Format the tooltip

<!-- markdownlint-disable MD013 -->

By default, tooltip shows information of x and y value in points. In addition to that, you can show more information in tooltip. For example the format `${series.name} ${point.x}` shows series name and point x value.

INDEX.JS

```

var chartData = [

Tooltip template

Any HTML elements can be displayed in the tooltip by using the [template](#) property of the tooltip. You can use the `${x}` and `${y}` as place holders in the HTML element to display the x and y values of the corresponding data point.

INDEX.JS

```

Customize the appearance of tooltip

The [fill](#) and [border](#) properties are used to customize the background color and border of the tooltip respectively. The [textStyle](#) property in the tooltip is used to customize the font of the tooltip text. The [highlightColor](#) property is used to customize the point color while hovering for tooltip.

Zooming in ##Platform_Name## Chart control

Enable zooming

Chart can be zoomed in three ways.

- Selection - By setting [enableSelectionZooming](#) property to true in `zoomSettings`, you can zoom the chart by using the rubber band selection.
- Mousewheel - By setting [enableMouseWheelZooming](#) property to true in `zoomSettings`, you can zoom in and zoom out the chart by scrolling the mouse wheel.
- Pinch - By setting [enablePinchZooming](#) property to true in `zoomSettings`, you can zoom the chart through pinch gesture in touch enabled devices.

Pinch zooming is supported only in browsers that support multi-touch gestures. Currently IE11, Chrome and Opera browsers support multi-touch in desktop devices.

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

After zooming the chart, a zooming toolbar will appear with **zoom**, **zoomin**, **zoomout**, **pan** and **reset** buttons. Selecting the Pan option will allow to pan the chart and selecting the Reset option will reset the zoomed chart.

Modes

The [mode](#) property in zoomSettings specifies whether the chart is allowed to scale along the horizontal axis or vertical axis. The default value of the mode is XY (both axis).

There are three types of mode.

- X- Allows us to zoom the chart horizontally.
- Y - Allows us to zoom the chart vertically.
- XY – Allows us to zoom the chart both vertically and horizontally.

INDEX.JS

```
var series1 = [];
var point1;
var value = 80;
var i;
for (i = 1; i < 500; i++) {
    if (Math.random() > .5) {
        value += Math.random();
    } else {
        value -= Math.random();
    }
    point1 = { x: new Date(1950, i + 2, i), y: value.toFixed(1) };
    series1.push(point1);
}

Enable scrollbar

Using the [enableScrollbar](#) property, you can add a scrollbar to a zoomed chart. This scrollbar allows you to zoom or pan the chart. The appearance of the scrollbar can be customized using properties in [scrollbarSettings](#). For example, you can use [trackColor](#) and [trackRadius](#) properties to customize the track of the scrollbar, and [scrollbarRadius](#) and [scrollbarColor](#) properties to customize the scroller. The ability to zoom through the scrollbar can be enabled or disabled using the [enableZoom](#) property in [scrollbarSettings](#). Additionally, you can change the color of the grip and height of the scrollbar using the [gripColor](#) and [height](#) properties.

INDEX.JS

```

var series1 = [];
var point1;
var value = 80;
var i;
for (i = 1; i < 500; i++) {
    if (Math.random() > .5) {
        value += Math.random();
    } else {
        value -= Math.random();
    }
    point1 = { x: new Date(1950, i + 2, i), y: value.toFixed(1) };
    series1.push(point1);
}
var chart = new ej.charts.Chart({
    chartArea: { border: { width: 0 } },

Note: To use zooming feature, we need to inject `Zoom` module `Chart.Inject(Zoom)` method.

<!-- markdownlint-disable MD036 -->

Data editing in ##Platform_Name## Chart control

Enable Data Editing

We can use the data editing through inject the `DataEditing` module in the chart. It provides drag and drop support to the rendered points. Now, we can change the location or value of the point based on its `y` value. To enable the data editing, set the `enable` property to true in the drag settings of the series. Also, we can set color using `fill` property and set the data editing minimum and maximum range using `minY` and `maxY` properties.

INDEX.JS

```

var chart = new ej.charts.Chart({
  primaryXAxis: {
    valueType: 'DateTime',
    labelFormat: 'y',
    intervalType: 'Years',
    edgeLabelPlacement: 'Shift',
    majorGridLines: { width: 0 }
  },
  //Initializing Primary Y Axis
  primaryYAxis: {

Note: To use crosshair feature, we need to inject **Crosshair** module **Chart.Inject(Crosshair)** method.

Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the closest point and trackball tooltip displays the information about the point. To use trackball feature, we need to inject **Crosshair** module and **Tooltip** module using

Chart.Inject(Crosshair, Tooltip).

Trackball can be enabled by setting the [enable](#) property of the crosshair to true and [shared](#) property in **tooltip** to true in chart.

Synchronized Charts in ##Platform_Name## Chart control

Tooltip synchronization

The tooltip can be synchronized across multiple charts using the [showTooltip](#) and [hideTooltip](#) methods. When we hover over a data point in one chart, we call the [showTooltip](#) method for the other charts to display related information in other connected charts simultaneously.

In the [showTooltip](#) method, specify the following parameters programmatically to enable tooltip for a particular chart:

- **x** - Data point x-value or x-coordinate value.
- **y** - Data point y-value or y-coordinate value.

INDEX.JS

```

Crosshair synchronization

The crosshair can be synchronized across multiple charts using the [showCrosshair](#) and [hideCrosshair](#) methods. When we hover over one chart, we call the [showCrosshair](#) method for the other charts to align with data points in other connected charts, simplifying data comparison and analysis.

In the [showCrosshair](#) method, specify the following parameters programmatically to enable crosshair for a particular chart:

- **x** - Specifies the x-value of the point or x-coordinate.
- **y** - Specifies the y-value of the point or y-coordinate.

INDEX.JS

```

var charts = [];
var chart = new ej.charts.Chart({

Selection in ##Platform_Name## Chart control

Chart provides selection support for the series and its data points on mouse click.

When Mouse is clicked on the data points, the corresponding series legend also will be selected.

We have different types of selection mode for selecting a data.

- None
- Point
- Series
- Cluster
- DragXY
- DragX
- DragY

Point

You can select a point, by setting `selectionMode` to point.

INDEX.JS

Rectangular selection

DragXY, DragX and DragY

To fetch a collection of data under a particular region, you have to set `selectionMode` as `DragXY`.

- DragXY - Allow us to select data with respect to both horizontal and vertical axis.
- DragX - Allow us to select data with respect to horizontal axis.
- DragY - Allow us to select data with respect to vertical axis.

The selected data's are returned as an array collection in the

[dragComplete](#) event.

INDEX.JS

```

Chart print in ##Platform_Name## Chart control

Print

The rendered chart can be printed directly from the browser by calling the public method print. ID of the chart div element must be passed as argument to that method.

INDEX.JS

```

var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        title: 'Manager',
        valueType: 'Category',
        majorGridLines: { width: 0 }
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        title: 'Sales',
        minimum: 0,
        maximum: 20000,
        majorGridLines: { width: 0 }
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: [{ x: 'John', y: 10000 }, { x: 'Jake', y: 12000 }, { x: 'Peter', y: 18000 }, { x: 'James', y: 11000 }, { x: 'Mary', y: 9700 }],
            xName: 'x', width: 2,
            yName: 'y'
        }
    ],
    //Initializing Chart title
    title: 'Sales Comparision',
    '#element');

```

```
document.getElementById('print').onclick = () => {
    chart.print();
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

Export

The rendered chart can be exported to JPEG, PNG, SVG, PDF, XLSX, or CSV format using the export method in chart. The input parameters for this method are type for format and fileName for result.

The optional parameters for this method are,

- orientation - either portrait or landscape mode during PDF export,
- controls - pass collections of controls for multiple export,
- width - width of chart export, and
- height - height of chart export.

INDEX.JS

```
var chart = new ej.charts.Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    title: 'Manager',
```

```

        valueType: 'Category',
        majorGridLines: { width: 0 }
    },
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        title: 'Sales',
        minimum: 0,
        maximum: 20000,
        majorGridLines: { width: 0 }
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: [{ x: 'John', y: 10000 }, { x: 'Jake', y: 12000
}, { x: 'Peter', y: 18000 },
            { x: 'James', y: 11000 }, { x: 'Mary', y: 9700 }],
            xName: 'x', width: 2,
            yName: 'y'
        }
    ],
    //Initializing Chart title
    title: 'Sales Comparision',
}, '#element');
document.getElementById('print').onclick = () => {
    chart.export('PNG', 'result');
};

```

Adding header and footer in PDF export

In the export method, specify the following parameters to add a header and footer text to the exported PDF document:

- **header** - Specify the text that should appear at the top of the exported PDF document.
- **footer** - Specify the text that should appear at the bottom of the exported PDF document.

INDEX.JS

```

var chart = new ej.charts.Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    title: 'Manager',
    valueType: 'Category',
    majorGridLines: { width: 0 }
  },
  //Initializing Primary Y Axis

Multiple chart export

You can export the multiple charts in single page by passing the multiple chart objects in the export method of chart. To export multiple charts in a single page, follow the given steps:

Initially, render more than one chart to export, and then add button to export the multiple charts. In button click, call the export method in charts, and then pass the multiple chart objects in the export method.

INDEX.JS

```

var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        title: 'Manager',
        valueType: 'Category',
        majorGridLines: { width: 0 }
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        title: 'Sales',
        minimum: 0,
        maximum: 20000,

Exporting chart using base64 string

The chart can be exported as an image in the form of a base64 string by utilizing HTML canvas. This process involves rendering the chart onto a canvas element and then converting the canvas content to a base64 string.

INDEX.JS

```

var chart = new ej.charts.Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',
    majorGridLines: { width: 0 },
    majorTickLines: { width: 0 },
    minorTickLines: { width: 0 }
  },
  //Initializing Primary Y Axis
  primaryYAxis: {
    {
      minimum: 0,
      maximum: 40,
      interval: 10,
      lineStyle: {width : 0},
      minorTickLines: {width: 0},
      majorTickLines: {width : 0},
    },
    chartArea: {
      border: {
        width: 0
      }
    }
  },
  //Initializing Chart Series
  series: [
    {
      type: 'Column',
      dataSource: [
        { x: 'DEU', y: 35.5 }, { x: 'CHN', y: 18.3 }, { x: 'ITA', y:
17.6 }, { x: 'JPN', y: 13.6 },
        { x: 'US', y: 12 }, { x: 'ESP', y: 5.6 }, { x: 'FRA', y: 4.6
}, { x: 'AUS', y: 3.3 },
        { x: 'BEL', y: 3 }, { x: 'UK', y: 2.9 }
      ]
    }
  ]
}

```

```

        xName: 'x', width: 2,
        yName: 'y'
    }
},
],
}, '#element');
document.getElementById('export').onclick = function () {
    var svg = document.querySelector("#element_svg");
    var svgData = new XMLSerializer().serializeToString(svg);
    var canvas = document.createElement("canvas");
    document.body.appendChild(canvas);
    var svgSize = svg.getBoundingClientRect();
    canvas.width = svgSize.width;
    canvas.height = svgSize.height;
    var ctx = canvas.getContext("2d");
    var img = document.createElement("img");

```

Chart appearance in ##Platform_Name## Chart control

Custom color palette

You can customize the default color of series or points by providing a custom color palette of your choice by using the [palettes](#) property.

INDEX.JS

```
var chartData = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
var chart = new ej.charts.Chart({
  primaryXAxis: {
    valueType: 'Category',
    title: 'Countries'
  },
  primaryYAxis: {
    minimum: 0, maximum: 80,
    interval: 20, title: 'Medals'
  },
  series:[{
    dataSource: chartData,
    xName: 'country', yName: 'gold',
    name: 'Gold', type: 'Column'
  }, {
    dataSource: chartData,
    xName: 'country', yName: 'silver',
    name: 'Silver', type: 'Column'
  }, {
    dataSource: chartData,
    xName: 'country', yName: 'bronze',
    name: 'Bronze', type: 'Column'
  }],
  // palettes for chart
  palettes: ["#E94649", "#F6B53F", "#6FAAB0", "#C4C24A"],
  title: 'Olympic Medals'
}, '#element');
```

INDEX.HTML

```

</body></html>

```

Data point customization

The color of individual data point or data points within a range can be customized using the options below.

Point color mapping

You can bind the color for the points from [dataSource](#) for the series using [pointColorMapping](#) property.

INDEX.JS

```

var chart = new ej.charts.Chart({
    primaryXAxis: { valueType: 'Category', majorGridLines: { width: 0 } },
    primaryYAxis: {
        lineStyle: { width: 0 },
        majorTickLines: { width: 0 },
        minorTickLines: { width: 0 },
        labelFormat: '{value}°C',
    },
    chartArea: {
        border: {
            width: 0
        }
    },
    series: [
        {
            pointColorMapping: "color",
            dataSource: [
                { x: 'Jan', y: 6.96, color: "red" },
                { x: 'Feb', y: 8.9, color: "blue" },
                { x: 'Mar', y: 12, color: "orange" },
                { x: 'Apr', y: 17.5, color: "aqua" },
                { x: 'May', y: 22.1, color: "grey" }
            ], xName: 'x', yName: 'y', type: 'Column',
            animation: { enable: false },
            cornerRadius: {
                topLeft: 10, topRight: 10
            }
        }
    ]
});

```

```

        },
    ],
    title: 'USA CLIMATE - WEATHER BY MONTH',
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Chart title

Chart can be given a title using [title](#) property, to show the information about the data plotted.

INDEX.JS

```

var chartData = [
  { x: new Date(1975, 0, 1), y: 16, y1: 10, y2: 4.5 },
  { x: new Date(1980, 0, 1), y: 12.5, y1: 7.5, y2: 5 },
  { x: new Date(1985, 0, 1), y: 19, y1: 11, y2: 6.5 },
  { x: new Date(1990, 0, 1), y: 14.4, y1: 7, y2: 4.4 },
  { x: new Date(1995, 0, 1), y: 11.5, y1: 8, y2: 5 },
  { x: new Date(2000, 0, 1), y: 14, y1: 6, y2: 1.5 },
  { x: new Date(2005, 0, 1), y: 10, y1: 3.5, y2: 2.5 },
  { x: new Date(2010, 0, 1), y: 16, y1: 7, y2: 3.7 }
];
var chart = new ej.charts.Chart({
  primaryXAxis: {
    title: 'Years',
    lineStyle: { width: 0 },
    labelFormat: 'y',
    intervalType: 'Years',
    valueType: 'DateTime',
    edgeLabelPlacement: 'Shift'
  },
  primaryYAxis: {
    {
      title: 'Percentage (%)',
      minimum: 0, maximum: 20, interval: 2,
      labelFormat: '{value}%'
    }
  },
  series: [
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y',
      width: 2, name: 'China',
      marker: {
        visible: true, width: 10, height: 10
      }
    },
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y1',
      width: 2, name: 'Australia',
      marker: {
        visible: true, width: 10, height: 10
      }
    },
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y2',
      width: 2, name: 'Japan',

```

```

        marker: {
            visible: true, width: 10, height: 10
        },
    ],
    //Title for chart
    title: 'Unemployment Rates 1975-2010',
    titleStyle: {
        fontFamily: 'Arial',
        fontStyle: 'italic',
        fontWeight: 'regular',
        color: '#E27F2D',
        size: '23px'
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">

    { x: new Date(1995, 0, 1), y: 11.5, y1: 8, y2: 5 },
    { x: new Date(2000, 0, 1), y: 14, y1: 6, y2: 1.5 },
    { x: new Date(2005, 0, 1), y: 10, y1: 3.5, y2: 2.5 },
    { x: new Date(2010, 0, 1), y: 16, y1: 7, y2: 3.7 }
];
var chart = new ej.charts.Chart({
  primaryXAxis: {
    title: 'Years',
    lineStyle: { width: 0 },
    labelFormat: 'y',
    intervalType: 'Years',
    valueType: 'DateTime',
    edgeLabelPlacement: 'Shift'
  },
  primaryYAxis: {
    {
      title: 'Percentage (%)',
      minimum: 0, maximum: 20, interval: 2,
      labelFormat: '{value}%'
    },
  },
  series: [
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y',
      width: 2, name: 'China',
      marker: {
        visible: true, width: 10, height: 10
      },
    },
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y1',
      width: 2, name: 'Australia',
      marker: {
        visible: true, width: 10, height: 10
      },
    },
    {
      type: 'StepLine',
      dataSource: chartData, xName: 'x', yName: 'y2',
      width: 2, name: 'Japan',
      marker: {
        visible: true, width: 10, height: 10
      },
    },
  ],
  //Title for chart
  title: 'Unemployment Rates 1975-2010',
  titleStyle: { position: 'Bottom' },
  legendSettings: { visible: false }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Render methods in ##Platform_Name## Chart control

Chart uses following two rendering methods.

- SVG
- Canvas

SVG

SVG is used to render Chart by default for all browsers except IE8 and old versions.

Canvas

You can switch between SVG and Canvas rendering by using the `enableCanvas` option. The canvas mode rendering is used in the following scenarios,

- Plotting large number of data points.
- Performing high frequency live updates.

Limitations

- Animation is not supported.

Accessibility in ##Platform_Name## Chart control

The Chart control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Chart control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

```

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>

.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}

</style>

<div> - All
features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

```

WAI-ARIA attributes

The Chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chart control:

- img (role)
- button (role)
- region (role)
- aria-label (attribute)
- aria-hidden (attribute)
- aria-pressed (attribute)

Keyboard interaction

The Chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chart control.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the chart element. |

| **Tab** | Moves the focus to the next element in the chart. |

- | Shift + Tab | Moves the focus to the previous element in the chart. |
- | Down Arrow | Moves the focus to the data point left side from the selected point. |
- | Up Arrow | Moves the focus to the data point right side from the selected point. |
- | Left Arrow | Moves the focus to the next series in the chart. |
- | Right Arrow | Moves the focus to the previous series in the chart. |
- | ESC | Cancel the tooltip for the data point. |
- | Enter/Space | Selects the data point in the series. |
- | Down/Left Arrow | Moves the focus to the legend left side from the selected legend. |
- | Up/Right Arrow | Moves the focus to the legend right side from the selected legend. |
- | Enter/Space | Toggles the visibility of the corresponding series. |
- | Ctrl + + | Zoom in the chart. |
- | Ctrl + - | Zoom out the chart. |
- | Down/Up Arrow | Pan the chart vertically. |
- | Left/Right Arrow | Pan the chart horizontally. |
- | R | Reset the zoomed chart. |
- | Ctrl + P | Prints the Chart. |

Ensuring accessibility

The Chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chart control with accessibility tools.

Internationalization in ##Platform_Name## Chart control

Chart provide supports for internationalization for below chart elements.

- Datalabel.
- Axis label.
- Tooltip.

For more information about number and date formatter you can refer [internationalization](#).

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing an component that works in different cultures/locales. Internationalization library is used to globalize number, date, time values in Chart component using `labelFormat` property in axis.

Numeric Format

In the below example axis, point and tooltip labels are globalized to EUR.

INDEX.JS

```
var chartData = [
  { x: 1900, y: 4, y1: 2.6 }, { x: 1920, y: 3.0, y1: 2.8 },
  { x: 1940, y: 3.8, y1: 2.6 }, { x: 1960, y: 3.4, y1: 3 },
  { x: 1980, y: 3.2, y1: 3.6 }, { x: 2000, y: 3.9, y1: 3 }
]
var chart = new ej.charts.Chart({
  primaryXAxis: {
    title: 'Year',
    edgeLabelPlacement: 'Shift'
  },
  primaryYAxis: {
    title: 'Sales Amount in Millions',
    //Label format as currency
    labelFormat: 'c'
  },
  series:[{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    name: 'Product X', type: 'Column',
    marker: { dataLabel: { visible: true }}
  },{
    dataSource: chartData,
    xName: 'x', yName: 'y1',
    name: 'Product Y', type: 'Column',
    marker: { dataLabel: { visible: true }}
  }],
  title: 'Average Sales Comparison',
  tooltip: { enable: true, format: '${series.name} <br>${point.x} :
  ${point.y}' }
}, '#element');

Localization in ##Platform_Name## Chart control

Localization library allows to localize the default text content of Chart. In Chart component, it has the static text on some features(like zooming toolbars) and this can be changed to any other culture(Arabic, Deutsch, French, etc) by defining the locale value and translation object.

<!-- markdownlint-disable MD033 -->

Locale key words	Text to display
Zoom	Zoom
ZoomIn	ZoomIn
ZoomOut	ZoomOut
Reset	Reset
Pan	Pan
ResetZoom	Reset Zoom

To load translation object in an application use load function of L10n class.

For more information about localization, refer this [localization](#).

