or formatted using the [pdfQueryCellInfo](#) event. In this event, you can format the treegrid cells of exported PDF document based on the column cell value.

In the following sample, the background color is set for **Progress** column in the exported document by using the `args.style` and `backgroundColor` properties.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        ganttChart.pdfExport();
    }
};
var pdfQueryCellInfo = function(args){
    if(args.column.field === 'Progress'){
        if(args.value < 50) {
            args.style = {backgroundColor: '#F08080'};
        } else {
            args.style = {backgroundColor: '#A569BD'};
        }
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID'},
        { field: 'TaskName'},

```

```

        { field: 'StartDate'},
        { field: 'Duration', visible: false},
        { field: 'Progress'}
    ],
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler,
    pdfQueryCellInfo: pdfQueryCellInfo
});
gantChart.appendTo('#GanttExport');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Timeline cell formatting

Timeline cells in the exported PDF document can be customized or formatted using the [pdfQueryTimelineCellInfo](#) event.

In the following sample, the header background color is set for timeline cells in the exported document by using the `args.headerBackgroundColor` property.

INDEX.JS

```
var clickHandler = function(args) {
```

```

    if (args.item.id === 'GanttExport_pdfexport') {
        ganttChart.pdfExport();
    }
};
var pdfQueryTimelineCellInfo = function(args){
    if(args.column.field === 'Progress'){
        args.timelineCell.backgroundColor = new ej.pdfexport.PdfColor(240,
248, 255);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID'},
        { field: 'TaskName'},
        { field: 'StartDate'},
        { field: 'Duration', visible: false},
        { field: 'Progress'}
    ],
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler,
    pdfQueryTimelineCellInfo: pdfQueryTimelineCellInfo
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Taskbar formatting

Taskbars in the exported PDF document can be customized or formatted using the [pdfQueryTaskbarInfo](#) event.

In the following sample, the taskbar background color is customized in the chart side of the exported document by using the `args.taskbar` property.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        ganttChart.pdfExport();
    }
};

var pdfQueryTaskbarInfo = function(args){
    if(args.data.Progress < 50 && !args.data.hasChildRecords) {
        args.taskbar.progressColor = new ej.pdfexport.PdfColor(205, 92, 92);
        args.taskbar.taskColor = args.taskbar.taskBorderColor = new
ej.pdfexport.PdfColor(240, 128, 128);
    }
};

var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName' },
        { field: 'StartDate' },
        { field: 'Duration', visible: false },
        { field: 'Progress' }
    ],
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler,
    pdfQueryTaskbarInfo: pdfQueryTaskbarInfo

```

```
});
ganttChart.appendTo('#GanttExport');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">

```

Theme

PDF export provides an option to include theme for the exported PDF document. To apply theme in exported PDF, define the **theme** in **pdfExportProperties**. The available themes are:

- Material
- Fabric
- Bootstrap
- Bootstrap 4

INDEX.JS

```
var clickHandler = function(args){
  if (args.item.id === 'GanttExport_pdfexport') {
    var exportProperties = {
      theme:"Fabric"
    };
  }
};
```

```

        ganttChart.pdfExport (exportProperties);
    }
};
var ganttChart = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    },
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    toolbarClick: clickHandler
});
ganttChart.appendTo('#GanttExport');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Gantt</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customized Theme

PDF export provides an option to customize the Gantt style for the exported PDF document. To customize Gantt style in exported PDF, define the `ganttStyle` in `pdfExportProperties`.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'GanttExport_pdfexport') {
        var exportProperties = {
            ganttStyle: {
                fontFamily: 1,
                columnHeader: {
                    backgroundColor: new ej.pdfexport.PdfColor(179, 219,
255)
                },
                taskbar: {
                    taskColor: new ej.pdfexport.PdfColor(240, 128, 128),

Customizing header and footer of PDF export in ##Platform_Name## Gantt control

PDF export provides an option to specify and customize text, page number, line and image in header and footer of exported PDF document by using [pdfExportProperties](#).

Write a text in header and footer

This functionality helps to customize the text that appears in the header or footer sections of a PDF document. Text can be added to [header](#) or [footer](#) of exported PDF document by using [pdfExportProperties](#).

- **type** property in the content array indicates the content type, such as 'Text'.
- **Value** property determines the text.
- **Position** property determines the horizontal and vertical positions of the text element.
- **style** property define the visual styling properties for the text element

`ts

```
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Text',
        value: 'INVOICE',
        position: { x: 380, y: 0 },
        style: { textBrushColor: '#C25050', fontSize: 25 },
      },
    ]
  }
},
```

Draw a line in header and footer

This functionality helps to customize the line that appears in the header or footer sections of the PDF document. A line can be added to [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- **type** determines content type, such as 'Line'.
- **style** is used to set properties like the color (penColor), size (penSize), and style (dashStyle) of the line.
- **points** specifies the coordinates for the start and end points of the line.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

`ts

```
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
```

```
{
  type: 'Line',
  style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
  points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
}
```

Add page number in header and footer

This feature allows to customize the page number that appears in the header or footer sections of the PDF document. Page numbers can be added in [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- **type** indicates that the content is a page number.
- **pageNumberType** specifies the type of numbering to be used.
- **format** is an optional attribute that allows you to customize the text format of the page number.
- **position** defines the coordinates (x, y) where the page number will be located.
- **style** sets the styling properties of the page number text, such as color (textBrushColor), font size (fontSize), and horizontal alignment (hAlign).

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
```

```
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
```

```

format: 'Page {$current} of {$total}', //optional
position: { x: 0, y: 25 },
style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
}
]
}
}
,

```

Insert an image in header and footer

This feature allows to customize the image that appears in the header or footer sections of the PDF document. Image (Base64 string) can be added in the exported document in [header](#) or [footer](#) of the exported PDF document by using [pdfExportProperties](#).

- **type** indicates that the content is an image.
- **src** specifies the source of the image, which should be Base64 string.
- **Position** determines the horizontal and vertical positions of the image will be located.
- **size** sets the dimensions of the image.

Note: PDF Export supports base64 string to export the images.

```

`ts
// Replace it with a valid Base64-encoded image.
let image: string = "/9j/4AAQSkZJRgABAQEAAeAB4AAD..."
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Image',
        src: image,
        position: { x: 40, y: 10 },
        size: { height: 100, width: 250 },
      }
    ]
  }
}

```

Data markers in ##Platform_Name## Gantt control

Data markers are a set of events used to represent the schedule events for a task. Data markers are defined in data source as array of objects, and this value is mapped to the Gantt control using the [taskFields.indicators](#) property. You can represent more than one data marker in a task.

Data markers can be defined using the following properties:

- [date](#): Defines the date of indicator.
- [iconClass](#): Defines the icon class of indicator.
- [name](#): Defines the name of indicator.
- [tooltip](#): Defines the tooltip of indicator.

Note: Data Marker **tooltip** will be rendered only if tooltip property has value.

The following code example demonstrates how to implement data markers in the Gantt chart.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: [
    {
      TaskID: 1,
      TaskName: 'Project Initiation',
      StartDate: new Date('04/02/2019'),
      EndDate: new Date('04/21/2019'),
      subtasks: [
        {

```

```

TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 4, Progress: 50,
Indicators: [
    {
        'date': '04/08/2019',
        'iconClass': 'e-btn-icon e-notes-info e-icons e-
icon-left e-gantt e-notes-info::before',
        'name': 'Custom String',
        'tooltip': 'Follow up'
    },
    {
        'date': '04/11/2019',
        'iconClass': 'e-btn-icon e-notes-info e-icons e-
icon-left e-gantt e-notes-info::before',
        'name': '<span style="color:red">String
Template</span>',
    }
],
    { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
    {

Global local in ##Platform_Name## Gantt control

Localization

The [Localization](#) library allows you to localize default text content of the Gantt. The Gantt component has static text on some features (like toolbar area text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

[locale](#) value and translation object.

The following list of properties and its values are used in the Gantt.

Locale key words | Text

emptyRecord | No records to display

id | ID

name | Name

startDate | Start Date

endDate | End Date

duration | Duration

progress | Progress

dependency | Dependency

notes | Notes

baselineStartDate | Baseline Start Date

baselineEndDate | Baseline End Date

type | Type

offset | Offset

resourceName | Resources

resourceID | Resource ID

day | day

hour | hour

minute | minute

days | days

hours | hours

minutes | minutes

generalTab | General

customTab | Custom Columns

writeNotes | Write Notes

addDialogTitle | New Task

editDialogTitle | Task Information

add | Add

edit | Edit

update | Update

delete | Delete

cancel | Cancel

search | Search

task | task

tasks | tasks

zoomIn | Zoom in

zoomOut | Zoom out

zoomToFit | Zoom to fit

expandAll | Expand all

collapseAll | Collapse all

nextTimeSpan | Next timespan

prevTimeSpan | Previous timespan

saveButton | Save

taskBeforePredecessor_FS | You moved "{0}" to start before "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor_FS | You moved "{0}" away from "{1}" and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor_SS | You moved "{0}" to start before "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor_SS | You moved "{0}" to start after "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor_FF | You moved "{0}" to finish before "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor_FF | You moved "{0}" to finish after "{1}" finishes and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskBeforePredecessor_SF | You moved "{0}" away from "{1}" to starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

taskAfterPredecessor_SF | You moved "{0}" to finish after "{1}" starts and the two tasks are linked. As the result, the links cannot be honored. Select one action below to perform

okText | Ok

confirmDelete | Are you sure you want to Delete Record?

from | From

to | To

taskLink | Task Link

lag | Lag

start | Start

finish | Finish

enterValue | Enter the value

taskInformation | Task Information

deleteTask | Delete Task

deleteDependency | Delete Dependency

convert | Convert

save | Save

above | Above

below | Below

child | Child

milestone | Milestone

toTask | To Task

toMilestone | To Milestone

eventMarkers | Event markers

leftTaskLabel | Left task label

rightTaskLabel | Right task label

timelineCell | Timeline cell

confirmPredecessorDelete | Are you sure you want to remove dependency link?

taskMode | Task Mode

changeScheduleMode | Change Schedule Mode

subTasksStartDate | SubTasks Start Date

subTasksEndDate | SubTasks End Date

scheduleStartDate | Schedule Start Date

scheduleEndDate | Schedule End Date

auto | Auto

manual | Manual

zoomToFit | Zoom to fit

excelExport | Excel export

csvExport | CSV export

pdfExport | Pdf export

unit | Unit

work | Work

taskType | Task Type

unassignedTask | Unassigned Task

group | Group

Loading translations

To load translation object in an application use [load](#) function of [L10n](#) class.

The below example demonstrates the Gantt in **Deutsch** culture.

INDEX.JS

```
ej.base.L10n.load({
  'de-DE': {
    'gantt': {
      "id": "Ich würde",
      "name": "Name",
      "startDate": "Anfangsdatum",
      "duration": "Dauer",
      "progress": "Fortschritt",
    }
  }
});
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  locale: 'de-DE',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
});
ganttChart.appendTo('#Gantt');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

  <link href="https://cdn.syncfusion.com/ej2/material.css"
rel="stylesheet" type="text/css">

  <style>
    .e-gantt .e-gantt-chart .e-custom-event-marker {
      width: 1px;
      border-left: 2px green dotted;
    }
  </style>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Gantt"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in gantt component.

INDEX.JS

```

import * as cagregorian from './ca-gregorian.js';
import * as numbers from './numbers.js';
var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 4, Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',

```

        <div id="Gantt"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* In the above sample, **Timeline** is formatted by **NumberFormatOptions** and **DateFormatOptions**.

* By default, **locale** value is **en-US**. If you want to change **en-US** culture, then set the **locale**.

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Gantt component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Urdu, etc.). To enable RTL Gantt, set the **enableRtl** to true.

INDEX.JS

Accessibility in ##Platform_Name## Gantt control

The Gantt component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Gantt component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation |

|

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Gantt component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Gantt component:

The following ARIA attributes are used in Gantt:

| Attributes | Purpose |

| --- | --- |

| **grid (role)** | This attribute is added to the **e-table** element present in the Gantt, which represents Grid part |

| **gridcell (role)** | This attribute is added to the **td** elements present within the **e-table**, which represents the work cells of Gantt |

| **columnheader (role)** | This attribute is added to the **th** elements within the **e-table**, which represents the header cells of Grid table |

| **separator (role)** | This attribute is added to the **e-split-bar** element, which represents the splitter between the Grid table and Chart |

| **dialog (role)** | This attribute is added to the **e-dialog** element, which represents the pop-up dialog |

| **toolbar (role)** | This attribute is added to the **e-gantt-toolbar** element, which represents the toolbars of Gantt |

| **aria-label** | It indicates the element's information
 It is assigned to the Gantt UI elements such as timeline cell, taskbar, left label, right label, dependency line, and event markers. |

| **aria-selected** | This attribute is assigned to the Gantt chart row, and it defaults to **false**. The value is changed to **true** when the user selects a grid cell or task |

| **aria-expanded** | This attribute is assigned to the Gantt chart parent task row. The value is changed to **true** when the user clicks a parent taskbar to expand. After the user clicked a parent taskbar to collapse, the attribute value is changed to **false** |

| **aria-grabbed** | This attribute is assigned to the taskbars of Gantt when the user tries to achieve taskbar editing |

Keyboard navigation

The Gantt component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Gantt component.

| **Press** | **To do this** |

| --- | --- |

| **Home** | Selects the first row. |

| **End** | Selects the last row. |

| **DownArrow** | Moves the cell focus/row or cell selection downward. |

| **UpArrow** | Moves the cell focus/row or cell selection upward. |

| **LeftArrow** | Moves the cell focus/row or cell selection left side. |

| **RightArrow** | Moves the cell focus/row or cell selection right side. |

| **Ctrl + Up Arrow** | Collapses all tasks. |

| **Ctrl + Down Arrow** | Expands all tasks. |

| **Ctrl + Shift + Up Arrow** | Collapses the selected row. |

| **Ctrl + Shift + Down Arrow** | Expands the selected row. |

| **Enter** | Saves request. |

| **Esc** | Cancels request. |

| **Insert** | Adds a new row. |

| **Ctrl + Insert** | Opens addRowDialog. |

| **Ctrl + F2** | Opens editRowDialog. |

- | Delete | Deletes the selected row. |
- | Shift + F5 | FocusTask |
- | Ctrl + Shift + F | Focus search |
- | Shift + DownArrow | Extends the row/cell selection downwards. |
- | Shift + UpArrow | Extends the row/cell selection upwards. |
- | Shift + LeftArrow | Extends the cell selection to the left side. |
- | Shift + RightArrow | Extends the cell selection to the right side. |
- | Tab / Shift + Tab | To focus the close icon in the message. |
- | Alt + j | Focus Gantt component. |

Ensuring accessibility

The Gantt component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Gantt component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Gantt component with accessibility tools.

Touch interaction in ##Platform_Name## Gantt control

The Gantt control supports to perform user interactions in mobile and tablet devices. This section explains how to interact with the Gantt features in touch-enabled devices.

Tooltip

To perform **touch and hold** action on a element, refer to [tooltip popup](#).

Context menu

To perform **long press** action on a row, [context menu](#) is opened, and then tap a menu item to trigger its action.

Sorting

To perform **tap** action on a column header, trigger [sorting](#) operation to the selected column. A popup is displayed for multi-column sorting. To sort multiple columns, tap the popup, and then tap the desired column headers.

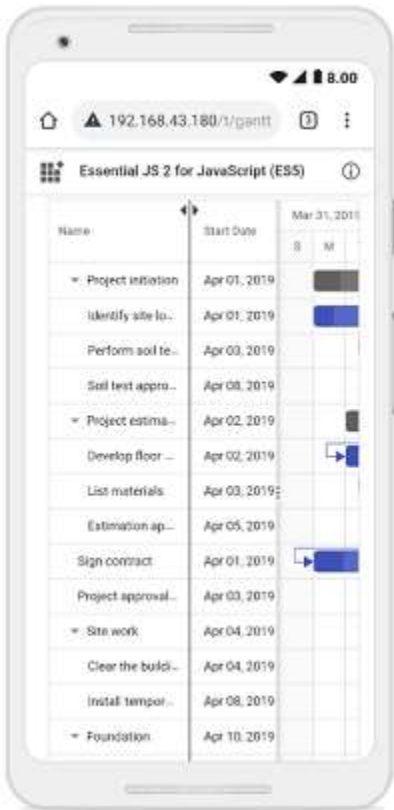

The following screenshot shows Gantt touch sorting,

Column resize

When the right edge of the column header cell is **tapped**, a floating handler will be visible over the right border of the column. To [resize](#) the column, drag the floating handler as needed.

The following screenshot represents the Gantt column resizing in touch device.

Editing

The Gantt control editing actions can be achieved using the double tap and tap and drag actions on a element.

The following table describes different types of editing modes available in Gantt.

Action | Description

Parent taskbar | You cannot create dependency relationship to parent tasks.

Taskbar without dependency | If you tap a valid child taskbar, it will create FS type dependency line between tasks, otherwise exits from task dependency edit mode.

Taskbar with dependency | If you tap the second taskbar, which has already been directly connected,

it will ask to remove it.

Removing dependency | Once you tap the taskbar with direct dependency, then confirmation dialog will be shown for removing dependency.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttData = [
    {
        TaskID: 1,
        TaskName: 'Project Initiation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location',
StartDate: new Date('04/02/2019'), Duration: 3, Progress: 50 },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate:
new Date('04/02/2019'), Duration: 4, Progress: 50 },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate:
new Date('04/02/2019'), Duration: 4,Predecessor:"2FS", Progress: 50 },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for
estimation', StartDate: new Date('04/04/2019'), Duration: 3, Progress: 50 },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 3, Progress: 50 },

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

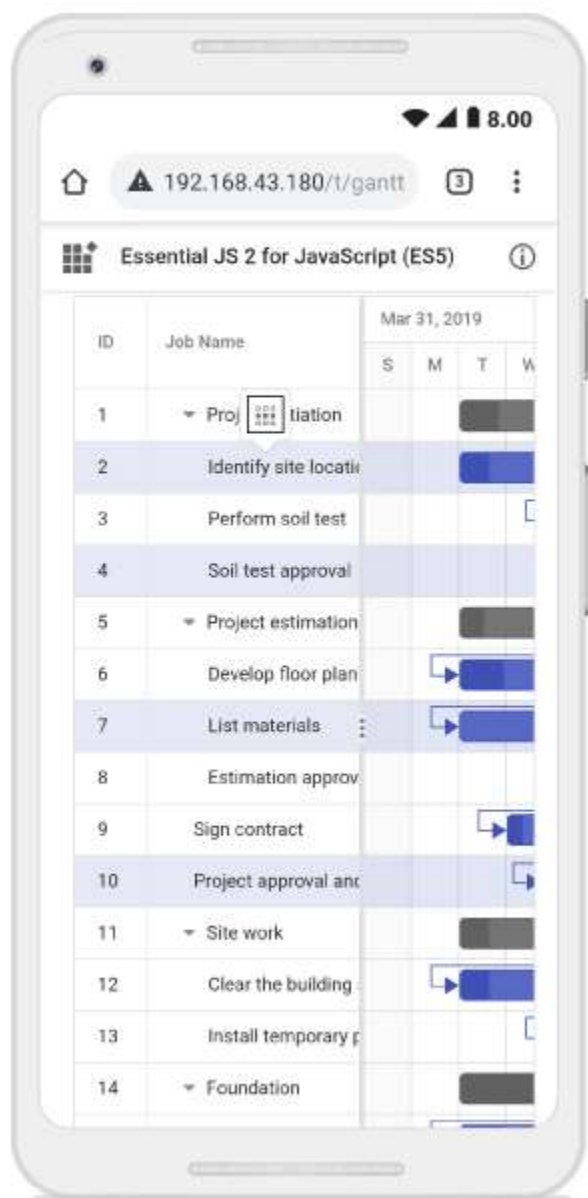

Note: In mobile device, you cannot create dependency other than FS by taskbar editing. By using cell/dialog editing, you can add all type of dependencies.

Selection

When you tap gantt row, tapped row will be selected.

[Single selection](#) : To select a single row or cell, perform single tap on it.

[Multiple selection](#) : To perform multiple selection, tap on the multiple selection popup, and then tap the desired rows or cells.

Loading animation in ##Platform_Name## Gantt control

The loading indicator is used to display a visual indicator while the Gantt is fetching data or performing certain actions, such as sorting or filtering. The gantt support two indicator types, which is achieved by setting the [loadingIndicator.indicatorType](#) property to Shimmer or Spinner. The default value of the indicator type is "Spinner."

In the following sample, the Shimmer indicator is displayed while the gantt is scrolled when using the virtual data.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Sort,ej.gantt.Selection,ej.gantt.Filter);
```

```

var ganttChart = new ej.gantt.Gantt({
    dataSource: virtualData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        endDate: 'EndDate',
        duration: 'Duration',
        progress: 'Progress',
        parentID: 'parentID'
    },
    columns: [
        { field: 'TaskID' },
        { field: 'TaskName' },
        { field: 'StartDate' },
        { field: 'Duration' },
        { field: 'Progress' }
    ],
    loadingIndicator: { indicatorType: 'Shimmer' },
    enableVirtualization: true,
        allowFiltering: true,
        allowSorting: true
});
ganttChart.appendTo('#Gantt');

Style and appearance in ##Platform_Name## Gantt control

To modify the Gantt Chart appearance, you need to override the default CSS of gantt chart. Please find the list of CSS classes and its corresponding section in Gantt Chart. Also, you have an option to create your own custom theme for all the JavaScript controls using our [Theme Studio](#).

Section | CSS Class | Purpose of Class

Root | e-gantt | This class is in the root element (div) of the gantt chart control.

Header | e-gridheader | This class is added in the root element of header element. In this class, You can override thin line between header and content of the gantt chart.

| e-table | This class is added at 'table' of the gantt chart header. This CSS class makes table width as 100 %.

| e-columnheader | This class is added at 'tr' of the gantt chart header.

Grid Content | e-gridcontent | This class is added at root of body content. This is to override background color of the body.

| e-table | This class is added to table of content. This CSS class makes table width as 100 %.

| e=row | This class is added to rows of gantt chart.

| e-altrow | This class is added to alternate rows of gantt chart. This is to override alternate row color of the gantt chart.

| e-rowcell | This class is added to all cells in the gantt chart. This is to override cells appearance and styling.

Chart Content | e-gantt-chart | This class is added to the chart side of the gantt chart.

| e-chart-row | This class is added to rows of gantt chart.

Timeline | e-timeline-header-container | This class is added to timeline of the gantt chart.

| e-header-cell-label | This class is added to the header cell of the timeline.

| e-weekend-header-cell | This class is added to the weekend cells.

Taskbar | e-taskbar-main-container | This class is added to taskbar of the gantt chart.

| e-gantt-parent-taskbar | This class is added to the parent task bar of the gantt chart.

| e-gantt-milestone | This class is added to the milestone tasks of the gantt chart.

| e-gantt-unscheduled-taskbar | This class is added to the unscheduled tasks.

| e-gantt-manualparenttaskbar | This class is added to the manual scheduled parent taskbar.

| e-gantt-child-manualtaskbar | This class is added to the manual scheduled child taskbar.

| e-gantt-unscheduled-manualtask | This class is added to the manual unscheduled tasks.

Splitter | e-split-bar | This class is added to the gantt chart splitter.

|e-resize-handler| This class is added to the resize handler of the gantt chart splitter.

|e-arrow-left| This class is added to the left arrow of the resize handler.

|e-arrow=right| This class is added to the right arrow of the resize handler.

Connector Lines|e-line| This class is added to the connector lines.

|e-connector-line-right-arrow| This class is added to the right arrow of the connector line.

|e-connector-line-left-arrow| This class is added to the left arrow of the connector line.

Labels|e-task-label| This class is added to the task labels.

|e-right-label-container| This class is added to the right label.

|e-left-label-container| This class is added to the left label.

Event Markers|e-event-markers| This class is added to the event markers.

Baseline|e-baseline-bar| This class is added to the baseline.

|e-baseline-gantt-milestone-container| This class is added to the baseline of milestone tasks.

Tooltip|e-gantt-tooltip| This class is added to the tooltip.

How To

Open add edit dialog in ##Platform_Name## Gantt control

Gantt add and edit dialogs can be opened dynamically by using [openAddDialog](#) and [openEditDialog](#) methods. The following code example shows how to open add and dialog on separate button click actions.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit);
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowEditing: true,
    allowAdding: true
  }
});
ganttChart.appendTo('#Gantt');
var editBtn= new ej.buttons.Button();
editBtn.appendTo('#editDialog');
var addBtn= new ej.buttons.Button();
addBtn.appendTo('#addDialog');
document.getElementById('editDialog').addEventListener('click', () => {
  ganttChart.editModule.dialogModule.openEditDialog();
});
document.getElementById('addDialog').addEventListener('click', () => {
```

```
ganttChart.editModule.dialogModule.openAddDialog();
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Gantt</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Gantt Controls">
  <meta name="author" content="Syncfusion">

</head>
<body>
  <button id="editDialog">Open EditDialog</button> <button
id="addDialog">Open AddDialog</button>

  <div id="container">
    <div id="Gantt"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

NOTE: We should select any one of the row in Gantt to open the edit dialog.

Change schedule date in ##Platform_Name## Gantt control

In the Gantt control, you can change the schedule start and end dates by clicking the custom button programmatically using the [updateProjectDates](#) method. You can pass the start and end dates as method arguments to the [updateProjectDates](#) method. You can also pass the Boolean value as an additional parameter, which is used to round-off the schedule start and end dates displayed in Gantt timeline.

INDEX.JS

```
var ganttData = [
  {
    TaskID: 1,
    TaskName: 'Project Initiation',
    StartDate: new Date('04/02/2019'),
    EndDate: new Date('04/21/2019'),
```

```

        isParent:true,
        subtasks: [
            { TaskID: 2, TaskName: 'Identify Site location', StartDate:
new Date('04/02/2019'), Duration: 3, Progress: 50,isParent:false },
            { TaskID: 3, TaskName: 'Perform Soil test', StartDate: new
Date('04/02/2019'), Duration: 3, Progress: 70, resources: [2, 3,
5],isParent:false },
            { TaskID: 4, TaskName: 'Soil test approval', StartDate: new
Date('04/02/2019'), Duration: 3, Predecessor:"2FS", Progress:
80,isParent:false },
        ]
    },
    {
        TaskID: 5,
        TaskName: 'Project Estimation',
        StartDate: new Date('04/02/2019'),
        EndDate: new Date('04/21/2019'),
        isParent:true,
        subtasks: [
            { TaskID: 6, TaskName: 'Develop floor plan for estimation',
StartDate: new Date('04/04/2019'), Duration: 4, Progress: 50, resources:
[4],isParent:false },
            { TaskID: 7, TaskName: 'List materials', StartDate: new
Date('04/04/2019'), Duration: 4, Progress: 50, DurationUnit:'day',
resources: [4, 8],isParent:false },
            { TaskID: 8, TaskName: 'Estimation approval', StartDate: new
Date('04/04/2019'), Duration: 4,Predecessor:"6SS", DurationUnit:'minute',
Progress: 70, resources: [12, 5],isParent:false }
        ]
    },
];

var ganttChart = new ej.gantt.Gantt({
    dataSource: ganttData,
    height:'450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks'
    }
});
ganttChart.appendTo('#Gantt');
var dateBtn= new ej.buttons.Button();
dateBtn.appendTo('#updateSchedule');
document.getElementById('updateSchedule').addEventListener('click',
function() {
    ganttChart.updateProjectDates(new Date('01/10/2019'),new
Date('06/20/2019'),true);
});

```

Copy paste records in ##Platform_Name## Gantt control

You can copy and paste a record in the Gantt chart by using the `addRecord` method and `custom context menu`. It is also possible to copy and paste the parent record with multiple hierarchical child records on the required position.

INDEX.JS

```

ej.base.enableRipple(true);
var copiedRecord;
var enableFlag;
var gantt = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    dependency: 'Predecessor',
    duration: 'Duration',
    progress: 'Progress',
    child: 'subtasks'
  },
  editSettings: {
    allowAdding: true,

```

```

        allowEditing: true,
        allowDeleting: true,
        allowTaskbarEditing: true
    },
    toolbar: ['Add', 'Edit', 'Update', 'Delete', 'Cancel', 'ExpandAll',
    'CollapseAll'],
    allowSelection: true,
    enableContextMenu: true,
    contextMenuItems: [
        { text: 'Copy', target: '.e-content', id: 'copy' },
        { text: 'Paste', target: '.e-content', id: 'paste' },
    ],
    contextMenuClick: function (args) {
        if (args.item.id === 'copy') {
            copiedRecord = args.rowData;
            copiedRecord.taskData.TaskID = gantt.currentViewData.length + 1;
        }
        if (args.item.id === 'paste') {
            gantt.addRecord(copiedRecord.taskData, 'Below', args.rowData.index);
            if (copiedRecord.hasChildRecords) {
                addChildRecords(copiedRecord, args.rowData.index + 1);
            }
            copiedRecord = undefined;
        }
    },
    contextMenuOpen: function (args) {
        if (args.type !== 'Header') {
            if (copiedRecord) {
                args.hideItems.push('Copy');
            } else {
                args.hideItems.push('Paste');
            }
        }
    }
});
gantt.appendTo('#Gantt');
function addChildRecords(record, index) {
    for(var i=0; i<record.childRecords.length; i++) {
        var childRecord = record.childRecords[i];
        childRecord.taskData.TaskID = ganttChart.currentViewData.length
+ 1;
        ganttChart.addRecord(childRecord.taskData, 'Child', index);
        if (childRecord.hasChildRecords) {
            addChildRecords(childRecord, index + (i+1));
        }
    }
}

Maintain record index in ##Platform_Name## Gantt control

Row dropped record's index position can be maintained in the Gantt chart by changing the database table index position using the `rowDrop` event. In this event, the `fromIndex` and `dropIndex` values can be passed to the server side using Ajax request. On the server side, the `insert` and `insertAtTop` methods are used to update the row index position. The following code snippets explain the solution.

`ts

```

import { Gantt, Selection, Edit, RowDD, IGanttData } from '../src/index';
import { Ajax } from '@syncfusion/ej2-base';

Gantt.Inject(Selection, Edit, RowDD);

let gantt: Gantt = new Gantt({
  dataSource: new DataManager({
    url: 'https://localhost:44379/Home/UrlDatasource',
    adaptor: new UrlAdaptor,
    crossDomain: true,
    batchUrl: 'https://localhost:44379/Home/BatchUpdate'
  }),
  taskFields: {
    id: 'TaskID',

```

```

name: 'TaskName',
startDate: 'StartDate',
duration: 'Duration',
progress: 'Progress',
dependency: 'Predecessor',
child: 'subtasks'
},
allowRowDragAndDrop: true,
rowDrop: function (args) {
let record = this.flatData[args.fromIndex][this.taskFields.id];
let record2 = this.flatData[args.dropIndex][this.taskFields.id];
let data: IGanttData = args.data[0];
let uri = 'https://localhost:44379/Home/RowDropMethod';
let dragdropdata = {
record: data[0].taskData,
position: args.dropIndex,
dragidMapping: record,
dropidMapping: record2
};
let ajax = new Ajax(
{
url: uri,
type: 'POST',
contentType: "application/json",
data: JSON.stringify(dragdropdata),
});
ajax.send();
}
});
gantt.appendTo('#ganttContainer');
`ts
public IActionResult RowDropMethod([FromBody] DragDropData value)

```

```
{
var data = new CRUDModel();
copyRecord = true;
if (value.position == "bottomSegment" || value.position == "topSegment")
{
{
var childCount = 0;
int parent1 = (int)value.record.parentID;
childCount += FindChildRecords(parent1);
if (childCount == 1)
{
var i = 0;
for (; i < DataList.Count; i++)
{
if (DataList[i].taskID == parent1)
{
DataList[i].isParent = false;
break;
}
if (DataList[i].taskID == value.record.taskID)
{
DataList[i].parentID = null;
break;
}
}
}
DataList.Remove(DataList.Where(ds => ds.taskID == value.dragidMapping).FirstOrDefault());
var j = 0;
for (; j < DataList.Count; j++)
{
if (DataList[j].taskID == value.dropidMapping)
{

```

```

value.record.parentID = DataList[j].parentID;
break;
}
}
data.Value = value.record;
if (value.position == "bottomSegment")
{
this.Insert(data, value.dropidMapping);
}
else if (value.position == "topSegment")
{
this.InsertAtTop(data, value.dropidMapping);
}
}
else if (value.position == "middleSegment")
{
DataList.Remove(DataList.Where(ds => ds.taskID == value.dragidMapping).FirstOrDefault());
value.record.parentID = value.dropidMapping;
FindDropdata(value.dropidMapping);
data.Value = value.record;
this.Insert(data, value.dropidMapping);
}
copyRecord = false;
return Json(new { updatedRecords = value.record });
}
`

```

Custom field in ##Platform_Name## Gantt control

Generally in Gantt, Custom fields are displayed in the Custom Tab of the Add/Edit dialogs. However, they can be included in the General Tab of Add/Edit Dialog Box using `actionBegin` and `actionComplete` events. These events are used to append the custom field to the dialog box. The following code snippets demonstrate the solution.

INDEX.JS

```

var divElement;
var inputs = {
    booleanedit: ej.buttons.CheckBox,
    dropdownedit: ej.dropdowns.DropDownList,

```

```

datepickeredit: ej.calendars.DatePicker,
datetimepickeredit: ej.calendars.DateTimePicker,
maskededit: ej.inputs.MaskedTextBox,
numericedit: ej.inputs.NumericTextBox,
stringedit: ej.inputs.TextBox
};
var gantt = new ej.gantt.Gantt({
    dataSource: GanttData,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
        duration: 'Duration',
        progress: 'Progress',

Maintain zoom to fit in ##Platform_Name## Gantt control

In the Gantt control, While performing edit actions or dynamically change dataSource, the timeline gets refreshed. When zoomToFit toolbar item is clicked and perform editing actions or dynamically change dataSource, the timeline gets refreshed. So that, the timeline will not fit to the project any more.

Maintain zoomToFit after edit actions

We can maintain zoomToFit after editing actions(cell edit,dialog edit,taskbar edit) by using [fitToProject](#) method in `actionComplete` and `taskbarEdited` event.

INDEX.JS

```

var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  allowSelection: true,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },
  toolbar: ['Edit', 'ZoomToFit'],
  editSettings: {
    allowEditing: true,
    allowTaskbarEditing: true,
  },
  labelSettings: {
    leftLabel: 'TaskName'
  },
  projectStartDate: new Date('03/24/2019'),
  projectEndDate: new Date('04/28/2019'),
  taskbarEdited: function(args) {
    if (args) {
      var obj = document.getElementById("Gantt").ej2_instances[0];
      obj.dataSource = GanttData;
      obj.fitToProject();
    }
  },
  actionComplete: function (args) {
    if ((args.action === "CellEditing" || args.action === "DialogEditing")
    && args.requestType === "save") {
      var obj = document.getElementById("Gantt").ej2_instances[0];
      obj.dataSource = GanttData;
      obj.fitToProject();
    }
  }
});

```

```
ganttChart.appendTo('#Gantt');
```

Maintain zoomToFit after change dataSource dynamically

We can maintain **zoomToFit** after change dataSource dynamically, by calling [fitToProject](#) method in dataBound event.

INDEX.JS

```
var ganttChart = new ej.gantt.Gantt({
  dataSource: GanttData,
  height: '450px',
  taskFields: {
    id: 'TaskID',
    name: 'TaskName',
    startDate: 'StartDate',
    duration: 'Duration',
    progress: 'Progress',
    dependency: 'Predecessor',
    child: 'subtasks'
  },
},
```

```

        toolbar: ['ZoomToFit'],
        labelSettings: {
            leftLabel: 'TaskName'
        },
        projectStartDate: new Date('03/24/2019'),
        projectEndDate: new Date('04/28/2019'),
        dataBound: function (args) {
            this.fitToProject();
        }
    });
    ganttChart.appendTo('#Gantt');
    document.getElementById('changeData').addEventListener('click', function ()
    {
        var obj = document.getElementById('Gantt').ej2_instances[0];
        obj.dataSource = data;
    });

```

INDEX.HTML

```

```

Drag and drop in ##Platform_Name## Gantt control

In Gantt, it is possible to drag a record from another component and drop it in Gantt chart with updating the Gantt record. Here, dragging an item from **TreeView** component to Gantt and that item is updated as a resource for the Gantt record, we can achieve this, by using [nodeDragStop](#) event of **TreeView** control.

INDEX.JS

```
ej.gantt.Gantt.Inject(ej.gantt.Edit);
var treeObj = new ej.navigations.TreeView({
    fields: { dataSource: editingResources, id: 'resourceId', text:
    'resourceName' },
    allowDragAndDrop: true,
    height: "200px",
    nodeDragStop: function (args) {
        var chartEle = ej.base.closest(args.target, '.e-chart-row');
        var gridEle = ej.base.closest(args.target, '.e-row');
        if(gridEle) {
            var index = ganttChart.treeGrid.getRows().indexOf(gridEle);
            ganttChart.selectRow(index);
        }
        if (chartEle) {
            var index = chartEle.ariaRowIndex;
            ganttChart.selectRow(Number(index));
        }
        var record= args.draggedNodeData;
        var selectedData = ganttChart.flatData[ganttChart.selectedRowIndex];
        var selectedDataResource = selectedData.taskData.resources;
        var resources = [];
        if (selectedDataResource) {
            for (var i = 0; i < selectedDataResource.length; i++) {
                resources.push(selectedDataResource[i].resourceId);
            }
        }
        resources.push(parseInt(record.id));
        if (chartEle || gridEle) {
            var data = {
                TaskID: selectedData.taskData.TaskID,
                resources: resources
            };
            ganttChart.updateRecordByID(data);
            var elements = document.querySelectorAll('.e-drag-item');
            while (elements.length > 0 && elements[0].parentNode) {
                elements[0].parentNode.removeChild(elements[0]);
            }
        }
    }
});
var ganttChart = new ej.gantt.Gantt({
    dataSource: editingData,
    resources: editingResources,
    height: '450px',
    taskFields: {
        id: 'TaskID',
        name: 'TaskName',
        startDate: 'StartDate',
```

```

        duration: 'Duration',
        progress: 'Progress',
        child: 'subtasks',
        dependency: 'Predecessor',
        resourceInfo: 'resources'
    },
    editSettings: {
        allowEditing: true
    },
    resourceFields: {
        id: 'resourceId',
        name: 'resourceName'
    },
    splitterSettings: {
        position: "30%"
    },
    labelSettings: {
        rightLabel: 'resources'
    }
});
gantChart.appendTo('#Gantt');
treeObj.appendTo('#TreeView');

```

The following screenshot shows dropping record from another component in to Gantt, and **Rose Fuller** is added as resource for the task **Develop floor plan estimation**.

New row position in ##Platform_Name## Gantt control

In Gantt, a new row can be added in one of the following positions: Top, Bottom, Above, Below and Child. This position can be specified through the `newRowPosition` property. We can make use of the `toolbarClick` event to create a context menu that specifies the position in which the new row is to be added when adding a record through toolbar click.

The following code snippets demonstrate how to achieve this.

INDEX.JS

```

var clickHandler = function(args) {
    if (args.item.id === 'GanttExport_add') {
        var contextMenuObj =
document.getElementById("contextmenu").ej2_instances[0];
        contextMenuObj.open(60, 20);
    }
};
ej.gantt.Gantt.Inject(ej.gantt.Toolbar);
var menuItems = [
    {
        text: 'Bottom'
    },
    {
        text: 'Above'
    },

```

```

        {
            text: 'Below'
        },
        {
            text: 'Child'
        },
        {
            text: 'Top'
        }
    ]];
    var menuOptions = {
        items: menuItems,
        select: select
    };
    var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
    function select(args) {
        let gantt = (document.getElementsByClassName('e-gantt')[0]).ej2_instances[0];
        if (args.item.text === "Bottom") {
            gantt.editSettings.newRowPosition = "Bottom";
            gantt.openAddDialog();
        } else if (args.item.text === "Above") {
            if (gantt.selectedRowIndex == -1) {
                alert("Please select any row");
            } else {
                gantt.editSettings.newRowPosition = "Above";
                gantt.openAddDialog();
            }
        } else if (args.item.text === "Below") {
            if (gantt.selectedRowIndex == -1) {
                alert("Please select any row");
            } else {
                gantt.editSettings.newRowPosition = "Below";
                gantt.openAddDialog();
            }
        } else if (args.item.text === "Child") {
            if (gantt.selectedRowIndex == -1) {
                alert("Please select any row");
            } else {
                gantt.editSettings.newRowPosition = "Child";
                gantt.openAddDialog();
            }
        } else if (args.item.text === "Top") {
            gantt.editSettings.newRowPosition = "Top";
            gantt.openAddDialog();
        }
    }
    var ganttChart = new ej.gantt.Gantt({

Render timeline from 1 to 365 days in ##Platform_Name## Gantt control

Gantt chart contains different types of in-built timeline view modes and it can be defined by using [timelineViewMode](#) property and also we can customize the timescale mode of top tier and bottom tier by using [topTier.unit](#) and [bottomTier.unit](#) properties. Timeline tier's unit can be defined by using [unit](#) property and [format](#) property was used to define date format of timeline cell and [formatter](#) property was used to define custom method to format the date value of timeline cell.

In the [bottomTier.unit](#) timescale mode, it is possible to display timeline from 1 to 365 days by making use of the formatter in the `timelineSettings` property. The following example shows how to use the formatter method for timeline cells.

INDEX.JS

```

var GanttData = [
    {
        TaskID: 1,
        TaskName: 'Product concept',
        StartDate: new Date('01/02/2019'),
        EndDate: new Date('01/21/2019'),
        subtasks: [
            { TaskID: 2, TaskName: 'Defining the product and its usage',
              StartDate: new Date('01/02/2019'), Duration: 3, Progress: 30 },
            { TaskID: 3, TaskName: 'Defining target audience', StartDate:
              new Date('01/02/2019'), Duration: 3 },
            {
                TaskID: 4, TaskName: 'Prepare product sketch and notes',
                StartDate: new Date('01/02/2019'), Duration: 2,
                Predecessor: '2', Progress: 30
            },
        ],
    },
    {
        TaskID: 5,
        TaskName: 'Market research',
        StartDate: new Date('01/02/2019'),
        EndDate: new Date('01/21/2019'),
        subtasks: [
            {
                TaskID: 6,
                TaskName: 'Demand analysis',
                StartDate: new Date('01/04/2019'),
                EndDate: new Date('01/21/2019'),
                subtasks: [
                    {
                        TaskID: 7, TaskName: 'Customer strength', StartDate:
                          new Date('01/04/2019'), Duration: 4,
                        Predecessor: '5', Progress: 30
                    },
                    { TaskID: 8, TaskName: 'Market opportunity analysis',
                      StartDate: new Date('01/04/2019'), Duration: 4, Predecessor: '5' }
                ]
            },
            {
                TaskID: 9, TaskName: 'Competitor analysis', StartDate: new
                  Date('01/04/2019'), Duration: 4,
                Predecessor: '7, 8', Progress: 30
            },
            { TaskID: 10, TaskName: 'Product strength analysis', StartDate:
              new Date('01/04/2019'), Duration: 4, Predecessor: '9' },
            {
                TaskID: 11, TaskName: 'Research complete', StartDate: new
                  Date('01/04/2019'), Duration: 0, Predecessor: '10',

Grid

Getting started in ##Platform_Name## Grid control

This section explains the steps to create a simple Grid and demonstrates the basic usage of the grid component using the Essential JS 2

[quickstart](#) seed repository. This seed repository is pre-configured with the Essential JS 2 package.

Dependencies

Following is the list of minimum dependencies required to use the grid.

```

|-- @syncfusion/ej2-grids
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
,

```

Setup for local development

Clone the Essential JS 2 quickstart application project from [GitHub](#), and install the necessary npm packages using the following command line scripts.

```
`  
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart  
cd quickstart  
npm install  
`
```

Configuring system JS

Syncfusion Grid packages have to be mapped in the **system.config.js** configuration file.

```
System.config({  
  paths: {  
    'npm:': './node_modules/',  
    'syncfusion:': 'npm:@syncfusion/'  
  },  
  map: {  
    app: 'app',  
    //Syncfusion packages mapping  
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",  
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",  
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",  
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",  
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",  
    "@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",  
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",  
    "@syncfusion/ej2-dropdowns": "syncfusion:ej2-dropdowns/dist/ej2-dropdowns.umd.min.js",  
    "@syncfusion/ej2-notifications": "syncfusion:ej2-notifications/dist/ej2-notifications.umd.min.js",  
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",  
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",  
    "@syncfusion/ej2-grids": "syncfusion:ej2-grids/dist/ej2-grids.umd.min.js",  
    "@syncfusion/ej2-excel-export": "syncfusion:ej2-excel-export/dist/ej2-excel-export.umd.min.js",  
    "@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",  
    "@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",  
    "@syncfusion/ej2-querybuilder": "syncfusion:ej2-querybuilder/dist/ej2-querybuilder.umd.min.js",  
    "@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js"  
  },  
});
```

```
packages: {  
  'app': { main: 'app', defaultExtension: 'js' }  
}  
});  
System.import('app');  
`
```

Adding CSS reference

Combined CSS files are available in the Essential JS 2 package root folder. This can be referenced in your `[src/styles/styles.css]` using the following code.

```
`  
@import '../node_modules/@syncfusion/ej2/material.css';  
`
```

To know about individual component CSS, please refer to [Individual Component theme files](#) section.

Adding Grid component

You can start adding Essential JS 2 grid component to the application. To get started, add the grid component in **app.ts** and **index.html** files using the following code.

Place the following grid code in the **app.ts**.

```
`ts  
import { Grid } from '@syncfusion/ej2-grids';  
import { data } from './datasource';  
let grid: Grid = new Grid({  
  dataSource: data,  
  columns: [  
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120, type: 'number' },  
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type: 'string' },  
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C' },  
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format: 'yMd' }  
  ],  
  height: 315  
});  
grid.appendTo('#Grid');  
`
```

Now, add an HTML div element to act as the grid element in **index.html** using the following code.

```
`html
```

```
<!DOCTYPE html>
<html lang="en">
<head>
<title>Essential JS 2</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0, user-scalable=no" />
<meta name="description" content="Essential JS 2" />
<meta name="author" content="Syncfusion" />
<link rel="shortcut icon" href="resources/favicon.ico" />
<link href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css" rel="stylesheet" />
<!--style reference from app-->
<link href="/styles/styles.css" rel="stylesheet" />
<!--system js reference and configuration-->
</head>
<body>
<!--Element which will render as Grid-->
<div id="Grid"></div>
</body>
</html>
```

Module injection

To create grids with additional features, inject the required modules. The following modules are used to extend grid's basic functionality.

- [Page](#) - Inject this module to use paging feature.
- [Sort](#) - Inject this module to use sorting feature.
- [Filter](#) - Inject this module to use filtering feature.
- [Group](#) - Inject this module to use grouping feature.
- **ExcelExport** - Inject this module to use Excel export feature.
- **PdfExport** - Inject this module to use PDF export feature.

These modules should be injected into the grid using the **Grid.Inject** method.

Additional feature modules are available [here](#).

Enable paging

The paging feature enables users to view the grid record in a paged view. It can be enabled by setting the [allowPaging](#) property to true. Inject the [Page](#) module as follows. If the [Page](#) module is not injected, the pager will not be rendered in the grid. Pager can be customized using the [pageSettings](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page);
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
  ],
  allowPaging: true,
  pageSettings: { pageSize: 7 }
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

        .e-row[aria-selected="true"] .e-customizedExpandcell {
            background-color: #e0e0e0;
        }
        .e-grid.e-gridhover tr[role='row']:hover {
            background-color: #eee;
        }
        .e-expand::before {
            content: '\e5b8';
        }
        .empImage {
            margin: 6px 16px;
            float: left;
            width: 50px;
            height: 50px;
        }
    </style>
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
    </head>
    <body>

        <div id="container">
            <div id="Grid"></div>
        </div>
    <script>
    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
    </body></html>

```

Enable sorting

The sorting feature enables you to order the records. It can be enabled by setting the [allowSorting](#) property as true. Inject the [Sort](#)

module as follows. If [Sort](#) module is not injected, you cannot sort when a header is clicked. Sorting feature can be customized using the [sortSettings](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },

```

```

        { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
    ],
    allowSorting: true,
    allowPaging: true,
    pageSettings: { pageSize: 7 }
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable filtering

The filtering feature enables you to view reduced amount of records based on filter criteria. It can be enabled by setting the [allowFiltering](#) property as true. The [Filter](#) module has to be injected as follows.

If [Filter](#) module is not injected, filter bar will not be rendered in the grid. Filtering feature can be customized using the [filterSettings](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Sort, ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
    ],
    allowFiltering: true,
    allowPaging: true,
    pageSettings: { pageSize: 6 },
    allowSorting: true
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enable grouping

The grouping feature enables users to view the grid record in a grouped view. It can be enabled by setting the [allowGrouping](#) property to true. The [Group](#) module has to be injected as follows. If [Group](#) module is not injected, the group drop area will not be rendered in the grid. Grouping feature can be customized using the [groupSettings](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Sort, ej.grids.Filter,
ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:

Run the application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

`

npm start

`

Output will be displayed as follows.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Sort, ej.grids.Filter,
ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:

Module in ##Platform_Name## Grid control

The following feature modules should be injected to extend grid's functionality.

The available grid modules are:

Module	Description
-----	-----
Page	Inject this module to use paging feature.
Sort	Inject this module to use sorting feature.
Filter	Inject this module to use filtering feature.
Group	Inject this module to use grouping feature.
Edit	Inject this module to use editing feature.
Aggregate	Inject this module to use aggregate feature.
ColumnChooser	Inject this module to use column chooser feature.
ColumnMenu	Inject this module to use column menu feature.
CommandColumn	Inject this module to use command column feature.
ContextMenu	Inject this module to use context menu feature.
DetailRow	Inject this module to use detail template feature.
ForeignKey	Inject this module to use foreign key feature.
Freeze	Inject this module to use frozen rows and columns feature.
Resize	Inject this module to use resize feature.
Reorder	Inject this module to use reorder feature.
RowDD	Inject this module to use row drag and drop feature.
Search	Inject this module to use search feature and this is a default injected module.
Selection	Inject this module to use selection feature and this is a default injected module.
Scroll	Inject this module to use scrolling feature and this is a default injected module.
Print	Inject this module to use to use print feature and this is a default injected module.
Toolbar	Inject this module to use toolbar feature.
VirtualScroll	Inject this module to use virtual scroll feature.

| **ExcelExport** | Inject this module to use excel export feature. |

| **PdfExport** | Inject this module to use PDF export feature. |

These modules should be injected into the grid using the **Grid.Inject** method.

Data Binding

Data binding in ##Platform_Name## Grid control

The Grid uses [DataManager](#), which supports both RESTful JSON data services binding and local JavaScript object array binding. The [dataSource](#) property can be assigned either with the instance of [DataManager](#) or JavaScript object array collection.

It supports two kinds of data binding method:

- Local data
- Remote data

Sending additional parameters to the server

To add a custom parameter to the data request, use the **addParams** method of **Query** class. Assign the **Query** object with additional parameters to the grid [query](#) property.

INDEX.JS

```
var data = new ej.data.DataManager({
  url: 'https://services.syncfusion.com/js/production/api/Orders',
  adaptor: new ej.data.ODataAdaptor()
});
var grid = new ej.grids.Grid({
  dataSource: data,
  query: new ej.data.Query().addParams('ej2grid', 'true'),
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
  ]
});
grid.appendTo('#Grid');
```

INDEX.HTML

    .e-row[aria-selected="true"] .e-customizedExpandcell {
        background-color: #e0e0e0;
    }
    .e-grid.e-gridhover tr[role='row']:hover {
        background-color: #eee;
    }
    .e-expand::before {
        content: '\e5b8';
    }
    .empImage {
        margin: 6px 16px;
        float: left;
        width: 50px;
        height: 50px;
    }
</style>
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}

```

```

    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The parameters added using the [query](#) property will be sent along with the data request for every grid action.

Handling HTTP error

During server interaction from the grid, some server-side exceptions may occur, and you can acquire those error messages or exception details

in client-side using the [actionFailure](#) event.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

The [actionFailure](#) event will be triggered not only for the server errors, but also when there is an exception while processing the grid actions.

Binding with ajax

You can use Grid [dataSource](#) property to bind the datasource to Grid from external ajax request. In the below code we have fetched the datasource from the server with the help of ajax request and provided that to [dataSource](#) property by using **onSuccess** event of the ajax.

```

`ts
import { Grid, Page } from '@syncfusion/ej2-grids';
import { Ajax } from '@syncfusion/ej2-base';
Grid.Inject(Page);
let grid: Grid = new Grid({
allowPaging: true,
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120 },
{ field: 'CustomerID', headerText: 'Customer ID', textAlign: 'Right', width: 120 },
{ field: 'EmployeeID', headerText: 'Employee ID', textAlign: 'Right', width: 120 },
{ field: 'ShipCountry', headerText: 'Ship Country', textAlign: 'Right', width: 120 }
]
});
grid.appendTo('#Grid');
let button = document.getElementById('btn');
button.addEventListener("click", function(e){
let ajax = new Ajax("https://ej2services.syncfusion.com/production/web-services/api/Orders", "GET");
ajax.send();
ajax.onSuccess = function (data: string) {

```

```
grid.dataSource = JSON.parse(data);
};
});
`
```

* If you bind the dataSource from this way, then it acts like a local dataSource. So you cannot perform any server side crud actions.

[See Also](#)

Local data in `##Platform_Name##` Grid control

To bind local data to the grid, you can assign a JavaScript object array to the [dataSource](#) property. The local data source can also be provided as an instance of the [DataManager](#).

INDEX.JS

```
var gridData = data.slice(0, 7);
var grid = new ej.grids.Grid({
  dataSource: gridData,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
  ]
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, [DataManager](#) uses **JsonAdaptor** for local data-binding.

Refresh the data source

You can add/delete the data source records through an external button. To reflect the data source changes in the grid, invoke the [refresh](#) method.

To refresh the data source:

Step 1:

Add/delete the data source record by using the following code.

```
`ts
grid.dataSource.unshift(data); // add a new record.
grid.dataSource.splice(selectedRow, 1); // delete a record.
`
```

Step 2:

Refresh the grid after the data source change by using the [refresh](#) method.

```
`ts
grid.refresh(); // refresh the Grid.
`
```

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 280
});
grid.appendTo('#Grid');
var add = new ej.buttons.Button({}, '#add');
var dele = new ej.buttons.Button({}, '#delete');
document.getElementById('add').onclick = function() {
  var data = { OrderID: 10247, CustomerID: "ASDFG", Freight: 40.4,
OrderDate: new Date(8367642e5) };
  (grid.dataSource).unshift(data); // add new record.
  grid.refresh(); // refresh the Grid.
};
document.getElementById('delete').onclick = function() {
  if (grid.getSelectedRowIndex().length) {
    var selectedRow = grid.getSelectedRowIndex()[0];
    (grid.dataSource).splice(selectedRow, 1); // delete the selected
record.
  } else {
    alert("No records selected for delete operation");
  }
  grid.refresh(); // refresh the Grid.
};
```

INDEX.HTML

```

Remote data in ##Platform_Name## Grid control

To bind remote data to grid component, assign service data as an instance of [DataManager](#) to the [dataSource](#) property. To interact with remote data source, provide the endpoint url.

INDEX.JS

```
var data = new ej.data.DataManager({
  url: 'https://services.syncfusion.com/js/production/api/Orders',
  adaptor: new ej.data.ODataAdaptor()
});
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
  ]
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

By default, [DataManager](#) uses **ODataAdaptor** for remote data-binding.

OData adaptor - Binding OData service

[OData](#) is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

INDEX.JS

```

var data = new ej.data.DataManager({
    url: 'https://services.syncfusion.com/js/production/api/Orders',
    adaptor: new ej.data.ODataAdaptor(),
    crossDomain: true
});
var grid = new ej.grids.Grid({

```

```

        dataSource: data,
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
            { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
            { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
            { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
        ]
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Grid</title>

```

OData v4 adaptor - Binding OData v4 service

The ODataV4 is an improved version of OData protocols, and the [DataManager](#) can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

INDEX.JS

```

var data = new ej.data.DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7',
    adaptor: new ej.data.ODataV4Adaptor()
});
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
        'Right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
        ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
        'Right', width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140,
        format: 'yMd' }
    ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Grid</title>

splitbuttons/styles/material.css" rel="stylesheet">

  <style>
    .e-row[aria-selected="true"] .e-customizedExpandcell {
      background-color: #e0e0e0;
    }
    .e-grid.e-gridhover tr[role='row']:hover {
      background-color: #eee;
    }
    .e-expand::before {
      content: '\e5b8';
    }
    .empImage {
      margin: 6px 16px;
      float: left;
      width: 50px;
      height: 50px;
    }
  </style>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>

```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Web API adaptor

You can use **WebApiAdaptor** to bind grid with Web API created using OData endpoint.

```
`ts
```

```

import { Grid } from '@syncfusion/ej2-grids';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';

let data: DataManager = new DataManager({
url: '/api/OrderAPI',
adaptor: new WebApiAdaptor
});

let grid: Grid = new Grid({
dataSource: data,
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120, type: 'number' },
{ field: 'CustomerID', width: 140, headerText: 'Customer ID', type: 'string' },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C' },
{ field: 'OrderDate', headerText: 'Order Date', width: 140, format: 'yMd' }
]
});

grid.appendTo('#Grid');
`

```

The response object should contain properties, **Items** and **Count**, whose values are a collection of entities and total count of the entities, respectively.

The sample response object should look like this:

```

、
{
Items: [{..}, {..}, {..}, ...],
Count: 830
}
、

```

Remote save adaptor

You may need to perform all Grid Actions in client-side except the CRUD operations, that should be interacted with server-side to persist data. It can be achieved in Grid by using **RemoteSaveAdaptor**.

Datasource must be set to **json** property and set **RemoteSaveAdaptor** to the **adaptor** property. CRUD operations can be mapped to server-side using **updateUrl**, **insertUrl**, **removeUrl**, **batchUrl**, **crudUrl** properties.

You can use the following code example to use **RemoteSaveAdaptor** in Grid.

```

`ts
import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, RemoteSaveAdaptor } from '@syncfusion/ej2-data';
import { data } from './datasource.ts';

Grid.Inject(Edit, Toolbar);

let dataSource: DataManager = new DataManager({
json: data,
adaptor: new RemoteSaveAdaptor,
insertUrl: '/Home/Insert',
updateUrl: '/Home/Update',
removeUrl: '/Home/Delete'
});

let grid: Grid = new Grid({
dataSource: dataSource,
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true },
columns: [
{ field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true, textAlign: 'Right', width: 120, type: 'number'
},
{ field: 'CustomerID', width: 140, headerText: 'Customer ID', type: 'string' },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C' },
{ field: 'OrderDate', headerText: 'Order Date', width: 140, format: 'yMd' }
]
}
)

```

```

]
});
grid.appendTo('#Grid');
`

```

The following code example describes the CRUD operations handled at server-side.

```

`
public ActionResult Update(OrdersDetails value)
{
    ...
    return Json(value);
}
public ActionResult Insert(OrdersDetails value)
{
    ...
    return Json(value);
}
public ActionResult Delete(int key)
{
    ...
    return Json(data);
}
`

```

Custom adaptor

You can create your own adaptor by extending the built-in adaptors. The following demonstrates custom adaptor approach and how to add a serial number for the records by overriding the built-in response processing using the **processResponse** method of the **ODataAdaptor**.

INDEX.JS

```

class SerialNoAdaptor extends ej.data.ODataV4Adaptor {
    processResponse() {
        var i= 0;
        // calling base class processResponse function
        var original = super.processResponse.apply(this, arguments);
        // adding serial number
        original.result.forEach(function(item){item['Sno'] = ++i});
        return { result: original.result, count: original.count };
    }
}
var data = new ej.data.DataManager({
    url: 'https://services.syncfusion.com/js/production/api/Orders',

```

```

    adaptor: new SerialNoAdaptor()
});
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'Sno', width: 120, headerText: 'SNO', textAlign: 'Right' },
        { field: 'CustomerID', width: 140, headerText: 'Customer Name',
type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
    ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Offline mode

On remote data binding, all grid actions such as paging, sorting, editing, grouping, filtering, etc, will be processed on server-side. To avoid postback for every action, set the grid to load all data on initialization and make the actions process in client-side. To enable this behavior, use the **offline** property of [DataManager](#).

INDEX.JS

```

var data = new ej.data.DataManager({
    url: 'https://services.syncfusion.com/js/production/api/Orders',
    adaptor: new ej.data.ODataAdaptor(),
    offline: true
});
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Sort, ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
    ]

```

```

        { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
    ],
    allowPaging: true,
    pageSettings: { pageSize: 7 },
    allowSorting: true,
    allowGrouping: true
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

```

Immutable mode in ##Platform_Name## Grid control

To enable this feature, you have to set the [enableImmutableMode](#) property as **true**.

* This feature uses the primary key value for data comparison. So, you need to provide the [isPrimaryKey](#) column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page);
var immutableStart;
var normalStart;
var primaryKey = 0;
var immutableInit = true;
var init = true;
var immutableGrid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    pageSettings: { pageSize: 50 },
    enableImmutableMode: true,
    beforeDataBound: function() {
        immutableStart = new Date().getTime();
    },
    dataBound: function() {
        var val = immutableInit ? '' : new Date().getTime() -
immutableStart;
        document.getElementById('immutableDelete').innerHTML = 'Immutable
rendering Time: ' + "<b>" + val + "</b>" + '<b>ms</b>';
        immutableStart = 0; immutableInit = false;
    },
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true,
textAlign: 'Right', width: 120 },
        { field: 'ProductName', headerText: 'Product Name', width: 160 },
        { field: 'ProductID', headerText: 'Product ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'CustomerName', headerText: 'Customer Name', width: 160 }
    ],
    height: 240
});
immutableGrid.appendTo('#immutable');
document.getElementById('delete').addEventListener('click', function(e) {
    immutableGrid.dataSource.splice(0, 5);
    normalGrid.setProperties({ dataSource: immutableGrid.dataSource });
    immutableGrid.setProperties({ dataSource: immutableGrid.dataSource });
});
document.getElementById('addtop').addEventListener('click', function(e) {
    var addedRecords = [
        { 'OrderID': ++primaryKey, 'ProductName': 'Chai', 'ProductID':
'Sasquatch Ale', 'CustomerID': 'QUEDE', 'CustomerName': 'Yoshi Tannamuri' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Georg Pipp's',
'ProductID': 'Valkoinen suklaa', 'CustomerID': 'RATTC', 'CustomerName':
'Martin Sommer' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Yoshi Tannamuri',
'ProductID': 'Gula Malacca', 'CustomerID': 'COMMI', 'CustomerName': 'Ann
Devon' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Palle Ibsen',
'ProductID': 'Rogede sild', 'CustomerID': 'RATTC', 'CustomerName': 'Paula
Wilson' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Francisco Chang',
'ProductID': 'Mascarpone Fabioli', 'CustomerID': 'ROMEY', 'CustomerName':
'Jose Pavarotti' }
    ]
    var aData = addedRecords.concat(immutableGrid.dataSource);
    normalGrid.setProperties({ dataSource: aData });
    immutableGrid.setProperties({ dataSource: aData });
});
document.getElementById('addbottom').addEventListener('click', function(e) {
    var addedRecords = [
        { 'OrderID': ++primaryKey, 'ProductName': 'Chai', 'ProductID':
'Sasquatch Ale', 'CustomerID': 'QUEDE', 'CustomerName': 'Yoshi Tannamuri' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Georg Pipp's',
'ProductID': 'Valkoinen suklaa', 'CustomerID': 'RATTC', 'CustomerName':
'Martin Sommer' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Yoshi Tannamuri',
'ProductID': 'Gula Malacca', 'CustomerID': 'COMMI', 'CustomerName': 'Ann
Devon' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Palle Ibsen',
'ProductID': 'Rogede sild', 'CustomerID': 'RATTC', 'CustomerName': 'Paula
Wilson' },
        { 'OrderID': ++primaryKey, 'ProductName': 'Francisco Chang',
'ProductID': 'Mascarpone Fabioli', 'CustomerID': 'ROMEY', 'CustomerName':
'Jose Pavarotti' }
    ]
    var aData = immutableGrid.dataSource.concat(addedRecords);
    normalGrid.setProperties({ dataSource: aData });
    immutableGrid.setProperties({ dataSource: aData });
});

```

```

});
document.getElementById('reverse').addEventListener('click', function(e) {
    var aData = immutableGrid.dataSource.reverse();
    normalGrid.setProperties({ dataSource: aData });
    immutableGrid.setProperties({ dataSource: aData });
});
document.getElementById('paging').addEventListener('click', function(e) {
    var totalPages = immutableGrid.dataSource.length /
immutableGrid.pageSettings.pageSize;
    var page = Math.floor(Math.random() * totalPages) + 1;
    normalGrid.setProperties({ pageSettings: { currentPage: page } });
    immutableGrid.setProperties({ pageSettings: { currentPage: page } });
});
var normalGrid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    pageSettings: { pageSize: 50 },
    beforeDataBound: function() {
        normalStart = new Date().getTime();
    },
    dataBound: function() {
        var val = init ? '' : new Date().getTime() - normalStart;
        document.getElementById('normalDelete').innerHTML = 'Normal
rendering Time: ' + "<b>" + val + "</b>" + '<b>ms</b>';
        normalStart = 0; init = false;
    },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true,
textAlign: 'Right', width: 120 },
        { field: 'ProductName', headerText: 'Product Name', width: 160 },
        { field: 'ProductID', headerText: 'Product ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'CustomerName', headerText: 'Customer Name', width: 160 }
    ],
    height: 240
});
normalGrid.appendTo('#normal');

```

</body></html>

```

Limitations

The following features are not supported in the immutable mode:

- Frozen rows and columns
- Row Template
- Detail Template
- Hierarchy Grid
- Column reorder
- Virtual scroll
- Infinite scroll
- Grouping

Performance tips for ##Platform_Name## Grid control

This article is a comprehensive guide on improving the loading performance of the ##PlatformName## Grid, especially when dealing with large datasets along with large number of columns. It provides valuable insights into the steps that need to be followed to bind a large data source without experiencing any performance degradations. By offering detailed explanations and actionable tips, this resource aims to empower readers with the knowledge and best practices necessary to optimize the performance of the ##PlatformName## Grid during data binding, ensuring a smooth and efficient user experience.

How to improve loading performance by binding large dataset

As you all know, a grid is made up of rows and columns. For instance, when you bind 10 rows and 10 columns, it means 100 elements will be rendered in the DOM (Document Object Model). So, it is recommended to render only a limited number of rows and columns to guarantee the best loading performance for the control.

Optimizing performance with paging

To boost the performance efficiency of your application, especially when dealing with large datasets, it is advised to implement paging. [Paging](#) allows you to display grid data in segmented pages, facilitating easier navigation through substantial datasets. This feature proves particularly beneficial in enhancing the overall performance of your application. For more information on implementing paging, you can refer to the [documentation](#) section dedicated to this feature.

Optimizing performance with row virtualization or infinite scrolling

To enhance your application's efficiency, especially when dealing with substantial datasets, it is recommended to either using [virtualization](#) or [infinite scrolling](#). Implementing these techniques can significantly reduce the load on your application and elevate its overall performance.

1. **Virtualization:** The Virtual scrolling feature in the ##Platform_Name## Grid enables the efficient handling and display of large volumes of data without compromising performance. This approach optimizes the rendering process by loading only the visible rows within the Grid viewport, rather than rendering the entire dataset simultaneously. For more information on implementing row virtualization , you can refer to the [documentation](#) section dedicated to this feature.
2. **Infinite scrolling:** The Infinite Scrolling feature in the ##Platform_Name## Grid is a powerful tool for seamlessly handling extensive data sets without compromising grid performance. It operates on a "load-on-demand" concept, ensuring that data is fetched only when needed. In the default infinite scrolling mode, a new block of data is loaded each time the scrollbar reaches the end of the vertical scroller. For more information on implementing infinite scrolling , you can refer to the [documentation](#) section dedicated to this feature.

Optimizing performance with column virtualization in large no of columns

[Column virtualization](#) feature in the ##Platform_Name## Grid that allows you to optimize the rendering of columns by displaying only the columns that are currently within the viewport. It allows horizontal scrolling to view additional columns. This feature is particularly useful when dealing with grids that have a large number of columns, as it helps to improve the performance and reduce the initial loading time.

It is possible to enable both row and column virtualization. This feature allows for efficient handling of large datasets by dynamically loading only the visible rows and columns, optimizing performance and enhancing the overall responsiveness of the grid. For more information on implementing column virtualization , you can refer to the [documentation](#) section dedicated to this feature.

How to overcome browser height limitation in virtual scrolling

[Documentation link](#)

How to improve loading performance by binding large data by showing custom text or element

When integrating image or template elements into a column, it's recommended to utilize the [Column Template](#) feature rather than customizing the data through [rowDataBound](#) or [queryCellInfo](#) events. These events are triggered for each row and cell rendering, introducing delays in the control's rendering process. Moreover, rendering custom elements using these events may result in the persistence of

rendered elements, potentially causing longer rendering times over time. By opting for the column template feature, you can efficiently meet this requirement without experiencing rendering delays and ensure a more streamlined rendering process.

How to improve loading performance by referring individual script and CSS

To improve the performance of Syncfusion Grid control during the initial render as well as certain actions, suggested you to download the specific control scripts using CRG (Custom Resource Generator) to speed up the project. By default, the ej2.min.js script file contains all the Syncfusion control scripts. So, it will take some time to load the scripts to the project. Using [CRG](#), you can select the controls which you want to use, and the modules for those controls, then you can download the scripts and CSS for the selected controls and use them as per your need.

[CRG website link](#)

So to improve the performance of grid during the initial rendering, suggested you to refer individual script and CSS.

How to update cell values without frequent server calls

Efficiently update cell values without the need for frequent server calls, especially beneficial for live update scenarios. Even when the data is initially bound from the server, performing edit operations can be done without triggering a database refresh. Utilize the [setCellValue](#) method to update the Grid without affecting the database and only refresh the UI.

How to optimize server-side data operations with adaptors

The ##Platform_Name## Grid provides support for various adaptors (OData, ODataV4, WebAPI, URL, etc.) to facilitate server-side data operations and CRUD functionalities. By leveraging these adaptors along with the `DataManager` control, you can seamlessly bind remote data sources to the grid and execute actions. During data operations like filtering, sorting, and paging, the corresponding action queries are generated as per the adaptor's requirements. It is crucial to handle these actions on the application end and return the processed data back to the grid. Refer to the documentation for comprehensive details. It's worth noting that for efficient data processing, the suggested order for returning processed data to the grid is as follows

- Filtering
- Sorting
- Aggregates
- Paging
- Grouping

How to avoid MaxJsonLength error while passing large amount of records

The ##Platform_Name## Grid control is client-server based. So, we send the data as JSON object between client and server. The reported issue occurs due to the serialization of the large-sized JSON object. We need to increase the maximum length for serializing the large-sized JSON object. You have to alter the [MaxJsonLength](#) property on your web.config file or in the place of deserialization.

Solution: 1

```
`csharp
<configuration>
<system.web.extensions>
```

```

<scripting>
<webServices>
<jsonSerialization maxJsonLength="25000000"/>
</webServices>
</scripting>
</system.web.extensions>
</configuration>
`

```

Solution : 2

```

`csharp
var serializer = new JavaScriptSerializer { MaxJsonLength = Int32.MaxValue };
`

```

Microsoft excel limitation while exporting millions of records to excel file format

By default, Microsoft Excel supports only 1,048,576 records in an excel sheet. Hence it is not possible to export millions of records to excel. You can refer the [documentation](#) link for more details on Microsoft excel specifications and limits. So suggest to export the data in CSV (Comma-Separated Values) or other formats that can handle large datasets more efficiently than Excel.

Columns

Columns in ##Platform_Name## Grid control

The column definitions are used as the [dataSource](#) schema in the Grid. This plays a vital role in rendering column values in the required format. The grid operations such as sorting, filtering and grouping etc. are performed based on column definitions. The [field](#) property of the [columns](#) is necessary to map the data source values in Grid columns.

1. If the column [field](#) is not specified in the dataSource, the column values will be empty.
2. If the [field](#) name contains “dot” operator, it is considered as complex binding.

Column types

Column type can be specified using the [columns.type](#) property. It specifies the type of data the column binds.

If the [format](#) is defined for a column, the column uses [type](#) to select the appropriate format option ([number](#) or [date](#)).

Grid column supports the following types:

- string
- number
- boolean
- date
- datetime

If the [type](#) is not defined, it will be determined from the first record of the [dataSource](#).

Incase if the first record of the [dataSource](#) is null/blank value for a column then it is necessary to define the [type](#) for that column.

ValueAccessor

The [valueAccessor](#) is used to access/manipulate the value of display data. You can achieve custom value formatting by using the [valueAccessor](#).

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', width: 100,
valueAccessor: currencyFormatter },
    { field: 'ShipName', headerText: 'Ship Name', width: 180,
valueAccessor: valueAccess },
  ],
  height: 315
});
grid.appendTo('#Grid');
function currencyFormatter(field, data, column) {
  return '€' + data['Freight'];
}
function valueAccess(field, data, column) {
  return data[field] + '-' + data['ShipRegion'];
}
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Display array type columns

You can bind an array of objects in a column by using the [valueAccessor](#) property. In this example, the name field has an array of two objects, FirstName and LastName. These two objects are joined and bound to a column using the [valueAccessor](#).

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: stringData,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 100 },
        { field: 'Name', headerText: 'Full Name', width: 120, valueAccessor:
valueAccess },
        { field: 'Title', headerText: 'Title', width: 150 }
    ],
    height: 315
});
grid.appendTo('#Grid');
function valueAccess(field, data, column){
    return data[field].map(function (s) {
        return s.LastName || s.FirstName }).join(' ');
    }
}

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Expression column

You can achieve the expression column by using the [valueAccessor](#) property.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: foodInformation,
  columns: [
    { field: 'FoodName', headerText: 'FoodName', width: 120 },
    { field: 'Protein', headerText: 'Protein', textAlign: 'Right',
width: 100 },
    { field: 'Fat', headerText: 'Fat', textAlign: 'Right', width: 100 },
    { field: 'Carbohydrate', headerText: 'Carbohydrate', textAlign:
'Right', width: 130 },
    { headerText: 'Calories In Take', valueAccessor: totalCalories,
textAlign: 'Right', width: 150 },
  ],
  height: 315
});
grid.appendTo('#Grid');
function totalCalories(field, data, column){
  return data.Protein * 4 + data.Fat * 9 + data.Carbohydrate * 4;
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Format

To format cell values based on specific culture, use the [columns.format](#) property. The grid uses [Internalization](#) library to format [number](#) and [date](#) values.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120 },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID'
},
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign:
'Right', width: 140, format: 'yMd' }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

</body></html>

```

By default, the [number](#) and [date](#) values are formatted in **en-US** locale. You can localize the currency and date in different locale as explained [here](#)

Number formatting

The number or integer values can be formatted using the below format strings.

Format | Description | Remarks

{ type:'date', format:'dd/MM/yyyy' } | 04/07/1996

{ type:'date', format:'dd.MM.yyyy' } | 04.07.1996

{ type:'date', skeleton:'short' } | 7/4/96

{ type: 'dateTime', format: 'dd/MM/yyyy hh:mm a' } | 04/07/1996 12:00 AM

{ type: 'dateTime', format: 'MM/dd/yyyy hh:mm:ss a' } | 07/04/1996 12:00:00 AM

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'Freight', headerText: 'Freight', format:'C2', width: 120
},
        { field: 'OrderDate',format: {type:'date', format:'dd/MM/yyyy'},
headerText:'Order Date', width:150},
        { field: 'OrderDate', format:{ type: 'dateTime', format: 'dd/MM/yyyy
hh:mm a' }, headerText: 'Ship Date', width: 180 }
    ],
});
grid.appendTo('#Grid');

```

```

Render boolean values as checkbox

To render boolean values as checkbox in columns, you need to set [displayAsCheckBox](#) property as **true**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit);
var grid = new ej.grids.Grid({
    dataSource: data,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'Verified', headerText: 'Verified', width: 150,
displayAsCheckBox: true }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Visibility

You can hide any particular column in Grid before rendering by defining [visible](#) property as false. In the below sample **ShipCity** column is defined as visible false.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'ShipCity', width: 140, headerText: 'Ship City', visible:
false },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

</body></html>

```

Lock columns

You can lock columns by using [column.lockColumn](#) property. The locked columns will be moved to the first position. Also you can't reorder its position.

In the below example, **Ship City** column is locked and its reordering functionality is disabled.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Reorder);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowReordering: true,
    allowSelection: false,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City',width: 100, lockColumn:
true, customAttributes: { class: 'customcss' } },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 },
        { field: 'ShipPostalCode', headerText: 'Ship Postal code', width:
100 },
        { field: 'ShipRegion', headerText: 'Ship Region', width: 100 }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Controlling Grid actions

You can enable or disable grid action for a particular column by setting the [allowFiltering](#), [allowGrouping](#), [allowSorting](#), [allowReordering](#), and [allowEditing](#) properties.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Group, ej.grids.Filter, ej.grids.Sort,
ej.grids.Edit, ej.grids.Reorder);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    allowGrouping: true,
    allowSorting: true,
    allowReordering: true,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', allowGrouping: false,
textAlign: 'Right', width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', allowFiltering: false,
allowReordering: false, allowEditing: false, width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', allowSorting: false,
width: 100 }
    ],
    height: 220
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Show or hide columns by external button

You can show or hide grid columns dynamically using external buttons by invoking the [showColumns](#) or [hideColumns](#) method.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 280
});
grid.appendTo('#Grid');
var show = new ej.buttons.Button({ cssClass: 'e-flat' }, '#show');
var hide = new ej.buttons.Button({ cssClass: 'e-flat' }, '#hide');
document.getElementById('show').onclick = function() {
  grid.showColumns(['Customer ID', 'Ship Name']); //show by HeaderText
};
document.getElementById('hide').onclick = function() {
  grid.hideColumns(['Customer ID', 'Ship Name']); //hide by HeaderText
};
```

```

Customize column styles

You can customize the appearance of the header and content of a particular column using the [customAttributes](#) property.

To customize the grid column, follow the given steps:

Step 1:

Create a CSS class with custom style to override the default style for rowcell and headercell.

```

.e-grid .e-rowcell.customcss{
background-color: #ecedee;
color: 'red';
font-family: 'Bell MT';
font-size: 20px;
}
.e-grid .e-headercell.customcss{
background-color: #2382c3;
color: white;
}

```

```
font-family: 'Bell MT';
font-size: 20px;
}
,
```

Step 2:

Add the custom CSS class to the specified column by using the [customAttributes](#) property.

```
`ts
{ field: 'ShipCity', headerText: 'Ship City', customAttributes: {class: 'customcss'}, width: 100 },
,
```

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  enableHover: false,
  allowSelection: false,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', customAttributes: {
class: 'customcss' }, width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

Display custom tooltip for columns

To display a custom ToolTip ([EJ2 Tooltip](#)), you can render the Grid control inside the Tooltip component and set the target as ".e-rowcell". The tooltip is displayed when hovering the grid cells.

Change the tooltip content for the grid cells by using the following code in the [beforeRender](#) event.

```

`ts
function beforeRender(args) {
// event triggered before render the tooltip on target element.
tooltip.content = args.target.closest("td").innerText;
}
`

```

INDEX.JS

```

var tooltip = new ej.popups.Tooltip({
    target: ".e-rowcell", // set the target element to show the tooltip on
    hovering it
    beforeRender: beforeRender
}, "#Tooltip");

```

```

var grid= new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipName', headerText: 'Ship Name', width: 140 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    ],
    height: 315
});
grid.appendTo('#Grid');
function beforeRender(args) {
    // event triggered before render the tooltip on target element.
    tooltip.content = args.target.closest("td").innerText;
}

```

INDEX.HTML

```

Align the text of Grid content and header

For aligning the text of Grid content and header part, kindly use [textAlign](#) and [headerTextAlign](#) properties.

Grid column supports the following alignments:

- Left
- Right
- Center
- Justify

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', type: 'number',
      textAlign: 'Right', headerTextAlign: 'Right', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', type: 'string',
      textAlign: 'Left', headerTextAlign: 'Left', width: 90 },
    { field: 'OrderDate', headerText: 'Order Date', type: 'date',
      textAlign: 'Center', headerTextAlign: 'Center', format: 'yMd', width: 140 },
    { field: 'ShipCountry', headerText: 'Ship Country', type: 'string',
      textAlign: 'Justify', headerTextAlign: 'Justify', width: 120 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

How to prevent checkbox in the blank row

By default, cells in the grid will be blank if the corresponding column values in the data source are null or undefined. The grid also has the option to prevent the rendering of checkboxes in such cases, even if the [displayAsCheckBox](#) property is set to true for that column, by using the [rowDataBound](#) event of the Grid.

In the following sample, the `rowDataBound` event of the Grid is used to set the innerHTML of the checkbox element to empty.

INDEX.JS

```

var grid= new ej.grids.Grid({
  dataSource: data,
  rowDataBound: rowDataBound,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'Freight', headerText: 'Freight', width: 100, textAlign:
'Right' },
    { field: 'ShipName', headerText: 'Ship Name', width: 180 },
    { field: 'Verified', headerText: 'Verified', width: 150,
displayAsCheckBox: true },
  ]
});
grid.appendTo('#Grid');
function rowDataBound(args) {
  var count = 0;
  var keys = Object.keys(args.data);
  for (var i = 0; i < keys.length; i++) {
    if (args.data[keys[i]] == null || args.data[keys[i]] == '' ||
args.data[keys[i]] == undefined) {
      count++;
    }
  }
  if (count == keys.length) {
    for (var i = 0; i < grid.columns.length; i++) {
      if (grid.columns[i].displayAsCheckBox) {
        args.row.children[i].innerHTML = '';
      }
    }
  }
}
}

```

INDEX.HTML

```

```

When columns are auto-generated, the column [type](#) will be determined from the first record of the [dataSource](#).

Set [isPrimaryKey](#) for auto generated columns when editing is enabled

Primary key can be defined in the declaration of column object of the grid. When we didn't declare the columns, the grid will generate the columns automatically. For these auto generated columns, you can set [isPrimaryKey](#) column property as true by any one of the following two ways,

If Primary key "column index" is known then refer the following code example

```
`ts
import { Grid, Edit } from '@syncfusion/ej2-grids';
Grid.Inject(Edit);
let data: Object[] = [
{ OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5 },
{ OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6 },
{ OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4 }];
let grid: Grid = new Grid ({
dataSource: data,
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true }
});
grid.appendTo('#Grid');
grid.dataBound = () => {
var column: Column = grid.columns[0];
column.isPrimaryKey = 'true';
}
`
```

If Primary key "column fieldname" is known then refer the following code example

```
`ts
import { Grid, Edit } from '@syncfusion/ej2-grids';
Grid.Inject(Edit);
let data: Object[] = [
{ OrderID: 10248, CustomerID: 'VINET', EmployeeID: 5 },
{ OrderID: 10249, CustomerID: 'TOMSP', EmployeeID: 6 },
{ OrderID: 10250, CustomerID: 'HANAR', EmployeeID: 4 }];
```

```

let grid: Grid = new Grid ({
  dataSource: data,
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true }
});

grid.appendTo('#Grid');

grid.dataBound = () => {
  var column: Column = grid.getColumnByField('OrderID');
  column.isPrimaryKey = 'true';
}

```

Set column options to auto generated columns

You can set column options such as [format](#), [width](#) to the auto generated columns by using [dataBound](#) event of the grid.

In the below example, [width](#) is set for **OrderID** column, **date** type is set for **OrderDate** column and **numeric** type is set for **Freight** column.

INDEX.JS

```

var data = [
  { OrderID: 10248, CustomerID: 'VINET', Freight: 32.3800,
    OrderDate: "1996-07-02T00:00:00.000Z" },
  { OrderID: 10249, CustomerID: 'TOMSP', Freight: 32.3800,
    OrderDate: "1996-07-19T00:00:00.000Z" },
  { OrderID: 10250, CustomerID: 'HANAR', Freight: 32.3800,
    OrderDate: "1996-07-22T00:00:00.000Z" }];
var grid = new ej.grids.Grid ({
  dataSource: data,
  dataBound: dataBound
});
grid.appendTo('#Grid');
function dataBound(args) {
  for (var i = 0; i < this.columns.length; i++) {
    this.columns[0].width = 120;
    if(this.columns[i].field === "OrderDate"){
      this.columns[i].type="date";
    }
    if (this.columns[i].type === "date") {
      this.columns[i].format = { type: "date", format:
"dd/MM/yyyy" };
    }
    this.columns[2].format = "P2";
  }
  this.refreshColumns();
}

```

Headers in ##Platform_Name## Grid control

Header text

By default, the header text of a column in Grid is displayed from the column's [field](#) value. However, you can easily override the default header title and provide a custom header text for the column using the [headerText](#) property.

To enable the `headerText` property, you simply need to define it in the [columns](#) property. The following example demonstrates how to enable header text for a Grid column.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 140, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
format: 'C', width: 120 },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
format: 'yMd', width: 140 }
    ],

```

```

        height: 315
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
        }
    </script>
    <script src="index.js" type="text/javascript"></script>

```

```
</body>
</html>
```

* The **headerText** property is optional, and if it is not defined, then the corresponding column's field value is set as header text for that column.

* You can also use the [headerTemplate](#) property to apply custom HTML content to the header cell.

Header template

The [headerTemplate](#) property is used to customize the header element of a Grid column. With this property, you can render custom HTML elements or **##Platform_Name##** control to the header element. This feature allows you to add more functionality to the header, such as sorting or filtering.

In this demo, the custom element is rendered for both **CustomerID** and **OrderDate** column headers.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width:
120, },
    {
      field: 'CustomerID', headerText: 'Customer ID', width: 140,
      headerTemplate: ` <div>
        <span class="e-icon-userlogin"></span>
        Customer ID
      </div>`,
    },
    { field: 'Freight', headerText: 'Freight', format: "C", width: 120,
      headerTemplate: ` <div id='Freight'></div>`, },
    {
      field: 'OrderDate', headerText: 'Order Date', textAlign: "Right",
      width: 200, format: 'yMd',
      headerTemplate: `<div><span id='OrderDate'></span>
        <label id='headerText' style='margin-left:8px'>Order Date</label>
      </div>`
    },
  ],
  height: 315
});
grid.appendTo('#Grid');
var dropdownData = ['Freight', 'Shipment', 'Cargo'];
var dropDownColumn = new ej.dropdowns.DropDownList({
  value: 'Freight',
  popupHeight: '200px',
  dataSource: dropdownData,
});
dropDownColumn.appendTo('#Freight');
var toggleButton = new ej.buttons.Switch({
  headerText: 'Order Date',
  change: onSwitchToggle,
});
toggleButton.appendTo('#OrderDate');
function onSwitchToggle(args) {
  headerText = args.checked ? 'Purchase Date' : 'Order Date';
```

```
document.getElementById('headerText').innerHTML = headerText;
}
```

        }
    </script>
    <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* The `headerTemplate` property is only applicable to Grid columns that have a header element.

* You can use any HTML or `##Platform_Name##` control in the header template to add additional functionality to the header element.

Stacked header

In Grid, you can group multiple levels of column headers by stacking the Grid columns. This feature allows you to organize the Grid columns in a more structured and understandable way. This can be achieved by setting the [columns->columns](#) property. Within this property, you can define an array of column objects to group together as sub-headers under a main header. You can define the `headerText` property of each sub-header column to set the text for that sub-header.

You can customize the appearance of the stacked header elements by using the `headerTemplate` property. This property accepts an id reference, which allows you to define custom HTML elements or `##Platform_Name##` control to the header element. Here's an example of how to use stacked headers with a custom `headerTemplate` in Syncfusion Grid.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
    'Center', headerTemplate: '#orderID' },
    {
      headerText: 'Order Details', headerTemplate: '#orderDate',
      columns: [
        { field: 'OrderDate', headerText: 'Order Date', format:
        'yMd', width: 130, textAlign: 'Right', minWidth: 10, },
        { field: 'Freight', headerText: 'Freight($)', width: 120,
        format: 'C1', textAlign: 'Right', minWidth: 10, },
      ]
    },
    {
      headerText: 'Ship Details',
      headerTemplate: '<div> <span>Ship Details</span><span><i
class="fa fa-truck"></i></span></div>',
      columns: [
        { field: 'ShippedDate', headerText: 'Shipped Date', format:
        'yMd', textAlign: 'Right', width: 150, minWidth: 10, },
        { field: 'ShipCountry', headerText: 'Ship Country', width:
        150, minWidth: 10, },
      ]
    }
  ]
});
grid.appendTo('#Grid');
var dropdownData = ['Order Details', 'Order Information'];
var dropdownList = new ej.dropdowns.DropDownList({
  value: 'Order Details',
  popupHeight: '200px',
  dataSource: dropdownData,
});
dropdownList.appendTo('#orderdate');
```

```

Align the text of header text

You can horizontally align the text in column headers of the Grid control using the [headerTextAlign](#) property. By default, the text is aligned to the left, but you can change the alignment by setting the value of the `headerTextAlign` property to one of the following options:

- **Left:** Aligns the text to the left (default).
- **Center:** Aligns the text to the center.
- **Right:** Aligns the text to the right.
- **Justify:** Header text is justified.

Here is an example of using the `headerTextAlign` property to align the text of a Grid column header:

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 140 },
    { field: 'Freight', headerText: 'Freight', format: 'C', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', format: 'yMd', width:
140 },
  ],
  height: 315,
});
grid.appendTo('#Grid');
var alignmentData = [
  { text: 'Left', value: 'Left' },
  { text: 'Right', value: 'Right' },
  { text: 'Center', value: 'Center' },
  { text: 'Justify', value: 'Justify' }
]
var dropdownList = new ej.dropdowns.DropDownList({
  value: 'Left',
  popupHeight: '240px',
  width: 100,
  dataSource: alignmentData,
  change: changeAlignment,
});
dropdownList.appendTo('#dropdown');
function changeAlignment(args) {
  grid.columns.forEach((column) => {
    column.headerTextAlign = args.value
  })
  grid.refreshHeader();
}
```

    <input type="text" tabindex="1" id="dropdown" />
  </div>
  <div id="Grid">
  </div>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* The `headerTextAlign` property only changes the alignment of the text in the column header, and not the content of the column. If you want to align both the column header and content, you can use the [textAlign](#) property.

* You can also use the `headerTextAlign` property with the stacked header feature in Syncfusion Grid. The property will align the header text in the sub-headers as well.

Autowrap the header text

The autowrap allows the cell content of the grid to wrap to the next line when it exceeds the boundary of the specified cell width. The cell content wrapping works based on the position of white space between words. To support the Autowrap functionality in Syncfusion Grid, you should set the

appropriate [width](#) for the columns. The column width defines the maximum width of a column and helps to wrap the content automatically.

To enable autowrap, set the `allowTextWrap` property to **true**. You can also configure the auto wrap mode by setting the `textWrapSettings.wrapMode` property.

Grid provides the below three options for configuring:

- **Both:** This is the default value for `wrapMode`. With this option, both the grid header text and content is wrapped.
- **Header:** With this option, only the grid header text is wrapped.
- **Content:** With this option, only the grid content is wrapped.

* If a column width is not specified, then the Autowrap of columns will be adjusted with respect to the grid's width.

* If a column's header text contains no white space, the text may not be wrapped.

* If the content of a cell contains HTML tags, the Autowrap functionality may not work as expected. In such cases, you can use the [headerTemplate](#) and [template](#) properties of the column to customize the appearance of the header and cell content.

In the example below, the `textWrapSettings.wrapMode` property is set to **Header** only the grid header text is wrap to the next line.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowTextWrap: true,
  textWrapSettings: { wrapMode: 'Header' },
  height: 400,
  columns: [
    { field: 'Inventor', headerText: 'Inventor Name', width: 180, textAlign: 'Right' },
    { field: 'NumberofPatentFamilies', headerText: 'Number of Patent Families', width: 180, textAlign: "Right" },
    { field: 'Country', headerText: 'Country', width: 140, textAlign: 'Right' },
    { field: 'Active', headerText: 'Active', width: 120 },
    { field: 'Mainfieldsofinvention', headerText: 'Main Feilds Of Invention', width: 200 },
  ],
});
grid.appendTo('#Grid');
var dropdownData = [
  { text: 'Header', value: 'Header' },
  { text: 'Both', value: 'Both' },
]
var dropdown = new ej.dropdowns.DropDownList({
  dataSource: dropdownData,
  popupHeight: '240px',
  width: '100px',
  value: grid.textWrapSettings.wrapMode,
  change: valueChange,
```

```
});
dropdown.appendTo('#dropdownlist');
function valueChange(args) {
    grid.textWrapSettings.wrapMode = args.value;
}
```

```

Change the height of header

Changing the height of the header can be useful in cases where the default height is not sufficient to display the header content cell. For example, if you have a header with a lot of text or if you want to add an image to the header, you may need to increase the height of the header to accommodate the content. This can be easily achieved by changing the height of the header using CSS or by dynamically adjusting the height using a methods.

Using CSS

You can use CSS to override the default height of the **.e-grid .e-headercell** class to change the height of the header. Here is an example code snippet:

```

`css
.e-grid .e-headercell {
height: 130px;
}
`

```

Using methods

To change the height of the header dynamically, you can use the [getHeaderContent](#) method to get the header content element of the Syncfusion Grid. Then, you can use the **querySelectorAll** method to get all the header cell elements with the class **e-headercell**. Finally, you can loop through each header cell element and set its style property to adjust the height.

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    {field: 'OrderID', headerText: 'Order ID', width: 120},
    {field: 'CustomerID', headerText: 'Customer ID', width: 140},
    {field: 'Freight', headerText: 'Freight', format: 'C', width: 120},
    {field: 'OrderDate', headerText: 'Order Date', format: 'yMd', width: 140},
  ],
});
grid.appendTo('#Grid');
var button = new ej.buttons.Button({
  content: 'CHANGE HEIGHT TO 20PX',
});
button.appendTo('#small');
var button1 = new ej.buttons.Button({
  content: 'DEFAULT HEIGHT TO 42PX',
});
button1.appendTo('#medium');
var button2 = new ej.buttons.Button({
  content: 'CHANGE HEIGHT TO 60PX',
});

```

```

button2.appendTo('#big');
document.getElementById('changeHeight').onclick = function (event) {
    var heightMap = { small: '20px', medium: '42px', big: '60px' };
    var headerCells = (grid).getHeaderContent().querySelectorAll('.e-
headercell');
    headerCells.forEach((headerCell) => {
        headerCell.style.height = (heightMap)[
            event.target.id
        ];
    });
}

```

INDEX.HTML

```

    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* You can also use the [getHeaderTable](#) method to get the table element of the header, and then adjust the height.

* You cannot change the height of row below the default height of 42px using the **e-columnheader** class.

Change the header text dynamically

The Syncfusion Grid controls provides a way to modify the header text of a corresponding column in real-time based on events or other events. This feature can be useful in various scenarios, such as displaying a custom header text for a specific column or updating the header text dynamically based on input. By allowing for dynamic changes to the header text, the Grid provides a more flexible and customizable experience.

Using event

To modify the header text of a corresponding column dynamically, you can use the [headerCellInfo](#) event provided by the Syncfusion Grid. This event is triggered for each header cell element rendered in the Grid.

When the [headerCellInfo](#) event is triggered, it provides a **HeaderCellInfoEventArgs** object as a parameter. This object contains the following properties:

- **cell**: Defines the header cell that is being modified.
- **node**: Defines the DOM element of the header cell that is being modified.

You can use these properties to access and modify the header text of the corresponding column. Once the header text is modified, you can refresh the Grid to reflect the changes by calling the [refreshHeader](#) method of the Grid.

Using method

The Grid control provides several methods that allow you to change the column header text dynamically. Here are some of the methods you can use:

1. [getColumnByField](#): This method takes a field name as a parameter and returns the entire column object that corresponds to that field name, including properties such as headerText, width, and alignment. You can use this method to modify any aspect of the column. 2. [getColumnHeaderByField](#): Retrieves the header element of a column based on its field name. You can modify the **textContent** property of the header element to change the header text. This method does not return a reference to the column object itself, only to the header element. 3. [getColumnIndexByField](#): Retrieves the index of a column based on its field name. You can then use the [getColumnByIndex](#) method to retrieve the column object and modify its **headerText** property to change the header text. 4. [getColumnByUid](#): Retrieves the column object based on its unique identifier (UID). You can modify the **headerText** property of the column object to change the header text. 5. [getColumnHeaderByIndex](#): Retrieves the header element of a column based on its zero-based index. You can modify the **textContent** property of the header element to change the header text. This method does not return a reference to the column object itself, only to the header element. 6. [getColumnIndexByUid](#): Retrieves the index of a column based on its unique identifier (UID). You can then use the [getColumnByIndex](#) method to retrieve the column object and modify its **headerText** property to change the header text. 7. [getColumnHeaderByUid](#): Retrieves the header element of a column based on its unique identifier (UID). You can modify the **textContent** property of the header element to change the header text. This method does not return a reference to the column object itself, only to the header element. If you only have an **template** for the column header, and the column itself is not defined with a **field**, then you can use the [getColumnHeaderByUid](#) method to get a reference to the header element and modify its text content to change the header text.

* When you change the header text dynamically, make sure to **refresh** the Grid to reflect the changes by calling the [refreshHeader](#) method.

* The UID is automatically generated by the Grid control and may change whenever the grid is refreshed or updated.

Here is an example of how to change the header text of a column using the [getColumnByField](#) method:

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 140 },
    { field: 'Freight', headerText: 'Freight', format: 'C', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', format: 'yMd', width:
140 },
  ],
});
grid.appendTo('#Grid');
var columns =
[
  { text: 'OrderID', value: 'OrderID' },
  { text: 'CustomerID', value: 'CustomerID' },
  { text: 'Freight', value: 'Freight' },
  { text: 'OrderDate', value: 'OrderDate' },
]
var field = { text: 'text', value: 'value' };
var dropdown = new ej.dropdowns.DropDownList({
```

```

    dataSource: columns,
    fields: field,
    value: 'OrderID',
    popupHeight: '240px',
    width: 220,
  });
  dropdown.appendTo('#dropdownlist');
  var textbox = new ej.inputs.TextBox({
    placeholder: 'Enter new header text',
    width: 220,
  });
  textbox.appendTo('#textboxvalue');
  var button = new ej.buttons.Button({
    content: 'Change',
  });
  button.appendTo('#buttons');
  document.getElementById('buttons').onclick = function () {
    if (textbox.value.trim() !== '') {
      var column = grid.getColumnByField(dropdown.value);
      column.headerText = textbox.value;
      grid.refreshHeader();
    }
  };
};

```

INDEX.HTML

```

Changing header text using headerValueAccessor property

The [headerValueAccessor](#) property in Syncfusion Grid allows you to customize the text of a column header cell, which can be useful in scenarios where you want to change the text to display it in a different language, format or add additional information to the header. This property is triggered every time the header cell is rendered.

To enable the `headerValueAccessor` property, you need to set the `headerValueAccessor` property of the corresponding column. This property accepts a callback function that takes two arguments:

- **field:** Represents the current field of the column.
- **column:** Represents the current column object.

* The `headerValueAccessor` property should only be used to change the text of the header and not to perform any DOM-oriented operations such as adding or manipulating DOM elements in the header. In such cases, you should use the [headerCellInfo](#) event instead.

* The `headerValueAccessor` property is triggered every time the header cell is rendered or refreshed.

* The callback function defined for the `headerValueAccessor` property should return a string that represents the new text of the column header.

* If you only need to refresh the column header, you can dynamically change the header content using the [refreshHeader](#) method.

* You can use this property for individual columns or for all columns by adding it to the grid's properties.

Here's an example of how to use the `headerValueAccessor` property to change the header text of a column:

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', headerValueAccessor:
headerValueAccessor, width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', headerValueAccessor:
headerValueAccessor, width: 140 },
    { field: 'Freight', headerText: 'Freight', headerValueAccessor:
headerValueAccessor, format: 'C', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', headerValueAccessor:
headerValueAccessor, format: 'yMd', width: 140 },
  ],
});
grid.appendTo('#Grid');
var columns = [
  { text: 'OrderID', value: 'OrderID' },
  { text: 'CustomerID', value: 'CustomerID' },
  { text: 'Freight', value: 'Freight' },
  { text: 'OrderDate', value: 'OrderDate' },
];
var field = { text: 'text', value: 'value' };
var dropdown = new ej.dropdowns.DropDownList({
  dataSource: columns,
  fields: field,
  value: 'OrderID',
  popupHeight: '240px',
  width: 220,
});
dropdown.appendTo('#dropdownlist');
var textbox = new ej.inputs.TextBox({
  placeholder: 'Enter new header text',
  width: 220,
});
textbox.appendTo('#textboxvalue');
var button = new ej.buttons.Button({
  content: 'Change',
});
button.appendTo('#buttons');
function headerValueAccessor(field, columns) {
  if (textbox && textbox.value && textbox.value.trim() !== '' &&
columns.field === dropdown.value) {
    columns.headerText = textbox.value;
  }
}
document.getElementById('buttons').onclick = function () {
  grid.refreshHeader();
}
```

```
};
```

</body>
</html>

```

Changing the header text of all columns

If you want to change the header text of all columns in the grid, you can loop through the Columns collection of the grid and set the `headerText` property for each column. Here is an example:

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'OrderID', textAlign: 'Right', width: 90 },
        { field: 'CustomerID', headerText: 'CustomerID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right', format: 'C2', width: 90 },
        { field: 'ShipCity', headerText: 'Ship City', format: 'yMd', width: 120 }
    ],
    height: 280,
});
grid.appendTo('#Grid');
var headerTextMap =
{
    'OrderID': 'Order ID',
    'CustomerID': 'Customer ID',
    'Freight': 'Freight Charge',
    'ShipCity': 'Ship To City'
}
var button = new ej.buttons.Button({
    content: 'Change Header Text',
    cssClass: "e-success",
});
button.appendTo('#buttons');
document.getElementById('buttons').onclick = function () {
    grid.columns.forEach((column) => {
        column.headerText = headerTextMap[column.field];
    });
    grid.refreshHeader();
};

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Grid</title>
    <meta charset="utf-8">

</body>
</html>

```

Change the orientation of header text

By default, the text in the column headers of the Syncfusion Grid controls is oriented horizontally. However, in some cases, you may want to change the orientation of the header text to vertical, diagonal, or at a custom angle. This can be achieved by adding a custom CSS class to the column header cell using the [customAttributes](#) property of the Grid columns.

Follow the below steps to change the orientation of the header text in Grid:

Step 1: Create a CSS class with orientation style for grid header cell

To **rotate** the header text, you can create a CSS class with the **transform** property that rotates the header text 90 degrees. This class will be added to the header cell using the **customAttributes** property.

```
`css
.orientationcss .e-headercelldiv {
transform: rotate(90deg);
}
`
```

Step 2: Add the custom CSS class to the grid column

Once you have created the CSS class, you can add it to the particular column by using the **customAttributes** property. This property allows you to add any custom attribute to the grid column.

For example, to add the orientationcss class to the Freight column, you can use the following code:

```
{ field: 'Freight', headerText: 'Freight', textAlign: 'Center', format: 'C2', customAttributes: {class:
'orientationcss'}, width: 80}
`
```

Step 3: Resize the header cell height

After adding the custom CSS class to a column, you need to resize the header cell height so that the rotated header text is fully visible. You can do this by using the following code:

```
setHeaderHeight(args) {
let textWidth: number = document.querySelector('.orientationcss > div').scrollWidth;//Obtain the width
of the headerText content.
let headerCell: NodeList = document.querySelectorAll('.e-headercell');
for(let i: number = 0; i < headerCell.length; i++) {
(<HTMLElement>headerCell.item(i)).style.height = textWidth + 'px'; //Assign the obtained textWidth as
the height of the headerCell.
}
}
`
```

INDEX.JS

```
var customAttributes = { class: 'orientationcss' };
var grid = new ej.grids.Grid({
  dataSource: data,
  created: setHeaderHeight,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width:
100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', textAlign: 'center', format: 'C2', customAttributes:
customAttributes, width: 80 },
```

```

    { field: 'ShipCity', headerText: 'Ship City', width: 100, format: 'yMd'
  },
  ],
  height: 240,
});
grid.appendTo('#Grid');
function setHeaderHeight() {
  var textWidth = document.querySelector('.orientationcss >
div').scrollWidth;
  var headerCell = document.querySelectorAll('.e-headercell');
  for (var i = 0; i < headerCell.length; i++) {
    // Assign the obtained textWidth as the height of the headerCell.
    headerCell.item(i).style.height = textWidth + 'px';
  }
}
}

```

INDEX.HTML

```

Custom tooltip for header

Custom tooltips for headers provide additional information when hovering over a column header in the Syncfusion Grid. This can be useful in situations where there is not enough space to display all of the information related to a column, or when there is additional context that may be helpful.

To enable custom tooltips for headers, you can use the [beforeRender](#) event of the Grid control. This event is triggered for each header cell before it is rendered, allowing you to add a custom tooltip to the header cell using [tooltip](#) control.

Here's an example of how to use the `beforeRender` event to add a custom tooltip to a header cell:

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', type: 'date', format:
'yMd', width: 120 },
  ],
});
grid.appendTo('#Grid');
var columnDescriptions = {
  'Order ID': 'A unique number assigned to each order.',
  'Freight': 'The cost of shipping the order.',
  'Ship Name':
    'The name of the person or company who will receive the shipment.',
  'Ship Country': 'The country to which the shipment will be sent.',
  'Order Date': 'The date when the order was placed.',
};
var tooltip = new ej.popups.Tooltip({
  beforeRender: beforeRender,
  target: '.e-headertext',

```

```
});
tooltip.appendTo('#tooltip');
function beforeRender(args) {
    var description = columnDescriptions[args.target.innerText];
    if (description) {
        tooltip.content = args.target.innerText + ': ' + description;
    }
}
```

INDEX.HTML

```

            <div id="Grid"></div>
        </div>
    </div>
    <script>
        var ele = document.getElementById('container');
        if (ele) {
            ele.style.visibility = "visible";
```

```

    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* The [headerCellInfo](#) event can also be used to customize the header tooltip. This event is triggered for each header cell after it is rendered.

Customize header text styles

Customizing the grid header styles allows you to modify the appearance of the column header in the Grid control to meet your design requirements. You can customize the font, background color, and other styles of the header cells. To customize the header styles in the grid, you can use CSS, properties, methods, or event support provided by the Syncfusion `##Platform_Name##` Grid control.

Using CSS

You can apply styles to the header cells using CSS selectors. The Grid provides a class name for each header cell element, which you can use to apply styles to that specific header cell. The `.e-headercell` class can be used to change the background color and text color of the column header.

`CSS

```

.e-grid .e-headercell {
background-color: #a2d6f4;
color:rgb(3, 2, 2);
}
`

```

Here's an example that demonstrates how to customize the appearance of a specific column header in the Grid using `className`.

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign: 'Right' },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150, textAlign: 'Right' },
    { field: 'OrderDate', headerText: 'Order Date', width: 130, format: 'yMd', textAlign: 'Right' },
    { field: 'Freight', headerText: 'Freight', width: 140, format: 'C2', textAlign: 'Right' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 130, format: 'yMd', textAlign: 'Right' },
  ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

</body>
</html>

```

Using property

You can customize the appearance of the column headers in Grid using the [customAttributes](#) property. The `customAttributes` property takes an object with the name-value pair to customize the CSS properties for grid header cells. You can also set multiple CSS properties to the custom class using the `customAttributes` property.