INDEX.JS

```
var chartData = [
  { x: 1900, y: 4, y1: 2.6 }, { x: 1920, y: 3.0, y1: 2.8 },
  { x: 1940, y: 3.8, y1: 2.6 }, { x: 1960, y: 3.4, y1: 3 },
  { x: 1980, y: 3.2, y1: 3.6 }, { x: 2000, y: 3.9, y1: 3 }
]
ej.base.L10n.load({
  'ar-AR': {
    'chart': {
      ZoomIn: 'تكبير',
      ZoomOut: 'تصغير',

Ej1 api migration in ##Platform_Name## Chart control

This article describes the API migration process of Chart component from Essential JS 1 to Essential JS 2.

Annotations

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
rotation of annotation	Property:annotations.angle\$("#chart").ejChart({ annotations: [{angle: 90}]});	Property:annotations.rotationlet chart: Chart = new Chart({annotations: [{rotation: 90}]});chart.appendTo('#chart');
annotations	Property:annotations.content\$("#chart").ejChart({ annotations: [{ content: 'Chart'}]});	Property:annotations.contentlet chart: Chart = new Chart({annotations: [{content: 'Chart'}]});chart.appendTo('#chart');
coordinate unit for annotation	Property:annotations.coordinateUnit\$("#container").ejChart({ annotations :[{ coordinateUnit : "pixels"}]});	Property:annotations.coordinateUnitslet chart: Chart = new Chart({annotations: [{coordinateUnits: 'Pixel'}]});chart.appendTo('#chart');
horizontalAlignment for annotation	Property:annotations.horizontalAlignment\$("#container").ejChart({ annotations :[{ horizontalAlignment : "middle"}]});	Property:annotations.horizontalAlignmentlet chart: Chart = new Chart({annotations: [{horizontalAlignment: 'Center'}]});chart.appendTo('#chart');
margin for annotation	Property:annotations.margin\$("#container").ejChart({ annotations :[{ margin { right: 5, left: 5, top: 5, bottom: 5}}]});	Not applicable
Opacity for annotation	Property:annotations.opacity\$("#container").ejChart({ annotations :[{ opacity: 0.4 }]});	Not applicable

Region for annotation with respect to chart or series	Property:annotations.region \$("#container").ejChart({ annotations : [{ region : "chart" }] });	Property:annotations.region let chart: Chart = new Chart({ annotations: [{ region: 'Chart' }] }); chart.appendTo('#chart');
verticalAlignm ent for annotation	Property:annotations.verticalAlignment \$("#container").ejChart({ annotations : [{ verticalAlignment : "middle" }] });	Property:annotations.verticalAlignm ent let chart: Chart = new Chart({ annotations: [{ verticalAlignment: 'Center' }] }); chart.appendTo('#chart');
Visibility of annotations	Property:annotations.visible \$("#container").ejChart({ annotations : [{ visible: true }] });	Not applicable
X offset for annotation	Property:annotations.x \$("#container").ejChart({ annotations : [{ x : "100" }] });	Property:annotations.x let chart: Chart = new Chart({ annotations: [{ x: '100' }] }); chart.appendTo('#chart');
X axis name in which annotation to be rendered	Property:annotations.xAxisName \$("#container").ejChart({ annotations : [{ xAxisName : "xAxis" }] });	Property:annotations.xAxisName let chart: Chart = new Chart({ annotations: [{ xAxisName: 'xAxis' }] }); chart.appendTo('#chart');
Y offset for annotation	Property:annotations.y \$("#container").ejChart({ annotations : [{ y : "100" }] });	Property:annotations.y let chart: Chart = new Chart({ annotations: [{ y: '100' }] }); chart.appendTo('#chart');
Y axis name in which annotation to be rendered	Property:annotations.yAxisName \$("#container").ejChart({ annotations : [{ yAxisName : "yAxis" }] });	Property:annotations.yAxisName let chart: Chart = new Chart({ annotations: [{ yAxisName: 'yAxis' }] }); chart.appendTo('#chart');

Columns

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
Columns in chart	Property:columnDefinitions\$("#chart").ejChart({ columnDefinitions: [] });	Property:columns let chart: Chart = new Chart({ columns: [] }); chart.appendTo('#chart');
unit	Property:unit \$("#container").ejChart({	Not Applicable

	<code>columnDefinitions :[{unit : "percentage"}]]});</code>	
width of columns in chart	<code>Property:columnWidth\$("#chart").ejChart({ columnDefinitions: [{ columnWidth: '50%'}]]});</code>	<code>Property:widthlet chart: Chart = new Chart({ columns: [{ width: '300'}]]});chart.appendTo('#chart');</code>
Line customization	<code>Property:lineColor, lineWidth\$("#chart").ejChart({ columnDefinitions: [{ columnWidth: '50%', lineColor: 'brown', lineWidth: 2}]]});</code>	<code>Property:borderlet chart: Chart = new Chart({ columns: [{ width: '300', border: { width: 2, color: 'brown'}}]]});chart.appendTo('#chart');</code>

CommonSeriesOptions

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
commonSeriesOptions	<code>Property:commonSeriesOptions \$("#container").ejChart({ commonSeriesOptions: { }});</code>	Not Applicable

Crosshair

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
crosshair	<code>Property:visible\$("#container").ejChart({ crosshair: { visible: true}});</code>	<code>Property:enablelet chart: Chart = new Chart({ crosshair: { enable: false }});chart.appendTo('#chart');</code>
trackballTooltipSettings	<code>Property:trackballTooltipSettings\$("#container").ejChart({ crosshair: { trackballTooltipSettings: { border: { width:2 }}}});</code>	Not applicable

marker	Property:marker\$("#container").ejChart({ crosshair : { marker : { border : { width :2 } } }});	Not applicable
crosshair line style	Property:line\$("#container").ejChart({ crosshair : { line: { width: 2, color: 'red' } }});	let chart: Chart = new Chart({ crosshair: { border: { width: 2, color: 'black' }}});
type	Property:type\$("#container").ejChart({ crosshair : { type: 'trackball' }});	Not applicable
		## 3D chart
		Behaviour API in Essential JS 1 API in Essential JS 2
		3d chart Property:enable3D\$("#container").ejChart({ enable3D: true}); Not applicable
		Rotation of 3d chart Property:enableRotation\$("#container").ejChart({ enableRotation: false}); Not applicable
		depth Property:depth\$("#container").ejChart({ depth: 45}); Not applicable
		## Canvas rendering
		Behaviour API in Essential JS 1 API in Essential JS 2
		canvas rendering Property:enableCanvasRendering\$("#container").ejChart({ enableCanvasRendering: true}); Not applicable
		## Indicators
		Behaviour API in Essential JS 1 API in Essential JS 2

		Type of Indicator	Property:type\$("#container").ejChart({ indicators: [{ type: 'Sma' }] });	Property:typetlet chart: Chart = new Chart({ indicators: [{ type: 'Sma' }] });
		Period for indicator	Property:period\$("#container").ejChart({ indicators: [{ period: 14 }] });	Property:typetlet chart: Chart = new Chart({ indicators: [{ period: 14 }] });
		Period for indicator	Property:period\$("#container").ejChart({ indicators: [{ period: 14 }] });	Property:periodlet chart: Chart = new Chart({ indicators: [{ period: 14 }] });
		%K value in stochastic indicator	Property:kPeriod\$("#container").ejChart({ indicators: [{ kPeriod: 14 }] });	Property:kPeriodlet chart: Chart = new Chart({ indicators: [{ kPeriod: 14 }] });
		%D value in stochastic indicator	Property:dPeriod\$("#container").ejChart({ indicators: [{ dPeriod: 3 }] });	Property:dPeriodlet chart: Chart = new Chart({ indicators: [{ dPeriod: 3 }] });
		Shows overSold/over Bought values	Not applicable	Property:showZoneslet chart: Chart = new Chart({ indicators: [{ showZones: true }] });
		Overbought value for RSI and stochastic indicator	Not applicable	Property:overBoughtlet chart: Chart = new Chart({ indicators: [{ overBought: 80 }] });
		Oversold value for RSI and stochastic indicator	Not applicable	Property:overSoldlet chart: Chart = new Chart({ indicators: [{ overSold: 20 }] });
		Standard deviation for Bollingerbands	Property:standardDeviations\$("#container").ejChart({ indicators: [{ standardDeviations: 2 }] });	Property:standardDeviationlet chart: Chart = new Chart({ indicators: [{

			<code>standardDeviation : 2 }]]]);</code>
	standard deviation	<code>Property:standardDeviations\$("#container").ejChart({ indicators: [{ standardDeviations: 2 }]]]);</code>	<code>Property:standardDeviationlet chart: Chart = new Chart({ indicators: [{ standardDeviation : 2 }]]]);</code>
	Field for indicator	<code>Property:field\$("#container").ejChart({ indicators: [{ field: 'Close' }]]]);</code>	<code>Property:fieldlet chart: Chart = new Chart({ indicators: [{ field: 'Close' }]]]);</code>
	Slow period for MACD indicator	<code>Property:shortPeriod\$("#container").ejChart({ indicators: [{ shortPeriod: 12 }]]]);</code>	<code>Property:slowPeriodlet chart: Chart = new Chart({ indicators: [{ slowPeriod: 12 }]]]);</code>
	Fast period for MACD indicator	<code>Property:longPeriod\$("#container").ejChart({ indicators: [{ longPeriod: 26 }]]]);</code>	<code>Property:fastPeriodlet chart: Chart = new Chart({ indicators: [{ fastPeriod: 26 }]]]);</code>
	Line style for MACD indicator	<code>Property:macdLine\$("#container").ejChart({ indicators: [{ macdLine: { width: 2, fill: 'red' } }]]]);</code>	<code>Property:fastPeriodlet chart: Chart = new Chart({ indicators: [{ macdLine: { width: 2, color: 'red' } }]]]);</code>
	Type of MACD indicator	<code>Property:macdType\$("#container").ejChart({ indicators: [{ macdType: 'both' }]]]);</code>	<code>Property:fastPeriodlet chart: Chart = new Chart({ indicators: [{ macdType: 'Both' }]]]);</code>
	Color of the positive bars in Macd indicators	Not applicable	<code>Property:macdPositiveColorlet chart: Chart = new Chart({ indicators: [{ macdPositiveColor : 'red' }]]]);</code>

		Color of the negative bars in Macd indicators	Not applicable	Property:macdNegativeColor let chart: Chart = new Chart({ indicators: [{ macdNegativeColor: 'red' }] });
		Color for Bollinger bands	Not applicable	Property:bandColor let chart: Chart = new Chart({ indicators: [{ bandColor: 'red' }] });
		Appearance of upper line in indicator	Property:upperLine\$("#container").ejChart({ indicators: [{ upperLine: { fill: '#EECCAA', width: 2 } }] });	Property:upperLine let chart: Chart = new Chart({ indicators: [{ upperLine: { type: 'Smooth', color: '#FFEEFF', width: 2, dashArray: '10,5' } }] });
		Appearance of lower line in indicator	Property:lowerLine\$("#container").ejChart({ indicators: [{ lowerLine: { fill: '#EECCAA', width: 2 } }] });	Property:lowerLine let chart: Chart = new Chart({ indicators: [{ lowerLine: { type: 'Smooth', color: '#FFEEFF', width: 2, dashArray: '10,5' } }] });
		Appearance of period line in indicator	Property:periodLine\$("#container").ejChart({ indicators: [{ periodLine: { fill: '#EECCAA', width: 2 } }] });	Property:lowerLine let chart: Chart = new Chart({ indicators: [{ lowerLine: { type: 'Smooth', color: '#FFEEFF', width: 2, dashArray: '10,5' } }] });
		Name of the series for which indicator has to be drawn.	Property:seriesName\$("#container").ejChart({ indicators: [{ seriesName: '' }] });	Property:lowerLine let chart: Chart = new Chart({ indicators: [{ seriesName: '' }] });

		Options to customize the histogram in MACD indicator	Property:seriesName\$("#container").ejChart({ indicators: [{ histogram: { } }]});	Not applicable
		Enabling animation	Property:enableAnimation\$("#container").ejChart({ indicators: [{ enableAnimation: true }]});	Property:animation.enablelet chart: Chart = new Chart({ indicators: [{ animation: { enable: true } }]});
		Animation duration	Property:animationDuration\$("#container").ejChart({ indicators: [{ animationDuration: 3000 }]});	Property:animation.durationlet chart: Chart = new Chart({ indicators: [{ animation: { duration: 3000 } }]});
		Tooltip	Property:tooltip\$("#container").ejChart({ indicators: [{ tooltip: { visible: true } }]});	Not applicable
		Trigger value of MACD indicator.	Property:trigger\$("#container").ejChart({ indicators: [{ trigger: 14 }]});	Not applicable
		Fill color for indicator	Property:fill\$("#container").ejChart({ indicators: [{ fill: '#EEDDCC' }]});	Property:animation.enablelet chart: Chart = new Chart({ indicators: [{ fill: 'red' }]});
		Width for indicator	Property:width\$("#container").ejChart({ indicators: [{ width: 2 }]});	Property:widthlet chart: Chart = new Chart({ indicators: [{ width: 3 }]});
		xAxis Name of indicator	Property:xAxisName\$("#container").ejChart({ indicators: [{ xAxisName: '' }]});	Property:xAxisNamelet chart: Chart = new Chart({ indicators: [{ xAxisName: '' }]});

		yAxis Name of indicator Property: yAxisName\$("#container").ejChart({ indicators: [{ yAxisName: ' ' }] });	Property: yAxisNamelet chart: Chart = new Chart({ indicators: [{ yAxisName: ' ' }] });
		Visibility of indicator Property: visibility\$("#container").ejChart({ indicators: [{ visibility: true }] });	Not applicable
## Legend			
	Behavior	API in Essential JS 1	API in Essential JS 2
	Default legend	Property: visible\$("#container").ejChart({ legend: { visible: true } });	Property: visiblelet chart: Chart = new Chart({ legendSettings: { visible: true } });
	Legend height	Property: size.height\$("#container").ejChart({ legend: { size: { height: 50 } } });	Property: heightlet chart: Chart = new Chart({ legendSettings: { height: '30' } });

bearFillColor	Property:bearFillColor\$("#chart").ejChart({ series: [{bearFillColor: 'red'}]});	Property:bearFillColorlet chart: Chart = new Chart({ series: [{bearFillColor: 'red'}]});chart.appendTo('#chart');
Border	Property:border\$("#chart").ejChart({ series: [{ border: { color: 'red', width: 2, dashArray: '10, 5' } }]});	Property:rowslet chart: Chart = new Chart({ series: [{ border: { color: 'red', width: 2 } }]});chart.appendTo('#chart');
BoxPlotMode	Property:boxPlotMode\$("#chart").ejChart({ series: [{ boxPlotMode: 'inclusive' }]});	Property:rowslet chart: Chart = new Chart({ series: [{ boxPlotMode: 'Inclusive' }]});chart.appendTo('#chart');
Minimum radius of Bubble series	Property:bubbleOptions.minRadius\$("#chart").ejChart({ series: [{ bubbleOptions: { minRadius: 2 } }]});	Property:minRadiuslet chart: Chart = new Chart({ series: [{ minRadius: 2 }]});chart.appendTo('#chart');
Maximum radius of Bubble series	Property:bubbleOptions.maxRadius\$("#chart").ejChart({ series: [{ bubbleOptions: { maxRadius: 10 } }]});	Property:maxRadiuslet chart: Chart = new Chart({ series: [{ maxRadius: 2 }]});chart.appendTo('#chart');
bullFillColor	Property:bullFillColor\$("#chart").ejChart({ series: [{bullFillColor: 'red'}]});	Property:bullFillColorlet chart: Chart = new Chart({ series: [{bullFillColor: 'red' }]});

		<code>});});chart.appendTo('#chart');</code>
Cardinal spline tension for spline series	<code>Property:cardinalSplineTension\$("#chart").ejChart({ series: [{ cardinalSplineTension: 0.5 }]});</code>	<code>Property:cardinalSplineTensionlet chart: Chart = new Chart({ series: [{ cardinalSplineTension: 0.5 }]});chart.appendTo('#chart');</code>
Column Width for rectangle series	<code>Property:columnWidth\$("#chart").ejChart({ series: [{ columnWidth: 0.5 }]});</code>	<code>Property:columnWidthlet chart: Chart = new Chart({ series: [{ columnWidth: 0.5 }]});chart.appendTo('#chart');</code>
Column spacing for rectangle series	<code>Property:columnSpacing\$("#chart").ejChart({ series: [{ columnSpacing: 0.5 }]});</code>	<code>Property:columnSpacinglet chart: Chart = new Chart({ series: [{ columnSpacing: 0.5 }]});chart.appendTo('#chart');</code>
Topleft radius for rectangle series	<code>Property:cornerRadius.topLeft\$("#chart").ejChart({ series: [{ topLeft: 0 }]});</code>	<code>Property:cornerRadius.topLeftlet chart: Chart = new Chart({ series: [{ topLeft: 0 }]});chart.appendTo('#chart');</code>
topRight radius for rectangle series	<code>Property:cornerRadius.topRight\$("#chart").ejChart({ series: [{ topRight: 0 }]});</code>	<code>Property:cornerRadius.topRightlet chart: Chart = new Chart({ series: [{ topRight: 0 }]});chart.appendTo('#chart');</code>
bottomRight radius for rectangle series	<code>Property:cornerRadius.bottomRight\$("#chart").ejChart({ series: [{ bottomRight: 0 }]});</code>	<code>Property:cornerRadius.bottomRightlet chart: Chart = new Chart({ series: [{ bottomRight: 0 }]});chart.appendTo('#chart');</code>
bottomLeft radius for rectangle series	<code>Property:cornerRadius.bottomLeft\$("#chart").ejChart({ series: [{ bottomLeft: 0 }]});</code>	<code>Property:cornerRadius.bottomLeftlet chart: Chart = new Chart({ series: [{ bottomLeft: 0 }]});chart.appendTo('#chart');</code>
DashArray property	<code>Property:dashArray\$("#chart").ejChart({ series: [{ dashArray: '10, 5' }]});</code>	<code>Property:dashArraylet chart: Chart = new Chart({ series: [{ dashArray: '10, 5' }]});</code>

		<code>});});chart.appendTo('#chart');</code>
Data Source for series	<code>Property:dataSource\$("#chart").ejChart({ series: [{ dataSource: [] }]});</code>	<code>Property:dashArraylet chart: Chart = new Chart({ series: [{ dataSource: [] }]});chart.appendTo('#chart');</code>
Draw type for Polar series	<code>Property:drawType\$("#chart").ejChart({ series: [{ drawType: 'Line' }]});</code>	<code>Property:drawTypelet chart: Chart = new Chart({ series: [{ drawType: 'Line' }]});chart.appendTo('#chart');</code>
Empty Point Settings for series	<code>Property:emptyPointSettings.visible\$("#chart").ejChart({ series: [{ emptyPointSettings: { visible: false } }]});</code>	Not Applicable
Empty Point Display mode	<code>Property:emptyPointSettings.displayMode\$("#chart").ejChart({ series: [{ displayMode: 'gap' }]});</code>	<code>Property:emptyPointSettings.displayModelet chart: Chart = new Chart({ series: [{ displayMode: 'Average' }]});chart.appendTo('#chart');</code>
Empty Point color	<code>Property:emptyPointSettings.color\$("#chart").ejChart({ series: [{ color: 'red' }]});</code>	<code>Property:emptyPointSettings.filllet chart: Chart = new Chart({ series: [{ fill: 'red' }]});chart.appendTo('#chart');</code>
Empty Point Border	<code>Property:emptyPointSettings.border\$("#chart").ejChart({ series: [{ emptyPointSettings: { color: 'red', width: 2 } }]});</code>	<code>Property:filllet chart: Chart = new Chart({ series: [{ emptyPointSettings: { color: 'red', width: 2 } }]});chart.appendTo('#chart');</code>
Enable animation for series	<code>Property:enableAnimation\$("#chart").ejChart({ series: [{ enableAnimation: true }]});</code>	<code>Property:animation.enablelet chart: Chart = new Chart({ series: [animation: { enable: false }]});chart.appendTo('#chart');</code>
Animation duration for series	<code>Property:animationDuration\$("#chart").ejChart({ series: [{ animationDuration: 1000 }]});</code>	<code>Property:animation.durationlet chart: Chart = new Chart({ series: [animation: { duration: 1000 }]});chart.appendTo('#chart');</code>

Animation delay for series	Not Applicable	Property:animation.durationlet chart: Chart = new Chart({ series: [animation: { delay: 100 }] }); chart.appendTo('#chart');
Drag settings for series	Property:dragSettings\$("#chart").ejChart({ series: [{ dragSettings: { mode: 'X' } }] });	Not Applicable
Errorbar settings for series	Property:errorBarSettings\$("#chart").ejChart({ series: [{ errorBarSettings: { } }] });	Property:errorBarSettingslet chart: Chart = new Chart({ series: [{errorBarSettings: { } }] });
Closed series	Property:isClosed\$("#chart").ejChart({ series: [{ isClosed: true }] });	Property:isClosedlet chart: Chart = new Chart({ series: [{ isClosed: true }] });
Stacking Property for series	Property:isStacking\$("#chart").ejChart({ series: [{ isStacking: true }] });	Not Applicable
Line cap for series	Property:lineCap\$("#chart").ejChart({ series: [{ lineCap: 'butt' }] });	Not Applicable
Line join for series	Property:lineJoin\$("#chart").ejChart({ series: [{ lineJoin: 'round' }] });	Not Applicable
Opacity for series	Property:opacity\$("#chart").ejChart({ series: [{ opacity: 0.7 }] });	Property:opacitylet chart: Chart = new Chart({ series: [{ opacity: 0.7 }] });
Outlier settings of series	Property:outLierSettings\$("#chart").ejChart({ series: [{ outLierSettings: { shape: 'rectangle' , size: { height: 30, width: 20 } } }] });	Not Applicable
Palette	Property:palette\$("#chart").ejChart({ series: [{ palette: "ColorFieldName" }] });	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ pointColorMapping: 'color' }] }); chart.appendTo('#chart');
Positive fill for waterfall series	Property:positiveFill\$("#chart").ejChart({ series: [{ positiveFill: "red" }] });	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ pointColorMapping: 'color' }] }); chart.appendTo('#chart');

Show average value in box and whisker series	Property:showMedian\$("#chart").ejChart({ series: [{ showMedian: true }];});	Property:pointColorMappinglet chart: Chart = new Chart({ series: [{ showMean: false }];});chart.appendTo('#chart');
To group the series of stacking collection.	Property:stackingGroup\$("#chart").ejChart({ series: [{ stackingGroup: 'group' }];});	Property:stackingGrouplet chart: Chart = new Chart({ series: [{ stackingGroup: 'group' }];});chart.appendTo('#chart');
Specifies the type of the series to render in chart.	Property:type\$("#chart").ejChart({ series: [{ type: 'Line' }];});	Property:typetlet chart: Chart = new Chart({ series: [{ type: 'Line' }];});chart.appendTo('#chart');
Defines the visibility of the series.	Property:visibility\$("#chart").ejChart({ series: [{ visibility: true }];});	Property:visiblelet chart: Chart = new Chart({ series: [{ visible: true }];});chart.appendTo('#chart');
Enables or disables the visibility of legend item.	Property:visibleOnLegend \$("#chart").ejChart({ series: [{ visibleOnLegend : true }];});	Property:toggleVisibilitylet chart: Chart = new Chart({ legendSettings: [{ toggleVisibility: true }];});chart.appendTo('#chart');
Specifies the different types of spline curve.	Property:splineType \$("#chart").ejChart({ series: [{ splineType : 'Natural' }];});	Property:splineTypetlet chart: Chart = new Chart({ legendSettings: [{ splineType: 'Natural' }];});chart.appendTo('#chart');
Specifies the name of the x-axis that has to be associated with this series. Add an axis instance with this name to axes collection.	Property:xAxisName\$("#chart").ejChart({ series: [{ xAxisName : 'secondaryXAxis' }];});	Property:xAxisNamelet chart: Chart = new Chart({ series: [{ xAxisName: 'secondaryXAxis' }];});chart.appendTo('#chart');

Name of the property in the datasource that contains x value for the series.	Property:xName\$("#chart").ejChart({ series: [{ xName : 'x' }]});	Property:xNamelet chart: Chart = new Chart({ series: [{ xName: 'x' }]});chart.appendTo('#chart');
Specifies the name of the y-axis that has to be associated with this series. Add an axis instance with this name to axes collection.	Property:yAxisName\$("#chart").ejChart({ series: [{ yAxisName : 'secondaryYAxis' }]});	Property:yAxisNamelet chart: Chart = new Chart({ series: [{ yAxisName: 'secondaryYAxis' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains y value for the series.	Property:yName\$("#chart").ejChart({ series: [{ yName : 'y' }]});	Property:yNamelet chart: Chart = new Chart({ series: [{ yName: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains high value for the series.	Property:high\$("#chart").ejChart({ series: [{ high : 'y' }]});	Property:highlet chart: Chart = new Chart({ series: [{ high: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains low value for the series.	Property:low\$("#chart").ejChart({ series: [{ low : 'y' }]});	Property:lowlet chart: Chart = new Chart({ series: [{ low: 'y' }]});chart.appendTo('#chart');
Name of the property in the datasource that contains	Property:close\$("#chart").ejChart({ series: [{ close : 'y' }]});	Property:closelet chart: Chart = new Chart({ series: [{ close: 'y' }]});chart.appendTo('#chart');

close value for the series.		
Name of the property in the datasource that contains open value for the series.	Property:open\$("#chart").ejChart({ series: [{ open : 'y' }]});	Property:openlet chart: Chart = new Chart({ series: [{ open: 'y' }]});chart.appendTo('#chart');
Option to add trendlines to chart.	Property:trendLines\$("#chart").ejChart({ series: [{ trendLines : [{}]}]});	Property:trendLineslet chart: Chart = new Chart({ series: [{ trendLines : [{}]}]});chart.appendTo('#chart');
Options for customizing the appearance of the series or data point while highlighting.	Property:highlightSettings\$("#chart").ejChart({ series: [{ highlightSettings : {} }]});	Not applicable.
Options for customizing the appearance of the series/data point on selection.	Property:selectionSettings\$("#chart").ejChart({ series: [{ selectionSettings : {} }]});	Not applicable.
## marker		
visibility of marker	Property:visible\$("#chart").ejChart({ series: [{ marker: { visible: true } }]});	Property:visiblelet chart: Chart = new Chart({ series: [{ marker: { visible: false } }]});chart.appendTo('#chart');
Fill for marker	Property:fill\$("#chart").ejChart({ series: [{ marker: { fill : 'red' } }]});	Property:visiblelet chart: Chart = new Chart({ series: [{ marker: { fill : 'red' } }]});chart.appendTo('#chart');

Opacity for marker	Property:opacity\$("#chart").ejChart({ series: [{ marker: { opacity : 0.5 } }]});	Property:opacitylet chart: Chart = new Chart({ series: [{ marker: { opacity : 0.5 } }]});chart.appendTo('#chart');
Shape of marker	Property:shape\$("#chart").ejChart({ series: [{ marker: { shape : 'Circle' } }]});	Property:shapelet chart: Chart = new Chart({ series: [{ marker: { shape : 'Triangle' } }]});chart.appendTo('#chart');
ImageUrl of marker	Property:imageUrl\$("#chart").ejChart({ series: [{ marker: { imageUrl : '' } }]});	Property:imageUrllet chart: Chart = new Chart({ series: [{ marker: { imageUrl : '' } }]});chart.appendTo('#chart');
Border of marker	Property:border\$("#chart").ejChart({ series: [{ marker: { border : { width: 2, color: 'red' } } }]});	Property:shapelet chart: Chart = new Chart({ series: [{ marker: { border : { width: 2, color: 'red' } } }]});chart.appendTo('#chart');
Height of marker	Property:size.height\$("#chart").ejChart({ series: [{ marker: { size: { height: 30 } } }]});	Property:heightlet chart: Chart = new Chart({ series: [{ marker: { height: 25 } }]});chart.appendTo('#chart');
Width of marker	Property:size.width\$("#chart").ejChart({ series: [{ marker: { size: { width: 30 } } }]});	Property:widthlet chart: Chart = new Chart({ series: [{ marker: { width: 25 } }]});chart.appendTo('#chart');
Width of marker	Property:size.width\$("#chart").ejChart({ series: [{ marker: { size: { width: 30 } } }]});	Property:widthlet chart: Chart = new Chart({ series: [{ marker: { width: 25 } }]});chart.appendTo('#chart');
DataLabelSettings of marker	Property:marker.dataLabel\$("#chart").ejChart({ series: [{ marker: { dataLabel: { } } }]});	Property:marker.dataLabellet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { } } }]});

		<code>}};});chart.appendTo('#chart');</code>
Visibility of dataLabel	<code>Property:dataLabel.visible\$("#chart").ejChart({ series: [{ marker: {dataLabel: { visible: true } } }]});</code>	<code>Property:dataLabel.visiblelet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { visible: true } } }]});chart.appendTo('#chart');</code>
Text mapping name of dataLabel	<code>Property:dataLabel.textMappingName\$("#chart").ejChart({ series: [{ marker: {dataLabel: { textMappingName: '' } } }]});</code>	<code>Property:dataLabel.namelet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { name: '' } } }]});chart.appendTo('#chart');</code>
Fill color of data label	<code>Property:dataLabel.fill\$("#chart").ejChart({ series: [{ marker: {dataLabel: { fill: 'pink' } } }]});</code>	<code>Property:dataLabel.filllet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { fill: 'pink' } } }]});chart.appendTo('#chart');</code>
Opacity of data label	<code>Property:dataLabel.opacity\$("#chart").ejChart({ series: [{ marker: {dataLabel: { opacity: 0.6 } } }]});</code>	<code>Property:dataLabel.filllet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { opacity: 0.4 } } }]});chart.appendTo('#chart');</code>
Text position of data label	<code>Property:dataLabel.textPosition\$("#chart").ejChart({ series: [{ marker: {dataLabel: { textPosition: 'middle' } } }]});</code>	<code>Property:dataLabel.positionlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { position: 'Top' } } }]});chart.appendTo('#chart');</code>
Alignment of data label	<code>Property:dataLabel.verticalAlignment\$("#chart").ejChart({ series: [{ marker: {dataLabel: { verticalAlignment: 'near' } } }]});</code>	<code>Property:dataLabel.alignmentlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { alignment: 'Near' } } }]});chart.appendTo('#chart');</code>
Border of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { border: { color: 'blue', width: 2, opacity: 0.4 } } }]});</code>	<code>Property:dataLabel.alignmentlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { border: { color: 'blue', width: 2 } } }]});</code>

		<code>}};});chart.appendTo('#chart');</code>
Offset for data label	<code>Property:dataLabel.offset\$("#chart").ejChart({ series: [{ marker: {dataLabel: { offset: { x: 5, y: 6 } } } }]});</code>	Not Applicable
Margin of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { margin: { top: 10, bottom: 10, left: 10, right: 10 } } } }]});</code>	<code>Property:dataLabel.marginlet chart: Chart = new Chart({ series: [{ marker: { dataLabel: { margin: { top: 10, bottom: 10, left: 10, right: 10 } } } }]});chart.appendTo('#chart');</code>
Font of data label	<code>Property:dataLabel.border\$("#chart").ejChart({ series: [{ marker: {dataLabel: { font: { fontFamily: 'SegoeUI', fontStyle: 'italic', fontWeight: '600', opacity: 0.5, size: 12, color: 'red' } } } }]});</code>	<code>Property:dataLabel.marginlet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { font: { fontFamily: 'SegoeUI', fontStyle: 'italic', fontWeight: '600', opacity: 0.5, size: 12, color: 'red' } } } }]});chart.appendTo('#chart');</code>
HTML template in dataLabel	<code>Property:dataLabel.template\$("#chart").ejChart({ series: [{ marker: {dataLabel: { template: 'Chart' } } }]});</code>	<code>Property:dataLabel.templatelet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { template: 'Chart' } } }]});chart.appendTo('#chart');</code>
Rounded corner radius X	Not Applicable	<code>Property:dataLabel.rxlet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { rx: 10 } } }]});chart.appendTo('#chart');</code>
Rounded corner radius Y	Not Applicable	<code>Property:dataLabel.rylet chart: Chart = new Chart({ series: [{ marker: {dataLabel: { ry: 10 } } }]});chart.appendTo('#chart');</code>

Maximum Label width for data label	Property:dataLabel.maximumLabelWidth\$("#chart").ejChart({ series: [{ marker: {dataLabel: { maximumLabelWidth: 20}} } }]);	Not Applicable
Enable wrapping of text for data label	Property:dataLabel.enableWrap\$("#chart").ejChart({ series: [{ marker: {dataLabel: { enableWrap: true }} } }]);	Not Applicable
To show contrast color for data label	Property:dataLabel.showContrastColor\$("#chart").ejChart({ series: [{ marker: {dataLabel: { showContrastColor: true }} } }]);	Not Applicable
To show edge label for data label	Property:dataLabel.showEdgeLabels\$("#chart").ejChart({ series: [{ marker: {dataLabel: { showEdgeLabels: true }} } }]);	Not Applicable
## TrendLines		
Behavior	API in Essential JS 1	API in Essential JS 2
Trendlines settings	Property:series.trendLines\$("#chart").ejChart({ series: [{ trendLines: []}]});	Property:series.trendLineslet chart: Chart = new Chart({ series: [{ trendLines: []}]});chart.appendTo('#chart');
Visibility of trendline	Property:trendLines.visibility\$("#chart").ejChart({ series: [{ trendLines: [visibility: true]}]});	Not applicable
Type of trendline	Property:trendLines.type\$("#chart").ejChart({ series: [{ trendLines: [type: 'linear']}]});	Property:trendLines.typelet chart: Chart = new Chart({ series: [{ trendLines: [type: 'Polynomial']}]});chart.appendTo('#chart');
Name of trendline	Property:trendLines.name\$("#chart").ejChart({ series: [{ trendLines: [name: 'trendLine']}]});	Property:trendLines.namelet chart: Chart = new Chart({ series: [{ trendLines: [name: 'trendLine']}]});chart.appendTo('#chart');
Period of trendline	Property:trendLines.period\$("#chart").ejChart({ series: [{ trendLines: [period: 45]}]});	Property:trendLines.periodlet chart: Chart = new Chart({ series: [{ trendLines: [period: 45]}]});chart.appendTo('#chart');
Polynomial order for	Property:trendLines.polynomialOrder\$("#chart").ejChart({ series: [{ trendLines: [polynomialOrder: 3]}]});	Property:trendLines.polynomialOrderlet chart: Chart = new Chart({ series: [{ trendLines: [

Polynomial type trendLines		polynomialOrder: 3]]]]);chart.appendTo('#chart');
Backward forecast for trendLines	Property:trendLines.backwardforecast\$("#chart").ejChart({ series: [{ trendLines: [backwardforecast: 3]}]]]);	Property:trendLines.backwardforecastlet chart: Chart = new Chart({ series: [{ trendLines: [backwardforecast: 3]}]]]);chart.appendTo('#chart');
Forward forecast for trendLines	Property:trendLines.forwardForecast\$("#chart").ejChart({ series: [{ trendLines: [forwardForecast: 3]}]]]);	Property:trendLines.forwardForecastlet chart: Chart = new Chart({ series: [{ trendLines: [forwardForecast: 3]}]]]);chart.appendTo('#chart');
Fill for trendLines	Property:trendLines.fill\$("#chart").ejChart({ series: [{ trendLines: [fill: '#EEFFCC']}]]]);	Property:trendLines.filllet chart: Chart = new Chart({ series: [{ trendLines: [fill: 'EEFFCC']}]]]);chart.appendTo('#chart');
Width for trendLines	Property:trendLines.width\$("#chart").ejChart({ series: [{ trendLines: [width: 2]}]]]);	Property:trendLines.widthlet chart: Chart = new Chart({ series: [{ trendLines: [width: 2]}]]]);chart.appendTo('#chart');
Intercept value for trendLines	Property:trendLines.intercept\$("#chart").ejChart({ series: [{ trendLines: [intercept: 2]}]]]);	Property:trendLines.interceptlet chart: Chart = new Chart({ series: [{ trendLines: [intercept: 2]}]]]);chart.appendTo('#chart');
Legend shape for trendLines	Not Applicable	Property:trendLines.legendShapelet chart: Chart = new Chart({ series: [{ trendLines: [legendShape: 'Rectangle']}]]]);chart.appendTo('#chart');
Animation settings for trendLines	Not Applicable	Property:trendLines.animationlet chart: Chart = new Chart({ series: [{ trendLines: [animation: { enable: true }]}]]]);chart.appendTo('#chart');
Marker settings	Not Applicable	Property:trendLines.markerlet chart: Chart = new Chart({ series: [{

for trendLines		trendLines: [{marker: { visible: true }}}]);chart.appendTo('#chart');
Tooltip for trendLines	Property:trendLines.tooltip\$("#chart").ejChart({ series: [{ trendLines: [{ tooltip: { } }]}]})	Property:trendLines.enableTooltiplet chart: Chart = new Chart({ series: [{ trendLines: [{enableTooltip: true }]}]);chart.appendTo('#chart');
DashArray for trendLines	Property:trendLines.dashArray\$("#chart").ejChart({ series: [{ trendLines: [{ dashArray: '10, 5' }]}]})	Not Applicable.
Visible on legend for trendLines	Property:trendLines.visibleOnLegend\$("#chart").ejChart({ series: [{ trendLines: [{ visibleOnLegend: true }]}]})	Not Applicable.
## StripLines		
Behaviour	API in Essential JS 1	API in Essential JS 2
Default behaviour for striplines	Property:primaryXAxis.stripLines\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ visible: true }]}});	Property:primaryXAxis.stripLineslet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ visible: true }]}});chart.appendTo('#chart');
border for stripline	Property:stripLines.borderColor\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ borderColor: 'pink' }]}});	Property:stripLines.borderlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ border: { color: 'red', width: 2 } }]}});chart.appendTo('#chart');
Background color for stripline	Property:stripLines.color\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ color: 'pink' }]}});	Property:stripLines.borderlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ color: 'red' }]}});chart.appendTo('#chart');
Start value for stripline	Property:stripLines.start\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ start: 10 }]}});	Property:stripLines.startlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ start: 5 }]}});chart.appendTo('#chart');

End value for stripline	Property:stripLines.end\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ end: 10 }] } });	Property:stripLines.endlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ end: 5 }] } }); chart.appendTo('#chart');
Startfrom Axis for stripline	Property:stripLines.startFromAxis\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ startFromAxis: true }] } });	Property:stripLines.startFromAxislet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ startFromAxis: true }] } }); chart.appendTo('#chart');
Text in stripline	Property:stripLines.text\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ text: 'StripLine; }] } });	Property:stripLines.textlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ text: 'stripline' }] } }); chart.appendTo('#chart');
Text alignment in stripline	Property:stripLines.textAlignment\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ textAlignment: 'Far; }] } });	Property:stripLines.horizontalAlignmentlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ horizontalAlignment: 'Far' }] } }); chart.appendTo('#chart');
Vertical Text alignment in stripline	Not Applicable	Property:stripLines.verticalAlignmentlet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ verticalAlignment: 'Far' }] } }); chart.appendTo('#chart');
Size of stripline	Property:stripLines.width\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ width: 10; }] } });	Property:stripLines.sizelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ size: 10 }] } }); chart.appendTo('#chart');
ZIndex of stripline	Property:stripLines.zIndex\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ zIndex: 'Behind' }] } });	Property:stripLines.sizelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ zIndex: 'Behind' }] } }); chart.appendTo('#chart');
Font style of stripline	Property:stripLines.fontStyle\$("#chart").ejChart({ primaryXAxis: { stripLines: [{ fontStyle: {} }] } });	Property:stripLines.textStylelet chart: Chart = new Chart({ primaryXAxis: { stripLines: [{ textStyle: {} }] } }); chart.appendTo('#chart');
## Multilevel Labels		
Behaviour	API in Essential JS 1	API in Essential JS 2

Default behaviour for multilevel Labels	Property:primaryXAxis.multilevelLabels\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ visible: true }] } });	Property:primaryXAxis.multilevelLabels1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ }] } });chart.appendTo('#chart');
Default behaviour for multilevel Labels	Property:primaryXAxis.multilevelLabels\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ visible: true }] } });	Property:primaryXAxis.multilevelLabels1let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ }] } });chart.appendTo('#chart');
Text alignment for multilevel Labels	Property:multiLevelLabels.textAlignment\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ textAlignment: 'Near' }] } });	Property:multilevelLabels.alignmentlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ alignment: 'Near' }] } });chart.appendTo('#chart');
Text overflow for multilevel Labels	Property:multiLevelLabels.textOverFlow\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ textOverFlow: 'Trim' }] } });	Property:multiLevelLabels.overFlowlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ overFlow: 'Trim' }] } });chart.appendTo('#chart');
Border for multilevel Labels	Property:multiLevelLabels.border\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ border: { width: 2, color: 'red', type: 'brace' } }] } });	Property:multiLevelLabels.borderlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ border: { width: 2, color: 'red', type: 'brace' } }] } });chart.appendTo('#chart');
Start value for label	Property:multiLevelLabels.start\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ start: 45 }] } });	Property:multiLevelLabels.categories.startlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ start: 45}] }] } });chart.appendTo('#chart');
End value for label	Property:multiLevelLabels.start\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ end: 45 }] } });	Property:multiLevelLabels.categories.endlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ end: 45}] }] } });chart.appendTo('#chart');
Text for label	Property:multiLevelLabels.text\$("#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ text: 'Start' }] } });	Property:multiLevelLabels.categories.textlet chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ text: 'text' }] }] } });

		} }}}});chart.appendTo('#chart');
maximum text width for label	Property:multiLevelLabels.maximumTextWidth\$("<#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ maximumTextWidth: 10 }] } }));	Property:multiLevelLabels.categories.maximumTextWidth let chart: Chart = new Chart({ primaryXAxis: { multilevelLabels: [{ categories: [{ maximumTextWidth: 20 }] }] } }));chart.appendTo('#chart');
level of labels	Property:multiLevelLabels.level\$("<#chart").ejChart({ primaryXAxis: { multilevelLabels: [{ level: 2 }] } }));	Not applicable. Categories are used

Methods

Behaviour	API in Essential JS 1	API in Essential JS 2
animation for series	Property:chart.animate\$("<#chart").ejChart({ animate: () { } });	Not applicable
Redraw for chart	Property:chart.redraw\$("<#chart").ejChart({ redraw: () { } });	Property:chart.refresh() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.width = '400';chart.refresh();
Export	Property:chart.export\$("<#chart").ejChart({ export: () { } });	Property:chart.export() let chart: Chart = new Chart({});chart.export('JPEG', 'chart');chart.appendTo('#chart');
Print	Property:chart.print\$("<#chart").ejChart({ print: () { } });	Property:chart.print() let chart: Chart = new Chart({});chart.print('chart');chart.appendTo('#chart');
AddSeries	Not Applicable	Property:chart.addSeries() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.addSeries();
RemoveSeries	Not Applicable	Property:chart.removeSeries() let chart: Chart = new Chart({});chart.appendTo('#chart');chart.removeSeries();

Events

Behaviour	API in Essential JS 1	API in Essential JS 2
Fires on annotation click	Property:annotationClick\$("<#chart").ejChart({ annotationClick: () { } });	Not applicable
Fires after animation	Property:animationComplete\$("<#chart").ejChart({ animationComplete: () { } });	Property:animationComplete() let chart: Chart = new Chart({

		animationComplete: () => { });chart.appendTo('#chart');
Fires on axis label click	Property:axisLabelClick\$("#chart").ejChart({ axisLabelClick: () { }});	Not applicable
Fires before axis label render	Property:axisLabelRendering\$("#chart").ejChart({ axisLabelRendering: () { }});	Property:axisLabelRender() let chart: Chart = new Chart({ axisLabelRender: () => { });chart.appendTo('#chart');
Fires on axis label mouseMove	Property:axisLabelMouseMove\$("#chart").ejChart({ axisLabelMouseMove: () { }});	Not applicable
Fires on axis label initialize	Property:axisLabelInitialize\$("#chart").ejChart({ axisLabelInitialize: () { }});	Not applicable
Fires before axis range calculation	Property:axesRangeCalculate\$("#chart").ejChart({ axesRangeCalculate: () { }});	Property:axisRangeCalculated() let chart: Chart = new Chart({ axisRangeCalculated: () => { });chart.appendTo('#chart');
Fires on axis title rendering	Property:axisTitleRendering\$("#chart").ejChart({ axisTitleRendering: () { }});	Not applicable
Fires on after chart resize	Property:afterResize\$("#chart").ejChart({ afterResize: () { }});	Not applicable
Fires on before chart resize	Property:beforeResize\$("#chart").ejChart({ beforeResize: () { }});	Property:resized let chart: Chart = new Chart({ resized: () => { });chart.appendTo('#chart');
Fires on chart click	Property:chartClick\$("#chart").ejChart({ chartClick: () { }});	Property:chartMouseClicked let chart: Chart = new Chart({ chartMouseClicked: () => { });chart.appendTo('#chart');

Fires on chart mouse move	Property:chartMouseMove\$("#chart").ejChart({ chartMouseMove: () { }});	Property:chartMouseMovelet chart: Chart = new Chart({ chartMouseMove: () => { }});chart.appendTo('#chart');
Fires on chart mouse leave	Property:chartMouseLeave\$("#chart").ejChart({ chartMouseLeave: () { }});	Property:chartMouseLeavelet chart: Chart = new Chart({ chartMouseLeave: () => { }});chart.appendTo('#chart');
Fires on before chart double click	Property:chartDoubleClick\$("#chart").ejChart({ chartDoubleClick: () { }});	Not applicable
Fires on chart mouse up	Not Applicable	Property:chartmouseUplet chart: Chart = new Chart({ chartmouseUp: () => { }});chart.appendTo('#chart');
Fires on chart mouse down	Not Applicable	Property:chartmouseDownlet chart: Chart = new Chart({ chartmouseDown: () => { }});chart.appendTo('#chart');
Fires during the calculation of chart area bounds. You can use this event to customize the bounds of chart area	Property:chartAreaBoundsCalculate\$("#chart").ejChart({ chartAreaBoundsCalculate: () { }});	Not applicable
Fires when the dragging is started	Property:dragStart\$("#chart").ejChart({ dragStart: () { }});	Not applicable

Fires while dragging	Property:dragging\$("#chart").ejChart({ dragging: () { }});	Not applicable
Fires when the dragging is completed	Property:dragEnd\$("#chart").ejChart({ dragEnd: () { }});	Property:dragCompletelet chart: Chart = new Chart({ dragComplete: () => { }});chart.appendTo('#char t');
Fires when chart is destroyed completely.	Property:destroy\$("#chart").ejChart({ destroy: () { }});	Not applicable
Fires after chart is created.	Property:create\$("#chart").ejChart({ create: () { }});	Property:loadedlet chart: Chart = new Chart({ loaded: () => { }});chart.appendTo('#char t');
Fires before rendering the data labels.	Property:displayTextRendering\$("#chart").ejChart ({ displayTextRendering: () { }});	Property:textRenderlet chart: Chart = new Chart({ textRender: () => { }});chart.appendTo('#char t');
Fires, when error bar is rendering.	Property:errorBarRendering\$("#chart").ejChart({ errorBarRendering: () { }});	Not applicable
Fires during the calculation of legend bounds.	Property:legendBoundsCalculate\$("#chart").ejChar t({ legendBoundsCalculate: () { }});	Not applicable
Fires on clicking the legend item.	Property:legendItemClick\$("#chart").ejChart({ legendItemClick: () { }});	Not applicable
Fires when moving mouse over legend item	Property:legendItemMouseMove\$("#chart").ejCha rt({ legendItemMouseMove: () { }});	Not applicable

Fires before rendering the legend item.	Property:legendItemRendering\$("#chart").ejChart({ legendItemRendering: () { }});	Property:legendRenderlet chart: Chart = new Chart({ legendRender: () => { }});chart.appendTo('#char t');
Fires before loading the chart.	Property:load\$("#chart").ejChart({ load: () { }});	Property:loadlet chart: Chart = new Chart({ load: () => { }});chart.appendTo('#char t');
Fires, when multi level labels are rendering.	Property:multiLevelLabelRendering\$("#chart").ejChart({ multiLevelLabelRendering: () { }});	Property:axisMultiLabelRender let chart: Chart = new Chart({ axisMultiLabelRender : () => { }});chart.appendTo('#char t');
Fires on clicking a point in chart.	Property:pointRegionClick\$("#chart").ejChart({ pointRegionClick: () { }});	Property:pointClick let chart: Chart = new Chart({ pointClick : () => { }});chart.appendTo('#char t');
Fires when mouse is moved over a point.	Property:pointRegionMouseMove\$("#chart").ejChart({ pointRegionMouseMove: () { }});	Property:pointMove let chart: Chart = new Chart({ pointMove : () => { }});chart.appendTo('#char t');
Fires before rendering chart.	Property:preRender\$("#chart").ejChart({ preRender: () { }});	Not applicable
Fires when point render.	Not Applicable	Property:pointRender let chart: Chart = new Chart({ pointRender : () => { }});chart.appendTo('#char t');
Fires after selected the data in chart.	Property:rangeSelected\$("#chart").ejChart({ rangeSelected: () { }});	Not applicable
Fires after selecting a series.	Property:seriesRegionClick\$("#chart").ejChart({ seriesRegionClick: () { }});	Not applicable

Fires before rendering a series.	Property:seriesRendering\$("#chart").ejChart({ seriesRendering: () { }});	Property:seriesRender let chart: Chart = new Chart({ seriesRender : () => { }});chart.appendTo('#chart');
Fires before rendering the marker symbols.	Property:symbolRendering\$("#chart").ejChart({ symbolRendering: () { }});	Not applicable
Fires before rendering the trendline	Property:trendlineRendering\$("#chart").ejChart({ trendlineRendering: () { }});	Not applicable
Fires before rendering the Chart title.	Property:titleRendering\$("#chart").ejChart({ titleRendering: () { }});	Not applicable
Fires before rendering the Chart sub title.	Property:subTitleRendering\$("#chart").ejChart({ subTitleRendering: () { }});	Not applicable
Fires before rendering the tooltip.	Property:toolTipInitialize\$("#chart").ejChart({ toolTipInitialize: () { }});	Property:tooltipRender let chart: Chart = new Chart({ tooltipRender : () => { }});chart.appendTo('#chart');
Fires before rendering crosshair tooltip in axis	Property:trackAxisToolTip\$("#chart").ejChart({ trackAxisToolTip: () { }});	Not applicable
Fires before rendering trackball tooltip.	Property:trackToolTip\$("#chart").ejChart({ trackToolTip: () { }});	Not applicable

Event triggered when scroll starts.	Property:scrollStart\$("#chart").ejChart({ scrollStart: () { }});	Property:scrollStart let chart: Chart = new Chart({ scrollStart : () => { }});chart.appendTo('#chart');
Event triggered when scroll ends.	Property:scrollEnd\$("#chart").ejChart({ scrollEnd: () { }});	Property:scrollEndlet chart: Chart = new Chart({ scrollEnd: () => { }});chart.appendTo('#chart');
Event triggered when scroll changes.	Property:scrollChange\$("#chart").ejChart({ scrollChange: () { }});	Property:scrollChangelet chart: Chart = new Chart({ scrollChange: () => { }});chart.appendTo('#chart');
Fires while performing rectangle zooming in chart.	Property:zoomComplete\$("#chart").ejChart({ zoomComplete: () { }});	Property:zoomCompletele t chart: Chart = new Chart({ zoomComplete: () => { }});chart.appendTo('#chart'); ## Chart properties
Behaviour	API in Essential JS 1	API in Essential JS 2
selected data index	Property:selectedDataPointIndexes\$("#chart").ejChart({ selectedDataPointIndexes: [{ seriesIndex: 0, pointIndex: 1}]});	Property:selectedDataIndexeslet chart: Chart = new Chart({selectedDataIndexes: [{ series: 0, point: 1}]});chart.appendTo('#chart');
sideBySideSeries Placement for column based series	Property:sideBySideSeriesPlacement\$("#chart").ejChart({ sideBySideSeriesPlacement});	Property:sideBySidePlacementlet chart: Chart = new Chart({ sideBySidePlacement: true});chart.appendTo('#chart');
ZoomSettings	Property:zooming\$("#chart").ejChart({ zooming: { enable: true, enableDeferredZoom: true, enablePinch: true, enableMouseWheel: true, enableScrollBar: true, toolbarItems: [], type: 'X' }});	Property:zoomSettingslet chart: Chart = new Chart({ zoomSettings: { enable: true, enablePinchZooming: true, enableDeferredZooming: true, enableMouseWheelZooming: true, enableSelectionZooming: true, enableScrollBar: true }});chart.appendTo('#chart');
Background color of the chart	Property:background\$("#container").ejChart({ background: 'transparent'});	Property:backgroundlet chart: Chart = new Chart({ background: '#EEFFCC'});chart.appendTo('#chart');

URL of the image to be used as chart background.	Property:backGroundImageUrl \$("#container").ejChart({ backGroundImageUrl : '../images/chart/wheat.png'}) ;	Not Applicable
Customizing border of the chart	Property:border \$("#container").ejChart({ border: { width: 2, color: '#CCEEFF', opacity: 0.5}});	Property:borderlet chart: Chart = new Chart({ border: { width: 2, color: '#CCEEFF'}});chart.appendTo('#char t');
This provides options for customizing export settings	Property:exportSettings\$("#containe r").ejChart({ exportSettings: { filename : "chart", angle: '45' }});	Property:export()let chart: Chart = new Chart({ border: { width: 2, color: '#CCEEFF'}});chart.appendTo('#char t');chart.export(type, fileName);
ChartArea customization	Property:chartArea\$("#container") .ejChart({ chartArea: { background: 'transparent', border: { opacity: 0.3, color: 'red', width: 2}}});	Property:chartArealet chart: Chart = new Chart({ chartArea: { background: 'transparent', border: { width: 2, color: '#CCEEFF' }});chart.appendTo('#chart');chart .export(type, fileName);

Rows

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
rows in chart	Property:rowDefinitions\$("#chart").ejC hart({ rowDefinitions: []});	Property:rowslet chart: Chart = new Chart({ rows: []});chart.appendTo('#chart');
unit	Property:unit \$("#container").ejChart({ rowDefinitions :[{unit : "percentage"}]});	Not Applicable
height of rows in chart	Property:rowHeight\$("#chart").ejChart ({ rowDefinitions: [{ rowHeight: '50%'}]});	Property:heightlet chart: Chart = new Chart({ rows: [{ height: '300'}]});chart.appendTo('#chart
Line customization	Property:lineColor, lineWidth\$("#chart").ejChart({ rowDefinitions: [{ rowHeight: '50%', lineColor: 'brown', lineWidth: 2}]});	Property:borderlet chart: Chart = new Chart({ rows: [{ height: '300', border: { width: 2, color: 'brown'}}]});chart.appendTo('#ch art');

Series

<!-- markdownlint-disable MD033 -->

Behaviour	API in Essential JS 1	API in Essential JS 2
bearFillColor	Property:bearFillColor\$("#chart").ejChart({ series: [{bearFillColor: 'red' }]});	Property:bearFillColorlet chart: Chart = new Chart({ series: [{bearFillColor: 'red' }]});chart.appendTo('#chart');
Border	Property:border\$("#chart").ejChart({ series: [{ border: { color: 'red', width: 2, dashArray: '10, 5' } }]});	Property:rowslet chart: Chart = new Chart({ series: [{ border: { color: 'red', width: 2} }]});chart.appendTo('#chart');
BoxPlotMode	Property:boxPlotMode\$("#chart").ejChart({ series: [{ boxPlotMode: 'inclusive' }]});	Property:rowslet chart: Chart = new Chart({ series: [{ boxPlotMode: 'Inclusive' }]});chart.appendTo('#chart');
Minimum radius of Bubble series	Property:bubbleOptions.minRadius\$("#chart").ejChart({ series: [{ bubbleOptions: { minRadius: 2 } }]});	Property:minRadiuslet chart: Chart = new Chart({ series: [{ minRadius: 2 }]});chart.appendTo('#chart');

How To

Live chart in ##Platform_Name## Chart control

You can update a chart with live data by using the set interval.

To update live data in a chart, follow the given steps:

Step 1:

Initialize the chart with series.

```
import { Chart } from '@syncfusion/ej2-charts';
```

```
// initialize Chart component
```

```
let chart: Chart = new Chart(
```

```
//Initializing Chart Series
```

```
series:[
```

```
type: 'Line',
```

```
]
```

```
);
```

```
// render initialized Chart
```

```
chart.appendTo('#container');
```

```
`
```

Step 2:

Update the data to series, and refresh the chart at specified interval by using the set interval.

To refresh the chart, invoke the `refresh` method.

INDEX.JS

```
var series1 = [];
var value = 10;
var i;
var intervalId;
for (i = 0; i < 50; i++) { // Data update
    if (Math.random() > .5) {
        value += Math.random() * 2.0;
    }
    series1[i] = { x: i, y: value };
}
var chart = new ej.charts.Chart({
    series: [
        {
            type: 'Line',
            dataSource: series1,
            xName: 'x',
            yName: 'y', animation: { enable: false }
        },
    ],
    width: '650px',
    height: '350px'
}, '#element');
var setTimeoutValue = 100;
intervalId = setInterval(
    function() {
        if (document.getElementById('container') === null) {
            clearInterval(intervalId);
        } else {
            if (Math.random() > .5) {
                value += Math.random() * 2.0;
            }
            series1.push({ x: i, y: value });
            i++;
            series1.shift(); // Used to remove the first element
            chart.series[0].dataSource = series1;
            chart.refresh();
        }
    }, setTimeoutValue);
```

```

Prevent data label in ##Platform_Name## Chart control

To prevent the chart data label when the data value is 0, follow the given steps:

Step 1:

Get the point value and check whether the `args.point.y` value is zero or not by using the [textRender](#) event. If the value is zero, then set the `args.cancel` to true.

The output will appear as follows,

INDEX.JS

```

var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [

```

```

        { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },
        { x: new Date(2007, 0, 1), y: 0 }, { x: new Date(2008,
0, 1), y: 38 },
        { x: new Date(2009, 0, 1), y: 54 }, { x: new Date(2010,
0, 1), y: 57 },
    ],
    xName: 'x', width: 2, marker: {
        dataLabel : { visible: true },
        visible: true,
        width: 10,

Tool tip format in ##Platform_Name## Chart control

Using [tooltipRender](#) event, you can able to format the datetime value instead of rendered value.

To format the datetime value, please follow the steps below

Step 1:

By using [tooltipRender](#) event we can able to get the current point x value. Using this value to format the tooltip by using `formatDate` method.

The output will appear as follows,

INDEX.JS

```

var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [
                { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },
                { x: new Date(2007, 0, 1), y: 30 }, { x: new Date(2008,
0, 1), y: 38 },
                { x: new Date(2009, 0, 1), y: 54 }, { x: new Date(2010,
0, 1), y: 57 },
            ],
            xName: 'x', width: 2, marker: {
                dataLabel : { visible: true },
                visible: true,
                width: 10,
                height: 10
            },
            yName: 'y', name: 'Germany',
        }
    ]
});

```

```

    ],
    //Initializing Chart title
    title: 'Inflation - Consumer Price',
    tooltip: {enable: true},
    tooltipRender: function(args) { // To format the current point x
value
        var intl = new ej.base.Internationalization();
        var formattedString = intl.formatDate(new Date(args.point.x), {
skeleton: 'yMd' });
        args.text = formattedString;
    },
    width: '650px',
    height: '350px'
}, '#element');

```

Add series in ##Platform_Name## Chart control

You can add or remove the chart series dynamically by using the `addSeries` or `removeSeries` method.

To add or remove the series dynamically, follow the given steps:

Step 1:

To add a new series to chart dynamically, pass the series value to the `addSeries` method.

To remove the new series from chart dynamically, pass the series index to the `removeSeries` method.

INDEX.JS

```

var chart = new ej.charts.Chart({
    primaryXAxis: {
        title: 'Manager',
        valueType: 'Category',
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        title: 'Sales',
        minimum: 0,
        maximum: 20000,
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: [{ x: 'John', y: 10000 }, { x: 'Jake', y: 12000 }, { x: 'Peter', y: 18000 }, { x: 'James', y: 11000 }, { x: 'Mary', y: 9700 }],

Points customization in ##Platform_Name## Chart control

You can customize the series points with patterns by using the `pointColorMapping` property.

To customize the series point colors, follow the given steps:

Step 1:

Define the patterns and map the pattern URL to the series point using `pointColorMapping` property in series.

INDEX.TS

```
import { Chart, ColumnSeries, Category, DataLabel, Tooltip } from
'@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, DataLabel, Category, Tooltip);
import { EmitType } from 'syncfusion/ej2-base';
let chart: Chart = new Chart({
  //Initializing Primary X Axis
```

```

Stacking total in ##Platform_Name## Chart control

By using the [annotation](#), you can show any element in desired view.

To show the total value in data points, follow the given steps:

Step 1:

Define annotation for each x point in chart, now change the annotation value in chart by using the [annotationRender](#) event. In this event, assign the stacked value of the last series to the annotation to show the total value of the

stacking series.

INDEX.JS

```
var i = 0;
var chart = new ej.charts.Chart({
  primaryXAxis: {
    valueType: 'Category', interval: 1
  },
  // Initialize the chart series
  series: [
    {

Marker customization in ##Platform_Name## Chart control

By using the [pointRender](#), you can customize the marker shape.

To Customize the marker shape, follow the given steps:

Step 1:

Customize the marker shape in each data point by using the [pointRender](#) event. Using this event, you can set the `shape` value to the argument.

INDEX.JS

```

var shapes = [
    'Diamond', 'Circle', 'Rectangle', 'Line', 'Triangle', 'Rectangle'
];
var shapeRender = function(args) {
    args.shape = shapes[args.point.index];
}
var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        title: 'Countries', valueType: 'Category',
        interval: 1
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        title: 'Penetration', rangePadding: 'None',
        labelFormat: '{value}%', minimum: 0,
        maximum: 75, interval: 15
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [{ x: 'WW', y: 12, text: 'World Wide' },
                { x: 'EU', y: 5, text: 'Europe' },
                { x: 'APAC', y: 15, text: 'Pacific' },
                { x: 'LATAM', y: 6.4, text: 'Latin' },
                { x: 'MEA', y: 30, text: 'Africa' },
                { x: 'NA', y: 25.3, text: 'America' }],
            name: 'December 2007',
            marker: {
                visible: true, width: 10, height: 10,
                shape: 'Diamond', dataLabel: { name: 'text' }
            }
        }
    ]
});

```

```

        },

Tool tip table in ##Platform_Name## Chart control

You can show the tooltip as table by using template property in tooltip.

Follow the given steps to show the table tooltip,

Step 1:

Initialize the tooltip template div as shown in the following html page,

,

```
<div id='templateWrap'>
```

Female	
#{x}:	#{y}

```
</div>
```

,

Step 2:

To show that tooltip template, set the element id to the `template` property in tooltip.

INDEX.JS

```
var chart = new ej.charts.Chart({
  title: 'Population of India ( 2010 - 2016 )',
  // Initialize the chart axes
  primaryXAxis: {
    minimum: 2010, maximum: 2016,
    edgeLabelPlacement: 'Shift',
  },
  primaryYAxis: {
    minimum: 900, maximum: 1300,
    labelFormat: '{value}M',
  },
  // Initialize the chart series
  series: [
    {

Footer in ##Platform_Name## Chart control

By using **annotation**, you can place any html elements to chart in a desired view.

To create footer and watermark for chart, follow the given steps:

Step 1:

Initialize the custom elements by using the **annotation** property.

By using the `content` option of the annotation object, you can specify the id of the element that needs to be displayed in the chart area as follow,

INDEX.JS

```
var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'Category',
        interval: 1, majorGridLines: { width: 0 },
        labelIntersectAction: 'Rotate90'
    },
    //Initializing Annotations
    annotations: [{ // watermark for chart
        content: '<div id="chart_cloud" style="font-size:450%; opacity:
0.3;" >syncfusion</div>',
        x: 'Wed', y: 20, coordinateUnits: 'Point', horizontalAlignment:
'Center'
    }, { //footer for chart
        content: '<div id="chart" > <a href="https://www.syncfusion.com"
target="_blank">www.syncfusion.com</a></div>',
        x: 400, y: 340, coordinateUnits: 'Pixel', horizontalAlignment:
'Center'
    }
    ],
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        minimum: 0,
        maximum: 40,
        interval: 10,
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Spline',
            dataSource: [
                { x: 'Sun', y: 15 }, { x: 'Mon', y: 5 }, { x: 'Tue', y:
32 },
                { x: 'Wed', y: 15 }, { x: 'Thu', y: 29 }, { x: 'Fri', y:
24 },
                { x: 'Sat', y: 18 },
            ],
            xName: 'x', width: 2, marker: {
                visible: true
            },
            yName: 'y', name: 'Max Temp',
        }
    ],
    //Initializing Chart title
    title: 'NC Weather Report - 2016',

```

Threshold in ##Platform_Name## Chart control

You can mark a threshold in chart by using the **stripline**.

To mark a threshold in chart, follow the given steps:

Step 1:

By using the start and end properties of **striplines** object in vertical axis, you can mark the threshold for y values of the series.

INDEX.JS

```

var chart = new ej.charts.Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',

```

```

    },
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        minimum: 10, maximum: 40, interval: 5,
        lineStyle: { color: '#808080' }, labelFormat: '{value} °C',
        rangePadding: 'None',
        //Initializing Striplines
        stripLines: [
            {
                start: 30, end: 30.1, color: '#ff512f', visible: true,
                textStyle: { size: '18px', color: '#ffffff', fontWeight:
'600' },
            }
        ]
    },
    //Initializing Chart Series
    series: [

Grid data chart in ##Platform_Name## Chart control

You can visualize the data that returned by grid in chart.

To visualize the data in chart, follow the given steps:

Step 1:

Initialize the grid with datasource.

Step 2:

By using the grid's `actionComplete` event and `getCurrentViewRecords` method, you can get the current page records.

By using the grid's `databound` event, you can update the current page records into the chart's datasource and visualize the grid data in chart.

INDEX.JS

```

var chart = new ej.charts.Chart();
var data = new ej.data.DataManager(orderData).executeLocal(new
ej.data.Query().take(100));
var grid = new ej.grids.Grid({
    dataSource: data,
    allowPaging: true,
    pageSettings: { pageSize: 10 },
    columns: [

```

```

        { field: 'OrderDate', headerText: 'Order Date', width: 130, format:
'yMd', textAlign: 'Right' },
        { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right' }
    ],
    dataBound: function () {
        chart = new ej.charts.Chart({
            //Initializing Primary X Axis
            primaryXAxis: {
                valueType: 'DateTime',

Percentage tool tip in ##Platform_Name## Chart control

By using the [tooltipRender](#) event, you can show the percentage value for each point of pie series in tooltip.

To show the percentage value in pie tooltip, follow the given steps:

Step 1:

By using the [tooltipRender](#) event, you can get the `args.point.y` and `args.series.sumOfPoints` values. You can use these values to calculate the percentage value for each point of pie series. To display the percentage value in tooltip, use the `args.content` property.

INDEX.JS

```

var chart = new ej.charts.AccumulationChart({
    series: [
        {
            dataSource: [
                { 'x': 'Chrome', y: 37 }, { 'x': 'UC Browser', y: 17 },
                { 'x': 'iPhone', y: 19 }, { 'x': 'Others', y: 4, text:
'4%' }, { 'x': 'Opera', y: 11 }
            ],
            dataLabel: {
                visible: true
            },
            radius: '70%', xName: 'x',
            yName: 'y', startAngle: 0,
            endAngle: 360, innerRadius: '0%'
        }
    ],
    enableSmartLabels: true,
    legendSettings: {
        visible: false,
    },
    // Initialize the tooltip
    tooltip: { enable: true },
    title: 'Mobile Browser Statistics',
    tooltipRender: function(args) {
        var value = args.point.y / args.series.sumOfPoints * 100;
        args.text = args.point.x + ' ' + Math.ceil(value) + ' %';
    },
    width: '650px',
    height: '350px'
}, '#element');

```

Data label template in ##Platform_Name## Chart control

You can bind text and interior information for a point from dataSource other than x and y value. To change color for the background in the datalabel template, you can use `${point.text}`.

To use point.text, you have to bind the property from dataSource to name in the datalabel options.

Follow the given steps to show the table tooltip,

Step 1:

Initialize the datalabel template div as shown in the following html page,

```
<script id="index" type="text/x-template">
<div id='templateWrap' style="background-color: ${point.text}; border-radius:
3px;"><span>${point.y}</span></div>
</script>
```

Step 2:

To show that datalabel template, set the element id to the `template` property in datalabel.

INDEX.JS

```
var datalabelData = [
  { x: 10, y: 7000, color: 'red' },
  { x: 20, y: 1000, color: 'yellow' },
  { x: 30, y: 12000, color: 'orange' },
  { x: 40, y: 14000, color: 'skyblue' },
  { x: 50, y: 11000, color: 'blue' },
  { x: 60, y: 5000, color: 'green' },
  { x: 70, y: 7300, color: 'pink' },
  { x: 80, y: 9000, color: 'white' },
  { x: 90, y: 12000, color: 'magenta' },
  { x: 100, y: 14000, color: 'purple' },
  { x: 110, y: 11000, color: 'teal' },
  { x: 120, y: 5000, color: 'gray' },
];
var Chart = new ej.charts.Chart({
  series:[{
    dataSource: datalabelData,
    xName: 'x', yName: 'y',
    type: 'Line',
    marker: { visible: true, dataLabel: { visible: true, name: 'color',
template: '#index'}}
  }],
  }, '#element');
```

INDEX.HTML

Hide tool tip in ##Platform_Name## Chart control

By using the [tooltipRender](#) event, you can cancel the tooltip for unselected series in the chart.

To hide the tooltip value in unselected series, follow the given steps:

Step 1:

By using the [tooltipRender](#) event, you can get the series elements in the arguments. By using this argument we can compare whether seriesElementclasslist is deselected container or not. If it is true then we cancel the tooltip by setting the value for `args.cancel` as true.

INDEX.JS

```

var chart = new ej.charts.Chart({
    //Initializing Primary X Axis
    primaryXAxis: {
        valueType: 'DateTime',
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Line',
            dataSource: [
                { x: new Date(2005, 0, 1), y: 21 }, { x: new Date(2006,
0, 1), y: 24 },

Dotted line in ##Platform_Name## Chart control

By using **annotation**, you can add dotted lines in the chart.

To add dotted lines in the chart, follow the given steps:

Step 1:

Initialize the custom elements by using the **annotation** property.

By setting **coordinateUnits** value as **point** in annotation object you can placed dotted lines in the chart based on point x and y values.

INDEX.JS

```

var columnData = [{ country: "USA", gold: 50 }, { country: "China", gold:
40 }, { country: "Japan", gold: 70 },
{ country: "Australia", gold: 60 }, { country: "France", gold: 50 }, {
country: "Germany", gold: 40 },
{ country: "Italy", gold: 40 }, { country: "Sweden", gold: 30 }];

var chart = new ej.charts.Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    primaryYAxis: {

```

```

        title: 'Medals'
    },

Grid data pie in ##Platform_Name## Chart control

You can visualize the filtered data that returned by grid in pie chart.

To visualize the data in pie chart, follow the given steps:

Step 1:

Initialize the grid with datasource.

Step 2:

By using the grid's `actionComplete` event and `getCurrentViewRecords` method, you can get the current page records. By setting `allowFiltering` value as `true`, you can filter the data. By using the grid's `databound` event, you can update the current page filtered records into the chart's datasource and display the grid filtered data in chart.

INDEX.JS

```

var chart = new ej.charts.Chart();
var filtertype = [
    { id: 'Menu', type: 'Menu' },
    { id: 'CheckBox', type: 'CheckBox' },
    { id: 'Excel', type: 'Excel' }
];
var grid = new ej.grids.Grid(
    {
        dataSource: orderData,
        allowPaging: true,
        allowFiltering: true,
        filterSettings: { type: 'Menu' },
        columns: [
            { field: 'OrderID', headerText: 'Order ID', width: 120,
textAlign: 'Right' },
            { field: 'CustomerName', headerText: 'Customer Name', width: 150
},
            {
                field: 'OrderDate', headerText: 'Order Date', width: 130,
                format: { type: 'dateTime', format: 'M/d/y hh:mm a' },
textAlign: 'Right'
            },
            { field: 'Freight', width: 120, format: 'C2', textAlign: 'Right'
}
        ],
        pageSettings: { pageCount: 5 },
        databound: function () {
            chart = new ej.charts.AccumulationChart({
                series: [
                    {

Down sampling in ##Platform_Name## Chart control

Downsampling is the process of reducing the data rate. We have given a 2000 data points for chart. After applying downsampling algorithm, chart data points has been reduced and rendered with 400 data points.

Downsampling data using the "Largest-Triangle-Three-Buckets algorithm"[LTTB](#) which describes the point in the bucket that forms the largest triangle using the area of the triangles. This helps to reducing the number of points.

In Downsampling when we perform zooming, particular level of zoomed chart we can see the chart clearly with original data, so we can use original data for that level of zooming. This can be achieved by [zoomComplete](#) event. Refer the below sample for downsampling with zooming feature.

INDEX.JS

```

var downdata = [
  { "x": 0, "y": 0 }, { "x": 1, "y": -5.066007678219755 }, { "x": 2, "y": -5.928724334840155 }, { "x": 3, "y": -6.1456656801181255 }, { "x": 4, "y": 4.321188375669889 }, { "x": 5, "y": 2.948801782921425 }, { "x": 6, "y": 4.348879326401061 }, { "x": 7, "y": 7.465662701191096 }, { "x": 8, "y": -7.454572839171574 }, { "x": 9, "y": -4.215304469008361 }, { "x": 10, "y": -2.576748758502486 }, { "x": 11, "y": -1.2947957433215151 }, { "x": 12, "y": -3.7712577868615975 }, { "x": 13, "y": -0.7118919161845909 }, { "x": 14,

Before applying downsampling algorithm

After applying downsampling algorithm

Clicked data in `##Platform_Name##` Chart control
By using the [pointClick](#) event, you can get the chart data of clicked area.
To show the clicked area data from pie, follow the given steps:

Step 1:

By using the [pointClick](#) event, you can get the `args.point.x` and `args.point.y` values.

INDEX.JS

```

Legend in table in ##Platform_Name## Chart control

The **annotation** property is used to add legend in table and the **multiLevelLabels** property is used to customize the axis label in table format.

To add legend in table with x-axis labels, follow the given steps:

Step 1:

Initialize the custom elements using the **annotation** property.

Create table and rectangle shapes in the html page and set this to the **content** property of annotation.

By setting **coordinateUnits** value to **pixel** in annotation object, you can place the legend in chart based on pixel values.

Syn pan in ##Platform_Name## Chart control

Using the [chartMouseMove](#) event, you can achieve the synchronized panning between multiple charts.

To make a synchronized panning chart, follow the given steps:

Step 1:

Initially create two charts, and enable `zoomSettings` for both charts.

To use the [chartMouseMove](#) event, assign the first chart's `zoomFactor` and `zoomPosition` values to the second chart. Now, pan the first zoomed chart, and then the second chart will be panned automatically based on `zoomFactor` and `zoomPosition`.

The following code sample demonstrates the output.

INDEX.JS

```

var columnData = [{ country: "USA", gold: 50 }, { country: "China", gold: 40 }, { country: "Japan", gold: 70 }, { country: "Australia", gold: 60 }, { country: "France", gold: 50 }, { country: "Germany", gold: 40 }, { country: "Italy", gold: 40 }, { country: "Sweden", gold: 30 }];

var chart = new ej.charts.Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    primaryYAxis: {
        title: 'Medals'
    },
    annotations: [{
        content: '<div id ="test" style="border-top:3px dashed grey;border-top-width: 2px; width: 10000px"></div>',
        x: 'France',
        y: 50,
        coordinateUnits: 'Point',
        Region: 'Chart'
    }],
    series: [{
        dataSource: columnData,
        xName: 'country', yName: 'gold',
        type: 'Line'
    }],
}, '#element');

Axis hide in ##Platform_Name## Chart control

By using the [chartMouseClicked](#) event, you can hide the axis line through legend.

To hide the axis line through legend click, follow the given steps:

Step 1:

Create a chart with multiple axes.

By using the [chartMouseClicked](#) event, you can get the legend's target ids. Using this event, you can also get the `yAxisName` of each axis, based on which you can hide the axis line when clicking the legend.

The following code sample demonstrates the output.

INDEX.JS

```

var chartData = [
    { x: new Date(1975, 0, 1), y: 16, y1: 10, y2: 4.5 },
    { x: new Date(1980, 0, 1), y: 12.5, y1: 7.5, y2: 5 },
    { x: new Date(1985, 0, 1), y: 19, y1: 11, y2: 6.5 },

Dialog chart in ##Platform_Name## Chart control

Using the `content` property of the dialog component, you can show the chart in dialog pop-up.

To show the chart in dialog component, follow the given steps:

Step 1:

Initialize the dialog and button components, and then create a basic chart and set the visibility of dialog to `false` when initialize.

By setting the chart `id` in the `content` property of dialog component, you can show chart when clicking the button component.

Dynamic chart in ##Platform_Name## Chart control

By using html button, you can add the chart dynamically when click the button.

To add the chart dynamically through button click, follow the given steps:

Step 1:

Initially create the html button.

Then create chart inside of button `onClick` function. Now click the button charts will render based on click count.

The following code sample demonstrates the output.

INDEX.JS

```

let count = 0;
document.getElementById('btn').onclick = () => {
    //Create div element dynamically and append to DOM
    var chartEle = document.createElement('div');
    chartEle.id = 'chartContainer' + count;
    document.getElementsByTagName('body')[0].appendChild(chartEle);
    //Created chart here
    var chart = new ej.charts.Chart({
        series: [{
            type: 'Line', xName: 'x', width: 2, marker: { visible: true },
            yName: 'y', name: 'Germany',
            dataSource: [{ x: 1, y: 21 }, { x: 2, y: 24 }, { x: 3, y: 36 },
                { x: 4, y: 38 }, { x: 5, y: 54 }, { x: 6, y: 57 }, { x: 7, y: 70 }
        ]],
        title: 'Inflation - Consumer Price', tooltip: { enable: true },
        height: '400', width: '800'
    });
    chart.appendTo('#' + chartEle.id);
    count++;
}

```

CheckBox

Label and size in ##Platform_Name## Check box control

This section explains the different sizes and labels.

Label

The CheckBox caption can be defined by using the [label](#) property. This reduces the manual addition of label for CheckBox. You can customize the label position before or after the CheckBox through the [labelPosition](#) property.

INDEX.JS

```

ej.base.enableRipple(true);
//Label position - Left.
var checkbox = new ej.buttons.CheckBox({ label: 'Left Side Label',
labelPosition: 'Before' });
checkbox.appendTo('#checkbox1');
//Label position - Right.
checkbox = new ej.buttons.CheckBox({ label: 'Right Side Label', checked:
true });
checkbox.appendTo('#checkbox2');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 CheckBox</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
<link href="styles.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <ul>
            <li><input type="checkbox" id="checkbox1"></li>
            <li><input type="checkbox" id="checkbox2"></li>
        </ul>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    width: 30%;
    position: absolute;
    top: 45%;
    left: 45%;
}
.e-checkbox-wrapper {
    margin-top: 18px;
}
li {
    list-style: none;
}

```

Size

The different CheckBox sizes available are default and small. To reduce the size of default CheckBox to small, set the [cssClass](#) property to `e-small`.

INDEX.JS

```
ej.base.enableRipple(true);
//Small CheckBox.
var checkbox = new ej.buttons.CheckBox({ label: 'Small', cssClass: 'e-small'
});
checkbox.appendTo('#checkbox1');
//Default CheckBox.
checkbox = new ej.buttons.CheckBox({ label: 'Default' });
checkbox.appendTo('#checkbox2');
```

INDEX.HTML

```

Accessibility in ##Platform_Name## Check box control

The Check box component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Check box component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Check box component followed the [WAI-ARIA](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/) patterns to meet the accessibility. The following ARIA attributes are used in the Check box component:

Attributes	Purpose
---	---
aria-disabled	Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable.

Keyboard interaction

The Check box component followed the [keyboard interaction](https://www.w3.org/WAI/ARIA/apg/patterns/Check box/#keyboardinteraction) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Check box component.

Space	When the Check box has focus, pressing the Space key changes the state of the Check box.

Ensuring accessibility

The Check box component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Check box component is shown in the following sample. Open the [sample](https://ej2.syncfusion.com/accessibility/Check box.html) in a new window to evaluate the accessibility of the Check box component with accessibility tools.

How To

Customized checkbox in ##Platform_Name## Check box control

Customize CheckBox Appearance

You can customize the appearance of the CheckBox component using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the CheckBox is customized through the custom classes to create primary, success, warning, and danger info type of checkbox.

INDEX.JS

```
// To customize CheckBox appearance
// Refer the 'e-primary' class details in 'style.css'.
var checkbox = new ej.buttons.CheckBox({ label: 'Primary', cssClass: 'e-
primary', checked: true });
checkboxbox.appendTo('#checkbox1');
// Refer the 'e-success' class details in 'style.css'.
checkboxbox = new ej.buttons.CheckBox({ label: 'Success', cssClass: 'e-
success', checked: true });
checkboxbox.appendTo('#checkbox2');
// Refer the 'e-info' class details in 'style.css'.
checkboxbox = new ej.buttons.CheckBox({ label: 'Info', cssClass: 'e-info',
checked: true });
checkboxbox.appendTo('#checkbox3');
// Refer the 'e-warning' class details in 'style.css'.
checkboxbox = new ej.buttons.CheckBox({ label: 'Warning', cssClass: 'e-
warning', checked: true });
checkboxbox.appendTo('#checkbox4');
// Refer the 'e-danger' class details in 'style.css'.
checkboxbox = new ej.buttons.CheckBox({ label: 'Danger', cssClass: 'e-danger',
checked: true });
checkboxbox.appendTo('#checkbox5');
```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  width: 30%;
  position: absolute;
  top: 45%;
  left: 45%;
}
li {
  list-style: none;
}
.e-checkbox-wrapper {
  margin-top: 18px;
}
.e-checkbox-wrapper.e-primary:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #e03872;
}
.e-checkbox-wrapper.e-success .e-frame.e-check,
.e-checkbox-wrapper.e-success .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
  background-color: #689f38;
}
.e-checkbox-wrapper.e-success:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #449d44;
}
.e-checkbox-wrapper.e-info .e-frame.e-check,
.e-checkbox-wrapper.e-info .e-checkbox:focus + .e-frame.e-check { /* csslint
allow: adjoining-classes */
  background-color: #2196f3;
}

```

```
.e-checkbox-wrapper.e-info:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #0b7dda;
}
.e-checkbox-wrapper.e-warning .e-frame.e-check,
.e-checkbox-wrapper.e-warning .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
  background-color: #ef6c00;
}
.e-checkbox-wrapper.e-warning:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #cc5c00;
}
.e-checkbox-wrapper.e-danger .e-frame.e-check,
.e-checkbox-wrapper.e-danger .e-checkbox:focus + .e-frame.e-check { /*
csslint allow: adjoining-classes */
  background-color: #d84315;
}
.e-checkbox-wrapper.e-danger:hover .e-frame.e-check { /* csslint allow:
adjoining-classes */
  background-color: #ba3912;
}
```

Custom Frame

CheckBox frame can be customized as per the requirement by adding CSS rules.

In the following example, to-do list is displayed with round checkbox by changing `border-radius` as `100%` by adding `e-custom` class.

INDEX.JS

```
// To customize CheckBox frame appearance
var checkbox = new ej.buttons.CheckBox({ label: 'Buy groceries', cssClass:
'e-custom', checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new ej.buttons.CheckBox({ label: 'Pay rent', cssClass: 'e-custom'
});
checkbox.appendTo('#checkbox2');
checkbox = new ej.buttons.CheckBox({ label: 'Make Dinner', cssClass: 'e-
custom' });
checkbox.appendTo('#checkbox3');
checkbox = new ej.buttons.CheckBox({ label: 'Finish To-do list article',
cssClass: 'e-custom' });
checkbox.appendTo('#checkbox4');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 CheckBox</title>
  <meta charset="utf-8">

    <div id="container">
        <ul>
            <li><input type="checkbox" id="checkbox1"></li>
            <li><input type="checkbox" id="checkbox2"></li>
            <li><input type="checkbox" id="checkbox3"></li>
            <li><input type="checkbox" id="checkbox4"></li>
        </ul>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    width: 30%;
    position: absolute;
    top: 45%;
    left: 45%;
}
li {
    list-style: none;
}
.e-checkbox-wrapper {
    margin-top: 18px;
}
.e-custom .e-frame {
    border-radius: 100%;
}
.e-checkicon.e-checkbox-wrapper .e-frame.e-check::before {
    content: '\e77d';
}
.e-checkicon.e-checkbox-wrapper .e-check {
    font-size: 8.5px;
}

```

```

}
.e-checkicon.e-checkbox-wrapper .e-frame.e-check {
  background-color: white;
  border-color: grey;
  color: grey;
}
.e-checkicon.e-checkbox-wrapper:hover .e-frame.e-check {
  background-color: white;
  border-color: grey;
  color: grey;
}
.e-checkicon.e-checkbox-wrapper .e-checkbox:focus + .e-frame.e-check {
  background-color: white;
  border-color: grey;
  box-shadow: none;
  color: grey;
}
}

```

Custom Check Icon

CheckBox check icon can be customized as per the requirement by adding CSS rules.

In the following example, the check icon can be customized by changing check icon content, background and border color in focus and hovered states by adding `e-checkicon` class.

INDEX.JS

```

// To customize CheckBox frame appearance
var checkbox = new ej.buttons.CheckBox({ label: 'Buy groceries', cssClass:
'e-checkicon', checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new ej.buttons.CheckBox({ label: 'Pay rent', cssClass: 'e-
checkicon' });
checkbox.appendTo('#checkbox2');
checkbox = new ej.buttons.CheckBox({ label: 'Make Dinner', cssClass: 'e-
checkicon' });
checkbox.appendTo('#checkbox3');
checkbox = new ej.buttons.CheckBox({ label: 'Finish To-do list article',
cssClass: 'e-checkicon' });
checkbox.appendTo('#checkbox4');

```

INDEX.HTML

```

Name and value in form submit in ##Platform_Name## Check box control

The [name](#) attribute of the CheckBox is used to group Checkboxes. When the Checkboxes are grouped in form, the checked items [value](#) attribute will post to the server on form submit that can be retrieved through the name. The disabled and unchecked CheckBox value will not be sent to the server on form submit.

In the following code snippet, Cricket and Hockey are in the checked state, Tennis is in [disabled](#) state and Basketball is in unchecked state. Now, the value that is in checked state only be sent on form submit.

INDEX.JS

```
ej.base.enableRipple(true);
//Name and Value attribute in form submit.
var checkbox = new ej.buttons.CheckBox({ name: 'Sport', value: 'Cricket',
label: 'Cricket', checked: true });
checkbox.appendTo('#checkbox1');
checkbox = new ej.buttons.CheckBox({ name: 'Sport', value: 'Hockey', label:
'Hockey', checked: true });
checkbox.appendTo('#checkbox2');
checkbox = new ej.buttons.CheckBox({ name: 'Sport', value: 'Tennis', label:
'Tennis', disabled: true });
checkbox.appendTo('#checkbox3');
checkbox = new ej.buttons.CheckBox({ name: 'Sport', value: 'Basketball',
label: 'Basketball' });
checkbox.appendTo('#checkbox4');
var button = new ej.buttons.Button({ isPrimary: true });
button.appendTo('#btnElement');
```

Right to left in ##Platform_Name## Check box control

CheckBox component has RTL support. This can be achieved by setting `enableRtl` as `true`.

The following example illustrates how to enable right-to-left support in CheckBox component.

INDEX.JS

```
ej.base.enableRipple(true);  
// Initialize CheckBox component.  
var checkbox = new ej.buttons.CheckBox({ label: 'Default', enableRtl: true  
});  
// Render initialized CheckBox.  
checkbox.appendTo('#element');
```

INDEX.HTML

```

Chips

Types in ##Platform_Name## Chips control

The ChipList control has the following types.

- Input Chip
- Choice Chip
- Filter Chip
- Action Chip

Input Chip

Input Chip holds information in compact form. It converts user input into chips.

INDEX.JS

```

new ej.buttons.ChipList({chips: ['Andrew', 'Janet', 'Laura', 'Margaret']},
'#chip');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Customization in ##Platform_Name## Chips control

This section explains the customization of styles, leading icons, avatar, and trailing icons in Chip control.

Styles

The Chip control has the following predefined styles that can be defined using the `cssClass` property.

Class	Description
-----	-----
e-primary	Represents a primary chip.
e-success	Represents a positive chip.
e-info	Represents an informative chip.
e-warning	Represents a chip with caution.
e-danger	Represents a negative chip.

INDEX.JS

```
new ej.buttons.ChipList({ chips: [{
  "text": "Apple",
  "cssClass": "e-primary"
},
{
  "text": "Microsoft",
  "cssClass": "e-info"
},
{
  "text": "Google",
  "cssClass": "e-success"
},
{
  "text": "Tesla",
  "cssClass": "e-warning"
},
{
  "text": "Intel",
  "cssClass": "e-danger"
}
] }, '#chip');
```

INDEX.HTML

```

  position: absolute;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 16px;
  top: 45%;
  left: 45%;
}
#chip .andrew {
background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/andrew.png')
}
#chip .margaret {
background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/margaret.png')
}
#chip .laura {
background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/laura.png')
}
#chip .janet {
background-image:
url('https://ej2.syncfusion.com/demos/src/chips/images/janet.png')
}
```

Style in ##Platform_Name## Chips control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the chip text

Use the following CSS to customize the chip text properties.

```
.e-chip .e-chip-text {
font-size: 20px;
color: black;
font-weight: normal;
}
,
```

Customizing the chip icon

Use the following CSS to customize the chip icon properties.

```
、  
  
.e-chip .e-icon {  
background-image: url('https://ej2.syncfusion.com/demos/src/chips/images/laura.png');  
opacity: 0.8;  
}  
、
```

Customizing the chip delete button

Use the following CSS to customize the chip delete button.

```
、  
  
.e-chip-list .e-chip .e-chip-delete.e-dlt-btn {  
color: #e3165b;  
font-size: 12px;  
}  
、
```

Customizing the chip outline

Use the following CSS to customize the chip outline.

```
、  
  
.e-chip-list .e-chip.e-outline {  
border-color: #e3165b;  
border-width: 3px;  
}  
、
```

Customizing the chip on selection

Use the following CSS to customize the chip on selection.

```
、  
  
/ To customize single chip on selection /  
.e-chip-list.e-selection .e-chip.e-active {  
background-color: #ffca1c;  
color: #e3165b;  
}  
  
/ To customize multiple chip on selection /  
.e-chip-list .e-chip.e-active {  
background-color: #e3165b;  
color: white;
```

```
}  
`
```

Customizing the chip avatar text

Use the following CSS to customize the chip avatar text properties.

```
`  
  
.e-chip-list .e-chip .e-chip-avatar {  
background-color: #d51a1a;  
color: #fafafa;  
}  
`
```

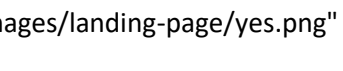

Accessibility in ##Platform_Name## Chips component

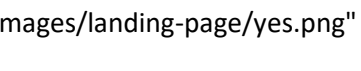

The Chips component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

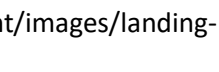

The accessibility compliance for the Chips component is outlined below.

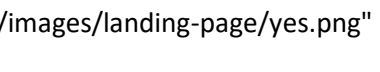

| Accessibility Criteria | Compatibility |

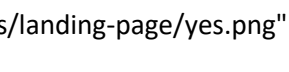

| -- | -- |

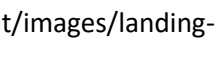

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

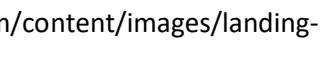

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {  
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Chips component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Chips component:

Attributes	Purpose
------------	---------

---	---
-----	-----

<code>role=checkbox</code>	Indicates the ChipList component wrapper element as <code>checkbox</code> .
----------------------------	---

<code>role=option</code>	Used to convey a significant and contextual message to the user(ChipList).
--------------------------	--

<code>role=button</code>	Used to convey a significant and contextual message to the user(Single Chip).
--------------------------	---

<code>aria-label</code>	Provides an accessible name for the Chip.
-------------------------	---

<code>aria-selected</code>	Indicates the element is selected.
----------------------------	------------------------------------

<code>aria-disabled</code>	Indicates element is perceivable but disabled.
----------------------------	--

<code>aria-multiselectable</code>	Indicates multiple items to be selected.
-----------------------------------	--

Keyboard interaction

The Chips component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Chips component.

Keyboard shortcuts	Actions
--------------------	---------

-----	-----
-------	-------

Enter / Space	Selects the targeted chip from the ChipList/ChipCollection.
----------------------	--

Delete / Backspace	Deletes the targeted chip from the ChipList/ChipCollection.
---------------------------	--

Ensuring accessibility

The Chips component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Chips component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Chips component with accessibility tools.

Circular Gauge

Gauge dimensions in ##Platform_Name## Circular gauge control

Size for Container

Circular gauge can render to its container size. You can set the size via inline or CSS as demonstrated below.

```
,  
  
<div id='container'>  
  <div id='element' style="width:650px; height:350px;"></div>  
</div>  
,
```

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({  
  }, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
  <title>EJ2 Animation</title>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width, initial-scale=1.0">  
  <meta name="description" content="Typescript UI Controls">  
  <meta name="author" content="Syncfusion">  
  <link href="index.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
  popups/styles/material.css" rel="stylesheet">  
  
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
  type="text/javascript"></script>  
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
  ="text/javascript"></script>  
</head>  
<body>  
  
  <div id="container">  
    <div id="element"></div>  
  </div>  
<script>  
var ele = document.getElementById('container');  
if(ele) {  
  ele.style.visibility = "visible";  
}  
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Size for Circular Gauge

You can also set size for the gauge directly through [width](#) and [height](#) properties.

In Pixel

You can set the size of the gauge in pixel as demonstrated below.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  // Width and height for gauge in pixel.
  width: '650', height: '350'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting value in percentage, gauge gets its dimension with respect to its container. For example, when the height is '50%', gauge renders to half of the container height.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  // Width and height for gauge in percentage.
  width: '80%', height: '50%'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

Gauge axes in ##Platform_Name## Circular gauge control

By default, gauge will be displayed with an axis. Each axis contains its own ranges, pointers and annotation.

Axis Customization

You can customize the width and color of an axis line by using [lineStyle](#) property.

Background for an axis can be customized by using [background](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    lineStyle: {
      width: 2,
```

```

        color: 'red'
    },
    background: 'rgba(0, 128, 128, 0.3)'
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Angles and Direction

Circular gauge axis can sweep from 0 to 360 degrees. By default start angle of an axis is 200 degree and end angle is 160 degree and you can customize this option by using [startAngle](#) and [endAngle](#) property.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    startAngle: 270,
    endAngle: 90
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

The [direction](#) property enables you to render the gauge axis either in **ClockWise** or in **AntiClockWise** direction.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    direction: 'AntiClockWise'
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Axis Radius

By default, radius of an axis is calculated based on the available size.

You can customize this, by using [radius](#) property.

It takes value either in **percentage** or in **pixel**.

In Pixel

You can set the radius of the gauge in pixel as demonstrated below,

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
    axes: [{
        radius: '150'
    }]
}, '#element');
```

INDEX.HTML

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In Percentage

By setting value in percentage, gauge gets its dimension with respect to its available size.

For example, when the radius is '50%', gauge renders to half of the available size.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
    axes: [{
        radius: '50%'
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Ticks

You can customize the [height](#),

[color](#) and [width](#) of major ticks and minor ticks by using [majorTicks](#) and [minorTicks](#) property.

By default, [interval](#) for

[majorTicks](#) will be calculated automatically and also you can customize the interval for major and minor ticks using [interval](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    majorTicks: {
      interval: 10,
      color: 'red',
      height: 10,
      width: 3
    },
    minorTicks: {
      interval: 5,
      color: 'green',
      height: 5,
      width: 2
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tick Position

Both minor and major ticks can be moved by using [offset](#) and [position](#) property. The [offset](#) defines the distance between the axis and ticks.

By default, offset value is 0. The [position](#) will place the ticks either inside or outside of the axis.

By default, ticks will be placed **inside** the axis.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    majorTicks: {
      interval: 10,
      color: 'red',
      height: 10,
      width: 3,
      position: 'Inside',
      offset: 5
    },
    minorTicks: {
      interval: 5,
      color: 'green',
      height: 5,
      width: 2,
      position: 'Inside',
      offset: 5
    }
  }
  ],
  element: '#element');

```

INDEX.HTML

Display the last label, even if it isn't in the visible range

If the last label is not in the visible range, it will be hidden by default. If you want to show the last label, set the `showLastLabel` property to `true` in the `axes` API of circular gauge.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    showLastLabel: true,
    minimum: 0,
    maximum: 170,
    startAngle: 210, endAngle: 150
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Auto Angle

Labels can be swept along the axis angle by enabling [autoAngle](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    labelStyle: {
      autoAngle: true
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Smart Labels

When an axis makes a complete circle, then the first and last label of the axis will get overlap with each other.

In this scenario, you can either hide 1st or last label using [hiddenLabel](#) property.

When `hiddenLabel` value is `First`, then the 1st label will be hidden and when the `hiddenLabel` value is `Last`, then the last label will be hidden.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 12,
    startAngle: 0,
    endAngle: 360,
    majorTicks: {
      interval: 1,
      position: 'Inside',
      height: 10
    },
    minorTicks: {
      interval: 0.2,
      position: 'Inside',
      height: 5
    },
    labelStyle: {
      position: 'Inside',
      hiddenLabel: 'First'
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Label Format

Axis labels can be formatted by using [format](#) property in [labelStyle](#) and its supports all globalize format.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    labelStyle: {
      format: 'p1'
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

The following table describes the result of applying some commonly used label formats on numeric values.

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place

0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

Custom Label Format

Axis labels support custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    labelStyle: {
      format: '{value}°C'
    }
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Hide intersecting axis labels

When the axis labels overlap with each other, you can hide the intersected labels by setting the `hideIntersectingLabel` property to true in the axis.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
    axes: [{
        hideIntersectingLabel: true,
        minimum: 0,
        maximum: 200,
        startAngle: 270, endAngle: 90,
        majorTicks:{
            interval:4
        },
        minorTicks: {
            interval:2
        }
    }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Minimum and Maximum

The [minimum](#) and [maximum](#) properties

enables you to customize the start and end values of an axis.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 50,
    maximum: 250
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

```

Multiple Axes

In addition to the default axis, you can add n number of axis to a gauge.

Each axis will have its own ranges, pointers, annotations and customization options.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    majorTicks: {
      interval: 10,
      position: 'Inside',
      height: 10,
    },
    pointers: [],
    minorTicks: {
      interval: 5,
      position: 'Inside',
      height: 5,
    }
  }, {
    pointers: [],
    majorTicks: {
      interval: 10,
      position: 'Inside',
      height: 10,
      color: '#27d5ff'
    },
    minorTicks: {
      interval: 5,
      position: 'Inside',
      height: 5,
      color: '#27d5ff'
    }
  }
], '#element');
```

INDEX.HTML

```

    <div id="element"></div>
  </div>
```

```
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Gauge ranges in ##Platform_Name## Circular gauge control

You can categories certain interval on gauge axis using [ranges](#) property.

Start and End

Start and end value of a range in an axis can be customized by using [start](#) and [end](#) properties.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
    axes: [{
        ranges: [{
            start: 40,
            end: 80
        }]
    }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

Color and thickness of the range can be customized by using [color](#), [startWidth](#) and [endWidth](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    ranges: [{
      start: 40,
      end: 80, endWidth: 15,
      startWidth: 15,
      color: '#ff5985'
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Radius

You can place the range inside or outside of the axis by using [radius](#) property. The radius of the range can takes value either in percentage or in pixels. By default, ranges

take 100% of the axis radius.

In Pixel

You can set the radius of the range in pixel as demonstrated below,

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    ranges: [{
      start: 40,
      end: 80,
      radius: '100'
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting value in percentage, range gets its dimension with respect to its axis radius. For example, when the radius is '50%', range renders to half of the axis radius.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    ranges: [{
      start: 40,
      end: 80,
      radius: '50%'
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Dragging Range

The ranges can be dragged over the axis line by clicking and dragging the same. To enable or disable the range drag, use the [enableRangeDrag](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  enableRangeDrag: true,
  height: '250px',
  width: '250px',
```

```

    axes: [{
      ranges: [{
        start: 0,
        end: 100,
        startWidth: 8, endWidth: 8,
        radius: '108%',
        color: '#30B32D'
      }],
      pointers: [{
        value: 50
      }]
    }]
  }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple Ranges

You can add multiple ranges to an axis with the above customization as demonstrated below.

Note: You can set the range color to axis ticks and labels by enabling `useRangeColor` property in [majorTicks](#),

[minorTicks](#) and [labelStyle](#) object.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
    ranges: [{
      start: 0,
      end: 25,
      radius: '108%'
    }, {
      start: 25,
      end: 50,
      radius: '70%'
    }, {
      start: 50,
      end: 75,
      radius: '70%'
    }, {
      start: 75,
      end: 100,
      radius: '108%'
    }
  ]
}],
  '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>

```

```
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Rounded corner radius

You can customize the corner radius using the `roundedCornerRadius` property in `ranges`.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    ranges: [{
      start: 40,
      end: 80,
      radius: '50%',
      roundedCornerRadius: 5,
    }]
  }]
}, '#element');

Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient will be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

To apply linear gradient to the range, follow the below code sample.

INDEX.JS

```

var rangeLinearGradient = {
  startValue: '0%', endValue: '100%',
  colorStop: [
    { color: '#9E40DC', offset: '0%', opacity: 0.9 },
    { color: '#E63B86', offset: '70%', opacity: 0.9 }
  ]
};
var circulargauge = new ej.circulargauge.CircularGauge({
  title: 'Short Put Distance',
  titleStyle: {
    size: '18px'
  },
  centerY: '57%',
  axes: [{
    annotations: [{
      content: '12 M', radius: '108%', angle: 98, zIndex: '1'
    }, {
      content: '11 M', radius: '80%', angle: 81, zIndex: '1'
    }, {
      content: '10 M', radius: '50%', angle: 69, zIndex: '1'
    }, {
      content: 'Doe', radius: '108%', angle: 190, zIndex: '1'
    }, {
      content: 'Almaida', radius: '80%', angle: 185, zIndex: '1'
    }, {
      content: 'John', radius: '50%', angle: 180, zIndex: '1'
    }
  ],
  lineStyle: {
    width: 0
  },
  radius: '90%',
  labelStyle: {
    font: {

```

```

        size: '0px'
    },
    majorTicks: {
        width: 0
    },
    minorTicks: {
        width: 0
    },
    startAngle: 200, endAngle: 130,
    minimum: 0, maximum: 14,
    ranges: [{
        start: 0, end: 12, radius: '115%',
        startWidth: 25, endWidth: 25,
        linearGradient : rangeLinearGradient
    }, {
        start: 0, end: 11, radius: '85%',
        startWidth: 25, endWidth: 25,
        linearGradient : rangeLinearGradient
    }, {
        start: 0, end: 10, radius: '55%',
        startWidth: 25, endWidth: 25,
        linearGradient : rangeLinearGradient
    }],
    pointers: [{
        type: 'Marker', value: 12, markerShape: 'Image',
        imageUrl:

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

To apply radial gradient to the range, follow the below code sample.

INDEX.JS

```
var rangeRadialGradient = {
  radius: '50%', innerPosition: { x: '50%', y: '50%' },
  outerPosition: { x: '50%', y: '50%' },
  colorStop: [
    { color: '#9E40DC', offset: '90%', opacity: 0.9 },
    { color: '#E63B86', offset: '160%', opacity: 0.9 }]
};

var circulargauge = new ej.circulargauge.CircularGauge({
  title: 'Short Put Distance',
  titleStyle: {
    size: '18px'
  },
  centerY: '57%',
  axes: [{
    annotations: [{
      content: '12 M', radius: '108%', angle: 98, zIndex: '1'
    }, {
      content: '11 M', radius: '80%', angle: 81, zIndex: '1'
    }, {
      content: '10 M', radius: '50%', angle: 69, zIndex: '1'
    }, {
      content: 'Doe', radius: '108%', angle: 190, zIndex: '1'
    }, {
      content: 'Almaida', radius: '80%', angle: 185, zIndex: '1'
    }, {
      content: 'John', radius: '50%', angle: 180, zIndex: '1'
    }
  ],
  lineStyle: {
    width: 0
  },
  radius: '90%',
  labelStyle: {
    font: {
      size: '0px'
    }
  },
  majorTicks: {
    width: 0
  },
  minorTicks: {
    width: 0
  },
  startAngle: 200, endAngle: 130,
  minimum: 0, maximum: 14,
  ranges: [{
    start: 0, end: 12, radius: '115%',
    startWidth: 25, endWidth: 25,
    radialGradient: rangeRadialGradient
  }, {
    start: 0, end: 11, radius: '85%',
    startWidth: 25, endWidth: 25,
    radialGradient: rangeRadialGradient
  }, {

Gauge supports 3 types of pointers such as **Needle**, **RangeBar** and **Marker**. You can choose any one of the pointer by using **type** property.

Needle Pointers

A needle pointer contains three parts, a needle, a cap / knob and a tail. The length of the needle can be customized by using **radius** property. The length of the tail can be

customized by using **length** property. The radius of the cap can be customized by using **radius** in cap object. The needle and tail

length takes value either in **percentage** or **pixel**.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
    axes: [{
        pointers: [{
            value: 90,
            radius: '50%',
            cap: {
                radius: 10
            },
            needleTail: {
                length: '25%'
            }
        }
    ]
}]
}, '#element');

```

RangeBar Pointer

RangeBar pointer is like ranges in an axis, that can be placed on gauge to mark the pointer value.