To customize the header of a column, you can follow the steps below:

Step 1: Define a CSS class that specifies the styles you want to apply to the header cell of the column. For example, to change the background color and text color of the header cell, define a CSS class like this:

```
`CSS
.e-grid .e-headercell.customcss {
background-color: rgb(43, 205, 226);
color: black;
}
```

Step 2: Set the `customAttributes` property of the desired column to an object that contains the CSS class `customcss`. This CSS class will be applied to the header cell of the specified column in the Grid.

```
`ts
{field: "Freight" headerText: "Freight" customAttributes: {class: '.customcss'}}
`
```

The following example demonstrates how to customize the appearance of the **OrderID** and **Freight** columns using custom attributes.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  columns: [
    {field: 'OrderID',headerText: 'Order ID',customAttributes: { class:
'customcss' },textAlign: 'Center'},
    { field: 'CustomerName', headerText: 'Customer Name', textAlign:
'Center'},
    {field: 'Freight',headerText: 'Freight',customAttributes: { class:
'customcss' },textAlign: 'Center'},
    {field: 'OrderDate',headerText: 'Order Date',format: 'yMd',textAlign:
'Center'}
  ],
});
grid.appendTo('#Grid');
```

Using method

The Syncfusion Grid provides methods to customize the appearance of the grid columns header.

1. [getColumnHeaderByIndex](#): The method is used to customize the appearance of a specific column header in the grid by specifying the index of the column for which you want to customize the header.
2. [getColumnHeaderByField](#): This method is used to retrieve the header element of a specific column by its field name. You can use the retrieved element to customize the appearance of the header element.
3. [getColumnHeaderByUid](#): This method is used to retrieve the header element of a specific column by its unique ID. You can use the retrieved element to customize the appearance of the header element.
4. [getColumnIndexByField](#): This method is used to retrieve the index of a specific column by its field name. You can use the retrieved index to access the header element and customize its appearance.
5. [getColumnIndexByUid](#): This method is used to retrieve the index of a specific column by its unique ID. You can use the retrieved index to access the header element and customize its appearance.

Here's an example of how to use these methods to change the style of a specific column header:

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  dataBound: dataBound,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign: 'Right' },
    { field: 'CustomerName', headerText: 'Customer Name', width: 150 },
    { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
      textAlign: 'Right' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
  ],
  height: 315,
});
grid.appendTo('#Grid');
function dataBound() {
  grid.getColumnHeaderByIndex(0).style.color = '#0d0b0b';
  grid.getColumnHeaderByField('CustomerName').style.background = '#f45ddeab';
  grid.getColumnHeaderByField('CustomerName').style.color = '#0d0b0b';
  grid.getColumnHeaderByUid('grid-column2').style.background = '#f45ddeab';
  var columnIndex = grid.getColumnIndexByField('ShipCountry');
  grid.getColumnHeaderByIndex(columnIndex).style.color = '#0d0b0b';
  var index = grid.getColumnIndexByUid('grid-column2');
  grid.getColumnHeaderByIndex(index).style.color = '#0d0b0b';
}
```

="text/javascript"></script>
</head>
<body>
  <div id="container">
    <div id="Grid"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* The UID is automatically generated by the Grid control and may change whenever the grid is refreshed or updated.

Using event

To customize the appearance of the grid header, you can handle the [headerCellInfo](#) event of the grid. This event is triggered when each header cell is rendered in the grid, and provides an object that contains information about the header cell. You can use this object to modify the styles of the header column.

The following example demonstrates how to add a `headerCellInfo` event handler to the grid. In the event handler, checked whether the current header column is **Order Date** field and then applied the appropriate CSS class to the cell based on its value.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  headerCellInfo: onHeaderCellInfo,
  columns: [
    {field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Center'},
    {field: 'CustomerID', headerText: 'CustomerID', width: 150 },
    {field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Center'},
    { field: 'Freight', headerText: 'Freight', width: 120, format:
'C2', textAlign: 'Center' },
    {field: 'ShippedDate', headerText: 'Shipped Date', width: '130', format:
'yMd', textAlign: 'Center'}
  ],
});
grid.appendTo('#Grid');
function onHeaderCellInfo(args) {
  if (args.cell.column.field == 'OrderDate') {
    args.node.classList.add('customcss');
  }
}
```

INDEX.HTML

```

How to refresh header

The refresh header feature in the Syncfusion `##Platform_Name##` Grid allows you to update the header section of the grid whenever changes are made to the grid's columns. This feature is useful when you want to reflect changes in the header immediately, such as modifying the column header text, width, or alignment.

To use the refresh header feature, you can call the [refreshHeader](#) method of the Grid control. This method updates the grid header with the latest changes made to the columns.

The following example demonstrates how to use the `refreshHeader` method to update the grid header:

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 100, },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', format: 'yMd' },
    { field: 'Freight', headerText: 'Freight', width: 120 }
  ],
  height: 280,
});
grid.appendTo('#Grid');
var button = new ej.buttons.Button({
  content: 'Refresh Header',

```

```
});
button.appendTo('#buttons');
document.getElementById('buttons').onclick = function () {
    var column = grid.getColumnByIndex(1);
    column.headerText = 'New Header Text'; // update the header text of the
    column object
    grid.refreshHeader();
};
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>

    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <div id="container">
        <div style="padding-bottom: 10px">
            <button ej2-button id="buttons" cssClass="e-small"></button>
            <br><br>
            <div id="Grid"></div>
        </div>
        <script>
            var ele = document.getElementById('container');
            if (ele) {
```

```

        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* The `refreshHeader` method updates only the grid header and not the entire grid.

* If you want to refresh the entire grid, you can use the `refresh` method instead.

How to get header element

To get the header element in a Syncfusion Grid, you can use one of the following methods:

1. [getHeaderContent](#): This method returns the header div element of the Grid. You can use this method to access the entire header content of the Grid.

```

`ts
const headerElement = grid.getHeaderContent();
`

```

2. [getHeaderTable](#): This method returns the header table element of the Grid. You can use this method to access only the header table of the Grid.

```

`ts
const headerTableElement = grid.getHeaderTable();
`

```

3. [getColumnHeaderByUid](#): This method returns the column header element by its unique identifier.

```

`ts
const columnHeaderElement = grid.getColumnHeaderByUid("e-grid2");
`

```

4. [getColumnHeaderByIndex](#): This method returns the column header element by its index.

```

`ts
const columnHeaderElement = grid.getColumnHeaderByIndex(0);
`

```

5. [getColumnHeaderByField](#): This method returns the column header element by its field name.

```

`ts
const columnHeaderElement = grid.getColumnHeaderByField("OrderID");
`

```

* The UID is automatically generated by the Grid control and may change whenever the grid is refreshed or updated.

Column template in ##Platform_Name## Grid control

Render image in a column

The column [template](#) has options to display custom element instead of a field value in the column.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  columns: [
    {
      headerText: 'Employee Image', textAlign: 'Center',
      template: '#template', width: 150
    },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 125 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'Title', headerText: 'Title', width: 170 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

splitbuttons/styles/material.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
grids/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <script id="template" type="text/x-template">
            <div class="image">
                
            </div>
        </script>
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Grid actions such as editing, grouping, filtering and sorting etc. will depend upon the column [field](#). If the [field](#) is not specified in the template column, the grid actions cannot be performed.

Render other components in a column

You can render any component in a grid column using the [template](#) property.

To render other components in the grid, ensure the following steps:

Step 1:

Initialize the column template for your custom component.

```

`ts
template: `<div>
<select class="e-control e-dropdownlist">
<option value="1" selected="selected">Order Placed</option>
<option value="2">Processing</option>
<option value="3">Delivered</option>
</select>
</div>`
`

```

Step 2:

Using the [queryCellInfo](#) event, you can render the DropDown component with the following code.

```
`ts
function dropdown(args: QueryCellInfoEventArgs) {
let ele=args.cell.querySelector('select');
let drop = new DropDownList({popupHeight: 150, popupWidth: 150});
drop.appendTo(ele);
}
`
```

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    {
      headerText: 'Order Status',
      template:
        `<div>
          <select class="e-control e-dropdownlist">
            <option value="1" selected="selected">Order
Placed</option>
            <option value="2">Processing</option>
            <option value="3">Delivered</option>
          </select>
        </div>`, width: 140
    },
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', width: 100, format:
'yMd' },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
  ],
  height: 315,
  queryCellInfo: dropdown
});
grid.appendTo('#Grid');
function dropdown(args) {
  var ele = args.cell.querySelector('select');
  var drop = new ej.dropdowns.DropDownList({ popupHeight: 150, popupWidth:
150 });
  drop.appendTo(ele);
}
```

INDEX.HTML

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using condition template

You can render the template elements based on condition.

In the following code, checkbox is rendered based on **Discontinued** field value.

```

<script id="template" type="text/x-template">
<div class="template_checkbox">

```

```

${if(Discontinued)}
<input type="checkbox" checked> ${else}
<input type="checkbox"> ${/if}
</div>
</script>
`

```

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: productData,
  columns: [
    {
      headerText: 'Discontinued', textAlign: 'Center',
      template: '#template', width: 120
    },
    { field: 'ProductID', headerText: 'Product ID', textAlign:
'Right', width: 100 },
    { field: 'ProductName', headerText: 'Name', width: 120 },
    { field: 'SupplierID', headerText: 'SupplierID', width: 100 },
    { field: 'UnitsInStock', headerText: 'Stock', width: 100,
  textAlign: 'Right' }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

```

How to get the row object by clicking on the template element

You can get the row object without selecting the row and achieve it using the column template feature and the `getRowObjectFromUID` method of the Grid.

In the following sample, the button element is rendered in the Employee Data column. By clicking the button, you can get the row object using the `getRowObjectFromUID` method of the Grid and display it in the console.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: employeeData,
    columns: [
        {
            headerText: 'Employee Data', textAlign: 'Right',
            template: '#template', width: 150, isPrimaryKey: true
        },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 130 },
        { field: 'FirstName', headerText: 'Name', width: 120 },
        { field: 'Title', headerText: 'Title', width: 170 }
    ],
    height: 315,

```

```

        recordClick: (args) => {
            if (args.target.classList.contains('empData')) {
                var rowObj =
grid.getRowObjectFromUID(ej.base.closest(args.target, '.e-
row').getAttribute('data-uid')
            );
            console.log(rowObj);
        }
    }
});
grid.appendTo('#Grid');

```

INDEX.HTML

Complex data binding in ##Platform_Name## Grid control

You can achieve complex data binding in the grid by using the dot(.) operator in the [column.field](#).

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: complexData,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 100 },
    { field: 'Name.FirstName', headerText: 'First Name', width: 120 },
    { field: 'Name.LastName', headerText: 'Last Name', width: 100 },
    { field: 'Title', headerText: 'Title', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

For OData and ODataV4 adaptors, you need to add [expand](#) query to the [query](#) property (of Grid), to eager load the complex data.

```
`ts
```

```

import { DataManager, ODataAdaptor, Query } from '@syncfusion/ej2-data';

let data: DataManager = new DataManager({
    adaptor: new ODataAdaptor(),
    crossDomain: true,
    url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders'
});

let query: Query = new Query().expand('Employee');

let grid: Grid = new Grid({
    dataSource: data,
    query: query,
    columns: [

```

```
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120 },
{ field: 'ShipCity', headerText: 'Ship City', width: 100 },
{ field: 'Employee.City', headerText: 'Employee City', width: 150 }
],
height: 315
});
grid.appendTo('#Grid');
`
```

Foreign key column in ##Platform_Name## Grid control

The Foreign key column in the Syncfusion Grid control allows you to display related data from a foreign key data source in a column within the grid. This feature is particularly useful when you have a column in the grid that represents a foreign key relationship with another data source.

To enable and integrate the foreign key column in the ##Platform_Name## Grid control, follow these steps:

1. Inject the ForeignKeyService in the Grid

```
ej.grids.Grid.Inject(ej.grids.ForeignKey);
`
```

2. Define the foreign key column in the grid using the following properties: * [dataSource](#): Specifies the foreign data source that contains the related data. * [foreignKeyField](#): Maps the column name in the grid to the field in the foreign data source that represents the foreign key relationship. * [foreignKeyValue](#): Specifies the field from the foreign data source that should be displayed in the grid as the related data.

```
{field: 'EmployeeID', headerText: 'Employee ID', width: 150, foreignKeyValue: 'FirstName',
foreignKeyField: 'EmployeeID', dataSource: employeeData}
`
```

The `foreignKeyField` property should match the name of the field in the foreign data source that represents the foreign key relationship, and the `foreignKeyValue` property should specify the field from the foreign data source that should be displayed in the grid as the related data.

Binding local data

The Syncfusion Grid control provides a convenient way to bind local data to a foreign key column. This allows you to display related data from a local data source within the grid. Here's an example of how to bind local data to a Foreign Key column in Syncfusion Grid:

In this example, **data** is the local data source for the Grid, and **employeeData** is the local data source for the foreign key column. The `field` property of the column is set to **EmployeeID** which represents the foreign key value in the **data**. The `foreignKeyValue` property is set to **FirstName** which represents the field name in the **employeeData** that you want to display in the foreign key column.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.ForeignKey);
```

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 100 },
        {field: 'EmployeeID', headerText: 'Employee Name', width:
120, foreignKeyValue: 'FirstName', dataSource: employeeData},
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 80},
        { field: 'ShipCity', headerText: 'Ship City', width: 130 },
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<script>
    var ele = document.getElementById('container');
    if (ele) {
        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Binding remote data

The Foreign key column in Syncfusion Grid allows you to bind remote data for a foreign key column. You can assign the service data as an instance of **DataManager** to the **dataSource** property, and provide the endpoint **URL** as the data source URL.

This example demonstrates how to use the foreign key column with remote data binding using the [ODataV4Adaptor](#) in the grid:

INDEX.JS

```

var data = new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
    adaptor: new ej.data.ODataV4Adaptor()
});
var employeeData = new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Employees/',
    adaptor: new ej.data.ODataV4Adaptor()
});
ej.grids.Grid.Inject(ej.grids.ForeignKey);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 100 },
        {field: 'EmployeeID', headerText: 'Employee Name', width:
120, foreignKeyValue: 'FirstName', dataSource: employeeData},
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 80},
        { field: 'ShipCity', headerText: 'Ship City', width: 130 },
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>

```

* For remote data, the sorting and grouping is done based on [column.foreignKeyField](#) instead of [column.foreignKeyValue](#).

* If [column.foreignKeyField](#) is not defined, then the column uses [column.field](#).

Use edit template in foreignkey column

The Syncfusion Grid provides support for using an edit template in a foreign key column. By default, a dropdown control is used for editing foreign key column. However, you can render a different control for editing by using the [column.edit](#) property. Here's an example that demonstrates how to use an edit template in a foreign key column:

In this example, an [AutoComplete](#) control is rendered as the edit template for the “EmployeeID” foreign key column. The [dataSource](#) property of the [AutoComplete](#) control is set to the employees data, and the fields property is configured to display the “FirstName” field as the value.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.ForeignKey, ej.grids.Edit, ej.grids.Toolbar);
var autoCompleteObj;
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true,
      textAlign: 'Right', width: 100 },
    {
      field: 'EmployeeID', headerText: 'Employee Name', width: 150,
      foreignKeyValue: 'FirstName', dataSource: employeeData,
      edit: {
        create: function () {
          // to create input element
          return ej.base.createElement('input');
        },
        read: function () {
          // return edited value to update data source
          var value = new ej.data.DataManager(employeeData).executeLocal(
            new ej.data.Query().where('FirstName', 'equal',
              autoCompleteObj.value)
          );
          return value.length && value[0]['EmployeeID']; // to convert
            foreign key value to local value.
        },
        destroy: function () {
          // to destroy the custom component.
          autoCompleteObj.destroy();
        },
        write: function (args) {
          autoCompleteObj = new ej.dropdowns.AutoComplete({
            dataSource: employeeData,
            fields: { value: args.column.foreignKeyValue },
            value: args.foreignKeyData[0][args.column.foreignKeyValue],
          });
          autoCompleteObj.appendTo(args.element);
        }
      },
    },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 80 },
    { field: 'ShipCity', headerText: 'Ship City', width: 130 },
  ],
  height: 270,
});
grid.appendTo('#Grid');

Customize filter UI in foreignkey column

The Syncfusion Grid allows you to customize the filtering user interface (UI) for foreign key columns by using the [column.filter](#) property. By default, a dropdown control is used for filtering foreign key columns. However, you can create your own custom filtering UI by specifying a template function for the [column.filter](#) property. Here's an example that demonstrates how to create a custom filtering UI in a foreign key column:

In this example, a [DropDownList](#) control is rendered as the filter UI for the “EmployeeID” foreign key column. The [dataSource](#) property of the DropDownList control is set to the employees data, and the

fields property is configured to display the **FirstName** field as the [text](#) and **EmployeeID** field as the [value](#). The **value** property is set to the current filter value of the column.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.ForeignKey, ej.grids.Filter);
var dropInstance;
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: { type: 'Menu' },
  columns: [
    {field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width:
100, },
    {field: 'EmployeeID', headerText: 'Employee Name', width:
150, foreignKeyValue: 'FirstName', dataSource: fEmployeeData,
    filter: {
      ui: {
        create: function (args) {
          var flValInput = new ej.base.createElement('input', {
            className: 'flm-input',
          });
          args.target.appendChild(flValInput);
          dropInstance = new ej.dropdowns.DropDownList({
            dataSource: new ej.data.DataManager(fEmployeeData),
            fields: { text: 'FirstName', value: 'FirstName' },
            placeholder: 'Select a value',
            popupHeight: '200px',
          });
          dropInstance.appendTo(flValInput);
        },
        write: function (args) {
          dropInstance.value = args.filteredValue;
        },
        read: function (args) {
          args.fltrObj.filterByColumn(
            args.column.field,
            args.operator,
            dropInstance.value
          );
        },
      },
    },
  ],
  { field: 'Freight', headerText: 'Freight', width: 100, textAlign:
'Right' },
  { field: 'ShipCity', headerText: 'Ship City', width: 180 },
],
  height: 315,
});
grid.appendTo('#Grid');
```

Use filter bar template in foreignkey column

You can use the filter bar template in a foreign key column in Grid by defining the [column.filterBarTemplate](#) property. This allows you to customize the filter bar for the foreign key column with a custom control or HTML template. Here's an example that demonstrates how to use a filter bar template in a foreign key column:

In this example, the “**EmployeeID**” column is a foreign key column, and the **filter** function is used as the filter bar template for this column. The **filter** function can be defined in your control code and should return the desired control or HTML template for the filter bar. The column header shows the custom filter bar template and you can select filter value by using the **DropDown** options.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.ForeignKey, ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    {
      field: 'EmployeeID', headerText: 'Employee Name', width: 120,
foreignKeyValue: 'FirstName', dataSource: fEmployeeData,
filterBarTemplate: {
      create: function() {
        return ej.base.createElement('input', { className: 'flm-
input' });
      },
      write: function(args) {
        fEmployeeData.splice(0, 0, { 'FirstName': 'All' }); //
for clear filtering
        var dropInstance = new ej.dropdowns.DropDownList({
          dataSource: new ej.data.DataManager(fEmployeeData),
          fields: { text: 'FirstName' },
          placeholder: 'Select a value',
          popupHeight: '200px',
          index: 0,
          change: function(e) {
            if (e.value !== 'All') {
              grid.filterByColumn('EmployeeID', 'equal',
e.value);
            }
            else {
              grid.removeFilteredColsByField('EmployeeID');
            }
          }
        });
        dropInstance.appendTo(args.element);
      }
    },
    { field: 'ShipCity', headerText: 'Ship City', width: 130 }
  ],
  height: 260
});
```

```
grid.appendTo('#Grid');
```

Perform aggregation in foreignkey column

By default, aggregations are not supported in a foreign key column in the Syncfusion Grid. However, you can achieve aggregation for a foreign key column by using [customAggregate](#).

To perform aggregation in a foreign key column, follow these steps:

1. Define a foreign key column in the Grid. 2. Implement a custom aggregate function to calculate the aggregation for the foreign key column. 3. Set the [customAggregate](#) property of the column to the custom aggregate function.

Here's an example that demonstrates how to perform aggregation in a foreign key column:

In the provided example, the `customAggregateFn` function is used to filter the data based on the **FirstName** field of the foreign key column, using the `getForeignData` internal function. The function then counts the occurrences of **Margaret**. The result is displayed in the grid's footer template using the `footerTemplate`.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.ForeignKey, ej.grids.Aggregate);
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, },
    { field: 'EmployeeID', headerText: 'Employee Name', width: 120,
foreignKeyValue: 'FirstName', dataSource: employeeData, },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 80 },
    { field: 'ShipCity', headerText: 'Ship City', width: 130 },
  ],
  height: 280,
  aggregates: [
    {
      columns: [
        {
          type: 'Custom',
          customAggregate: customAggregateFn,
          field: 'EmployeeID',
          footerTemplate: 'Count of Margaret: ${Custom}',
        },
      ],
    },
  ],
});
grid.appendTo('#Grid');
function customAggregateFn(data1, column) {
  return data1.result.filter((count) => {
    return (
      ej.base.getValue(
        'FirstName',
        ej.grids.getForeignData(grid.getColumnByField(column.field),
count) [0]
      ) === 'Margaret'
    );
  }).length;
}
```

Enable multiple foreign key columns

The Syncfusion Grid control supports the feature of enabling multiple foreign key columns with editing options. This allows users to display columns from foreign data sources in the Grid control.

In the following example, **Customer Name** and **Ship City** are foreign key columns that display the **ContactName** and **City** columns from foreign data.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Edit, ej.grids.Toolbar,
ej.grids.ForeignKey);
var grid = new ej.grids.Grid({
    dataSource: orderDetails,
    allowPaging: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
isPrimaryKey: true, width: 100 },
        { field: 'CustomerID', foreignKeyField: 'CustomerID',
foreignKeyValue: 'ContactName', dataSource: customerData, width: 170,
headerText: 'Customer Name', validationRules: { required: true } },
        { field: 'Freight', headerText: 'Freight', editType: 'numericedit',
width: 130, textAlign: 'Right', format: 'C2' },
        { field: 'EmployeeID', foreignKeyField: 'EmployeeID',
foreignKeyValue: 'City', dataSource: employeeData, width: 150, headerText:
'Ship City', validationRules: { required: true } },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 270
});
grid.appendTo('#Grid');
```

INDEX.HTML

Auto fit columns in ##Platform_Name## Grid control

The [autoFitColumns](#) method resizes the column to fit the widest cell's content without wrapping. You can autofit a specific column at initial rendering by invoking the [autoFitColumns](#) method in [dataBound](#) event.

To use the [autoFitColumns](#) method, inject the **Resize** module in the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Resize);
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 140 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 130 },
    { field: 'ShipName', headerText: 'Ship Name', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 120 },
    { field: 'ShipAddress', headerText: 'Ship Address', width: 150 }
  ],
  dataBound: function() {
    grid.autoFitColumns(['ShipName', 'ShipAddress'])
  },
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can autofit all the columns by invoking the [autoFitColumns](#) method without column names.

Column reorder in ##Platform_Name## Grid control

Reordering can be done by drag and drop of a particular column header from one index to another index within the grid. To enable reordering, set the [allowReordering](#) to true.

To use reordering, inject the [Reorder](#) module in the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Reorder);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowReordering: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

You can disable reordering a particular column by setting the [columns.allowReordering](#) to **false**.

Reorder single column

Grid have option to reorder Columns either by Interaction or by using the [reorderColumns](#) method. In the below sample, **ShipCity** column is reordered to last column position by using the method.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Reorder);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowReordering: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipRegion', headerText: 'Ship Region', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 280
});
grid.appendTo('#Grid');
var reorderSingleColsBtn = new ej.buttons.Button();
reorderSingleColsBtn.appendTo('#reorderSingleCol');
document.getElementById('reorderSingleCol').addEventListener('click',
function(){
  grid.reorderColumns('ShipCity', 'ShipName');
});
```

Reorder multiple columns

User can reorder a single column at a time by Interaction. Sometimes we need to have reorder multiple columns at the same time, It can be achieved through programmatically by using [reorderColumns](#) method.

In the below sample, **Ship City** and **Ship Region** column is reordered to last column position.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Reorder);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowReordering: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipRegion', headerText: 'Ship Region', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    height: 280
});
grid.appendTo('#Grid');
var reorderMultipleCols = new ej.buttons.Button();
reorderMultipleCols.appendTo('#reorderMultipleCols');
document.getElementById('reorderMultipleCols').addEventListener('click',
function() {
    grid.reorderColumns(['ShipCity', 'ShipRegion'], 'ShipName');
});

```

```

Reorder events

During the reorder action, the grid component triggers the below three events.

1. The [columnDragStart](#) event triggers when column header element drag (move) starts.
2. The [columnDrag](#) event triggers when column header element is dragged (moved) continuously.
3. The [columnDrop](#) event triggers when a column header element is dropped on the target column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Reorder);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowReordering: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    columnDragStart: function() {
        alert('columnDragStart event is Triggered');
    },
    columnDrag: function() {
        alert('columnDrag event is Triggered');
    },
    columnDrop: function() {
        alert('columnDrop event is Triggered');
    },
    height: 315
});
grid.appendTo('#Grid');

```

Column resizing in ##Platform_Name## Grid control

Column width can be resized by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. Each column can be auto resized by double-clicking the right edge of the column header to fit the width of that column based on the widest cell content. To enable column resize, set the [allowResizing](#) property to true.

To use the column resize, inject **Resize** module in the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Resize);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowResizing: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width:150 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'Freight', headerText: 'Freight', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipAddress', headerText: 'Ship Address', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
    { field: 'ShipPostalCode', headerText: 'Ship Postal code', width:
150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

              </td>
              <td>{Country}
              </td>
            </tr>
          </tbody>
        </table>
      </td>
    </tr>
  </script>

  <div id="container">

```

```

        <div id="Grid"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* You can disable resizing for a particular column by setting the [columns.allowResizing](#) to false.

* In RTL mode, you can click and drag the left edge of the header cell to resize the column.

Column resizing externally

To resize a column, set width to that particular column and then refresh the grid header by using the [refreshHeader\(\)](#) method. Please refer the below code

```

`ts
var grid = document.getElementById('Grid').ej2_instances[0]; //Grid Instance
var columns = grid.columns;
columns[0].width = 150;
grid.refreshHeader();
`

```

Min and max width

Column resize can be restricted between minimum and maximum width by defining the [columns->minWidth](#) and [columns->maxWidth](#).

In the following sample, minimum and maximum width are defined for **OrderID**, **Ship Name**, and **Ship Country** columns.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Resize);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowResizing: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
minWidth: 100, width: 150, maxWidth: 300 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'Freight', headerText: 'Freight', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', minWidth: 120, width:
150, maxWidth: 250 },
        { field: 'ShipAddress', headerText: 'Ship Address', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', minWidth: 150,
width: 200, maxWidth: 350 },
        { field: 'ShipPostalCode', headerText: 'Ship Postal code', width:
150 }
    ],

```

```

        height: 315
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

            <td>${Country}
            </td>
        </tr>
    </tbody>
</table>
</td>
</tr>
</script>

<div id="container">
    <div id="Grid"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The `maxWidth` and `minWidth` properties will be considered only when the user resizes the column. When resizing the window, these properties will not be considered. This is because columns cannot be re-rendered when resizing the window.

Resize stacked column

Stacked columns can be resized by clicking and dragging the right edge of the stacked column header. While dragging, the width of the respective child columns will be resized at the same time. You can disable resize for any particular stacked column by setting `allowResizing` as **false** to its columns.

In this example, we have disabled resize for **Ship City** column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Resize);
var grid = new ej.grids.Grid({

```

```

    dataSource: data,
    allowResizing: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, minWidth: 10 },
        {
            headerText: 'Order Details', columns: [
                { field: 'OrderDate', headerText: 'Order Date',
textAlign: 'Right', width: 125, minWidth: 10, format: 'yMd' },
                { field: 'Freight', headerText: 'Freight($)', textAlign:
'Reight', width: 100, format: 'C2', minWidth: 10 },
            ]
        },
        {
            headerText: 'Ship Details', columns: [
                { field: 'ShipCity', headerText: 'Ship City', width:
100, minWidth: 10, allowResizing: false },
                { field: 'ShipCountry', headerText: 'Ship Country',
width: 120, minWidth: 10 },
            ]
        }
    ]
});
grid.appendTo('#Grid');

```

            </tr>
          </tbody>
        </table>
      </td>
    </tr>
  </script>

  <div id="container">
    <div id="Grid"></div>
  </div>
</script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Touch interaction

When the right edge of the header cell is tapped, a floating handler will be visible over the right border of the column. To resize the column, tap and drag the floating handler as needed. You can autoFit a column by using the Column menu of the grid.

The following screenshot represents the column resizing in touch device.

Resizing events

During the resizing action, the grid component triggers the below three events.

1. The [resizeStart](#) event triggers when column resize starts.
2. The [resizing](#) event triggers when column header element is dragged (moved) continuously..
3. The [resizeStop](#) event triggers when column resize ends.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Resize);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowResizing: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width:150 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'Freight', headerText: 'Freight', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 },
        { field: 'ShipAddress', headerText: 'Ship Address', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipPostalCode', headerText: 'Ship Postal code', width:
150 }
    ],
    resizeStart: function() {
        alert('ResizeStart event is Triggered');
    },
    resizing: function() {
        alert('Resizing event is Triggered');
    },
    resizeStop: function() {
        alert('ResizeStop event is Triggered');
    },
    height: 315
});
grid.appendTo('#Grid');

```

Column chooser in ##Platform_Name## Grid control

The column chooser feature in the Syncfusion ##Platform_Name## Grid control allows you to dynamically show or hide columns. This feature can be enabled by defining the [showColumnChooser](#) property as **true**.

To use the column chooser, inject the **ColumnChooser** module in the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
    dataSource: data,
    showColumnChooser: true,
    toolbar: ['ColumnChooser'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right' },
        { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
        { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
textAlign: 'Right' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
150 }
    ],
    height: 235
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The column chooser dialog displays the header text of each column by default. If the header text is not defined for a column, the corresponding column field name is displayed instead.

Hide column in column chooser dialog

You can hide the column names in column chooser by defining the [columns->showInColumnChooser](#) as **false**. This feature is useful when working with a large number of columns or when you want to limit the number of columns that are available for selection in the column chooser dialog.

In this example, the `columns->showInColumnChooser` property is set to false for the **Order ID** column. As a result, the **Order ID** column will not be displayed in the column chooser dialog.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
    dataSource: data,
    showColumnChooser: true,
    toolbar: ['ColumnChooser'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right', showInColumnChooser: false },
        { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },

```

```

        { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
        textAlign: 'Right' },
        { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
        width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
        150 }
    ],
    height: 272
});
grid.appendTo('#Grid');

```

  }
  </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The `columns->showInColumnChooser` property is applied to each column element individually. By setting it to false, you can hide specific columns from the column chooser dialog.

Open column chooser by external button

The Syncfusion `##Platform_Name##` Grid provides the flexibility to open the column chooser dialog on a web page using an external button. By default, the column chooser button is displayed in the right corner of the grid control, and clicking the button opens the column chooser dialog below it. However, you can programmatically open the column chooser dialog at specific **X** and **Y** axis positions by using the [openColumnChooser](#) method.

Here's an example of how to open the column chooser in the Grid using an external button:

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
  dataSource: data,
  showColumnChooser: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
    'Right', showInColumnChooser: false },
    { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
    'yMd', textAlign: 'Right' },
    { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
    textAlign: 'Right' },
    { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
    width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
    150 }
  ],
  height: 235
});
grid.appendTo('#Grid');
var showButton = new ej.buttons.Button({ cssClass: 'e-primary' }, '#show');
document.getElementById('show').onclick = function() {
  grid.columnChooserModule.openColumnChooser(100, 40); // give X and Y
axis
};
```

Customize column chooser dialog size

The column chooser dialog in Syncfusion **##Platform_Name##** Grid comes with default size, but you can modify its height and width as per your specific needs using CSS styles.

To customize the column chooser dialog size, you can use the following CSS styles:

```

`css
.e-grid .e-dialog.e-ccdlg {
height: 500px;
width: 200px;
}
.e-grid .e-ccdlg .e-cc-contentdiv {
height: 200px;

```

width: 230px;

}

,

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
  dataSource: data,
  showColumnChooser: true,
  toolbar: ['ColumnChooser'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right', showInColumnChooser: false },
    { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
    { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
textAlign: 'Right' },
    { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
150 }
  ],
  height: 235
});
grid.appendTo('#Grid');
```

</body></html>

```

Change default search operator of the column chooser

The column chooser dialog in the Syncfusion `##Platform_Name##` Grid provides a search box that allows you to search for column names. By default, the search functionality uses the "startswith" operator to match columns and display the results in the column chooser dialog. However, there might be cases where you need to change the default search operator to achieve more precise data matching.

To change the default search operator of the column chooser in Syncfusion Grid, you need to use the [operator](#) property of the `columnChooserSettings`.

Here's an example of how to change the default search operator of the column chooser to **contains** in the `##Platform_Name##` Grid:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
    dataSource: data,
    showColumnChooser: true,
    toolbar: ['ColumnChooser'],
    columnChooserSettings: { operator: 'contains' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right' },
        { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd', textAlign: 'Right' },

```

```

        { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
        textAlign: 'Right' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 130 },
        { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
130 }
    ],
    height: 235
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

```

Diacritics searching in column chooser

By default, the grid ignores diacritic characters when performing a search in the column chooser. However, in some cases, you may want to include diacritic characters in the search. To enable this behavior, you can set the [columnChooserSettings->ignoreAccent](#) property to **true**.

Here is an example that demonstrates the usage of the `ignoreAccent` property to include diacritic characters for searching in the column chooser:

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ColumnChooser);
var grid = new ej.grids.Grid({
  dataSource: data,
  showColumnChooser: true,
  toolbar: ['ColumnChooser'],
  columnChooserSettings : { ignoreAccent: true },
  columns: [
    { field: 'OrderID^', headerText: 'Order ID^', width: 120, textAlign:
'Right' },
    { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd', textAlign: 'Right' },
    { field: 'F^reight', headerText: 'F^reight', width: 120, format:
'C2', textAlign: 'Right' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 130 },
    { field: 'ShipCity', headerText: 'Ship City', visible: false, width:
130 }
  ],
  height: 272
});
grid.appendTo('#Grid');
```

Column menu in ##Platform_Name## Grid control

The column menu has options to integrate features like sorting, grouping, filtering, column chooser, and autofit. It will show a menu with the integrated feature when users click on multiple icon of the column. To enable column menu, you need to define the [showColumnMenu](#) property as true.

To use the column menu, inject the **ColumnMenu** module in the grid.

The default items are displayed in following table.

Item	Description
----- -----	
SortAscending	Sort the current column in ascending order.
SortDescending	Sort the current column in descending order.
Group	Group the current column.
Ungroup	Ungroup the current column.
AutoFit	Auto fit the current column.
AutoFitAll	Auto fit all columns.
ColumnChooser	Choose the column visibility.
Filter	Show the filter option as given in filterSettings.type

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.Sort,
ej.grids.Filter, ej.grids.ColumnMenu);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowGrouping: true,
  allowSorting: true,
  allowFiltering: true,
  filterSettings: { type: 'CheckBox' },
  allowPaging: true,
  groupSettings: { showGroupedColumn: true },
  showColumnMenu: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 200, textAlign:
'Right',
      showInColumnChooser: false },
    { field: 'Freight', width: 150, format: 'C2', textAlign: 'Right',
editType: 'numericedit' },
    { field: 'ShipName', headerText: 'Ship Name', width: 300 },
    { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
width: 200 },
    { field: 'ShipCity', headerText: 'Ship City', width: 200 }
  ]
});
grid.appendTo('#Grid');

```

* You can disable column menu for a particular column by defining the [columns.showColumnMenu](#) as false.

* You can customize the default items by defining the [columnMenuItems](#) with required items.

Column menu events

During the resizing action, the grid component triggers the below two events.

1. The [columnMenuOpen](#) event triggers before the column menu opens.
2. The [columnMenuClick](#) event triggers when the user clicks the column menu of the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.Sort,
ej.grids.Filter, ej.grids.ColumnMenu);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowGrouping: true,
  allowSorting: true,
  allowFiltering: true,
  filterSettings: { type: 'CheckBox' },
  allowPaging: true,
  groupSettings: { showGroupedColumn: true },
  showColumnMenu: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 200, textAlign:

Custom column menu item

Custom column menu items can be added by defining the [columnMenuItems](#) as collection of the [columnMenuItemModel](#). Actions for this customized items can be defined in the [columnMenuClick](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.Sort,
ej.grids.Filter, ej.grids.ColumnMenu);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowSorting: true,
    showColumnMenu: true,
    columnMenuItems:[{text:'Clear Sorting', id:'gridclearsorting'}],
    columnMenuClick: function(args){
        if(args.item.id === 'gridclearsorting'){
            grid.clearSorting();
        }
    },
    sortSettings:{
        columns:[{direction: "Ascending", field: "OrderID"}]
    },
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', width: 200, textAlign:
        'Right', showInColumnChooser: false },
        { field: 'Freight', width: 150, format: 'C2', textAlign: 'Right',
        editType: 'numericedit' },
        { field: 'ShipName', headerText: 'Ship Name', width: 300 },
        { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
        width: 200 },
        { field: 'ShipCity', headerText: 'Ship City', width: 200 }
    ]
});
grid.appendTo('#Grid');

```

Customize menu items for particular columns

Sometimes, you have a scenario that to hide an item from column menu for particular columns. In that case, you need to define the [columnMenuOpenEventArgs.hide](#) as true in the [columnMenuOpen](#) event.

The following sample, **Filter** item was hidden in column menu when opens for the **OrderID** column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.Sort,
ej.grids.Filter, ej.grids.ColumnMenu);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    showColumnMenu: true,
    filterSettings: {type: 'Menu'},
    allowFiltering: true,
    allowGrouping: true,
    allowSorting: true,
    columnMenuOpen: function (args) {
        for (var item of args.items) {
            if (item.text === 'Filter' && args.column.field === 'OrderID') {
                item.hide = true;
            } else {
                item.hide = false;
            }
        }
    },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 200, textAlign:
'Right', showInColumnChooser: false },
        { field: 'Freight', width: 150, format: 'C2', textAlign: 'Right',
editType: 'numericedit' },
        { field: 'ShipName', headerText: 'Ship Name', width: 300 },
        { field: 'ShipCountry', headerText: 'Ship Country', visible: false,
width: 200 },
        { field: 'ShipCity', headerText: 'Ship City', width: 200 }
    ]
});
grid.appendTo('#Grid');

```

              </td>
              <td>{Country}
              </td>
            </tr>
          </tbody>
        </table>
      </td>
    </tr>
  </script>

```

```

    <div id="container">
      <div id="Grid"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize the icon of column menu

You can customize the column menu icon by overriding the default grid class `.e-icons.e-columnmenu` with a custom property `content` as mentioned below.

```

.e-grid .e-columnheader .e-icons.e-columnmenu::before {
content: "\e941";
}

```

In the below sample, grid is rendered with a customized column menu icon.

INDEX.JS

```

var grid= new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipName', headerText: 'Ship Name', width: 140 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
  ],
  showColumnMenu: true,
  height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Column spanning in ##Platform_Name## Grid control

The column spanning feature in the Syncfusion Grid allows you to merge adjacent cells horizontally, creating a visually appealing and informative layout. By defining the [colSpan](#) attribute in the [queryCellInfo](#) event, you can easily span cells and customize the appearance of the grid.

In the following demo, Employee **Davolio** doing analysis from 9.00 AM to 10.00 AM, so that cells have spanned.

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: columnSpanData,
  queryCellInfo: QueryCellEvent,
  gridLines: 'Both',
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', isPrimaryKey:
true, textAlign: 'Right', width: 150 },
    { field: 'EmployeeName', headerText: 'Employee Name', width: 200 },
    { field: '9:00', headerText: '9.00 AM', width: 120 },
    { field: '9:30', headerText: '9.30 AM', width: 120 },
    { field: '10:00', headerText: '10.00 AM', width: 120 },
    { field: '10:30', headerText: '10.30 AM', width: 120 },
    { field: '11:00', headerText: '11.00 AM', width: 120 },
    { field: '11:30', headerText: '11.30 AM', width: 120 },
    { field: '12:00', headerText: '12.00 PM', width: 120 },
    { field: '12:30', headerText: '12.30 PM', width: 120 },
    { field: '2:30', headerText: '2.30 PM', width: 120 },
    { field: '3:00', headerText: '3.00 PM', width: 120 },
    { field: '3:30', headerText: '3.30 PM', width: 120 },
    { field: '4:00', headerText: '4.00 PM', width: 120 },
    { field: '4:30', headerText: '4.30 PM', width: 120 },
    { field: '5:00', headerText: '5.00 PM', width: 120 }
  ],
  width: 'auto',
  height: 'auto',
  allowTextWrap: true
});
grid.appendTo('#Grid');
function QueryCellEvent(args) {
  var data = args.data;
  switch (data.EmployeeID) {

Change the border color while column spanning

You can change the border color for the spanned cells by the using [queryCellInfo](#) event. This event triggers before the cell element is appended to the Grid element.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: columnSpanData,
    queryCellInfo: QueryCellEvent,
    gridLines: 'Both',
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', isPrimaryKey: true,
        textAlign: 'Right', width: 150 },
        { field: 'EmployeeName', headerText: 'Employee Name', width: 200 },
        { field: '9:00', headerText: '9.00 AM', width: 120 },
        { field: '9:30', headerText: '9.30 AM', width: 120 },
        { field: '10:00', headerText: '10.00 AM', width: 120 },
        { field: '10:30', headerText: '10.30 AM', width: 120 },
        { field: '11:00', headerText: '11.00 AM', width: 120 },
        { field: '11:30', headerText: '11.30 AM', width: 120 },
        { field: '12:00', headerText: '12.00 PM', width: 120 },
        { field: '12:30', headerText: '12.30 PM', width: 120 },
        { field: '2:30', headerText: '2.30 PM', width: 120 },

```

Responsive columns in ##Platform_Name## Grid control

You can toggle column visibility based on media queries which are defined at the [hideAtMedia](#).

The [hideAtMedia](#) accepts valid [Media Queries](#). In the below sample, for **OrderID** column, [hideAtMedia](#) property value is set as **(min-width: 700px)** so that **OrderID** column will get hidden when the browser screen width is less than 700px.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    {
      field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
      'Right',
      hideAtMedia: '(min-width: 700px)'
    }, // column hides when browser screen width less than 700px;
    {
      field: 'CustomerID', headerText: 'Customer ID', width: 150,
      hideAtMedia: '(max-width: 500px)'
    }, // column shows when browser screen width less than or equal to
    500px;
    {
      field: 'OrderDate', headerText: 'Order Date', width: 130,
      format: 'yMd',
      textAlign: 'Right', hideAtMedia: '(min-width: 500px)'
    }, // column hides when browser screen size less than 500px;
    { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right' }
  ], // it always shown
  height: 315
});
grid.appendTo('#Grid');
```

```

Row

Row in ##Platform_Name## Grid control

The row represents record details fetched from data source.

Row customization

Using event

You can customize the appearance of a row by using the [rowDataBound](#) event. The [rowDataBound](#) event triggers for every row. In the event handler, you can get the

[RowDataBoundEventArgs](#) that contains details of the row.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    enableHover: false,
    allowSelection: false,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'Freight', headerText: 'Freight', width: 100, format: 'C2'
    },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    rowDataBound: rowBound,
    height: 280
});
grid.appendTo('#Grid');
function rowBound(args) {
    if (args.data['Freight'] < 30) {
        args.row.classList.add('below-30');
    } else if (args.data['Freight'] < 80) {
        args.row.classList.add('below-80');
    } else {
        args.row.classList.add('above-80');
    }
}

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Using CSS customize alternate rows

You can change the grid's alternative rows' background color by overriding the **.e-altrow** class.

```

.e-grid .e-altrow {
background-color: #fafafa;
}

```

Please refer to the following example.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data.slice(0, 8),
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
    ]
});
grid.appendTo('#Grid');

```

```

Using CSS customize selected row

The background color of the selected row can be changed by overriding the following CSS style.

,

```
.e-grid td.e-active {
background-color: #f9920b;
}
,
```

This is demonstrated in the following sample:

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data.slice(0, 8),
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
  ]
});
grid.appendTo('#Grid');
```

INDEX.HTML

Adding a new row programmatically

The Grid can add a new row between the existing rows using the [addRecord](#) method of the Grid.

This is demonstrated in the following sample:

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'Freight', headerText: 'Freight', width: 100, format: 'C2'
},
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ]
});
grid.appendTo('#Grid');
document.getElementById('addrow').onclick = function () {
    grid.addRecord(
        { OrderID: 3232, CustomerID: 'ALKIT', ShipCity: 'London', Freight:
40, ShipName: 'Que Delícia'}, 2);
};

```

```

When working with remote data, it is impossible to add a new row between the existing rows.

How to get the row information when hovering over the cell

It is possible to get the row information when hovering over the specific cell. This can be achieved by using the [rowDataBound](#) event and [getRowInfo](#) method of the Grid.

In the following sample, the `mouseover` event is bound to a grid row in the `rowDataBound` event, and when hovering over the specific cell, using the `getRowInfo` method, row information will be retrieved and displayed in the console.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  rowDataBound: rowDataBound,
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'Freight', headerText: 'Freight', width: 100, format: 'C2'
},
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ]
});
grid.appendTo('#Grid');
function rowDataBound(args) {
  args.row.addEventListener('mouseover', function(e) {
    console.log(grid.getRowInfo(e.target))
  })
}
```

Row height in ##Platform_Name## Grid control

You can customize the row height of grid rows through the [rowHeight](#) property. The **rowHeight** property

is used to change the row height of entire grid rows.

In the below example, the **rowHeight** is set as '60px'.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data.slice(0, 8),
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
  ],
  rowHeight: 60
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

```

Customize row height for particular row

Grid row height for particular row can be customized using the [rowDataBound](#) event by setting the **rowHeight** in arguments for each row based on the requirement.

In the below example, the row height for the row with OrderID as '10249' is set as '90px' using the **rowDataBound** event.

INDEX.JS

```

var gridData = new ej.data.DataManager(data).executeLocal(new
ej.data.Query().take(8));
var grid = new ej.grids.Grid({
    dataSource: gridData,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID',
type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140,
format: 'yMd' }
    ],
    rowDataBound: rowDataBound
});
function rowDataBound(args) {
    if((args.data).OrderID === 10249){
        args.rowHeight = 90;
    }
}
grid.appendTo('#Grid');

```

INDEX.HTML

```

* In virtual scrolling mode, it is not applicable to set the **rowHeight** using the **rowDataBound** event.

Row template in ##Platform_Name## Grid control

The row template feature in Grid allows you to customize the appearance and layout of rows in the grid. This feature is useful when you want to display custom content, such as images, buttons, or other controls, within the rows.

To enable the row template feature, you need to set the [rowTemplate](#) property of the Grid control. This property accepts a custom HTML template that defines the layout for each row.

In the following example, Employee Information with Employee Photo is presented in the first column and employee details like Name, Address, etc., are presented in the second column.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  rowTemplate: '#rowtemplate',
  columns: [
    { headerText: 'Employee Image', width: 150, textAlign: 'Center',
      field: 'OrderID' },
    { headerText: 'Employee Details', width: 300, field: 'EmployeeID' }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

    <div id="Grid"></div>
  </div>
</script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Row template with formatting

The row template feature in Syncfusion Grid allows you to customize the layout of rows in the grid. This is useful when you want to display images, buttons, or other custom content within the rows of a grid.

By default, Syncfusion Grid provides the [columns->format](#) property to format the values displayed in each column. However, when using the [rowtemplate](#), the [columns->format](#) property cannot be directly applied to format the values inside the template.

To format the values within the row template, you can define a global function that handles the formatting logic. This function can be invoked inside the template to format the corresponding values.

Here is an example of how to define a global formatting function for a date column and use it inside a [rowTemplate](#):

INDEX.JS

```
var intl = new ej.base.Internationalization();
var dFormatter = intl.getDateFormat({ skeleton: 'yMd', type: 'date' });
(window).formatDate = (date) => dFormatter(date);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  rowTemplate: '#rowtemplate',
  columns: [
    { headerText: 'Employee Image', width: 150, textAlign: 'Center',
field: 'OrderID' },
    { headerText: 'Employee Details', width: 300, field: 'EmployeeID' }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

          </colgroup>
          <tbody>
            <tr>
              <td class="CardHeader">First Name </td>
              <td>{FirstName} </td>
            </tr>
            <tr>
              <td class="CardHeader">Last Name</td>
              <td>{LastName} </td>
            </tr>
            <tr>
              <td class="CardHeader">Title
              </td>
              <td>{Title}
              </td>
            </tr>
            <tr>
              <td class="CardHeader">Birth Date
              </td>
              <td>{formatDate(data.BirthDate)}
              </td>
            </tr>
            <tr>
              <td class="CardHeader">Hire Date
              </td>
              <td>{formatDate(data.HireDate)}
              </td>
            </tr>
          </tbody>
        </table>
      </td>
    </tr>
  </script>
  <div id="container">

```

```

        <div id="Grid"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

When using the `rowTemplate` feature in Syncfusion Grid, keep in mind that any formatting applied to columns using the `columns->format` property will not work inside the template.

Render syncfusion control in row template

The Grid allows you to render custom Syncfusion controls within the rows of the grid. This feature is helpful as it enables you to display interactive Syncfusion controls instead of field values in the grid.

To enable a Syncfusion control in a row template, you need to set the `rowTemplate` property of the Grid control. This property accepts a custom HTML template that defines the layout for each row.