RangeBar starts from the beginning of the gauge and ends at the pointer value.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    pointers: [{
      value: 50,
      type: 'RangeBar',
      radius: '60%'
    }]
  }]
});

```

```
    }}
  }, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

RangeBar can be customized in terms of color, border and thickness by using

[color](#), [border](#) and [pointerWidth](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    pointers: [{
      value: 50,
      type: 'RangeBar',
      radius: '60%',
      color: '#007D1',
      border: {
        color: 'grey',
        width: 2
      },
      pointerWidth: 15
    }],
  }],
});
```

```
    }}
  }, '#element');
```

INDEX.HTML

```

```

Rounded corner for range bar pointer

The start and end pointers of range bar in the circular gauge are rounded to form arc gauges.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    lineStyle: {
      color: 'transparent'
    },
    ranges: [
      { start: 0, end: 50, color: '#30B32D', radius:'108%' },
      { start: 50, end: 100, color: '#FFDD00', radius:'108%' }
    ],
    pointers: [{
      value: 50,
      type: 'RangeBar',
      roundedCornerRadius: 6
    }]
  }]
}, '#element');
```

INDEX.HTML

```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Marker Pointer

Different type of marker shape can be used to mark the pointer value in axis. You can change the marker shape using [markerShape](#) property in pointer. Gauge supports the below marker shape.

- Circle
- Rectangle
- Triangle
- InvertedTriangle
- Diamond

We can use image instead of rendering marker shape to denote the pointer value. It can be achieved by setting [markerShape](#) to Image and assigning image path to [imageUrl](#) in pointer.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      type: 'Marker',
      markerShape: 'InvertedTriangle',
```

```

        radius: '100%',
        markerHeight: 15,
        markerWidth: 15
    }
  }
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

The marker can be customized in terms of color, border, width and height by using

[color](#),

[border](#),

[markerWidth](#) and

[markerHeight](#) property in

[pointer](#).

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    pointers: [{
```

```

        value: 90,
        type: 'Marker',
        markerShape: 'Triangle',
        radius: '100%',
        color: 'white',
        border: {
            color: '#007DD1',
            width: 2
        },
        markerHeight: 15,
        markerWidth: 15
    }
}
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Dragging pointer

The pointers can be dragged over the axis line by clicking and dragging the same. To enable or disable the pointer drag, use the [enablePointerDrag](#) property.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{

```

```

        pointers: [{
            value: 90,
            type: 'Marker',
            markerShape: 'Triangle',
            radius: '100%',
            color: 'white',
            border: {
                color: '#007DD1',
                width: 2
            },
            markerHeight: 15,
            markerWidth: 15
        }]
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple Pointers

In addition to the default pointer, you can add n number of pointer to an axis by using **pointers** property.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({

```

```

    axes: [{
      pointers: [{
        value: 90,
        type: 'Marker',
        markerShape: 'InvertedTriangle',
        radius: '100%',
        markerHeight: 15,
        markerWidth: 15
      }, {
        value: 90,
        type: 'RangeBar',
        radius: '60%',
        pointerWidth: 10
      }, {
        value: 90,
        radius: '60%',
        cap: {
          radius: 15,
          border: {
            width: 5
          }
        },
        needleTail: {
          length: '22%',
        },
        pointerWidth: 25
      }
    ]
  }],
  '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Animation

Pointer will get animate on loading the gauge, this can be handled by using

[animation](#) property in pointer.

The [enable](#) property in animation allows you to enable or disable the animation.

The [duration](#) property specify the duration of the animation in milliseconds.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    pointers: [{
      value: 90,
      animation: {
        enable: true,
        duration: 1500
      }
    }]
  }]
}, '#element');

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Gradient Color

Gradient support allows to add multiple colors in the ranges and pointers of the circular gauge. The following gradient types are supported in the circular gauge.

- Linear Gradient
- Radial Gradient

Linear Gradient

Using linear gradient, colors will be applied in a linear progression. The start value of the linear gradient can be set using the [startValue](#) property. The end value of the linear gradient will be set using the [endValue](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

The linear gradient can be applied to all pointer types like marker, range bar and needle. To do so, follow the below code sample.

INDEX.JS

```

var pointerLinearGradient = {
  startValue: '0%',
  endValue: '100%',
  colorStop: [
    { color: '#FEF3F9', offset: '0%', opacity: 0.9 },
    { color: '#E63B86', offset: '70%', opacity: 0.9 }
  ]
};
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    startAngle: 270,
    endAngle: 90,
    lineStyle: { width: 3, color: '#E63B86' },
    labelStyle: {
      font: { size: '0px' }
    },
    majorTicks: {
      height: 0,
    },
    minorTicks: {
      height: 0,
    },
  },
  radius: '90%',
  minimum: 0,
  maximum: 100,
  pointers: [{
    radius: '80%',
    value: 80,
    animation: { enable: true, duration: 1000 },
    color: '#e3a21a',
    pointerWidth: 10,
    linearGradient: pointerLinearGradient,
    cap: {

```

```

        radius: 8,
        color: 'white',
        border: {
            color: '#e3a21a',
            width: 1
        }
    },
    needleTail: {
        length: '20%',
        linearGradient: pointerLinearGradient
    }
}, {
    radius: '60%', value: 40,
    animation: { duration: 1000 },
    color: '#ffbb13',
    pointerWidth: 10,
    linearGradient: pointerLinearGradient,
    cap: {
        radius: 8, color: 'white',
        border: { color: '#ffbb13', width: 1 }
    },
    needleTail: {
        length: '20%',
        linearGradient: pointerLinearGradient
    }
}
]]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Radial Gradient

Using radial gradient, colors will be applied in circular progression. The inner circle position of the radial gradient will be set using the [innerPosition](#) property. The outer circle position of the radial gradient can be set using the [outerPosition](#) property. The color stop values such as color, opacity and offset are set using [colorStop](#) property.

The radial gradient can be applied to all pointer types like marker, range bar and needle. To do so, follow the below code sample.

INDEX.JS

```

var pointerRadialGradient = {
  radius: '50%',
  innerPosition: { x: '50%', y: '50%' },
  outerPosition: { x: '50%', y: '50%' },
  colorStop: [
    { color: '#FEF3F9', offset: '0%', opacity: 0.9 },
    { color: '#E63B86', offset: '60%', opacity: 0.9 }
  ]
};
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    startAngle: 270,
    endAngle: 90,
    lineStyle: { width: 3, color: '#E63B86' },
    labelStyle: {
      font: { size: '0px' }
    },
    majorTicks: {
      height: 0
    },
    minorTicks: {
      height: 0
    },
  },
  radius: '90%',
  minimum: 0,
  maximum: 100,
  pointers: [{
    radius: '80%',
    value: 80,
    animation: { enable: true, duration: 1000 },
    pointerWidth: 10,
    radialGradient: pointerRadialGradient,
    cap: {
      radius: 8,
      color: 'white',
      border: {
        color: '#e3a21a',
        width: 1
      }
    },
  },
  needleTail: {
    length: '20%',

```

```

        radialGradient: pointerRadialGradient,
    }, {
        radius: '60%', value: 40,
        animation: { duration: 1000 },
        pointerWidth: 10,
        radialGradient: pointerRadialGradient,
        cap: {
            radius: 8, color: 'white',
            border: { color: '#ffb133', width: 1 }
        },
        needleTail: {
            length: '20%',
            radialGradient: pointerRadialGradient
        }
    }
}
}, '#element');

```

INDEX.HTML

```

Gauge annotations in ##Platform_Name## Circular gauge control

Annotations are used to mark a specific area of interest in the gauge with texts, shapes or images.

Content

You can place any custom element on the axis area by assigning the id of the element to [content](#) property of [annotation](#) object.

Note: To use annotation feature, we need to inject **Annotations** module using **CircularGauge.Inject(Annotations)** method.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    annotations: [{
      content: 'annotation-template',
      zIndex: '1'
    }],
    pointers: [{
      value: 50
    }]
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script id="annotation-template" type="text/x-template">
    <div id='templateWrap'>
      <div class='des'>
        <span>Pointer Value : 50</span>
      </div>
    </div>
  </script>
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
  var ele = document.getElementById('container');
  if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Position

Annotation can be placed around the axis by using [radius](#) and [angle](#) property.

For example, if the angle is 90 degree and the radius is 110%, then the annotation, will be placed at the right side of the axis.

Radius of the annotation takes value either in pixel or percentage. By setting value in percentage, annotation gets its position with respect to its axis radius.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    annotations: [{
      content: '#annotation-template',
      angle: 90,
      radius: '150%',
      zIndex: '1'
    }],
    pointers: [{
      value: 50
    }]
  }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Sub Gauge

As the annotation allows you to place any custom element, we can initialize a gauge to the element and can be used to place that in another gauge.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 12,
    startAngle: 0,
    endAngle: 360,
    lineStyle: { width: 0 },
    ranges: [
      {
        start: 0, end: 3,
        color: 'rgba(29,29,29,0.7)'
      }, {
        start: 3, end: 12,
        color: 'rgba(168,145,102,0.1)'
      }
    ],

- [Tooltip for Annotation](#)

Animation in ##Platform_Name## Circular Gauge control

All of the elements in the Circular Gauge, such as the axis lines, ticks, labels, ranges, pointers, and annotations, can be animated sequentially by using the [animationDuration](#) property. The animation for the Circular Gauge is enabled when the `animationDuration` property is set to an appropriate value in milliseconds, providing a smooth rendering effect for the control. If the `animationDuration` property is set to `0`, which is the default value, the animation effect is disabled. If the animation is enabled, the control will behave in the following order.

1. The axis line will be animated in the rendering direction (clockwise or anticlockwise).
2. Each tick line and label will then be animated.
3. If available, ranges will be animated.
4. If available, annotations will be animated.

The animation of the Circular Gauge is demonstrated in the following example.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  animationDuration: 2000,
  axes: [

```

```

{
  annotations: [
    {
      angle: 165,
      radius: '35%',
      zIndex: 1,
      content:
        '<div style="font-size:18px;margin-left: -
20px;margin-top: -12px; color:#9DD55A">60</div>',
    },
    ],
    radius: '80%',
    startAngle: 230,
    endAngle: 130,
    majorTicks: {
      offset: 5,
    },
    lineStyle: { width: 8, color: '#E0E0E0' },
    minorTicks: {
      offset: 5,
    },
    labelStyle: {
      font: {
        fontFamily: 'inherit',
      },
      offset: -1,
    },

Gauge legend in ##Platform_Name## Circular gauge control

Legend provides valuable information for interpreting what the circular gauge axis range displays, and they can be represented in various colors, shapes, and other identifiers based on the data. It gives a breakdown of what each symbol represents in the axis range of circular gauge.

You can add the legend for circular gauge ranges by setting the visible property of `legendSettings` to true.

Legend customization

Customization option is also provided for the legend shape, alignment, and position.

Position and alignment

The position of the legend is used to place legend in various positions. You can use the `position` property in `legendSettings`. Based on the position, the legend item will be aligned. The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Custom
- Auto

The legend alignment is used to align the legend items in specific location. You can use the alignment property in `legendSettings` to align the legend items. The following options are available to customize the legend alignment:

- Near
- Center
- Far

The legends can also be positioned to absolute position using the `location.x` and `location.y` properties available in `legendSettings`.

Legend size

The legend size can be modified using the `height` and `width` properties in `legendSettings`.

Legend opacity

To specify the transparency for legend shape, set the `opacity` property in `legendSettings`.

Legend shape

To change the legend item shape, specify the desired shape in the `shape` property of the legend. By default, the shape of the legend is `circle`.

It also supports the following shapes:

- Circle
- Rectangle
- Diamond
- Triangle

- InvertedTriangle
- Image

You can customize a shape using the `shapeWidth` and `shapeHeight` properties.

Legend padding

You can control the spacing between the legend items using the `padding` option of the legend. The default value of padding is 5.

Legend border

You can customize the legend border using the border option in the legend. The legend border can be customized using the border `color` and `width` properties.

Font of the legend text

The font of the legend item text can be customized using the following properties:

- fontFamily
- fontStyle
- fontWeight
- opacity
- color
- size

The following code example shows how to add legend in the gauge.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
    ranges: [{
      start: 0,
      end: 25,
      radius: '108%'
    }, {
      start: 25,
      end: 50,
      radius: '108%'
    }, {
      start: 50,
      end: 75,
      radius: '108%'
    }, {
      start: 75,
```

```

        end: 100,
        radius: '108%'
    }
  ]],
  legendSettings : {
    visible: true,
    position: 'Bottom',
    alignment: 'Near',
    width: '450',
    height: '80',
    shapeWidth: 30,
    shapeHeight: 30,
    padding: 15,
    border: {
      color: 'green',
      width: 3
    }
  }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Toggle option in legend

The toggle option has been provided for legend. So, if you toggle the legend, the given color will be changed to the corresponding circular gauge range. You can enable the toggle option using [toggleVisibility](#) in the `legendSettings` property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    minimum: 0,
    maximum: 100,
    majorTicks: {
      useRangeColor: true
    },
    minorTicks: {
      useRangeColor: true
    },
    labelStyle: {
      useRangeColor: true
    },
    ranges: [{
      start: 0,
      end: 25,
      radius: '108%'
    }, {
      start: 25,
      end: 50,
      radius: '108%'
    }, {
      start: 50,
      end: 75,
      radius: '108%'
    }, {
      start: 75,
      end: 100,
      radius: '108%'
    }
  ]
}],
  legendSettings : {
    visible: true,
    toggleVisibility: true
  }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

legendRendering event will be triggered before rendering each legend item, using this event you can customize needed legend items using following arguments.

Argument name	Description
fill	Specifies the legend shape color
text	Specifies the current legend text
shape	Customize the shape of the legends
name	Specifies the name of the event
cancel	Set to true, to cancel the event status

Gauge user interaction in ##Platform_Name## Circular gauge control

Tooltip for pointers

Circular gauge will displays the pointer details through [tooltip](#),when the mouse is moved over the pointer.

Enable Tooltip

By default, tooltip is not visible. Enable the tooltip by setting [enable](#) property to true and injecting GaugeTooltip module using `CircularGauge.Inject(GaugeTooltip)` method.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  // Title for circular gauge.
  tooltip: {
    enable: true
  },
  axes:[{
    pointers:[{
      value: 70
    }],
  }],
}, '#element');

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Template

Any HTML elements can be displayed in the tooltip by using the [template](#) property of the tooltip.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  // Title for circular gauge.
  tooltip: {
    enable: true,
    template: '${value}'
  },
  axes:[{
    pointers:[{
      value: 70
    }]
  }]
}, '#element');

```

INDEX.HTML

```

Tooltip for ranges

Circular gauge displays the information about the ranges through tooltip when hovering the mouse over the ranges. You can enable this feature by setting the type property of tooltip to 'Range' in the array collection.

Range tooltip customization

To customize the range tooltip, use the `rangeSettings` property in tooltip. The following options are available to customize the range tooltip:

- `fill` - Specifies the range tooltip fill color.
- `textStyle` - Specifies the range tooltip text style.
- `format` - Specifies the range content format.
- `template` - Specifies the custom template for tooltip.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.
- `showMouseAtPosition` - Displays the position of the tooltip on the cursor position.

Tooltip for annotation

Circular gauge displays the information about the annotations through tooltip when hovering the mouse over the annotation. You can enable this feature by setting the type property of tooltip to 'Annotation' in the array collection.

Annotation tooltip customization

To customize the annotation tooltip, use the `annotationSettings` property in tooltip. The following options are available to customize the annotation tooltip:

- `fill` - Specifies the annotation tooltip fill color.
- `textStyle` - Specifies the annotation tooltip text style.
- `format` - Specifies the annotation content format.
- `template` - Specifies the tooltip content with custom template.
- `enableAnimation` - Animates as it moves from one point to another.
- `border` - Specifies the tooltip border.

The following code example shows the tooltip for the ranges and annotation.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  // Title for circular gauge.
  axes: [{
    radius: '90%',
    minimum: 0,
    maximum: 120,
    startAngle: 240,
    endAngle: 120,
    annotations: [{
      content: 'CircularGauge', zIndex: '1', angle: 180
    }],
   LineStyle: { width: 0 },
    majorTicks: { color: 'white', offset: -5, height: 12 },
    minorTicks: { width: 0 },
    labelStyle: { useRangeColor: true, font: { color: '#424242', size:
'13px', fontFamily: 'Roboto' } },
    pointers: [{
      value: 70,
      radius: '60%',
      color: '#33BCBD',
      cap: { radius: 10, border: { color: '#33BCBD', width: 5 } },
      animation: { enable: false }
    }],
    ranges: [{
      start: 0,
      end: 50,
      startWidth: 10, endWidth: 10,
      radius: '102%',
      color: '#3A5DC8',
    }, {
      start: 50,
      end: 120,
      radius: '102%',
      startWidth: 10, endWidth: 10,
      color: '#33BCBD',
```

```

    ]]
  }],
  tooltip: {
    type: ['Pointer', 'Range', 'Annotation'],
    enable: true,
    enableAnimation: false,
    annotationSettings: { template: '<div>CircularGauge</div>' },
    rangeSettings: { fill: 'red' }
  }
}, '#element');

```

INDEX.HTML

```

Pointer Drag

Pointers can be dragged over the axis value. This can be achieved by clicking and dragging the pointer. To enable or disable the pointer drag, you can use

[enablePointerDrag](#) property.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  enablePointerDrag: true,
  tooltip: {
    enable: true
  },
  axes:[{
    pointers:[{
      value: 70
    }]
  }]
}, '#element');

```

Gauge appearance in ##Platform_Name## Circular gauge control

Gauge Title

Circular gauge can be given a title by using [title](#) property, to show the information about the gauge.

Title can be customized by using [titleStyle](#) property in gauge.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  title: 'Speedometer',
  titleStyle: {
    color: '#27d5ff'
  }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Gauge Position

Gauge can be positioned anywhere in the container with the help of [centerX](#) and [centerY](#) property and it accepts values either in percentage or in pixels.

The default value of the [centerX](#) and

[centerY](#) property is 50%, which means gauge will get rendered to the centre of the container.

In Pixel

You can set the mid point of the gauge in pixel as demonstrated below,

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  centerX: '20',
  centerY: '20',
  axes: [{
    lineStyle: {
      width: 2,
      color: '#F8F8F8'
    },
    startAngle: 90,
    endAngle: 180
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting the value in percentage, gauge gets its mid point with respect to its plot area.

For example, when the [centerX](#) value as '0%' and [centerY](#) value is '50%', gauge will get positioned at the top left corner of the plot area.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  centerX: '10%',
  centerY: '50%',
  axes: [{
    lineStyle: {
      width: 2,
      color: '#F8F8F8'
    },
    startAngle: 0,
    endAngle: 180
  }]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Area Customization

Customize the gauge background

Using [background](#) and [border](#) properties, you can change the background color and border of the circular gauge.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  background: 'skyblue',
  // Customize the chart border and opacity.
  border: {color: "#FF0000", width: 2},
  axes: [{
    radius: '90%',
    maximum: 120,
    startAngle: 230,
    endAngle: 130,
    majorTicks: {
      width: 1, color: '#8c8c8c'
    },
    lineStyle: { width: 2 },
    minorTicks: {
      width: 1, color: '#8c8c8c'
    },
    pointers: [{
      value: 60,
      radius: '60%'
    }],
    ranges: [{
      start: 0,
      end: 70,
      radius: '110%',
      strokeWidth: 10
    }, {
      start: 70,
      end: 110,
      radius: '110%',
      strokeWidth: 10
    }, {
      start: 110,
      end: 120,
      radius: '110%',
      strokeWidth: 10
    }
  ]
}],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Gauge Margin

You can set margin for gauge from its container through [margin](#) property.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
    background: 'skyblue',
    // Customize the chart border and opacity.
    border: {color: "#FF0000", width: 2},
    // Change chart margin to left, right, top and bottom.
    margin: { left: 40, right: 40, top: 40, bottom: 40 },
    axes: [{
        radius: '90%',
        maximum: 120,
        startAngle: 230,
        endAngle: 130,
        majorTicks: {
            width: 1, color: '#8c8c8c'
        },
        lineStyle: { width: 2 },
        minorTicks: {
            width: 1, color: '#8c8c8c'
        },
        pointers: [{
            value: 60,
            radius: '60%'
        }],
        ranges: [{
            start: 0,
            end: 70,
            radius: '110%',
            strokeWidth: 10
        }, {
            start: 70,
            end: 110,
            radius: '110%',
            strokeWidth: 10
        }, {
            start: 110,

```

```

        end: 120,
        radius: '110%',
        strokeWidth: 10
    }]
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

```

Radius calculation based on angles

Render semi or quarter circular gauges by modifying the start and end angles. By enabling the radius based on angle option, the radius of circular gauge will be calculated based on the start and end angles to avoid excess white space.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  moveToCenter: true,
  axes: [{
    lineStyle: {
      width: 2,
      color: '#F8F8F8'
    },
    startAngle: 270,
    endAngle: 90,
  }

```

```
        radius: '80%'
    }]
}, '#element');
```

Accessibility in ##Platform_Name## Circular gauge control

Circular Gauge has built-in accessibility features like screen reading and WAI-ARIA attributes.

WAI-ARIA attributes

The Circular Gauge control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Circular Gauge control:

| Attributes | Purpose |

| --- | --- |

| **role=region** | It is specified in the pointer where the interactive drag and drop function is supported to update the pointer value. |

| **aria-label** | Provides an accessible name for the axis labels, legend title, legend item label, text pointer and annotation. |

Screen reading in Circular Gauge

Accessibility in the Circular Gauge control ensures that all users, regardless of ability or disability, can use screen reading. The following Circular Gauge elements will be read aloud using screen reading software, such as Narrator for Windows.

Elements	Description
---	---
Axis labels	Reads the axis labels of the Circular Gauge.
Legend title	Reads the title of the legend in the Circular Gauge.
Legend item label	Reads the label of the legend item in the Circular Gauge.
Text pointer	Reads the text content shown as a pointer in Circular Gauge.
Annotation	Reads the content specified in the annotation.

Ensuring accessibility

The Circular Gauge control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Circular Gauge control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Circular Gauge control with accessibility tools.

- [Accessibility in Syncfusion ##Platform_Name## controls](#)

Internationalization in ##Platform_Name## Circular gauge control

Circular Gauge provides internationalization support for below elements.

- Axis Labels
- Tooltip

For more information about number formatter, you can refer [internationalization](#).

Globalization

Globalization is the process of designing and developing a control that works in different cultures/locales.

Internationalization library is used to globalize number in the Circular Gauge using [format](#) property in [labelStyle](#).

Numeric Format

In the below example, axis labels are globalized to **EUR**.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [{
    labelStyle: {
      position: 'Inside',
      //Label format as currency.
```

```

        format: 'c'
    }
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
  popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-to-left

Circular Gauge can render its elements from right to left, which improves the user experience for certain language users. To do so, set the [enableRtl](#) property to **true**. When this property is enabled, elements such as the tooltip and legend will be rendered from right to left. Meanwhile, the axis can be rendered from right to left by setting the [direction](#) property to **AntiClockWise**. For more information on axis, click [here](#).

The following example illustrates the right to left rendering of the Circular Gauge.

INDEX.JS

```

var circulargauge = new ej.circulargauge.CircularGauge({
  enableRtl:true,
  tooltip: {
    type:['Pointer', 'Range'],
    format:'Pointer : {value} ',
    enable: true,
    enableAnimation: false

```

```

    },
    legendSettings: {
        visible: true
    },
    axes: [{

Ej1 api migration in ##Platform_Name## Circular gauge control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Circular gauge dimensions

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Height** | **Property:** *height*

 \$("#container").ejCircularGauge({ height: 400 }); | **Property:** *height*

 let gauge: CircularGauge = new CircularGauge({
 height : '350px'
 });
 gauge.appendTo('#container'); |

| **Width** | **Property:** *width*

 \$("#container").ejCircularGauge({ width: 100 }); | **Property:** *width*

 let gauge: CircularGauge = new CircularGauge({
 width : '150px'
 });
 gauge.appendTo('#container'); |

| **Height(In Percentage)** | Not Applicable | **Property:** *height*

 let gauge: CircularGauge = new CircularGauge({
 height : '50%'
 });
 gauge.appendTo('#container'); |

|Width(In Percentage)| Not Applicable | **Property:** *width*
 let gauge: CircularGauge = new CircularGauge({
 width : '80%'
 });
 gauge.appendTo('#container');

Axis Line

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Axisline Width| **Property:** *scales.size*
 \$("#container").ejCircularGauge({
 scales: [{
 showScaleBar: true, size: 6
 }]}); | **Property:** *axes.lineStyle.width*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 lineStyle: { width: 4 }
 }]});
 gauge.appendTo('#container');

|Axisline Color| **Property:** *scales.size*
 \$("#container").ejCircularGauge({
 scales: [{
 showScaleBar: true, backgroundColor: "red"
 }]}); | **Property:** *axes.lineStyle.width*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{
 lineStyle: { color: 'red' }
 }]});
 gauge.appendTo('#container');

|Axisline BackgroundColor| Not Applicable | **Property:** *axes.background*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ background: 'red' }]
 });
 gauge.appendTo('#container');

|Axisline Direction| **Property:** *scales.direction*
 \$("#container").ejCircularGauge({
 scales: [{
 direction: "counterclockwise"
 }]}); | **Property:** *axes.direction*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ direction: 'AntiClockWise' }]
 });
 gauge.appendTo('#container');

|Axisline Radius| **Property:** *scales.radius*
 \$("#container").ejCircularGauge({
 scales: [{
 showScaleBar: true, radius: 150
 }]}); | **Property:** *axes.radius*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ radius: '150' }]
 });
 gauge.appendTo('#container');

|Axisline Startangle| **Property:** *scales.startAngle*
 \$("#container").ejCircularGauge({
 scales: [{
 startAngle: 80
 }]}); | **Property:** *axes.startAngle*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ startAngle: 200 }]
 });
 gauge.appendTo('#container');

|Axisline Endangle| **Property:** *scales.sweepAngle*
 \$("#container").ejCircularGauge({
 scales: [{
 sweepAngle: 250
 }]}); | **Property:** *axes.endAngle*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ endAngle: 150 }]
 });
 gauge.appendTo('#container');

|Minimum Axisvalue| **Property:** *scales.minimum*
 \$("#container").ejCircularGauge({
 scales: [{
 minimum: 20
 }]}); | **Property:** *axes.minimum*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ minimum: 20 }]
 });
 gauge.appendTo('#container');

|Maximum Axisvalue| **Property:** *scales.maximum*
 \$("#container").ejCircularGauge({
 scales: [{
 maximum: 200
 }]}); | **Property:** *axes.maximum*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ maximum: 200 }]
 });
 gauge.appendTo('#container');

Ticks

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Type of Ticks| **Property:** *scales.ticks.type*
 \$("#container").ejCircularGauge({
 scales: [{ type: "major" }];
 | **Property:** *axes.majorTicks*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { }
 };
 gauge.appendTo('#container');

|Height of Major Ticks| **Property:** *scales.ticks.height*
 \$("#container").ejCircularGauge({
 scales: [{ height: 12 }];
 | **Property:** *axes.majorTicks.height*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { height: 12 }
 };
 gauge.appendTo('#container');

|Width of Major Ticks| **Property:** *scales.ticks.width*
 \$("#container").ejCircularGauge({
 scales: [{ width: 3 }];
 | **Property:** *axes.majorTicks.width*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { width: 3 }
 };
 gauge.appendTo('#container');

|Color of Major Ticks| **Property:** *scales.ticks.color*
 \$("#container").ejCircularGauge({
 scales: [{ color: "#777777" }];
 | **Property:** *axes.majorTicks.color*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { color: "#777777" }
 };
 gauge.appendTo('#container');

|Offset of Major Ticks| **Property:** *scales.ticks.distanceFromScale*
 \$("#container").ejCircularGauge({
 scales: [{ distanceFromScale: 10 }];
 | **Property:** *axes.majorTicks.offset*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { offset: 10 }
 };
 gauge.appendTo('#container');

|Angle of Major Ticks| **Property:** *scales.ticks.angle*
 \$("#container").ejCircularGauge({
 scales: [{ angle: 10 }];
 | Not Applicable|

|Interval of Major Ticks| **Property:** *scales.majorIntervalValue*
 \$("#container").ejCircularGauge({
 scales: [{ majorIntervalValue: 10 }];
 | **Property:** *axes.majorTicks.interval*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 majorTicks: { interval: 10 }
 };
 gauge.appendTo('#container');

|Height of Minor Ticks| **Property:** *scales.ticks.height*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'minor', height: 12 }];
 | **Property:** *axes.minorTicks.height*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 minorTicks: { height: 12 }
 };
 gauge.appendTo('#container');

|Width of Minor Ticks| **Property:** *scales.ticks.width*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'minor', width: 3 }];
 | **Property:** *axes.minorTicks.width*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 minorTicks: { width: 3 }
 };
 gauge.appendTo('#container');

|Color of Minor Ticks| **Property:** *scales.ticks.color*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'minor', color: "#777777" }];
 | **Property:** *axes.minorTicks.color*
 let gauge: CircularGauge = new CircularGauge({
 axes: {
 minorTicks: { color: "#777777" }
 };
 gauge.appendTo('#container');

| Offset of Minor Ticks | **Property:** *scales.ticks.distanceFromScale*
 \$("#container").ejCircularGauge({ scales: [{ ticks: [{ type: 'minor', distanceFromScale: 10 }]}]; | **Property:** *axes.minorTicks.offset* let gauge: CircularGauge = new CircularGauge({ axes: [{ minorTicks: { offset: 10 } }]; gauge.appendTo('#container');

| Angle of Major Ticks | **Property:** *scales.ticks.angle* \$("#container").ejCircularGauge({ scales: [{ ticks: [{ type: 'minor', angle: 10 }]}]; | Not Applicable |

| Interval of Minor Ticks | **Property:** *scales.majorIntervalValue* \$("#container").ejCircularGauge({ scales: [{ ticks: [{ type: 'minor' }], majorIntervalValue: 10 }]; | **Property:** *axes.minorTicks.interval* let gauge: CircularGauge = new CircularGauge({ axes: [{ minorTicks: { interval: 10 } }]; gauge.appendTo('#container');

Labels

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Autoangle | **Property:** *scales.labels.autoAngle* \$("#container").ejCircularGauge({ scales: [{ labels: [{ showLabels: true, autoAngle: true }]}]; | **Property:** *axes.labelStyle.autoAngle* let gauge: CircularGauge = new CircularGauge({ axes: [{ labelStyle: { autoAngle: true } }]; gauge.appendTo('#container');

| Angle | **Property:** *scales.labels.angle* \$("#container").ejCircularGauge({ scales: [{ labels: [{ showLabels: true, angle: 30 }]}]; | Not Applicable |

| Offset | **Property:** *scales.labels.distanceFromScales* \$("#container").ejCircularGauge({ scales: [{ labels: [{ showLabels: true, distanceFromScales: 10 }]}]; | **Property:** *axes.labelStyle.offset* let gauge: CircularGauge = new CircularGauge({ axes: [{ labelStyle: { offset: 5 } }]; gauge.appendTo('#container');

| Format | **Property:** *scales.labels.unitText* \$("#container").ejCircularGauge({ scales: [{ labels: [{ unitText: "kmph", unitTextPosition: "front" }]}]; | **Property:** *axes.labelStyle.format* let gauge: CircularGauge = new CircularGauge({ axes: [{ labelStyle: { format: "kmph" } }]; gauge.appendTo('#container');

| UnitText Position | **Property:** *scales.labels.placement* \$("#container").ejCircularGauge({ scales: [{ labels: [{ showLabels: true, placement: "near" }]}]; | **Property:** *axes.labelStyle.position* let gauge: CircularGauge = new CircularGauge({ axes: [{ labelStyle: { position: "Outside" } }]; gauge.appendTo('#container');

| Label Range Color | Not Applicable | **Property:** *axes.labelStyle.useRangeColor* let gauge: CircularGauge = new CircularGauge({ axes: [{ labelStyle: { useRangeColor: true } }]; gauge.appendTo('#container');

| LabelText Color | **Property:** *scales.labels.color* \$("#container").ejCircularGauge({ scales: [{ labels: [{ color: "red" }]}]; | **Property:**

axes.labelStyle.font.color
 let gauge: CircularGauge = new CircularGauge({
 axes:
 [{ labelStyle: { font: { color: "red" } } }];
 gauge.appendTo('#container');

| Opacity | **Property:** *scales.labels.opacity*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ opacity: 0.3 } }];
Property: *axes.labelStyle.font.opacity*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { font: { opacity: 0.5 } } }];
 gauge.appendTo('#container');

| Label Font Family | **Property:** *scales.labels.font.fontFamily*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ font: { fontFamily: "Arial" } }] }];
Property: *axes.labelStyle.font.fontFamily*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { font: { fontFamily: 'Roboto' } } }];
 gauge.appendTo('#container');

| Label Font Style | **Property:** *scales.labels.font.fontStyle*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ font: { fontStyle: "Bold" } }] }];
Property: *axes.labelStyle.font.fontStyle*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { font: { fontStyle: 'Bold' } } }];
 gauge.appendTo('#container');

| Label Font Size | **Property:** *scales.labels.font.size*
 \$("#container").ejCircularGauge({
 scales: [{ labels: [{ font: { size: "12px" } }] }];
Property: *axes.labelStyle.font.size*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { font: { size: '12px' } } }];
 gauge.appendTo('#container');

| Label Font Weight | Not Applicable | **Property:** *axes.labelStyle.font.fontWeight*
 let gauge:
 CircularGauge = new CircularGauge({
 axes: [{ labelStyle: { font: {
 fontWeight: 'Regular' } } }];
 gauge.appendTo('#container');

Ranges

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Start Value | **Property:** *scales.ranges.startValue*
 \$("#container").ejCircularGauge({
 scales: [{ ranges: [{ showRanges: true , startValue: 20 }] }];
Property: *axes.ranges.start*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ ranges: [{ start: 20 }] }];
 gauge.appendTo('#container');

| End Value | **Property:** *scales.ranges.endValue*
 \$("#container").ejCircularGauge({
 scales: [{ ranges: [{ showRanges: true , endValue: 30 }] }];
Property: *axes.ranges.end*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ ranges: [{ end: 30 }] }];
 gauge.appendTo('#container');

| Start Width | **Property:** *scales.ranges.startWidth*
 \$("#container").ejCircularGauge({
 scales: [{ ranges: [{ showRanges: true , startWidth: 10 }] }];
Property: *axes.ranges.startWidth*
 let gauge: CircularGauge = new CircularGauge({

 axes: [{
 ranges: [{ startWidth: 10 }]
 }] };

gauge.appendTo('#container');

| End Width | **Property:** *scales.ranges.endWidth*

 \$("#container").ejCircularGauge({

 scales: [{
 ranges: [{ showRanges: true, endWidth: 10 }]
 }] }; |
Property: *axes.ranges.endWidth*

 let gauge: CircularGauge = new CircularGauge({

 axes: [{
 ranges: [{ endWidth: 10 }]
 }] };

gauge.appendTo('#container');

| Color | **Property:** *scales.ranges.backgroundColor*

 \$("#container").ejCircularGauge({

 scales: [{
 ranges: [{ showRanges: true, backgroundColor: "red" }]

 }] }; | **Property:** *axes.ranges.color*

 let gauge: CircularGauge = new CircularGauge({

 axes: [{
 ranges: [{ color: "red" }]
 }] };

gauge.appendTo('#container');

| Offset | **Property:** *scales.ranges.distanceFromScale*

 \$("#container").ejCircularGauge({

 scales: [{
 ranges: [{ showRanges: true , distanceFromScale: 10 }]

 }] }; | Not Applicable |

| Placement | **Property:** *scales.ranges.placement*

 \$("#container").ejCircularGauge({

 scales: [{
 ranges: [{ showRanges: true, placement: "center" }]
 }] }; | Not Applicable |

| Opacity | **Property:** *scales.ranges.opacity*

 \$("#container").ejCircularGauge({

scales: [{
 ranges: [{ showRanges: true, opacity: 0.5 }]
 }] }; | Not
Applicable |

| Radius | Not Applicable | **Property:** *axes.ranges.radius*

 let gauge: CircularGauge = new
CircularGauge({
 axes: [{
 ranges: [{ radius: '80' }]
 }] };

 gauge.appendTo('#container');

| Rounded Corner Radius | Not Applicable | **Property:** *axes.ranges.roundedCornerRadius*

 let
gauge: CircularGauge = new CircularGauge({
 axes: [{
 ranges: [{
roundedCornerRadius: 10 }]
 }] };
 gauge.appendTo('#container');

| Gradients | **Property:** *scales.ranges.gradients*

 \$("#container").ejCircularGauge({

 scales: [{
 ranges: [{
 showRanges: true,

 gradients: { colorInfo: [{ colorStop : 0, color:"#FFFFFF" }] } }]
 }] }; | Not Applicable |

| Border | **Property:** *scales.ranges.border*

 \$("#container").ejCircularGauge({

scales: [{
 ranges: [{
 showRanges: true,

 border: { color: "blue", width: 2 } }]
 }] }; | Not Applicable |

Needle Pointer

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Needle Pointer | **Property:** *scales.pointers.type*

 \$("#container").ejCircularGauge({

 scales: [{
 pointers: [{ type: 'needle' }]
 }] }; | **Property:**
axes.pointers.type

 let gauge: CircularGauge = new CircularGauge({
 axes: [{

 pointers: [{ type: 'needle', value: 20 }]
 }] };

gauge.appendTo('#container');

| Needle Pointer Color| **Property:** *scales.pointers.backgroundColor*
 \$("#container").ejCircularGauge({ scales: [{ backgroundColor: 'red' }] }); | **Property:** *axes.pointers.color* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ color: 'red' }] }] }; gauge.appendTo('#container');

| Animation| **Property:** *enableAnimation*
 \$("#container").ejCircularGauge({ enableAnimation: true }); | **Property:** *axes.pointers.animation* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ animation: true, duration: 1000 }] }] }; gauge.appendTo('#container');

| Pointer Width| **Property:** *scales.pointers.width*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ width: 5 }] }] }; | **Property:** *axes.pointers.pointerWidth* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ pointerWidth: 5 }] }] }; gauge.appendTo('#container');

| Pointer Radius| **Property:** *scales.pointers.distanceFromScale*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ distanceFromScale: 10 }] }] }; | **Property:** *axes.pointers.radius* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ radius: 80 }] }] }; gauge.appendTo('#container');

| Opacity| **Property:** *scales.pointers.opacity*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ opacity: 0.5 }] }] }; | Not Applicable

| Needle Type| **Property:** *scales.pointers.needleType*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ needleType: "triangle" }] }] }; | Not Applicable

| Back Needle Length| **Property:** *scales.pointers.backNeedleLength*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ showBackNeedle: true, backNeedleLength: 3 }] }] }; | **Property:** *axes.pointers.needleTail.length* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ needleTail: { length: 5 } }] }] }; gauge.appendTo('#container');

Marker Pointer

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Marker Pointer| **Property:** *scales.pointers.type*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ type: 'marker' }] }] }; | **Property:** *axes.pointers.type* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ type: 'marker', value: 20 }] }] }; gauge.appendTo('#container');

| Marker Type| **Property:** *scales.pointers.markerType*
 \$("#container").ejCircularGauge({ scales: [{ pointers: [{ type: 'marker', markerType: "rectangle" }] }] }; | **Property:** *axes.pointers.markerShape* let gauge: CircularGauge = new CircularGauge({ axes: [{ pointers: [{ type: 'marker', markerShape: 'Diamond' }] }] }; gauge.appendTo('#container');

| Marker Width| **Property:** *scales.pointers.width*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'marker', width: 20 }]
 });
Property: *axes.pointers.markerWidth*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ type: 'marker', markerWidth: 20 }]
 });
 gauge.appendTo('#container');

| Marker Height| **Property:** *scales.pointers.length*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'marker', length: 25 }]
 });
Property: *axes.pointers.markerHeight*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ type: 'marker', markerHeight: 25 }]
 });
 gauge.appendTo('#container');

| Marker Image| **Property:** *scales.pointers.imageUrl*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'marker', imageUrl: "football.png" }]
 });
Property: *axes.pointers.imageUrl*
 let gauge: CircularGauge = new
 CircularGauge({
 axes: [{ type: 'marker', imageUrl:
 "football.png" }]
 });
 gauge.appendTo('#container');

| Border Customization| **Property:** *scales.pointers.border*
 \$("#container").ejCircularGauge({
 scales: [{ type: 'marker',
 border: { color: 'red', width: 2 } }]
 });
Property:
axes.pointers.border
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ type: 'marker',
 border: { color: 'red', width: 2 } }]
 });
 gauge.appendTo('#container');

Rangebar Pointer

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Rangebar| Not Applicable| **Property:** *axes.pointers.type*
 let gauge: CircularGauge = new
 CircularGauge({
 axes: [{ type: 'RangeBar' }]
 });
 gauge.appendTo('#container');

| Rounded Corner Radius| Not Applicable| **Property:** *axes.pointers.roundedCornerRadius*
 let
 gauge: CircularGauge = new CircularGauge({
 axes: [{ type: 'RangeBar', roundedCornerRadius: 10 }]
 });
 gauge.appendTo('#container');

Annotations

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Content| **Property:** *scales.customLabels.value*
 \$("#container").ejCircularGauge({
 scales: [{ value: 'Lineargauge' }]
 });
Property: *axes.annotations.content*
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ content: 'Annotation' }]
 });
 gauge.appendTo('#container');

| Angle| **Property:** *scales.customLabels.textAngle*
 \$("#container").ejCircularGauge({
 scales: [{ textAngle: 90 }]
 });
Property:
axes.annotations.angle
 let gauge: CircularGauge = new CircularGauge({
 axes: [{ angle: 90 }]
 });
 gauge.appendTo('#container');

|Font Family| **Property:** *scales.customLabels.font.fontFamily*

 \$("#container").ejCircularGauge({
 scales:[{
 customLabels: [{ font: {
 fontFamily: "Arial" } }]
 }]}); | **Property:** *axes.annotations.textStyle.fontFamily*

 let
 gauge: CircularGauge = new CircularGauge({
 axes: [{
 annotations: [{
 textStyle: { fontFamily: "Arial" } }]
 }]});
 gauge.appendTo('#container'); |

|Font Color| **Property:** *scales.customLabels.color*

 \$("#container").ejCircularGauge({

 scales:[{
 customLabels: [{ color : "red" }]
 }]}); | **Property:**
axes.annotations.textStyle.color

 let gauge: CircularGauge = new CircularGauge({

 axes: [{
 annotations: [{ textStyle: { color: "red" } }]
 }]});

 gauge.appendTo('#container'); |

|Auto Angle| Not Applicable| **Property:** *axes.annotations.autoAngle*

 let gauge: CircularGauge
 = new CircularGauge({
 axes: [{
 annotations: [{ autoAngle : true }]

 }]});
 gauge.appendTo('#container'); |

|Radius| Not Applicable| **Property:** *axes.annotations.radius*

 let gauge: CircularGauge = new
 CircularGauge({
 axes: [{
 annotations: [{ radius : "10%" }]

 }]});
 gauge.appendTo('#container'); |

|Annotation Position| **Property:** *scales.customLabels.position*

 \$("#container").ejCircularGauge({
 scales:[{
 customLabels: [{ position
 : { x: 10, y: 10 } }]
 }]}); | Not Applicable |

|Annotation Position Type| **Property:** *scales.customLabels.positionType*

 \$("#container").ejCircularGauge({
 scales:[{
 customLabels: [{
 positionType : "outer" }]
 }]}); | Not Applicable |

|ZIndex| Not Applicable| **Property:** *axes.annotations.zIndex*

 let gauge: CircularGauge = new
 CircularGauge({
 axes: [{
 annotations: [{ zIndex : '1' }]
 }]});

 gauge.appendTo('#container'); |

Appearance

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Title| Not Applicable| **Property:** *title*

 let gauge: CircularGauge = new CircularGauge({

 title: 'Circular Gauge'
 });
 gauge.appendTo('#container'); |

|Background Color| **Property:** *backgroundColor*

 \$("#container").ejCircularGauge({

 backgroundColor : "red"
 }); | **Property:** *background*

 let gauge: CircularGauge =
 new CircularGauge({
 background : "red"
 });
 gauge.appendTo('#container'); |

|Localization| **Property:** *locale*

 \$("#container").ejCircularGauge({
 locale : "en-
 US"
 }); | **Property:** *locale*

 let gauge: CircularGauge = new CircularGauge({

 locale : "en-US"
 });
 gauge.appendTo('#container'); |

|Border| Not Applicable| **Property:** *border*

 let gauge: CircularGauge = new CircularGauge({

 border : { color: "red" , width: 2 }
 });
 gauge.appendTo('#container'); |

|Center of X| Not Applicable| **Property:** *centerX*

 let gauge: CircularGauge = new
 CircularGauge({
 centerX : "120px"
 });
 gauge.appendTo('#container'); |

|Center of Y| Not Applicable| **Property:** *centerY*
let gauge: CircularGauge = new CircularGauge({ centerY : "150px" }); gauge.appendTo('#container');

|Theme| **Property:** *theme* \$("#container").ejCircularGauge({ theme : "flatlight" }); **Property:** *theme* let gauge: CircularGauge = new CircularGauge({ theme : "Material" }); gauge.appendTo('#container');

|Margin| Not Applicable| **Property:** *margin*
let gauge: CircularGauge = new CircularGauge({ margin: { left: 40, right: 40, top: 40, bottom: 40 } }); gauge.appendTo('#container');

Events

doubleClick: function (args) { } <br/> }); | Not Applicable |
```

How To

Gauge range in `##Platform_Name##` Circular gauge control

Add a range to the circular gauge dynamically

You can add a range to the circular gauge dynamically by pushing the new ranges to the circular gauge axes in button click.

To add ranges dynamically to the circular gauge, follow the given steps:

Step 1:

Initialize the circular gauge with one range.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({  
  axes: [{  
    minimum: 0, maximum: 120,  
    ranges: [  
      {  
        start: 0, end: 20  
      }  
    ]  
  }]  
});
```

```
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <button id="addRange">Add Range</button>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Step 2:

You can add ranges to the circular gauge dynamically using the button click event. In button click, add the new ranges to the circular gauge axes. To refresh the circular gauge, invoke the `refresh` method.

INDEX.JS

```
var circulargauge = new ej.circulargauge.CircularGauge({
  axes: [
    {
      minimum: 0, maximum: 120,
      ranges: [
        {
          start: 0, end: 20
        }
      ]
    }
  ]
}, '#element');
document.getElementById("addRange").onclick = function () {
```

```

    var start =
+ (circulargauge.axes[0].ranges[circulargauge.axes[0].ranges.length -
1].start) + 20;
    var end = start + 20;
    if (end > circulargauge.axes[0].maximum) {
        circulargauge.axes[0].maximum = end;
    }
    let range = { start: start, end: end };
    circulargauge.axes[0].ranges.push(new
ej.circulargauge.Range((circulargauge.axes[0].ranges[0]), 'ranges', range));
    circulargauge.refresh();
}

```

INDEX.HTML

```

Color Picker

Mode and value in ##Platform_Name## Color picker control

Rendering palette at initial load

By default, the **Picker** area will be rendered at initial load. To render the Palette area while opening the ColorPicker pop-up, and specify the [mode](#) property as **Palette**.

In the following sample, it will render the **Palette** at initial load.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker(
{
    //To render palette at initial load.
    mode: 'Palette'
},
'#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

</head>
<body>

  <div id="container">
    <div class="wrap">
      <h4>Select color</h4>
      <input id="element" type="color">
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
```

```

        visibility: hidden;
    }
    #loader {
        color: #008cff;
        font-family: 'Helvetica Neue', 'calibiri';
        font-size: 14px;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .wrap {
        margin: 0 auto;
        width: 300px;
        text-align: center;
    }

```

Color value

The [value](#) property can be used to specify the color value to the ColorPicker. It supports either **three** or **six** digit hex codes. To include **opacity**, set the color value as **four** or **eight** digit hex code.

In the following sample, the color value sets as **four** digit hex code, the last digit represents the **opacity** value.

INDEX.JS

```

ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({
    //To set color value.
    value: '035a',
    mode: 'Picker',
    modeSwitcher: false
}, '#element');

```

Localization in ##Platform_Name## Color picker control

Localization

The [Localization](#) library allows you to localize default text content of the ColorPicker. The ColorPicker component has static text for control buttons (apply / cancel) and mode switcher that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

The following list of properties and its values are used in the ColorPicker.

Locale key words | Text

Apply | Apply

Cancel | Cancel

ModeSwitcher | Switch Mode

Loading translations

To load translation object in an application use [load](#) function of [L10n](#) class.

The below example demonstrates the ColorPicker in Deutsch culture.

INDEX.JS

```
ej.base.enableRipple = true;
ej.base.L10n.load({
  'de-DE': {
    'colorpicker': {
      "Apply": "Anwenden",
      "Cancel": "Abbrechen",
      "ModeSwitcher": "Modus wechseln"
    }
  }
});
var colorPicker = new ej.inputs.ColorPicker({ locale: 'de-DE' },
'#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="wrap">
            <h4>Choose color</h4>
            <input id="element" type="color">
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 0 auto;
    width: 300px;
    text-align: center;
}

```

Right to Left - RTL

ColorPicker component has **RTL** support. It helps to render the ColorPicker from right-to-left direction. It improves the user experiences and accessibility for users who use right-to-left languages(Arabic, Farsi, Urdu, etc). This can be achieved by setting the [enableRtl](#) property to **true**.

The following example illustrates how to enable right-to-left support in ColorPicker component.

INDEX.JS

```

ej.base.enableRipple = true;
ej.base.L10n.load({

```

```

    'ar-AE': {
      'colorpicker': {
        'Apply': 'تطبيق',
        'Cancel': 'إلغاء',
        'ModeSwitcher': 'مفتاح كهربائي الوضع'
      }
    }
  });
  var colorPicker = new ej.inputs.ColorPicker({ enableRtl: true, locale: 'ar-AE' }, '#element');

```

INDEX.HTML

Accessibility in ##Platform_Name## Color picker control

The Color picker component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Color picker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Color picker component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Color picker component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the Color picker component as **color** and the tiles as **gridcell** in the color palette. |

| **aria-label** | Indicates the accessible name for the tiles. |

| **aria-selected** | Indicates the current selected state of the tile. |

| **aria-haspopup** | Indicates the availability of the popup element. |

| **aria-expanded** | Indicates whether the popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

Keyboard interaction

The Color picker component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Color picker component.

| Press | To do this |

| --- | --- |

| **Up Arrow** | Moves the handler/tile up from the current position. |

- | Down Arrow | Moves the handler/tile down from the current position. |
- | Left Arrow | Moves the handler/tile left from the current position. |
- | Right Arrow | Moves the handler/tile right from the current position. |
- | Enter | Apply the selected color value. |
- | Tab | To focus the next focusable element in the Color picker popup. |

Ensuring accessibility

The Color picker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Color picker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Color picker component with accessibility tools.

Style and appearance in `##Platform_Name##` Color picker control

To modify the ColorPicker appearance, you need to override the default CSS of ColorPicker component. Please find the list of CSS classes and its corresponding section in ColorPicker component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-custom-picker .e-container .e-handler|To customized Color Picker selection handler
- |.color-picker.e-dropdown-popup ul .e-container|To customize the Color Picker container
- |.color-picker.e-dropdown-popup ul .e-item.e-palette-item|To customize the Color Picker pallete item
- |.color-picker.e-dropdown-popup .e-container .e-switch|To customize the Color Picker switch control
- |.color-picker.e-dropdown-popup .e-container .e-slider-preview|To customize the Color Picker slider control

How To

Hide control buttons in `##Platform_Name##` Color picker control

ColorPicker can be rendered without control buttons (Apply/Cancel). In this case, while selecting a color, the ColorPicker pop-up is closed and selected colors can be applied directly. To hide control buttons, set the [showButtons](#) property to `false`.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({ showButtons: false },
'#element');
```

INDEX.HTML

Render palette alone in `##Platform_Name##` Color picker control

To render the **Palette** alone in ColorPicker, specify the `mode` property as **Palette**, and set the `modeSwitcher` property to **false**.

In the following sample, the `showButtons` property is disabled to hide the control buttons and it renders only the **Palette** area.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker(
{
    //To render palette.
    mode: 'Palette',
    //To hide the mode switcher.
    modeSwitcher: false,
    showButtons: false
},
'#element');
```

> To render **Picker** alone specify the [mode](#) property as 'Picker'.

Colorpicker in dropdownbutton in **##Platform_Name##** Color picker control

This section explains about how to render the ColorPicker in DropDownButton. The [target](#) property of the DropDownButton helps to achieve this scenario. To know about the usage of **target** property refer to [Popup templating](#) section.

In the below sample, the color picker is rendered as inline type by setting [inline](#) property as **true** and the rendered color picker wrapper is passed as a **target** to the DropDownButton to achieve the above scenario.

INDEX.JS

```

ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker(
    {
        inline: true,
        change: function (args) {
            ddb.element.children[0].style.backgroundColor =
args.currentValue.hex;
            closePopup();
        }
    }
);

```

```

    },
    '#element');
var ddb = new ej.splitbuttons.DropDownButton(
{
    target: ".e-colorpicker-wrapper",
    iconCss: "e-dropdownbtn-preview",
    beforeClose: function (args) {
        args.element.parentElement.querySelector('.e-cancel').removeEventListener('click', closePopup);
    },
    open: function (args) {
        args.element.parentElement.querySelector('.e-cancel').addEventListener('click', closePopup);
        tooltip();
    }
},
"#dropdownbtn");
function closePopup() {
    ddb.toggle();
}
function tooltip() {
    var zindex = (document.getElementsByClassName('e-color-picker-tooltip')[0]).style.zIndex;
    var zIndexIntValue = parseInt(zindex) + 2;
    (document.getElementsByClassName('e-color-picker-tooltip')[0]).style.zIndex = zIndexIntValue.toString();
}

```

  font-family: 'Helvetica Neue', 'Helvetica', 'Arial', 'sans-serif';
  font-size: 14px;
}
```

Customize colorpicker in `##Platform_Name##` Color picker control

Custom palette

By default, the Palette will be rendered with default colors. To load custom colors in the palette, specify the colors in the [presetColors](#) property. To customize the color palette, add a custom class to palette tiles using [beforeTileRender](#) event.

The following sample demonstrates the above functionalities.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({
  mode: 'Palette',
  modeSwitcher: false,
  showButtons: false,
  inline: true,
  // To specify number of columns to be rendered.
  columns: 4,
  value: '#ba68c8',
  //To load custom colors.
  presetColors: {
    'custom1': ['#ef9a9a', '#e57373', '#ef5350', '#f44336', '#f48fb1',
    '#f06292',
    '#ec407a', '#e91e63', '#ce93d8', '#ba68c8', '#ab47bc',
    '#9c27b0', '#b39ddb',
    '#9575cd', '#7e57c2', '#673ab7'],
    'custom2': ['#9fa8da', '#7986cb', '#5c6bc0', '#3f51b5', '#90caf9',
    '#64b5f6',
    '#42a5f5', '#2196f3', '#81d4fa', '#4fc3f7', '#29b6f6',
    '#03a9f4',
    '#80ddea', '#4dd0e1', '#26c6da', '#00bcd4'],
    'custom3': ['#80cbc4', '#4db6ac', '#26a69a', '#009688', '#a5d6a7',
    '#81c784',
    '#66bb6a', '#4caf50', '#c5e1a5', '#aed581', '#9ccc65',
    '#8bc34a', '#e6ee9c',
    '#dce775', '#d4e157', '#cddc39'],
    'custom4': ['#fff59d', '#fff176', '#ffee58', '#ffeb3b', '#ffe082',
    '#ffd54f',
    '#ffca28', '#ffc107', '#ffcc80', '#ffb74d', '#ffa726',
    '#ff9800', '#ffab91',
    '#ff8a65', '#ff7043', '#ff5722']
  },
  beforeTileRender: function (args) {
    ej.base.addClass([args.element], ['e-icons', 'e-custom-tile']);
  },
  change: function (args) {
    document.getElementById('preview').style.backgroundColor =
    args.currentValue.rgba;
  }
}, '#element');
```

```

Hide input area from picker

By default, the input area will be rendered in ColorPicker. To hide the input area from it, add `e-hide-value` class to ColorPicker using the [cssClass](#) property.

In the following sample, the ColorPicker is rendered without input area.

INDEX.JS

```

ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({ cssClass: 'e-hide-value' },
'#element');

```

INDEX.HTML

```

```

Custom handle

Color picker handle shape and UI can be customized. Here, we have customized the handle as **svg icon**. The same way you can customize the handle based on your requirement.

The following sample show the customized color picker handle.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker(
  {
    value: '#344aee',
    // To hide the input area
    cssClass: 'e-custom-picker',
    modeSwitcher: false,
    open: function(args) {
      args.element.querySelector('.e-handler').classList.add('e-
icons');
    }
  }, '#element');
```

}
```

Custom primary button

By default, the applied color will be updated in primary button of the color picker. You can customize that as **icon**.

In the following sample, the **picker** icon is added to primary button and using [change](#) event the selected color will be updated in bottom portion of the icon.

INDEX.JS

```
ej.base.enableRipple = true;  
var colorPicker = new ej.inputs.ColorPicker(  
    {  
        change: function (args) {  
  
            colorPicker.element.nextElementSibling.querySelector('.e-selected-color').style.borderColor = args.currentValue.rgba;  
        }  
    },  
    '#element');  
ej.base.addClass([colorPicker.element.nextElementSibling.querySelector('.e-selected-color')], 'e-icons');
```

```

> The Essential JS 2 provides a set of icons that can be loaded by applying `e-icons` class name to the element. You can also use third party icon to customize the primary button.

Display hex code in input

The color picker input element can be showcased in the place of primary button. The applied color hex code will be updated in the primary button input.

The following sample shows the color picker with input.

INDEX.JS

```
ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({}, '#element');
var target = colorPicker.element.nextElementSibling;
target.insertBefore(colorPicker.element, target.children[1]);
```

INDEX.HTML

Custom UI

The color picker UI can be customized in all possible ways. The following sample shows the excel like UI customization with help of SplitButton and Dialog component. In that by clicking the more colors option from color palette, the dialog contains color picker will open.

INDEX.JS

```

ej.base.enableRipple = true;
var colorPalette = new ej.inputs.ColorPicker(
  {
    mode: 'Palette',
    inline: true,
    showButtons: false,
    modeSwitcher: false,
    change: paletteOnChange
  }
, '#palette');
var splitBtn = new ej.splitbuttons.SplitButton(
  {
    target: '#target',
    iconCss: 'e-icons e-font-icon',
    open: function (args) {
      args.element.children[1].addEventListener('click', openDialog);
    },
    beforeClose: function (args) {
      args.element.children[1].removeEventListener('click',
openDialog);
    }
  }
, '#split-btn');
var modalDialog = new ej.popups.Dialog(
  {
    target: '.wrap',
    width: '270px',
    height: '336px',
    isModal: true,
    visible: false,
    cssClass: 'e-dlg-picker',
    content: '<input type="color" id="picker" />',
    animationSettings: { effect: 'Zoom' },
    open: dialogOpen,
    overlayClick: dlgClose
  }
, '#modal-dialog');
var colorPicker = new ej.inputs.ColorPicker(
  {
    inline: true,
    modeSwitcher: false,
    change: pickerOnChange
  }

```

```

, '#picker');
function openDialog() {
    modalDialog.show();
}
function dialogOpen() {
    colorPicker.refresh();
    colorPicker.element.nextElementSibling.querySelector('.e-ctrl-btn .e-cancel').addEventListener('click', dlgClose);
}
function dlgClose() {
    modalDialog.hide();
}
function paletteOnChange(args) {
    splitBtn.element.querySelector('.e-font-icon').style.borderBottomColor = args.currentValue.rgba;
}
function pickerOnChange(args) {
    paletteOnChange(args);
    dlgClose();
}

```

Handle no color support in ##Platform_Name## Color picker control

The ColorPicker component supports no color functionality. By clicking the no color tile from palette, the selected color becomes **empty** and considered as no color has been selected from color picker.

Default no color

To achieve this, set [noColor](#) property as **true**.

In the following sample, the first tile of the color palette represents the no color tile. By clicking the no color tile you can achieve the above functionalities.

INDEX.JS

```

ej.base.enableRipple = true;
var preview = document.getElementById('preview');
var colorPicker = new ej.inputs.ColorPicker(
  {
    mode: "Palette",
    value: "#ba68c8",
    showButtons: false,
    modeSwitcher: false,
    //To enable no color support
    noColor: true,
    change: function(args) {
      preview.style.backgroundColor = args.currentValue.hex;
      preview.textContent = args.currentValue.hex ?
args.currentValue.hex : 'No color';
    }
  },
  '#element');
preview.style.backgroundColor = "#ba68c8";
preview.textContent = "#ba68c8";

```

Disabled in ##Platform_Name## Color picker control

To achieve disabled state in ColorPicker, set the [disabled](#) property to `true`. The ColorPicker pop-up cannot be accessed in disabled state.

The following example shows the `disabled` state of ColorPicker component.

INDEX.JS

```

ej.base.enableRipple = true;
var colorPicker = new ej.inputs.ColorPicker({ disabled: true }, '#element');

```

INDEX.HTML

```

ComboBox

Tags in ##Platform_Name## Combo box control

The ComboBox can be initialized on three different tags as described in below. Though it is initialized in different tags, the UI appearance and built-in features behave in the same way.

Select element

When a ComboBox is initialized on SELECT element, the list items can be assigned through the option tag of the HTML select element.

- The nested items are wrapped and grouped based on the tag that is available within the `

INDEX.JS

```

// initialize ComboBox component
let comboBoxObject = new ej.dropdowns.ComboBox({
    placeholder: "Select a vegetable",
    popupHeight: "200px"
});

```

```
// render initialized ComboBox
comboBoxObject.appendTo('#selectElement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>
```

Input element

The ComboBox has also be rendered through `<input>` element with an array of either simple or complex data that is set through the [dataSource](#) property. It can retrieve data from local data sources as well as remote data services.

Detailed information about the data binding with an example is available in: [Data Binding to ComboBox](#)

Data binding in ##Platform_Name## Combo box control

The ComboBox loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of array or `DataManager`.

The ComboBox also supports different kinds of data services such as OData, OData V4, and Web API, and data formats such as XML, JSON, and JSONP with the help of `DataManager` adaptors.

Fields	Type	Description
text	string	Specifies the display text of each list item.
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

When binding complex data to the ComboBox, fields should be mapped correctly. Otherwise, the selected item remains undefined.

Binding local data

Local data can be represented in two ways as described below.

1. Array of simple data

The ComboBox has support to load array of primitive data such as strings and numbers. Here, both value and text field act the same.

INDEX.JS

```
var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize ComboBox component
var listObj = new ej.dropdowns.ComboBox({
  dataSource: sportsData,
  // set placeholder to ComboBox input element
  placeholder: "Select games"});
listObj.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
```

```
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" tabindex="1" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

2. Array of JSON data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Id** column and **Game** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.JS

```
let sportsData = [
    { Id: 'Game1', Game: 'Badminton' },
    { Id: 'Game2', Game: 'Basketball' },
    { Id: 'Game3', Game: 'Cricket' },
    { Id: 'Game4', Game: 'Football' },
    { Id: 'Game5', Game: 'Golf' },
    { Id: 'Game6', Game: 'Hockey' },
    { Id: 'Game7', Game: 'Rugby' },
    { Id: 'Game8', Game: 'Snooker' }
];

// initialize ComboBox component
var listObj = new ej.dropdowns.ComboBox({
    //set the data to dataSource property
    dataSource: sportsData,
    // maps the appropriate column to fields property
    fields: { value: 'Game' },
    // set placeholder to ComboBox input element
    placeholder: "Find a game"});
listObj.appendTo('#comboelement');
```

INDEX.HTML

```

</body></html>
```

3. Array of Complex data

The ComboBox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Code.Id** column and **Country.Name** column from complex data have been mapped to the **value** field and **text** field, respectively.

INDEX.JS

```
let countriesData = [
  { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
  { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
  { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
  { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
  { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
  { Country: { Name: 'France' }, Code: { Id: 'FR' } }
];
```

```
// initialize ComboBox component
var listObj = new ej.dropdowns.ComboBox({
  //set the data to dataSource property
  dataSource: countriesData,
  // maps the appropriate column to fields property
  fields: { value: 'Country.Name' },
  // set placeholder to ComboBox input element
  placeholder: "Find a country"});
listObj.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Binding remote data

The ComboBox supports retrieval of data from remote data services with the help of **DataManager** component. The **Query** property is used to fetch data from the database and bind it to the ComboBox. In the following sample, displayed first 6 contacts from the **customer** table of **Northwind** Data Service.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new ej.data.Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(6),
  //map the appropriate columns to fields property
  fields: { value: 'FirstName' },
  //set the placeholder to ComboBox input
  placeholder: "Select an employee",
  //sort the resulted items
  sortOrder: 'Ascending'
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

Templates in ##Platform_Name## Combo box control

The ComboBox has been provided with several options to customize each list item, group title, selected value, header, and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the ComboBox can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
    url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
  }),
  //bind the Query instance to query property
  query: new ej.data.Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
  //map the appropriate columns to fields property
  fields: { value: 'FirstName' },
  //set the placeholder to ComboBox input
  placeholder: "Select an employee",
  //sort the resulted items
  sortOrder: 'Ascending',
  //set the value to itemTemplate property
  itemTemplate: "<span><span class='name'>${FirstName}</span><span class
='city'>${City}</span></span>"
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

INDEX.JS

```

var groupPredicate = new ej.data.Predicate('City',
'equal','london').or('City','equal','seattle');
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().from('Employees').select(['FirstName',
'City','EmployeeID']).take(6).where(groupPredicate),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName', groupBy: 'City'},
    //set the placeholder to ComboBox input
    placeholder:"Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending',

```

```
//set the value to groupTemplate
groupTemplate: "<strong>${City}</strong>"
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Header template

The header element is shown statically at the top of the popup list items within the ComboBox, and any custom element can be placed as a header element using the [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: new ej.data.DataManager({
```

```

        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    )),
    //bind the Query instance to query property
    query: new ej.data.Query().from('Employees').select(['FirstName',
'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName'},
    //set the placeholder to ComboBox input
    placeholder: "Select an employee",
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the value to headerTemplate
    headerTemplate: "<span class='head'><span class='name'>Name</span><span
class='city'>City</span></span>",
    //set the value to item template
    itemTemplate: "<span class='item' ><span
class='name'>${FirstName}</span><span class='city'>${City}</span></span>"
    });
    //render the component
    comboBoxObject.appendTo('#comboelement');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Footer template

The ComboBox has options to show a footer element at the bottom of the list items in the popup list. Here, you can place any custom element as a footer element using the [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the ComboBox.

INDEX.JS

```
var sportsData = [ "Basketball", "Cricket", "Football", "Golf"];
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
  //bind the data manager instance to dataSource property
  dataSource: sportsData ,
  //set the placeholder to ComboBox input
  placeholder:"Select games",
  //set the value to footer template
  footerTemplate:"<span class='foot'> Total list items: "+
sportsData.length +"</span>"
});

//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

```

```
if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

No records template

The ComboBox is provided with support to custom design the popup list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, popup list content displays the notification of no data available.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: [],
    //set the placeholder to ComboBox input
    placeholder:"Select an item",
    //set the value to noRecords template
    noRecordsTemplate:"<span class='norecord'> NO DATA AVAILABLE</span>"
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <input type="text" tabindex="1" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
```

```
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Action failure template

There is also an option to custom design the popup list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the ComboBox displays the notification.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        // Here, use the wrong url to display the action failure
        template
            url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
            adaptor: new ej.data.ODataV4Adaptor(),
            crossDomain: true
    }),
    //bind the Query instance to query property
    query: new
ej.data.Query().from('Employees').select(['FirstName']).take(6),
    //map the appropriate columns to fields property
    fields: { text: 'FirstName', value: 'EmployeeID' },
    //set the placeholder to ComboBox input
    placeholder: "Select an employee",
    //set the value to action failure template
    actionFailureTemplate: "<span class='action-failure'> Data fetch get
fails</span>"
});
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```

Grouping in ##Platform_Name## Combo box control

The ComboBox supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the [groupBy](#) field in the data table. The group header is displayed both as inline and fixed headers. The fixed group header content is updated dynamically on scrolling the popup list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

INDEX.JS

```
var vegetableData = [
    { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
    { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
    { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
    { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
    { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
    { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
    { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
    { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
    { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
    { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
    { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
];
//initiate the ComboBox
var vegetables = new ej.dropdowns.ComboBox({
    //set the grouped data to dataSource property
    dataSource: vegetableData,
    // map the groupBy field with Category column
    fields: { groupBy: 'Category', value: 'Vegetable' },
```

```
// set the placeholder to the ComboBox input
placeholder: "Find a vegetable"
});
//render the ComboBox component
vegetables.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

HTML select

The ComboBox also supports grouping of list items under specific groups by initiating the `<select>` element using `optgroup`. The nested items are wrapped based on the `<optgroup>` tag that is presents in the `<select>` element

,

```
<select id="selectElement">
```

```
<optgroup label="Beans">
```

```
<option value="1">Chickpea</option>
```

```
<option value="2">Green bean</option>
<option value="3" selected="selected">Horse gram</option>
</optgroup>
<optgroup label="Leafy and Salad">
<option value="4">Spinach</option>
<option value="5">Cabbage</option>
<option value="6">Wheat grass</option>
<option value="7">Yarrow</option>
</optgroup>
</select>
,
```

INDEX.JS

```
// initialize ComboBox component
let comboBoxObject = new ej.dropdowns.ComboBox({
  placeholder: "Select a vegetable",
  popupHeight: "200px"
});
// render initialized ComboBox
comboBoxObject.appendTo('#selectElement');
```

        <option value="6">Wheat grass</option>
        <option value="7">Yarrow</option>
    </optgroup>
</select>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers.

Filtering in ##Platform_Name## Combo box control

The ComboBox has built-in support to filter data items when `allowFiltering` is enabled. The filter operation starts as soon as you start typing characters in the component.

To display filtered items in the popup, filter the required data and return it to the ComboBox via [updateData](#) method by using the [filtering](#) event.

The following sample illustrates how to query the data source and pass the data to the ComboBox through the `updateData` method in `filtering` event.

INDEX.JS

```

//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODATAV4Adaptor(),
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new ej.data.Query().select(['ContactName']),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to ComboBox input

```

```
placeholder: "Find a customer",
//set the filterType to searching operation
filterType: 'StartsWith',
//sort the resulted items
sortOrder: 'Ascending'
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>

="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:50px auto 0; width:250px;">
    <br>
    <input type="text" id="comboelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Limit the minimum filter character

When filtering the list items, you can set the limit for character count to raise remote request and fetch filtered data on the ComboBox. This can be done by manual validation within the filter event handler.

In the following example, the remote request does not fetch the search data until the search key contains three characters.

INDEX.JS

```
//initiates the component
var searchData = new ej.data.DataManager({
    url:
    'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ej.data.ODataV4Adaptor(),
    crossDomain: true
});
var comboBoxObject = new ej.dropdowns.ComboBox({
    dataSource: searchData,
    query: new ej.data.Query().select(['ContactName',
    'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to ComboBox input element
    placeholder: "Select customers",
    //sort the resulted items
    sortOrder: 'Ascending',
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //bind the filtering event handler
    filtering: (e) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            // restrict the remote request until search key contains 3
            characters.
            if (e.text.length < 3) { return; }
            var query = new ej.data.Query().select(['ContactName',
            'CustomerID']);
            query = (e.text !== '') ? query.where('ContactName', 'startswith',
            e.text, true) : query;
            e.updateData(searchData, query);
        }
    }
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <br>
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Change the filter type

While filtering, you can change the filter type to `contains`, `startsWith`, or `endsWith` for string type within the filter event handler.

In the following examples, data filtering is done with `endsWith` type.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data manager instance to dataSource property
    dataSource: new ej.data.DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    }),
    query: new ej.data.Query().select(['ContactName',
    'CustomerID']).take(7),
    // map the appropriate column
    fields: { text: 'ContactName', value: 'CustomerID' },
    // set placeholder to ComboBox input element
    placeholder: "Select customers",
    //sort the resulted items
    sortOrder: 'Ascending',
    // set true to allowFiltering for enable filtering supports
    allowFiltering: true,
    //bind the filtering event handler
    filtering: (e) => {
        // load overall data when search key empty.
        if(e.text == '') e.updateData(searchData);
        else{
            var query = new ej.data.Query().select(['ContactName',
            'CustomerID']);
            // change the type of filtering to ends with filtering
```

```

        query = (e.text !== '') ? query.where('ContactName', 'endswith',
e.text, true) : query;
        e.updateData(searchData, query);
    }
}
});
//render the component
comboBoxObject.appendTo('#comboelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</head>
<body>

  <div id="container" style="margin:50px auto 0; width:250px;">
    <br>
    <input type="text" id="comboelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by passing the fourth optional parameter of the `where` clause.

The following example shows how to perform case-sensitive filter.

INDEX.JS

```

//initiates the component
var searchData = new ej.data.DataManager({

```

```

        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ej.data.ODataV4Adaptor(),
        crossDomain: true
    });
    var comboBoxObject = new ej.dropdowns.ComboBox({
        dataSource: searchData,
        query: new ej.data.Query().select(['ContactName',
        'CustomerID']).take(7),
        // map the appropriate column
        fields: { text: 'ContactName', value: 'CustomerID' },
        // set placeholder to ComboBox input element
        placeholder: "Select customers",
        //sort the resulted items
        sortOrder: 'Ascending',
        // set true to allowFiltering for enable filtering supports
        allowFiltering: true,
        //bind the filtering event handler
        filtering: (e) => {
            // load overall data when search key empty.
            if(e.text == '') e.updateData(searchData);
            else{
                var query = new ej.data.Query().select(['ContactName',
                'CustomerID']);
                query = (e.text !== '') ? query.where('ContactName', 'startswith',
                e.text, true) : query;
                e.updateData(searchData, query);
            }
        }
    });
    //render the component
    comboBoxObject.appendTo('#comboelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 ComboBox</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Diacritics Filtering

The ComboBox supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample, data with diacritics are bound as dataSource for ComboBox.

INDEX.JS

```
// create local data
var data = [
  'Aeróbics',
  'Aeróbics en Agua',
  'Aerografía',
  'Aerodelaje',
  'Águilas',
  'Ajedrez',
  'Ala Delta',
  'Álbumes de Música',
  'Alusivos',
  'Análisis de Escritura a Mano'];
// initialize ComboBox component
var comboObj = new ej.dropdowns.ComboBox({
  //set the local data to dataSource property
  dataSource: data,
  // set the placeholder to ComboBox input element
  placeholder: 'e.g: aero',
  // enabled the ignoreAccent property for ignore the diacritics
  ignoreAccent: true,
  // set true for enable the filtering support.
  allowFiltering: true
});
comboObj.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">

Virtualization in ComboBox Component

ComboBox virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a ComboBox activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

Furthermore, Incremental Search is supported with virtualization in the Combobox component. When a key is typed, the focus is moved to the respective element in the open popup state. In the closed popup state, the popup opens, and focus is moved to the respective element in the popup list based on the typed key. The Incremental Search functionality is well-suited for scenarios involving remote data binding.

When the `enableVirtualization` property is enabled, the `skip` and `take` properties provided by the user within the Query class at the initial state or during the `actionBegin` or `actionComplete` events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

Binding local data

The Combobox can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the `fields` property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the `actionBegin` event occurs before the data retrieval starts. Once the data retrieval is successful, the `actionComplete` event is triggered, indicating that the data fetch process is complete.

In the following example, `id` column and `text` column from complex data have been mapped to the `value` field and `text` field, respectively.

INDEX.JS

```
var records = [];
for (var i = 1; i <= 150; i++) {
    var item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'id', text: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: false,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:50px auto 0; width:250px;">
        <input type="text" id="comboelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Binding Remote data

The Combobox supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the **actionBegin** and **actionComplete** events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the **actionBegin** and **actionComplete** events at that time as well.

The following sample displays the OrderId from the **Orders** Data Service.

INDEX.JS

```
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the dataSource property
    dataSource: new ej.data.DataManager({
        url: 'https://ej2services.syncfusion.com/js/development/api/orders',
        adaptor: new ej.data.WebApiAdaptor(),
        crossDomain: true
    }),
    //map the appropriate columns to fields property
    fields: { text: 'OrderID', value: 'OrderID' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
```

```
popupHeight: '200px'
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">

</head>
<body>

  <div id="container" style="margin:50px auto 0; width:250px;">
    <input type="text" id="comboelement">
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Grouping with Virtualization

The Combobox component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding virtualization, enhancing performance and responsiveness.

The following sample shows the example for Grouping with Virtualization.

INDEX.JS

```

var records = [];
for (var i = 1; i <= 150; i++) {
    var dropdownsItem = {};
    dropdownsItem.id = 'id' + i;
    dropdownsItem.text = "Item ".concat(i);
    var randomAutoGroup = Math.floor(Math.random() * 4) + 1;
    switch (randomAutoGroup) {
        case 1:
            dropdownsItem.group = 'Group D';
            break;
        case 2:
            dropdownsItem.group = 'Group C';
            break;
        case 3:
            dropdownsItem.group = 'Group B';
            break;
        case 4:
            dropdownsItem.group = 'Group A';
            break;
        default:
            break;
    }
    records.push(dropdownsItem);
}
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { groupBy: 'group', text: 'text', value: 'id' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set allowFiltering property to true
    allowFiltering: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
comboBoxObject.appendTo('#comboelement');

```

```

Filtering with Virtualization

The ComboBox component supports Filtering with Virtualization. The ComboBox includes a built-in feature that enables data filtering when the [allowFiltering](#) option is enabled. In the context of Virtual Scrolling, the filtering process operates in response to the typed characters. Specifically, the DropDownList sends a request to the server, utilizing the full data source, to achieve filtering. Before initiating the request, an action event is triggered. Upon successful retrieval of data from the server, an action complete event is triggered. The initial data is loaded when the popup is opened. Whether the filter list has a selection or not, the popup closes.

The following sample shows the example for Filtering with Virtualization.

INDEX.JS

```
var records = [];
for (var i = 1; i <= 150; i++) {
    var item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //bind the dataSorce property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'id', text: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
```

```
enableVirtualization: true,
//set allowFiltering property to true
allowFiltering: true,
//set the height of the popup element
popupHeight: '200px'
});
//render the component
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 ComboBox</title>
  <meta charset="utf-8">

</body></html>
```

Localization in ##Platform_Name## Combo box control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the ComboBox.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No records found |

| actionFailureTemplate | The request failed |

Loading translations

To load translation object to your application, use `load` function of `L10n` class.

In the following sample, French culture is set to the ComboBox and no data is loaded. Hence, the [noRecordsTemplate](#) property displays its text in French culture initially, and if the sample is run offline, the [actionFailureTemplate](#) property displays its text appropriately.

INDEX.JS

```
//bind the data manager instance to dataSource property
var customerData = new ej.data.DataManager({
  url: 'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
  adaptor: new ej.data.ODataV4Adaptor(),
  crossDomain: true
});
//initiates the component
var comboBoxObject = new ej.dropdowns.ComboBox({
  //set the data to dataSource property
  dataSource: customerData,
  // set locale culture to ComboBox
  locale: 'fr-BE',
  // map appropriate column
  fields: { text: 'ContactName', value: 'CustomerID' },
  // take 0 item to showcase noRecordsTemplate property.
  query: new ej.data.Query().select(['ContactName',
  'CustomerID']).take(0),
  // set placeholder to ComboBox input element
  placeholder: 'Sélectionnez un éléments'
});
comboBoxObject.appendTo('#comboelement');
ej.base.L10n.load({
  'fr-BE': {
    'dropdowns': {
      'noRecordsTemplate': 'Aucun enregistrement trouvé',
      'actionFailureTemplate': 'Modèle d'échec d'action'
    }
  }
});
```

Style in ##Platform_Name## Combo box control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

,

```
.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
color: #ab3243;
background: #32a5ab;
}
,
```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

,

```
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon: hover {
```

```
color: #bb233d;
```

```
font-size: 13px;
```

```
}
```

```
,
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
,
```

```
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-
input-focus::after {
```

```
background: #c000ff;
```

```
}
```

```
,
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
,
```

```
.e-outline.e-input-group.e-input-focus: hover: not(.e-success): not(.e-warning): not(.e-error): not(.e-
disabled): not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper: hover: not(.e-
success): not(.e-warning): not(.e-error): not(.e-disabled): not(.e-float-icon-left),.e-outline.e-input-group.e-
input-focus: not(.e-success): not(.e-warning): not(.e-error): not(.e-disabled),.e-outline.e-input-group.e-
control-wrapper.e-input-focus: not(.e-success): not(.e-warning): not(.e-error): not(.e-disabled) {
```

```
border-color: #b1bd15;
```

```
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
```

```
}
```

```
,
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
,
```

```
.e-input-group.e-control-wrapper .e-input[disabled] {
```

```
-webkit-text-fill-color: #0d9133;
```

```
}
```

```
,
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
,
```

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-
wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-
float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left)
.e-float-line::after {
```

```
background-color: #2319b8;
```

```
}
```

```
.e-ddl.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-float-
input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {
```

```
color: #2319b8;
```

```
}
```

```
,
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
,
```

```
.e-ddl.e-input-group input.e-input::placeholder {
```

```
color: red;
```

```
}
```

```
,
```

Customizing the text selection color

Use the following CSS to customize the selection color of text and background.

```
,
```

```
.e-ddl.e-input-group input.e-input::selection {
```

```
color: red;
```

```
background: yellow;
```

```
}
```

```
,
```

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
,
```

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {
```

```
background-color: #1f9c99;
```

```
color: #2319b8;
```

```
}
```

```
,
```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

,

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {
background-color: #29c2b8;
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
```

,

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.JS

```
var sportsData = ['Badminton', 'Cricket', 'Football', 'Golf', 'Tennis'];
// initialize ComboBox component
var listObj = new ej.dropdowns.ComboBox({
  dataSource: sportsData,
  // set placeholder to ComboBox input element
  placeholder: "Select games"});
listObj.appendTo('#comboelement');
```

INDEX.HTML

```

Accessibility in ##Platform_Name## Combo box control

The ComboBox component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The ComboBox component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ComboBox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The ComboBox component uses the **combobox** role, and each list item has an **option** role. The following **ARIA attributes** denote the ComboBox state.

| Properties | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the ComboBox input element has a popup list or not. |

| aria-expanded | Indicates whether the popup list has expanded or not. |

| aria-selected | Indicates the selected option. |

| aria-readonly | Indicates the readonly state of the ComboBox element. |

| aria-disabled | Indicates whether the ComboBox component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the popup list to indicate popup as a child element. |

| aria-autocomplete | This attribute contains the 'both' to a list of options shows and the currently selected suggestion also shows inline. |

Keyboard interaction

You can use the following key shortcuts to access the ComboBox without interruptions.

| Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | Selects the first item in the ComboBox when no item selected. Otherwise, selects the item next to the currently selected item. |

| Arrow Up | Selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |

| Enter | Selects the focused item and popup list closes when it is in open state. |

| Tab | Focuses on the next TabIndex element on the page when the popup is closed.
Otherwise, closes the popup list and remains the focus of the component. |

| Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |

| Alt + Down | Open the popup list |

| Alt + Up | Close the popup list |

| Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |

| Home | Cursor moves to before of first character in input |

| End | Cursor moves to next of last character in input |

In the following sample, focus the ComboBox component using alt+t keys.