Here is an example that demonstrates rendering Syncfusion controls within a row template :

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    rowTemplate: '#rowtemplate',
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120 },
        { field: 'Quantity', headerText: 'Quantity', width: 170 },
        { field: 'ShipAddress', headerText: 'ShipAddress', width: 170 },
        { field: 'OrderDate', headerText: 'Order Date', width: 120 },
        { field: 'OrderStatus', headerText: 'Order Status', width: 120 },
    ],
    dataBound: () => {
        var gridInstance = document.getElementById('Grid').ej2_instances[0];
        var chipList =
gridInstance.getContentTable().querySelectorAll('.chipList');
        for (var i = 0; i < chipList.length; i++) {
            var chipValue = chipList[i].innerText;
            new ej.buttons.ChipList({ chips: [chipValue] }, chipList[i]);
        }
        var NumericList =
gridInstance.getContentTable().querySelectorAll('.numeric');
        for (var i = 0; i < NumericList.length; i++) {
            var numberValue = new ej.inputs.NumericTextBox({});
            numberValue.appendTo(NumericList[i]);
        }
        var dateList =
gridInstance.getContentTable().querySelectorAll('.date-input');
        for (var i = 0; i < dateList.length; i++) {
            var dateInput = dateList[i];
            var dateValue = dateInput.value;
            var datepicker = new ej.calendars.DatePicker({
                value: new Date(dateValue),
            });

```

```

    });
    datepicker.appendTo(dateInput);
}
var dropdownList =
gridInstance.getContentTable().querySelectorAll('.dropdownlist-input');
for (var i = 0; i < dropdownList.length; i++) {
    var dropdownInputValue = dropdownList[i];
    var dropData = ['Processing', 'Order Placed', 'Delivered'];
    var dropdown = new ej.dropdowns.DropDownList({
        dataSource: dropData,
        value: dropdownList[i].value,
        popupHeight: 150,
        popupWidth: 150
    });
    dropdown.appendTo(dropdownInputValue);
}
},
});
grid.appendTo('#Grid');

```

INDEX.HTML

Limitations

Row template feature is not compatible with all the features which are available in the grid, and it has limited features support. The features that are incompatible with the row template feature are listed below.

- Filtering
- Paging
- Sorting
- Searching
- Rtl
- Export
- Context Menu
- State Persistence
- Selection
- Grouping
- Editing
- Frozen rows & columns
- Virtual & Infinite scrolling
- Column chooser
- Column menu
- Detail Row
- Foreignkey column
- Resizing
- Reordering
- Aggregates
- Clipboard

- Adaptive view

Detail template in ##Platform_Name## Grid control

The detail template in the Grid control allows you to display additional information about a specific row in the grid by expanding or collapsing detail content. This feature is useful when you need to show additional data or custom content that is specific to each row in the grid. You can use the [detailTemplate](#) property to define an HTML template for the detail row. This template can include any HTML element or ##Platform_Name## control that you want to display as detail content.

Here's an example of using the `detailTemplate` property in the grid control:

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  detailTemplate: '#detailtemplate',
  columns: [
    { field: 'FirstName', headerText: 'First Name', width: 140 },
    { field: 'LastName', headerText: 'Last Name', width: 140 },
    { field: 'Title', headerText: 'Title', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

<div id="container">
    <div id="Grid"></div>
</div>
<script>
    var ele = document.getElementById('container');
    if (ele) {
        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

Rendering custom control

The Grid control provides a powerful feature that allows you to render custom controls inside the detail row. This feature is helpful when you need to add additional information or functionality for a specific row in the grid.

To render a custom control inside the detail row, you need to define a template using the [detailTemplate](#) property and handle the [detailDataBound](#) event. This template can include any HTML element or `##Platform_Name##` control that you want to display as the detail content.

The `detailDataBound` event is an event that is triggered after a detail row is bound to data. This event provides an object of type [DetailDataBoundEventArgs](#) as a parameter.

For example, to render grid inside the detail row, place an HTML div element as the `detailTemplate` and render the DIV element as grid control in the `detailDataBound` event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    detailTemplate: '#detailtemplate',
    columns: [
        { field: 'FirstName', headerText: 'First Name', width: 140 },
        { field: 'LastName', headerText: 'Last Name', width: 140 },
        { field: 'Title', headerText: 'Title', width: 150 },
        { field: 'Country', headerText: 'Country', width: 150 }
    ],
    detailDataBound: function(e){
        var detail = new ej.grids.Grid({
            dataSource: data.filter(function(item){ return
item['EmployeeID'] === e.data['EmployeeID'];}),
            columns: [
                { field: 'OrderID', headerText: 'Order ID', width: 110 },
                { field: 'CustomerID', headerText: 'Customer Name', width:
140 },

```

```

        { field: 'ShipCountry', headerText: 'Ship Country', width:
150 }
    ]
    });
    detail.appendTo(e.detailElement.querySelector('.custom-grid'));
}
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    <div id="container">
        <div id="Grid"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Expand by external button

The Grid provides a feature that allows users to expand the detail row of a grid using an external button. By default, detail rows render in a collapsed state, but this feature enables users to view additional details associated with a particular row.

To achieve expanding the detail row of a grid using an external button, you need to invoke the [expand](#) method provided by the **detailRowModule** object of the Syncfusion Grid library. This method will expand the detail row of a specific grid row.

Here is an example of how to use the **expand** method to expand a detail row:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  detailTemplate: '#detailtemplate',
  columns: [
    { field: 'FirstName', headerText: 'First Name', width: 140 },
    { field: 'LastName', headerText: 'Last Name', width: 140 },
    { field: 'Title', headerText: 'Title', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  height: 260
});
grid.appendTo('#Grid');
var expandButton = new ej.buttons.Button();
expandButton.appendTo('#expand');
var textbox = new ej.inputs.TextBox({
  placeholder: 'Enter the Row Index',
  floatLabelType: 'Auto',
  width: 250
});
textbox.appendTo('#rowindex');
document.getElementById('expand').addEventListener('click', function(args){
  grid.detailRowModule.expand(textbox.value);
});

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize detail template icon

The detail template icon in the Syncfusion Grid is used to expand or collapse the detail content of a row. By default, the icon represents a right arrow for the collapsed state and a down arrow for the expanded state. If you want to customize this icon, you can achieve it by overriding the following CSS styles:

```

`css
.e-grid .e-icon-grightarrow::before {
content: '\e300';
}
.e-grid .e-icon-gdownarrow::before {
content: '\e304';
}

```

Here is an example of how to customize the detail template icon:

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  detailTemplate: '#detailtemplate',
  columns: [
    { field: 'FirstName', headerText: 'First Name', width: 140 },
    { field: 'LastName', headerText: 'Last Name', width: 140 },
    { field: 'Title', headerText: 'Title', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

```

Limitations

Detail template is not supported with the following features:

- Frozen rows and columns
- Immutable mode
- Infinite scrolling
- Virtual scrolling
- Print
- Row template
- Row spanning
- Column spanning
- Lazy load grouping
- State persistence

Row drag and drop in ##Platform_Name## Grid control

The Syncfusion ##Platform_Name## Grid control provides built-in support for row drag and drop functionality. This feature allows you to easily rearrange rows within the grid by dragging and dropping them to new positions. Additionally, you can also drag and drop rows from one grid to another grid, as well as drag and drop rows to custom controls.

To use the row drag and drop feature in Grid control, you need to inject the **RowDD** module in the grid. The **RowDD** is responsible for handling the row drag and drop functionality in the grid control. Once you have injected the **RowDD**, you can then use the [allowRowDragAndDrop](#) and [targetID](#) properties to enable and configure the row drag and drop feature in the Grid.

Drag and drop within grid

The drag and drop feature allows you to rearrange rows within the grid by dragging them using a drag icon. This feature can be enabled by setting the [allowRowDragAndDrop](#) property to **true**. This property is a boolean value that determines whether row drag and drop is enabled or not. By default, it is set to **false**, which means that row drag and drop is disabled.

Here's an example of how to enable drag and drop within the Grid:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.RowDD);
var grid = new ej.grids.Grid({

```

```

dataSource: data,
allowRowDragAndDrop: true,
selectionSettings: { type: 'Multiple' },
height: 400,
columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right' },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', width: 100,
format: 'yMd', textAlign: 'Right' },
    { field: 'Freight', headerText: 'Freight', width: 120, format: 'C2',
textAlign: 'Right' },
    { field: 'ShipCity', headerText: 'Ship City', width: 130 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 130 }
]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Drag and drop to grid

The grid row drag and drop allows you to drag grid rows and drop to another grid. This feature can be enabled by setting the [allowRowDragAndDrop](#) property to **true** in the Grid control. This property specifies whether to enable or disable the row drag and drop feature in the Grid. By default, this property is set to **false**, which means that row drag and drop functionality is not enabled.

To specify the target control where the grid rows should be dropped, use the [targetID](#) property of the [rowDropSettings](#) object. The [targetID](#) property takes the ID of the target control as its value.

Here's an example code snippet that demonstrates how to enable Row drag and drop another Grid control:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.RowDD);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowRowDragAndDrop: true,
    rowDropSettings: { targetID: 'DestGrid' },
    selectionSettings: { type: 'Multiple' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});
grid.appendTo('#Grid');
var destGrid = new ej.grids.Grid({
    dataSource: [],
    allowRowDragAndDrop: true,
    rowDropSettings: { targetID: 'Grid' },
    selectionSettings: { type: 'Multiple' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});
destGrid.appendTo('#DestGrid');

```

INDEX.HTML

```

</body></html>

```

* The row drag and drop feature is not supported in virtual scrolling and frozen rows and columns mode.

* In order to use row drag and drop, you need to inject the **RowDD** module in the grid.

Drag and drop to custom control

The Grid provides the feature to drag and drop grid rows to any custom control. This feature allows you to easily move rows from one control to another without having to manually copy and paste data. To enable row drag and drop, you need to set the [allowRowDragAndDrop](#) property to **true** and defining the custom control ID in the [targetID](#) property of the `rowDropSettings` object. The ID provided in `targetID` should correspond to the ID of the target control where the rows are to be dropped.

In the below example, the selected grid row is dragged and dropped in to the TreeGrid control by using [rowDrop](#) event. Once the row is dropped into the TreeGrid control, we have removed the corresponding grid row from grid and its data inserted in custom control.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.RowDD);
var grid = new ej.grids.Grid({
  dataSource: sampleGridData,
  allowPaging: true,
  pageSettings: true,
  allowSelection: true,
  allowRowDragAndDrop: true,
  rowDropSettings: { targetID: 'TreeGrid' },
  selectionSettings: { type: 'Multiple' },
  editSettings: { allowDeleting: true },
  rowDrop: function (args) {
    var grid = document.getElementById('Grid').ej2_instances[0];
    var tree = document.getElementById('TreeGrid').ej2_instances[0];
    if (args.target.closest('.e-treegrid')) {
      args.cancel = true;
      var rowIndex =
        args.target.closest('.e-row') !== null
          ? args.target.closest('.e-row').rowIndex
          : 0;
      for (var i = 0; i < args.data.length; i++) {
        tree.addRecord(args.data[i], rowIndex);
        grid.deleteRecord('taskID', args.data[i]);
      }
    }
  },
  columns: [
    { field: 'taskID', headerText: 'taskID', textAlign: 'Right', width: 90 },
    { field: 'taskName', headerText: 'taskName', textAlign: 'Left', width: 180 },
    { field: 'description', headerText: 'description', textAlign: 'Left', width: 180 },
    { field: 'category', headerText: 'category', textAlign: 'Left', width: 180 },
    { field: 'startDate', headerText: 'startDate', textAlign: 'Right', format: 'yMd', width: 120 },
    { field: 'duration', headerText: 'duration', textAlign: 'Right', width: 80 }
  ],
});
grid.appendTo('#Grid');
```

```

var treeGridObj = new ej.treegrid.TreeGrid({
  childMapping: 'subtasks',
  editSettings: { allowAdding: true, allowEditing: true },
  columns: [
    { field: 'taskID', headerText: 'Task ID', width: 90, textAlign: 'Right' },
    { field: 'taskName', headerText: 'Task Name', width: 180, textAlign: 'Left' },
    { field: 'startDate', headerText: 'Start Date', width: 90, textAlign: 'Right', type: 'date', format: 'yMd' },
    { field: 'duration', headerText: 'Duration', width: 80, textAlign: 'Right' }
  ],
});
treeGridObj.appendTo('#TreeGrid');

```

```

* The **rowDrop** event is fired when a row is dropped onto a custom control, regardless of whether the drop is successful or not. You can use the **args.cancel** property to prevent the default action.

Drag and drop rows without drag icon

By default, when performing a drag and drop operation in the Syncfusion Grid, drag icons are displayed. However, in some cases, you may want to hide these drag icons. This can be achieved by setting the **targetID** property of the **rowDropSettings** object to the current Grid's ID.

By setting the **targetID**, the Grid will render without a helper icon for row dragging. You can then customize the drag and drop action by binding to the **rowDrop** event of the Grid. In the **rowDrop** event, you can prevent the default action by setting **args.cancel** to **true**, and reorder the rows using the **reorderRows** method of the Grid.

Here's an example of how to hide the drag and drop icon in the Syncfusion Grid:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.RowDD);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowRowDragAndDrop: true,
    rowDropSettings: { targetID: 'Grid' },
    selectionSettings: { type: 'Multiple' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120, textAlign:
'Right' },
        { field: 'CustomerID', headerText: 'Customer Name', width: 130 },
        { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd', textAlign: 'Right' },
        { field: 'Freight', headerText: 'Freight', width: 120, format:
'C2', textAlign: 'Right' },
        { field: 'ShipCity', headerText: 'Ship City', width: 130 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 130 },
    ],
    rowDrop: (args) => {
        args.cancel = true;
        var value = [];
        for (var index = 0; index < args.rows.length; index++) {
            value.push(args.fromIndex + index);
        }
        grid.reorderRows(value, args.dropIndex);
    }
});

```

```
    },
  });
  grid.appendTo('#Grid');
```

INDEX.HTML

```

* The selection feature must be enabled in the Grid to allow users to select rows before performing the drag and drop operation.

* Multiple rows can be selected by clicking and dragging inside the grid. For multiple row selection, the [type](#) property must be set to **Multiple**.

Drag and drop events

The Grid control provides a set of events that are triggered during drag and drop operations on grid rows. These events allow you to customize the drag element, track the progress of the dragging operation, and perform actions when a row is dropped on a target element. The following events are available:

1. [rowDragStartHelper](#): This event is triggered when a click occurs on the drag icon or a grid row. It allows you to customize the drag element based on specific criteria.
2. [rowDragStart](#): This event is triggered when the dragging of a grid row starts.
3. [rowDrag](#): This event is triggered continuously while the grid row is being dragged.
4. [rowDrop](#): This event is triggered when a drag element is dropped onto a target element.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.RowDD);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowRowDragAndDrop: true,
  selectionSettings: { type: 'Multiple' },

Limitations

- Single row is able to drag and drop in same grid without enable the row selection.
- Row drag and drop feature is not having built in support with row template, detail template, hierarchy grid and grouping features of grid.

Row spanning in ##Platform_Name## Grid control

The grid provides an option to span row cells, allowing you to merge two or more cells in a row into a single cell. This feature can be useful in scenarios where you want to display information that spans across multiple rows, but want to avoid repeating the same information in each row.

To achieve this, You need to define the [rowSpan](#) attribute to span cells in the [queryCellInfo](#) event. The `rowSpan` attribute is used to specify the number of rows that the current cell should span.

The `queryCellInfo` event is triggered for each cell in the grid, and allows you to customize the cells in the grid. By handling this event, you can set the `rowSpan` attribute for a cell to achieve row spanning.

In the following demo, **Davolio** cell is spanned to two rows in the **EmployeeName** column. Also Grid supports the spanning of rows and columns for same cells. **Lunch Break** cell is spanned to two rows and three columns in the **1:00** column.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: columnSpanData,
  queryCellInfo: QueryCellEvent,
  gridLines: 'Both',
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', isPrimaryKey:
true, textAlign: 'Right', width: 150 },
    { field: 'EmployeeName', headerText: 'Employee Name', width: 200 },
    { field: '9:00', headerText: '9.00 AM', width: 120 },
    { field: '9:30', headerText: '9.30 AM', width: 120 },
    { field: '10:00', headerText: '10.00 AM', width: 120 },
    { field: '10:30', headerText: '10.30 AM', width: 120 },
    { field: '11:00', headerText: '11.00 AM', width: 120 },
```

```

        { field: '11:30', headerText: '11.30 AM', width: 120 },
        { field: '12:00', headerText: '12.00 PM', width: 120 },
        { field: '12:30', headerText: '12.30 PM', width: 120 },
        { field: '1:00', headerText: '1.00 PM', width: 120 },
        { field: '1:30', headerText: '1.30 PM', width: 120 },
        { field: '2:00', headerText: '2.00 PM', width: 120 },

To disable the spanning for particular grid page, you need to use **requestType** from **queryCellInfo** event argument.

The **rowSpan** and **colSpan** attributes can be used together to merge cells both vertically and horizontally.

Cell

Cell in **##Platform_Name##** Grid control

Cell customization

The appearance of cells can be customized by using the [queryCellInfo](#) event. The [queryCellInfo](#) event triggers for every cell. In that event handler, you can get [QueryCellInfoEventArgs](#) that contains the details of the cell.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  enableHover: false,
  allowSelection: false,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',

Custom attributes

You can customize the grid cells by adding a CSS class to the [customAttribute](#) property of the column.

```

`css
.e-attr {

```

```
background: '#d7f0f4';
}
,
`ts
{
field: "ShipCity", headerText: "Ship City", customAttributes: {class: "e-attr"}, width: "120"
}
,

```

In the below example, we have customized the cells of **OrderID** and **ShipCity** columns.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', customAttributes:
{class: "e-attr"}, textAlign: 'Right', width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', customAttributes:
{class: "e-attr"}, width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 280
});
grid.appendTo('#Grid');
```

Grid lines

The [gridLines](#) have option to display cell border and it can be defined by the [gridLines](#) property.

The available modes of grid lines are:

- | Modes | Actions |
|-------------|---|
| ----- ----- | |
| Both | Displays both the horizontal and vertical grid lines. |
| None | No grid lines are displayed. |
| Horizontal | Displays the horizontal grid lines only. |
| Vertical | Displays the vertical grid lines only. |
| Default | Displays grid lines based on the theme. |

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  gridLines: 'Both',
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

```

By default, the grid renders with **Default** mode.

[See Also](#)

Content in `##Platform_Name##` Grid control

The HTML tags can be displayed in the Grid header and content by enabling the [disableHtmlEncode](#) property.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: '<span> Order ID </span>',
      disableHtmlEncode: true, textAlign: 'Right', width: 140 },
    { field: 'CustomerID', headerText: '<span> Customer ID </span>',
      disableHtmlEncode: false, width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', width: 100, format:
      'yMd' },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
  ],
  height: 315
});
grid.appendTo('#Grid');
```

Auto wrap in ##Platform_Name## Grid control

The auto wrap allows the cell content of the grid to wrap to the next line when it exceeds the boundary of the cell width. The Cell Content wrapping works based on the position of white space between words. To enable auto wrap, set the [allowTextWrap](#) property to **true**. You can configure the auto wrap mode by setting the [textWrapSettings.wrapMode](#) property.

There are three types of [wrapMode](#). They are:

- **Both:** Both value is set by default. Auto wrap will be enabled for both the content and the header.
- **Header:** Auto wrap will be enabled only for the header.
- **Content:** Auto wrap will be enabled only for the content.

Note: When a column width is not specified, then auto wrap of columns will be adjusted with respect to the grid's width.

In the following example, the [textWrapSettings.wrapMode](#) is set to **Content**.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    gridLines: 'Default',
    allowTextWrap: true,
    textWrapSettings: { wrapMode: 'Content' },
    columns: [
        { field: 'RoolNo', headerText: 'Rool No', width: 120 },
        { field: 'Name', headerText: 'Name of the inventor', width: 100 },
        { field: 'patentfamilies', headerText: 'No of patentfamilies',
width: 100 },
        { field: 'Country', headerText: 'country', width: 130 },

```

```

        { field: 'mainfields', headerText: 'Main fields of Invention',
width: 150 },
        ],
        height: 315
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

Clip mode in ##Platform_Name## Grid control

The clip mode provides options to display its overflow cell content and it can be defined by the [columns.clipMode](#) property.

There are three types of [clipMode](#). They are:

- **Clip:** Truncates the cell content when it overflows its area.
- **Ellipsis:** Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip:** Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    columns: [
        { field: 'RoolNo', headerText: 'Rool No', width: 100 },
        { field: 'Name', headerText: 'Name of the inventor', clipMode:
'Clip', width: 100 },
        { field: 'patentfamilies', headerText: 'No of patent families',
clipMode: 'Ellipsis', width: 100 },
        { field: 'Country', headerText: 'Country', width: 80 },
        { field: 'mainfields', headerText: 'Main fields of Invention',
clipMode: 'EllipsisWithTooltip', width: 100 },
    ]
});
grid.appendTo('#Grid');

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, [columns.clipMode](#) value is **Ellipsis**.

Editing

Edit in ##Platform_Name## Grid control

The Grid component has options to dynamically insert, delete and update records. Editing feature requires a primary key column for CRUD operations. To define the primary key, set [columns.isPrimaryKey](#) to **true** in particular column.

You can start the edit action either by double clicking the particular row or by selecting the required row and click on **Edit** button in the toolbar. Similarly, you can add a new record to grid either by clicking on **Add** button in the toolbar or on an external button which is bound to invoke the [addRecord](#) method of the grid, **Save** and **Cancel** while in edit mode is possible using respective toolbar icon in grid.

Deletion of the record is possible by selecting the required row and click on **Delete** button in the toolbar.

To use CRUD, inject the [Edit](#) module in grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit);
var grid = new ej.grids.Grid({
  dataSource: data,
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

    var ele = document.getElementById('container');
    if(ele) {
        ele.style.visibility = "visible";
    }
    </script>
    <script src="index.js" type="text/javascript"></script>
    </body></html>

```

* If [columns.isIdentity](#) is enabled, then it will be considered as a read-only column when editing and adding a record.

* You can disable editing for a particular column, by specifying [columns.allowEditing](#) to `false`.

Toolbar with edit option

The grid toolbar has the [built-in items](#) to execute Editing actions. You can define this by using the [toolbar](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
    true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
        width: 100, isPrimaryKey: true },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable editing for particular column

You can disable editing for particular columns by using the [columns.allowEditing](#).

In the following demo, editing is disabled for the **CustomerID** column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120,
allowEditing: false },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

INDEX.HTML

</body></html>

```

Disable editing for a particular row or cell

You can disable the editing for a particular row by using the [actionBegin](#) event of Grid based on **requestType** as **beginEdit**.

In the below demo, the rows which are having the value for **ShipCountry** column as "France" is prevented from editing.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    actionBegin: function(args) {
        if (args.requestType === "beginEdit") {
            if (args.rowData.ShipCountry == "France") {
                args.cancel = true;
            }
        }
    },
    toolbar: ['Edit', 'Update', 'Cancel'],
    editSettings: { allowEditing: true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

For batch mode of editing, you can use [cellEdit](#) event of Grid. In the below demo, the cells which are having the value as "France" is prevented from editing.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  cellEdit: function(args) {
    if (args.value == "France") {
      args.cancel = true;
    }
  },
  toolbar: ['Edit', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, mode: 'Batch' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
  ],
  height: 273
});
grid.appendTo('#Grid');

```

```

Editing template column

You can edit the template column value by defining the **field** for that particular column.

In the below demo, the **ShipCountry** column is rendered with the template.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', template:
'#template', editType: 'dropdownedit', width: 150 }
  ],
  height: 273
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Troubleshoot editing works only for first row

The Editing functionalities can be performed based upon the primary key value of the selected row. If **primaryKey** is not defined in the grid, then edit or delete action take places the first row.

How to make a Grid column always editable

Make the Grid column always editable using the column template feature of the Grid.

In the following example, the textbox is rendered in the Freight column using a column template. The keyup event for the Grid is bound using the [created](#) event of the Grid, and the edited changes are saved in the data source using the [updateRow](#) method of the Grid.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, isPrimaryKey: true },
        { field: 'OrderDate', headerText: 'Order Date', width: 130,
textAlign: 'Right', format: 'yMd' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 140 },
        { field: 'Freight', headerText: 'Receipt Amount', width: 150,
template: '#template' }
    ],
    height: 315,
    created: (args) => {
        grid.element.addEventListener('keyup', function (e) { // Bind the
keyup event for the grid.
            if (e.target.classList.contains('custemp')) { // Based on this
condition, you can find whether the target is an input element or not.

```

```

        var row = ej.grids.parentsUntil(e.target, 'e-row');
        var rowIndex = row.rowIndex; // Get the row index.
        var uid = row.getAttribute('data-uid');
        var rowData = grid.getRowObjectFromUID(uid).data; // Get the
row data.
        rowData.Freight = e.target.value; // Update the new value
for the corresponding column.
        grid.updateRow(rowIndex, rowData); // Update the modified
value in the row data.
    }
    });
}
});
grid.appendTo('#Grid');

```

INDEX.HTML

Edit types in `##Platform_Name##` Grid control

Customize editors using params

The [columns.editType](#) is used to define the editor component for any particular column. You can set the [columns.editType](#) based on data type of the column.

- [NumericTextBox](#) component for integers, double, and decimal data types.
- [TextBox](#) component for string data type.
- [DropDownList](#) component to show all unique values related to that field.
- [CheckBox](#) component for boolean data type.
- [DatePicker](#) component for date data type.
- [DateTimePicker](#) component for date time data type.

Also, you can customize the behavior of the editor component through the [columns.edit.params](#).

The following table describes editor component and their example edit params of the column.

Component | Example

[NumericTextBox](#) | params: { decimals: 2, value: 5 }

[DropDownList](#) | params: { value: 'Germany' }

[Checkbox](#) | params: { checked: true }

[DatePicker](#) | params: { format: 'dd.MM.yyyy' }

[DateTimePicker](#) | params: { value: new Date() }

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerName', headerText: 'CustomerName', textAlign:
'Right', width: 200 },
    { field: 'OrderDate', headerText: 'Order Date', type: 'date', width:

<script src="index.js" type="text/javascript"></script>
</body></html>

```

If edit type is not defined in the column, then it will be considered as the **stringedit** type (Textbox component) .

[Restrict to type decimal points in a NumericTextBox while editing the numeric column](#)

By default, the number of decimal places will be restricted to two in the NumericTextBox while editing the numeric column. We can restrict to type the decimal points in a NumericTextBox by using the **validateDecimalOnType** and **decimals** properties of NumericTextBox.

In the below demo, while editing the row we have restricted to type the decimal point value in the NumericTextBox of **Freight** column.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 150, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    {
      field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 150, edit: {
        params: {
          validateDecimalOnType: true,
          decimals: 0,
          format: "N"
        }
      }
    },
    { field: 'ShipCity', headerText: 'Ship City', editType:
'dropdownedit', width: 150 }
  ],
  height: 265
});
grid.appendTo('#Grid');
```

```

Provide custom data source and enabling filtering to DropDownList

You can provide data source to the DropDownList by using the [columns.edit.params](#) property.

While setting new data source using edit params, you must specify a new `query` property too for the dropdownlist as follows,

```

`ts
{
  params: {
    query: new Query(),
    dataSource: country,
    fields: { value: 'ShipCountry', text: 'ShipCountry' },
    allowFiltering: true
  }
}

```

```
}
,
```

You can also enable filtering for the dropdownlist by passing the `allowFiltering` as `true` to the edit params.

In the below demo, DropDownList is rendered with custom Datasource for the `ShipCountry` column and enabled filtering to search dropdownlist items.

INDEX.JS

```
var country = [
    { ShipCountry: 'United States', countryId: '1' },
    { ShipCountry: 'Australia', countryId: '2' },
    { ShipCountry: 'India', countryId: '2' }
];
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: cascadeData,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true, minLength: 3 } },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 120,
editType: 'dropdownedit', edit: {
            params: {
                query: new ej.data.Query(),
                dataSource: country,
                fields: { value: 'ShipCountry', text: 'ShipCountry' },
                allowFiltering: true
            }
        }
    ]
},
height: 273
});
grid.appendTo('#Grid');
```

Open popup while focusing the edit dropdown list

You can open the DropDownList popup while focusing the cell by invoking the [showPopup](#) method inside the ['focus'](#) event of DropDownList component.

In the below demo, we have bound the focus event for the edit DropDownList using the [columns.edit.params](#) property.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', edit: { params:
{ focus: ddFocus } }, editType: 'dropdownedit', width: 150 }
  ],
  height: 265
});
grid.appendTo('#Grid');
function ddFocus(e) {
  e.event.target.querySelector('.e-
dropdownlist').ej2_instances[0].showPopup();
}
```

INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom editors using template

The cell edit template is used to add a custom component for a particular column by invoking the following functions:

- **create** - It is used to create the element at the time of initialization.
- **write** - It is used to create the custom component or assign default value at the time of editing.
- **read** - It is used to read the value from the component at the time of save.
- **destroy** - It is used to destroy the component.

Render TimePicker component while editing

Use the cell edit template feature of the Grid to render the TimePicker component in the Grid edit form. In the below sample, we have rendered TimePicker component in the **OrderDate** column.

INDEX.JS

```
var ddElem;
var timeObject;
ej.base.enableRipple(true);
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar, ej.grids.Page);
var grid = new ej.grids.Grid({
  dataSource: purchaseData,
  allowPaging: true,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true
},
  columns: [
    { field: 'OrderID', headerText: 'Order ID', type: 'number',
isPrimaryKey: true, validationRules: { required: true }, textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', type: 'string', width:
140 },
    { field: 'Freight', headerText: 'Freight', type: 'number', editType:
'numericedit', format: 'C2', textAlign: 'Right', width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', type: 'date', format:
'hh:mm', width: 150, edit: {

Render AutoComplete component while editing

Use the cell edit template feature of the Grid to render the AutoComplete component in the Grid edit form. In the below sample, we have rendered AutoComplete component in the **CustomerID** column.

INDEX.JS

```

var inpuEle;
var autoCompleteIns;
var autoCompleteData = [
    { CustomerID: 'VINET', Id: '1' },
    { CustomerID: 'TOMSP', Id: '2' },
    { CustomerID: 'HANAR', Id: '3' },
    { CustomerID: 'VICTE', Id: '4' },
    { CustomerID: 'SUPRD', Id: '5' }
];
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar, ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: purchaseData,
    allowPaging: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', type: 'number',
isPrimaryKey: true, validationRules: { required: true }, textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', type: 'string',
width: 140, edit: {
            create: createCustomerIDFn,
            destroy: destroyCustomerIDFn,
            read: readCustomerIDFn,
            write: writeCustomerIDFn }
        },
        { field: 'Freight', headerText: 'Freight', type: 'number', editType:
'numericedit', format: 'C2', textAlign: 'Right', width: 120 },

```

```

        { field: 'OrderDate', headerText: 'Order Date', type: 'date', format:
'yMd', editType: 'datepickeredit', width: 150 }
    ],
    pageSettings: { pageSize: 7 },
    height: 255,
});
grid.appendTo('#Grid');
function createCustomerIDFn() {
    inpuEle = document.createElement('input');
    return inpuEle;
}
function destroyCustomerIDFn() {
    autoCompleteIns.destroy();
}
function readCustomerIDFn() {
    return autoCompleteIns.value;
}
function writeCustomerIDFn(args) {
    autoCompleteIns = new ej.dropdowns.AutoComplete({
        allowCustom: true,
        value: args.rowData[args.column.field],

```

Render MultiSelect DropDown component while editing

Use the cell edit template feature of the Grid to render the MultiSelect DropDown component in the Grid edit form. In the below sample, we have rendered MultiSelect DropDown component in the **ShipCity** column.

INDEX.JS

```

var ddElem;
var multiSelectObj;
var multiselectDatasource = [
    { ShipCity: 'Reims', Id: '1' },
    { ShipCity: 'Münster', Id: '2' },
    { ShipCity: 'Rio de Janeiro', Id: '3' },

```

```

    { ShipCity: 'Lyon', Id: '4' },
    { ShipCity: 'Charleroi', Id: '5' },
  ];
  ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar, ej.grids.Page);
  var grid = new ej.grids.Grid({
    dataSource: purchaseData,
    allowPaging: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
      { field: 'OrderID', headerText: 'Order ID', type: 'number',
isPrimaryKey: true, validationRules: { required: true }, textAlign: 'Right',
width: 100 },
      { field: 'CustomerID', headerText: 'Customer ID', type: 'string',
width: 140 },
      { field: 'Freight', headerText: 'Freight', type: 'number', editType:
'numericedit', format: 'C2', textAlign: 'Right', width: 120 },
      { field: 'ShipCity', headerText: 'Ship City', type: 'string', width:
180, edit: {
        create: createShipCityFn,
        read: readShipCityFn,
        destroy: destroyShipCityFn,
        write: writeShipCityFn }
      }
    ],
    pageSettings: { pageSize: 7 },
    height: 255,
  });
  grid.appendTo('#Grid');
  function createShipCityFn() {
    ddElem = document.createElement('input');
    return ddElem;
  }
  function readShipCityFn() {
    return multiSelectObj.value.join(', ');
  }
  function destroyShipCityFn() {
    multiSelectObj.destroy();
  }
  function writeShipCityFn(args) {
    {
      let multiSelectVal = args.rowData[args.column.field]
        ? args.rowData[args.column.field].split(',')
        : [];
      multiSelectObj = new ej.dropdowns.MultiSelect({
        value: multiSelectVal,
        dataSource: multiSelectDatasource,
        fields: { value: 'ShipCity', text: 'ShipCity' },
        floatLabelType: 'Never',
        mode: 'Box',
      });
      multiSelectObj.appendTo(ddElem);
    }
  }
}

```

```

Render MaskedTextBox component while editing

Use the cell edit template feature of the Grid to render the MaskedTextBox component in the Grid edit form. In the following sample, the MaskedTextBox component is rendered in the Mask column.

INDEX.JS

```

var elem;
var maskObj;
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        {
            field: 'Mask', headerText: 'Mask', width: 140, edit: {
                create: function() {
                    elem = document.createElement('input');
                    return elem;
                },
                read: function() {
                    return maskObj.value;
                },
                destroy: function() {
                    maskObj.destroy();
                },
                write: function(args) {
                    maskObj = new ej.inputs.MaskedTextBox({
                        mask: "0-0-0-0",
                        value: args.rowData.Mask
                    });
                    maskObj.appendTo(args.element);
                }
            }
        }

Render RichTextEditor component while editing

Use the cell edit template feature of the Grid to render the RichTextEditor component in the Grid edit form. In the below sample, we have rendered RichTextEditor component in the **ShipAddress** column, so we use [allowTextWrap](#) property to true.

INDEX.JS

```

var tbElem;
var textEditor;
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar, ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: purchaseData,
    allowPaging: true,
    allowTextWrap: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    created: function (args) {
        this.keyConfigs.enter = '';
    },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', type: 'number',
isPrimaryKey: true, validationRules: { required: true }, textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', type: 'string',
width: 140 },
        { field: 'Freight', headerText: 'Freight', type: 'number', editType:
'numericedit', format: 'C2', textAlign: 'Right', width: 120 },
        { field: 'ShipAddress', headerText: 'Ship Address', type: 'string',
valueAccessor: valueAccessor, disableHtmlEncode: false, width: 180, edit: {
create: createShipAddressFn,
destroy: destroyShipAddressFn,
read: readShipAddressFn,
write: writeShipAddressFn }
}
}

```

```

    ],
    pageSettings: { pageSize: 7 },
    height: 255,
  });
  grid.appendTo('#Grid');

  function createShipAddressFn() {
    tbElem = document.createElement('textarea');
    return tbElem;
  }
  function destroyShipAddressFn() {
    textEditor.destroy();
  }
  function readShipAddressFn() {
    return textEditor.value;
  }
  function writeShipAddressFn(args) {
    textEditor = new ej.inputs.TextBox({
      multiline: true,
      value: args.rowData[args.column.field],
      floatLabelType: 'Auto',
    });
    textEditor.appendTo(tbElem);
  }

  function valueAccessor(field, data, column) {
    var value = data[field];
    if (value != undefined) {
      return value.split('\n').join('<br>');
    } else {

[Render multiple columns in DropDownList component while editing](#)

Use the cell edit template feature of the Grid to render the DropDownList component in the Grid edit form.

The DropDownList has been provided with several options to customize each list item, group title, selected value, header, and footer element. By default, list items can be rendered as a single column in the DropDownList component. Instead of this, multiple columns can be rendered. This can be achieved by using the [headerTemplate](#) and [itemTemplate](#) properties of the DropDownList component.

This is demonstrated in the following sample.

INDEX.JS

```
var element;
var dropdownobj;
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'ShipCountry', width: 300, headerText: 'ShipCountry' ,
edit: {
            create: function () {
                element = document.createElement('input');
                return element;
            },
            read: function () {
                return dropdownobj.value;
            },
            destroy: function () {
                dropdownobj.destroy();
            },
            write: function (args) {
                dropdownobj = new ej.dropdowns.DropDownList({
                    dataSource: data,
                    value: args.rowData[args.column.field],
                    query: new ej.data.Query().select(['EmployeeID',
'ShipCountry']).take(10),
                    fields: { text: 'ShipCountry', value: 'ShipCountry' },
                    placeholder: 'Select a Country',
                    headerTemplate:
'<table><tr><th>EmployeeID</th><th>ShipCountry</th></tr></table>',
                    itemTemplate: '<div class="e-grid"><table class="e-
table"><tbody><tr><td class="e-rowcell">${EmployeeID}</td><td class="e-
rowcell">${ShipCountry}</td></tr> </tbody></table></div>'
                });
                dropdownobj.appendTo(element);
            }
        }
    ]
});
grid.appendTo('#Grid');
```

```

Access editor components

You can access the component instance from the component element using the `ej2_instances` property.

In the below demo, you can access the Editor component instance while adding or editing actions on the [actionComplete](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    actionComplete: function(args) {
        if (args.requestType === 'beginEdit' || args.requestType === 'add')
        {
            var tr = args.row;
            var numericTextBox = tr.querySelector('.e-numerictextbox'); //
            numeric TextBox component element
            if (numericTextBox) {
                console.log('NumericTextBox instance: ',
                (numericTextBox).ej2_instances[0]); // numeric TextBox instance
            }
            var dropDownList = tr.querySelector('.e-dropdownlist'); //
            dropDownList component element
            if (dropDownList) {
                console.log('DropDownList instance: ',
                (dropDownList).ej2_instances[0]); // dropDownList instance
            }
        }
    },
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],

```

```

editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
],
height: 273
});
grid.appendTo('#Grid');

```

In line editing in ##Platform_Name## Grid control

In Normal edit mode, when you start editing the currently selected record is changed to edit state. You can change the cell values and save edited data to the data source. To enable Normal edit, set the [editSettings.mode](#) as **Normal**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

```

Normal edit mode is default mode of editing.

Automatically update the column based on another column edited value

You can update the column value based on another column edited value by using the Cell Edit Template feature.

In the below demo, we have update the **TotalCost** column value based on the **UnitPrice** and **UnitInStock** column value while editing.

INDEX.JS

```

var priceElem;
var priceObj;
var stockElem;
var stockObj;
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: productData,
    editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true,
        mode: 'Normal',
        newRowPosition: 'Top'
    },
    allowPaging: true,
    pageSettings: { pageCount: 5 },
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    columns: [
        {
            field: 'ProductID',
            isPrimaryKey: true,
            headerText: 'Product ID',
            textAlign: 'Right',
            validationRules: { required: true, number: true },
            width: 140
        },
        {
            field: 'ProductName',

```

```

        headerText: 'Product Name',
        validationRules: { required: true },
        width: 140
    },
    {
        field: 'UnitPrice',
        headerText: 'UnitPrice',
        textAlign: 'Right',
        edit: {
            create: function() {
                priceElem = document.createElement('input');
                return priceElem;
            },
            read: function() {
                return priceObj.value;
            },
            destroy: function() {
                priceObj.destroy();
            },
            write: function(args) {

Cancel edit based on condition

You can prevent the CRUD operations of the Grid by using condition in the [actionBegin](#) event with requestType as **beginEdit** for editing, **add** for adding and **delete** for deleting actions.

In the below demo, we prevent the CRUD operation based on the **Role** column value. If the Role Column is **Employee**, we are unable to edit/delete that row.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var isAddable = true;
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'Role', headerText: 'Role', width: 120, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    actionBegin: actionBegin,
    height: 240
});
grid.appendTo('#Grid');
function actionBegin(args) {
    if (args.requestType == 'beginEdit') {
        if (args.rowData['Role'].toLowerCase() == 'employee') {
            args.cancel = true;
        }
    }
    if (args.requestType == 'delete') {
        if (args.data[0]['Role'].toLowerCase() == 'employee') {
            args.cancel = true;
        }
    }
    if (args.requestType == 'add') {
        if (!isAddable) {
            args.cancel = true;
        }
    }
}
}
var button = document.createElement('button');
button.innerText = 'Grid is Addable';
document.body.insertBefore(button, document.body.children[0])
button.addEventListener('click', btnClick.bind(this));
function btnClick(args) {
    args.target.innerText == 'Grid is Addable' ? (args.target.innerText =
'Grid is Not Addable') : (args.target.innerText = 'Grid is Addable');
    isAddable = !isAddable;
}
}

```

Perform CRUD action programmatically

Grid methods can be used to perform CRUD operations programmatically. The [addRecord](#), [deleteRecord](#), and [startEdit](#) methods are used to perform CRUD operations in the following demo.

- To add a new record to the Grid, use the [addRecord](#) method. In this method, you can pass the data parameter to add a new record to the Grid, and the index parameter to add a record at a specific index. If you call this method with no parameters, it will create an empty row in the Grid.
- To change the selected row to the edit state, use the [startEdit](#) method.
- If you need to update the row data in the Grid's datasource, you can use the [updateRow](#) method. In this method, you need to pass the index value of the row to be updated along with the updated data.
- If you need to update the particular cell in the row, you can use the [setCellValue](#) method. In this method, you need to pass the primary key value of the data source, field name, and new value for the particular cell.
- To remove a selected row from the Grid, use the [deleteRecord](#) method. For both edit and delete operations, you must select a row first.

Note: In both normal and dialog editing modes, these methods can be used.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true},
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, isPrimaryKey:true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 230
});
grid.appendTo('#Grid');
document.getElementById('add').onclick = function () {
  grid.addRecord({ "OrderID": "10248", "CustomerID": "RTER", "ShipCity":
"America", "ShipName": "Hanari" });
};
document.getElementById('edit').onclick = function () {
  grid.startEdit();
};
document.getElementById('delete').onclick = function () {
  grid.deleteRecord();
};
document.getElementById('updaterow').onclick = function () {
  grid.updateRow(0, { OrderID: 10248, CustomerID: 'RTER', ShipCity:
'America', ShipName: 'Hanari' });
};
document.getElementById('updatecell').onclick = function () {
  grid.setCellValue(grid.currentViewData[0].OrderID, 'CustomerID', 'Value
Changed');
};
```

```

The `showDeleteConfirmDialog` supports all type of edit modes.

Default column values on add new row

The grid provides an option to set the default value for the columns when adding a new record in it. To set a default value for the particular column by defining the [columns.defaultValue](#).

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true, minLength: 3 }, defaultValue: 'HANAR' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
  ],
  height: 273
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add `newRowPosition` is supported for **Normal** and **Batch** editing modes.

Move the focus to a particular cell instead of first cell while editing a row

The [recordDoubleClick](#) event allows you to move the focus to the corresponding cell (the cell that you double-clicked to edit a row) instead of the first cell in edit form. With the help of this event, you can focus the double-clicked column in inline edit mode.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true,
    mode: "Normal"
    },

Dialog editing in ##Platform_Name## Grid control

In Dialog edit mode, when you start editing the currently selected row data will be shown on a dialog. You can change the cell values and save edited data to the data source. To enable Dialog edit, set the [editSettings.mode](#) as **Dialog**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

```

Customize edit dialog

You can customize the Header and Footer appearance of the edit dialog in the [actionComplete](#) event based on `requestType` as `beginEdit` or `add`.

In the following example, We have customized the dialog's height and title of the dialog's header and also we have changed the button content name in the dialog's footer.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },
  actionComplete: function (args) {
    if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
      let dialog = args.dialog;
      // set the height of the dialog
      dialog.height = 400;
      // change the header of the dialog
      dialog.header = args.requestType === 'beginEdit' ? 'Edit Record
of ' + args.rowData['CustomerID'] : 'New Customer';
      // change the footer button name of the dialog
      dialog.getButtons()[0].content = "Ok";
      dialog.getButtons()[1].content = "Close";
    }
  },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 273
});
grid.appendTo('#Grid');
```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The Grid add or edit dialog element has the max-height property, which is calculated based on the available window height. So, in the normal window (1920 x 1080), it is possible to set the dialog's height up to 658px.

Show or hide columns in dialog editing

The Grid has the option to show hidden columns or hide visible columns while editing in the dialog edit mode by using the [actionBegin](#) event of the Grid.

In the `actionBegin` event, when the `requestType` is `beginEdit` or `add`, the column will be shown or hidden using the `column.visible` property. When the `requestType` is `save`, the properties will be reset to their original state.

In the following example, the CustomerID column is rendered as a hidden column, and the ShipCountry column is rendered as a visible column. In the edit mode, the CustomerID column will be changed to a visible state and the ShipCountry column will be changed to a hidden state.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Edit);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120,
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 265,
  actionBegin: function (args) {
    if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
      for (var i = 0; i < this.columns.length; i++) {
        if (this.columns[i].field == "CustomerID") {
          this.columns[i].visible = true;
        }
        else if (this.columns[i].field == "ShipCountry") {
          this.columns[i].visible = false;
        }
      }
    }
    if (args.requestType === 'save') {
      for (var i = 0; i < this.columns.length; i++) {
        if (this.columns[i].field == "CustomerID") {
          this.columns[i].visible = false;
        }
        else if (this.columns[i].field == "ShipCountry") {
          this.columns[i].visible = true;
        }
      }
    }
  }
});
```

```

    }
  });
  grid.appendTo('#Grid');

```

Use wizard like dialog editing

Wizard helps you to create intuitive step-by-step forms to fill. You can achieve the wizard-like editing by using the dialog template feature. It supports your own editing template by defining the [editSettings.mode](#) as **Dialog** and [editSetting.template](#) as SCRIPT element ID or HTML string which holds the template.

The following example demonstrates the wizard-like editing in the grid with obtrusive validation.

INDEX.JS

```

var countryData = ej.data.DataUtil.distinct(data, 'ShipCountry', true);
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Edit);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog', template: '#dialogtemplate' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 265,
    actionComplete: (args) => {
        if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
            new ej.dropdowns.DropDownList({
                value: args.rowData.ShipCountry,
                popupHeight: '300px',
                floatLabelType: 'Always',
                dataSource: countryData,
                fields: {text: 'ShipCountry', value: 'ShipCountry'},
                placeholder: 'Ship Country'
            },
            args.form.elements.namedItem('ShipCountry'));
        }
    }
});

```

```

        new ej.buttons.CheckBox({
            label: 'Verified',

Customize Add/Edit Dialog footer

In dialog edit mode, a dialog will show up when editing the currently selected row or adding a new row. By default, you can save or cancel the edited changes by clicking the Save or Cancel button in the dialog's footer. Along with these buttons, it is possible to add a custom button in the footer section using the [actionComplete](#) event of the Grid.

In the following sample, using the `dialog` argument of the `actionComplete` event, the action for the custom button can be customized.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete'],
  editSettings: {
    allowEditing: true,
    allowAdding: true,
    allowDeleting: true,
    mode: 'Dialog',
  },
  actionComplete: actionComplete,
  columns: [{
    field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width:
100, isPrimaryKey: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 },
  ]
});
grid.appendTo('#Grid');
function actionComplete(args) {
  if (args.requestType === 'beginEdit' || args.requestType === 'add') {
    var newFooterButton = {
      buttonModel: { content: 'custom' },
      click: onCustomButtonClick
    };
    args.dialog.buttons.push(newFooterButton);
    args.dialog.refresh();
  }
}
function onCustomButtonClick() {
  alert('Add/Edit dialog custom footer button clicked');
}
```

Template editing in ##Platform_Name## Grid control

Inline or dialog template editing

The dialog/inline template editing provides an option to customize the default behavior of dialog editing. Using the dialog template, you can render your own editors by defining the [editSettings.mode](#) as **Dialog/Inline** and [editSetting.template](#) as SCRIPT element ID or HTML string which holds the template.

In some cases, you need to add the new field editors in the dialog which are not present in the column model. In that situation, the dialog template will help you to customize the default edit dialog.

In the following sample, grid enabled with dialog template editing.

INDEX.JS

```

var countryData = ej.data.DataUtil.distinct(data, 'ShipCountry', true);
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog', template: '#dialogtemplate' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 265,
    actionBegin: function (args) {
        if (args.requestType === 'save') {
            // cast string to integer value.
            args.data['Freight'] =
parseFloat(args.form.querySelector("#Freight").value);
        }
    },
    actionComplete: function (args) {
        if ((args.requestType === 'beginEdit' || args.requestType ===
'add')) {
            // Add Validation Rules
            args.form.ej2_instances[0].addRules('Freight', {max: 500});
            // EJ2-control Rendering
            new ej.dropdowns.DropDownList({value: args.rowData.ShipCountry,
popupHeight: '200px', floatLabelType: 'Always',
dataSource: countryData, fields: {text: 'ShipCountry',
value: 'ShipCountry'}, placeholder: 'Ship Country'},
args.form.elements.namedItem('ShipCountry'));
            new ej.buttons.CheckBox({ label: 'Verified', checked:
args.rowData.Verified }, args.form.elements.namedItem('Verified'));

```

```

        new ej.inputs.NumericTextBox({value: args.rowData.Freight,
format: 'C2', placeholder: 'Freight', floatLabelType: 'Always' },
args.form.elements.namedItem('Freight'));
        // Set initail Focus
        if (args.requestType === 'beginEdit') {
            (args.form.elements.namedItem('CustomerID')).focus();
        }
    }
});
grid.appendTo('#Grid');

```

</body></html>

```

The template form editors should have **name** attribute.

Template context

The Essential JS2 packages has a built-in template engine. Using the template engine, you can access the row information inside the HTML element and bind the attributes, values, or elements based on this row information.

The following properties will be available at the time of template execution.

Property Name	Usage
---------------	-------

isAdd	A Boolean property; it defines whether the current row should be a new record or not.
-------	---

In the following code example, the **OrderID** textbox has been disabled by using the **isAdd** property.

,

// The disabled attributes will be added based on the isAdd property.

```

<input id="OrderID" name="OrderID" type="text" value=${if(isAdd)} " ${else} ${OrderID} ${/if}
${if(isAdd)}" ${else} disabled ${/if}/>

```

,

The following code example illustrates rendering the **OrderID** textbox, when a new record is added.

,

```

${if(isAdd)}
<div class="form-group col-md-6">
<div class="e-float-input e-control-wrapper">
<input id="OrderID" name="OrderID" type="text" value=${if(isAdd)} " ${else} ${OrderID} ${/if} />
<span class="e-float-line"></span>
<label class="e-float-text e-label-top" for="OrderID">Order ID</label>
</div>
</div>

```

`${/if}`

,

The dialog/inline dialog template syntax supports the ES6 expression string literals, and you can refer to the [Template Engine](#) for more template syntax.

Render editors as components

You can convert the form editors to EJ2 controls in the [actionComplete](#) event based on the `requestType` as `beginEdit` or `add`.

The following code example illustrates rendering the drop-down list control in the `actionComplete` event.

``ts`

```
actionComplete: (args: DialogEditEventArgs) => {
  if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
    let countryData: {}[] = DataUtil.distinct(data, 'ShipCountry', true);
    new DropDownList({value: args.rowData.ShipCountry, popupHeight: '200px', floatLabelType: 'Always',
      dataSource: countryData, fields: {text: 'ShipCountry', value: 'ShipCountry'}, placeholder: 'Ship Country'},
      args.form.elements.namedItem('ShipCountry') as HTMLInputElement);
  }
}
```

}

,

Get value from editor

You can read, format, and update the current editor value in the [actionBegin](#) event at the time of setting `requestType` to `save`.

In the following code example, the `freight` value has been formatted and updated.

``ts`

```
actionBegin: (args: SaveEventArgs) => {
  if (args.requestType === 'save') {
    // cast string to integer value.
    args.data['Freight'] = parseFloat(args.form.querySelector("#Freight").value);
  }
}
```

}

,

Set focus to editor

By default, the first input element in the dialog will be focused while opening the dialog. If the first input element is in disabled or hidden state, focus the valid input element in the [actionComplete](#) event based on `requestType` as `beginEdit`.

``ts`

```

actionComplete: (args: DialogEditEventArgs) => {
// Set initail Focus
if (args.requestType === 'beginEdit') {
(args.form.elements.namedItem('CustomerID')as HTMLInputElement).focus();
}
}
,

```

Adding validation rules for custom editors

If you have used additional fields that are not present in the column model, then add the validation rules to the [actionComplete](#) event.

```

`ts
actionComplete: (args: DialogEditEventArgs) => {
if ((args.requestType === 'beginEdit' || args.requestType === 'add')) {
// Add Validation Rules
args.form.ej2_instances[0].addRules('Freight', {max: 500});
}
}
,

```

Render tab component inside the dialog template

You can use the [tab](#) component inside the dialog edit UI using the dialog template feature. The dialog template feature can be enabled by defining the [editSettings.mode](#) as **Dialog** and [editSetting.template](#) as SCRIPT element ID or HTML string which holds the template.