INDEX.JS

```
var gameList = [
    { id: 'Game1', game: 'Badminton' },
    { id: 'Game2', game: 'Basketball' },
    { id: 'Game3', game: 'Cricket' },
    { id: 'Game4', game: 'Football' },
    { id: 'Game5', game: 'Golf' },
    { id: 'Game6', game: 'Hockey' },
    { id: 'Game7', game: 'Rugby' },
    { id: 'Game8', game: 'Snooker' },
    { id: 'Game9', game: 'Tennis' },
];
// initialize ComboBox component
var comboBoxObject = new ej.dropdowns.ComboBox({
    //set the data to dataSource property
    dataSource: gameList,
    //map to column to fields
    fields: { text: 'game', value: 'id' },
    // set placeholder to ComboBox input element
    placeholder: "Select games",
    // set the popup list height
    popupHeight: '200px'
});
// render initialized ComboBox
comboBoxObject.appendTo('#comboelement');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the control.
        comboBoxObject.focusIn();
    }
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Ensuring accessibility

The ComboBox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ComboBox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ComboBox component with accessibility tools.

How To

Autofill in ##Platform_Name## Combo box control

The ComboBox supports the **autofill** behaviour with the help of [autofill](#) property. Whenever you change the input value, the ComboBox will autocomplete your data by matching the typed character. Suppose, if no matches found then, comboBox doesn't suggest any item.

In the following sample, showcase that how to work autofill with ComboBox.

INDEX.JS

```
let searchData = [
  { Name: 'Australia', Code: 'AU' },
  { Name: 'Bermuda', Code: 'BM' },
  { Name: 'Canada', Code: 'CA' },
  { Name: 'Cameroon', Code: 'CM' },
  { Name: 'Denmark', Code: 'DK' },
  { Name: 'France', Code: 'FR' },
  { Name: 'Finland', Code: 'FI' },
  { Name: 'Germany', Code: 'DE' },
  { Name: 'Greenland', Code: 'GL' },
  { Name: 'Hong Kong', Code: 'HK' },
  { Name: 'India', Code: 'IN' },
  { Name: 'Italy', Code: 'IT' },
  { Name: 'Japan', Code: 'JP' },
  { Name: 'Mexico', Code: 'MX' },
  { Name: 'Norway', Code: 'NO' },
  { Name: 'Poland', Code: 'PL' },
  { Name: 'Switzerland', Code: 'CH' },
  { Name: 'United Kingdom', Code: 'GB' },
  { Name: 'United States', Code: 'US' }
];
//initiates the component
let comboBoxObject = new ej.dropdowns.ComboBox({
  // bind the country data to dataSource property
  dataSource: searchData,
  // maps the appropriate column to fields property
  fields: { value: "Name" },
  //set the placeholder to ComboBox input
  placeholder: "Find a country",
  //enable the autofill property to fill a first matched value in input
  //when press a down key
  autofill: true
});
comboBoxObject.appendTo('#comboelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 ComboBox</title>
  <meta charset="utf-8">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Cascading in ##Platform_Name## Combo box control

The cascading ComboBox is a series of ComboBox, where the value of one ComboBox depends upon another's value. This can be configured by using the [change](#) event of the parent ComboBox. Within that change event handler, data has to be loaded to the child ComboBox based on the selected value of the parent ComboBox.

The following example, shows the cascade behavior of country, state, and city ComboBox. Here, the [dataBind](#) method is used to reflect the property changes immediately to the ComboBox.

INDEX.JS

```
//define the country ComboBox data
var countryData = [
    { CountryName: 'Australia', CountryId: '2' },
    { CountryName: 'United States', CountryId: '1' }
];
//define the state ComboBox data
var stateData = [
    { StateName: 'New York', CountryId: '1', StateId: '101' },

Icons support in ##Platform_Name## Combo box control

You can render **icons** to the list items by mapping the [iconCss](#) field. This `iconCss` field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, icon classes are mapped with `iconCss` field.

INDEX.JS

```
let sortFormatData = [
  { Class: 'asc-sort', Type: 'Sort A to Z', Id: '1' },
  { Class: 'dsc-sort', Type: 'Sort Z to A ', Id: '2' },
  { Class: 'filter', Type: 'Filter', Id: '3' },
  { Class: 'clear', Type: 'Clear', Id: '4' }
```

```

];
//initiates the component
let sortFormat = new ej.dropdowns.ComboBox({
  //set the data to dataSource property
  dataSource: sortFormatData,
  // map the icon column to iconCSS field.
  fields: { value: 'Type', iconCss: 'Class' },
  // set placeholder to ComboBox input element
  placeholder: 'Find a format'
});
sortFormat.appendTo('#comboelement');

```

Achieve virtual scrolling in ##Platform_Name## Combo box control

The Virtual Scrolling is used to display a large amount of data without buffering the entire load of a huge database record in the ComboBox, that is, when scrolling, the request is sent and fetch some amount of data from the server dynamically. Using the `scroll` event, get the data and generate the list add to popup using the `addItem` method.

Refer to the following code sample for virtual scrolling.

INDEX.JS

```
var data = new ej.data.DataManager({
    url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
    crossDomain: true
});
//initiates the component
let comboObject = new ej.dropdowns.ComboBox({
    // bind the DataManager instance to dataSource property
    dataSource: data,
    // bind the Query instance to query property
    query: new
ej.data.Query().from('Customers').select('ContactName').take(7),
    // map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'ContactName' },
    // set the placeholder to ComboBox input element
    placeholder: 'Select a customer',
    // sort the resulted items
    sortOrder: 'Ascending',
    // set the height of the popup element
    popupHeight: '200px',

    actionComplete: function (e) {
        let operator = new
ej.data.Query().from('Customers').select('ContactName');
        let start = 7;
        let end = 12;
        let listElement = this.list;
        listElement.addEventListener('scroll', () => {
            if ((listElement.scrollTop + listElement.offsetHeight >=
listElement.scrollHeight)) {
                let filterQuery = operator.clone();
                data.executeQuery(filterQuery.range(start,
end)).then((event) => {
                    start = end;
                    end += 5;
                    comboObject.addItem(event.result);
                }).catch((e) => {
                });
            }
        })
    }
});
comboObject.appendTo('#atcelement');
```

ContextMenu

Icons and navigation in ##Platform_Name## Context menu control

Icons

The ContextMenu item have an icon/image in it to provide visual representation of the action. To place the icon on a menu item, set the [iconCss](#) property to e-icons with the required icon CSS. By default, the icon is positioned to the left side of the menu item. In the following sample, the icons for Cut, Copy and Paste menu items are added using the [iconCss](#) property.

INDEX.JS

```

ej.base.enableRipple(true);
var menuItems = [
    {
        text: 'Cut',
        iconCss: 'e-db-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-db-icons e-paste',
    }
];
var menuOptions = {
    target: '#target',

```

```

        items: menuItems
    };
    // Initialize ContextMenu component.
    var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu')

```

Navigation

Navigation in ContextMenu is usage to navigate to the other web page when menu item is clicked. This can be achieved by providing link to the menu item using the [url](#) property. In the following sample, Navigation URL for Flipkart, Amazon, and Snapdeal menu items are added using the [url](#) property.

INDEX.JS

```
ej.base.enableRipple(true);
var menuItems = [
  {
    text: 'Flipkart',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=flipkart'
  },
  {
    text: 'Amazon',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=amazon'
  },
  {
    text: 'Snapdeal',
    iconCss: 'e-cart-icon e-link',
    url: 'https://www.google.co.in/search?q=snapdeal'
  }
];
var menuOptions = {
  target: '#target',
  items: menuItems,
  beforeItemRender: beforeItemRender
};
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu')
function beforeItemRender(args) {
  args.element.getElementsByTagName('a')[0].setAttribute('target',
  '_blank');
}
```

INDEX.HTML

- [How to change menu items dynamically](#)

Template and multilevel nesting in ##Platform_Name## Context menu control

Template

The ContextMenu items can be customized by using the [beforeItemRender](#) event. The item render event

triggers while rendering each menu item. The event argument will be used to identify the menu item and customize it based on the requirement. In the following sample, the menu item is rendered with keycode for specified action in ContextMenu using the template. Here, the keycode is specified for Save as, View page source, and Inspect in the right side corner of the menu items by adding span element in the [beforeItemRender](#) event.

INDEX.JS

```

ej.base.enableRipple(true);
var menuItems = [
    {
        text: 'Save as...'
    },
    {
        text: 'View page source'
    }
]

```

```

    },
    {
        text: 'Inspect'
    }
    ]];
var menuOptions = {
    target: '#target',
    items: menuItems,
    beforeItemRender: beforeItemRender
};
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
function beforeItemRender(args) {
    var shortCutSpan = ej.base.createElement('span');
    var text = args.item.text;
    var shortCutText = text === 'Save as...' ? 'Ctrl + S' : (text === 'View
page source' ? 'Ctrl + U' : 'Ctrl + Shift + I');
    shortCutSpan.textContent = shortCutText;
    args.element.appendChild(shortCutSpan);
    shortCutSpan.setAttribute('class', 'shortcut');
}

```

INDEX.HTML

```

    <div id="container">
        <!--target element-->

```

```

        <div id="target">Right click / Touch hold to open the
ContextMenu</div>
        <!--element which is going to render-->
        <ul id="contextmenu"></ul>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To create span element, `createElement` utility function used from `ej2-base`.

Multilevel nesting

The Multiple level nesting supports in ContextMenu. It can be achieved by mapping the `items` property inside the parent `menuitems`. In the below sample, three level nesting of ContextMenu is provided.

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Accessibility in ##Platform_Name## Context menu control

The Context menu component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Context menu component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Context menu component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Context menu component:

Attributes Purpose
--- ---
role Indicates Context menu component popup as menu , and the popup items as menuitem .
aria-haspopup Indicates the availability and type of interactive popup element.
aria-expanded Indicates whether the subtree can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed.
aria-label Indicates the menu item text.

Keyboard interaction

The Context menu component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Context menu component.

Press To do this
--- ---
Esc Closes the opened sub menu.
Enter Selects the focused item.
Up Navigates up or to the previous menu item.
Down Navigates down or to the next menu item.
Left Close the current sub menu and navigates to the parent menu.
Right Navigates and open the next sub menu.

Ensuring accessibility

The Context menu component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Context menu component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Context menu component with accessibility tools.

Style and appearance in ##Platform_Name## Context menu control

To modify the ContextMenu appearance, you need to override the default CSS of ContextMenu component. Please find the list of CSS classes and its corresponding section in ContextMenu component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

|.e-contextmenu-wrapper |To customize the context menu wrapper

|.e-contextmenu-wrapper .e-menu-parent|To customize the context menu items

|.e-contextmenu-wrapper ul .e-menu-item.e-selected .e-caret::before|To customize the context menu caret icon

|.e-contextmenu-wrapper ul .e-menu-item .e-menu-icon::before|To customize the icons of the context menu

How To

Populate menu items with data source in ##Platform_Name## Context menu control

To bind local data source to the ContextMenu, menu items are populated from data source and mapped to [items](#) property.

The below example demonstrates how to bind local data source to the ContextMenu and separator is added using [insertAfter](#) method.

INDEX.JS

```
ej.base.enableRipple(true);  
var data = [  
  { id: 1, parentId: null, text: 'View' },  
  { id: 2, parentId: null, text: 'Sort by' },  
  { id: 3, parentId: null, text: '' },  
  { id: 4, parentId: null, text: 'New' },  
  { id: 5, parentId: null, text: '' },  
  { id: 6, parentId: null, text: 'Display Settings' },  
  { id: 7, parentId: null, text: 'Personalize' },  
  //first level child  
  { id: 8, parentId: 1, text: 'Large Icons' },  
  { id: 9, parentId: 1, text: 'Medium Icons' },  
  { id: 10, parentId: 1, text: 'Small Icons' },  
  { id: 11, parentId: 2, text: 'Name' },  
  { id: 12, parentId: 2, text: 'Size' },  
  { id: 13, parentId: 4, text: 'Folder' },  
  { id: 14, parentId: 4, text: 'Shortcut' },
```

```

    { id: 15, parentId: 4, text: '' },
    { id: 16, parentId: 4, text: 'Contact' }
  ];
  var record;
  var menuItems = [];
  for (var i = 0; i < data.length; i++) {
    record = data[i];
    if (record.parentId) {
      if (!menuItems[record.parentId - 1].items) {
        menuItems[record.parentId - 1].items = []
      }
      menuItems[record.parentId - 1].items.push({ text: record.text });
    } else {
      menuItems.push({ text: record.text });
    }
  }
  var menuOptions = {
    target: '#target',
    items: menuItems,
    beforeItemRender: (args) => {
      if (!args.item.text) {
        args.element.classList.add('e-separator');
      }
    }
  };
  var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');

Open and close contextmenu in ##Platform_Name## Context menu control

ContextMenu can be opened and closed programmatically whenever required by using the open and close methods.

In the following example, the ContextMenu is opened using the [open](#) method at the specified position using [top](#) and [left](#). Also, ContextMenu is closed using [close](#) method on ContextMenu item click or document click.

INDEX.JS

```

ej.base.enableRipple(true);
var menuItems = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
var menuOptions = {
    items: menuItems
};
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
var button = new ej.buttons.Button();
button.appendTo('#btnElement');
document.getElementById('btnElement').onclick=function() {
    var contextMenuObj =
document.getElementById("contextmenu").ej2_instances[0];
    contextMenuObj.open(60, 20);
}

```

Change menu items dynamically in ##Platform_Name## Context menu control

The items visible in the ContextMenu can be changed dynamically based on the target in which you open the ContextMenu. To achieve this behavior, initialize ContextMenu with all items using [items](#) property and then based on the context you open hide/show required items using [hideItems](#)/[showItems](#) method in [beforeOpen](#) event.

In the following example, the datasource for Clipboard div is **Cut**, **Copy**, **Paste** and for the Editor div is **Add**, **Edit**, **Delete** is changed on [beforeOpen](#) event using [hideItems](#) and [showItems](#) method.

INDEX.JS

```

ej.base.enableRipple(true);
var menuItems = [
    {
        text: 'Cut'
    },
    {
        text: 'Copy'
    },
    {
        text: 'Paste'
    },
    {
        text: 'Add'
    },
    {
        text: 'Edit'
    },
    {
        text: 'Delete'
    }
];
var menuOptions = {
    target: '#target .e-div',
    items: menuItems,
    beforeOpen: beforeOpen
};
// Initialize ContextMenu component.
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
function beforeOpen (args) {
    if (args.event.target.id === 'right') {
        menuObj.hideItems(['Cut', 'Copy', 'Paste']);
        menuObj.showItems(['Add', 'Edit', 'Delete']);
    } else if (args.event.target.id === 'left') {
        menuObj.showItems(['Cut', 'Copy', 'Paste']);
        menuObj.hideItems(['Add', 'Edit', 'Delete']);
    }
}

```

Show table in sub ContextMenu

Menu items of the ContextMenu can be customized according to the requirement. The section explains about how to customize table template

in sub menu item.

This can be achieved by appending table layout while `li` rendering by using [beforeItemRender](#) event.

INDEX.JS

```

ej.base.enableRipple(true);
var header = document.createElement('h4');
header.textContent = 'Insert Table';
var table = document.createElement('table');

```

```

for (var i = 0; i < 5; i++) {
    var row = document.createElement('tr');
    table.appendChild(row);
    for (var j = 0; j < 6; j++) {
        var col = document.createElement('td');
        row.appendChild(col);
        col.setAttribute('class', 'e-border');
    }
}
var menuItems = [
    {
        text: 'Cut',
        iconCss: 'e-cm-icons e-cut'
    },
    {
        text: 'Copy',
        iconCss: 'e-icons e-copy'
    },
    {
        text: 'Paste',
        iconCss: 'e-cm-icons e-paste'
    },
    {
        separator: true
    },
    {
        text: 'Link',
        iconCss: 'e-icons e-link'
    },
    {
        text: 'Table',
        iconCss: 'e-icons e-table',
        items: [
            {
                id: 'table'
            }
        ]
    }
];
var menuOptions = {
    target: '#target',
    items: menuItems,
    beforeItemRender: function(args) {
        if (args.item.id === 'table') {
            args.element.classList.add('bg-transparent');
            args.element.appendChild(header);
            args.element.appendChild(table);
        }
    }
};
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');

```

Show UI components in ContextMenu

UI components can also be placed inside the each `li` element of ContextMenu.

In the following example, CheckBox component is placed inside each `li` element and this can be achieved by creating CheckBox component in [beforeItemRender](#) event and appending it into the `li` element.

INDEX.JS

```
ej.base.enableRipple(true);
var menuItems = [
    { text: 'Option 1' },
    { text: 'Option 2' },
    { text: 'Option 3' }
];
var i = 1;
var menuOptions = {
    target: '#target',
    items: menuItems,
    beforeItemRender: function(args) {
        var checkbox = new ej.buttons.CheckBox({ label: 'Option'+ i,
checked: i%2 === 0 ? true : false });
        args.element.innerHTML = '';
        checkbox.appendTo('#checkbox'+i);
        var checkbox = document.getElementsByClassName('e-checkbox-
wrapper');
        args.element.appendChild(checkbox[0]);
        i++;
    },
    beforeClose: function(args) {
        args.cancel = true;
    },
    select: function(args) {
        var selectedElem = args.element.parentElement.querySelectorAll('.e-
selected');
        for(var i=0; i < selectedElem.length; i++){
            var ele = selectedElem[i];
            ele.classList.remove('e-selected');
        }
        var checkbox = args.element.childNodes[0];
        var frame = checkbox.querySelector('.e-frame');
        if (checkbox && frame.classList.contains('e-check')) {
            frame.classList.remove('e-check');
        } else if (checkbox) {
            frame.classList.add('e-check');
        }
    }
};
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
```

```

Underline a character in the item text in ##Platform_Name## Context menu control

Underline a particular character in a text can be handled in [beforeItemRender](#) event by

adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

INDEX.JS

```

ej.base.enableRipple(true);
var menuItems = [
    {
        text: 'Cut'
    },
    {

```

```

        text: 'Copy'
    },
    {
        text: 'Paste'
    }
    ]];
var menuOptions = {
    target: '#target',
    items: menuItems,
    beforeItemRender: function(args) {
        if (args.item.text === 'Copy') {
            args.element.innerHTML = '<u>C</u>opy';
        }
    }
};
// Initialize ContextMenu component.
var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');
```

INDEX.HTML

Open a dialog on contextmenu item click in **##Platform_Name##** Context menu control

This section explains about how to open a dialog on ContextMenu item click. This can be achieved by handling dialog open in [select](#) event of the ContextMenu.

In the following sample, Dialog will open while clicking **Save As...** item.

INDEX.JS

```

ej.base.enableRipple(true);
var dialog = new ej.popups.Dialog({
    content: "This file can be saved as PDF",
    buttons: [{
        buttonModel: {
            isPrimary: true,
            content: 'Submit',
            cssClass: 'e-flat',
        },
        click: function () {
            this.hide();
        }
    }],
    target: document.getElementById("container"),
    width: '200px',
    height: '110px'
});
// Render initialized Dialog
dialog.appendTo('#dialog');
dialog.hide();
var menuItems = [
    {
        text: 'Back'
    },
    {
        text: 'Forward'
    },
    {
        text: 'Reload'
    },
    {
        separator: true
    },
    {
        text: 'Save As...'
    },
    {
        text: 'Print'
    },
    {

```

```

        text: 'Cast'
    }
    });
    var menuOptions = {
        target: '#target',
        items: menuItems,
        select: function(args) {
            if(args.item.text === 'Save As...') {
                dialog.show();
            }
        }
    };
    var menuObj = new ej.navigations.ContextMenu(menuOptions, '#contextmenu');

```

Change animation settings in ##Platform_Name## Context menu control

To change the animation of the ContextMenu, [animationSettings](#) property is used. The supported effects for ContextMenu are,

Effect	Functionality
-----	-----
None	Specifies the sub menu transform with no animation effect.
SlideDown	Specifies the sub menu transform with slide down effect.
ZoomIn	Specifies the sub menu transform with zoom in effect.
FadeIn	Specifies the sub menu transform with fade in effect.

The following sample illustrates how to open ContextMenu with **FadeIn** effect with the **duration** of **800ms**.

Enable or disable context menu items in ##Platform_Name## Context menu control

You can enable and disable the menu items using the [enableItems](#) method in ContextMenu. To enable menuitems, set the `enable` property in argument to `true` and vice-versa.

In the following example, the **Display Settings** in parent items and **Medium icons** in sub menu items are disabled.

INDEX.HTML

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To disable sub menu items, use the [beforeOpen](#) event.

DashboardLayout

Setting size of cells in ##Platform_Name## Dashboard layout control

The entire layout dimensions are assigned based on the height and width of the parent element. Hence a responsive or static layout can be created by assigning a percentage or static dimension values to the parent element. The layout adapts to mobile resolutions by transforming the entire layout into a stacked orientation so that the panels will be displayed in a vertical column.

The **Dashboard Layout** is a grid structured component which can be split into subsections of equal size known as cells. The total number of cells in each row is defined using the [columns](#) property of the component. The width of each cell will be auto calculated based on total number of cells placed in a row and the height of a cell will be same as that of its width. However, the height of these cells can also be configured to any desired size using the [cellAspectRatio](#) property (cellwidth/cellheight ratio) which defines the cell width to height ratio.

The number of rows within the layout has no limits and can have any number of rows based on the panels count and position. Panels which acts as data containers will be placed or positioned over these cells.

Modifying cell size

In a dashboard, the data to be held by the panel in a cell may be of different size, hence different cell dimensions may be required in different scenarios. In this case, the size of these grid cells can be modified to the required size using the [columns](#) and [cellAspectRatio](#) properties.

The following sample demonstrates how to modify a cell size using [columns](#) and [cellAspectRatio](#) properties. In the below sample the width of the parent element is divided into 5 equal cells based on the columns property value resulting the width of each cell as 100px. The height of these cells will be 50px based on the cellAspectRatio value 100/50 (i.e. for every 100px of width, 50px will be the height of the cell).

INDEX.JS

```

var dashboard = new ej.layouts.DashboardLayout({

```

```

    cellSpacing: [10, 10],
    columns: 5,
    cellAspectRatio: 100/50,
    //Dashboard Layout's dragstart event
    dragStart: onDragStart,
    //Dashboard Layout's drag event
    drag: onDrag,
    //Dashboard Layout's dragstop event
    dragStop: onDragStop,
    panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
    { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
    { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
    { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
    ]
  });
  dashboard.appendTo('#dashboard_layout');
  //Dashboard Layout's dragstart event function
  function onDragStart(args) {
    console.log("Drag start");
  }
  //Dashboard Layout's drag event function
  function onDrag(args) {
    console.log("Dragging");
  }
  //Dashboard Layout's dragstop event function
  function onDragStop(args) {
    console.log("Drag stop");
  }
}

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Setting cell spacing

The spacing between each panel in a row and column can be defined using the [cellSpacing](#) property. Adding spacing between the panels will make the layout effective and provides a clear data representation.

The following sample demonstrates the usage of the [cellSpacing](#) property which helps in a neat and clear representation of a data.

INDEX.JS

```

// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
    cellSpacing: [20, 20],
    columns: 5,
    panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content:'<div
class="content">0</div>' },
    { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content:'<div
class="content">1</div>' },
    { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content:'<div
class="content">2</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content:'<div
class="content">3</div>' },
    { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content:'<div
class="content">4</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content:'<div
class="content">5</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content:'<div
class="content">6</div>' }
    ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');

```

INDEX.HTML

```

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Graphical representation of layout

These cells combinedly will form a grid-structured layout which will be hidden initially. This grid structured layout can be made visible by enabling the [showGridLines](#) property which clearly pictures the cells split-up within the layout. These gridlines will be helpful in panels sizing and placement within the layout during initial designing of a dashboard.

In the following sample, the grid lines indicate the cells split-up of the layout and the data containers placed over these cells are known as panels.

INDEX.JS

```

// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  showGridLines: true,
  columns: 5,
  panels: [

```

```

    { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
    { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">3</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">4</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DashboardLayout </title>
  <meta charset="utf-8">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Rendering component in right-to-left direction

It is possible to render the Dashboard Layout in right-to-left direction by setting the [enableRtl](#) API to true.

The following sample demonstrates Dashboard Layout in right-to-left direction.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  enableRtl: true,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, header:
'<div>Panel 0</div>', content: '<div class="content"></div>',
  { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, header: '<div>Panel
1</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, header: '<div>Panel
2</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, header: '<div>Panel
3</div>', content: '<div class="content"></div>',
  { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, header: '<div>Panel
4</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, header: '<div>Panel
5</div>', content: '<div class="content"></div>',
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, header: '<div>Panel
6</div>', content: '<div class="content"></div>'}]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
```

Panels

Position sizing of panels in `##Platform_Name##` Dashboard layout control

Panels are the basic building blocks of the dashboard layout component. They act as a container for the data to be visualized or presented. These panels can be positioned or resized for effective presentation of the data.

The below table represents all the available panel properties and the corresponding functionalities

PanelObject	Description
---	---
id	Specifies the id value of the panel.
row	Specifies the row value in which the panel to be placed.
col	Specifies the column value in which the panel to be placed.
sizeX	Specifies the width of the panel in cells count.
sizeY	Specifies the height of the panel in cells count.
minSizeX	Specifies the minimum width of the panel in cells count.
minSizeY	Specifies the minimum height of the panel in cells count.
maxSizeX	Specifies the maximum width of the panel in cells count.
maxSizeY	Specifies the maximum height of the panel in cells count.
header	Specifies the header template of the panel.
content	Specifies the content template of the panel.
cssClass	Specifies the CSS class name that can be appended with each panel element.

Positioning of panels

The panels within the layout can be easily positioned or ordered using the `row` and `col` properties of the panels. Positioning of panels will be beneficial to represent the data in any desired order.

The following sample demonstrates the positioning of panels within the dashboard layout using the `row`, `column` properties of the panels.

INDEX.JS

```
// initialize dashboardlayout component
let dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [20, 20],
  columns: 3,
  panels: [
    { "row": 0, "col": 0, content: '<div class="content">1</div>' },
    { "row": 0, "col": 1, content: '<div class="content">2</div>' },
    { "row": 0, "col": 2, content: '<div class="content">3</div>' },
    { "row": 1, "col": 0, content: '<div class="content">4</div>' },
  ]
});
```

```

    { "row": 1, "col": 1, content: '<div class="content">5</div>' },
    { "row": 1, "col": 2, content: '<div class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
  <title>Essential JS 2 DashboardLayout </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    <!--element which is going to render the dashboardlayout-->
    <div id="dashboard_default"></div>
  </div>
  <script>
    var ele = document.getElementById('container');
    if (ele) {
      ele.style.visibility = "visible";
    }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body>
</html>
```

Sizing of panels

A panel's size can be varied easily by defining the `sizeX` and `sizeY` properties. The `sizeX` property defines the width and `sizeY` property defines height of a panel in cells count. These properties will be helpful in designing a dashboard, where the content of each panel may vary in size.

The following sample demonstrates the sizing of panels within the dashboard layout using the `sizeX` and `sizeY` properties of the panels.

INDEX.JS

```

// initialize dashboardlayout component
let dashboard = new ej.layouts.DashboardLayout({
```

```

    cellSpacing: [20, 20],
    columns: 5,
    panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
    { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
    { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
    { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
    { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
    ]
  });
  // render initialized dashboardlayout
  dashboard.appendTo('#dashboard default');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Setting header of panels in ##Platform_Name## Dashboard layout control

The Dashboard layout component is mostly used to represent the data used for monitoring or managing a process. These data or any HTML template can be placed as the content of a panel using the `content` property. Also, word or phrase that summarize about the panel's content can be added as the header on the top of each panel using the `header` property of the panel.

The following sample demonstrates how to add content for each panel using the header and content properties of the panels.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  columns: 6,
  panels: [{ 'id': 'Panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0,
  header: '<div>Panel 0</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1,
  header: '<div>Panel 1</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel2', 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4,
  header: '<div>Panel 2</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel3', 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0,
  header: '<div>Panel 3</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel4', 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0,
  header: '<div>Panel 4</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel5', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2,
  header: '<div>Panel 5</div>', content: '<div class="content">Panel
Content<div>',
    { 'id': 'Panel6', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3,
  header: '<div>Panel 6</div>', content: '<div class="content">Panel
Content<div>'
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DashboardLayout </title>

```

Placing components as content of panels

In a dashboard, components like the chart, grids, maps, gauge etc. can be used to present a complex data. Any such components can be placed as the panel content by assigning the corresponding component element as the **content** of the panel.

The following sample demonstrates how to add ej2-chart components as the **content** for each panel in the dashboard layout component.

INDEX.JS

```

// initialize dashboardlayout component
let dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  columns: 6,
  panels: [{ 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 0,
    header: '<div class="header"> Product usage ratio </div>', content: '<div
    id="pie"><div>',
    { 'id': 'Panel2', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
    class="header"> Last year Sales Comparison </div>', content: '<div
    id="column"><div>' },
    { 'id': 'Panel3', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
    class="header"> Mobile browsers usage </div>', content: '<div
    id="pie1"><div>' },
    { 'id': 'Panel4', 'sizeX': 3, 'sizeY': 2, 'row': 1, 'col': 0, header: '<div
    class="header"> Sales increase percentage </div>', content: '<div
    id="line"><div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
let chartData = [
  { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
  { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
  { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },

```

```

        { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
        { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
        { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
    ];
    let chart = new ej.charts.Chart({
        primaryXAxis: {
            valueType: 'Category'
        },
        series:[{
            dataSource: chartData,
            xName: 'month',
            yName: 'sales',
            type: 'Column'
        }],
        height:"162px"
    }, '#column');
    let lineData = [
        { x: 2013, y: 28 }, { x: 2014, y: 25 }, { x: 2015, y: 26 }, { x: 2016,
        y: 27 },
        { x: 2017, y: 32 }, { x: 2018, y: 35 },
    ];
    let linechart = new ej.charts.Chart({
        series:[{
            dataSource: lineData,
            xName: 'x', yName: 'y',
            //Series type as line
            type: 'Line'
        }],
        height:"162px"
    }, '#line');
    let accChart = new ej.charts.AccumulationChart({
        series: [
            {
                dataSource: [{ x: 'TypeScript', y: 13, text: 'TS 13%' }, { x:

                10%' }, { x: 'Angular', y: 40, text: 'Angular 40%' }],
                xName: 'x',
                yName: 'y',
                innerRadius: "20%"
            },
            {
                tooltip:{enable: true},
                height:"162px"
            }
        ],
        '#pie');
    let piechart = new ej.charts.AccumulationChart({
        // Initialize the chart series
        series: [
            {
                dataSource: [
                    { 'x': 'Chrome', y: 37, text: '37%' }, { 'x': 'UC
                    Browser', y: 17, text: '17%' },
                    { 'x': 'iPhone', y: 19, text: '19%' },
                    { 'x': 'Others', y: 4, text: '4%' }, { 'x': 'Opera', y:
                    11, text: '11%' },
                    { 'x': 'Android', y: 12, text: '12%' }
                ],
                dataLabel: {

```

```

        visible: true, position: 'Inside', name: 'text', font: {
fontWeight: '600' }
        },
        radius: '70%', xName: 'x', yName: 'y', name: 'Browser'
    }
    ],
    center: { x: '50%', y: '50%' },
    enableSmartLabels: true,
    height: "162px",
    enableAnimation: false,
    legendSettings: { visible: false },
    // Initialize tht tooltip
    tooltip: { enable: true, format: '${point.x} : <b>${point.y}%</b>'
},
}, '#piel');

```

Add remove panels in ##Platform_Name## Dashboard layout control

In real-time cases, the data being presented within the dashboard need to be updated frequently which includes adding or removing the data dynamically within the dashboard. This can be easily achieved by using the [addPanel](#) and [removePanel](#) public methods of the component.

Add or remove panels dynamically

Panels can be added dynamically by using the [addPanel](#) public method by passing the [panel](#) property as parameter. Also, they can be removed dynamically by using the [removePanel](#) public method by simply passing the [panel id](#) value as a parameter.

It is also possible to remove all the panels in a Dashboard Layout by calling [removeAll](#) method.

```
`js
```

```
dashboard.removeAll();
```

```
,
```

The following sample demonstrates how to add and remove the panels dynamically in the dashboard layout component. Here, panels can be added in any desired position of required size by selecting them in the numeric boxes and clicking add button and remove them by selecting the id of the panel.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  panels: [{ 'id': 'Panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0,
  content: '<div class="content">0</div>' },
  { 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
  { 'id': 'Panel2', 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
  { 'id': 'Panel3', 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },
  { 'id': 'Panel4', 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>' },
  { 'id': 'Panel5', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>' },
  { 'id': 'Panel6', 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
var count = 7;
var data = ["Panel0", "Panel1", "Panel2", "Panel3", "Panel4", "Panel5",
"Panel6"];
var sizeX = new ej.inputs.NumericTextBox ({
  placeholder: 'Ex: 1',
  floatLabelType: 'Never',
  value: 1,
```

```

        min:1,
        max: 5
    });
    sizeX.appendTo('#sizeX');
    var idValue = new ej.dropdowns.DropDownList ({
        dataSource: data
    });
    idValue.appendTo("#value");
    var sizeY = new ej.inputs.NumericTextBox ({
        //set the data to dataSource property
        placeholder: 'Ex: 1',
        floatLabelType: 'Never',
        value: 1,
        min:1,
        max: 5
    });
    sizeY.appendTo('#sizeY');
    var row = new ej.inputs.NumericTextBox ({
        //set the data to dataSource property
        placeholder: 'Ex: 1',
        floatLabelType: 'Never',
        value: 0,
        min:0,
        max: 5
    });
    row.appendTo('#row');
    var column = new ej.inputs.NumericTextBox ({
        //set the data to dataSource property
        placeholder: 'Ex: 1',
        floatLabelType: 'Never',
        value: 0,
        min:0,
        max: 4
    });
    column.appendTo('#column');
    document.getElementById('add').onclick = function() {
        var panel = {
            id: "Panel"+ count.toString(),
            sizeX: sizeX.value,
            sizeY: sizeY.value,
            row: row.value,
            col: column.value,
            content: "<div class='content'>" + count + "</div>"
        }
        dashboard.addPanel(panel);
        count = count + 1;
        (idValue.dataSource).push(panel.id);
        idValue.refresh();
    };
    document.getElementById('remove').onclick = function() {
        dashboard.removePanel(idValue.value.toString());

        (idValue.dataSource).splice((idValue.dataSource).indexOf(idValue.value.toString()), 1);
        idValue.refresh();
        idValue.value = null;
    }
}

```

Interaction With Panels

Dragging moving of panels in ##Platform_Name## Dashboard layout control

The Dashboard Layout component is provided with dragging functionality to drag and reorder the panels within the layout. While dragging a panel, a holder will be highlighted below the panel indicating the panel placement on panel drop. This helps the user to decide whether to place the panel in the current position or revert to previous position without disturbing the layout.

If one or more panels collide while dragging, then the colliding panels will be pushed towards left or right or top or bottom direction where an adaptive space for the collided panel is available. The position changes of these collided panels will be updated dynamically during dragging of a panel so the user can conclude whether to place the panel in the current position or not.

While dragging a panel in Dashboard layout the following dragging events will be triggered,

- [dragStart](#) - Triggers when panel drag starts
- [drag](#) - Triggers when panel is being dragged
- [dragStop](#) - Triggers when panel drag stops

The following sample demonstrates dragging and pushing of panels. Here, for e.g. While dragging the panel 0 over panel 1, these panels get collided and push the panel 1 towards the feasible direction so that panel 0 gets placed in the panel 1 position.

INDEX.JS

```
// initialize dashboardlayout component
```

```

var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
  { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
  { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
  { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },
  { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>' },
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>' },
  { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard layout');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DashboardLayout </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 DashboardLayout
Component">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

<body>
  <div id="container">
    <!--element which is going to render the dashboardlayout-->
    <div id="dashboard_layout"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the dragging handler

Initially, the complete panel will act as the handler for dragging the panel such that the dragging action occurs on clicking anywhere over a panel. However, this dragging handler for the panels can be customized using the [draggableHandle](#) property to restrict the dragging action within a particular element in the panel.

The following sample demonstrates customizing the dragging handler of the panels where dragging action of panel occurs only with the header of the panel.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  columns: 6,
  draggableHandle: '.e-panel-header',
  panels: [{ 'id': 'Panel1', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 0,
    header: '<div class="header"> Product usage ratio </div><span class="handler e-icons burg-icon"></span>', content: '<div id="pie"><div>' },
    { 'id': 'Panel2', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
class="header"> Last year Sales Comparison </div> <span class="handler e-
icons burg-icon"></span>', content: '<div id="column"><div>' },
    { 'id': 'Panel3', 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 3, header: '<div
class="header"> Mobile browsers usage </div><span class="handler e-icons
burg-icon"></span>', content: '<div id="pie1"><div>' },
    { 'id': 'Panel4', 'sizeX': 3, 'sizeY': 2, 'row': 1, 'col': 0, header: '<div
class="header"> Sales increase percentage </div><span class="handler e-icons
burg-icon"></span>', content: '<div id="line"><div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
var chartData = [
  { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
  { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
  { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
  { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
  { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
  { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
var chart = new ej.charts.Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  series: [{
    dataSource: chartData,
    xName: 'month',
    yName: 'sales',
    type: 'Column'
  }],
  height: "162px"
}, '#column');
var lineData = [
  { x: 2013, y: 28 }, { x: 2014, y: 25 }, { x: 2015, y: 26 }, { x: 2016,
y: 27 },
  { x: 2017, y: 32 }, { x: 2018, y: 35 },
];
```

```

var linechart = new ej.charts.Chart({
  series:[{
    dataSource: lineData,

Disable dragging of panels

By default, the dragging of panels is enabled in Dashboard Layout. It can also be disabled with the help of [allowDragging](#) API. Setting [allowDragging](#) to false disables the dragging functionality in Dashboard Layout.

The following sample demonstrates Dashboard Layout with dragging support disabled.

INDEX.JS

```

// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  allowDragging: false,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
  { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },

```

```

    {'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content:'<div
class="content">2</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content:'<div
class="content">3</div>'},
    {'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content:'<div
class="content">4</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content:'<div
class="content">5</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content:'<div
class="content">6</div>'}]]
  });
  // render initialized dashboardlayout
  dashboard.appendTo('#dashboard_layout');

```

INDEX.HTML

```

```

Moving panels in ##Platform_Name## Dashboard layout control

Other than drag and drop, it is possible to move the panels in Dashboard Layout programmatically. This can be achieved using [movePanel](#) method. The method is invoked as follows,

```
`js
movePanel(id, row, col)
`
```

Where,

- id - ID of the panel which needs to be moved.
- row - New row position for moving the panel.
- col - New column position for moving the panel.

Each time a panel's position is changed(Programatically or through UI interaction), the Dashboard Layout's [change](#) event will be triggered.

The following sample demonstrates moving a panel programmatically to a new position in the Dashboard Layout's [created](#) event.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  //Dashboard Layout's created event
  created: onCreate,
  //Dashboard Layout's change event
  change: onChange,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },
    { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>' },
    { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>' },
    { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_layout');
//Dashboard Layout's created event function
function onCreate(args) {
  // movePanel("id", row, col)
  this.movePanel("layout_0", 1, 0);
}
//Dashboard Layout's change event function
function onChange(args) {
  console.log("Change event triggered");
}
```

```
}

```

INDEX.HTML

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Resizing of panels in ##Platform_Name## Dashboard layout control

The DashboardLayout component is also provided with the panel resizing functionality which can be enabled or disabled using the [allowResizing](#) property. This functionality allows to resize the panels dynamically through UI interactions using the resizing handlers which controls the panel resizing in various directions.

Initially, the panels can be resized only in south-east direction. However, panels can also be resized in east, west, north, south and south-west directions by defining the required directions with [resizableHandles](#) property.

On resizing a panel in Dashboard layout the following events will be triggered,

- [resizeStart](#) - Triggers when panel resize starts
- [resize](#) - Triggers when panel is being resized
- [resizeStop](#) - Triggers when panel resize stops

The following sample demonstrates how to enable and disable the resizing of panels in the DashboardLayout component in different directions.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  allowResizing: true,
  columns: 5,
  //Dashboard Layout's resizestart event
  resizeStart: onResizeStart,
  //Dashboard Layout's resize event
  resize: onResize,
  //Dashboard Layout's resizestop event
  resizeStop: onResizeStop,
  resizableHandles: ['e-south-east', 'e-east', 'e-west', 'e-north', 'e-south'],
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div class="content">0</div>' },
    { 'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div class="content">1</div>' },
    { 'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div class="content">2</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div class="content">3</div>' },
    { 'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div class="content">4</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div class="content">5</div>' },
    { 'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div class="content">6</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
//Dashboard Layout's resizestart event function
function onResizeStart(args) {
  console.log("Resize start");
}
//Dashboard Layout's resize event function
function onResize(args) {
  console.log("Resizing");
}
//Dashboard Layout's resizestop event function
function onResizeStop(args) {
  console.log("Resize stop");
}
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DashboardLayout </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Essential JS 2 DashboardLayout Component">
```

  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Resizing panels programmatically

The Dashboard Layout panels can also be resized programmatically by using [resizePanel](#) method. The method is invoked as follows,

```
`js
```

```
resizePanel(id, sizeX, sizeY)
```

```
,
```

Where,

- id - ID of the panel which needs to be resized.
- sizeX - New panel width in cells count for resizing the panel.
- sizeY - New panel height in cells count for resizing the panel.

The following sample demonstrates resizing panels programmatically in the Dashboard Layout's [created](#) event.

INDEX.JS

```

// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  //Dashboard Layout's created event
  created: onCreate,
  columns: 5,
  panels: [{ 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, content: '<div
class="content">0</div>' },

```

```

    {'sizeX': 3, 'sizeY': 2, 'row': 0, 'col': 1, content: '<div
class="content">1</div>'},
    {'sizeX': 1, 'sizeY': 3, 'row': 0, 'col': 4, content: '<div
class="content">2</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 1, 'col': 0, content: '<div
class="content">3</div>'},
    {'sizeX': 2, 'sizeY': 1, 'row': 2, 'col': 0, content: '<div
class="content">4</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 2, content: '<div
class="content">5</div>'},
    {'sizeX': 1, 'sizeY': 1, 'row': 2, 'col': 3, content: '<div
class="content">6</div>'}]]
    });
    // render initialized dashboardlayout
    dashboard.appendTo('#dashboard_layout');
    //Dashboard Layout's created event function
    function onCreated(args) {
        // resizePanel("id", sizeX, sizeY)
        this.resizePanel("layout_4", 1, 1);
        this.resizePanel("layout_5", 2, 1);
    }

Floating of panels in ##Platform_Name## Dashboard layout control

The floating functionality of the component allows to effectively use the entire layout for the panel's placement. If the floating functionality is enabled, the panels within the layout get floated upwards automatically to occupy the empty cells available in previous rows. This functionality can be enabled or disabled using the [allowFloating](#) property of the component.

The following sample demonstrates how to enable or disable the floating of panels in the DashboardLayout component.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [10, 10],
  allowFloating: false,
  cellAspectRatio: 100/75,
  columns: 6,
  panels: [{ 'sizeX': 2, 'sizeY': 2, 'row': 1, 'col': 0, content: '<div
class="content">0</div>' },
  { 'sizeX': 2, 'sizeY': 2, 'row': 2, 'col': 2, content: '<div
class="content">1</div>' },
  { 'sizeX': 2, 'sizeY': 2, 'row': 3, 'col': 4, content: '<div
class="content">2</div>' } ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
var resetPanels = dashboard.serialize();
resetPanels[0].content = '<div class="content">0</div>';
resetPanels[1].content = '<div class="content">1</div>';
resetPanels[2].content = '<div class="content">2</div>';
var toggleBtn = new ej.buttons.Button({
  cssClass: "e-flat e-primary e-outline",
  content: "Enable Floating",
  isToggle: true
});
toggleBtn.appendTo("#toggle");
document.getElementById('toggle').onclick = function() {
  var panels = [];
  if (toggleBtn.content == "Disable Floating and Reset") {
    toggleBtn.content = 'Enable Floating';
    dashboard.allowFloating = false;
    dashboard.panels = resetPanels;
  } else {
    toggleBtn.content = 'Disable Floating and Reset';
    dashboard.allowFloating = true;
  }
};
```

Responsive adaptive in ##Platform_Name## Dashboard layout control

The control is provided with built-in responsive support, where panels within the layout get adjusted based on their parent element's dimensions to accommodate any resolution which relieves the burden of building responsive dashboards.

The dashboard layout is designed to automatically adapt with lower resolutions by transforming the entire layout into a stacked one so that the panels will be displayed in a vertical column. By default, whenever the screen resolution meets 600px or lower resolutions this layout transformation occurs. This transformation can be modified for any user defined resolution by defining the for the [mediaQuery](#) property of the component.

The following sample demonstrates the usage of [mediaQuery](#) property to turn out the layout into a stacked one in user defined resolution. Here, whenever, the window size reaches 700px or lesser, the layout becomes a stacked layout.

INDEX.JS

```
// initialize dashboardlayout component
```

```

var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [20, 20],
  mediaQuery: 'max-width: 700px',
  columns: 5,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
  { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
  { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
  ]
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');

```

INDEX.HTML

Save restore in ##Platform_Name## Dashboard layout control

The current layout structure of the Dashboard Layout component can be obtained and saved to construct another dashboard with same panel structure using the `serialize` public method of the component. This method returns the component's current panel setting which can be used to construct a dashboard with the same layout settings.

The following sample demonstrates how to save and restore the state of the panels using the `serialize` method. Here, the panel's settings are stored on the save button click and restored to the previously saved panel setting on clicking the restore button.

INDEX.JS

```
// initialize dashboardlayout component
var dashboard = new ej.layouts.DashboardLayout({
  cellSpacing: [20, 20],
  columns: 5,
  panels: [{ "sizeX": 1, "sizeY": 1, "row": 0, "col": 0, content: '<div
class="content">0</div>' },
  { "sizeX": 3, "sizeY": 2, "row": 0, "col": 1, content: '<div
class="content">1</div>' },
  { "sizeX": 1, "sizeY": 3, "row": 0, "col": 4, content: '<div
class="content">2</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 1, "col": 0, content: '<div
class="content">3</div>' },
  { "sizeX": 2, "sizeY": 1, "row": 2, "col": 0, content: '<div
class="content">4</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 2, content: '<div
class="content">5</div>' },
  { "sizeX": 1, "sizeY": 1, "row": 2, "col": 3, content: '<div
class="content">6</div>' }
],
  created: restorePanelModel
});
// render initialized dashboardlayout
dashboard.appendTo('#dashboard_default');
var restoreModel;
var saveBtn = new ej.buttons.Button({
  cssClass: "e-primary",
  content: "Save",
});
saveBtn.appendTo("#save");
var restoreBtn = new ej.buttons.Button({
  cssClass: "e-flat e-outline",
  content: "Restore",
});
restoreBtn.appendTo("#restore");
document.getElementById('save').onclick = function() {
  restorePanelModel();
};
document.getElementById('restore').onclick = function() {
  dashboard.panels = restoreModel;
};
function restorePanelModel() {
```

```

restoreModel = dashboard.serialize();
restoreModel[0].content = '<div class="content">0</div>';
restoreModel[1].content = '<div class="content">1</div>';
restoreModel[2].content = '<div class="content">2</div>';
restoreModel[3].content = '<div class="content">3</div>';
restoreModel[4].content = '<div class="content">4</div>';
restoreModel[5].content = '<div class="content">5</div>';
restoreModel[6].content = '<div class="content">6</div>';
}

```

```

Style in ##Platform_Name## Dashboard layout control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the dashboard layout panel header

Use the following CSS to customize the dashboard layout panel header.

`

```
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-header {  
color: #754131;  
background-color: #c9e2f7;  
text-align: center;  
}
```

`

Customizing the dashboard layout panel content

Use the following CSS to customize the dashboard layout panel content.

`

```
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-panel-content {  
background-color: #c9e2f7;  
padding: 50px;  
}
```

`

Customizing the dashboard layout panel resize icon

Use the following CSS to customize the dashboard layout resize icon.

`

```
.e-dashboardlayout.e-control .e-panel .e-panel-container .e-resize.e-double{  
color: #0378d5;  
font-size: 30px;  
height: 20px;  
width: 20px;  
}
```

`

Customizing the dashboard layout panel background

Use the following CSS to customize the dashboard layout panel background.

`

```
.e-dashboardlayout.e-control.e-responsive {  
background: #b3d3ed;
```

```
}
,
```

How To

Resize the panel dynamically in `##Platform_Name##` Dashboard layout control

In Dashboard Layout, the height of a panel is based on its width. While resizing the panel, the height and width should be changed.

To resize the height of a panel alone, the [resizePanel](#) method is used. In this case, the [cellAspectRatio](#) property configures the height of the cells based on the cell width to height ratio (cell width/cell height ratio) when the height will not be completely adjusted to `sizeY` value.

Refer to the following code snippet to determine the height of a panel.

```
`ts
```

```
let panelContent: HTMLElement = document.getElementById("panelContent");
```

```
let panelHeight: number = panelContent.offsetHeight;
```

```
,
```

INDEX.JS

```
// initialize dashboardlayout component
var dashboardObject = new ej.layouts.DashboardLayout({
    cellAspectRatio: 100/70,
    columns: 4,
    panels: [{
        id: 'panel0', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 0, header:
        '<div>Panel 0</div>',
        content: '<div class="content" id="panelContent">Place your
content here</div>'
    },
    {
        id: 'panel1', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 1,
        header: '<div>Panel 1</div>',
        content: '<div class="content" id="panelContent">Place your
content here</div>'
    },
    {
        id: 'panel2', 'sizeX': 1, 'sizeY': 1, 'row': 0, 'col': 2,
        header: '<div>Panel 2</div>',
        content: '<div class="content" id="panelContent">Place your
content here</div>'
    }
    ]
});
// render initialized dashboardlayout
dashboardObject.appendTo('#defaultLayout');
var btnInstance = new ej.buttons.Button({cssClass: "e-outline e-success"});
btnInstance.appendTo('#editbtn');

document.getElementById('editbtn').onclick = function() {
    var panelContent = document.getElementById("panelContent");
    var panelHeight = panelContent.offsetHeight;
    var panelWidth = panelContent.offsetWidth;
    var diff = Math.round(panelHeight/panelWidth);
```

```

dashboardObject.resizePanel('panel0', 1, diff);
dashboardObject.resizePanel('panel1', 1, diff);
dashboardObject.resizePanel('panel2', 1, diff);
};

```

Accessibility in ##Platform_Name## Dashboard Layout component

The Dashboard Layout component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dashboard Layout component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | ` |`

| Screen Reader Support | ` |`

| Right-To-Left Support | ` |`

| Color Contrast | ` |`

| Mobile Device Support | ` |`

| Keyboard Navigation Support | ` |`

| [Accessibility Checker](#) Validation | ` |`

| [Axe-core](#) Accessibility Validation | ` |`

`<style>`

```
.post .post-content img {  
display: inline-block;  
margin: 0.5em 0;  
}
```

`</style>`

`<div> - All features of the component meet the requirement.</div>`

`<div> - Some features of the component do not meet the requirement.</div>`

`<div> - The component does not meet the requirement.</div>`

WAI-ARIA attributes

The Dashboard Layout component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Dashboard Layout component:

| **Attributes** | **Purpose** |

| --- | --- |

| `role=list` | Indicates the role as a list for the Dashboard Layout element. |

| `role=listitem` | Indicates the role as a listitem for the Dashboard panels. |

| `role=presentation` | Indicates the role as a presentation for the table when the `showGridLines` property is enabled. |

| **aria-grabbed** | When the panel is chosen for dragging, the aria-grabbed attribute is set to "true." If it's set to "false," the element can be grabbed for drag-and-drop, but it won't be actively held. |

Keyboard interaction

Keyboard support is not applicable for the Dashboard Layout.

Ensuring accessibility

The Dashboard Layout component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dashboard Layout component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dashboard Layout component with accessibility tools.

DataManager

Data binding in ##Platform_Name## Data control

DataManager supports both RESTful JSON data services binding and local JavaScript object array binding.

Local data binding

DataManager can be bound to local data source by assigning the array of JavaScript objects to the **json** property or simply passing them

to the constructor while instantiating. Now the JavaScript object array can be queried and manipulated.

INDEX.JS

```
var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var result = new ej.data.DataManager(data).executeLocal(new
ej.data.Query().take(8));
var table = (document.getElementById('datatable'));
result.forEach((data) => {
    table.appendChild(compiledFunction(data)[0]);
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Remote data binding

DataManager can be bound to remote data source by assigning service end point URL to the **url** property. With the provided **url**, the **DataManager** handles all communication with the data server with help of queries.

When querying data, the **DataManager** will convert the query object(**Query**) into server request after calling [executeQuery](#) and waits for the server response(JSON format).

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.syncfusion.com/js/production/api/orders';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI }).executeQuery(new
ej.data.Query().take(8)).then((e) => {
    (e.result).forEach((data) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});

```

Adaptors in ##Platform_Name## Data control

Each data source or remote service uses different way in accepting request and sending back the response. **DataManager** cannot anticipate every way a data source works. To tackle this problem the **DataManager** uses the adaptor concept to communicate with particular data source.

For local data sources, the role of the data adaptor is to query the JavaScript object array based on the **Query** object and manipulate them.

When comes with remote datasource, the data adaptor is used to send the request that the server can understand and process the server response.

The adaptor can be assigned using the **adaptor** property of the **DataManager**.

Json adaptor

JsonAdaptor is used to query and manipulate JavaScript object array.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var result = new ej.data.DataManager(data).executeLocal(new
ej.data.Query().take(8));
var table = (document.getElementById('datatable'));
result.forEach((data) => {
    table.appendChild(compiledFunction(data)[0]);
});

```

```
});
```

INDEX.HTML

```

        <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
      </thead>
      <tbody>
      </tbody>
    </table>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Url adaptor

UrlAdaptor act as the base adaptor for interacting with remote data services. Most of the built-in adaptors are derived from the **UrlAdaptor**.

`ts

```

import { DataManager, Query, UrlAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.syncfusion.com/js/production/api/UrlDataSource';
new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`

```

UrlAdaptor expects response as a JSON object with properties **result** and **count** which contains the collection of entities and the total number of records respectively.

The sample response object should be as follows,

```

{
"result": [{..}, {..}, {..}, ...],
"count": 67
}
`

```

OData adaptor

OData is standardized protocol for creating and consuming data. You can retrieve data from OData service using **DataManager**. The **ODataAdaptor** helps you to interact with OData service. You can refer to the following code example of remote Data binding using OData service.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>'
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.syncfusion.com/js/production/api/Orders';
var table = (document.getElementById('datatable'));

```

```

new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataAdaptor })
    .executeQuery(new ej.data.Query().take(8))
    .then((e) => {
        (e.result.items).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr>
                    <th>Order ID</th>
                    <th>Customer ID</th>
                    <th>Employee ID</th>
                </tr>
            </thead>

```

```

        <tbody>
        </tbody>
    </table>
</div>
<script>
    var ele = document.getElementById('container');
    if (ele) {
        ele.style.visibility = "visible";
    }
</script>
<script src="index.js" type="text/javascript"></script>
</body>
</html>

```

By default, **ODataAdaptor** is used by **DataManager**.

ODataV4 adaptor

The ODataV4 is an improved version of OData protocols and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 Services, refer the [odata documentation](#). You can use the **ODataV4Adaptor** to interact with ODataV4 service.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>'
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Web API adaptor

You can use the **WebApiAdaptor** to interact with Web API created with OData endpoint. The **WebApiAdaptor** is extended from the **ODataAdaptor**. Hence to use **WebApiAdaptor**, the endpoint should understand the OData formatted queries send along with request.

To enable OData query option for Web API, please refer to the [documentation](#)

`ts

```

import { DataManager, Query, WebApiAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.syncfusion.com/js/production/api/Orders';
new DataManager({
    url: SERVICE_URI,

```

```

adaptor: new WebApiAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`

```

WebApiAdaptor expects JSON response from the server and the response object should contain properties **Items** and **Count** whose values are collection of entities and total count of the entities respectively.

The sample response object should look like below.

```

{
Items: [{..}, {..}, {..}, ...],
Count: 830
}
`

```

WebMethod Adaptor

The **WebMethodAdaptor** is used to bind data source from remote services and code behind methods. It can be enabled in Grid using Adaptor property of DataManager as **WebMethodAdaptor**.

For every operations, an Fetch post will be send to the specified data service.

```

`ts
import { DataManager, Query, WebMethodAdaptor } from '@syncfusion/ej2-data';
let SERVICE_URI = 'Default.aspx/DataSource';
new DataManager({
url: SERVICE_URI,
adaptor: new WebMethodAdaptor
}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`

```

WebMethodAdaptor expects JSON response from the server and the response object should contain properties **result** and **count** whose values are collection of entities and total count of the entities respectively.

The sample response object should look like below.

```

`
{

```

```

result: [{..}, {..}, {..}, ...],
count: 830
}
,

```

The controller method's data parameter name must be `value`.

Custom Data Adaptor

The `CustomDataAdaptor` provides an option to send your own request to handle the data operations.

You can get the current action details inside the `getData` method of `CustomDataAdaptor` to build the request. Once the data is fetched from the service successfully, then the `onSuccess` method can be invoked to handle the further data processing. In failure case, invoke the `onFailure` method.

```
`ts
```

```

import { DataManager, Query, CustomDataAdaptor, FetchOption } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'http://controller.com/actions';
new DataManager({
  adaptor: new CustomDataAdaptor({
    getData: function (option: FetchOption) {
      let request: object;
      fetch(SERVICE_URI, {
        method: 'POST',
        headers: {
          'Content-Type': 'application/json; charset=utf-8',
        },
      }).then((response) => {
        request = extend({}, option, { httpRequest: response });
        if (response.status >= 200 && response.status <= 299) {
          return response.json();
        }
      }).then((data) => {
        option.onSuccess(data, request);
      }).catch((error) => {
        option.onFailure(request);
      });
    },
  }),
},

```

```

}).executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`

```

Since the `CustomDataAdaptor` is extended from the `UrlAdaptor`, it expects response as a JSON object with properties `result` and `count` which contains the collection of entities and the total number of records respectively.

The sample response object should be as follows,

```

{
"result": [{..}, {..}, {..}, ...],
"count": 67
}
`

```

Performing CRUD action with CustomDataAdaptor

You can perform the CRUD actions using the `addRecord`, `updateRecord`, `deleteRecord` and `batchUpdate` methods.

```

`ts
import { DataManager, Query, CustomDataAdaptor, FetchOption } from '@syncfusion/ej2-data';
let createRequest: Function = (url: string, option: FetchOption) => {
let request: object;
fetch(SERVICE_URI, {
method: 'POST',
headers: {
'Content-Type': 'application/json; charset=utf-8',
},
}).then((response) => {
request = extend({}, option, { httpRequest: response });
if (response.status >= 200 && response.status <= 299) {
return response.json();
}
}).then((data) => {
option.onSuccess(data, request);
}).catch((error) => {

```

```

option.onFailure(request);
});
}
let baseUrl: string = "http://localhost:65327/Home/";
new DataManager({
  adaptor: new CustomDataAdaptor({
    getData: function (option: FetchOption) {
      createRequest(baseUrl + 'UrlDatasource', option);
    },
    addRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Insert', option);
    },
    updateRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Update', option);
    },
    deleteRecord: function (option: FetchOption) {
      createRequest(baseUrl + 'Delete', option);
    }
  })
  // to handle Batch operation
  //batchUpdate: function (option: FetchOption) {
  // createRequest(baseUrl + 'Delete', option);
  //}
})
}).executeQuery(new Query().take(8)).then((e) => {
  //e.result will contain the records
});
`

```

GraphQL Adaptor

The **GraphQLAdaptor** provides an option to retrieve data from the GraphQL server. It performs CRUD and data operations such as paging, sorting, filtering etc by sending the required arguments to the server.

You can provide the GraphQL query string by using the **query** property of the **GraphQLAdaptor**. Since, the **GraphQLAdaptor** is extended from the **UrlAdaptor**, it expects response as a JSON object with properties **result** and **count** which contains the collection of entities and the total number of records

respectively. The GraphQL response should be returned in JSON format like { "data": { ... } } with query name as field, you need to set the `result` and `count` properties to map the response.

`ts

```
import { DataManager, Query, GraphQLAdaptor } from '@syncfusion/ej2-data';
```

```
const SERVICE_URI: string = 'http://controller.com/actions';
```

```
new DataManager({
```

```
url: SERVICE_URI, adaptor: new GraphQLAdaptor({
```

```
response: {
```

```
result: 'getOrders.OrderData',
```

```
count: 'getOrders.OrderCount'
```

```
},
```

```
query: `query getOrders($datamanager: String) {
```

```
getOrders(datamanager: $datamanager) {
```

```
OrderCount,
```

```
OrderData{OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry}
```

```
}
```

```
`
```

```
})
```

```
}).executeQuery(new Query().take(8)).then((e) => {
```

```
//e.result will contain the records
```

```
});
```

```
,
```

The Schema for the GraphQL server is

`ts

```
input OrderInput {
```

```
OrderID: Int!
```

```
CustomerID: String!
```

```
EmployeeID: Int!
```

```
ShipCity: String!
```

```
ShipCountry: String!
```

```
}
```

```
type Order {
```

```
OrderID: Int!
```

```

CustomerID: String!
EmployeeID: Int!
ShipCity: String!
ShipCountry: String!
}
type ReturnType {
  getOrders: [Order]
  count: Int
}
type Query {
  getOrders(datamanager: String): ReturnType
}
type Mutation {
  createOrder(value: OrderInput): Order!
  updateOrder(key: Int!, keyColumn: String, value: OrderInput): Order
  deleteOrder(key: Int!, keyColumn: String, value: OrderInput): Order!
}
`

```

The resolver for the corresponding action is

```

`ts
import { data } from "./db";
const resolvers = {
  Query: {
    getOrders: (parent, { datamanager }, context, info) => {
      if (datamanager.search) {
        // Perform searching
      }
      if (datamanager.sorted) {
        // Perform sorting
      }
      if (datamanager.where) {
        // Perform filtering
      }
    }
  }
}

```

```

if (datamanager.search) {
// Perform search
}
if (datamanager.skip && datamanager.take) {
// Perform Paging
}
return { OrderData: data, OrderCount: data.length };
},
Mutation: {
createOrder: (parent, { value }, context, info) => {
// Perform Insert
return value;
},
updateOrder: (parent, { key, keyColumn, value }, context, info) => {
// Perform Update
return value;
},
deleteOrder: (parent, { key, keyColumn, value }, context, info) => {
// Perform Delete
return value;
},
};
export default resolvers;
`

```

The query parameters will be send in a string format which contains the below details.

Parameters	Description
RequiresCounts	If it is true then the total count of records will be included in response.
Skip	Holds the number of records to skip.
Take	Holds the number of records to take.
Sorted	Contains details about current sorted column and its direction.

| **Where** | Contains details about current filter column name and its constraints. |

| **Group** | Contains details about current Grouped column names. |

Performing CRUD action with GraphQLAdaptor

You can perform the CRUD actions by returning the mutation queries inside the **getMutation** method based on the action.

```
`ts
import { DataManager, Query, GraphQLAdaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'http://controller.com/actions';
new DataManager({
url: SERVICE_URI, adaptor: new GraphQLAdaptor({
response: {
result: 'getOrders.getOrders',
count: 'getOrders.count'
},
query: `query getOrders($datamanager: String) {
getOrders(datamanager: $datamanager) {
count,
getOrders{OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry}
}
}`,
getMutation: function (action): string {
if (action === 'insert') {
return `mutation CreateOrderMutation($value: OrderInput!){
createOrder(value: $value){
OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
}}`;
}
if (action === 'update') {
return `mutation Update($key: ID!, $keyColumn: String,$value: OrderInput){
updateOrder(key: $key, keyColumn: $keyColumn, value: $value) {
OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
}
}`;
}
} else {
```

```

return `mutation Remove($key: ID!, $keyColumn: String, $value: OrderInput){
deleteOrder(key: $key, keyColumn: $keyColumn, value: $value) {
  OrderID, CustomerID, EmployeeID, ShipCity, ShipCountry
}
};
}
}
})
}.executeQuery(new Query().take(8)).then((e) => {
//e.result will contain the records
});
`

```

Writing custom adaptor

Sometimes the built-in adaptors does not meet your requirement. In such cases you can create your own adaptor.

To create and use custom adaptor, please refer to the below steps.

- Select an built-in adaptor which will act as base class for your custom adaptor.
- Override the desired method to achieve your requirement.
- Assign the custom adaptor to the `adaptor` property of **DataManager**.

For the sake of demonstrating custom adaptor approach, we are going to see how to add serial number for the records by overriding the built-in response processing using `processResponse` method of the `ODataV4Adaptor`.

INDEX.JS

```

var template =
`<tr><td>${Sno}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>`;

var compiledFunction = ej.base.compile(template);

class SerialNoAdaptor extends ej.data.ODataV4Adaptor {
  processResponse() {
    let i = 0;
    // calling the base class processResponse function
    let original = super.processResponse.apply(this, arguments);
    // Adding serial number
    original.forEach((item) => item['Sno'] = ++i);
    return original;
  }
}

const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';

```

```

var table = document.getElementById('datatable');

new ej.data.DataManager({ url: SERVICE_URI, adaptor: new SerialNoAdaptor()
})
    .executeQuery(new ej.data.Query().take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

Querying in ##Platform_Name## Data control

In this section, you will see in detail about how to build query using [Query](#) class and consume the data source.

Specifying resource name using `from`

The [from](#) method is used to specify the resource name or table name from where the data should be retrieved.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().from('Orders').take(8)).then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

Projection using `select`

The [select](#) method is used to select particular fields or columns from the data source.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().select(['OrderID', 'CustomerID',
'EmployeeID']).take(8))

```

```
.then((e) => {
    (e.result).forEach((data) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

INDEX.HTML

Eager loading navigation properties

You can use the [expand](#) method to eagerly load navigation properties. The navigation properties values are accessed using appropriate field names separated by dot(.) sign.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${Employee.FirstName}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
table.innerHTML = '<tr><th>OrderID</th><th>CustomerID</th><th>Employee
Name</th></tr>';
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().expand('Employee').select(['OrderID',
'CustomerID', 'Employee.FirstName']).take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

```

Sorting

You can use the [sortBy](#) method to perform sort operation in the data source. Default sorting order is **ascending**. To change the sort order, either you can specify the second argument of [sortBy](#) as **descending** or use the [sortByDesc](#) method.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().sortBy('CustomerID',
'descending').take(8))
    .then((e) => {
        (e.result).forEach((data) => {

```

```

        table.appendChild(compiledFunction(data)[0]);
    });
});

```

INDEX.HTML

```

```

Multi sorting can be performed by simply chaining the multiple `sortBy` methods.

Filtering

You can use the [where](#) method to build filter criteria which allows you to get reduced view of records. The [where](#) method can also be chained to form multiple filter criteria.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().where('EmployeeID', 'equal',
3).take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

Filter Operators

Filter operators are generally used to specify the filter type. The various filter operators supported by **DataManager** is listed below.

- greaterthan
- greaterthanorequal
- lessthan
- lessthanorequal
- equal
- notequal
- startswith
- endswith
- contains

These filter operators are used for creating filter query using [where](#) method and [Predicate](#) class.

Build complex filter criteria using `Predicate`

Sometimes chaining [where](#) method is not sufficient to create very complex filter criteria, in such cases we can use [Predicate](#) class to create composite filter criteria.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
let table = (document.getElementById('datatable'));
//Building complex filter criteria using `Predicate`
var predicate = new ej.data.Predicate('EmployeeID', 'equal', 3);
predicate = predicate.or('EmployeeID', 'equal', 2);
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().where(predicate).take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

Searching

You can use the [search](#) method to create search criteria, it differs from the filter in the way that search criteria will applied to all fields in the data source whereas filter criteria will be applied to a particular field.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var table = (document.getElementById('datatable'));
new ej.data.DataManager(data)
  .executeQuery(new ej.data.Query().search('VI', ['CustomerID']))
  .then((e) => {
    (e.result).forEach((data) => {
      table.appendChild(compiledFunction(data)[0]);
    });
  });

```

INDEX.HTML

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

You can search particular fields by passing the field name collection in the second argument of [search](#) method.

Grouping

DataManager allow you to group records by category. The [group](#) method is used to add group query.

INDEX.JS

```

var template = '<tr><td>${field} -
${key}</td><td></td><td></td></tr>${for(item of

```

```

items) }<tr><td>${item.OrderID}</td><td>${item.CustomerID}</td><td>${item.Emp
loyeeID}</td></tr>${/for}';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().group('CustomerID').take(8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Grid"></div>
    <table id="datatable" class="e-table">

```

```

        <thead>
            <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
        </thead>
        <tbody>
        </tbody>
    </table>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiple grouping can be done by simply chaining the [group](#) method.

Paging

You can query paged data using [page](#) method. This allow you to query particular set of records based on the page size and index.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().page(2, 8))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });

```

INDEX.HTML

```

```

Aggregation

The [aggregate](#) method allows you to get aggregated value for a field based on the type. The built-in aggregate types are,

- sum
- average
- min
- max
- count
- truecount
- falsecount

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var footerFn = ej.base.compile('<tr><td></td><td></td><td>Minimum:
${min}</td></tr>');
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new
ej.data.Query().take(5).requiresCount().aggregate('min', 'EmployeeID'))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
        table.appendChild(footerFn({ min: e.aggregates['EmployeeID - min']
    })[0]);
    });

```

        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Hierarchical query

You can use the [hierarchy](#) method to build nested query. The hierarchical queries are commonly required when you use foreign key binding.

The [foreignKey](#) method is used to specify the key field of the foreign table and the second argument of the [hierarchy](#) method accepts a selector function which selects the records from the foreign table.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>'
var group = '<tr><td colspan=3>' +
'<table id="datatable" class="e-
table"><tr><th>ID</th><th>Price</th><th>Quantity</th></tr>' +
'${for(detail of
Order_Details)}<tr><td>${detail.ProductID}</td><td>${detail.UnitPrice}</td><
td>${detail.Quantity}</td></tr>${/for}' +
'<table></td></tr>';
var compiledFunction = ej.base.compile(template);
var groupFn = ej.base.compile(group);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().from('Orders').take(3).hierarchy(
        new ej.data.Query()
            .foreignKey("OrderID")
            .from("Order_Details")
            .sortBy("Quantity"),
        function () {

```

```

        // Selective loading of child elements
        return [10248, 10249, 10250]
    }
    })
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data) [0]);
            table.appendChild(groupFn(data) [0]);
        });
    });
});

```

Manipulation in ##Platform_Name## Data control

In this section, you will see in detail about how to manipulate data using **DataManager**. The **DataManager** can create, update and delete records either in local data source or remote data source.

Each data sources uses different way in handling the CRUD operations and hence **DataManager** uses data adaptors to manipulate data that can be understood by a particular data source.

Insert

The [insert](#) method of **DataManager** is used to add new record to the data source. For remote data source, the new record will be send along with the request to the server.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var table = (document.getElementById('datatable'));
var dm = new ej.data.DataManager(data.slice(0, 4));
dm.executeQuery(new ej.data.Query())
    .then((e) => {
        (e.result).forEach((data) => {

table.tBodies[0].appendChild(compiledFunction(data)[0].firstChild);
        });
    });
var button = document.getElementById('manipulate');
var orderid = document.getElementById('OrderID');
var cusid = document.getElementById('CustomerID');
var empid =document.getElementById('EmployeeID');
button.onclick = function() {
    var data = {
        OrderID: orderid.value,
        CustomerID: cusid.value,
        EmployeeID: empid.value
    };
    if (!data.OrderID) { return; }
    dm.insert(data);
    dm.executeQuery(new ej.data.Query())
        .then((e) => {
            table.tBodies[0].innerHTML = '';
            (e.result).forEach((data) => {

```

```

table.tBodies[0].appendChild(compiledFunction(data)[0].firstChild);
    });
};

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

In remote data sources, when the primary key field is an identity field, then it is advised to return the created data in the response.

Update

The [update](#) method of **DataManager** is used to modify/update a record in the data source. For remote data source, the modified record will be send along with the request to the server.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var table = (document.getElementById('datatable'));
var dm = new ej.data.DataManager(data.slice(0, 4));
dm.executeQuery(new ej.data.Query()
    .then((e) => {
        (e.result).forEach((data) => {
            table.tBodies[0].appendChild(compiledFunction(data)[0].firstChild);
        });
    }));
var button = document.getElementById('manipulate');
var orderid = document.getElementById('OrderID');
var cusid = document.getElementById('CustomerID');
var empid = document.getElementById('EmployeeID');
button.onclick = () => {
    var data = {
        OrderID: +orderid.value,
        CustomerID: cusid.value,

```

```

        EmployeeID: +empid.value
    };
    if (!data.OrderID) { return; }
    dm.update('OrderID', data);
    dm.executeQuery(new ej.data.Query())
        .then((e) => {
            table.tBodies[0].innerHTML = '';
            (e.result).forEach((data) => {

table.tBodies[0].appendChild(compiledFunction(data)[0].firstChild);
            });
        });
};

```

</body></html>

```

Primary key name and its value are required to find the record to be removed.

Batch Edit Operation

DataManager supports batch processing for the CRUD operations. You can use the [saveChanges](#) method to batch the edit operation. For remote data source, requests to add, remove and change are handled altogether at a time rather than passing the request separately for each operation.

INDEX.JS

```

var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
var table = (document.getElementById('datatable'));
var dm = new ej.data.DataManager({ json: (data).slice(0, 4) });
dm.executeQuery(new ej.data.Query())
    .then((e) => {
        (e.result).forEach((data) => {

```

```

table.tBodies[0].appendChild(compiledFunction(data)[0].firstChild);
    });
});
var changes = {
    changedRecords: [], addedRecords: [], deletedRecords: []
};
var orderid = document.getElementById('OrderID');
var cusid = document.getElementById('CustomerID');
var empid = document.getElementById('EmployeeID');
document.getElementById('added').onclick = () => {
    changes.addedRecords.push({
        OrderID: +orderid.value,
        CustomerID: cusid.value,
        EmployeeID: +empid.value
    });
    orderid.value = cusid.value = empid.value = null;
};
document.getElementById('changed').onclick = () => {
    changes.changedRecords.push({

State persistence in ##Platform_Name## Data control

State persistence refers to the ability of the DataManager to maintain its state in the browser's localStorage, even when the browser is refreshed or when navigating to a different page within the same browser. To enable this feature, you need to set the `id` and `enablePersistence` properties in the DataManager. This allows the DataManager's query object to persistently store in the local storage.

`ts

```
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
```

```
let SERVICE_URI =
```

```
"https://services.syncfusion.com/js/production/api/UrlDataSource";
```

```
new DataManager({
```

```
url: SERVICE_URI,
```

```
adaptor: new UrlAdaptor(),
```

```
//Mandatory properties to use state persistence.
```

```
enablePersistence: true,
```

```
id: "johnDoe",
```

```
})
```

```
.executeQuery(new Query().take(8))
```

```
.then((e) => {
```

```
//e.result will contain the records
```

```
});
```

```
`
```

Preventing a query from persistence

By default, the DataManager can persist various types of queries, such as sorting, searching, filtering, and selection queries. However, there may be cases where you want to exclude specific queries from

persistence. To achieve this, you can utilize the `ignoreOnPersist` property and specify the queries you wish to exclude. Refer to the table below for the naming conventions of DataManager queries:

Sorting: `onSortBy`

Searching: `onSearch`

Selection: `onSelect`

Filtering: `onWhere`

Grouping: `onGroup`

The `ignoreOnPersist` property type is an array, allowing you to exclude multiple queries from persistence according to your requirements.

Refer to the following example, which demonstrates how to exclude the sorting query ("`onSortBy`") and the search query ("`onSearch`") from being persisted in the DataManager:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
enablePersistence: true,
id: "DataManagerid",
//sort and search query won't persist now.
ignoreOnPersist: ["onSortBy", "onSearch"],
})
.executeQuery(new Query().sortBy("Designation", "descending").take(8))
.then((e) => {
//e.result will contain the records
});
`
```

How to get or set the existing persisted data

To access or modify the existing persisted data in the DataManager, you can utilize the [getPersistedData](#) and [setPersistData](#) methods available in the DataManager.

The [getPersistedData](#) method allows you to retrieve the existing persisted data. It takes a single argument, which is the DataManager's `id`. By passing the DataManager's id, you can retrieve the persisted data associated with the DataManager from the `window.localStorage`. Here is an example of how to use the `getPersistedData` method:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
let dataManager = new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
enablePersistence: true,
id: "Johndoe",
});
let persistedQuery = dataManager.getPersistedData("Johndoe");
`
```

On the other hand, the [setPersistData](#) method enables you to add a query to the existing persisted data. It accepts three arguments:

Original event: Set this argument to null.

Id: Pass the DataManager's id value.

Query: Provide the query that you want to add to the persisted data.

Here is an example demonstrating how to add a query to the existing persisted data:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
let dataManager = new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
enablePersistence: true,
id: "Johndoe",
});
let query = new Query().sortBy("Designation", "descending").take(8);
dataManager.setPersistData(null, "Johndoe", query);
`
```

By using the setPersistData method, you can append the specified query to the DataManager's existing persisted data.

Restoring the initial state of Datamanager

If you have enabled the `enablePersistence` feature in the DataManager, it automatically retains the previous state when the browser is refreshed or reloaded. However, there might be situations where you want to clear the persistence and load the initial state of the DataManager. In such cases, you can utilize the `clearPersistence()` method provided by the DataManager.

Here is a code example demonstrating how to clear the persistence in the DataManager:

```
`ts
import { DataManager, Query, UrlAdaptor } from "@syncfusion/ej2-data";
let SERVICE_URI =
"https://services.syncfusion.com/js/production/api/UrlDataSource";
let dataManager = new DataManager({
url: SERVICE_URI,
adaptor: new UrlAdaptor(),
enablePersistence: true,
id: "dataManagerid",
});
let query = new Query().sortBy("Designation", "descending").take(8);
//sets persist query to browser storage.
dataManager.setPersistData(null, "Johndoe", query);
//clears the persisted query.
dataManager.clearPersistence();
`
```

By invoking the `clearPersistence()` method, you can remove the persisted data and restore the DataManager to its initial state.

Use case example demonstrating state persistence with the DataManager

This demonstration involves two controls, namely the **Grid** control and the **Chart** control, which both fetch data from the same instance of the DataManager, which has the state persistence feature enabled.

The Grid control is responsible for displaying the entire dataset, while the Chart control presents user reviews based on specific data from the "column name" field. Both controls are associated with the same DataManager instance and it has enabled the state persistence feature. The query state of the DataManager is automatically saved in the browser's local storage as the user applies filtering and sorting actions. In both controls are reloaded the data with the last persisted state while refreshing or reloading the browser.

In this demo, the filter query and sort query are persisted, whereas the search query is not persisted. The `onSearch` query is excluded from persistence by setting it in the `ignoreOnPersist` property of the DataManager.

For a more detailed explanation and steps of this use case, refer to the following:

Step 1: To initiate the demo, users are required to select a username from the dropdown list. After making a selection, the Grid and Chart controls will load with initial data using the DataManager. Specifically for this demo, the DataManager's id will be set to the chosen username. The DataManager will then store the query with this id in the window.localStorage. Refer to the code example for your reference:

Step 2: This demo allows you to select Grid items by clicking checkboxes and adding them to your cart using the "Add" button in the toolbar. Additionally, you can sort the products from high price to low price by clicking the "Price Low-High" and "Price High-Low" buttons. Furthermore, you can view the added products from the wishlist by clicking the wishlist icon. All this information is persisted and stored by the DataManager based on the user ID.

You also can filter the product items using the product category filter. However, this category filter is also not persisted.

The Chart control allows you to see the product reviews.

Step 3: To log out, simply use the "Logout" button.

Step 4: After logging out or refreshing the browser, you will need to select a username from the dropdown list once again (repeat step 1). However, the Grid data will now be loaded based on the last persisted wishlist, associated with the chosen username. The complete example is as follows:

To clear the wishlist for a specific user, click the "Clear Wishlist" button. This will remove all the saved wishlist items for that user.

[Here](#), you can find the Use case example demonstrating state persistence with the DataManager.

How to in ##Platform_Name## Data control

Work in offline mode

On remote data binding, every time invoking [executeQuery](#) will send request to the server and the query will be processed on server-side. To avoid post back to server on calling [executeQuery](#), you can set the **DataManager** to load all the data on initialization time and make the query processing in client-side. To enable this behavior, you can use **offline** property of **DataManager**.

INDEX.JS

```
var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7';
var table = (document.getElementById('datatable'));
var dm = new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor, offline: true });
dm.ready.then((e) => {
    (e.result).forEach((data) => {
        table.appendChild(compiledFunction(data)[0]);
    });
});
```

splitbuttons/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="Grid"></div>
        <table id="datatable" class="e-table">
            <thead>
                <tr><th>Order ID</th><th>Customer ID</th><th>Employee
ID</th></tr>
            </thead>
            <tbody>
            </tbody>
        </table>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The loaded data will be cached in the `json` property of **DataManager**.

Sending additional parameters to server

You can use the [addParams](#) method of [Query](#) class, to add custom parameter to the data request.

INDEX.JS

```
var template =
'<tr><td>${OrderID}</td><td>${CustomerID}</td><td>${EmployeeID}</td></tr>';
var compiledFunction = ej.base.compile(template);
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Orders';
var table = (document.getElementById('datatable'));
new ej.data.DataManager({ url: SERVICE_URI, adaptor: new
ej.data.ODataV4Adaptor })
    .executeQuery(new ej.data.Query().addParams('$top', '7'))
    .then((e) => {
        (e.result).forEach((data) => {
            table.appendChild(compiledFunction(data)[0]);
        });
    });
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adding custom headers

You can add custom headers to the request made by **DataManager** using the **headers** property.

```

`ts
import { DataManager, Query, ReturnOption, ODataV4Adaptor } from '@syncfusion/ej2-data';
const SERVICE_URI: string = 'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/';
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor, headers:[{ 'syncfusion': 'true' }] })
.executeQuery(new Query())
.then((e: ReturnOption) => {
//get result from e.result
});
`

```

Adding custom headers while making cross domain request will initiate preflight request.

DatePicker

Date range in ##Platform_Name## Datepicker control

DatePicker provides an option to select a date value within a specified range by using the [min](#) and [max](#) properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected date value is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

INDEX.JS

```
ej.base.enableRipple(true);

//Creates a DatePicker with min and max properties.
var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var datepicker = new ej.calendars.DatePicker({
    //sets the min date
    min: new Date(currentYear, currentMonth, 7),
    //sets the max date
    max: new Date(currentYear, currentMonth, 27),
    //sets the value
    value: new Date(new Date().setDate(14))
});
datepicker.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DatePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element" type="text">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date format in ##Platform_Name## DatePicker control

Date format is a way of representing the date value in different string format in the textbox.

By default, the DatePicker's format is based on the culture. You can also set the own custom format by using the [format](#) property.

Once the date format property has been defined it will be common to all the cultures.

To know more about the date format standards, refer to the [Internationalization Date Format](#) section.

The following example demonstrates the DatePicker with the custom format (`yyyy-MM-dd`).

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    value: new Date(),
    // sets the format.
    format: 'yyyy-MM-dd'
});
datepicker.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DatePicker control</title>
  <meta charset="utf-8">

  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>
```

```

    <div id="container">
        <input id="element" type="text">
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Date masking in ##Platform_Name## Datepicker control

DatePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the MaskedDateTime module to enable the masking support.

INDEX.JS

```

var datePickerObject = new ej.calendars.DatePicker({
    enableMask: true
});
datePickerObject.appendTo('#mask');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DatePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="styles.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-popups/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-dropdowns/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="mask">

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| Keys | Actions |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the date. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of DatePicker component with mask.

INDEX.JS

```

var datePickerObject = new ej.calendars.DatePicker({
    enableMask: true
});
datePickerObject.appendTo('#mask');
var datePickerFormat = new ej.calendars.DatePicker({
    enableMask: true,
    format: "M/d/yyyy",
});
datePickerFormat.appendTo('#format');

```

INDEX.HTML

```

</body></html>

```

Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

```
`ts
```

```
//Load the L10n from ej2-base
```

```
import { L10n } from '@syncfusion/ej2-base';
```

```
//load the locale object to set the localized mask placeholder value
```

```
L10n.load({
```

```
'de': {
```

```
'datepicker': { day: 'Tag' , month: 'Monat', year: 'Jahr' }
```

```
}
```

```
});
```

```
,
```

The following example demonstrates default and customized mask placeholder value.

INDEX.JS

```
var datePickerObject = new ej.calendars.DatePicker({
    enableMask: true
});
datePickerObject.appendTo('#mask');
var datePickerPlaceholder = new ej.calendars.DatePicker({
    enableMask: true,
    maskPlaceholder: {day: 'd', month: 'M', year: 'y'}
});
datePickerPlaceholder.appendTo('#placeholder');
```

INDEX.HTML

```

```

Globalization in ##Platform_Name## Datepicker control

Globalization is the combination of adapting the component to various languages by means of parsing and formatting the date or number [Internationalization](#) and also by adding cultural specific customizations and translating the text [localization](#)

By default, DatePicker date format, week and month names are specific to English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data and it allows to load the culture specific CLDR JSON data by using `loadCldr` method

The DatePicker component supports only the Gregorian type of calendar. All the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). To know more about CLDR-Data refer the

[CLDR-Data](#) link.

,

```
npm install cldr-data --save
```

,

Once the package installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data we need to install the JSON plugin loader. Here we have used the SystemJS JSON plugin loader.

,

```
npm install systemjs-plugin-json --save-dev
```

,

- Once installed, configure the `system.config.js` configuration settings as like below to map the `systemjs-plugin-json` loader.