To include the tab components in the dialog, follow the given steps:

Step 1:

Initialize the template for your tab component.

```

,

<div>
<div id="edittab"></div>
<div id="tab1">
<div class="form-row" >
<div class="form-group col-md-6">
<div class="e-float-input e-control-wrapper">
<input id="OrderID" name="OrderID" type="text" value=${if(isAdd)} " ${else} ${OrderID} ${/if}
${if(isAdd)} " ${else} disabled ${/if} />
<span class="e-float-line"></span>

```

```

<label class="e-float-text e-label-top" for="OrderID">Order ID</label>
</div>
</div>
</div>
<div class="form-row" >
<div class="form-group col-md-6">
<div class="e-float-input e-control-wrapper">
<input id="CustomerID" name="CustomerID" type="text" value=${if(isAdd)} " ${else} ${CustomerID}
${/if} />
<span class="e-float-line"></span>
<label class="e-float-text e-label-top" for="CustomerID">Customer ID</label>
</div>
</div>
</div>
<button id='next' class='e-info e-btn' style="float: right" type='button'> next</button>
</div>
<div id="tab2" style='display: none'>
<div class="form-row" >
<div class="form-group col-md-6">
<input type="text" name="ShipCountry" id="ShipCountry" value=${if(isAdd)} " ${else} ${ShipCountry}
${/if} />
</div>
</div>
<div class="form-row">
<div class="form-group col-md-6">
<input type="checkbox" name="Verified" id="Verified" ${if(isAdd)} " ${else} checked ${/if} />
</div>
</div>
<button id='submit' class='e-info e-btn' style="float: right" type='button'> submit</button>
</div>
</div>
,

```

Step 2:

To render the tab component, use the [actionComplete](#) event of the grid.

```

`ts
let tabObj: Tab = new Tab({
showCloseButton: false,
selecting: (e) => {if(e.isSwiped) {e.cancel = true;} if(e.selectingIndex === 1) {e.cancel = !validate(1)}},
items: [
{ header: { 'text': 'Details' }, content: '#tab1' },
{ header: { 'text': 'Verify' }, content: '#tab2' },
]
});
tabObj.appendTo('#edittab');
`

```

The following example demonstrates rendering the tab control inside the edit dialog. The tab control contains two tabs. You can fill the first tab and then navigate to the second tab. The validation for first tab will be done before navigating to the second tab.

INDEX.JS

```

var countryData = ej.data.DataUtil.distinct(data, 'ShipCountry', true);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Dialog', template: '#dialogtemplate' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true } },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 265,
  actionComplete: (args) => {
    if ((args.requestType === 'beginEdit' || args.requestType === 'add'))
    {
      var tabObj = new ej.navigations.Tab({
        showCloseButton: false,
        selecting: (e) => {if(e.isSwiped) {e.cancel = true;}
if(e.selectingIndex === 1) {e.cancel = !validate(1)}},
        items: [
          { header: { 'text': 'Details' }, content: '#tab1' },
          { header: { 'text': 'Verify' }, content: '#tab2' },
        ]
      });
      tabObj.appendTo('#edittab');
      new ej.dropdowns.DropDownList({value: args.rowData.ShipCountry,
popupHeight: '200px', floatLabelType: 'Always',
        dataSource: countryData, fields: {text: 'ShipCountry', value:
'ShipCountry'}, placeholder: 'Ship Country'},
args.form.elements.namedItem('ShipCountry'));
    }
  }
});

```

```

        new ej.buttons.CheckBox({ label: 'Verified', checked:
args.rowData.Verified }, args.form.elements.namedItem('Verified'));
        // Set initail Focus
        if (args.requestType === 'beginEdit') {
            (args.form.elements.namedItem('CustomerID')).focus();
        }
        document.getElementById('next').onclick = () => {
            moveNext();
        }
        function validate(tab) {
            let valid = true;
            [].slice.call(document.getElementById('tab' +
tab).querySelectorAll('[name]')).forEach(element => {
                element.form.ej2_instances[0].validate(element.name);
                if (element.getAttribute('aria-invalid') === 'true') {
                    valid = false;
                }
            });
            if (!valid) {
                return false;
            }
            return true;
        }
        function moveNext() {
            if (validate(1)) {
                tabObj.select(1);
            }
        }
        document.getElementById('submit').onclick = () => {
            if (validate(2)) {
                grid.endEdit();
            }
        }
    }
}
});
grid.appendTo('#Grid');

```

Batch editing in ##Platform_Name## Grid control

In Batch edit mode, when you double-click on the grid cell, then the target cell changed to edit state. You can bulk save (added, changed and deleted data in the single request) to data source by click on the toolbar's **Update** button or by externally invoking the `[batchSave]../api/grid/edit/#batchsave` method. To enable Batch edit, set the [editSettings.mode](#) as **Batch**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120, },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

</body></html>

```

If a column's [allowEditing](#) property is set to false, then the focus can be skipped in that non-editable column by clicking the tab or shift-tab key while in batch edit mode.

Automatically update the column based on another column edited value in batch mode

You can update the column value based on another column edited value in Batch mode by using the Cell Edit Template feature.

In the below demo, we have update the **TotalCost** column value based on the **UnitPrice** and **UnitInStock** column value while editing.

INDEX.JS

```

var priceElem;
var priceObj;
var stockElem;
var stockObj;
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: productData,
    editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true,
        mode: 'Batch',
        newRowPosition: 'Top'
    },
    allowPaging: true,
    pageSettings: { pageCount: 5 },
    toolbar: ['Add', 'Delete', 'Update', 'Cancel'],
    columns: [
        {
            field: 'ProductID',
            isPrimaryKey: true,
            headerText: 'Product ID',
            textAlign: 'Right',

Cancel edit based on condition in batch mode

You can prevent the CRUD operations of the Batch edit Grid by using condition in the [cellEdit](#), [beforeBatchAdd](#) and [beforeBatchDelete](#) events for Edit, Add and Delete actions respectively.

In the below demo, we prevent the CRUD operation based on the **Role** column value. If the Role Column is **Employee**, we are unable to edit/delete that row.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var isAddable = true;
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Delete', 'Update', 'Cancel'],

```

```

        editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Batch' },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true },
            { field: 'Role', headerText: 'Role', width: 120, },
            { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
            { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
        ],
        cellEdit: cellEdit,
        beforeBatchAdd: beforeBatchAdd,
        beforeBatchDelete: beforeBatchDelete,
        height: 240
    });
grid.appendTo('#Grid');
function cellEdit(args) {
    if (args.rowData['Role'] == 'Employee') {
        args.cancel = true;
    }
}
function beforeBatchAdd(args) {
    if (!isAddable) {
        args.cancel = true;
    }
}
function beforeBatchDelete(args) {
    if (args.rowData['Role'] == 'Employee') {
        args.cancel = true;
    }
}
var button = document.createElement('button');
button.innerText = 'Grid is Addable';
document.body.insertBefore(button, document.body.children[0]);
button.addEventListener('click', btnClick.bind(this));
function btnClick(args) {
    args.target.innerText == 'Grid is Addable' ? (args.target.innerText =
'Grid is Not Addable') : (args.target.innerText = 'Grid is Addable');
    isAddable = !isAddable;
}

```

* [editSettings.showConfirmDialog](#) requires the `editSettings.mode` to be `Batch`

* If [editSettings.showConfirmDialog](#) set to `false`, then confirmation dialog does not display in batch editing.

How to make editing in single click and arrow keys

When using batch mode, the TAB key allows you to edit or move to the next cell or row from the current record by default. Using the grid's load event, the same functionality can also be achieved by pressing the arrow keys. Additionally, the `editCell` method of the grid allows for cells to be made editable with a single click.

In the following sample, the [load](#) event of the Grid will be used to bind the keydown event handler. When any arrow key is pressed, the `editCell` method of the Grid will be used to identify the next or previous cell (td) and set it to be editable. Additionally, it is possible to enable editing of a cell with a single click by utilizing the `editCell` method within the [created](#) event of the Grid.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  enableHover: false,
  created: created,
  load: load,
  editSettings: {
    allowEditing: true,
    allowAdding: true,
    allowDeleting: true,
    mode: 'Batch',
  },
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',

Command column editing in ##Platform_Name## Grid control

The **command** column provides an option to add CRUD action buttons in a column. This can be defined by the [column.commands](#) property.

The available built-in command buttons are:

Command Button	Actions
----- -----	
Edit	Edit the current row.
Delete	Delete the current row.

| Save | Update the edited row. |

| Cancel | Cancel the edited state. |

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.CommandColumn, ej.grids.Edit);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  editSettings: { allowEditing: true, allowDeleting: true },
  columns: [
    { field: 'EmployeeID', isPrimaryKey: 'true', headerText: 'Employee ID', textAlign: 'Right', width: 125 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'Title', headerText: 'Title', width: 170 },
    { headerText: 'Commands', width: 120, commands: [{ type: 'Edit', buttonOption: { cssClass: 'e-flat', iconCss: 'e-edit e-icons' } }, { type: 'Delete', buttonOption: { cssClass: 'e-flat', iconCss: 'e-delete e-icons' } }, { type: 'Save', buttonOption: { cssClass: 'e-flat', iconCss: 'e-update e-icons' } }, { type: 'Cancel', buttonOption: { cssClass: 'e-flat', iconCss: 'e-cancel-icon e-icons' } } ] }
  ],
  height: 310
});
grid.appendTo('#Grid');
```

```

Validation in ##Platform_Name## Grid control

Column validation

Column validation allows you to validate the edited or added row data and it display errors for invalid fields before saving data.

Grid uses **Form Validator** component for column validation. You can set validation rules by defining the [columns.validationRules](#).

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true, minLength: 3 } },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
  ],
  height: 273
});
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom validation

You can define your own custom validation rules for the specific columns by using **Form Validator custom rules**.

In the below demo, custom validation applied for **CustomerID** column.

INDEX.JS

```

var customFn = function(args) {

```

```

        return args['value'].length >= 5;
    };
    ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
    var grid = new ej.grids.Grid({
        dataSource: data,
        toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
        editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true, mode: 'Normal' },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100, isPrimaryKey: true, validationRules: { required: true } },
            { field: 'CustomerID', headerText: 'Customer ID', width: 120,
validationRules: { required: true, minLength: [customFn, 'Need at least 5
letters'] } },
            { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
editType: 'numericedit', width: 120, format: 'C2' },
            { field: 'ShipCountry', headerText: 'Ship Country', editType:
'dropdownedit', width: 150 }
        ],
        height: 273
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

```

Custom validation based on dropdown change

You can apply validation rules and messages to a column based on another column value in edit mode. You can achieve this requirement by using the custom validation feature of Grid.

In the following sample, dropdownlist edit type is used for the **Role** and **Salary** columns. Here, you can apply the custom validation in the **Salary** column based on the value selected in the **Role** column.

INDEX.JS

```

var jobRole = [
    { role: 'TeamLead', destId: '0' },
    { role: 'Manager', destId: '1' },
    { role: 'Engineer', destId: '2' },
    { role: 'Sales', destId: '3' },
    { role: 'Support', destId: '4' },
];
var salaryDetails= [

```

```

    { salary: '11000', destId: '1' },
    { salary: '13500', destId: '2' },
    { salary: '16500', destId: '2' },
    { salary: '18500', destId: '1' },
    { salary: '21500', destId: '2' },
    { salary: '23000', destId: '2' },
  ];
  var grid = new ej.grids.Grid({
    dataSource: employeeDetails,
    allowPaging: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    load: () => {
      var column = grid.getColumnByField('Salary');
      column.validationRules = {
        required: [customFn, window['Please enter valid salary']],
      };
    },
    columns: [
      {
        field: 'EmployeeID',
        headerText: 'Employee ID',
        isPrimaryKey: true,
        textAlign: 'Right',
        width: 120
      },
      {
        field: 'Role',
        headerText: 'Role',
        width: 120,
        editType: 'dropdownedit',
        edit: {
          params: {
            query: new ej.data.Query(),
            dataSource: jobRole,
            fields: { value: 'role', text: 'role' },
            allowFiltering: true,
            change: ValChange
          }
        }
      },
      {
        field: 'Salary',
        headerText: 'Salary',
        width: 160,
        editType: 'dropdownedit',
        edit: {
          params: {
            query: new ej.data.Query(),
            dataSource: salaryDetails,
            fields: { value: 'salary', text: 'salary' },
            allowFiltering: true,
          }
        }
      }
    ],
  });

```

```

        field: 'Address',
        headerText: 'Address',
        width: 160
    }
    ]
});
grid.appendTo('#Grid');
window.role = '';
function customFn(args) {
    switch (window['role']) {
        case 'Engineer':
            if (args.value > 10000 && args.value < 15000) {
                return true;
            } else {
                this.rules['Salary']['required'][1] = 'Please enter valid
Engineer Salary';
            }
            break;
        case 'TeamLead':
            if (args.value > 15000 && args.value < 20000) {
                return true;
            } else {
                this.rules['Salary']['required'][1] = 'Please enter valid
TeamLead Salary';
            }
            break;
        case 'Manager':
            if (args.value > 20000 && args.value < 25000) {
                return true;
            } else {
                this.rules['Salary']['required'][1] = 'Please enter valid
Manager Salary';
            }
            break;
        case 'Sales':
            if (args.value > 5000 && args.value < 25000) {
                return true;
            } else {
                this.rules['Salary']['required'][1] = 'Please enter valid
Manager Salary';
            }
            break;
        case 'Support':
            if (args.value > 10000 && args.value < 19000) {
                return true;
            } else {
                this.rules['Salary']['required'][1] = 'Please enter valid
Manager Salary';
            }
            break;
    }
    return false;
}
function ValChange(args) {
    window['role'] = args.value;
}

```

Persisting data in server in ##Platform_Name## Grid control

Edited data can be persisted in the database using the RESTful web services.

All the CRUD operations in the grid are done through [DataManager](#). The **DataManager** has an option to bind all the CRUD related data in server-side.

For your information, the ODataAdaptor persists data in the server as per OData protocol.

In the below section, we have explained how to get the edited data details on the server-side using the [UrlAdaptor](#).

Using URL adaptor

You can use the [UrlAdaptor](#) of **DataManager** when binding data source from remote data. In the initial load of grid, data are fetched from remote data and bound to the grid using `url` property of **DataManager**. You can map The CRUD operation in grid can be mapped to server-side Controller actions using the properties `insertUrl`, `removeUrl`, `updateUrl`, `crudUrl` and `batchUrl`.

The following code example describes the above behavior.

```

`ts
import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Edit, Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    updateUrl: "Home/Update",
    insertUrl: "Home/Insert",
    removeUrl: "Home/Delete",
    adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({

```

```

dataSource: data,
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Normal' },
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100, isPrimaryKey: true,
validationRules: { required: true } },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120, validationRules: { required: true, minLength:
3 }, defaultValue: 'HANAR' },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', editType: 'numericedit', width: 120, format: 'C2'
},
{ field: 'ShipCountry', headerText: 'Ship Country', editType: 'dropdownedit', width: 150 }
],
height: 265
});
grid.appendTo('#Grid');
`

```

Also, when using the `UrlAdaptor`, you need to return the data as JSON from the controller action and the JSON object must contain a property as `result` with `dataSource` as its value and one more property `count` with the `dataSource` total records count as its value.

The following code example describes the above behavior.

```

`ts
public ActionResult DataSource(DataManager dm)
{
var DataSource = OrderRepository.GetAllRecords();
DataResult result = new DataResult();
result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
result.count = result.result.Count;
return Json(result, JsonRequestBehavior.AllowGet);
}
public class DataResult
{
public List<EditableOrder> result { get; set; }
public int count { get; set; }
}
`

```

Insert record

Using the `insertUrl` property, you can specify the controller action mapping URL to perform insert operation on the server-side.

The following code example describes the above behavior.

```
`ts
public ActionResult Insert(EditableOrder value)
{
    //Insert record in database
}
`
```

The newly added record details are bound to the `value` parameter. Please refer to the following screenshot.

Update record

Using the `updateUrl` property, the controller action mapping URL can be specified to perform save/update operation on the server-side.

The following code example describes the previous behavior.

```
`ts
public ActionResult Update(EditableOrder value)
{
    //Update record in database
}
`
```

The updated record details are bound to the `value` parameter. Please refer to the following screenshot.

Delete record

Using the `removeUrl` property, the controller action mapping URL can be specified to perform delete operation on the server-side.

The following code example describes the previous behavior.

```
`ts
public ActionResult Delete(int key)
{
    //Delete record in database
}
```

The deleted record primary key value is bound to the `key` parameter. Please refer to the following screenshot.

CRUD URL

Using the `crudUrl` property, the controller action mapping URL can be specified to perform all the CRUD operation at server-side using a single method instead of specifying separate controller action method for CRUD (insert, update and delete) operations.

The action parameter of `crudUrl` is used to get the corresponding CRUD action.

The following code example describes the above behavior.

```
`ts
import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Edit, Toolbar);
```

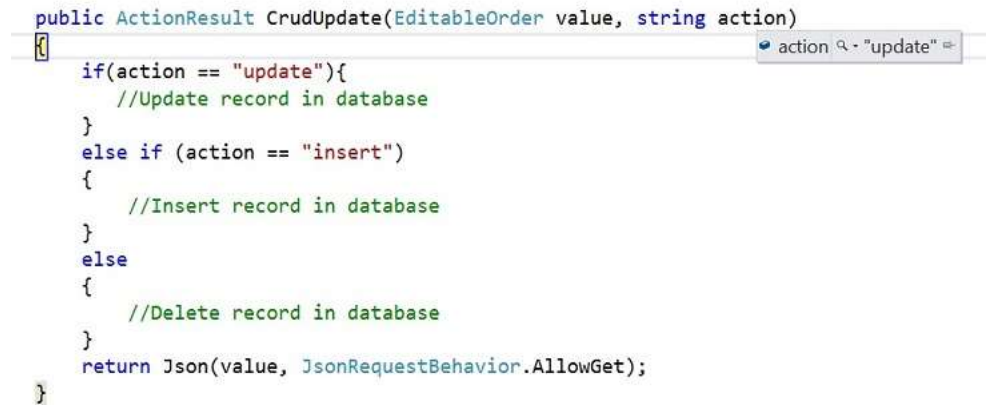

```

let data: DataManager = new DataManager({
url: "Home/DataSource",
crudUrl: "Home/CrudUpdate",
adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({
dataSource: data,
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Normal' },
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100, isPrimaryKey: true,
validationRules: { required: true } },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120, validationRules: { required: true, minLength:
3 }, defaultValue: 'HANAR' },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', editType: 'numericedit', width: 120, format: 'C2'
},
{ field: 'ShipCountry', headerText: 'Ship Country', editType: 'dropdownedit', width: 150 }
],
height: 265
});
grid.appendTo('#Grid');
`ts
public ActionResult CrudUpdate(EditableOrder value, string action)
{
if(action == "update"){
//Update record in database
}
else if (action == "insert")
{
//Insert record in database
}
else
{

```

```
//Delete record in database
}
}
,
```

Please refer to the following screenshot to know about the action parameter.

```
public ActionResult CrudUpdate(EditableOrder value, string action)
{
    if(action == "update"){
        //Update record in database
    }
    else if (action == "insert")
    {
        //Insert record in database
    }
    else
    {
        //Delete record in database
    }
    return Json(value, JsonRequestBehavior.AllowGet);
}
```

If you specify `insertUrl` along with `crudUrl`, then while adding `insertUrl` only will be invoked.

Batch URL

The `batchUrl` property supports only for batch editing mode. You can specify the controller action mapping URL to perform batch operation on the server-side.

The following code example describes the above behavior.

```
`ts
import { Grid, Edit, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Edit, Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    batchUrl: "Home/BatchUpdate",
    adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting: true, mode: 'Batch' },
    columns: [
```

```

{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100, isPrimaryKey: true,
validationRules: { required: true } },

{ field: 'CustomerID', headerText: 'Customer ID', width: 120, validationRules: { required: true, minLength:
3 }, defaultValue: 'HANAR' },

{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', editType: 'numericedit', width: 120, format: 'C2'
},

{ field: 'ShipCountry', headerText: 'Ship Country', editType: 'dropdownedit', width: 150 }
],
height: 265
});

grid.appendTo('#Grid');
`
`ts

public ActionResult BatchUpdate(string action, List<EditableOrder> added, List<EditableOrder> changed,
List<EditableOrder> deleted, int? key)
{
//Save the batch changes in database
}

`

public ActionResult BatchUpdate(string action, List<EditableOrder> added, List<EditableOrder> changed, List<EditableOrder> deleted, int? key)
{
//Save the batch changes in database
return Json(changed, JsonRequestBehavior.AllowGet);
}

```

changed: Count = 2

CustomerID	"HANAR-Updated"
EmployeeID	4
Freight	65.83
OrderDate	(7/8/1996 5:30:00 AM)

ShipCountry	"Brazil"
ShipName	"Hanari Carnes"
ShipPostalCode	"05454-876"
ShipRegion	"RJ"
Verified	true

Sorting in ##Platform_Name## Grid control

Sorting enables you to sort data in the **Ascending** or **Descending** order. To sort a column, click the column header.

To sort multiple columns, press and hold the CTRL key and click the column header. You can clear sorting of any one of the multi-sorted columns by pressing and holding the SHIFT key and clicking the specific column header.

To enable batch sorting in the Grid, set the [allowSorting](#) to true. Sorting options can be configured through the [sortSettings](#).

To sort, inject the [Sort](#) module in the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Sort);
var grid = new ej.grids.Grid({

```

```

        dataSource: data,
        allowSorting: true,
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        height: 315
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

```

* Grid columns are sorted in the **Ascending** order. If you click the already sorted column, the sort direction toggles.

* You can apply and clear sorting by invoking [sortColumn](#) and [clearSorting](#) methods.

* To disable sorting for a particular column, set the [columns.allowSorting](#) to false.

Initial sort

To sort at initial rendering, set the [field](#) and [direction](#) in the **sortSettings.columns**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowSorting: true,
    sortSettings: { columns: [{ field: 'OrderID', direction: 'Ascending' },
    { field: 'ShipCity', direction: 'Descending' }] },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 315
});

```

```
grid.appendTo('#Grid');
```

```

Multi-column sorting

You can sort more than one column in a Grid. To sort multiple columns, press and hold the **CTRL** key and click the column header. The sorting order will be displayed in the header while performing multi-column sorting.

To clear sorting for a particular column, press the "Shift + mouse left click".

The [allowSorting](#) must be true while enabling multi-column sort.

Set [allowMultiSorting](#) property as **false** to disable multi-column sorting.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowSorting: true,
    allowMultiSorting: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {

```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Sort order

By default, the sorting order will be as **ascending -> descending -> none**.

When first click a column header it sorts the column in ascending. Again click the same column header, it will sort the column in descending. A repetitive third click on the same column header will clear the sorting.

Sort foreign key column based on Text

For local data in Grid, sorting will be performed based on the [foreignKeyValue](#).

For remote data in Grid, sorting will be performed based on the [foreignKeyField](#), we need to handle the sorting operation at the server side.

`ts

```

import { Grid, ForeignKey, Sort } from '@syncfusion/ej2-grids';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';

Grid.Inject(ForeignKey, Sort);

let dataSource: DataManager = new DataManager({
  json: '/OData/Items',
  adaptor: new ODataV4Adaptor
});

let employeeData: DataManager = new DataManager({
  url: '/OData/Brands',
  adaptor: new ODataV4Adaptor
});

let grid: Grid = new Grid(
{
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
    {
      field: 'EmployeeID', headerText: 'Employee Name', width: 150, foreignKeyValue: 'FirstName',
      dataSource: employeeData
    },
    { field: 'Freight', headerText: 'Freight', width: 100, textAlign: 'Right'},

```

```
{ field: 'ShipName', headerText: 'Ship Name', width: 180 }
],
height: 315
});
grid.appendTo('#Grid');
`
```

The following code example describes the handling of sorting operation at the server side.

```
`
public class ItemsController : ODataController
{
    [EnableQuery]
    public IQueryable<Item> Get()
    {
        List<Item> GridData =
        JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQueryable().ToList();
        List<Brand> empData =
        JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQueryable().ToList();
        var queryString = HttpContext.Current.Request.QueryString;
        var allUrlKeyValues = ControllerContext.Request.GetQueryNameValuePairs();
        string key = allUrlKeyValues.LastOrDefault(x => x.Key == "$orderby").Value;
        if (key != null)
        {
            if (key == "EmployeeID") {
                GridData = SortFor(key); //Only for foreignKey Column ascending
            }
            else if(key == "EmployeeID desc") {
                GridData = SortFor(key); //Only for foreignKey Column descending
            }
        }
        var count = GridData.Count();
        var data = GridData.AsQueryable();
        return data;
    }
    public List<Item> SortFor(String Sorted)
`
```

```

{
List<Item> GridData =
JsonConvert.DeserializeObject<Item[]>(Properties.Resources.ItemsJson).AsQueryable().ToList();

List<Brand> empData =
JsonConvert.DeserializeObject<Brand[]>(Properties.Resources.BrandsJson).AsQueryable().ToList();

if (Sorted == "EmployeeID") //check whether ascending or descending
empData = empData.OrderBy(e => e.FirstName).ToList();
else if(Sorted == "EmployeeID desc")
empData = empData.OrderByDescending(e => e.FirstName).ToList();

List<Item> or = new List<Item>();
for (int i = 0; i < empData.Count(); i++) {
//Select the Field matching records

IEnumerable<Item> list = GridData.Where(pred => pred.EmployeeID ==
empData[i].EmployeeID).ToList();
or.AddRange(list);
}
return or;
}
}
,

```

Sorting events

During the sort action, the grid component triggers two events. The [actionBegin](#) event triggers before the sort action starts, and the [actionComplete](#) event triggers after the sort action is completed. Using these events you can perform the needed actions.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Sort);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowSorting: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315,
  actionBegin: actionHandler,
  actionComplete: actionHandler
});
grid.appendTo('#Grid');
function actionHandler(args) {

```

```
    alert(args.requestType + ' ' + args.type); //custom Action
}
```

INDEX.HTML

```

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The [args.requestType](#) is the current action name. For example, in sorting the [args.requestType](#) value is 'sorting'.

Custom sort comparer

You can customize the default sort action for a column by defining the [column.sortComparer](#) property. The sort comparer function has the same functionality like [Array.sort](#) sort comparer.

In the following example, custom sort comparer function was defined in the **Customer ID** column.

INDEX.JS

```
function sortComparer(reference, comparer) {
    if (reference == 32.38) {
        return -1;
    }
    return reference - comparer;
};
ej.grids.Grid.Inject(ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowSorting: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120 },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID'
},
        { field: 'Freight', headerText: 'Freight', textAlign:
'Right', width: 120, format: 'C2', sortComparer: sortComparer },
        { field: 'OrderDate', headerText: 'Order Date', textAlign:
'Right', width: 140, format: 'yMd' }
    ],
    height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Grid</title>

```

The sort comparer function will work only for the local data.

Touch interaction

When you tap the grid header on touchscreen devices, the selected column header is sorted. A popup

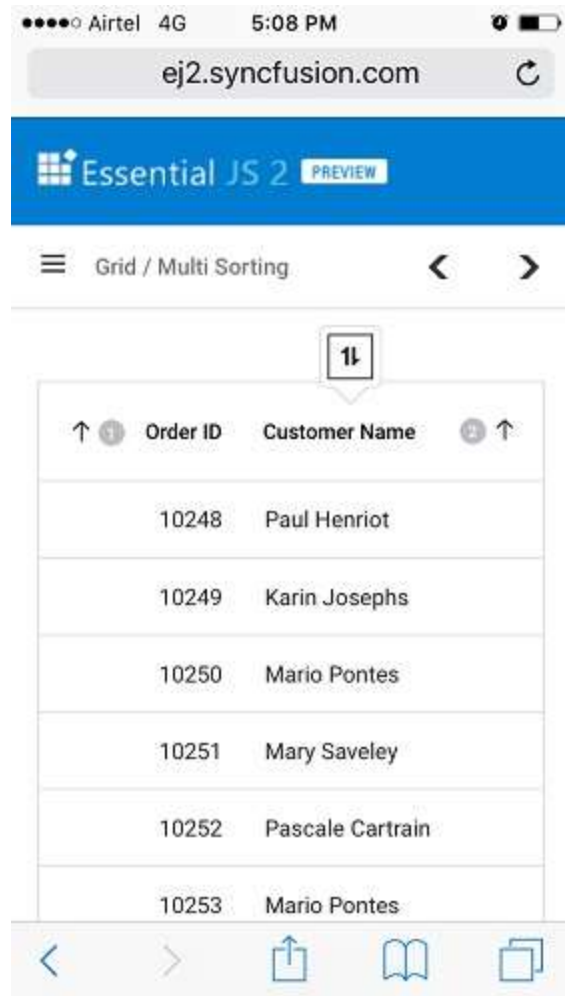

is displayed for multi-column sorting. To sort multiple columns, tap the popup , and then tap the desired grid headers.

The [allowMultiSorting](#) and [allowSorting](#) should be `true` then only the popup will be shown.

The following screenshot shows grid touch sorting.

Grouping

Grouping in ##Platform_Name## Grid control

The Grid has options to group records by dragging and dropping the column header to the group drop area. When grouping is applied, grid records are organized into a hierarchical structure to facilitate easier expansion and collapse of records.

To enable grouping in the grid, set the [allowGrouping](#) as true. Grouping options can be configured through the [groupSettings](#). To group, inject the [Group](#) module in the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Sort, ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowGrouping: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 267
});
```

```
});
grid.appendTo('#Grid');
```

```

* You can group and ungroup columns by using the [groupColumn](#) and [ungroupColumn](#) methods.

* To disable grouping for a particular column, set the [columns.allowGrouping](#) to false.

Initial group

To apply group at initial rendering, set the column field name in the `groupSettings.columns`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Sort, ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowGrouping: true,
    groupSettings: { columns: ['CustomerID', 'ShipCity'] },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 267
});
grid.appendTo('#Grid');

```

Group with paging

On grouping columns with paging feature, the aggregated information and total items are displayed based on the current page. The grid does not consider aggregated information and total items from other pages. To get additional details (aggregated information and total items) from other pages, set the [groupSettings.disablePageWiseAggregates](#) to false.

If remote data is bound to grid dataSource, two requests will be sent when performing grouping action; one for getting the grouped data and another for getting aggregate details and total items count.

Group by format

By default, a column will be grouped by the data or value present for the particular row. To group the numeric or datetime column based on the mentioned format, you have to enable the [enableGroupByFormat](#) property of the corresponding

grid columns.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Sort, ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowGrouping: true,
  groupSettings: { showDropArea: false, columns: ['OrderDate', 'Freight']
},
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'OrderDate', headerText: 'Order Date', format: 'yM',
enableGroupByFormat: true, width: 150 },
    { field: 'Freight', headerText: 'Freight', format: 'C2',
enableGroupByFormat: true, width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

Sort grouped columns in descending order during initial grouping

By default, grouped columns are sorted in ascending order. To sort grouped columns in descending order during initial grouping, you can set the [field](#) and [direction](#) in the `sortSettings.columns` property.

The `CustomerID` column will be sorted in descending order when the grid is initially grouped, as shown in the following example.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowGrouping: true,
  allowSorting: true,
  sortSettings: { columns: [{ field: 'CustomerID', direction: 'Descending'
}] },
  groupSettings: { columns: ['CustomerID'] },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 267
});
grid.appendTo('#Grid');
```

INDEX.HTML

Adding custom text in group caption

You can customize the group caption text by using the [groupSettings.captionTemplate](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    allowGrouping: true,
    groupSettings: { captionTemplate: '#captiontemplate', columns:
    ['EmployeeID'] },
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID' },
        { field: 'CustomerID', headerText: 'Customer ID' },
        { field: 'FirstName', headerText: 'Name', width: 120 },
        { field: 'Title', headerText: 'Title', width: 170 }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Render custom component in group caption

We can render custom components in the group caption by using the [groupSettings.captionTemplate](#) property.

In the below demo, we have rendered the EJ2 [ButtonComponent](#) in the group caption.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Group, ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    dataBound: () => {

```

```

        let groupCations =
document.getElementsByClassName('groupbutton');
        for(var i=0;i<groupCations.length;i++) {
            var button = new ej.buttons.Button({
                isPrimary: true
            });
            button.appendTo(groupCations[i]);
        }
    },
    height: 315,
    allowGrouping: true,
    groupSettings: {columns: ["ShipCountry"], captionTemplate:
"#captiontemplate"},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
        { field: 'CustomerID', headerText: 'Customer Name', width: 150
},
        { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
        { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
},
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ]
    });
grid.appendTo('#Grid');

```

INDEX.HTML

```

Reordering on grouped columns in ##Platform_Name## Grid control

Grid provides an option to interchange the position of the Grouped Columns by dragging and dropping the grouped headercells in the droparea. So, any new column entering into the droparea can also be dropped in any position.

To enable this feature, you have to set the [groupSettings.allowReordering](#) property as **true**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Group, ej.grids.Filter, ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowGrouping: true,
    groupSettings: { columns: ['ShipCity'], allowReordering: true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 240
});
grid.appendTo('#Grid');

```

INDEX.HTML

Lazy load grouping in ##Platform_Name## Grid control

The lazy load grouping allows you to load grouped records to the Grid through the on-demand concept. So, you can use this feature to load a huge amount of grouped data to the Grid without any performance degradation.

When you enable this feature, the Grid will render only the initial level caption rows in the collapsed state at grouping. The child rows of each caption will be fetched from the server and render in the Grid when you expand the caption row. The fetching child records count will be implicitly determined by the content area occupying rows count. So, if the child records exceed the count, then the Grid will request the server again to fetch the next block of child records on scrolling.

The caption row expand/collapse state will be persisted on paging and Grid pages count will be determined based on the caption rows count instead of the child rows.

To enable this feature, you have to set the [groupSettings.enableLazyLoading](#) property as **true**.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.LazyLoadGroup);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowGrouping: true,
  groupSettings: { enableLazyLoading: true, columns: ['ProductName',
'CustomerName'] },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'ProductName', headerText: 'Product Name', width: 160 },
    { field: 'ProductID', headerText: 'Product ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'CustomerName', headerText: 'Customer Name', width: 160 }
  ],
  height: 220
});
grid.appendTo('#Grid');
```

Handling the lazy load grouping at server-side

You can use the [UrlAdaptor](#) of [DataManager](#) when binding the remote data. Along with the default server request, this feature will additionally send the below details to handle the lazy load grouping. In the server end, these details are bound with the [ISLazyLoad](#) and [OnDemandGroupInfo](#) parameters in the [DataManagerRequest](#) model. Please refer to the below table and screenshots.

Property Name | Description

[isLazyLoad](#) | To differentiate the default grouping and lazy load grouping

[onDemandGroupInfo](#) | Have the details of expanded caption row grouping [level](#), [skip](#), [take](#) and [filter](#) query of the child records

```

.....if (dm.IsLazyLoad)
.....{
.....    dm.IsLazyLoad = true;
.....    groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy load grouping
.....    if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
.....    {
.....        count = groupedData.Cast<Customers>().Count();
.....    }
.....    else
.....    {
.....        count = groupedData.Cast<Group>().Count();
.....    }
.....    groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip : dm.OnDemandGroupInfo.Skip);
.....    groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take : dm.OnDemandGroupInfo.Take);
.....    return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count = count }) : Json(DataSource);
.....}

.....if (dm.IsLazyLoad)
.....{
.....    groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy load grouping
.....    if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
.....    {
.....        dm.OnDemandGroupInfo = (Syncfusion.EJ2.Base.OnDemandGroupInfo)
.....        {
.....            Level: 1,
.....            Skip: 0,
.....            Take: 33,
.....            Where: Count = 1
.....        };
.....        count = groupedData.Cast<Customers>().Count();
.....    }
.....    else
.....    {
.....        count = groupedData.Cast<Group>().Count();
.....    }
.....    groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip : dm.OnDemandGroupInfo.Skip);
.....    groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take : dm.OnDemandGroupInfo.Take);
.....    return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count = count }) : Json(DataSource);
.....}

```

The following code example describes the lazy load grouping handled at the server-side with other grid actions.

```
`ts
```

```

public IActionResult UrlDatasource([FromBody] DataManagerRequest dm)
{
    IEnumerable groupedData = null;
    IEnumerable<Customers> DataSource = customers;
    DataOperations operation = new DataOperations();
    if (dm.Search != null && dm.Search.Count > 0)
    {
        DataSource = operation.PerformSearching(DataSource, dm.Search); //Search
    }
    if (dm.Sorted != null && dm.Sorted.Count > 0) //Sorting
    {
        DataSource = operation.PerformSorting(DataSource, dm.Sorted);
    }
    if (dm.Where != null && dm.Where.Count > 0) //Filtering
    {
        DataSource = operation.PerformFiltering(DataSource, dm.Where, dm.Where[0].Operator);
    }
    int count = DataSource.Cast<Customers>().Count();
    if (dm.IsLazyLoad == false && dm.Skip != 0)
    {

```

```

DataSource = operation.PerformSkip(DataSource, dm.Skip); // Paging
}
if (dm.IsLazyLoad == false && dm.Take != 0)
{
    DataSource = operation.PerformTake(DataSource, dm.Take);
}
if (dm.IsLazyLoad)
{
    groupedData = operation.PerformGrouping<Customers>(DataSource, dm); // Lazy load grouping
    if (dm.OnDemandGroupInfo != null && dm.Group.Count() == dm.OnDemandGroupInfo.Level)
    {
        count = groupedData.Cast<Customers>().Count();
    }
    else
    {
        count = groupedData.Cast<Group>().Count();
    }
    groupedData = operation.PerformSkip(groupedData, dm.OnDemandGroupInfo == null ? dm.Skip :
    dm.OnDemandGroupInfo.Skip);
    groupedData = operation.PerformTake(groupedData, dm.OnDemandGroupInfo == null ? dm.Take :
    dm.OnDemandGroupInfo.Take);
}
return dm.RequiresCounts ? Json(new { result = groupedData == null ? DataSource : groupedData, count
= count }) : Json(DataSource);
}
`

```

Lazy load grouping with infinite scrolling

Infinite scrolling loads a huge amount of data without degrading the Grid's performance. By default, infinite scrolling is enabled only for the expanded grouped rows when lazy loading is enabled. Now, the Grid has an option to allow infinite scrolling for group caption rows. This is achieved by setting the [enableInfiniteScrolling](#) property as true when lazy loading is enabled in the grouped records.

This is demonstrated in the following sample:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.LazyLoadGroup,
ej.grids.InfiniteScroll);
var grid = new ej.grids.Grid({
    dataSource: data,

```

```

enableInfiniteScrolling: true,
allowGrouping: true,
groupSettings: { enableLazyLoading: true, columns: ['ProductName',
'CustomerName'] },
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'ProductName', headerText: 'Product Name', width: 160 },
    { field: 'ProductID', headerText: 'Product ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'CustomerName', headerText: 'Customer Name', width: 160 }
],
height: 220
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

type="text/javascript"></script>
<script src="es5-datasource.js" type="text/javascript"></script>

```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The Grid also supports the lazy load grouping with [virtualization](#)(virtual scrolling).

Limitations for lazy load grouping

- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited due to the browser capability.
- DataManager's `UrlAdaptor` and `JsonAdaptor` only have the built-in lazy load grouping support.
- Lazy load grouping is not compatible with batch editing, row template etc.
- Programmatic selection is not supported.

Filtering

Filtering in ##Platform_Name## Grid control

Filtering allows you to view particular records based on filter criteria. To enable filtering in the Grid, set the [allowFiltering](#) to true. Filtering options can be configured through [filterSettings](#).

To use filter, inject the [Filter](#) module in the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<script src="index.js" type="text/javascript"></script>
</body></html>

```

* You can apply and clear filtering by using [filterByColumn](#) and [clearFiltering](#) methods.

* To disable filtering for a particular column, set [columns.allowFiltering](#) to false.

Initial filter

To apply the filter at initial rendering, set the filter [predicate](#) object in [filterSettings.columns](#).

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: {
    columns: [{ field: 'ShipCity', matchCase: false, operator:
'startswith', predicate: 'and', value: 'reims' },
    { field: 'ShipName', matchCase: false, operator: 'startswith',
predicate: 'and', value: 'Vins et alcools Chevalier' }]
  },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 273
});
grid.appendTo('#Grid');

```

}
</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Filter operators

The filter operator for a column can be defined in the [filterSettings.columns.operator](#) property.

The available operators and its supported data types are:

Operator | Description | Supported Types

a*b | Everything that starts with "a" and ends with "b".

a* | Everything that starts with "a".

*b | Everything that ends with "b".

a | Everything that has an "a" in it.

ab* | Everything that has an "a" in it, followed by anything, followed by a "b", followed by anything.

Search			Columns	
Order ID		Shipped Date		Ship Country
10250		7/12/1996		Brazil
10251		7/15/1996		France
10252		7/11/1996		Belgium
10253		7/16/1996		Brazil
10254		7/23/1996		Switzerland
10255		7/15/1996		Switzerland
10256		7/17/1996		Brazil
10257		7/22/1996		Venezuela
10258		7/23/1996		Austria

LIKE filtering

The **LIKE** filter can process single search patterns using the "%" symbol, retrieving values matching the specified patterns. The following Grid features support LIKE filtering on string-type columns:

- Filter Menu
- Filter Bar with the [filterSettings.showFilterBarOperator](#) property enabled on the Grid [filterSettings](#).

- Custom Filter of Excel filter type.

For example:

Operator | Description

%ab% | Returns all the value that are contains "ab" character.

ab% | Returns all the value that are ends with "ab" character.

%ab | Returns all the value that are starts with "ab" character.

Order ID	Shipped Date	Ship Country
10250	7/12/1996	Brazil
10251	7/15/1996	France
10252	7/11/1996	Belgium
10253	7/16/1996	Brazil
10254	7/23/1996	Switzerland
10255	7/15/1996	Switzerland
10256	7/17/1996	Brazil
10257	7/22/1996	Venezuela
10258	7/23/1996	Austria

By default, the [filterSettings.columns.operator](#) value is **equal**.

Diacritics filter

By default, grid ignores diacritic characters while filtering. To include diacritic characters, set the [filterSettings.ignoreAccent](#) as **true**.

In the following sample, type **aero** in **Name** column to filter diacritic characters.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: { ignoreAccent: true },
```

```

        columns: [
            { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 140 },
            { field: 'Name', headerText: 'Name', width: 170 },
            { field: 'ShipName', headerText: 'Ship Name', width: 170 },
            { field: 'CustomerID', headerText: 'Supplier Name', width: 140 }
        ],
        allowPaging: true,
    });
    grid.appendTo('#Grid');

```

INDEX.HTML

```

Filter bar in ##Platform_Name## Grid control

By setting the [allowFiltering](#) to true, the filter bar row will render next to the header, which allows you to filter data. You can filter the records with different expressions depending upon the column type.

Filter bar expressions:

You can enter the following filter expressions (operators) manually in the filter bar.

Expression	Example	Description	Column Type
------------	---------	-------------	-------------

=	=value	equal	Number
---	--------	-------	--------

!=	!=value	notequal	Number
----	---------	----------	--------

>	>value	greaterthan	Number
---	--------	-------------	--------

<	<value	lessthan	Number
---	--------	----------	--------

=	>=value	greaterthanorequal	Number
---	---------	--------------------	--------

<=	<=value	lessthanorequal	Number
----	---------	-----------------	--------

/	/value	startswith	String
---	--------	------------	--------

%	%value	endswith	String
---	--------	----------	--------

N/A	N/A	Equal	operator will always be used for date filter. Date
-----	-----	-------	---

N/A	N/A	Equal	operator will always be used for Boolean filter. Boolean
-----	-----	-------	---

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    height: 273
});
grid.appendTo('#Grid');

Filter bar template with custom component

The [filterBarTemplate](#) is used to add custom components to a particular column, and does the following functions:

- **create**: Creates custom components.
- **write**: Wires events for custom components.

In the following sample, the dropdown is used as a custom component in the EmployeeID column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var gridObj = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        {
            field: 'EmployeeID', filterBarTemplate: {
                create: function(args){
                    var dd = document.createElement('input');
                    dd.id = 'EmployeeID';
                    return dd;
                },
                write: function(args){
                    var DropDownListObj = new ej.dropdowns.DropDownList({
                        dataSource: ['All', '1', '3', '4', '5', '6', '8', '9'],
                        fields: { text: 'EmployeeID', value: 'EmployeeID' },

```

```

                placeholder: 'Select a value',
                popupHeight: '200px',
                change: function(e) {
                    var gridObj =
(document.getElementsByClassName('e-grid')[0]).ej2_instances[0];
                    if (e.value == 'All') {

gridObj.removeFilteredColsByField('EmployeeID');
                        } else {

gridObj.filterByColumn('EmployeeID', 'equal', parseInt(e.value));
                        }
                    }
                })
                DropDownListObj.appendTo('#EmployeeID');
            },
            textAlign: 'Right', width: 100
        },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ]
});
gridObj.appendTo('#Grid');

```

```

Change default filterbar operator

You can change the filter operator as per the requirement by defining the **filter** property in Grid columns.

In this below demo, we have applied the filter operator **contains** for CustomerID column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowFiltering: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, filter: { operator: "contains" },
headerText: 'Customer ID', type: 'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 220
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Filter menu in ##Platform_Name## Grid control

You can enable filter menu by setting the [filterSettings.type](#) as **Menu**. The filter menu UI will be rendered based on its column type, which allows you to filter data. You can filter the records with different operators.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: { type: 'Menu' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 273
});
grid.appendTo('#Grid');
```

INDEX.HTML

</body></html>

```

* [allowFiltering](#) must be set as true to enable filter menu.

* Setting [columns.allowFiltering](#) as false will prevent filter menu rendering for a particular column.

Custom component in filter menu

The [column.filter.ui](#) is used to add custom filter components to a particular column.

To implement custom filter ui, define the following functions:

- **create**: Creates custom component.
- **write**: Wire events for custom component.
- **read**: Read the filter value from custom component.

In the following sample, dropdown is used as custom component in the OrderID column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: {type: 'Menu'},
  height: 273,
  columns: [
    {
      field: 'OrderID', headerText: 'Order ID', width: 120,
      textAlign: 'Right', filter: {
        ui: {
          create: function(args){
            var db = new ej.data.DataManager(data);
            var flValInput = new
ej.base.createElement('input', { className: 'flm-input' });
            args.target.appendChild(flValInput);
            this.dropInstance = new
ej.dropdowns.DropDownList({
              dataSource: new ej.data.DataManager(data),
              fields: { text: 'OrderID', value: 'OrderID'
},
              placeholder: 'Select a value',
              popupHeight: '200px'
            });
            this.dropInstance.appendTo(flValInput);
          },
          write: function(args){
            this.dropInstance.value = args.filteredValue;
          },
          read: function(args) {
            args.fltrObj.filterByColumn(args.column.field,
args.operator, this.dropInstance.value);
          }
        }
      }
    },
    { field: 'CustomerID', headerText: 'Customer Name', width: 150
},
    { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
    { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
}
  ]
});
grid.appendTo('#Grid');

```

Customizing filter menu operators list

You can customize the default filter operator list by defining the [filterSettings.operators](#) property.

The available options are:

- **stringOperator** - Defines the customized string operator list.
- **numberOperator** - Defines the customized number operator list.
- **dateOperator** - Defines the customized date operator list.
- **booleanOperator** - Defines the customized Boolean operator list.

The following sample illustrates customizing the string filter operators.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    filterSettings: {type: 'Menu',
        operators: {
            stringOperator: [
                { value: 'startsWith', text: 'starts with' },
                { value: 'endsWith', text: 'ends with' },
                { value: 'contains', text: 'contains' }],
        }
    },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    height: 273
});
grid.appendTo('#Grid');

```

```

Enable different filter for a column

You can use both **Menu** and **CheckBox** filter in a same Grid. To do so, set the [column.filter.type](#) as **Menu** or **CheckBox**.

In the following sample menu filter is enabled by default and checkbox filter is enabled for the CustomerID column using the [column.filter.type](#).

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: { type: 'Menu' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 ,
filter: { type : 'CheckBox' } },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
  height: 273
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

```

Filter by multiple keywords using filter menu

By default, the filtering action is performed based on the single keyword filter value from the built-in component of the filter menu dialog. Now data grid has an option to perform filtering actions based on multiple keywords instead of a single keyword alone. For this, set [filterSettings.type](#) as `Menu`.

In the following sample, filtering action with multiple keywords can be done by rendering the `MultiSelect` component as custom component in the OrderID column filter menu dialog.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowFiltering: true,
  filterSettings: { type: 'Menu' },
  columns: [
    {
      field: 'OrderID',
      headerText: 'Order ID',
      width: 120,
      textAlign: 'Right',
      filter: {
        ui: {
          create: function (args) {
            var dp = new ej.data.DataManager(data);
            var input = new ej.base.createElement('input', {
              className: 'flm-input',
            });
            args.target.appendChild(input);
            dropInstance = new ej.dropdowns.MultiSelect({
              dataSource: new ej.data.DataManager(data),
              fields: { text: 'OrderID', value: 'OrderID' },
              placeholder: 'Select a value',
              popupHeight: '200px',
              allowFiltering: true,
              mode: 'CheckBox',
            });
            dropInstance.appendTo(input);
          },
          write: function (args) {
            var grid = document.getElementById('Grid').ej2_instances[0];
            var filteredValue = [];
            grid.filterSettings.columns.map((item) => {
              if (item.field === 'OrderID' && item.value) {
                filteredValue.push(item.value);
              }
            });
            if (filteredValue.length > 0) {
              dropInstance.value = filteredValue;
            }
          },
          read: function (args) {
            var grid = document.getElementById('Grid').ej2_instances[0];
            grid.removeFilteredColsByField(args.column.field);
            args.fltrObj.filterByColumn(
              args.column.field,
              'contains',
              dropInstance.value
            );
          },
        },
      },
    },
    { field: 'CustomerID', headerText: 'Customer Name', width: 150 },
  ],
});

```

```

        {
            field: 'OrderDate',
            headerText: 'Order Date',
            width: 130,
            format: { type: 'dateTime', format: 'M/d/y hh:mm a' },
            textAlign: 'Right',
        },
        { field: 'Freight', width: 110, format: 'C2', textAlign: 'Right' },
    ],
    pageSettings: { pageCount: 5 },
});
grid.appendTo('#Grid');

```

Add current selection to filter checkbox

By default, the CheckBox filter can only filter the selected items. If filtering is done multiple times on the same column, the previously filtered values in the column will be cleared. Now, it is possible to retain those previous values by using the **Add current selection to filter** checkbox. This checkbox is displayed when data is searched in the search bar of the CheckBox filter.

The following image describes the above mentioned behavior.

Order ID	Customer Name	Order Date	Freight
10248		4/1996 10:10 AM	\$32.38
10249		5/1996 12:20 PM	\$11.61

Excel like filter in ##Platform_Name## Grid control

You can enable Excel like filter by defining. [filterSettings.type](#) as Excel. The excel menu contains an option such as Sorting, Clear filter, Sub menu for advanced filtering.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Filter);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowFiltering: true,
  filterSettings: { type: 'Excel' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCity', headerText: 'Ship City', width: 100 },
    { field: 'ShipName', headerText: 'Ship Name', width: 100 }
  ],
});
```

```

        height: 273
    });
    grid.appendTo('#Grid');

```

        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* By default, while opening the excel/checkbox filter in the Grid, the filter dialog will get and display the distinct data from the first 1000 records bound to the Grid to optimize performance. The remaining records will be returned as a result of the search option of the filter dialog.

* However, we can increase the excel/checkbox filter count by modifying the `filterChoiceCount` argument value(as per our need) in the `actionBegin` event when the `requestType` is `filterchoicerequest` or `filtersearchbegin`. This is demonstrated in the below code snippet,

```

`ts
function actionBegin(args: FilterSearchBeginEventArgs) {
if (args.requestType === "filterchoicerequest" || args.requestType === "filtersearchbegin") {
args.filterChoiceCount = 3000;
}
}
`

```

Render checkbox list data in on-demand for excel/checkbox filtering

The Excel/Checkbox filter type of Grid has a restriction where only the first 1000 unique sorted items are accessible to view in the filter dialog checkbox list content by scrolling. This limitation is in place to avoid any rendering delays when opening the filter dialog. However, the searching and filtering processes consider all unique items in that particular column.

The Excel/Checkbox filter in the Grid provides an option to load large data sets on-demand during scrolling to improve scrolling limitation functionality. This is achieved by setting the `filterSettings.enableInfiniteScrolling` property to **true**. This feature proves especially beneficial for managing extensive datasets, enhancing data loading performance in the checkbox list, and allowing interactive checkbox selection with persistence for the selection based on filtering criteria.

The Excel/Checkbox filter retrieves distinct data in ascending order, governed by its `filterSettings.itemsCount` property, with a default value of **50**. As the checkbox list data scroller reaches

its end, the next dataset is fetched and displayed, with the notable advantage that this process only requests new checkbox list data without redundantly fetching the existing loaded dataset.

Customize the items count for initial rendering

Based on the items count value, the Excel/Checkbox filter gets unique data and displayed in Excel/Checkbox filter content dialog. You can customize the count of on-demand data rendering for Excel/Checkbox filter by adjusting the [filterSettings.itemsCount](#) property. The default value is **50**

```
`ts
```

```
grid.filterSettings = { enableInfiniteScrolling = true, itemsCount = 40 };
```

```
,
```

It is recommended to keep the itemsCount below **300**. Higher values will result in unwanted whitespace because of DOM maintenance performance degradation.

Customize the loading animation effect

A loading effect is presented to signify that loading is in progress when the checkbox list data scroller reaches the end, and there is a delay in receiving the data response from the server. The loading effect during on-demand data retrieval for Excel/Checkbox filter can be customized using the [filterSettings.loadingIndicator](#) property. The default value is **Shimmer**.

```
`ts
```

```
grid.filterSettings = { enableInfiniteScrolling = true, loadingIndicator = 'Spinner' };
```

```
,
```

In the provided example, On-Demand Excel filter has been enabled for the ##Platform_Name## Grid

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Filter, ej.grids.Page, ej.grids.Selection,
ej.grids.Sort);
var urlapi = new ej.data.DataManager({
  url: 'https://services.syncfusion.com/js/production/api/UrlDataSource',
  adaptor: new ej.data.UrlAdaptor()
});
var grid = new ej.grids.Grid({
  dataSource: urlapi,
  query: new ej.data.Query().addParams('dataCount', '10000'),
  allowPaging: true,
  allowFiltering: true,
  allowSorting: true,
  filterSettings: { type: 'Excel', enableInfiniteScrolling: true,
itemsCount: 40, loadingIndicator: 'Spinner' },
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', isPrimaryKey:
true, width: '120' },
    { field: 'Employees', headerText: 'Employee Name', width: '150' },
    { field: 'Designation', headerText: 'Designation', width: '130' },

Searching in ##Platform_Name## Grid control

You can search records in a Grid, by using the [search](#) method with search key as a parameter. This also provides an option to integrate search text box in grid's toolbar by adding [search](#) item to the [toolbar](#).

To search records, inject the [Search](#) module in the grid.

The clear icon is shown in the Data Grid search text box when it is focused on search text or after typing the single character in the search text box. A single click of the clear icon clears the text in the search box as well as the search results in the Data Grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Search'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 150, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 272
});
grid.appendTo('#Grid');
```

Initial search

To apply search at initial rendering, set the fields, operator, key, and ignoreCase in the [searchSettings](#).

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Search'],

```

```

searchSettings: { fields: ['CustomerID'], operator: 'contains', key:
'Ha', ignoreCase: true },
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
],
height: 272
});
grid.appendTo('#Grid');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, grid searches all the bound column values. To customize this behavior define the [searchSettings.fields](#) property.

Search operators

The search operator can be defined in the [searchSettings.operator](#) property to configure specific searching.

The following operators are supported in searching:

Operator | Description

startsWith | Checks whether a value begins with the specified value.

endsWith | Checks whether a value ends with the specified value.

contains | Checks whether a value contains the specified value.

equal | Checks whether a value is equal to the specified value.

notEqual | Checks for values not equal to the specified value.

By default, the [searchSettings.operator](#) value is `contains`.

Search by external button

To search grid records from an external button, invoke the [search](#) method.

INDEX.JS

```
var grid = new ej.grids.Grid({
```

```

        dataSource: data,
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        height: 260
    });
    grid.appendTo('#Grid');
    var searchBtn= new ej.buttons.Button();
    searchBtn.appendTo('#search');
    document.getElementById('search').addEventListener('click', function() {
        var searchText = document.getElementsByClassName('searchtext')[0].value;
        grid.search(searchText);
    });

```

```

Search specific columns

By default, grid searches all visible columns. You can search specific columns by defining the specific column's field names in the [searchSettings.fields](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    searchSettings: { fields: ['CustomerID', 'ShipCity', 'ShipName'] },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCity', headerText: 'Ship City', width: 100 },
        { field: 'ShipName', headerText: 'Ship Name', width: 100 }
    ],
    toolbar: ['Search'],
    height: 270
});
grid.appendTo('#Grid');

```

Search on each key stroke

You can search the Grid data on each key stroke by binding the `keyup` event for the search input element inside the `created` event. Inside the `keyup` handler you can search the Grid by invoking the `search` method of the Grid component.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Search'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 272,
    created: () => {
        document.getElementById(grid.element.id +
"_searchbar").addEventListener('keyup', () => {
            grid.search(event.target.value)
        });
    }
});
grid.appendTo('#Grid');

```

Perform search operation in Grid using multiple keywords

You can perform a searching operation in the Grid using multiple keywords. This can be achieved by the [actionBegin](#) event of the Grid. In the following sample, we have performed the searching with multiple keywords by using the query property of grid when the requestType is searching in the [actionBegin](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var values;
var key = '';
var refresh = false;
var removeQuery = false;
var valueAssign = false;
var grid = new ej.grids.Grid({

```

```

        dataSource: data,
        toolbar: ['Search'],
        columns: [
            {
                field: 'OrderID', headerText: 'Order ID', textAlign:
'Center', width: 120,
            },
            {
                field: 'CustomerID', headerText: 'Customer ID', textAlign:
'Center', width: 150,
            },
            {
                field: 'ShipCity', headerText: 'Ship City', textAlign:
'Center', width: 150,
            },
            {
                field: 'ShipName', headerText: 'Ship Name', textAlign:
'Center', width: 150,
            },
        ],
        searchSettings: {
            fields: ['CustomerID', 'OrderID', 'ShipCity', 'ShipName'],
            key: '',
        },
        height: 272,
        actionBegin: (args) => {
            if (args.requestType == 'searching') {
                const keys = args.searchString.split(',');
                var flag = true;
                var predicate;
                if (keys.length > 1) {
                    if (grid.searchSettings.key !== '') {
                        values = args.searchString;
                        keys.forEach((key) => {
                            grid.getColumns().forEach((col) => {
                                if (flag) {
                                    predicate = new
ej.data.Predicate(col.field, 'contains', key, true);
                                    flag = false;
                                }
                                else {
                                    var predic = new
ej.data.Predicate(col.field, 'contains', key, true);
                                    predicate = predicate.or(predic);
                                }
                            });
                        });
                    }
                    grid.query = new ej.data.Query().where(predicate);
                    grid.searchSettings.key = '';
                    refresh = true;
                    valueAssign = true;
                    removeQuery = true;
                    grid.refresh();
                }
            }
        },
    },

```

```

    actionComplete: (args) => {
        if (args.requestType === 'refresh' && valueAssign) {
            document.getElementById(grid.element.id + '_searchbar').value =
values;
            valueAssign = false;
        }
        else if (
            document.getElementById(grid.element.id + '_searchbar').value
=== '' &&
            args.requestType === 'refresh' &&
            removeQuery
        )
        {
            grid.query = new ej.data.Query();
            removeQuery = false;
            grid.refresh();
        }
    },
});
grid.appendTo('#Grid');

```

```

* Search operation can be performed in foreign key column based on following way.

* When a value is searched on a grid with the foreign key column, a filter query is sent to the foreign key data source, and the appropriate column is filtered depending on the search value. The search query will be sent to the grid data source, and the value of the associated field will be returned.

Paging in ##Platform_Name## Grid control

Paging provides an option to display Grid data in page segments. To enable paging, set the [allowPaging](#) to true. When paging is enabled, pager component renders at the bottom of the grid. Paging options can be configured through the [pageSettings](#).

In the below sample, `pageSize` is calculated based on the grid height by using the `load` event.

To use paging, inject the [Page](#) module in the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],

```

```

height: 325,
load: () => {
    var rowHeight = grid.getRowHeight(); //height of the each row
    var gridHeight = grid.height;
    var pageSize = grid.pageSettings.pageSize; //initial page size
    var pageResize = (gridHeight - (pageSize * rowHeight)) / rowHeight;
    //new page size is obtained here
    grid.pageSettings.pageSize = pageSize + Math.round(pageResize);
}
});
grid.appendTo('#Grid');

```

```

You can achieve better performance by using grid paging to fetch only a pre-defined number of records from the data source.

Template

You can use custom elements inside the pager instead of default elements. The custom elements can be defined by using the [template](#) property. Inside this template, you can access the [CurrentPage](#), [pageSize](#), [pageCount](#), [totalPage](#) and [totalRecordCount](#) values.

INDEX.JS

```

var updateTemplate = function() {
    this.numeric = new ej.inputs.NumericTextBox({
        min: 1,
        max: 3,
        step: 1,
        format: '###.##',
        change: (args) => {
            var value = args.value;
            grid.goToPage(value);
        }
    });
    this.numeric.appendTo('#currentPage');
};
var flag = true;
ej.grids.Grid.Inject(ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,

```

```

columns: [
    { field: 'OrderID', headerText: 'Order ID', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
],
pageSettings: { template: '#template', pageSize: 7 },
dataBound: function() {
    if (flag) {
        flag = false;
        updateTemplate();
    }
},
actionComplete: (args) => {
    if (args.requestType === 'paging') {
        updateTemplate();
    }
}
});
grid.appendTo('#Grid');

```

INDEX.HTML

Pager with Page Size Dropdown

The pager Dropdown allows you to change the number of records in the Grid dynamically. It can be enabled by defining the `pageSettings.pageSize` property as true.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  pageSettings: { pageSize: true, pageSize: 8 },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

How to render Pager at the Top of the Grid

By default, Pager will be rendered at the bottom of the Grid. You can also render the Pager at the top of the Grid by using the `dataBound` event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Toolbar);
var initialGridLoad = true;
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    pageSettings: { pageSizes: true, pageSize: 8 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});
grid.appendTo('#Grid');
grid.dataBound = () =>{
    if (initialGridLoad) {
        initialGridLoad = false;
        var pager = document.getElementsByClassName('e-gridpager');
        var topElement;
        if (grid.allowGrouping || grid.toolbar) {
            topElement = grid.allowGrouping ?
document.getElementsByClassName('e-groupdroparea') :
document.getElementsByClassName('e-toolbar');
        } else {
            topElement = document.getElementsByClassName('e-gridheader');
        }
        grid.element.insertBefore(pager[0], topElement[0]);
    }
};

```

INDEX.HTML

```

```

During the paging action, the pager component triggers the below three events.

- * The **created** event triggers when Pager is created.
- * The **click** event triggers when the numeric items in the pager is clicked.
- * The **dropDownChanged** event triggers when pageSize DropDownList value is selected.

- [Group with Paging](#)

Scrolling in ##Platform_Name## Grid control

The scrollbar will be displayed in the grid when content exceeds the element [width](#) or [height](#). The vertical and horizontal scrollbars will be displayed based on the following criteria:

- The vertical scrollbar appears when the total height of rows present in the grid exceeds its element height.
- The horizontal scrollbar appears when the sum of columns width exceeds the grid element width.
- The [height](#) and [width](#) are used to set the grid height and width, respectively.

The default value for [height](#) and [width](#) is **auto**.

Set width and height

To specify the [width](#) and [height](#) of the scroller in the pixel, set the pixel value to a number.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    height: 315,
    width: 400,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },

```

```

        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

```

Responsive with parent container

Specify the [width](#) and [height](#) as **100%** to make the grid element fill its parent container.

Setting the [height](#) to **100%** requires the grid parent element to have explicit height.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group, ej.grids.Sort,
ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign:
'Right', width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer
ID', type: 'string' },

</body></html>

```

Sticky Header

You can make the Grid column headers remain fixed while scrolling by using the [enableStickyHeader](#) property.

In the below demo, the Grid headers will be sticky while scrolling the Grid's parent div element.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  enableStickyHeader: true,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ]
});
grid.appendTo('#Grid');
```

INDEX.HTML

```

</body></html>

```

Scroll to selected row

You can scroll the grid content to the selected row position by using the [rowSelected](#) event.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    height: '270',
    width: '100%',
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    rowSelected: rowSelected
});
grid.appendTo('#Grid');
var numeric = new ej.inputs.NumericTextBox({
    width: 200,
    min: 0,
    showSpinButton: false,
    format: 'N',
    placeholder: 'Enter index to select a row',
    change: onchange
}, '#numeric');
function onchange() {
    grid.selectionModule.selectRow(parseInt(numeric.getText(), 10));
}
function rowSelected(args) {
    var rowHeight =
grid.getRows()[grid.getSelectedRowIndex()[0]].scrollHeight;

```

```
grid.getContent().children[0].scrollTop = rowHeight *
grid.getSelectedRowIndexes()[0];
}
```

INDEX.HTML

```

Hide the scrollbar when the content is not overflown

You can hide the scrollbar of Grid content by using the [hideScroll](#) method when the content doesn't overflow its parent element.

In the following sample, we have invoked the [hideScroll](#) method inside the [dataBound](#) event.

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data.slice(0, 5),
  height: '315',
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  dataBound: () => {
    grid.hideScroll();
  }
});
grid.appendTo('#Grid');

```

INDEX.HTML

Frozen in ##Platform_Name## Grid control

Frozen rows and columns provides an option to make rows and columns always visible in the top and left side of the grid while scrolling.

In this demo, the [frozenColumns](#) is set as '2' and the [frozenRows](#) is set as '3'. Hence, the left two columns and top three rows are frozen.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Freeze);
var grid = new ej.grids.Grid({
    dataSource: data,
    height: 315,
    allowSelection: false,
    enableHover: false,
    frozenRows: 3,
    frozenColumns: 2,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },

```

```

        { field: 'ShipName', headerText: 'Ship Name', width: 150 },
        { field: 'ShipAddress', headerText: 'Ship Address', width: 170 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipRegion', headerText: 'Ship Region', width: 150 },
        { field: 'ShipPostalCode', headerText: 'Ship Postal Code', width:
150 },
        { field: 'Freight', headerText: 'Freight', width: 120 }
    ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

* Frozen rows and columns should not be set outside the grid view port.

* Frozen Grid will support row and column virtualization feature, which helps to improve the Grid performance while loading a large dataset.

Limitations of Frozen Grid

The following features are not supported in frozen rows and columns:

- Detail Template
- Hierarchy Grid

Freeze particular columns

You can use [isFrozen](#) property to freeze selected columns in grid.

In this demo, the columns with field name `OrderID` and `EmployeeID` is frozen using the `isFrozen` property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Freeze);
var grid = new ej.grids.Grid({
  dataSource: data,
  height: 315,
  allowSelection: false,
  enableHover: false,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, isFrozen: true },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, isFrozen: true },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipAddress', headerText: 'Ship Address', width: 170 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
    { field: 'ShipRegion', headerText: 'Ship Region', width: 150 },
    { field: 'ShipPostalCode', headerText: 'Ship Postal Code', width:
150 },
    { field: 'Freight', headerText: 'Freight', width: 120 }
  ]
});

```

```
grid.appendTo('#Grid');
```

INDEX.HTML

```

```
</body></html>
```

* [isFrozen](#) is not compatible with the Freeze direction feature.

Freeze Direction

You can freeze the Grid columns on the left or right side by using the [column.freeze](#) property and the remaining columns will be movable. The grid will automatically move the columns to the left or right position based on the [column.freeze](#) value.

Types of the [column.freeze](#) directions:

- **Left:** Allows you to freeze the columns at the left.
- **Right:** Allows you to freeze the columns at the right.
- **Fixed:** Allows you to lock the column at a fixed position by ensuring its visibility during horizontal scroll.

In this demo, the **ShipCountry** column is frozen at the left and the **CustomerID** column is frozen at the right side of the content table.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Freeze);
var grid = new ej.grids.Grid({
  dataSource: data,
  height: 315,
  enableHover: false,
  frozenRows: 2,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'Freight', headerText: 'Freight', format: 'C2', width: 120
},
    { field: 'CustomerID', headerText: 'Customer ID', width: 150,
freeze: 'Right' },
    { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipAddress', headerText: 'Ship Address', width: 170 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150,
freeze: 'Left' }
  ]
});
grid.appendTo('#Grid');
```

</body></html>

```

* Freeze Direction is not compatible with the [isFrozen](#) and [frozenColumns](#) properties.

Deprecated Methods

Deprecated Methods | [Previous](#) | [Current](#) | [Suggested Alternative Methods](#) | [Example for achieving the same results](#)

getMovableRows() | In the previous architecture of frozen grid, three separate tables were created for the left, right, and movable contents. When calling this method, it would return only the movable table

rows (tr's). | In the current architecture, the frozen left, right, and movable sections are applied within a single table. When calling this method, it will return all table rows (tr's) of the entire table. However, in this approach, we have introduced the `e-unfreeze` class for movable cells. This allows us to selectively retrieve the movable rows using the `e-unfreeze` class selector. | `getRows()` | `gridInstance.getMovableRows()[0].querySelectorAll('.e-unfreeze')` // Deprecated

 (or)

 `gridInstance.getRows()[0].querySelectorAll('.e-unfreeze')` // Alternative method

`getFrozenRightRows()` | In the previous architecture, this method would return only the table rows (tr's) from the freeze right table. | In the current architecture, the frozen left, right, and movable sections are applied within a single table. When calling this method, it will return all the rows (tr's) of the entire table. In this new approach, we have introduced the `e-rightfreeze` class for right freeze cells. As a result, you can now selectively retrieve the right freeze rows using the `e-rightfreeze` class selector. | `getRows()` | `gridInstance.getFrozenRightRows()[0].querySelectorAll('.e-rightfreeze')` // Deprecated

 (or)

 `gridInstance.getRows()[0].querySelectorAll('.e-rightfreeze')` // Alternative method

`getMovableRowByIndex()`
 `getFrozenRowByIndex()`
 `getFrozenRightRowByIndex()` | In the previous architecture, you could select rows by using separate methods for each table section. Like,
 `getMovableRowByIndex` - select a movable row
 `getFrozenRowByIndex` - select a freeze row
 `getFrozenRightRowByIndex` - select a right freeze row. | In the current architecture, the `getMovableRowByIndex`, `getFrozenRightRowByIndex` and `getFrozenRowByIndex` methods all return the same table row (tr) based on the given index. Additionally, class names for table cells (td's) have been separated as follows:
 Left-Freeze : `e-leftfreeze`
 Movable : `e-unfreeze`
 Right-Freeze : `e-rightfreeze`.
This separation of class names makes it easier to target and customize the cells within the particular row. | `getRowByIndex()` | **To get the left freeze cells:**
 `gridInstance.getRowByIndex(1).querySelectorAll('.e-leftfreeze')`

 To get the movable cells:
 `gridInstance.getRowByIndex(1).querySelectorAll('.e-unfreeze')`

 To get the right freeze cells:
 `gridInstance.getRowByIndex(1).querySelectorAll('.e-rightfreeze')`

`getMovableCellFromIndex()`
 `getFrozenRightCellFromIndex()` | `getMovableCellFromIndex()` - select a particular cell in the movable table.
 `getFrozenRightCellFromIndex()` - select a particular cell in the right freeze table. | In the new approach, you can select a particular cell by using both the `getFrozenRightCellFromIndex` and `getMovableCellFromIndex` methods. | `getCellFromIndex()` | `gridInstance.getCellFromIndex(1,1)`

`getMovableDataRows()`
 `getFrozenRightDataRows()`
 `getFrozenDataRows()` | These methods returns the viewport data rows for the freeze, movable, and right tables separately. | In the new approach, when calling the `getMovableDataRows`, `getFrozenRightDataRows`, and `getFrozenDataRows` methods, returns the entire viewport data rows. You can then select specific cells within these rows using the following selectors
 Left-Freeze : `e-leftfreeze`
 Movable : `e-unfreeze`
 * Right-Freeze : `e-rightfreeze`. | `getDataRows()` | **To get the movable data cells:**
 `gridInstance.getDataRows()[0].querySelectorAll('.e-unfreeze')`

 To get the right freeze data cells:
 `gridInstance.getDataRows()[0].querySelectorAll('.e-rightfreeze')`

 To get the left freeze data cells:
 `gridInstance.getDataRows()[0].querySelectorAll('.e-leftfreeze')`

`getMovableColumnHeaderByIndex()`
 `getFrozenRightColumnHeaderByIndex()`
 `getFrozenLeftColumnHeaderByIndex()` | In the previous architecture, these methods selects the movable, right freeze, and left freeze headers from the table separately. | In the new approach, when calling the `getMovableColumnHeaderByIndex`, `getFrozenRightColumnHeaderByIndex`, and

`getFrozenLeftColumnHeaderByIndex` methods, you will still receive the same results as before. | `getColumnHeaderByIndex()` | `gridInstance.getColumnHeaderByIndex(1)`

When a validation message is displayed in the frozen part (Left, Right, Fixed) of the table, scrolling is prevented until the validation message is cleared.

Virtual scroll in ##Platform_Name## Grid control

Grid allows you to load large amount of data without performance degradation.

To use virtualization, you need to inject `VirtualScroll` module in grid.

Row Virtualization

Row virtualization allows you to load and render rows only in the content viewport. It is an alternative way of paging in which the data will be loaded while scrolling vertically. To setup the row virtualization, you need to define [enableVirtualization](#) as true and content height by [height](#) property.

The number of records displayed in the Grid is determined implicitly by height of the content area. Also, you have an option to define a visible number of records by the [pageSettings.pageSize](#) property. The loaded data will be cached and reused when it is needed for next time.

INDEX.JS

```
var names = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica', 'Rachel', 'Phoebe',
'Gunter', 'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong',
'Perk', 'Green', 'Ken', 'Adams'];

Column Virtualization

Column virtualization allows you to virtualize columns. It will render columns which are in the viewport. You can scroll horizontally to view more columns.

To setup the column virtualization, set the

[enableVirtualization](#) and

[enableColumnVirtualization](#) properties as `true`.

INDEX.JS

Column's [width](#) is required for column virtualization. If column's width is not defined then Grid will consider its value as **200px**.

Virtualization with Grouping

Both the row and column virtualization can be used along with grouping. At initial rendering, the virtual height of scrollbar will be set based on the total number of records and after grouping, it will be refreshed based on the grouped state(expand/collapse). While collapse the group caption row in current viewport then the next view page grouped records are shown.

The collapsed/expanded state will persist only for local dataSource while scrolling.

Limitations for virtual scrolling

- While using column virtual scrolling, column width should be in the pixel. Percentage values are not accepted.
- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited by the browser capability.
- The cell selection is not supported for both row and column virtual scrolling.
- Virtual scrolling is not compatible with batch editing, detail template, rowspan, colspan and hierarchy features.
- Group expand and collapse state will not be persisted.
- Since data is virtualized in grid, the aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the

[Group with Page](#) topic.

- The page size provided must be two times larger than the number of visible rows in the grid. If the page size is failed to meet this condition then the size will be determined by grid.
- The height of the grid content is calculated using the row height and total number of records in the data source and hence features which changes row height such as text wrapping are not supported. If you want to increase the row height to accommodate the content then you can specify the row height as below to ensure all the table rows are in same height.

```

.e-grid .e-row {
height: 2em;
}

```

- Programmatic selection using the [selectRows](#) method is not supported in virtual scrolling.

Browser height limitation in virtual scrolling and solution

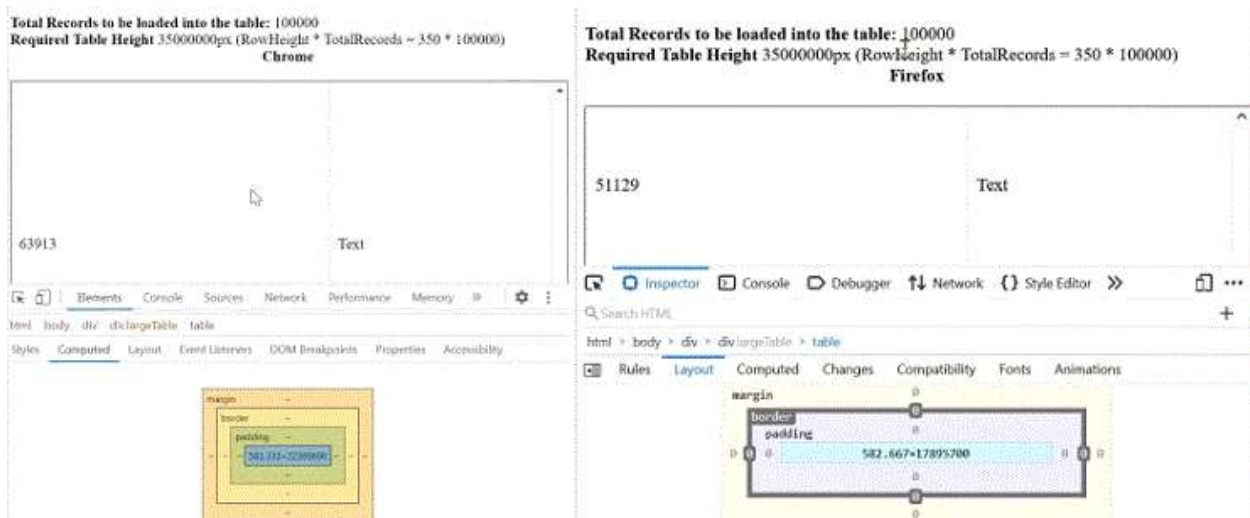

You can load millions of records in the Grid by using virtual scrolling, where the grid loads and renders rows on-demand while scrolling vertically. As a result, Grid lightens the browser's load by minimizing the DOM elements and rendering elements visible in the viewport. The height of the grid is calculated using the Total Records Count * [Row Height](#) property.

The browser has some maximum pixel height limitations for the scroll bar element. The content placed above the maximum height can't be scrolled if the element height is greater than the browser's maximum height limit. The browser height limit affects the virtual scrolling of the grid. When a large number of records are bound to the Grid, it can only display the records until the maximum height limit of the browser. Once the browser's height limit is reached while scrolling, the user won't be able to scroll further to view the remaining records.

For example, if the row height is set as 30px and the total record count is 1000000(1 million), then the height of the grid element will be 30,000,000 pixels. In this case, the browser's maximum height limit for a div is about 22,369,600 (The maximum pixel height limitation differs for different browsers). The records above the maximum height limit of the browser can't be scrolled.

This height limitation is not related to the Grid component. It fully depends on the default behavior of the browser. The same issue is reproduced in the normal HTML table too.

The following image illustrates the height limitation issue of a normal HTML table in different browsers (Chrome and Firefox).

Grid component also faced the same issue as mentioned in the below image.

The Grid has an option to overcome this limitation of the browser in the following ways.

Solution 1: Using external buttons

You can prevent the height limitation problem in the browser when scrolling through millions of records by loading the segment of data through different strategy.

In the following sample, Grid is rendered with a large number of records(nearly 2 million). Here, you can scroll 0.5 million records at a time in Grid. Once you reach the last page of 0.5 million records, the **Load Next Set** button will be shown at the bottom of the Grid. By clicking that button, you can view the next set of 0.5 million records in Grid. Also, the **Load Previous Set** button will be shown at the top of the Grid to load the previous set of 0.5 million records.

Let's see the step by step procedure for how we can overcome the limitation in the Syncfusion Grid component.

1. Create a custom adaptor by extending UrlAdaptor and binding it to the grid DataSource property. In the processQuery method of the custom adaptor, we handled the Skip query based on the current page set to perform the data operation with whole records on the server.

```
`ts
```

```
class CustomUrlAdaptor extends UrlAdaptor {
  processQuery(args) {
    if (arguments[1].queries) {
      for (var i = 0; i < arguments[1].queries.length; i++) {
        if (arguments[1].queries[i].fn === 'onPage') {
          // pageSet - defines the number of segments that we are going to split the 2million records. In this
          // example we have considered 0.5 million records for each set so the pageSet is 1, 2, 3 and 4.
          // maxRecordsPerPageSet – In this example we define the value as 0.5 million.
          // gridPageSize – the pageSize that we have defined in the Grid pageSettings->pageSize property
          // customize the pageIndex based on the current pageSet (It send the skip query including the previous
          // pageSet ) so that the other operations performed for total 2millions records instead of 0.5 million alone.
```

```

arguments[1].queries[i].e.pageIndex = (((pageSet - 1) * maxRecordsPerPageSet) / gridPageSize) +
arguments[1].queries[i].e.pageIndex;
}
}
}
let original = super.processQuery.apply(this, arguments);
return original;
}
}
let data: DataManager = new DataManager({
adaptor: new CustomUrlAdaptor,
url: "Home/UrlDatasource"
});
、

```

2. Render the grid by define the following features.

```

`ts
let grid: Grid = new Grid({
dataSource: data,
enableVirtualization: true,
pageSettings: {pageSize: 50},
height: 360,
beforeDataBound: beforeDataBound,
columns: [
{ field: 'OrderID', width: 120, headerText: 'Order ID', textAlign: 'Right' }
.....
.....
]
});
、

```

3. In the beforeDataBound event, we set the args.count as 0.5 million to perform scrolling with 0.5 million records and all the data operations are performed with whole records which is handled using the custom adaptor. And also particular segment records count is less than 0.5 million means it will directly assigned the original segmented count instead of 0.5 million.

```
`ts
beforeDataBound(args) {
// storing the total records count which means 2 million records count
totalRecords = args.count;
// change the count with respect to maxRecordsPerPageSet (maxRecordsPerPageSet = 500000)
args.count = args.count - ((pageSet - 1) maxRecordsPerPageSet) > maxRecordsPerPageSet
?maxRecordsPerPageSet : args.count - ((pageSet - 1) maxRecordsPerPageSet);
}
`
```

4. Render “Load Next Set” button and “Load Previous Set” button at bottom and top of the grid component.

```
`ts
let button: Button = new Button({
cssClass: 'e-info prevbtn',
onClick: prevBtnClick,
content: 'Load Previous Set...'
});
let grid: Grid = new Grid({
dataSource: data,
enableVirtualization: true,
pageSettings: {pageSize: 50},
height: 360,
beforeDataBound: beforeDataBound,
columns: [
{ field: 'OrderID', width: 120, headerText: 'Order ID', textAlign: 'Right' }
.....
.....
]
});
let button: Button = new Button({
cssClass: 'e-info nextbtn',
onClick: nextBtnClick,
content: 'Load Next Set...'
});
```

```
});  
`
```

5. While click on the **Load Next Set / Load Previous Set** button corresponding page data set is loaded to view remaining records of total 2 millions records after doing some simple calculation.

```
`ts
```

```
// Triggered when clicking the Previous/ Next button.
```

```
prevNxtBtnClick(args) {
```

```
if (grid.element.querySelector('.e-content') && grid.element.querySelector('.e-content').getAttribute('aria-busy') === 'false') {
```

```
// Increase/decrease the pageSet based on the target element.
```

```
pageSet = args.target.classList.contains('prevbtn') ? --pageSet : ++pageSet;
```

```
this.rerenderGrid(); // Re-render the Grid component.
```

```
}
```

```
}
```

```
`
```

You can view the hosted link for this sample [here](#).

LOAD PREVIOUS SET...				
Order ID	Customer ID	Freight	Country	Status
1	Alfki	\$12.30	📍Denmark	Active
2	Anatr	\$3.30	📍Brazil	Inactive
3	Anton	\$4.30	📍Germany	Active
4	Blomp	\$5.30	📍Austria	Inactive
5	Bolid	\$6.30	📍Switzerland	Active
6	Hanar	\$12.30	📍France	Active
7	Thomas	\$3.30	📍Itali	Inactive
8	Jack	\$4.30	📍Austria	Active
9	Alfki	\$5.30	📍USA	Inactive
10	Hanar	\$6.30	📍Belgium	Active
11	Alfki	\$3.30	📍Denmark	Active

| LOAD NEXT SET... | | | | |

If you perform grid actions such as filtering, sorting, etc., after scrolling through the 0.5 million data, the Grid performs those data actions with the whole records, not just the current loaded 0.5 million data.

Solution 2: Using RowHeight property

You can reduce the [row height](#) using the [rowHeight](#) property of the Grid. It will reduce the overall height to accommodate more rows. But this approach optimizes the limitation, but if the height limit is reached after reducing row height also, you have to opt for the previous solution or use paging.

In the following image, you can see how many records will be scrollable when setting rowHeight to "36px" and "30px".

The image displays two screenshots of a Grid control. The top screenshot shows a grid with 8 rows and 5 columns: Order ID, Customer ID, Weight, Country, and Status. The rows are numbered 1 to 8, and the status is either 'Active' or 'Inactive'. The bottom screenshot shows a similar grid but with 10 rows, including additional data for Order IDs 9 and 10. Both grids have a 'RowHeight' property set to 36px and 30px respectively.

Order ID	Customer ID	Weight	Country	Status
1	Alfo	\$12.50	Denmark	Active
2	Amir	\$3.30	Brazil	Inactive
3	Anton	\$4.50	Germany	Active
4	Bomp	\$5.30	Austria	Inactive
5	Bold	\$6.30	Switzerland	Active
6	Hansr	\$12.30	France	Active
7	Thomas	\$3.30	Italy	Inactive
8	Jack	\$4.30	Austria	Active
9	Alfo	\$8.30	USA	Inactive
10	Hansr	\$6.30	Belgium	Active

Solution 3: Using paging instead of virtual scrolling

Similar to virtual scrolling, the [paging](#) feature also loads the data in an on-demand concept. Pagination is also compatible with all the other features (Grouping, Editing, etc.) in Grid. So, use the paging feature instead of virtual scrolling to view a large number of records in the Grid without any kind of performance degradation or browser height limitation.

Infinite scroll in ##Platform_Name## Grid control

Infinite scrolling is used to load a huge amount of data without degrading the Grid performance. This feature works like the lazy loading concept, which means the buffer data is loaded only when the scrollbar reaches the end of the scroller.

To enable Infinite scrolling, set `enableInfiniteScrolling` property as true.

* In this feature, Grid will not make a new data request when you visit the same page again.

INDEX.JS

```
var names = ['TOM', 'Hawk', 'Jon', 'Chandler', 'Monica', 'Rachel', 'Phoebe', 'Gunter', 'Ross', 'Geller', 'Joey', 'Bing', 'Tribbiani', 'Janice', 'Bong', 'Perk', 'Green', 'Ken', 'Adams'];

```

InitialBlocks

You can define the initial loading pages count by using `infiniteScrollSettings.initialBlocks` property. By default, this feature loads three pages in initial rendering.

In the below demo, we have changed this property value to load five page records instead of three.

INDEX.JS

```

```

Cache Mode

Cache is used to store the loaded rows object in the Grid instance which can be reused for creating the row elements whenever you scroll to already visited page. Also, this mode maintains row elements based on the `infiniteScrollSettings.maxBlocks` count value, once this limit exceeds then it will remove row elements from DOM for new rows.

To enable the cache mode in Infinite scrolling, set `infiniteScrollSettings.enableCache` property as true.

INDEX.JS

```

```

Limitations for Infinite Scrolling

- Due to the element height limitation in browsers, the maximum number of records loaded by the grid is limited due to the browser capability.
- Initial loading rows total height must be greater than the viewport height.
- Cell selection will not be persisted in cache mode.
- Infinite scrolling is not compatible with batch editing, detail template and hierarchy features.
- The group records cannot be collapsed in cache mode.
- The aggregated information and total group items are displayed based on the current view items. To get these information regardless of the view items, refer to the

[Group with Page](#) topic.

- Programmatic selection using the [selectRows](#) and [selectRow](#) method is not supported in infinite scrolling.

Selection

Selection in ##Platform_Name## Grid control

Selection provides an option to highlight a row or a cell or a column. It can be done through simple mouse down or arrow keys. To disable selection in the Grid, set the [allowSelection](#) to false.

The grid supports two types of selection that can be set by using the [selectionSettings.type](#). They are:

- **Single:** The **Single** value is set by default, and it only allows selection of a single row or a cell or a column.
- **Multiple:** Allows you to select multiple rows or cells or columns.

To perform the multi-selection, press and hold CTRL key and click the desired rows or cells or columns. To select range of rows or cells or columns, press and hold the SHIFT key and click the rows or cells or columns.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  selectionSettings: { type: 'Multiple' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

INDEX.HTML

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Selection mode

The grid supports three types of selection mode that can be set by using

the [selectionSettings.mode](#). They are:

- **Row:** The **Row** value is set by default, and allows you to select only rows.
- **Cell:** Allows you to select only cells.
- **Both:** Allows you to select rows and cells at the same time.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  selectionSettings: { mode: 'Both' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

Touch interaction

When you tap a grid row on touchscreen device, the tapped row is selected. It also shows a popup

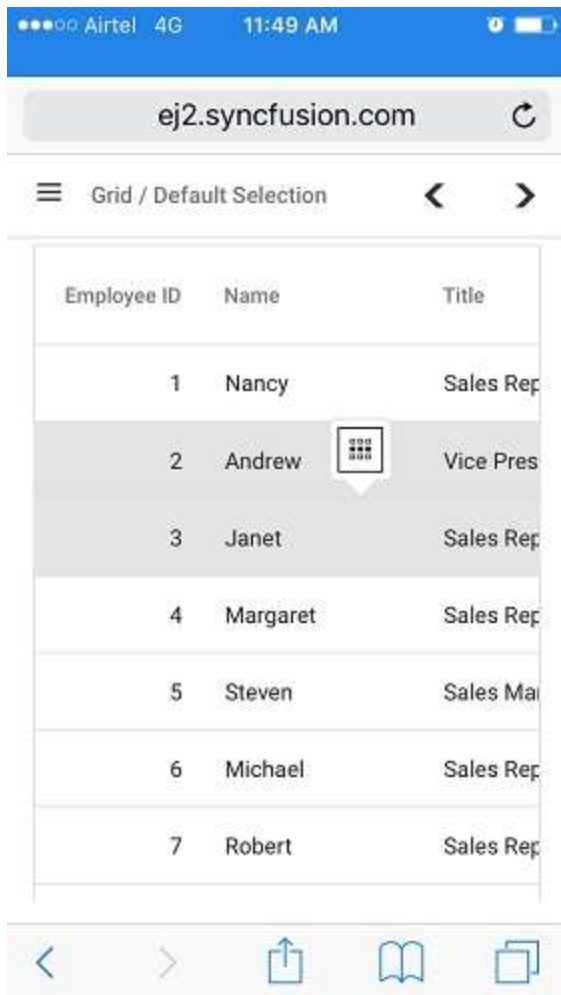

for multi-row selection. To select multiple rows or cells, tap the popup and then tap the desired rows or cells.

Multi-selection requires the selection [type](#) to be **multiple**.

The following screenshot represents a grid touch selection in the device.

Row selection in `##Platform_Name##` Grid control

Select row at initial rendering

To select a row at initial rendering, set the [selectedRowIndex](#) value.

INDEX.JS

```
var grid= new ej.grids.Grid({
  dataSource: data,
  selectionSettings: { type: 'Multiple', mode: 'Both' },
  selectedRowIndex: 1,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

Get selected row indexes

You can get the selected row indexes by using the [getSelectedRowIndexes](#) method.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    selectionSettings: {type: 'Multiple'},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 315,
    rowSelected: rowSelected
});
grid.appendTo('#Grid');
function rowSelected(args) {
    var selectedrowindex = grid.getSelectedRowIndexes(); // get the
selected row indexes.
    alert(selectedrowindex); // to alert the selected row indexes.
    var selectedrecords = grid.getSelectedRecords(); // get the selected
records.
}

```

INDEX.HTML

Simple multiple row selection

You can select multiple rows by clicking on rows one by one. This will not deselect the previously selected rows. To deselect the previously selected row, you can click on the selected row. You can enable this behavior by using [selectionSettings.enableSimpleMultiRowSelection](#) property.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: sdata,
    allowSelection: true,
    selectionSettings: {type: 'Multiple', enableSimpleMultiRowSelection:
true},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ]
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

Toggle selection

The Toggle selection allows to perform selection and unselection of the particular row or cell or column. To enable toggle selection, set [enableToggle](#) property of the selectionSettings as true. If you click on the selected row or cell or column then it will be unselected and vice versa.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    selectionSettings: {enableToggle: true},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

</body></html>

```

* If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

Clear selection programmatically

You can clear the Grid selection programmatically by using the [clearSelection](#) method.

In the demo below, we initially selected the third row using [selectedRowIndex](#). You can clear this selection by calling the [clearSelection](#) method in the button click event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Selection);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowSelection: true,
  allowPaging: true,
  selectionSettings: { type: 'Multiple' },
  selectedRowIndex: 2,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 130 },
    { field: 'Freight', headerText: 'Freight', format: 'C2', width: 100
}
  ],
  pageSettings: { pageSizes: true, pageSize: 5 }
});
grid.appendTo('#Grid');
var btn = new ej.buttons.Button({ cssClass: 'e-flat' }, '#show');
document.getElementById('show').onclick = () => {
  grid.clearSelection();
}

```

INDEX.HTML

```

Get selected records on various pages

Enabling the [selectionSettings.persistSelection](#) property will persist the selection in all Grid operations.

So the selection will be maintained on every page even after navigating to another page.

You can get the selected records using the [getSelectedRecords](#) method.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Selection);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowSelection: true,
    allowPaging: true,
    selectionSettings: { type: 'Multiple', persistSelection: true },
    columns: [
        { type: 'checkbox', width: 50 },
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
isPrimaryKey: true, width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 130 },
        { field: 'Freight', headerText: 'Freight', format: 'C2', width: 100
    }
    ],
    pageSettings: { pageSizes: true, pageSize: 5 }
});
grid.appendTo('#Grid');
var btn = new ej.buttons.Button({ cssClass: 'e-flat' }, '#show');
document.getElementById('show').onclick = () => {
    var selectedrecords = grid.getSelectedRecords();
    var selectedRecordsCount = selectedrecords.length;
    alert(selectedRecordsCount);
}

```

</body></html>

```

* To persist the grid selection, it is necessary to define any one of the columns as a primary key using the [columns.isPrimaryKey](#) property.

Cell selection in ##Platform_Name## Grid control

Cell selection can be done through simple mouse down or arrow keys (up, down, left, and right).

The grid supports two types of cell selection mode that can be set by using the [selectionSettings.cellSelectionMode](#). They are:

- **Flow:** The **Flow** value is set by default. The range of cells are selected between the start index and end index that includes in between cells of rows.
- **Box:** Range of cells are selected from the start and end column indexes that includes in between cells of rows within the range.

INDEX.JS

```

var grid = new ej.grids.Grid({
  dataSource: data,
  selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple', mode:
'Cell' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');

```

```

Cell selection requires the [selectionSettings.mode](#) to be **Cell** or **Both**, and [type](#) should be **Multiple**.

Toggle selection

The Toggle selection allows to perform selection and unselection of the particular row or cell or column. To enable toggle selection, set [enableToggle](#) property of the selectionSettings as true. If you click on the selected row or cell or column then it will be unselected and vice versa.

INDEX.JS

```
var grid = new ej.grids.Grid({
    dataSource: data,
    selectionSettings: {enableToggle: true},
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },

* If multi selection is enabled, then first click on any selected row (without pressing Ctrl key), it will clear the multi selection and in second click on the same row, it will be unselected.

Column selection in ##Platform_Name## Grid control

Column selection can be done through simple mouse down or arrow keys.

You can enable column selection by setting the [selectionSettings.allowColumnSelection](#) property as true.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  selectionSettings: { allowColumnSelection: true, type: 'Multiple' },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

Check box selection in ##Platform_Name## Grid control

Checkbox selection provides an option to select multiple grid records with help of checkbox in each row.

To render the checkbox in each grid row, you need to use checkbox column with type as `checkbox` using the column `type` property.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { type: 'checkbox' },
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

* By default, selection is allowed by clicking a grid row or checkbox in that row. To allow selection only through checkbox, you can set the

[selectionSettings.checkboxOnly](#) property to true.

* Selection can be persisted in all the operations using the [selectionSettings.persistSelection](#) property. For persisting selection on the grid, any one of the columns should be defined as a primary key using the [columns.isPrimaryKey](#) property.

Checkbox selection mode

In checkbox selection, selection can also be done by clicking on rows. This selection provides two types of Checkbox Selection mode which can be set by using the following API,

[selectionSettings.checkboxMode](#). The modes are;

- **Default:** This is the default value of the checkboxMode. In this mode, user can select multiple rows by clicking rows one by one.
- **ResetOnRowClick:** In ResetOnRowClick mode, when user clicks on a row it will reset previously selected row. Also you can perform multiple-selection in this mode by press

and hold CTRL key and click the desired rows. To select range of rows, press and hold the SHIFT key and click the rows.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  selectionSettings: {checkboxMode: 'ResetOnRowClick'},
  columns: [
    { type: 'checkbox', width: 50 },
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'ShipCountry', width: 140, headerText: 'Ship Country',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 315
});
grid.appendTo('#Grid');
```

Prevent specific rows from being selected in checkbox selection

You can prevent specific rows from being selected in the checkbox selection mode by hiding the checkboxes using the [rowDataBound](#) event. You achieve this by setting the [isSelectable](#) argument as false in the [rowDataBound](#) event based on certain conditions as per the needs of the application.

In the following sample, the selection of specific rows has been prevented based on the [isSelectable](#) argument in the [rowDataBound](#) event.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    selectionSettings: { persistSelection: true },
    allowFiltering: true,
    filterSettings: { type: 'CheckBox' },
    pageSettings: { pageSize: 20 },
    editSettings: {
        allowEditing: true,
        allowAdding: true,
        allowDeleting: true,
        mode: 'Normal',
    },
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel', 'Search'],
    height: 400,
    columns: [
        { type: 'checkbox', width: 120 },
        { field: 'List', headerText: 'List', width: 120 },
        { field: 'OrderID', isPrimaryKey: true, headerText: 'Order ID',
width: 150 },
        { field: 'CustomerID', headerText: 'CustomerID', width: 150 },
        { field: 'EmployeeID', headerText: 'Employee ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 }
    ]
});
grid.appendTo('#Grid');
grid.rowDataBound = function(args) {
    args.isSelectable = args.data.List % 5 === 0;
}
for (var i = 0; i < data.length; i++) {
    data[i]['List'] = i + 1;
}

```

Aggregates

Aggregates in ##Platform_Name## Grid control

Aggregate values are displayed in the footer, group footer, or group caption of the Grid. It can be configured through `aggregates` property.

[Field](#) and [type](#) are the minimum properties required to represent an aggregate column.

To use the aggregate feature, you have to inject the `Aggregate` module.

By default, the aggregate value can be displayed in the footer, group, and caption cells. To show the aggregate value in one of the cells, use the [footerTemplate](#), [groupFooterTemplate](#), or [groupCaptionTemplate](#) property.

Built-in aggregate types

The aggregate type should be specified in the [type](#) property to configure an aggregate column.

The built-in aggregates are,

- Sum
- Average
- Min
- Max
- Count
- Truecount
- Falsecount

* Multiple aggregates can be used for an aggregate column by setting the [type](#) property with an array of aggregate types.

* Multiple types for a column is supported only when one of the aggregate templates is used.

Footer aggregate in ##Platform_Name## Grid control

Footer aggregate value is calculated for all the rows, and it is displayed in the footer cells. Use the [footerTemplate](#) property to render the aggregate value in footer cells.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Aggregate);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
```

```

    { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd' },
    { field: 'Freight', headerText: 'Freight', width: 150, format: 'C2'
},
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
],
height: 290,
aggregates: [{
    columns: [{
        type: 'Sum',
        field: 'Freight',
        format: 'C2',
        footerTemplate: 'Sum: ${Sum}'
    }]
},
{
    columns: [{
        type: 'Max',
        field: 'Freight',
        format: 'C2',
        footerTemplate: 'Max: ${Max}'
    }]
}]
});
grid.appendTo('#Grid');

```

```

The aggregate values must be accessed inside the template using their corresponding [type](#) name.

How to format aggregate value

You can format the aggregate value result by using the [format](#) property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Aggregate);
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd' },
        { field: 'Freight', headerText: 'Freight', width: 150, format: 'C2'
},
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 290,
    aggregates: [{
        columns: [{

```

```

        type: 'Sum',
        field: 'Freight',
        format: 'C2',
        footerTemplate: 'Sum: ${Sum}'
    ]
},
{
    columns: [{
        type: 'Max',
        field: 'Freight',
        format: 'C2',
        footerTemplate: 'Max: ${Max}'
    }]
}]
});
grid.appendTo('#Grid');

```

How to place aggregates on top of the Grid

By default, the aggregated values are placed at the bottom of the footer section. It is possible to place the aggregated values at the top of the header. This is achieved by using the [dataBound](#) event, [getHeaderContent](#), and [getFooterContent](#) methods of the Grid.

In the following sample, the footer element is appended to the header element using the [getHeaderContent](#) and [getFooterContent](#) methods in the [dataBound](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Aggregate);
var grid = new ej.grids.Grid({
    dataSource: data,
    dataBound: dataBound,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 120, format:
'yMd' },
        { field: 'Freight', headerText: 'Freight', width: 150, format: 'C2'
},
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 290,
    aggregates: [{
        columns: [{
            type: 'Sum',
            field: 'Freight',
            format: 'C2',
            footerTemplate: 'Sum: ${Sum}'
        }]
    }]

```

```

    },
    {
        columns: [{
            type: 'Max',
            field: 'Freight',
            format: 'C2',
            footerTemplate: 'Max: ${Max}'
        }]
    }]
});
grid.appendTo('#Grid');
function dataBound() {
    grid.getHeaderContent().append(grid.getFooterContent());
}

```

```

The aggregate values must be accessed inside the template using their corresponding [type](#) name.

Custom aggregate in ##Platform_Name## Grid control

To calculate the aggregate value with your own aggregate functions, use the custom aggregate option. To use custom aggregation, specify the [type](#) as **Custom**, and provide the custom aggregate function in the [customAggregate](#) property.

The custom aggregate function will be invoked with different arguments for total and group aggregations.

- **Total aggregation:** The custom aggregate function will be called with the whole data and current [AggregateColumn](#)

object.

- **Group aggregation:** This will be called with the current group details and [AggregateColumn](#) object.

INDEX.JS

```

var customAggregateFn = function(data, aggColumn){
    return data.result.filter(function(item) {
        return item[aggColumn.columnName] === 'Brazil';
    }).length;
}
var grid = new ej.grids.Grid({
    dataSource: data,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'Freight', headerText: 'Freight', width: 150, format: 'C2'
},
        { field: 'ShipCountry', headerText: 'Ship Name', width: 150 }
    ],
    height: 268,
    aggregates: [{

```

```

        columns: [{
            type: 'Custom',
            customAggregate: customAggregateFn,
            columnName: 'ShipCountry',
            footerTemplate: 'Brazil Count: ${Custom}'
        }]
    });
    grid.appendTo('#Grid');

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To access the custom aggregate value inside the template, use the key as **Custom**.

Show the count of distinct values in aggregate row

You can calculate the aggregate value with your own aggregate functions. To use custom aggregation, specify the **type** as **Custom**, and provide the custom aggregate function in the [customAggregate](#) property.

In this below demo, we have show the count of distinct value for **ShipCountry** column by using custom aggregate.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Aggregate);
var customAggregateFn = function() {
    let results = new ej.data.DataManager(this.currentViewData).executeLocal(new
    ej.data.Query().select(['ShipCountry']));
    let distinct = new ej.data.DataUtil.distinct(results, 'ShipCountry', true);
    return distinct.length;
}
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
        width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
        'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
        width: 120, format: 'C2' },
        { field: "ShipCountry", headerText: "Ship Country", width: 150 }
    ],
    height: 220,
    aggregates: [{
        columns: [{
            type: 'Custom',
            customAggregate: customAggregateFn,
            columnName: 'ShipCountry',
            footerTemplate: 'Distinct Count: ${Custom}'
        }]
    }]
}

```

```

    ]]
  });
  grid.appendTo('#Grid');

```

Reactive aggregate in ##Platform_Name## Grid control

Auto update aggregate value in batch editing

When using batch editing, the aggregate values will be refreshed on every cell save. The footer, group footer, and group caption aggregate values will be refreshed.

Adding a new record to the grouped grid will not refresh the aggregate values.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Toolbar, ej.grids.Edit,
ej.grids.Group, ej.grids.Aggregate);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  pageSettings: { pageSize: 6 },
  toolbar: ['Delete', 'Update', 'Cancel'],
  editSettings: { allowEditing: true, allowDeleting: true, mode: 'Batch'
},
  allowGrouping: true,
  groupSettings: { showDropArea: false, columns: ['ShipCountry'] },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true,
textAlign: 'Right', width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'Freight', headerText: 'Freight', width: 150, format: 'C2'
},
    { field: 'ShipCountry', headerText: 'Ship Name', width: 150 }
  ],

Refresh aggregate values in inline editing

By default, reactive aggregate update is not supported by inline and dialog edit modes as it is not feasible to anticipate the value change event for every editor. But, you can refresh the aggregates manually in the inline edit mode using the refresh method of aggregate module.

In the following code, the input event for the Freight column editor has been registered and the aggregate value has been refreshed manually.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Toolbar, ej.grids.Edit,
ej.grids.Aggregate);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging:true,
    pageSettings:{pageSize:7},
    toolbar: ['Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowDeleting: true, mode: 'Normal'
},
    actionBegin: function(args){
        if(args.requestType === 'beginEdit'){
            selectedRecord = {};
            selectedRecord = args.rowData;
        };
    },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', isPrimaryKey:true,
textAlign: 'Right', width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'Freight', headerText: 'Freight', editType: 'numericedit',
format: 'C2', edit: { params: { change: funChange } },
width: 150},
        { field: 'ShipCountry', headerText: 'Ship Name', width: 150 }
    ],
    height: 268,
    aggregates: [{
        columns:[{
            type:'Sum',
            field:'Freight',
            format:'C2',
            footerTemplate:'Sum : ${Sum}'
        }]
    }]
}]

```

```

});
grid.appendTo('#Grid');
function funChange(args) {
    let gridObj = document.getElementById('Grid')['ej2_instances'][0];
    selectedRecords['Freight'] = args.value; // Set the edited value to
    aggregate column
    gridObj.aggregateModule.refresh(selectedRecords) // Refresh aggregates
    using edited data
}

```

Print in ##Platform_Name## Grid control

To print the Grid, use the [print](#) method from grid instance. The print option can be displayed on the [toolbar](#) by adding the `print` toolbar item.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Print'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 272
});
grid.appendTo('#Grid');

```

Page setup

Some of the print options cannot be configured through JavaScript code. So, you have to customize the layout, paper size, and margin options using the browser page setup dialog. Please refer to the following links to know more about the browser page setup:

- [Chrome](#)
- [Firefox](#)
- [Safari](#)
- [IE](#)

Print using an external button

To print the grid from an external button, invoke the [print](#) method.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 280
});
grid.appendTo('#Grid');
var printBtn = new ej.buttons.Button();
printBtn.appendTo('#print');
document.getElementById('print').addEventListener('click', function(){
  grid.print();
});
```

```

Print the hierarchy grid

By default, the grid will be print the master and expanded child grids alone. you can change the print option by using the [hierarchyPrintMode](#) property. The available options are,

Mode	Behavior
----- -----	
Expanded	Prints the master grid with expanded child grids.
All	Prints the master grid with all the child grids.
None	Prints the master grid alone.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar);
var grid= new ej.grids.Grid({
    dataSource: employeeData,
    toolbar: ["Print"],
    hierarchyPrintMode: 'All',
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:

```

Print the master detail grid

The Grid has the option to visualize details of a record in another Grid in a master and detailed manner. By default, Grid will print the master grid alone. Instead of this, it is possible to print both the master and detail grids by using the [beforePrint](#) event of the Grid.

In the following sample, the detail grid is added to the `element` argument of the `beforePrint` event, resulting in both the master and detail grids being printed on the page.

INDEX.JS

```

var names = ['AROUT', 'BERGS', 'BLONP', 'CHOPS', 'ERNSH'];
var masterdata = customerData.filter(function(e) {
    return names.indexOf(e.CustomerID) !== -1;
});
var mastergrid = new ej.grids.Grid({
    dataSource: masterdata,
    toolbar: ['Print'],
    selectedRowIndex: 1,
    beforePrint: beforePrint,
    columns: [
        { field: 'ContactName', headerText: 'Customer Name', width: 150 },
        { field: 'CompanyName', headerText: 'Company Name', width: 150 },
        { field: 'Address', headerText: 'Address', width: 150 },
        { field: 'Country', headerText: 'Country', width: 130 },
    ],
    rowSelected: rowSelected,
});
mastergrid.appendTo('#MasterGrid');
function rowSelected(args) {
    let selectedRecord = args.data;
    grid.dataSource = data.filter((record) => record.CustomerName ===
selectedRecord.ContactName).slice(0, 5);
    document.getElementById('key').innerHTML = selectedRecord.ContactName;
}
function beforePrint(args) {
    let customEle = document.createElement('div');
    customEle.innerHTML = document.getElementsByClassName('e-
statustext')[0].innerHTML + grid.element.innerHTML;
    customEle.appendChild(document.createElement('br'));
    args.element.append(customEle);
}
var grid = new ej.grids.Grid({
    allowSelection: false,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 100, textAlign:
'Right' },
        { field: 'Freight', headerText: 'Freight', width: 100, format: 'C2',
type: 'number' },
        { field: 'ShipName', headerText: 'Ship Name', width: 200 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
        { field: 'ShipAddress', headerText: 'Ship Address', width: 200 },
    ],
});

```

```

    ],
  });
  grid.appendTo('#DetailGrid');

```

```

Print large number of columns

By default, the browser uses A4 as page size option to print pages and to adapt the size of the page the browser print preview will auto-hide the overflowed contents. Hence grid with large number of columns will cut off to adapt the print page.

To show large number of columns when printing, adjust the scale option from print option panel based on your content size.

Show or Hide columns while Printing

You can show a hidden column or hide a visible column while printing the grid using [toolbarClick](#) and [printComplete](#) events.

In the `toolbarClick` event, based on `args.item.id` as `grid_print`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `printComplete` event, We have reversed the state back to the previous state.

In the below example, we have `CustomerID` as a hidden column in the grid. While printing, we have changed `CustomerID` to visible column and `ShipCity` as hidden column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar, ej.grids.Page);
var grid= new ej.grids.Grid({

```

```

        dataSource: data,
        allowPaging: true,
        toolbar: ['Print'],
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', visible:
false, width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        pageSettings: { pageSizes: true, pageSize: 6 },
        toolbarClick : function() {
            for (var i = 0; i < this.columns.length; i++) {
                if (this.columns[i].field == "CustomerID") {
                    this.columns[i].visible = true;
                }
                else if (this.columns[i].field == "ShipCity") {
                    this.columns[i].visible = false;
                }
            }
        },
        printComplete : function() {
            for (var i = 0; i < this.columns.length; i++) {
                if (this.columns[i].field == "CustomerID") {
                    this.columns[i].visible = false;
                }
                else if (this.columns[i].field == "ShipCity") {
                    this.columns[i].visible = true;
                }
            }
        }
    });
    grid.appendTo('#Grid');

Limitations of Printing Large Data

When grid contains large number of data, printing all the data at once is not a best option for the browser performance. Because to render all the DOM elements in one page will produce performance issues in the browser. It leads to browser slow down or browser hang. Grid have option to handle large number of data by Virtualization. However while printing, it is not possible to use virtualization for rows and columns.

If printing of all the data is still needed, we suggest to Export the grid to **Excel** or **CSV** or **Pdf** and then print it from another non-web based application.

Adaptive in ##Platform_Name## Grid control

The Grid user interface (UI) was redesigned to provide an optimal viewing experience and improve usability on small screens. This interface will render the filter, sort, column chooser, column

menu(supports only when the `rowRenderingMode` as Horizontal) and edit dialogs adaptively and have an option to render the grid row elements in the vertical direction.

Render adaptive dialogs

When we enable the `enableAdaptiveUI` property, the grid will render the filter, sort, and edit dialogs in full screen for a better user experience. This behavior is demonstrated in the below demo.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Filter, ej.grids.Sort,
ej.grids.Edit, ej.grids.Aggregate, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  enableAdaptiveUI: true,
  allowPaging: true,
  allowSorting: true,
  allowFiltering: true,
  filterSettings: { type: 'Excel' },
  toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel', 'Search'],
  editSettings: { allowAdding: true, allowEditing: true, allowDeleting:
true, mode: 'Dialog' },
  height: '100%',
  load: function() {
    grid.adaptiveDlgTarget = document.getElementsByClassName('e-mobile-
content')[0];
  },
  columns: [
    { field: 'SNO', headerText: 'S NO', isPrimaryKey: true, width: 150,
validationRules: { required: true, number: true } },
    { field: 'Model', headerText: 'Model Name', width: 200, editType:
"dropdownedit", validationRules: { required: true } },
    { field: 'Developer', headerText: 'Developer', filter: { type :
'Menu' }, width: 200, validationRules: { required: true } },
    { field: 'ReleaseDate', headerText: 'Released Date', type: 'date',
editType: "datepickeredit", format: 'yMMM', width: 200 },
    { field: 'AndroidVersion', headerText: 'Android Version', filter: {
type : 'CheckBox' }, width: 200, validationRules: { required: true } }
  ]
});
grid.appendTo('#adaptivebrowser');
```

INDEX.HTML

```

Vertical row rendering

The grid will render the row elements in vertical order while setting the [rowRenderingMode](#) property value as **Vertical**.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Filter, ej.grids.Sort,
ej.grids.Edit, ej.grids.Aggregate, ej.grids.Toolbar);
var grid = new ej.grids.Grid({

```

```

dataSource: data,
enableAdaptiveUI: true,
rowRenderingMode: 'Vertical',
allowPaging: true,
allowSorting: true,
allowFiltering: true,
filterSettings: { type: 'Excel' },
toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel', 'Search'],
editSettings: { allowAdding: true, allowEditing: true, allowDeleting:
true, mode: 'Dialog' },
height: '100%',
load: function() {
    grid.adaptiveDlgTarget = document.getElementsByClassName('e-mobile-
content')[0];
},
columns: [
    { field: 'SNO', headerText: 'S NO', isPrimaryKey: true, width: 150,
validationRules: { required: true, number: true } },
    { field: 'Model', headerText: 'Model Name', width: 200, editType:
"dropdownedit", validationRules: { required: true } },
    { field: 'Developer', headerText: 'Developer', filter: { type :
'Menu' }, width: 200, validationRules: { required: true } },
    { field: 'ReleaseDate', headerText: 'Released Date', type: 'date',
editType: "datepickeredit", format: 'yMMM', width: 200 },
    { field: 'AndroidVersion', headerText: 'Android Version', filter: {
type : 'CheckBox' }, width: 200, validationRules: { required: true } }
],
aggregates: [{
    columns: [{
        type: 'Count',
        field: 'Model',
        footerTemplate: 'Total Models: ${Count}'
    }]
}]
});
grid.appendTo('#verticalrender');

```

* [enableAdaptiveUI](#) property must be enabled for vertical row rendering.

Supported features by vertical row rendering

The following features are only supported in vertical row rendering:

- Paging, including Page size dropdown
- Sorting
- Filtering
- Selection
- Dialog Editing
- Aggregate

- Infinite scroll
- Toolbar - Options like **Add**, **Filter**, **Sort**, **Edit**, **Delete**, **Search**, and **Toolbar template** are available when their respective features are enabled. The toolbar dynamically includes a three-dotted icon, containing additional features like **ColumnChooser**, **Print**, **PdfExport**, **ExcelExport**, or **CsvExport**, once these features are enabled. Please refer to the following snapshot.

Order ID	10248

<div> <div> <div></div> <div></div> <div></div> </div> <div> <div>1 / 6</div> <div></div> <div></div> </div> <div> <div>Items per page</div> <div>5</div> </div> </div>	

The Column Menu feature, which includes grouping, sorting, autofit, filter, and column chooser, is exclusively supported for the Grid in **Horizontal** [rowRenderingMode](#).

Hierarchy grid in ##Platform_Name## Grid control

The Grid allows display of table data in a hierarchical structure to visualize relations between parent and child records. This feature is enabled by defining the [childGrid](#) and [childGrid.queryString](#). The [childGrid](#) describes the options of grid and the [childGrid.queryString](#) describes the relation between parent and child grids.

To use hierarchical binding, inject the [DetailRow](#) module in the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid= new ej.grids.Grid({
  dataSource: employeeData,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
    { field: 'FirstName', headerText: 'First Name', width: 150 },
    { field: 'City', headerText: 'City', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  childGrid: {
```

```

        dataSource: data,
        queryString: 'EmployeeID',

```

* Grid supports n level of child grids.

* Hierarchical binding is not supported when [DetailTemplate](#) is enabled.

ExpandAll by external button

By default, grid renders in collapsed state. You can expand all child grid rows by invoking the [expandAll](#) method, and collapse all grid rows by invoking the [collapseAll](#) through an external button.

INDEX.JS

```

var expandBtn = new ej.buttons.Button();
expandBtn.appendTo('#expandall');
var collapseBtn = new ej.buttons.Button();
collapseBtn.appendTo('#collapseall');
ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
        { field: 'FirstName', headerText: 'First Name', width: 150 },
        { field: 'City', headerText: 'City', width: 150 },
        { field: 'Country', headerText: 'Country', width: 150 }
    ],
    childGrid: {
        dataSource: data,

```

```

        queryString: 'EmployeeID',
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
    },
    height: 265
});
grid.appendTo('#Grid');
document.getElementById('expandall').addEventListener('click', function() {
    grid.detailRowModule.expandAll();
});
document.getElementById('collapseall').addEventListener('click', function()
{
    grid.detailRowModule.collapseAll();
});

```

Bind hierarchy grid with different field

By default, Parent and child grid relation will be maintained by `queryString` property. We should use the same field name to map both parent and child grid. To achieve parent and child relation with different fields, we need to change the mapping value in the child grid `load` event.

In the below sample, we have bound the child and parent grid with different fields. Parent grid field name as `EmployeeID` and the child grid field name as `ID`. We need to define the mapping value of `parentKeyFieldValue` from the parent row data in the child grid `load` event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
        { field: 'FirstName', headerText: 'First Name', width: 150 },
        { field: 'City', headerText: 'City', width: 150 },
        { field: 'Country', headerText: 'Country', width: 150 }
    ],
    childGrid: {
        dataSource: childdata,
        queryString: 'ID',
        columns: [
            { field: 'ID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipCity', headerText: 'Ship City', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
        load: load,
    },
    height: 315
});
grid.appendTo('#Grid');
function load(args) {
    this.parentDetails.parentKeyFieldValue =
this.parentDetails.parentRowData['EmployeeID'];
}

```

Adding Record in ChildGrid

Parent and child grid are related by [queryString](#) field value. To maintain this relation in newly added record, You need to set value for [queryString](#) field in the added data by the [actionBegin](#) event.

In the below demo, **EmployeeID** field relates the parent and child grids. To add a new record in child grid, We have to set the **EmployeeID** field with parent record's [queryString](#) field value in the [actionBegin](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow,ej.grids.Edit,ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
    { field: 'FirstName', headerText: 'First Name', width: 150 },
    { field: 'City', headerText: 'City', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  childGrid: {
    dataSource: data,
    queryString: 'EmployeeID',
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    editSettings: { allowEditing: true, allowAdding: true,
allowDeleting: true },
    columns: [
      { field: 'OrderID', headerText: 'Order ID', isPrimaryKey:true,
textAlign: 'Right', width: 120 },
      { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', allowEditing:false, width: 120 },
      { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
      { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    actionBegin: actionBegin
  }
});
grid.appendTo('#Grid');
function actionBegin(args) {
  if (args.requestType === "add") {
    // `parentKeyFieldValue` refers to the queryString field value of
the parent record.
    args.data.EmployeeID = this.parentDetails.parentKeyFieldValue;
  }
}

```

```
}
```

Dynamically bind data to child grid based on parent row Data

By default, the [childGrid.queryString](#) describes the relationship between parent and child grids and visualizes the data in a hierarchical structure. Instead of the `queryString` property, we can dynamically bind the datasource to the `childGrid` based on the parent row data using the [detailDataBound](#) event of the grid.

While expanding the child Grid, the `detailDataBound` event will be triggered. In this event, based on the EmployeeID column value of parent row data, filter the equally matched data from the `childGrid` datasource using the `DataManager` plugin and bind the filtered data as a datasource to the `childGrid`. This can be demonstrated by the following sample.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow);
var orderData = data;
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign: 'Right', width: 120 },
        { field: 'FirstName', headerText: 'First Name', width: 150 },
        { field: 'City', headerText: 'City', width: 150 },
        { field: 'Country', headerText: 'Country', width: 150 }
    ],
    childGrid: {
        columns: [
            { field: 'OrderID', headerText: 'Order ID', isPrimaryKey: true, textAlign: 'Right', width: 120 },
            { field: 'EmployeeID', headerText: 'Employee ID', textAlign: 'Right', width: 120 },
            { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
            { field: 'ShipName', headerText: 'Ship Name', width: 150 }
        ],
    },
    detailDataBound: function(args){
        var empIdValue =
args.childGrid.parentDetails.parentRowData.EmployeeID;

```

```

var matchedData = new ej.data.DataManager(orderData).executeLocal(
    new ej.data.Query().where('EmployeeID', 'equal', empIdValue,
true)
);
args.childGrid.query = new ej.data.Query();
args.childGrid.dataSource = matchedData;
}
});
grid.appendTo('#Grid');

```

State Persistence

State persistence in ##Platform_Name## Grid control

State persistence refers to the Grid's state maintained in the browser's [localStorage](#) even if the browser is refreshed or if you move to the next page within the browser. State persistence stores grid's model object in the local storage when the [enablePersistence](#) is defined as true.

Restore initial Grid state

When the [enablePersistence](#) property is set to **true**, the Grid will keep its state even if the page is reloaded. In some cases, you may be required to retain the Grid in its initial state. The Grid will not retain its initial state now since the [enablePersistence](#) property has been enabled.

You can achieve this by destroying the grid after disabling the `enablePersistence` property and clearing the local storage data, as shown in the sample below.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    enablePersistence: true,
    allowFiltering: true,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 230

```

```
});
grid.appendTo('#Grid');
document.getElementById('restore').onclick = function () {
    grid.enablePersistence = false;
    window.localStorage.setItem("gridGrid", "");
    grid.destroy();
    //reloads the page
    location.reload();
};
```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Maintaining custom query in a persistent state

The grid does not maintain the query params after page load event when the [enablePersistence](#) is set to true. This is because the grid refreshes its query params for every page load. You can maintain the custom query params by resetting the [addParams](#) method in the [actionBegin](#) event.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    allowFiltering: true,
    allowPaging: true,
    enablePersistence: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    actionBegin: actionHandler,
    height: 270
});
grid.appendTo('#Grid');
function actionHandler(args) {
    this.query.addParams('$filter', 'EmployeeID eq 1');
}

```

```

Add a new column in persisted columns list

The Grid columns can be persisted when the [enablePersistence](#) property is set to true. If you want to add the new columns with the existing persist state, you can use the Grid inbuilt method such as `column.push` and call the [refreshColumns\(\)](#) method for UI changes. Please refer to the following sample for more information.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    enablePersistence: true,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },

```

```

        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 230
});
grid.appendTo('#Grid');
document.getElementById('add').onclick = function () {
    var obj = { field: 'Freight', headerText: 'Freight', width: 120 };
    grid.columns.push(obj);
    grid.refreshColumns();
};

```

INDEX.HTML

```

```

Get or set local storage value in ##Platform_Name## Grid control

If the [enablePersistence](#) property is set to true, the grid property value is saved in the `window.localStorage` for reference. You can get/set the `localStorage` value by using the `getItem/setItem` method in the `window.localStorage`.

```
`ts
```

```
//get the Grid model.
```

```
let value: string = window.localStorage.getItem('gridGrid'); //"gridGrid" is component name +
component id.
```

```
let model: Object = JSON.parse(model);
```

```
,
```

```
`ts
```

```
//set the Grid model.
```

```
window.localStorage.setItem('gridGrid', JSON.stringify(model)); //"gridGrid" is component name +
component id.
```

```
,
```

Prevent to persist in ##Platform_Name## Grid control

Prevent columns from persisting

When the [enablePersistence](#) property is set to true, the Grid properties such as [Grouping](#), [Paging](#), [Filtering](#), [Sorting](#), and [Columns](#) will persist. You can use the `addOnPersist` method to prevent these Grid properties from persisting.

The following example demonstrates how to prevent Grid columns from persisting. In the [dataBound](#) event of the Grid, you can override the `addOnPersist` method and remove the columns from the key list given for persistence.

Note: When the `enablePersistence` property is set to true, the Grid features such as column template, column formatter, header text, and value accessor will not persist.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    enablePersistence: true,
    allowPaging: true,
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 230,
    dataBound: dataBound
});
grid.appendTo('#Grid');
function dataBound(args) {
    var cloned = this.addOnPersist;
    this.addOnPersist = function (key) {
        key = key.filter(function (item) { return item !== "columns"; });
        return cloned.call(this, key);
    };
}
document.getElementById('add').onclick = function () {
    var obj = { field: "Freight", headerText: 'Freight', width: 120 };
    grid.columns.push(obj);
    grid.refreshColumns();
};
document.getElementById('remove').onclick = function () {
    grid.columns.pop();
    grid.refreshColumns();
};

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add to persist in ##Platform_Name## Grid control

Persist the column template, header template and header Text

By default, the Grid properties such as column template, header text, header template, column formatter, and value accessor will not persist when [enablePersistence](#) is set to true. Because the column template and header text can be customized at the application level.

If you wish to restore all these column properties, then you can achieve it by cloning the grid's columns property using JavaScript Object's assign method and storing this along with the persist data manually. While restoring the settings, this column object must be assigned to the grid's columns property to restore the column settings as demonstrated in the following sample.

INDEX.JS

```

var grid = new ej.grids.Grid({
    dataSource: data,
    enablePersistence: true,
    allowFiltering: true,
    allowPaging: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150,
headerTemplate: '#customertemplate' },
        { field: 'ShipCity', headerText: 'Ship City', width: 150 },

Tool Bar

Tool bar in ##Platform_Name## Grid control

The Grid provides ToolBar support to handle grid actions. The [toolbar](#) property accepts either the collection of built-in toolbar items and [ItemModel](#) objects for custom toolbar items or HTML element ID for toolbar template.

To use ToolBar, inject [ToolBar](#) module in the grid.

Enable or disable toolbar items

You can enable/disable toolbar items by using the **enableItems** method.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Group, ej.grids.Sort);
```

```

var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Expand', 'Collapse'],
  allowGrouping: true,
  groupSettings: { columns: ['CustomerID'] },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 220,
  toolbarClick: clickHandler
});
grid.appendTo('#Grid');
var enable = new ej.buttons.Button({}, '#enable');
var disable = new ej.buttons.Button({}, '#disable');
enable.element.onclick = function() {
  grid.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'],
true); // enable toolbar items.
};
disable.element.onclick = function() {
  grid.toolbarModule.enableItems(['Grid_Collapse', 'Grid_Expand'],
false); // disable toolbar items.
};
function clickHandler(args) {
  if (args.item.id === 'Grid_Collapse') { // grid_Collapse is component id
+ '_' + toolbar item name.
    grid.groupModule.collapseAll();
  }
  if (args.item.id === 'Grid_Expand') {
    grid.groupModule.expandAll();
  }
}
}

```

Add toolbar at the bottom of Grid

You can add the Grid toolbar component at the bottom of Grid using the ['created'](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data.slice(0,8),
    toolbar: ['Print', 'Search'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },

```

```

        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 200,
    created: () => {
        let toolbar = grid.element.querySelector('.e-toolbar');
        grid.element.appendChild(toolbar);
    }
});
grid.appendTo('#Grid');

```

Tool bar items in ##Platform_Name## Grid control

Built-in toolbar items

Built-in toolbar items execute standard actions of the grid, and it can be added by defining the [toolbar](#) as a collection of built-in items. It renders the button with icon and text.

The following table shows built-in toolbar items and its actions.

Built-in Toolbar Items	Actions
----- -----	
Add	Adds a new record.
Edit	Edits the selected record.
Update	Updates the edited record.
Delete	Deletes the selected record.
Cancel	Cancels the edit state.
Search	Searches the records by the given key.
Print	Prints the grid.
ExcelExport	Exports the grid to Excel.
PdfExport	Exports the grid to PDF.
WordExport	Exports the grid to Word.
ColumnChooser	Choose the column's visibility.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbar: ['Print', 'Search'],
  columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:

<script src="index.js" type="text/javascript"></script>
</body></html>

```

* The [toolbar](#) has options to define both built-in and custom toolbar items.

Show only icons in built-in toolbar items

By default, the built-in toolbar items render as buttons with an icon and text. It is possible to hide the text and show only the icon using the following CSS style.

```

.e-toolbar .e-tbar-btn-text, .e-toolbar .e-toolbar-items .e-toolbar-item .e-tbar-btn-text {
display: none;
}

```

This is demonstrated in the following sample:

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
true },
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number', isPrimaryKey: true },

```

```

        { field: 'CustomerID', headerText: 'Customer ID', width: 140, type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 270
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom toolbar items

Custom toolbar items can be added by defining the [toolbar](#) as a collection of [ItemModels](#). Actions for this customized toolbar items are defined in the [toolbarClick](#) event.

By default, Custom toolbar items are in position **Left**. You can change the position by using the [align](#) property. In the below sample, we have applied position **Right** for the **Collapse All** toolbar item.

INDEX.JS

```

var clickHandler = function(args){
    if (args.item.id === 'expandall') {
        grid.groupModule.expandAll();
    }
    if (args.item.id === "collapseall") {
        grid.groupModule.collapseAll();
    }
};
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowGrouping: true,
    groupSettings: { columns: ['CustomerID'] },
    toolbar: [{ text: 'Expand All', tooltipText: 'Expand All', prefixIcon:
'e-expand', id: 'expandall', align:'left' }, { text: 'Collapse All',
tooltipText: 'collection All', prefixIcon: 'e-collapse', id: 'collapseall',
align:'Right' }],
    toolbarClick: clickHandler,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 200,
});

```

```
grid.appendTo('#Grid');
```

INDEX.HTML

```

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Grid"></div>
```

```

    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* The [toolbar](#) has options to define both built-in and custom toolbar items.

* If a toolbar item does not match the built-in items, it will be treated as a custom toolbar item.

Custom toolbar items are elements that are added to the toolbar, such as input, button, span, etc. In order to focus these items using the TAB or Shift + Tab keys, the `e-toolbar-item-focus` class should be used in the elements. If the `e-toolbar-item-focus` class is not used in the custom toolbar item elements, the focus of the item will be skipped when using the TAB or Shift + Tab keys.

Both built-in and custom items in toolbar

Grid have an option to use both built-in and custom toolbar items at same time.

In the below example, `Add`, `Edit`, `Delete`, `Update`, `Cancel` are built-in toolbar items and `Click` is custom toolbar item.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Edit, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbar: ['Add', 'Edit', 'Delete', 'Update', 'Cancel', { text: 'Click',
    tooltipText: 'Click', prefixIcon: 'e-expand', id: 'Click' }],
    toolbarClick: clickHandler,
    editSettings: { allowEditing: true, allowAdding: true, allowDeleting:
    true },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
        width: 100, isPrimaryKey: true },
        { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
        width: 120, format: 'C2' },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
    ],
    height: 273
});
grid.appendTo('#Grid');
function clickHandler(args) {
    if (args.item.id === 'Click') {
        alert("Cutom toolbar click...");
    }
};

Custom toolbar component in a specific position

By default, Custom toolbar items are in the Left position. You can change the position by using the [align](#) property. In the following sample, we have applied the Right position for the Collapse All toolbar item, Left for the Expand All toolbar item, and Center for the Search toolbar item.

INDEX.JS

```

function toolbarClick(args){
    if (args.item.id === 'expandall') {
        grid.groupModule.expandAll();
    }
    if (args.item.id === "collapseall") {
        grid.groupModule.collapseAll();
    }
};
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    allowGrouping: true,
    groupSettings: { columns: ['FirstName'] },
    toolbar: [{ text: 'Expand All', tooltipText: 'Expand All', prefixIcon:
'e-expand', id: 'expandall', align: 'Left'}, { text: 'Collapse All',
tooltipText: 'collection All', prefixIcon: 'e-collapse', id: 'collapseall',
align: 'Right' }, { text: 'Search', align: 'Center'}],
    toolbarClick: toolbarClick,
    columns: [
        { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
        { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
        { field: 'Country', headerText: 'Country', textAlign: 'Right',
width: 120, country: 'string' },
        { field: 'PostalCode', headerText: 'Postal Code', textAlign:
'Right', width: 140, type: 'string' }
    ],
    height: 200,
});
grid.appendTo('#Grid');

```

Custom tool bar in ##Platform_Name## Grid control

Custom toolbar is used to customize the whole toolbar. It can be added by defining **toolbarTemplate** as an HTML element ID.

Actions for this toolbar template items are defined in the [toolbarClick](#) event.

INDEX.JS

```
var clickHandler = function(args){
    var target = (args.originalEvent.target).closest('.e-toolbar-item');
    if (target.id === 'collapse') {
        grid.groupModule.collapseAll();
    }
};
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.Group, ej.grids.Sort);
var grid = new ej.grids.Grid({
    dataSource: data,
    toolbarTemplate: '#toolbar-template',
    toolbarClick: clickHandler,
    allowGrouping: true,
    groupSettings: { columns: ['CustomerID'] },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 200
});
grid.appendTo('#Grid');
```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Render drop-down list in custom toolbar

You can create your own ToolBar items in the Grid. It can be added by defining the [toolbar](#) as HTML element ID. Actions for this ToolBar template items are defined in the [toolbarClick](#).

To include components in the ToolBar, please ensure the following steps:

Step 1:

Initialize the template for your custom component. Using the following code add the DropDownList component to the ToolBar.

```

<div id='toolbar-template'>
<div id='dropdown' style="margin-top:5px">
<input type="text" tabindex="1" id='ddlelement' />
</div>
</div>

```

Step 2:

To render the DropDownList component, use the [dataBound](#) event of the Grid.

- You can select the grid row index based on the selected data in the DropDownList. The output will appear as follows.

INDEX.JS

```

var rowIndex = [0, 1, 2, 3, 4, 5, 6, 8, 9, 10, 11, 12, 13, 14];
ej.grids.Grid.Inject(ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  toolbarTemplate: '#toolbar-template',
  dataBound: dataBound,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C2' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 200
});
grid.appendTo('#Grid');
function dataBound() {
  var dropDownListObject = new ej.dropdowns.DropDownList({
    // set the data to dataSource property
    dataSource: rowIndex,
    change: change,
    popupHeight :200
  });
  dropDownListObject.appendTo('#ddlelement');
}
function change(args) {
  grid.selectRow(args.itemData);
}

```

Pdf Export

Pdf export in ##Platform_Name## Grid control

PDF export allows exporting Grid data to PDF document. You need to use the [pdfExport](#) method for exporting. To enable PDF export in the grid, set the [allowPdfExport](#) as true.

To use PDF export, inject the PdfExport module in grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.PdfExport, ej.grids.Page);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  pageSettings: { pageSize: 6 },
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    let exportProperties = {
      fileName: "new.pdf"
    };
    grid.pdfExport(exportProperties);
  }
}
}

```

}

```

```
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Show spinner while exporting

You can show/ hide spinner component while exporting the grid using `showSpinner/ hideSpinner` methods. You can use `toolbarClick` event to show spinner before exporting and hide a spinner in the `pdfExportComplete` or `excelExportComplete` event after the exporting.

In the `toolbarClick` event, based on the parameter `args.item.id` as `Gridpdfexport` or `Gridexcelexport` we can call the `showSpinner` method from grid instance.

In the `pdfExportComplete` or `excelExportComplete` event, We can call the `hideSpinner` method.

In the below demo, we have rendered the default spinner component when exporting the grid.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport,
ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowExcelExport: true,
  toolbar: ['PdfExport', 'ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },

Custom data source

PDF export provides an option to define datasource dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
    if (args['item'].id === 'Grid_pdfexport') {
        let exportProperties = {
            dataSource: data,
        };
        grid.pdfExport(exportProperties);
    }
}
}

Passing additional parameters to the server when exporting

You can pass the additional parameter in the `query` property by invoking `addParams` method. In the `toolbarClick` event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed `recordcount` as `12` using `addParams` method.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport,
ej.grids.ExcelExport, ej.grids.Toolbar);
var queryClone;
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    allowExcelExport: true,
    toolbar: ['PdfExport', 'ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
        { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
    ],
    height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args){
    if (args['item'].id === 'Grid_pdfexport') {
        queryClone = grid.query;
        grid.query = new ej.data.Query().addParams("recordcount", "12");
        grid.pdfExport();
    }
    if (args['item'].id === 'Grid_excelexport') {
        queryClone = grid.query;
        grid.query = new ej.data.Query().addParams("recordcount", "12");
        grid.excelExport();
    }
}
grid.pdfExportComplete = () => {
    grid.query = queryClone;
}
grid.excelExportComplete = () => {
```

```
        grid.query = queryClone;
    }
```

INDEX.HTML

```

Passing the selected records to the server using ajax request via custom toolbar button click

You can pass the selected records to the server with the help of an ajax request. In the `toolbarClick` event, you can get the selected records using the [getSelectedRecords](#) method and pass the selected records to the server using the **data** property of the ajax.

`ts

```

import { Grid, Page, Toolbar } from '@syncfusion/ej2-grids';
import { Ajax } from '@syncfusion/ej2-base';

Grid.Inject(Page, Toolbar);

let grid: Grid = new Grid({
    dataSource: data,
    allowSelection: true,
    toolbar: ['Selected'],
    columns: [
        { type: 'checkbox', width: 50, },
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120},
        { field: 'CustomerID', width: 140, headerText: 'CustomerID'},
        { field: 'ShipCity', headerText: 'Ship Country', width: 140 }
    ],
    toolbarClick: function (args) {
        if (args.item.text === 'Selected') {
            var selectedRecord = this.getSelectedRecords();
            var ajax = new Ajax({

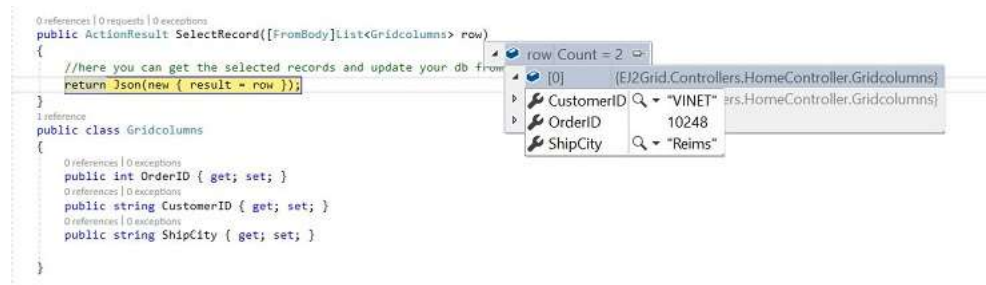

```

```

url: "/Home/SelectRecord",
type: "POST",
contentType: "application/json",
data: JSON.stringify(selectedRecord),
successHandler: function (response) {
    console.log(JSON.parse(response));
},
failure: function (response) {
    alert(response);
}
});
ajax.send();
},
});
grid.appendTo('#Grid');
`

```

The selected record details are bound to the `row` parameter. Please refer to the following screenshot.

[See Also](#)

- [How to Exporting Grid in Cordova application](#)

Export multiple grids in `##Platform_Name##` Grid control

The PDF export provides an option to export multiple grids to the same or different pages of a PDF file. Each grid is identified by its unique ID. You can specify which grid to export by listing their **IDs** in the `exportGrids` property.

[Same page](#)

PDF exporting provides support for exporting multiple grids on the same page. To export the grids on the same page, define `multipleExport.type` as **AppendToPage** in `exportProperties`. It also has an

option to provide blank space between the grids. This blank space can be defined by using `multipleExport.blankSpace` property.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.Page, ej.grids.Toolbar);
var firstGrid = new ej.grids.Grid({
  dataSource: data.slice(0, 5),
  allowPaging: true,
  allowPdfExport: true,
  exportGrids: ['FirstGrid', 'SecondGrid'],
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
  ],
});
firstGrid.appendTo('#FirstGrid');
var secondGrid = new ej.grids.Grid({
  dataSource: employeeData.slice(0, 5),
  allowPaging: true,
  allowPdfExport: true,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
    { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
    { field: 'City', headerText: 'City', textAlign: 'Right', width: 120
},
    { field: 'BirthDate', headerText: 'Birth Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
});
secondGrid.appendTo('#SecondGrid');
firstGrid.toolbarClick = function (args) {
  if (args['item'].id === 'FirstGrid_pdfexport') {
    var appendPdfExportProperties = {
      multipleExport: { type: "AppendToPage", blankSpace: 10 }
    };
    firstGrid.pdfExport(appendPdfExportProperties, true);
  }
}
```

[New page](#)

PDF export functionality enables the exporting of multiple grids into separate pages (each grid on a new page) within the PDF file. To achieve this, you can specify `multipleExport.type` as **NewPage** in `exportProperties`.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.Page, ej.grids.Toolbar);
var firstGrid = new ej.grids.Grid({
  dataSource: data.slice(0, 5),
  allowPaging: true,
  allowPdfExport: true,
  exportGrids: ['FirstGrid', 'SecondGrid'],
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
  ],
});
firstGrid.appendTo('#FirstGrid');
var secondGrid = new ej.grids.Grid({
  dataSource: employeeData.slice(0, 5),
  allowPaging: true,
  allowPdfExport: true,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
    { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
    { field: 'City', headerText: 'City', width: 120 },
  ],
});
secondGrid.appendTo('#SecondGrid');
firstGrid.toolbarClick = function(args){
  if (args['item'].id === 'FirstGrid_pdfexport') {
    var appendPdfExportProperties = {
      multipleExport: { type: 'NewPage' }
    };
    firstGrid.pdfExport(appendPdfExportProperties, true);
  }
}
```

```

Pdf export options in ##Platform_Name## Grid control

[Export current page](#)

PDF export provides an option to export the current page into PDF. To export current page, define the `exportType` to `CurrentPage`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    var exportProperties = {
      exportType: 'CurrentPage'
    };
    grid.pdfExport(exportProperties);
  }
}

```

INDEX.HTML

```

```

Export the selected records only

You can export the selected records data by passing it to `exportProperties.dataSource` Property in the `toolbarClick` event.

In the below exporting demo, We can get the selected records using `getSelectedRecords` method and pass the selected data to `PdfExport` or `excelExport` property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.ExcelExport,
ej.grids.Page, ej.grids.Toolbar, ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPdfExport: true,
    allowExcelExport: true,
    allowPaging: true,
    allowFiltering: true,
    selectionSettings: {type: 'Multiple'},
    toolbar: ['PdfExport', 'ExcelExport'],
    pageSettings: { pageCount: 5, pageSize: 5 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
        { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
},
        { field: 'ShipCountry', visible: false, headerText: 'Ship
Country', width: 150 }
    ],
});
grid.appendTo('#Grid');
grid.toolbarClick = (args) => {
    if (args.item.id === 'Grid_pdfexport') {
        let pdfdata = grid.getSelectedRecords();
        let exportProperties = {
            dataSource: pdfdata,
        };
        grid.pdfExport(exportProperties);
    }
    else if (args.item.id === 'Grid_excelexport') {
        let exceldata = grid.getSelectedRecords();
        let exportProperties = {
            dataSource: exceldata,
        };
        grid.excelExport(exportProperties);
    }
}
}

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Export filtered data only

You can export the filtered data by defining the resulted data in `exportProperties.dataSource` before export.

In the below Pdf exporting demo, We have gotten the filtered data by applying filter query to the grid data and then defines the resulted data in `exportProperties.dataSource` and pass it to `pdfExport` method.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.Page, ej.grids.Toolbar,
ej.grids.Filter);
var grid = new ej.grids.Grid(
{
    dataSource: data,
    allowPdfExport: true,
    allowPaging: true,
    allowFiltering: true,
    toolbar: ['PdfExport'],
    pageSettings: { pageCount: 5, pageSize: 5 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 130,
format: 'yMd', textAlign: 'Right' },
        { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
},
        { field: 'ShipCountry', visible: false, headerText: 'Ship
Country', width: 150 }
    ],
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
    if (args.item.id === 'Grid_pdfexport') {
        let pdfdata;
        let query = grid.renderModule.data.generateQuery(); // get grid
corresponding query
        for (var i = 0; i < query.queries.length; i++) {
            if (query.queries[i].fn == 'onPage') {
                query.queries.splice(i, 1); // remove page query to get
all records
                break;
            }
        }
        let fdata = new ej.data.DataManager({ json: data
}).executeQuery(query).then((e) => {
            pdfdata = e.result; // get all filtered records
            let exportProperties = {
                dataSource: pdfdata,
            };
            grid.pdfExport(exportProperties);
        }).catch((e) => true);
    }
}
```

```
}
```

Export hidden columns

PDF export provides an option to export hidden columns of Grid by defining the `includeHiddenColumn` as `true`.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'ShipCountry', width: 140, headerText: 'Ship Country',
visible: false },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    var exportProperties = {
      includeHiddenColumn: true
    };
    grid.pdfExport(exportProperties);
  }
}
```

Show or hide columns

You can show a hidden column or hide a visible column while exporting the grid using [toolbarClick](#) and [pdfExportComplete](#) events.

In the `toolbarClick` event, based on `args.item.id` as `Grid_pdfexport`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `pdfExportComplete` event, We have reversed the state back to the previous state.

In the below example, we have `CustomerID` as a hidden column in the grid. While exporting, we have changed `CustomerID` to visible column and `ShipCity` as hidden column.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.columns[1].visible = true;
    grid.columns[3].visible = false;
    grid.pdfExport();
  }
}
grid.pdfExportComplete = () => {
  grid.columns[1].visible = false;
  grid.columns[3].visible = true;
}
```

Change page size

Page size can be customized for the exported document using the `exportProperties`.

Supported page sizes are:

- Letter
- Note
- Legal
- A0
- A1
- A2
- A3
- A5
- A6
- A7
- A8
- A9
- B0
- B1
- B2
- B3
- B4
- B5
- Archa
- Archb
- Archc
- Archd
- Arche
- Flsa
- HalfLetter
- Letter11x17
- Ledger

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);

```

Font customization

Default fonts

By default, grid uses Helvetica font in the exported document. You can change the default font by using `pdfExportProperties.theme` property. The available default fonts are,

- Helvetica
- TimesRoman
- Courier
- Symbol
- ZapfDingbats

The code example for changing default font,

```
`ts
```

```
import { PdfStandardFont, PdfFontFamily, PdfFontStyle } from '@syncfusion/ej2-pdf-export';
```

```
...
```

```
let pdfExportProperties: PdfExportProperties = {
```

```
  theme: {
```

```
    header: {font: new PdfStandardFont(PdfFontFamily.TimesRoman, 11, PdfFontStyle.Bold),
```

```
    caption: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 9) },
```

```
    record: { font: new PdfStandardFont(PdfFontFamily.TimesRoman, 10) }
```

```
  }
```

```
};
```

Add custom font

You can change the default font of Grid header, content and caption cells in the exported document by using `pdfExportProperties.theme` property.

In the following example, we have used Advent Pro font to export the grid with Hungarian fonts.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.Page, ej.grids.Toolbar,
ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowGrouping: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Rendelés azonosító', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Ügyfél-azonosító',
type: 'string' },
    { field: 'Freight', headerText: 'fuvar', textAlign: 'Right', width:
120, format: 'C' },
    { field: 'OrderDate', headerText: 'Rendelés dátuma', textAlign:
'Right', width: 140, format: 'yMd' }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick= function(args){
  if (args['item'].id === 'Grid_pdfexport') {
    var pdfExportProperties = {
      theme: {
        header: {font: new
ej.pdfexport.PdfTrueTypeFont(window.adventProFont, 12) },
        caption: { font: new
ej.pdfexport.PdfTrueTypeFont(window.adventProFont, 10) },
        record: { font: new
ej.pdfexport.PdfTrueTypeFont(window.adventProFont, 9) }
      }
    };
    grid.pdfExport(pdfExportProperties);
  }
}
```

    <div id="container">
        <div id="Grid"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

PdfTrueTypeFont accepts base 64 format of the Custom Font.

Export grid as blob

The Grid offers an option to export the data as a **Blob** instead of downloading it as a file in the browser. To export the grid as a Blob, set the **isBlob** parameter to **true** in the [pdfExport](#) method. The grid returns the promise of a blob in the [pdfExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the `pdfExportComplete` event.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.PdfExport, ej.grids.Page);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  toolbarClick: toolbarClick,
  pdfExportComplete: pdfExportComplete,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 230
});
grid.appendTo('#Grid');
function toolbarClick(args) {
  if (args.item.id === 'Grid_pdfexport') {
    // pass fourth parameter as true to get the blob data of exported
grid
    grid.pdfExport(null, null, null, true);
  }
}
function pdfExportComplete(args) {
  // execute the promise to get the blob data
  args.promise.then((e) => {
    console.log(e.blobData);
  });
};
```

Pdf cell style customization in ##Platform_Name## Grid control

Conditional cell formatting

Grid cells in the exported PDF can be customized or formatted using [pdfQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported document by `args.cell` and `backgroundColor` property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
        { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
    ],
    height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args){
if (args['item'].id === 'Grid_pdfexport') {
    grid.pdfExport();
}
}
grid.pdfQueryCellInfo = (args) => {
    if(args.column.field == 'Freight'){
        if(args.value < 30) {
            args.style = {backgroundColor: '#99ffcc'};
        }
        else if(args.value < 60) {
            args.style = {backgroundColor: '#ffffb3'};
        }
        else {
            args.style = {backgroundColor: '#ff704d'};
        }
    }
}
grid.queryCellInfo = (args) => {
    if(args.column.field == 'Freight'){

Theme

PDF export provides an option to include theme for exported PDF document.

To apply theme in exported PDF, define the **theme** in **exportProperties**.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    var exportProperties = {
      theme: {
        header: {
          fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true, border: { color: '#64FA50', lineStyle: 'Thin' }
        },
        record: {
          fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
        },
        caption: {
          fontColor: '#64FA50', fontName: 'Calibri', fontSize: 17,
bold: true
        }
      }
    };
    grid.pdfExport(exportProperties);
  }
}
```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, material theme is applied to exported PDF document.

Adding header and footer in `##Platform_Name##` Grid control

You can customize text, page number, line, page size and changing orientation in header and footer.

Write a text in header and footer

You can add text either in Header or Footer of exported PDF document.

```
`ts
```

```

let exportProperties: PdfExportProperties = {
header: {
fromTop: 0,
height: 130,
contents: [
{
type: 'Text',
value: "Northwind Traders",
position: { x: 0, y: 50 },
style: { textBrushColor: '#000000', fontSize: 13 }
},
]
}
,

```

Draw a line in header and footer

you can add line either in Header or Footer of the exported PDF document.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

```
`ts
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Line',
        style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
        points: { x1: 0, y1: 4, x2: 685, y2: 4 }
      }
    ]
  }
}
```

Add page number in header and footer

you can add page number either in Header or Footer of exported PDF document.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
        format: 'Page { $current } of { $total }', //optional
        position: { x: 0, y: 25 },
```

```
style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
}
]
}
}
}
```

Insert an image in header and footer

Image (Base64 string) can be added in the exported document in header/footer using the `exportProperties`.

```

`ts
let exportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'Image',
        src: image,
        position: { x: 40, y: 10 },
        size: { height: 100, width: 250 },
      }
    ]
  }
}
`

```

The below code illustrates the pdf export customization.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.Page, ej.grids.Toolbar);

Repeat column header on every page

By default, column header will be placed on the first page of the pdf document but you can display column header on every page using `repeatHeader` property of `pdfGrid`.

In the below sample, we have enabled `repeatHeader` property in `pdfHeaderQueryCellInfo` event to show the header on every page.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: purchaseData,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['PdfExport'],

```

```

        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120},
            { field: 'CustomerID', width: 140, headerText: 'Customer ID'},
            { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
            { field: 'ShipName', headerText: 'ShipName', textAlign: 'Right',
width: 140 }
        ],
        height: 260
    });
    grid.appendTo('#Grid');
    grid.toolbarClick = function(args) {
        if (args['item'].id === 'Grid_pdfexport') {
            grid.pdfExport();
        }
    }
    grid.pdfHeaderQueryCellInfo = function(args){
        args.cell.row.pdfGrid.repeatHeader = true;
    }

```

Exporting hierarchy grid in ##Platform_Name## Grid control

The grid have an option to export the hierarchy grid to pdf document. By default, grid will exports the master grid with expanded child grids alone. you can change the exporting option by using the PdfExportProperties.hierarchyExportMode property. The available options are,

Mode	Behavior
Expanded	Exports the master grid with expanded child grids.
All	Exports the master grid with all the child grids.
None	Exports the master grid alone.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar,
ej.grids.PdfExport);
var grid= new ej.grids.Grid({

```

```

        dataSource: employeeData,
        toolbar: ["PdfExport"],
        allowPdfExport: true,
        columns: [
            { field: 'EmployeeID', headerText: 'Employee ID', textAlign:

Exporting grid with templates in ##Platform_Name## Grid control

The grid offers the option to export the column, detail, and caption templates to a PDF document. The template contains images, hyperlinks, and customized text.

Exporting with column template

The PDF export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to an PDF document.

In the following sample, the hyperlinks and images are exported to PDF using [hyperlink](#) and [image](#) properties in the [pdfQueryCellInfo](#) event.

PDF Export supports base64 string to export the images.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.PdfExport);
var grid = new ej.grids.Grid({
    dataSource: employeeData,
    allowPdfExport: true,
    toolbar: ['PdfExport'],
    columns: [
        {
            headerText: 'Employee Image', textAlign: 'Center',

```

```

        template: '#imageTemplate', width: 150
    },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 125 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'EmailID', headerText: 'Email ID', template:
'#mailTemplate', width: 170 }
    ],
    toolbarClick: toolbarClick,
    pdfQueryCellInfo: pdfQueryCellInfo,
    height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
    if (args.item.id === 'Grid_pdfexport') {
        grid.pdfExport();
    }
}

function pdfQueryCellInfo(args) {
    if (args.column.headerText === 'Employee Image') {
        args.image = {
            base64: args.data.EmployeeImage,
            height: 50,
            width: 50,
        };
    }
    if (args.column.headerText === 'Email ID') {
        args.hyperLink = {
            target: 'mailto:' + args.data.EmailID,
            displayText: args.data.EmailID,
        };
    }
}
}

```

INDEX.HTML

PDF Export		
Employee Image	Name	Email ID
	Nancy	nancy@domain.com
	Andrew	andrew@domain.com
	Janet	janet@domain.com
	Margaret	margaret@domain.com

Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `PdfExportProperties.hierarchyExportMode` property. The available options are:

- | Mode | Behavior |
- |-----|-----|
- | Expanded | Exports the parent grid with expanded detail rows. |
- | All | Exports the parent grid with all the detail rows. |
- | None | Exports the parent grid alone. |

The detail rows in the exported PDF can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the PDF document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnCount](#), [columnHeader](#), and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the PDF document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

If `columnCount` is not provided, the columns in the detail row of the PDF grid will be generated based on the count of the `columnHeader/rows` first row's [cells](#).

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar,
ej.grids.PdfExport);
var grid= new ej.grids.Grid({
  dataSource: employeeData,
  detailTemplate: '#detailtemplate',
  toolbar: ['PdfExport'],
  allowPdfExport: true,
  toolbarClick: toolbarClick,
  exportDetailTemplate: exportDetailTemplate,
  columns: [
    { field: 'Category', headerText: 'Category', width: 140 },
    { field: 'ProductID', headerText: 'Product ID', width: 120 },
    { field: 'Status', headerText: 'Status', width: 120 }
  ],
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    var exportProperties = {
      hierarchyExportMode: "Expanded"
    };
    grid.pdfExport(exportProperties);
  }
}
function exportDetailTemplate(args) {
  args.value = {
    columnCount: 2,
    columnHeader: [
      {
        cells: [{
          index: 0, colSpan: 2, value: 'Product Details',
          style: { backgroundColor: '#ADD8E6', pdfTextAlignment:
'Center', bold: true }
        }]
      },
    ],
    rows: [
      {
        cells: [
          {
            index: 0, rowspan: 4, image: { base64:
args.parentRow.data['ProductImg'], width: 80 }
          },
          {
            index: 1, value: "Offers: " +
args.parentRow.data['Offers'],
            style: { fontColor: '#0A76FF', fontSize: 15 }
          },
        ],
      },
      {
        cells: [
```

```

        {
            index: 1, value: 'Available: ' +
args.parentRow.data['Available']
        }
    },
    {
        cells: [
            {
                index: 1, value: 'Contact: ',
                hyperlink: {
                    target: 'mailto:' +
args.parentRow.data['Contact'],
                    displayText: args.parentRow.data['Contact']
                }
            }
        ]
    },
    {
        cells: [
            {
                index: 1, value: 'Ratings: ' +
args.parentRow.data['Ratings'],
                style: { fontColor: '#0A76FF', fontSize: 15 }
            }
        ]
    },
    {
        cells: [
            {
                index: 0, value: args.parentRow.data['productDesc'],
                style: { pdfTextAlignment: 'Center' }
            },
            { index: 1, value: args.parentRow.data['ReturnPolicy'] }
        ]
    },
    {
        cells: [
            {
                index: 0, value: args.parentRow.data['Cost'],
                style: { bold: true, pdfTextAlignment: 'Center' }
            },
            { index: 1, value: args.parentRow.data['Cancellation'] }
        ]
    },
    {
        cells: [
            {
                index: 0, value: args.parentRow.data['Status'],
                style: {
                    fontColor: args.parentRow.data['Status'] ===
'Available' ? '#00FF00' : '#FF0000',
                    pdfTextAlignment: 'Center', fontSize: 15
                }
            },
            {
                index: 1, value: args.parentRow.data['Delivery'],
                style: { fontColor: '#0A76FF', fontSize: 15 }
            }
        ]
    }

```

```

    ]
    }
    ],
    };
}

```

Exporting with caption template

The PDF export feature enables exporting of Grid with a caption template to an PDF document.

In the following sample, the customized caption text is exported to PDF using [captionText](#) property in the [exportGroupCaption](#) event.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Group, ej.grids.Toolbar, ej.grids.PdfExport);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  allowGrouping: true,
  groupSettings: { captionTemplate: '#captiontemplate', columns:
  ['EmployeeID'] },
  allowPdfExport: true,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', width: 120 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'City', headerText: 'City' },
    { field: 'Title', headerText: 'Title', width: 170 }
  ],
  toolbarClick: toolbarClick,
  exportGroupCaption: exportGroupCaption,
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
  if (args.item.id === 'Grid_pdfexport') {
    grid.pdfExport();
  }
}

function exportGroupCaption(args) {
  args.captionText = args.data.field + ' - ' + args.data.key;
}
```

Exporting grid in server in ##Platform_Name## Grid control

The Grid have an option to export the data to PDF in server side using Grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and [nuget.org](https://www.nuget.org). The following list of dependencies is required for Grid server side PDF exporting action.

- Syncfusion.EJ2
- Syncfusion.EJ2.GridExport
- Syncfusion.Compression.Base
- Syncfusion.Pdf.Base

Server configuration

The following code snippets shows server configuration using ASP.NET MVC Controller Action.

To Export the Grid in server side, You need to call the

[serverPdfExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult PdfExport(string gridModel)
{
```

```

GridPdfExport exp = new GridPdfExport();
Grid gridProperty = ConvertGridObject(gridModel);
return exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public class GridColumnModel
{
    public List<GridColumn> columns { get; set; }
}

public ActionResult DataSource(DataManager dm)
{
    var DataSource = OrderRepository.GetAllRecords();
    DataResult result = new DataResult();
    result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
    result.count = result.result.Count;
    return Json(result, JsonRequestBehavior.AllowGet);
}
`ts

import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    adaptor: new UrlAdaptor
});

```

```

let grid: Grid = new Grid({
  dataSource: data,
  toolbar: ['PdfExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 120 },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
    { field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
  ],
  height: 265
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
  if (args['item'].id === 'Grid_pdfexport') {
    grid.serverPdfExport("Home/PdfExport");
  }
}

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

Export grid as memory stream

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the **AsMemoryStream** parameter to **true** in the [PdfExport](#) method.

The following code demonstrates how to get the memory stream of exported grid.

```

`ts
public object PdfExport(string gridModel)
{
  GridPdfExport exp = new GridPdfExport();
  Grid gridProperty = ConvertGridObject(gridModel);
  // pass third parameter as true to get the Memory Stream of exported grid data
  return (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty, OrdersDetails.GetAllRecords(),
  true);
}

```

Merge grid's memory stream

The [Essential PDF](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

Merging with an existing memory stream

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, the [Merge](#) method of the [PdfDocumentBase](#) class is used to merge the grid's memory stream with an existing memory stream.

```
`ts
using Syncfusion.Pdf;

public MemoryStream ms1; // defines existing memory stream
public object PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    //Creates a PDF document.
    PdfDocument finalDoc = new PdfDocument();
    //Creates a PDF stream for merging. ms1 and ms2 represents the existing stream and grid's stream.
    Stream[] streams = { ms1, ms2 };
    //Merges PDFDocument.
    PdfDocumentBase.Merge(finalDoc, streams);
    //Save the document into stream.
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    //Close the document.
    finalDoc.Close(true);
    //Dispose the streams.
    ms1.Dispose();
    ms2.Dispose();
    return ms3;
```

```
}
`ts
```

Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;

public FileStream fs1; // defines existing file stream

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
    OrdersDetails.GetAllRecords(), true);
    PdfDocument finalDoc = new PdfDocument();
    //fs1 and ms1 represents the existing stream and grid's stream.
    Stream[] streams = { fs1, ms1 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    return ms3;
}
`ts
```

Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```
`ts
using Syncfusion.Pdf;

// get the file stream of local file

public FileStream fs1 = new FileStream("D:/PdfDoc.pdf", FileMode.Open, FileAccess.Read); //
PdfDoc.pdf is a local file which is located in local disk D.

public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
```

```

Grid gridProperty = ConvertGridObject(gridModel);
MemoryStream ms1 = (MemoryStream)exp.PdfExport<OrdersDetails>(gridProperty,
OrdersDetails.GetAllRecords(), true);
PdfDocument finalDoc = new PdfDocument();
//fs1 and ms1 represents the local file's stream and grid's stream.
Stream[] streams = { fs1, ms1 };
PdfDocumentBase.Merge(finalDoc, streams);
MemoryStream ms3 = new MemoryStream();
finalDoc.Save(ms3);
ms3.Position = 0;
return ms3;
}
`

```

Downloading the merged memory stream

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```

`ts
using Syncfusion.Pdf;
public ActionResult PdfExport(string gridModel)
{
    PdfDocument finalDoc = new PdfDocument();
    //ms1 and ms2 represents the streams needs to merge.
    Stream[] streams = { ms1, ms2 };
    PdfDocumentBase.Merge(finalDoc, streams);
    MemoryStream ms3 = new MemoryStream();
    finalDoc.Save(ms3);
    ms3.Position = 0;
    // Save the MemoryStream into FileStreamResult
    FileStreamResult fileStreamResult = new FileStreamResult(ms3, "application/pdf");
    fileStreamResult.FileName = "Export.pdf";
    //Close the document.
    finalDoc.Close(true);
    //Dispose the streams.
    ms1.Dispose();
}
`

```

```
ms2.Dispose();
// return the file
return fileStreamResult;
}
`
```

Rotate a header text to a certain degree in the exported grid on the server side

The Grid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported PDF file. To achieve this requirement, define the `BeginCellLayout` event of the `PdfExportProperties` with an event handler to perform the required action.

The `PdfHeaderQueryCellInfoEvent` will be triggered when creating a column header for the pdf document to be exported. Collect the column header details in this event and handle the custom in the `BeginCellLayout` event handler.

In the following demo, the `DrawString` method from the `Graphics` is used to rotate the header text of the column header inside the `BeginCellLayout` event handler.

A PDF exporting is not supported to rotate the column header on the client side.

```
`ts
public ActionResult PdfExport(string gridModel)
{
    GridPdfExport exp = new GridPdfExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerPdfHeaderQueryCellInfo = PdfHeaderQueryCellInfo;
    PdfGrid grid = new PdfGrid();
    PdfExportProperties pdfExportProperties = new PdfExportProperties();
    pdfExportProperties.IsRepeatHeader = true;
    pdfExportProperties.BeginCellLayout = new PdfGridBeginCellLayoutEventHandler(BeginCellEvent);
    gridProperty.ServerPdfQueryCellInfo = PdfQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.PdfExport<dynamic>(gridProperty, data, pdfExportProperties);
    return result;
}

public void BeginCellEvent(object sender, PdfGridBeginCellLayoutEventArgs args)
{
    PdfGrid grid = (PdfGrid)sender;
    var brush = new PdfSolidBrush(new PdfColor(Color.DimGray));
    args.Graphics.Save();
}
```

```

args.Graphics.TranslateTransform(args.Bounds.X + 50, args.Bounds.Height + 40); // give the value for
bounds x and Y by the user

args.Graphics.RotateTransform(-60); // give the rotate degree value by the user

// Draw the text at particular bounds.

args.Graphics.DrawString(headerValues[args.CellIndex], new PdfStandardFont(PdfFontFamily.Helvetica,
10), brush, new PointF(0, 0));

if (args.IsHeaderRow)
{
grid.Headers[0].Cells[args.CellIndex].Value = string.Empty;
}

args.Graphics.Restore();
}

private void PdfHeaderQueryCellInfo(object pdf)
{
ServerPdfHeaderQueryCellInfoEventArgs name = (ServerPdfHeaderQueryCellInfoEventArgs)pdf;
PdfGrid grid = new PdfGrid();
headerValues.Add(name.Column.HeaderText);
var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
PdfFont font = new PdfStandardFont(PdfFontFamily.Helvetica, 6);
SizeF size = font.MeasureString(longestString);
name.Headers[0].Height = size.Width * 2;
}

```

Limitations

- The export feature for detail templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

Excel Export

Excel exporting in `##Platform_Name##` Grid control

The excel export allows exporting Grid data to Excel document. You need to use the [excelExport](#) method for exporting. To enable Excel export in the grid, set the [allowExcelExport](#) as true.

To use excel export, You need to inject the `ExcelExport` module in grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,

```

```

        allowPaging: true,
        allowExcelExport: true,
        toolbar: ['ExcelExport'],
        columns: [
            { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
            { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
            { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
            { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
        ],
        height: 260
    });
    grid.toolbarClick = function(args){
        if (args['item'].id === 'Grid_excelexport') {
            grid.excelExport();
        }
    }
    grid.appendTo('#Grid');

```

```

Show spinner while exporting

You can show/ hide spinner component while exporting the grid using `showSpinner/ hideSpinner` methods. You can use `toolbarClick` event to show spinner before exporting and hide a spinner in the `pdfExportComplete` or `excelExportComplete` event after the exporting.

In the `toolbarClick` event, based on the parameter `args.item.id` as `Gridpdfexport` or `Gridexcelexport` we can call the `showSpinner` method from grid instance.

In the `pdfExportComplete` or `excelExportComplete` event, We can call the `hideSpinner` method.

In the below demo, we have rendered the default spinner component when exporting the grid.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport,
ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,

```

```

allowPaging: true,
allowPdfExport: true,
allowExcelExport: true,
toolbar: ['PdfExport', 'ExcelExport'],
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
],
height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
    if (args['item'].id === 'Grid_pdfexport') {
        grid.showSpinner();
        grid.pdfExport();
    }
    if (args['item'].id === 'Grid_excelext') {
        grid.showSpinner();
        grid.excelExport();
    }
}
grid.pdfExportComplete = () => {
    grid.hideSpinner();
}
grid.excelExportComplete = () => {
    grid.hideSpinner();
}

```

```

Custom data source

The excel export provides an option to define datasource dynamically before exporting. To export data dynamically, define the `dataSource` in `exportProperties`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 315
});
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_excelexport') {
    var excelExportProperties = {
      dataSource: data
    };
    grid.excelExport(excelExportProperties);
  }
}
grid.appendTo('#Grid');

```

Passing additional parameters to the server when exporting

You can pass the additional parameter in the `query` property by invoking `addParams` method. In the `toolbarClick` event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed `recordcount` as `12` using `addParams` method.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.PdfExport,
ej.grids.ExcelExport, ej.grids.Toolbar);

```

```

var queryClone;
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowPdfExport: true,
  allowExcelExport: true,
  toolbar: ['PdfExport', 'ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID',
visible: false },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
  ],
  height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args) {
  if (args['item'].id === 'Grid_pdfexport') {
    queryClone = grid.query;
    grid.query = new ej.data.Query().addParams("recordcount", "12");
    grid.pdfExport();
  }
  if (args['item'].id === 'Grid_excelexport') {
    queryClone = grid.query;
    grid.query = new ej.data.Query().addParams("recordcount", "12");
    grid.excelExport();
  }
}
grid.pdfExportComplete = () => {
  grid.query = queryClone;
}
grid.excelExportComplete = () => {
  grid.query = queryClone;
}

```

INDEX.HTML

```

Passing the selected records to the server using ajax request via custom toolbar button click

You can pass the selected records to the server with the help of an ajax request. In the `toolbarClick` event, you can get the selected records using the [getSelectedRecords](#) method and pass the selected records to the server using the **data** property of the ajax.

```
`ts
```

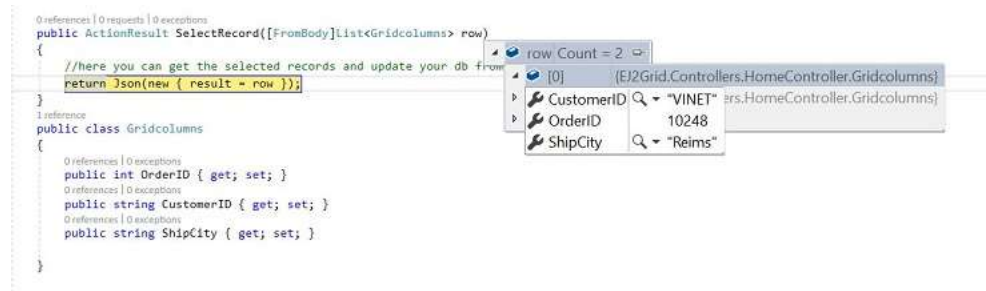

```
import { Grid, Page, Toolbar } from '@syncfusion/ej2-grids';
import { Ajax } from '@syncfusion/ej2-base';
Grid.Inject(Page, Toolbar);
let grid: Grid = new Grid({
  dataSource: data,
  allowSelection: true,
  toolbar: ['Selected'],
  columns: [
    { type: 'checkbox', width: 50, },
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120},
    { field: 'CustomerID', width: 140, headerText: 'CustomerID'},
    { field: 'ShipCity', headerText: 'Ship Country', width: 140 }
  ],
  toolbarClick: function (args) {
    if (args.item.text === 'Selected') {
      var selectedRecord = this.getSelectedRecords();
      var ajax = new Ajax({
        url: "/Home/SelectRecord",
        type: "POST",
        contentType: "application/json",
        data: JSON.stringify(selectedRecord),
        successHandler: function (response) {
          console.log(JSON.parse(response));
        },
        failure: function (response) {
          alert(response);
        }
      });
      ajax.send();
    }
  }
});
```

```

}
},
});
grid.appendTo('#Grid');
`

```

The selected record details are bound to the **row** parameter. Please refer to the following screenshot.

- [Exporting Grid in Cordova application](#)

Export multiple grids in ##Platform_Name## Grid control

The Excel export provides an option to export multiple grid data in the same or different sheets of an Excel file. Each grid is identified by its unique ID. You can specify which grids to export by listing their IDs in the **exportGrids** property.

Same sheet

Excel exporting provides support for exporting multiple grids on the same sheet. To export the grids in the same sheet, define **multipleExport.type** as **AppendToSheet** in **exportProperties**. It also has an option to provide blank rows between the grids. These blank rows count can be defined by using **multipleExport.blankRows** property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.ExcelExport, ej.grids.Page, ej.grids.Toolbar);
var firstGrid = new ej.grids.Grid({
    dataSource: data.slice(0, 5),
    allowPaging: true,
    allowExcelExport: true,
    exportGrids: ['FirstGrid', 'SecondGrid'],
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
    ],
    height: 315
});

```

```

var secondGrid = new ej.grids.Grid({
  dataSource: employeeData.slice(0, 5),
  allowPaging: true,
  allowExcelExport: true,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
    { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
    { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
    { field: 'City', headerText: 'City', width: 120 },
  ],
  height: 315
});
firstGrid.toolbarClick = function(args) {
  if (args['item'].id === 'FirstGrid_excelexport') {
    var appendExcelExportProperties = {
      multipleExport: { type: 'AppendToSheet', blankRows: 2 }
    };
    firstGrid.excelExport(appendExcelExportProperties, true);
  }
}
firstGrid.appendTo('#FirstGrid');
secondGrid.appendTo('#SecondGrid');

```

```

By default, `multipleExport.blankRows` value is 5.

[New sheet](#)

Excel export functionality enables the exporting of multiple grids onto separate sheets (each grid in new sheet of excel) within the Excel file. To achieve this, you can specify `multipleExport.type` as `NewSheet` in `exportProperties`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.ExcelExport, ej.grids.Page, ej.grids.Toolbar);
var firstGrid = new ej.grids.Grid({
    dataSource: data.slice(0, 5),
    allowPaging: true,
    allowExcelExport: true,
    exportGrids: ['FirstGrid', 'SecondGrid'],
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 },
        { field: 'ShipCountry', headerText: 'Ship Country', width: 150 },
    ],
    height: 315
});
var secondGrid = new ej.grids.Grid({

```

```

        dataSource: employeeData.slice(0, 5),
        allowPaging: true,
        allowExcelExport: true,
        columns: [
            { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120, type: 'number' },
            { field: 'FirstName', width: 140, headerText: 'First Name', type:
'string' },
            { field: 'LastName', width: 140, headerText: 'Last Name', type:
'string' },
            { field: 'City', headerText: 'City', width: 120 },
        ],
        height: 315
    });
    firstGrid.toolbarClick = function(args) {
        if (args['item'].id === 'FirstGrid_excelexport') {
            var appendExcelExportProperties = {
                multipleExport: { type: 'NewSheet' }
            };
            firstGrid.excelExport(appendExcelExportProperties, true);
        }
    }
    firstGrid.appendTo('#FirstGrid');
    secondGrid.appendTo('#SecondGrid');

```

Excel export options in ##Platform_Name## Grid control

The excel export provides an option to customize mapping of the grid to excel document.

Export current page

The excel export provides an option to export the current page into excel. To export current page, define `exportType` to `CurrentPage`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 315
});

```

```

grid.toolbarClick = function(args){
    if (args['item'].id === 'Grid_excelexport') {
        var excelExportProperties = {
            exportType: 'CurrentPage'
        };
        grid.excelExport(excelExportProperties);
    }
}
grid.appendTo('#Grid');

```

Export the selected records only

You can export the selected records data by passing it to `exportProperties.dataSource` Property in the `toolbarClick` event.

In the below exporting demo, We can get the selected records using `getSelectedRecords` method and pass the selected data to `PdfExport` or `excelExport` property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.PdfExport, ej.grids.ExcelExport,
ej.grids.Page, ej.grids.Toolbar, ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPdfExport: true,
    allowExcelExport: true,
    allowPaging: true,
    allowFiltering: true,
    selectionSettings: { type: 'Multiple' },
    toolbar: ['PdfExport', 'ExcelExport'],
    pageSettings: { pageCount: 5, pageSize: 5 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 120,
        textAlign: 'Right' },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        { field: 'OrderDate', headerText: 'Order Date', width: 130,
        format: 'yMd', textAlign: 'Right' },
        { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
        },
        { field: 'ShipCountry', visible: false, headerText: 'Ship
        Country', width: 150 }
    ]
});

```

```

    ],
    });
grid.appendTo('#Grid');
grid.toolbarClick = (args) => {
    if (args.item.id === 'Grid_pdfexport') {
        let pdfdata = grid.getSelectedRecords();
        let exportProperties = {
            dataSource: pdfdata,
        };
        grid.pdfExport(exportProperties);
    }
    else if (args.item.id === 'Grid_excelexport') {
        let exceldata = grid.getSelectedRecords();
        let exportProperties = {
            dataSource: exceldata,
        };
        grid.excelExport(exportProperties);
    }
}
}

    </body></html>

```

Export hidden columns

The excel export provides an option to export hidden columns of grid by defining `includeHiddenColumn` as `true`.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'ShipCountry', width: 140, headerText: 'Ship Country',
visible: false },
    ]
});

```

```

        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 315
});
grid.toolbarClick = function(args) {
    if (args['item'].id === 'Grid_excelexport') {
        var excelExportProperties = {
            includeHiddenColumn: true
        };
        grid.excelExport(excelExportProperties);
    }
}
grid.appendTo('#Grid');

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Show or hide columns

You can show a hidden column or hide a visible column while printing the grid using [toolbarClick](#) and [excelExportComplete](#) events.

In the `toolbarClick` event, based on `args.item.id` as `Grid_excelexport`. We can show or hide columns by setting `column.visible` property to `true` or `false` respectively.

In the `excelExportComplete` event, We have reversed the state back to the previous state.

In the below example, we have `CustomerID` as a hidden column in the grid. While exporting, we have changed `CustomerID` to visible column and `ShipCity` as hidden column.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },

```

```

        { field: 'CustomerID', width: 140, headerText: 'Customer ID',
        visible: false },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
        width: 120 },
        { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
        width: 140 }
    ],
    height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args){
    if (args['item'].id === 'Grid_pdfexport') {
        grid.columns[1].visible = true;

Export with filter options

The excel export provides an option to export with filter option in excel by defining `enableFilter` as `true`.

It requires the [allowFiltering](#) to be true.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar,
ej.grids.Filter);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    allowFiltering: true,
    toolbar: ['ExcelExport'],
    columns: [

```

```

        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
    ],
    height: 315
});
grid.toolbarClick = function(args){
    if (args['item'].id === 'Grid_excelexport') {
        var excelExportProperties = {
            enableFilter: true
        };
        grid.excelExport(excelExportProperties);
    }
}
grid.appendTo('#Grid');
```

Export the master detail grid

It is possible to export the master-detail grid on the same Excel sheet using the `ExcelExportProperties` class in the grid.

To export the master-detail grid on the same sheet in the following sample, you need to set the `multipleExport.type` to `AppendToSheet` in the `exportProperties`. A promise object is created by exporting the master grid first, and then the detail grid is exported after the master grid has been successfully exported.

INDEX.JS

```

var names = ['AROUT', 'BERGS', 'BLONP', 'CHOPS', 'ERNSH'];
var masterdata = customerData.filter(function(e) {
    return names.indexOf(e.CustomerID) !== -1;
});
var mastergrid = new ej.grids.Grid({
    dataSource: masterdata,
    allowExcelExport: true,
    toolbar: ['ExcelExport'],
    selectedRowIndex: 1,
    toolbarClick: toolbarClick,
    columns: [
        { field: 'ContactName', headerText: 'Customer Name', width: 150 },
        { field: 'CompanyName', headerText: 'Company Name', width: 150 },
        { field: 'Address', headerText: 'Address', width: 150 },
        { field: 'Country', headerText: 'Country', width: 130 },
    ],
    rowSelected: rowSelected,

```

```

});
mastergrid.appendTo('#MasterGrid');
function rowSelected(args) {
    let selectedRecord = args.data;
    grid.dataSource = data.filter((record) => record.CustomerName ===
selectedRecord.ContactName).slice(0, 5);
    document.getElementById('key').innerHTML = selectedRecord.ContactName;
}
function toolbarClick(args) {
    if (args.item.id === 'MasterGrid_excelexport') {
        const appendExcelExportProperties = {
            multipleExport: { type: 'AppendToSheet', blankRows: 2 },
        };
        const firstGridExport =
mastergrid.excelExport(appendExcelExportProperties, true);
        firstGridExport.then((fData) => {
            grid.excelExport(appendExcelExportProperties, false, fData);
        });
    }
}
var grid = new ej.grids.Grid({
    allowSelection: false,
    allowExcelExport: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', width: 100, textAlign:

Export grid as blob

The Grid offers an option to export the data as a **Blob** instead of downloading it as a file in the browser. To export the grid as a Blob, set the **isBlob** parameter to **true** in the [excelExport](#) method. The grid returns the promise of a blob in the [excelExportComplete](#) event.

The following example demonstrates how to obtain the blob data of the exported grid by executing the promise in the [excelExportComplete](#) event.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ExcelExport, ej.grids.Page);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowExcelExport: true,
    toolbar: ['ExcelExport', 'CsvExport'],

```

```

Excel cell style customization in ##Platform_Name## Grid control

Conditional cell formatting

Grid cells in the exported Excel can be customized or formatted using [excelQueryCellInfo](#) event. In this event, we can format the grid cells of exported PDF document based on the column cell value.

In the below sample, we have set the background color for **Freight** column in the exported excel by **args.cell** and **BackColor** property.

INDEX.JS

```

ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    allowPdfExport: true,
    toolbar: ['ExcelExport'],
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', width:
120 },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },

```

```

        { field: 'ShipCity', headerText: 'ShipCity', textAlign: 'Right',
width: 140 }
    ],
    height: 260
});
grid.appendTo('#Grid');
grid.toolbarClick = function(args){
    if (args['item'].id === 'Grid_excelexport') {
        grid.excelExport();
    }
}
grid.excelQueryCellInfo = (args) => {
    if(args.column.field == 'Freight'){
        if(args.value < 30) {
            args.style = {backgroundColor: '#99ffcc'};
        }
        else if(args.value < 60) {
            args.style = {backgroundColor: '#ffffb3'};
        }
        else {
            args.style = {backgroundColor: '#ff704d'};
        }
    }
}
grid.queryCellInfo = (args) => {
    if(args.column.field == 'Freight'){
        if(args.data['Freight'] < 30) {
            args.cell.bgColor = '#99ffcc';
        }
        else if(args.data['Freight'] < 60) {
            args.cell.bgColor = '#ffffb3';
        }
        else {
            args.cell.bgColor = '#ff704d';
        }
    }
}
}

```

```

Theme

The excel export provides an option to include theme for exported excel document.

To apply theme in exported Excel, define the **theme** in **exportProperties**.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.ExcelExport, ej.grids.Toolbar);
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd', textAlign: 'Right' }
  ],
  height: 315
});
grid.toolbarClick = function(args){
  if (args['item'].id === 'Grid_excelexport') {
    var excelExportProperties = {
      theme:
      {
        header: { fontName: 'Segoe UI', fontColor: '#666666' },
        record: { fontName: 'Segoe UI', fontColor: '#666666' },
        caption: { fontName: 'Segoe UI', fontColor: '#666666' }
      }
    };
    grid.excelExport(excelExportProperties);
  }
}
grid.appendTo('#Grid');
```

```

By default, material theme is applied to exported excel document.

Rotate a header text to a certain degree in the exported grid

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the [excelHeaderQueryCellInfo](#) event of the Grid.

The `excelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported. Customize the column header in this event.

In the following demo, using the `rotation` property of the style argument in the `excelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

INDEX.JS

```
var grid = new ej.grids.Grid({
  dataSource: data,
  allowPaging: true,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string', customAttributes: { class: 'orientationcss' }, textAlign: 'Center'
},
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120 },
    { field: 'OrderDate', headerText: 'Order Date', textAlign: 'Right',
width: 140, format: 'yMd' }
  ],
  created: setHeaderHeight,
  height: 260
});

function setHeaderHeight(args) {
  var textWidth = document.querySelector(".orientationcss >
div").scrollWidth;
  var headerCell = document.querySelectorAll(".e-headercell");
  for (var i = 0; i < headerCell.length; i++) {
    headerCell.item(i).style.height = textWidth + 'px';
  }
}

grid.excelHeaderQueryCellInfo = function (args) {
  var textWidth = document.querySelector(".orientationcss >
div").scrollWidth;
  if (args.gridCell.column.field == 'Freight') {
    args.style = { backColor: '#99ffcc', vAlign: 'Bottom' };
  }
  else {
    args.style = { vAlign: 'Center', rotation: dropDownListObject.value
};
  }
  args.cell.cellHeight = textWidth;
};

grid.excelQueryCellInfo = function (args) {
  if (args.column.field == 'Freight') {
```

```

        if (args.value < 30) {
            args.style = { backColor: '#99ffcc' };
        }
        else if (args.value < 60) {
            args.style = { backColor: '#ffffb3' };
        }
        else {
            args.style = { backColor: '#ff704d' };
        }
    }
};
grid.toolbarClick = function (args) {
    if (args['item'].id === 'Grid_excelexport') {
        grid.excelExport();
    }
};
grid.appendTo('#Grid');
var degree = [90, 180, 45, 135, 225, -90];
var dropDownListObject = new ej.dropdowns.DropDownList({
    dataSource: degree,
    placeholder: "Select a degree"
});
dropDownListObject.appendTo('#ddlelement');

```

Exporting hierarchy grid in ##Platform_Name## Grid control

The grid has an option to export the hierarchy grid to excel document. By default, it will use **Expanded** as hierarchyExportMode. you can change the exporting option by using the **ExcelExportProperties.hierarchyExportMode** property. The available options are,

| Mode | Behavior |

|-----|-----|

| Expanded | Exports the visible child grids in expanded state and remaining child grid in collapsed state when args.isChild property is set to true in [beforeExcelExport](#) event. |

| All | Exports the all the child grids in expanded state. |

| None | Exports all child grids in collapsed state when args.isChild property is set to true in [beforeExcelExport](#) event. |

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar,
ej.grids.ExcelExport);
var grid= new ej.grids.Grid({
  dataSource: employeeData,
  toolbar: ["ExcelExport"],
  allowExcelExport: true,
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 120 },
    { field: 'FirstName', headerText: 'First Name', width: 150 },
    { field: 'City', headerText: 'City', width: 150 },
    { field: 'Country', headerText: 'Country', width: 150 }
  ],
  childGrid: {
    dataSource: data,
    queryString: 'EmployeeID',
    columns: [
      { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
      { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
      { field: 'ShipCity', headerText: 'Ship City', width: 150 },
      { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
  },
  beforeExcelExport: beforeExcelExport,
  toolbarClick: toolbarClick
});
grid.appendTo('#Grid');
function beforeExcelExport(args) {
  args.isChild = true;
}
function toolbarClick(args) {
  if (args['item'].id === 'Grid_excelexport') {
    var exportProperties = {
      hierarchyExportMode: "Expanded"
    };
    grid.excelExport(exportProperties);
  }
}
```

```
}
}
```

Limitations

- Microsoft Excel permits up to seven nested levels in outlines. So that in the grid we can able to provide only up to seven nested level

and if it exceeds more than seven levels then the document will be exported without outline option. Please refer the [Microsoft Limitation](#)

Exporting grid with templates in ##Platform_Name## Grid control

The grid offers the option to export the column, detail, and caption templates to an Excel document. The template contains images, hyperlinks, and customized text.

Exporting with column template

The Excel export functionality allows you to export Grid columns that include images, hyperlinks, and custom text to an Excel document.

In the following sample, the hyperlinks and images are exported to Excel using [hyperlink](#) and [image](#) properties in the [excelQueryCellInfo](#) event.

Excel Export supports base64 string to export the images.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Toolbar, ej.grids.ExcelExport);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  allowExcelExport: true,
  toolbar: ['ExcelExport'],
  columns: [
    {
      headerText: 'Employee Image', textAlign: 'Center',
      template: '#imageTemplate', width: 150
    },
    { field: 'EmployeeID', headerText: 'Employee ID', textAlign:
'Right', width: 125 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'EmailID', headerText: 'Email ID', template:
'#mailTemplate', width: 170 }
  ],
  toolbarClick: toolbarClick,
  excelQueryCellInfo: excelQueryCellInfo,
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
  if (args.item.id === 'Grid_excelexport') {
    grid.excelExport();
  }
}
function excelQueryCellInfo(args) {
  if (args.column.headerText === 'Employee Image') {
    args.image = {
```

```

        base64: args.data.EmployeeImage,
        height: 70,
        width: 70,
    };
}
if (args.column.headerText === 'Email ID') {
    args.hyperLink = {
        target: 'mailto:' + args.data.EmailID,
        displayText: args.data.EmailID,
    };
}
}
}

```

Excel Export		
Employee Image	Name	Email ID
	Nancy	nancy@domain.com
	Andrew	andrew@domain.com
	Janet	janet@domain.com
	Margaret	margaret@domain.com

Exporting with detail template

By default, the grid will export the parent grid with expanded detail rows alone. Change the exporting option by using the `ExcelExportProperties.hierarchyExportMode` property. The available options are:

Mode	Behavior
----- -----	
Expanded	Exports the parent grid with expanded detail rows.
All	Exports the parent grid with all the detail rows.
None	Exports the parent grid alone.

The detail rows in the exported Excel can be customized or formatted using the [exportDetailTemplate](#) event. In this event, the detail rows of the Excel document are formatted in accordance with their parent row details.

In the following sample, the detail row content is formatted by specifying the [columnHeader](#) and [rows](#) properties using its [parentRow](#) details. This allows for the creation of detail rows in the Excel document. Additionally, custom styles can be applied to specific cells using the [style](#) property.

When using [rowSpan](#), it is essential to provide the cell's [index](#) for proper functionality.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.DetailRow, ej.grids.Toolbar,
ej.grids.ExcelExport);
var grid= new ej.grids.Grid({
  dataSource: employeeData,
  detailTemplate: '#detailtemplate',
  toolbar: ['ExcelExport'],
  allowExcelExport: true,
  toolbarClick: toolbarClick,
  exportDetailTemplate: exportDetailTemplate,
  columns: [
    { field: 'Category', headerText: 'Category', width: 120 },
    { field: 'ProductID', headerText: 'Product ID', width: 140 },
    { field: 'Status', headerText: 'Status', width: 200 }
  ],
  height: 273
});
grid.appendTo('#Grid');
function toolbarClick(args) {
  if (args['item'].id === 'Grid_excelexport') {
    var exportProperties = {
      hierarchyExportMode: "Expanded"
    };
    grid.excelExport(exportProperties);
  }
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Excel Export			
	Category	Product ID	Status
▶	Suits/Slim	EJ-SU-01	Available
▶	Suits/Classic	EJ-SU-02	Available
▶	Suits/Formal	EJ-SU-03	Available
▶	Phants/Slim	EJ-PH-01	Available
▶	Phants/Classic	EJ-PH-02	Available
▶	Shirts/Slim	EJ-SH-01	Available
▶	Shirts/Formal	EJ-SH-02	Available

Exporting with caption template

The Excel export feature enables exporting of Grid with a caption template to an Excel document.

In the following sample, the customized caption text is exported to Excel using [captionText](#) property in the [exportGroupCaption](#) event.

INDEX.JS

```
ej.grids.Grid.Inject(ej.grids.Group, ej.grids.Toolbar,
ej.grids.ExcelExport);
var grid = new ej.grids.Grid({
  dataSource: employeeData,
  allowGrouping: true,
  groupSettings: { captionTemplate: '#captiontemplate', columns:
[ 'EmployeeID' ] },
  allowExcelExport: true,
  toolbar: [ 'ExcelExport' ],
  columns: [
    { field: 'EmployeeID', headerText: 'Employee ID', width: 120 },
    { field: 'FirstName', headerText: 'Name', width: 120 },
    { field: 'City', headerText: 'City' },
    { field: 'Title', headerText: 'Title', width: 170 }
  ],
  toolbarClick: toolbarClick,
  exportGroupCaption: exportGroupCaption,
  height: 273
});
```

```

});
grid.appendTo('#Grid');
function toolbarClick(args) {
    if (args.item.id === 'Grid_excelexport') {
        grid.excelExport();
    }
}

function exportGroupCaption(args) {
    args.captionText = args.data.field + ' - ' + args.data.key;
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The screenshot shows a web interface with a blue header bar containing a button labeled "Employ..." with an upward arrow and a close icon. Below the header is a white section with a tab labeled "Excel Export". The main content area displays a table with three columns: "Name", "City", and "Title". The table contains three rows of data, each preceded by a dropdown arrow and a label: "EmployeeID - 1", "EmployeeID - 2", and "EmployeeID - 3".

	Name	City	Title
▼ EmployeeID - 1	Nancy	Seattle	Sales Representative
▼ EmployeeID - 2	Andrew	Tacoma	Vice President, Sales
▼ EmployeeID - 3	Janet	Kirkland	Sales Representative

Exporting grid in server in ##Platform_Name## Grid control

The Grid have an option to export the data to Excel in server side using Grid server export library.

Server dependencies

The Server side export functionality is shipped in the Syncfusion.EJ2.GridExport package, which is available in Essential Studio and nuget.org. The following list of dependencies is required for Grid server side Excel exporting action.

- Syncfusion.EJ2

- Syncfusion.EJ2.GridExport
- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

Server configuration

The following code snippets shows server configuration using ASP.NET MVC Controller Action.

To Export the Grid in server side, You need to call the [serverExcelExport](#) method for passing the Grid properties to server exporting action.

```
`ts
public ActionResult ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    return exp.ExcelExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public class GridColumnModel
{
    public List<GridColumn> columns { get; set; }
}

public ActionResult DataSource(DataManager dm)
{
    var DataSource = OrderRepository.GetAllRecords();
    DataResult result = new DataResult();
    result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
    result.count = result.result.Count;
    return Json(result, JsonRequestBehavior.AllowGet);
}
```

```

,
`ts
import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
url: "Home/DataSource",
adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({
dataSource: data,
toolbar: ['ExcelExport'],
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120 },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
{ field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
],
height: 265
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
if (args['item'].id === 'Grid_excelexport') {
grid.serverExcelExport("Home/ExcelExport");
}
}
,

```

Note: Refer to the GitHub sample for quick implementation and testing from [here](#).

CSV export in server side

You can export the Grid to CSV format by using the [serverCsvExport](#) method which will pass the Grid properties to server.

In the below demo, we have invoked the above method inside the [toolbarClick](#) event. In server side, we have deserialized the Grid properties and passed to the `CsvExport` method which will export the properties to CSV format.

```

`ts
public ActionResult CsvGridExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    return exp.CsvExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords());
}

private Grid ConvertGridObject(string gridProperty)
{
    Grid GridModel = (Grid)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty, typeof(Grid));
    GridColumnModel cols =
    (GridColumnModel)Newtonsoft.Json.JsonConvert.DeserializeObject(gridProperty,
    typeof(GridColumnModel));
    GridModel.Columns = cols.columns;
    return GridModel;
}

public ActionResult DataSource(DataManager dm)
{
    var DataSource = OrderRepository.GetAllRecords();
    DataResult result = new DataResult();
    result.result = DataSource.Skip(dm.Skip).Take(dm.Take).ToList();
    result.count = result.result.Count;
    return Json(result, JsonRequestBehavior.AllowGet);
}
`

`ts
import { Grid, Toolbar } from '@syncfusion/ej2-grids';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
Grid.Inject(Toolbar);
let data: DataManager = new DataManager({
    url: "Home/DataSource",
    adaptor: new UrlAdaptor
});
let grid: Grid = new Grid({

```

```

dataSource: data,
toolbar: ['CsvExport'],
columns: [
{ field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 100 },
{ field: 'CustomerID', headerText: 'Customer ID', width: 120 },
{ field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C2' },
{ field: 'ShipCountry', headerText: 'Ship Country', width: 150 }
],
height: 265
});
grid.appendTo('#Grid');
grid.toolbarClick = (args: Object) => {
if (args['item'].id === 'Grid_csvexport') {
grid.serverCsvExport("Home/CsvGridExport");
}
}
`

```

Export grid as memory stream

The Grid offers an option to export the data as a memory stream instead of downloading it as a file in the browser. To obtain the memory stream of the exported grid, set the `AsMemoryStream` parameter to **true** in the [ExcelExport](#) and [CsvExport](#) methods.

The following code demonstrates how to get the memory stream of exported grid.

```

`ts
public object ExcelExport(string gridModel)
{
GridExcelExport exp = new GridExcelExport();
Grid gridProperty = ConvertGridObject(gridModel);
// pass third parameter as true to get the Memory Stream of exported grid data
return (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
true);
}
public object CsvExport(string gridModel)
{
GridExcelExport exp = new GridExcelExport();

```

```

Grid gridProperty = ConvertGridObject(gridModel);

return (MemoryStream)exp.CsvExport<OrdersDetails>(gridProperty, OrderRepository.GetAllRecords(),
true);
}
`ts

```

Merge grid's memory stream

The [Essential XlsIO](#) library is used to merge multiple memory streams into a single stream. To learn more about the merge option, please refer to this [documentation](#).

You can merge a memory stream, a file stream, and a local file with the Grid's memory stream in the following ways:

Merging with an existing memory stream

If you already have a memory stream, you can directly use it to merge with the Grid's memory stream.

In the following code, **ExcelEngine** and **AddCopy** method of Worksheets are used to merge the grid's memory stream with an existing memory stream.

```

`ts
using Syncfusion.XlsIO;

public MemoryStream ms1; // defines existing memory stream

public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    // get the memory stream of exported grid data
    MemoryStream ms2 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);

    //New instance of ExcelEngine is created equivalent to launching Microsoft Excel with no workbooks
    open
    ExcelEngine excelEngine = new ExcelEngine();
    //Instantiate the Excel application object
    IApplication application = excelEngine.Excel;
    //Assigns default application version
    application.DefaultVersion = ExcelVersion.Xlsx;
    //open an workbook of existing memory stream and grid's memory stream through Open method of
    IWorkbooks
    IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
    //Copy all the worksheet from the Source workbook to the destination workbook

```

```

for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
//Saving the workbook as stream
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
return ms3;
}
`

```

Merging with an existing file stream

If you already have a file stream, you can directly use it to merge with the Grid's memory stream. In the following code, the existing file stream is merged with the Grid's memory stream.

```

`ts
using Syncfusion.XlsIO;

public FileStream fs1; // defines existing file stream

public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the existing stream and grid's stream.
    IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);

```

```

IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);
for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
    destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
//Saving the workbook as stream
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
return ms3;
}
`

```

Merging with a local file

To merge a local file with the Grid's memory stream, you need to convert it into a file stream before merging. In the following code, the existing local file is merged with the Grid's memory stream.

```

`ts
using Syncfusion.XlsIO;

// get the file stream of local file
public FileStream fs1 = new FileStream("D:/ExcelDoc.xlsx", FileMode.Open, FileAccess.Read); //
ExcelDoc.xlsx is a local file which is located in local disk D.

public object ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    MemoryStream ms1 = (MemoryStream)exp.ExcelExport<OrdersDetails>(gridProperty,
    OrderRepository.GetAllRecords(), true);
    ExcelEngine excelEngine = new ExcelEngine();
    IApplication application = excelEngine.Excel;
    application.DefaultVersion = ExcelVersion.Xlsx;
    //fs1 and ms1 represents the local file's stream and grid's stream.
    IWorkbook sourceWorkbook = application.Workbooks.Open(fs1);
    IWorkbook destinationWorkbook = application.Workbooks.Open(ms1);
    for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)

```

```

{
destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
return ms3;
}
`

```

[Downloading the merged memory stream](#)

You can download the merged memory stream by converting it into a `FileStreamResult`. In the following code, the merged memory stream is downloaded to the browser.

```

`ts
using Syncfusion.XlsIO;

public ActionResult ExcelExport(string gridModel)
{
ExcelEngine excelEngine = new ExcelEngine();
IApplication application = excelEngine.Excel;
application.DefaultVersion = ExcelVersion.Xlsx;
//open an workbook of streams through Open method of IWorkbooks
IWorkbook sourceWorkbook = application.Workbooks.Open(ms1);
IWorkbook destinationWorkbook = application.Workbooks.Open(ms2);
for (int i = 0; i < sourceWorkbook.Worksheets.Count; i++)
{
destinationWorkbook.Worksheets.AddCopy(sourceWorkbook.Worksheets[i]);
}
destinationWorkbook.ActiveSheetIndex = 1;
MemoryStream ms3 = new MemoryStream();
destinationWorkbook.SaveAs(ms3);
ms3.Position = 0;
// Save the MemoryStream into FileStreamResult
FileStreamResult fileStreamResult = new FileStreamResult(ms3, "Application/vnd.openxmlformats-officedocument.spreadsheetml.sheet");

```

```

fileStreamResult.FileDownloadName = "Export.xlsx";
//Dispose the instance of ExcelEngine
excelEngine.Dispose();
//Dispose the streams.
ms1.Dispose();
ms2.Dispose();
// return the file
return fileStreamResult;
}

```

Rotate a header text to a certain degree in the exported grid on the server side

The DataGrid has support to customize the column header styles such as changing text orientation, the font color, and so on in the exported Excel file. To achieve this requirement, use the `ServerExcelHeaderQueryCellInfo` event of the Grid.

The `ServerExcelHeaderQueryCellInfo` will be triggered when creating a column header for the excel document to be exported in the server side. Customize the column header in this event.

In the following demo, using the `HeaderCellRotate` method of the `GridExcelExport` class in the `ServerExcelHeaderQueryCellInfo` event, you can rotate the header text of the column header in the excel exported document.

```

`ts
public ActionResult ExcelExport(string gridModel)
{
    GridExcelExport exp = new GridExcelExport();
    Grid gridProperty = ConvertGridObject(gridModel);
    gridProperty.ServerExcelHeaderQueryCellInfo = ExcelHeaderQueryCellInfo;
    IEnumerable data = Utils.DataTableToJson(dt);
    var result = exp.ExcelExport<dynamic>(gridProperty, data);
    return result;
}

private void ExcelHeaderQueryCellInfo(object excel)
{
    ServerExcelHeaderQueryCellInfoEventArgs name = (ServerExcelHeaderQueryCellInfoEventArgs)excel;
    headerValues.Add(name.Column.HeaderText);
    var longestString = headerValues.Where(s => s.Length == headerValues.Max(m => m.Length)).First();
    GridExcelExport exp = new GridExcelExport();

```

```

var size = exp.ExcelTextSize(name.Style.Font.FontName, (float)name.Style.Font.Size, longestString);
name.Cell.RowHeight = size.Width;
exp.HeaderCellRotate(name, 45); // Give the rotate degree value by the user.
name.Style.Borders.LineStyle = Syncfusion.XlsIO.ExcelLineStyle.None;
}
`

```

Limitations

- The export feature for detail templates is not supported in server-side exporting.
- Multiple grids exporting feature is not supported with server side exporting.

Global local in ##Platform_Name## Grid control

Localization

The [Localization](#) library allows you to localize default text content of the Grid. The grid component has static text on some features (like group drop area text, pager information text, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the grid.

Locale keywords | Text

EmptyRecord | No records to display

True | true

False | false

InvalidFilterMessage | Invalid Filter Data

GroupDropArea | Drag a column header here to group its column

UnGroup | Click here to ungroup

GroupDisable | Grouping is disabled for this column

FilterbarTitle | \s filter bar cell

EmptyDataSourceError | DataSource must not be empty at initial load since columns are generated from dataSource in AutoGenerate Column Grid

Loading translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Grid in **Deutsch** culture.

INDEX.JS

```
ej.base.L10n.load({
  'de-DE': {
    'grid': {
      'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
      'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
      'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
      'EmptyDataSourceError': 'DataSource darf bei der Erstaustellung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
      'Item': 'Artikel',
      'Items': 'Artikel'
    },
    'pager': {
      'currentPageInfo': '{0} von {1} Seiten',
      'totalItemsInfo': '({0} Beiträge)',
      'firstPageTooltip': 'Zur ersten Seite',
      'lastPageTooltip': 'Zur letzten Seite',
      'nextPageTooltip': 'Zur nächsten Seite',
      'previousPageTooltip': 'Zurück zur letzten Seit',
      'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
      'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
    }
  }
});
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group);
var grid = new ej.grids.Grid({
  dataSource: data,
  locale: 'de-DE',
```

```

allowGrouping: true,
allowPaging: true,
pageSettings: { pageSize: 6 },
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
],
height: 220
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

```

Internationalization

The [Internationalization](#) library is used to globalize number, date, and time values in grid component using format strings in the [columns.format](#).

INDEX.JS

```

ej.base.setCulture('de');
ej.base.setCurrencyCode('EUR');
ej.base.L10n.load({
    'de-DE': {
        'grid': {
            'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
            'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
            'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
            'EmptyDataSourceError': 'DataSource darf bei der Erstausslastung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
            'Item': 'Artikel',
            'Items': 'Artikel'
        },
        'pager': {
            'currentPageInfo': '{0} von {1} Seiten',
            'totalItemsInfo': '({0} Beiträge)',
            'firstPageTooltip': 'Zur ersten Seite',
            'lastPageTooltip': 'Zur letzten Seite',

```

```

        'nextPageTooltip': 'Zur nächsten Seite',
        'previousPageTooltip': 'Zurück zur letzten Seit',
        'nextPagerTooltip': 'Gehen Sie zu den nächsten Pager-Elementen',
        'previousPagerTooltip': 'Gehen Sie zu vorherigen Pager-
Elementen'
    }
}
});
ej.grids.Grid.Inject(ej.grids.Page, ej.grids.Group);
var grid = new ej.grids.Grid({
    dataSource: data,
    locale: 'de-DE',
    allowGrouping: true,
    allowPaging: true,
    pageSettings: { pageSize: 6 },
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
        { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
        {
            field: 'Freight', headerText: 'Freight', width: 150, format: {
                format: 'C2', useGrouping: false,
                minimumSignificantDigits: 1, maximumSignificantDigits: 3,
currency: 'EUR'
            }, textAlign: 'Right'
        },
        { field: 'ShipName', headerText: 'Ship Name', width: 150 }
    ],
    height: 220
});
grid.appendTo('#Grid');

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

* In the above sample, Freight column is formatted by NumberFormatOptions.

* By default, [locale](#) value is en-US. If you want to change the en-US culture to a different culture, you have to change the [locale](#) accordingly.

Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Grid component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Grid, set the [enableRtl](#) to true.

INDEX.JS

```
ej.base.L10n.load({
  'ar-AE': {
    'grid': {
      'EmptyRecord': 'لا سجلات لعرضها',
      'EmptyDataSourceError': 'يجب أن يكون مصدر البيانات فارغة في',
      'التحميل الأولي منذ يتم إنشاء الأعمدة من مصدر البيانات في أوتوجينيراتد عمود الشبكة'
    },
    'pager': {

Accessibility in ##Platform_Name## Grid control

The Grid component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

WAI-ARIA attributes

The Grid component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Grid component:

Attributes	Purpose
---	---
<code>role=grid</code>	To represent the element containing the grid component.
<code>role=row</code>	To represent the element containing the cells of the row in the grid.
<code>role=rowgroup</code>	To represent the group of rows in the grid.
<code>role=columnheader</code>	To represent the cell in a row contains header information for a column in the grid.
<code>role=gridcell</code>	To represent a cell in the grid component.
<code>role=button</code>	To represent the element that acts as a button in the grid.
<code>role=search</code>	To represent the element that acts as a search region in the grid.
<code>role=presentation</code>	To represent the element to be not available for accessibility concerns.
<code>role=navigation</code>	To represent the element containing pager elements to navigate from one page to another.
<code>aria-colindex</code>	Defines the column index of the column with respect to the total number of columns within the grid.
<code>aria-rowindex</code>	Defines row index of the row with respect to the total number of rows within the grid.
<code>aria-rowspan</code>	Defines the number of rows spanned by a cell within the grid.
<code>aria-colspan</code>	Defines the number of columns spanned by a cell within the grid.
<code>aria-rowcount</code>	Defines the total number of rows in the grid.
<code>aria-colcount</code>	Defines the total number of columns in the grid.
<code>aria-selected</code>	Indicates the current "selected" state of the rows and cells in the grid.

| **aria-expanded** | Indicate if the expand icon in the hierarchy grid or grouped grid or detail grid is expanded or collapsed |

| **aria-sort** | Indicates whether the data in the grid are sorted in ascending or descending order. |

| **aria-busy** | Indicates an element is being modified and that assistive technologies may want to wait until the changes are complete before informing the user about the update. |

| **aria-owns** | Identifies an element in order to define a visual, functional, or contextual relationship between a parent and its child elements. |

| **aria-hidden** | Hides the element from accessibility concerns. |

| **aria-labelledby** | Provides an accessible name for the checkbox labels in excel filter, checkbox filter and column chooser dialog. |

| **aria-describedby** | Provides an description about the features enabled in the header when the grid header cell is focused. |

Keyboard interaction

The Grid component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Grid component.

Pager

Windows | MAC | To do this

Home | Fn + Left Arrow | Moves the focus to the first cell of the focused row.

End | Fn + Right Arrow | Moves the focus to the last cell of the focused row.

Ctrl + Home | Command + Fn + Left Arrow | Moves the focus to the first Cell of the first row in the grid.

Ctrl + End | Command + Fn + Right Arrow | Moves the focus to the last Cell of the last row in the grid.

Up Arrow | Up Arrow | Moves the cell focus upward from the focused cell.

Down Arrow | Down Arrow | Moves the cell focus downward from the focused cell.

Right Arrow | Right Arrow | Moves the cell focus right side from the focused cell.

Left Arrow | Left Arrow | Moves the cell focus left side from the focused cell.

Alt + J | Alt + J | Moves the focus to the entire grid.

Alt + W | Alt + W | Move the focus to the grid content element.

Selection

Windows | MAC | To do this

Ctrl + Up Arrow | Command + Up Arrow | Collapses all the visible groups.

Ctrl + Down Arrow | Command + Down Arrow | Expands all the visible groups.

Ctrl + Space | Ctrl + Space | Performs grouping when focused on a header element.

Enter | Enter | If the current cell is an expand/collapse cell then expands/collapses the current group/detailrow/childgrid.

Print

Windows | MAC | To do this

Ctrl + C | Command + C | Copies selected rows or cells data into the clipboard.

Ctrl + Shift + H | Ctrl + Shift + H | Copies selected rows or cells data with header into clipboard

Editing

Windows | MAC | To do this

Alt + Down arrow | Alt + Down arrow | Opens the filter menu(excel, menu and checkbox filter) when its header element is in focused state.

Column Menu

Windows | MAC | To do this

Ctrl + left arrow or right arrow | Command + left arrow or right arrow | Reorders the focused header column to the left or right side.

Sorting

Windows | MAC | To do this

Enter | Enter | Performs sorting(ascending/descending) on a column when its header element is in focused state.

Ctrl + Enter | Command + Enter | Performs multi-sorting on a column when its header element is in focused state.

Shift + Enter | Shift + Enter | Clears sorting for the focused header column.

* The Command and Control keys on Mac devices can be interchanged. When this switch occurs, use the Command key in place of the Control key and the Control key in place of the Command key for the above listed key interactions with Mac devices.

* For example, after switching the keys to group the columns when the header element is focused use Command + Space and for expanding the visible groups use Ctrl + Down Arrow.

Ensuring accessibility

The Grid component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Grid component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Grid component with accessibility tools.