```
`ts
```

```
System.config({
```

```
paths: {
```

```

'npm:': './node_modules/',
'syncfusion:': 'npm:@syncfusion/'
},
map: {
app: 'app',
//Syncfusion packages mapping
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"cldr-data": 'npm:cldr-data',
"plugin-json": "npm:systemjs-plugin-json/json.js"
},
meta: {
'*.json': { loader: 'plugin-json' }
},
packages: {
'app': { main: 'app', defaultExtension: 'js' },
'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`

```

- Now use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- DatePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DatePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```

`ts

```

```
//Load the loadCldr from ej2-base
import { loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
`
```

The **Localization** library allows you to localize default text content of the DatePicker. The DatePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords |Text

today | Name of the button to choose Today date.

placeholder | Hint to describe expected value in input element.

- Before changing the culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus',
    today:'heute' }
  }
});
`
```

- Set the culture by using the [locale](#) property. The below code example, initialize the DatePicker component in **German** culture with corresponding localized text.

```

`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
import { DatePicker } from '@syncfusion/ej2-calendars';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus',
    today:'heute' }
  }
});
let datePickerObject: DatePicker = new DatePicker({
//sets the locale.
  locale: 'de'
});
datePickerObject.appendTo('#element');
`

```

The following example demonstrates the DatePicker in **German** culture.

INDEX.JS

```

ej.base.enableRipple(true);

var L10n = ej.base.L10n;
L10n.load({
  'de': {
    'datepicker': { placeholder: 'Wählen Sie ein Datum aus',
    today:'heute' }
  }
});
loadCultureFiles('de');
var datePicker = new ej.calendars.DatePicker({
  locale: 'de'
});
datePicker.appendTo('#element');
function loadCultureFiles(name) {
  var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
  var loader = ej.base.loadCldr;
  var loadCulture = function (prop) {
    var val, ajax;
    ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/' +
'src/common/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
    ajax.onSuccess = function (value) {

```

```

        val = value;
    };
    ajax.send();
    loader(JSON.parse(val));
};
for (var prop = 0; prop < files.length; prop++) {
    loadCulture(prop);
}
}

```

INDEX.HTML

```

type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element">
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-To-Left

The DatePicker supports right-to-left functionality for languages like Arabic, Hebrew to displays the text in the right-to-left direction. Use

[enableRtl](#) property to set the RTL direction.

```
`ts
import { DatePicker } from '@syncfusion/ej2-calendars';
//Load the L10n from ej2-base
import { L10n, loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/he/ca-gregorian.json'),
  require('cldr-data/main/he/numbers.json')
  require('cldr-data/main/he/timeZoneNames.json')
);
//load the locale object to set the localized placeholder value
L10n.load({
  'he': {
    'datepicker': { placeholder: 'הזן תאריך',
    today:'היום' }
  }
});
// creates the datepicker with Hebrew culture.
let datepickerobject: DatePicker = new DatePicker({
  //sets the locale
  locale: 'he',
  value: new Date(),
  //sets the enableRtl
  enableRtl: true
});
datepickerobject.appendTo('#element');
```

The below code example demonstrates the DatePicker component in **Hebrew** culture and also explains how to set the localized text to

the placeholder using **load** method of [L10n](#) class.

INDEX.JS

```

ej.base.enableRipple(true);
loadCultureFiles('he');
var L10n=ej.base.L10n;
L10n.load({
  'he': {
    'datepicker': {
      placeholder: 'הזן תאריך',
      today: 'היום'
    }
  }
});
var datepicker = new ej.calendars.DatePicker({
  locale: 'he',enableRtl:true
});
datepicker.appendTo('#element');

function loadCultureFiles(name) {
  var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
  if (name === 'ar') {
    files.push('numberingSystems.json');
  }
  var loader = ej.base.loadCldr;
  var loadCulture = function (prop) {
    var val, ajax;
    if (name === 'ar' && prop === files.length - 1) {
      ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/supplemental/' + files[prop], 'GET', false);
    } else {
      ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/main/' + name + '/' + files[prop], 'GET', false);
    }
    ajax.onSuccess = function (value) {
      val = value;
    };
    ajax.send();
    loader(JSON.parse(val));
  };
  for (var prop = 0; prop < files.length; prop++) {
    loadCulture(prop);
  }
}

```

Strict mode in ##Platform_Name## Datepicker control

The [strictMode](#) is an act, that allows the user to enter only the valid date within the specified min/max range in textbox. If the date is invalid, then the component will stay with the previous value. Else, if the date is out of range, then the component will set the date to the min/max date.

The following example demonstrates the DatePicker in `strictMode` with min/max range of 5th to 25th in a month of May. Here, it allows to enter

only the valid date within the specified range. If you are trying to enter the out-of-range value as like 28th of May, then the value will set to the max date of 25th May. Since the value 28th is greater than to max value of 25th. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

INDEX.JS

```

var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    // sets the value
    value: new Date('27/10/2017'),
    //sets the min
    min: new Date('5/5/2017'),
    //sets the max
    max: new Date('5/25/2017'),
    // sets the format

```

```

        format: 'dd/MM/yyyy',
    });
    datepicker.appendTo('#element');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

By default, the DatePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range date in textbox.

If the date is out-of-range or invalid, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering out-of-range or invalid date value, then the model value will be set to **out of range** date value or **null** respectively with highlighted **error** class to indicates the date is out of range or invalid.

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
  placeholder: 'Choose a date',
  // sets the value
  value: new Date('27/10/2017'),
  //sets the min
  min: new Date('5/5/2017'),
  //sets the max
  max: new Date('5/25/2017'),
  // sets the format
  format: 'dd/MM/yyyy',
});
datepicker.appendTo('#element');
```

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <input id="element" type="text">
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Customization in ##Platform_Name## Datepicker control

You can customize the entire appearance of the input element and Calendar by using custom [cssClass](#) property.

and also you can use the calendar's [renderDayCell](#) event to customize the appearance of the each day cell.

Below is the list of classes that provides flexible way to customize the DatePicker component.

Class Name	Description
---	---
e-date-wrapper	Applied to DatePicker wrapper
e-datepicker	Applied to the DatePicker element.
e-float-text	Applied to the floating label.
e-date-icon	Applied to the DatePicker icon.
e-popup-wrapper	Applied to DatePicker popup wrapper.
e-calendar	Applied to Calendar element.
e-header	Applied to Calendar header.
e-title	Applied to Calendar title.
e-icon-container	Applied to Calendar previous and next icon container.
e-prev	Applied to Calendar previous icon.
e-next	Applied to Calendar next icon.
e-weekend	Applied to Calendar weekend dates.
e-other-month	Applied to Calendar other month dates.
e-day	Applied to each day cell of the Calendar.
e-selected	Applied to Calendar selected dates.
e-disabled	Applied to Calendar disabled dates.

The following example disables the weekends of every month using `renderDayCell` event. Here we have used the `e-disabled` class to highlight the disabled date.

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    // Bind the renderDayCell event to customize the each day cell.
    renderDayCell: onRenderCell,
    // sets the placeholder
    placeholder: 'Enter date',
    cssClass: 'e-custom-style'
});
```

```
function onRenderCell(args) {
    if (args.date.getDay() == 0 || args.date.getDay() == 6) {
        //sets isDisabled to true to disable the date.
        args.isDisabled = true;
        //To know about the disabled date customization, you can refer in
        "styles.css".
    }
}
datepicker.appendTo('#element');
```

INDEX.HTML

</body></html>
```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.JS

```

var month = new Date().getMonth();
var fullYear = new Date().getFullYear();

var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    // Sets the min.
    min: new Date(fullYear, month, 9),
    //Sets the max.
    max: new Date(fullYear, month, 15),
    // Sets the value.
    value: new Date(fullYear, month, 11)
});
datepicker.appendTo('#element');

```

Date views in ##Platform_Name## Datepicker control

The DatePicker has the following predefined views that provides a flexible way to navigate back and forth to select the date.

| View | Description |

| --- | --- |

| month (default) | Displays the days in a month |

| year | Displays the months in a year |

| decade | Displays the years in a decade |

Start view

You can use the [start](#) property to define the initial rendering view.

The following example demonstrates how to create a DatePicker with **decade** as initial rendering view.

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
  placeholder: 'Choose a date',
  //sets the start
  start: 'Decade'
});
datepicker.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DatePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Depth view

Define the [depth](#) property to control the view navigation.

Always the depth view has to be smaller than the start view, otherwise the view restriction will be not restricted.

The following example demonstrates how to create a DatePicker that allows users to select a month.

INDEX.JS

```

var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    //sets the start
    start: 'Decade',
    //sets the depth
    depth: 'Year'
});
datepicker.appendTo('#element');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To know more about Calendar views refer the Calendar's [Calendar Views](#) section.

Accessibility in ##Platform_Name## Datepicker control

The DatePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DatePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DatePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA

supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DatePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DatePicker component.

Keyboard Interaction

You can use the following keys to interact with the DatePicker. The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the below list of shortcut keys.

Input Navigation

Before opening the popup, use the below list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Opens the popup.** |

| **Alt + Up Arrow** | **Closes the popup.** |

| **Esc** | **closes the popup.** |

Calendar Navigation

Use the below list of keys to navigate the Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Focus the previous week date.** |

| **Down Arrow** | **Focus the next week date.** |

| **Left Arrow** | **Focus the previous date.** |

| **Right Arrow** | **Focus the next date.** |

| **Home** | **Focus the first date in the month.** |

| **End** | **Focus the last date in the month.** |

| **Page Up** | **Focus the same date in the previous month.** |

| **Page Down** | **Focus the same date in the next month.** |

| **Enter** | **Select the currently focused date.** |

| **Shift + Page Up** | **Focus the same date in the previous year.** |

| **Shift + Page Down** | **Focus the same date in the previous year.** |

| **Control + Upper Arrow** | **Moves into the inner level of view like month-year, year-decade** |

| **Control + Down Arrow** | **Moves out from the depth level view like decade-year, year-month** |

| **Control + Home** | **Focus the starting date in the current year.** |

| **Control + End** | **Focus the ending date in the current year.** |

To focus the DatePicker component use the **alt+t** keys.

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date'
});
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the component.
        datepicker.element.focus();
    }
};
datepicker.appendTo('#element');
```

Ensuring accessibility

The DatePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DatePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DatePicker component with accessibility tools.

- [Accessibility in Syncfusion components](#)

Style appearance in ##Platform_Name## Datepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DatePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

,

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {
```

```
height: 40px;
```

```
font-size: 20px;
```

```
}
```

,

Customizing the DatePicker icon element

Use the following CSS to customize the DatePicker icon element

,

/ To specify background color and font size /

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {
```

```
font-size: 12px;
```

```
background-color: darkgray;
```

```
}
```

,

Customizing the Calendar popup of the DatePicker

Please check the below section, to customize the style and appearance of the Calendar component

[Customizing Calendar's style and appearance](#)

Full screen mode support in mobiles and tablets

The DatePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DatePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar element to occupy the entire screen on mobile devices.

```
import { DatePicker } from '@syncfusion/ej2-calendars';
```

```
// creates a datepicker with fullScreenMode property
```

```
let datePickerObject: DatePicker = new DatePicker({
```

```
// Enable Full Screen Mode
```

```
fullScreenMode: true,  
});  
datepickerObject.appendTo('#element');  
,
```

How To

Disabled the datepicker component in `##Platform_Name##` Datepicker control

To disable the DatePicker, use its [enable](#) property.

The following example demonstrates the DatePicker in a disabled state.

INDEX.JS

```
var datepicker = new ej.calendars.DatePicker({
  placeholder: 'Choose a date',
  // sets the enabled
  enabled: false
});
datepicker.appendTo('#element');
```

INDEX.HTML

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Set the placeholder in `##Platform_Name##` DatePicker control

The following example demonstrates how to set `placeholder` in the DatePicker component.

Using `placeholder` you can display a short hint in the input element.

INDEX.JS

```
var datePicker = new ej.calendars.DatePicker({
    // sets the palceholder property.
    placeholder: 'Enter date'
});
datePicker.appendTo('#element');
```

  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Set the `readonly` in `##Platform_Name##` DatePicker control

The following example demonstrates how to set `readonly` in DatePicker component. You can achieve this by using `readonly` property.

INDEX.JS

```
var datePicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    // sets the readonly.
    readonly: true,
    // sets the value.
    value: new Date()
});
datePicker.appendTo('#element');
```

</body></html>
```

Prevent the popup close in ##Platform_Name## DatePicker control

To prevent the DatePicker popup from closing, use the `preventDefault` method from the `PreventableEventArgs`.

The following example demonstrates how to prevent the popup from closing.

INDEX.JS

```
var datePicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    close: function (args) {
        // prevent the popup close
        args.preventDefault();
    },
});
datePicker.appendTo('#element');
// open the datepicker popup
datePicker.show();
```

Customize the datepicker day header in ##Platform_Name## DatePicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property.

By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
Short	Sets the short format of day name (like Su) in day header.
Narrow	Sets the single character of day name (like S) in day header.
Abbreviated	Sets the min format of day name (like Sun) in day header.
Wide	Sets the long format of day name (like Sunday) in day header.

INDEX.JS

```
var datePickerObject = new ej.calendars.DatePicker({
    dayHeaderFormat: "Short"
});
datePickerObject.appendTo('#element');
var formatLabel = new ej.dropdowns.DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: function(args) {
        datePickerObject.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

Open datepicker popup on input click in ##Platform_Name## Datepicker control

To open the DatePicker popup upon input click by using `show` method in the `focus` event.

The following example demonstrates how to open the DatePicker popup upon focus the input.

INDEX.JS

```

var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    focus: function() {
        datepicker.show();
    }
});
datepicker.appendTo('#element');

```

Client side validation in ##Platform_Name## Datepicker control

To achieve the client side validation in a DatePicker component by using [Essential JavaScript 2 FormValidator](#). It provides an option to customize the feedback error messages to the corresponding fields to take action to resolve the issue.

In this below example, the required field validation is implemented by mapping the name attribute value to the rules property. It will validate the DatePicker component and display the validation message when the textbox value is empty during form post back or focus out.

INDEX.JS

```

var datepicker = new ej.calendars.DatePicker({
    placeholder: 'Choose a date',
    // sets the value
    value: new Date()
});
var options = {
    rules: {
        'datevalue': { required: true }
    },
    customPlacement: function (inputElement, errorElement) {
        //to place the error message in custom position.
        inputElement.parentElement.parentElement.appendChild(errorElement);
    }
};

```

```

    }
};
var formObject = new ej.inputs.FormValidator('#form-element', options);
datepicker.appendTo('#element');
```

INDEX.HTML

```

DateRangePicker

Range restriction in ##Platform_Name## Daterangepicker control

Range selection in a date range picker can be made-to-order with desire restrictions based on the application needs.

Restrict the range within a range

You can restrict the minimum and maximum date that can be allowed as start and end date in a range selection with the help of [min](#), [max](#) properties.

- **min** – sets the minimum date that can be selected as startDate.
- **max** – sets the maximum date that can be selected as endDate.

In the following sample, you can select a range from 15th day of this month to 15th day of next month.

INDEX.JS

```
var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var daterangepicker = new ej.calendars.DateRangePicker({
    //sets the min.
    min: new Date(currentYear, currentMonth, 15),
    //sets the max.
    max: new Date(currentYear, currentMonth+1, 15),
    placeholder:"Select a Range"
});
daterangepicker.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DateRangePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-lists/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element" type="text">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If the value of **min** or **max** properties changed through code behind, then you have to update the **start date**, **end date** property to set within the range. Or else, if the **start** and **end** date is out of specified date range, a validation error class will be appended to the input element. If **strictMode** is enabled, and both the start, end date is lesser than the min date then start and end date will be updated with **min** date. If both the start and end date is higher than the max date then start and end date will be updated with **max** date. Or else, if **startDate** is less than **min** date, **startDate** will be updated with **min** date or if **endDate** is greater than **max** date, **endDate** will be updated with the **max** date.

Range span

Days span between ranges can be limited in order to avoid excess or less days selection towards the required days in a range. In this, minimum and maximum span allowed within the date range can be customized by [minDays](#) and [maxDays](#) properties.

- **minDays**- Sets the minimum number of days between start and end date.
- **maxDays**- Sets the maximum number of days between start and end date.

In the following sample, the range selection should be greater than 3 days and less than 8 days else it will not set.

INDEX.JS

```

var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var daterangepicker = new ej.calendars.DateRangePicker({
    //sets the minimum number of days
    minDays: 4,
    //sets the maximum number of days
    maxDays: 7,
    placeholder:"Select a Range"
});
daterangepicker.appendTo('#element');

```

```

Strict mode

DateRangePicker provides an option to limit the user towards entering the valid date. With strict mode, you can set only the valid date. If any invalid range is specified, the date range value resets to previous value. This restriction can be availed by enabling [strictMode](#) property as true.

INDEX.JS

```

var daterangepicker = new ej.calendars.DateRangePicker({
  placeholder: 'Select a range',
  //enabling strict mode
  strictMode: true
});
daterangepicker.appendTo('#element');

```

INDEX.HTML

```

Globalization in ##Platform_Name## Daterangepicker control

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number (Internationalization), and also add culture specific customization and translation to the text (Localization).

By default, DateRangePicker date format, week, and month names are specific to the English culture. It utilizes the [Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It allows to load culture specific CLDR JSON data by using `loadCldr` method.

To use a different culture other than `English`, follow the below steps:

- Install the `CLDR-Data` package by using the below command (Installs the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

`ts
npm install cldr-data --save
`

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file. To import JSON data, install the JSON plugin loader. Here, The SystemJS JSON plugin loader is used.

`ts
npm install systemjs-plugin-json --save-dev
`

- After installation, configure the `system.config.js` configuration settings as given below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'npm:': './node_modules/',
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
    "cldr-data": 'npm:cldr-data',
    "plugin-json": "npm:systemjs-plugin-json/json.js"
  },
```

```

meta: {
  '*.json': { loader: 'plugin-json' }
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' },
  'cldr-data': { main: 'index.js', defaultExtension: 'js' }
}
});
System.import('app');
`

```

- Use the `loadCldr` method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- DateRangePicker displayed `Sunday` as the first day of week based on default culture ("en-US"). If you want to display the DateRangePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```

`ts
declare var require: any;

loadCldr(
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
`

```

The `Localization` library allows you to localize default text content of the DateRangePicker. The DateRangePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

placeholder | Hint to describe expected value in input element.

startLabel | Label to represent the start date.

endLabel | Label to represent the end date.

applyText | Text present in the apply button.

cancelText | Text present in the cancel button.

selectedDays | Text to represent selected days.

days | Text represents days.

customRange | Text present in the custom range button in presets container.

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through **load** method of

[L10n](#) class.

```
`ts
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'daterangepicker': { placeholder: 'Wählen Sie ein Datum aus' }
  }
});
`
```

- Set the culture by using the [locale](#) property. In the following code example, the DateRangePicker is initialized in **German** culture with corresponding localized text.

The following example demonstrates the DateRangePicker in **German** culture.

INDEX.JS

```
ej.base.enableRipple(true);

var L10n = ej.base.L10n;
L10n.load({
  'de': {
    'daterangepicker': {
      placeholder: 'Wählen Sie einen Bereich aus',
      startLabel: 'Wählen Sie Startdatum',
      endLabel: 'Wählen Sie Enddatum',
      applyText: 'Sich bewerben',
      cancelText: 'Stornieren',
      selectedDays: 'Ausgewählte Tage',
      days: 'Tage',
      stomRange: 'benutzerdefinierten Bereich',
      startDate: 'Anfangsdatum',
      endDate: 'Enddatum'
    }
  }
});
loadCultureFiles('de');
var daterangepicker = new ej.calendars.DateRangePicker({
```

```

        locale: 'de'
    });
    daterangepicker.appendTo('#element');
    function loadCultureFiles(name) {
        var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
        var loader = ej.base.loadCldr;
        var loadCulture = function (prop) {
            var val, ajax;
            ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/' +
'src/common/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
            ajax.onSuccess = function (value) {
                val = value;
            };
            ajax.send();
            loader(JSON.parse(val));
        };
        for (var prop = 0; prop < files.length; prop++) {
            loadCulture(prop);
        }
    }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element">
    </div>

```

```

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-To-Left

The DateRangePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateRangePicker component in **Hebrew** culture and also explains how to set the localized text to the placeholder using [load](#) method of

[L10n](#) class.

INDEX.JS

```

ej.base.enableRipple(true);
loadCultureFiles('he');
var L10n = ej.base.L10n;
L10n.load({
    'he': {
        'daterangepicker': {
            placeholder: 'בחר טווח',
            startLabel: 'תווית התחלה',
            endLabel: 'סוף',
            applyText: 'להחיל טקסט',
            cancelText: 'בטל טקסט',
            selectedDays: 'ימים נבחרים',
            days: 'א'ימים',
            customRange: 'טווח מותאם אישית',
            startDate: 'תאריך התחלה',
            endDate: 'תאריך סיום'
        }
    }
});
var daterangepicker = new ej.calendars.DateRangePicker({
    locale: 'he', enableRtl: true
});
daterangepicker.appendTo('#element');

function loadCultureFiles(name) {
    var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
    if (name === 'he') {
        files.push('numberingSystems.json');
    }
    var loader = ej.base.loadCldr;
    var loadCulture = function (prop) {
        var val, ajax;
        if (name === 'he' && prop === files.length - 1) {
            ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/supplemental/' + files[prop], 'GET', false);

```

```

    } else {
        ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/main/' + name + '/' + files[prop], 'GET', false);
    }
    ajax.onSuccess = function (value) {
        val = value;
    };
    ajax.send();
    loader(JSON.parse(val));
};
for (var prop = 0; prop < files.length; prop++) {
    loadCulture(prop);
}
}

```

</script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize the date format

Representation of start and end date strings can be customized to required format by using [format](#) property. By default, the format is based on the culture. To know more about the date format standards, refer to the Internationalization Date Format section. In the following sample, the date strings are formatted to `yyyy-MM-dd` and in between the string "to" is set as a [separator](#).

INDEX.JS

```
var daterangepicker = new ej.calendars.DateRangePicker({
  placeholder: 'Select a range',
  format: "yyyy-MM-dd",
  separator: "to"
});
daterangepicker.appendTo('#element');
```

INDEX.HTML

```

```

Customization in ##Platform_Name## Daterangepicker control

The DateRangePicker is available for UI customization that can be achieved by using available properties and events in the component.

Day cell format

The DateRangePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

INDEX.JS

```

var daterangepicker = new ej.calendars.DateRangePicker({
  placeholder: 'Select a range',
  renderDayCell: onRenderCell,
});
daterangepicker.appendTo('#element');
function onRenderCell(args) {
  if (args.date.getDay() == 0 || args.date.getDay() == 6) {
    //sets isDisabled to true to disable the date.
    args.isDisabled = true;
  }
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Preset Ranges

DateRangePicker provides an option to set the predefined ranges via [presets](#) property with the corresponding label. This property will accept the values in the order of label, start date (date object), end date (date object), and append these ranges to the presets pop-up for quick selection. In the following sample, you can easily choose the frequently used range options from the list of ranges.

INDEX.JS

```

let today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var daterangepicker = new ej.calendars.DateRangePicker({
    placeholder: 'Select a range',
    presets: [
        { label: 'Today', start: new Date(), end: new Date() },
        { label: 'This Month', start: new Date(new Date().setDate(1)),
end: new Date() },
        { label: 'Last Month', start: new Date(new Date(new
Date().setMonth(new Date().getMonth() - 1)).setDate(1)), end: new Date() },
        { label: 'Last Year', start: new Date(new Date().getFullYear() -
1, 0, 1), end: new Date() },
    ]
});
daterangepicker.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateRangePicker control</title>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

First day of week

Start day in a week will differ based on the culture, but you can also customize this based on the application needs. For this, you have to make use of [firstDayOfWeek](#) property. By default, first day of a week in en-US is Sunday. In the following example it is customized to Monday with the help of this property.

INDEX.JS

```

var daterangepicker = new ej.calendars.DateRangePicker({
    placeholder: 'Select a range',
    firstDayOfWeek:1
});
daterangepicker.appendTo('#element');

```

INDEX.HTML

Accessibility in ##Platform_Name## Daterangepicker control

The DateRangePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the DateRangePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The web accessibility makes web content and web applications more accessible for people with disabilities. It especially helps in dynamic content change and development of advanced user interface controls with AJAX, HTML, JavaScript, and related technologies. DateRangePicker provides built-in compliance with [WAI-ARIA](#) specifications. WAI-ARIA support is achieved through the attributes like `aria-expanded`, `aria-disabled`, and `aria-activedescendant` applied as an input element.

To know about the accessibility of Calendar, refer to the Calendar's [Accessibility](#) section.

It helps people with disabilities by providing information about the widget for assistive technology in the screen readers. DateRangePicker component contains grid role and grid cell for each day cell.

- **Aria-expanded:** Indicates the currently selected date of the DateRangePicker component.
- **Aria-disabled:** Indicates the disabled state of the DateRangePicker component.

Keyboard Interaction

Use the below keys to interact with the DateRangePicker.

This component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys:

Input Navigation

Before opening the popup, use the following list of keys to control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | Opens the popup. |

| **Alt + Up Arrow** | Closes the popup. |

| **Esc** | Closes the popup. |

Calendar Navigation

Use the following list of keys to navigate the currently focused Calendar after the popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | Focuses the same day of the previous week. |

| **Down Arrow** | Focuses the same day of the next week. |

| **Left Arrow** | Focuses the day before. |

| **Right Arrow** | Focuses the next day. |

| **Home** | Focuses the first day of the month. |

| **End** | Focuses the last day of the month. |

| **Page Up** | Focuses the same date of the previous month. |

| **Page Down** | Focuses the same date of the next month. |

| **Enter** | Selects the currently focused date. |

| **Shift + Page Up** | Focuses the same date for the previous year. |

| **Shift + Page Down** | Focuses the same date for the next year. |

| **Control + Home** | Focuses the first date of the current year. |

| **Control + End** | Focuses the last date of the current year. |

| **Alt + Right** | Focuses through out the pop-up container in forward direction. |

| **Alt + Left** | Focuses through out the pop-up container in backward direction. |

To focus the DateRangePicker component, use the **alt+t** keys.

INDEX.JS

```

    var daterangepicker = new ej.calendars.DateRangePicker({
        placeholder: 'Select a range'
    });
    daterangepicker.appendTo('#element');
    document.onkeyup = function (e) {
        if (e.altKey && e.keyCode === 84 /* t */) {
            // press alt+t to focus the component.
            daterangepicker.element.focus();
        }
    };
};

Ensuring accessibility

The DateRangePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateRangePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateRangePicker component with accessibility tools.

Style appearance in ##Platform_Name## Daterangepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DateRangePicker wrapper element

Use the following CSS to customize the appearance like height and font size of the wrapper element.

`

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}
```

`

Customizing the DateRangePicker icon element

Use the following CSS to customize the DateRangePicker icon element

`

/ To specify background color and font size /

```
.e-input-group .e-input-group-icon:last-child, .e-input-group.e-control-wrapper .e-input-group-icon:last-child {  
background-color: darkgray;  
font-size: 14px;  
}
```

`

Customizing the DateRangePicker popup calendar header

Use the following CSS to customize the DateRangePicker popup calendar header

`

/ To specify background and height /

```
.e-daterangepicker.e-popup .e-range-header {
```

```
background: beige;
height: 80px;
}
`
```

Customizing the DateRangePicker popup calendar header title

Use the following CSS to customize the DateRangePicker popup calendar header title

/ To specify color and font size /

```
.e-daterangepicker.e-popup .e-range-header .e-start-label, .e-daterangepicker.e-popup .e-range-header
.e-end-label {
color: brown;
font-size: 30px;
}
`
```

Customizing the DateRangePicker popup calendar content

Use the following CSS to customize the DateRangePicker popup calendar content

/ To specify background color /

```
.e-daterangepicker.e-popup .e-calendar {
background-color: brown;
}
`
```

Customizing the DateRangePicker popup calendar content title

Use the following CSS to customize the DateRangePicker popup calendar content title

/ To specify color and font size /

```
.e-daterangepicker.e-popup .e-calendar .e-header .e-title {
color: beige;
font-size: 20px;
}
`
```

Customizing the DateRangePicker popup calendar previous and next icon

Use the following CSS to customize the DateRangePicker popup calendar previous and next icon

`

/ To specify font size /

```
.e-calendar .e-header .e-prev, .e-calendar .e-header .e-next, .e-bigger.e-small .e-calendar .e-header .e-prev, .e-bigger.e-small .e-calendar .e-header .e-next {
```

```
font-size: 20px;
```

```
}
```

```
,
```

[Customizing the DateRangePicker popup calendar date cell grid on hovering](#)

Use the following CSS to customize the DateRangePicker popup calendar date cell grid on hovering

```
,
```

/ To specify background color and border /

```
.e-calendar .e-content td:hover span.e-day {
```

```
background-color: beige;
```

```
border: 1px solid black;
```

```
}
```

```
,
```

[Customizing the DateRangePicker popup calendar primary button in footer](#)

Use the following CSS to customize the DateRangePicker popup calendar primary button in footer

```
,
```

/ To specify background color and border color /

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-apply.e-flat.e-primary:disabled, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-apply.e-flat.e-primary:disabled {
```

```
background-color: brown;
```

```
border-color: black;
```

```
}
```

```
,
```

[Customizing the DateRangePicker popup calendar cancel button in footer](#)

Use the following CSS to customize the DateRangePicker popup calendar cancel button in footer

```
,
```

/ To specify background color, color, and border color /

```
.e-daterangepicker.e-popup .e-footer .e-btn.e-flat, .e-daterangepicker.e-popup .e-footer .e-css.e-btn.e-flat {
```

```
background-color: beige;
```

```
border-color: black;
```

```
color: maroon;
}
```

```
,
```

Customizing the footer element in the DateRangePicker popup calendar

Use the following CSS to customize the DateRangePicker popup calendar footer element

```
,
```

/ To specify background color, color, and border color /

```
.e-daterangepicker.e-popup .e-footer {
background-color: beige;
height: 50px;
}
```

```
,
```

Customizing the selected date cell grid in the DateRangePicker popup calendar

Use the following CSS to customize the selected date cell grid in the DateRangePicker popup calendar

```
,
```

/ To specify background and border /

```
.e-calendar .e-content td.e-focused-date.e-today span.e-day {
background: lightgrey;
border: 1px solid black;
}
```

```
,
```

Full screen mode support in mobiles and tablets

The DateRangePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateRangePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar and presets popup element to occupy the entire screen on mobile devices.

```
import { DateRangePicker } from '@syncfusion/ej2-calendars';
// creates a daterangepicker with fullScreenMode property
let daterangeObject: DateRangePicker = new DateRangePicker({
// Enable Full Screen Mode
fullScreenMode: true,
});
daterangeObject.appendTo('#element');
```

![DateRangePickerPresetsFullScreen](../images/DateRangePickerrPresetsFullScreen.gif)

How To

Disable the `daterangepicker` component in `##Platform_Name## Daterangepicker` control. `DateRangePicker` can be inactivated on a page, by setting `enabled` value as `false` that will disable the component completely from all the user interactions including in form post. The following example demonstrates the disabled component.

INDEX.JS

```
var daterangepicker = new ej.calendars.DateRangePicker({
    // sets the enabled as false
    enabled:false, placeholder:"Select Range"
});
daterangepicker.appendTo('#element');
```

INDEX.HTML

```

  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Set the placeholder in `##Platform_Name##` Daterangepicker control

The following example demonstrates how to set [placeholder](#) in the DateRangePicker control.

Using `placeholder` you can display a short hint in the input element.

INDEX.JS

```
var daterangepicker = new ej.calendars.DateRangePicker({
    // sets the placeholder property.
    placeholder: 'Select a range'
});
daterangepicker.appendTo('#element');
```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization using cssclass in ##Platform_Name## Daterangepicker control

To customize UI, you can make use of [cssClass](#) that will be added to the DateRangePicker component as the root CSS class. With this CSS class, you can override existing styles of DateRangePicker.

Following is the list of classes that provides flexible way to customize the DateRangePicker component.

Class Name	Description
---	---
e-date-range-wrapper	Applied to DateRangePicker wrapper.
e-range-icon	Applied to DateRangePicker icon.
e-popup	Applied to DateRangePicker popup wrapper.
e-calendar	Applied to both Calendar element.
e-right-calendar	Applied to right Calendar element.
e-left-calendar	Applied to left Calendar element.
e-start-label	Applied to start label in a popup.
e-end-calendar	Applied to end label in a popup.
e-day-span	Applied to day span details label in a popup.
e-footer	Applied to footer elements in a popup.
e-apply	Applied to apply button in footer in a popup.
e-cancel	Applied to cancel button in footer in a popup.
e-header	Applied to Calendar header.
e-title	Applied to Calendar title.
e-icon-container	Applied to Calendar previous and next icon container.
e-prev	Applied to Calendar previous icon.
e-next	Applied to Calendar next icon.
e-weekend	Applied to Calendar weekend dates.
e-other-month	Applied to Calendar other month dates.
e-day	Applied to each day cell of the Calendar.
e-selected	Applied to Calendar selected dates.
e-disabled	Applied to Calendar disabled dates.

INDEX.JS

```
var daterangepicker = new ej.calendars.DateRangePicker({
    // set the css class.
    cssClass:"customCSS", placeholder:"Select Range"
});
daterangepicker.appendTo('#element');
```

Customize the daterangepicker day header in ##Platform_Name## Daterangepicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property.

By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
----- -----	
Short	Sets the short format of day name (like Su) in day header.
Narrow	Sets the single character of day name (like S) in day header.

| **Abbreviated** | Sets the min format of day name (like Sun) in day header. |

| **Wide** | Sets the long format of day name (like Sunday) in day header. |

INDEX.JS

```
var daterangepickerObj = new ej.calendars.DateRangePicker({
    dayHeaderFormat: "Short",
    cssClass: "format-wide"
});
daterangepickerObj.appendTo('#element');
var formatLabel = new ej.dropdowns.DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: function(args) {
        daterangepickerObj.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

DateTimePicker

Globalization in ##Platform_Name## Datetimepicker control

Globalization is the combination of internalization and localization. You can adapt the component to various languages by parsing and formatting the date or number [Internationalization](#), and also add culture specific customization and translation to the text [localization](#).

By default, the date format, week, month, time format and meridian names are specific to the [American English](#) culture. It utilizes the

[Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data. To use a different culture other than [English](#), follow the steps below:

- Install the `CLDR-Data` package by using the following command (installs all the CLDR JSON data). To know more about CLDR-Data refer to the [CLDR-Data](#) link.

,

```
npm install cldr-data --save
```

,

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file. To import JSON data, install the JSON plugin loader. Here, The SystemJS JSON plugin loader is used.

,

```
npm install systemjs-plugin-json --save-dev
```

,

- After installation, configure the `system.config.js` configuration settings as given below to map the

`systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'npm:': './node_modules/',
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
    "cldr-data": 'npm:cldr-data',
    "plugin-json": "npm:systemjs-plugin-json/json.js"
  },
  meta: {
    '*.json': { loader: 'plugin-json' }
  },
  packages: {
    'app': { main: 'app', defaultExtension: 'js' },
    'cldr-data': { main: 'index.js', defaultExtension: 'js' }
  }
});
System.import('app');
```

- Use the [loadCldr](#) method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- DateTimePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the DateTimePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```
`ts
```

```
import { loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json') // To load the culture based first day of week
);
```

The **Localization** library allows you to localize default text content of the DateTimePicker. The DateTimePicker component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

today | Name of the button to choose Today date.

placeholder | Hint to describe expected value in input element.

- Before changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through `load` method of

[L10n](#) class.

```
`ts
```

```
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
```

```

'datetimepicker': {
placeholder: 'Wählen Sie ein Datum und eine Uhrzeit aus',
today:'heute'
}
}
});
`

```

- Set the culture by using the [locale](#) property. In the following code example, the DateTimePicker is initialized in **German** culture with corresponding localized text.

The following example demonstrates the DateTimePicker in **German** culture.

INDEX.JS

```

ej.base.enableRipple(true);

var L10n = ej.base.L10n;
L10n.load({
  'de': {
    'datetimepicker': {
      placeholder: 'Wählen Sie ein Datum und eine Uhrzeit aus',
      today: 'heute'
    }
  }
});
loadCultureFiles('de');
var datetimepicker = new ej.calendars.DateTimePicker({
  locale: 'de'
});
datetimepicker.appendTo('#element');
function loadCultureFiles(name) {
  var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
  var loader = ej.base.loadCldr;
  var loadCulture = function (prop) {
    var val, ajax;
    ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/' +
'src/common/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
    ajax.onSuccess = function (value) {
      val = value;
    };
    ajax.send();
    loader(JSON.parse(val));
  };
  for (var prop = 0; prop < files.length; prop++) {
    loadCulture(prop);
  }
}

```

</body></html>

```

Right-To-Left

The DateTimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction. The following code example initialize the DateTimePicker component in Arabic culture and also explains how to set the localized text to the placeholder using [load](#) method of

[L10n](#) class.

INDEX.JS

```

ej.base.enableRipple(true);
var L10n = ej.base.L10n;
L10n.load({
  'ar': {
    'datetimepicker': {

```

```

        placeholder: 'حدد التاريخ والوقت',
        today: 'اليوم'
    }
    });
    loadCultureFiles('ar');
    var datetimepicker = new ej.calendars.DateTimePicker({
        locale: 'ar'
    });
    datetimepicker.appendTo('#element');
    function loadCultureFiles(name) {
        var files = ['ca-gregorian.json', 'numbers.json',
'timeZoneNames.json'];
        if (name === 'ar') {
            files.push('numberingSystems.json');
        }
        var loader = ej.base.loadCldr;
        var loadCulture = function (prop) {
            var val, ajax;
            if (name === 'ar' && prop === files.length - 1) {
                ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/supplemental/' + files[prop], 'GET', false);
            } else {
                ajax = new
ej.base.Ajax('https://ej2.syncfusion.com/javascript/demos/src/common/cldr-
data/main/' + name + '/' + files[prop], 'GET', false);
            }
            ajax.onSuccess = function (value) {
                val = value;
            };
            ajax.send();
            loader(JSON.parse(val));
        };
        for (var prop = 0; prop < files.length; prop++) {

```

Strict mode in ##Platform_Name## Datetimepicker control

The [strictMode](#) is an act, that allows the user to enter only the valid date and time within the specified min/max range in textbox. If the input entered is invalid, then the component will stay with the previous value. Else, if the date and time is

out of range, then the component will set the date to the min/max value.

The following example demonstrates the DateTimePicker in `strictMode` with min/max range of 5/5/2019 2:00 AM to 5/25/2019 2:00 AM. Here, it allows to enter only the valid date and time within the specified range. If you are trying to enter the out-of-range value as

like 5/28/2019, then the value will set to the `max` value as 5/25/2019 2:00 AM. Since the value 28 is greater than to `max` value

of 25. Or else if you are trying to enter the invalid date, then the value will stay with the previous value.

INDEX.JS

```

var datetimepickerObject = new ej.calendars.DateTimePicker({
    // sets the value
    value: new Date('5/25/2017 4:00 PM'),
    //sets the min
    min: new Date('5/5/2017 2:00 PM'),
    //sets the max
    max: new Date('5/25/2017 3:00 PM'),
    // sets the placeholder
    placeholder: 'Select a date and time'
});
datetimepickerObject.appendTo('#element');

```

INDEX.HTML

```

```

By default, the DateTimePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range datetime in textbox.

If the datetime is out-of-range or invalid, then the model value will be set to **out of range** datetime value or **null** respectively with highlighted **error** class to indicates the datetime is out of range or invalid.

The following example demonstrates the strictMode as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid datetime value, then the model value will be set to **out of range** datetime value or **null** respectively with highlighted **error** class to indicates the datetime is out of range or invalid.

INDEX.JS

```
var datetimepickerObject = new ej.calendars.DateTimePicker({
```

```
// sets the value
value: new Date('5/25/2017 4:00 PM'),
//sets the min
min: new Date('5/5/2017 2:00 PM'),
//sets the max
max: new Date('5/25/2017 3:00 PM'),
// sets the placeholder
placeholder: 'Select a date and time'
});
datetimepickerObject.appendTo('#element');
```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date time range in ##Platform_Name## Datetimepicker control

DateTimePicker provides an option to select a date and time value within a specified range by using the [min](#)

and [max](#) properties. Always the min value has to be lesser than the max value.

When the min and max properties are configured and the selected datetime value is out-of-range or invalid, then the model value will be set to `out of range` datetime value or `null` respectively with highlighted `error` class to indicates the datetime is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property.

The below example allows selecting a date within the range from 7th to 27th day in a month.

INDEX.JS

```
ej.base.enableRipple(true);
var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var datetimepicker = new ej.calendars.DateTimePicker({
  min: new Date(currentYear, currentMonth, 7, 10),
  max: new Date(currentYear, currentMonth, 27, 22, 30),
  value: new Date(currentYear, currentMonth, 14, 10, 30),
  placeholder: 'Choose a datetime'
});
datetimepicker.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 DateTimePicker control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <!--style reference from the DateTimePicker component-->
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-lists/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-calendars/styles/material.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="element" type="text">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

If the value of `min` or `max` properties changed through code behind, then you have to update the `value` property to set within the range.

Date time format in ##Platform_Name## Datetimepicker control

DateTime format is a way of representing the date and time value in different string format in the textbox.

By default, the DateTimePicker's format is based on the culture. You can also set the own custom format by using the [format](#) property.

Once the format property has been defined it will be common to all the cultures.

To know more about the date format standards, refer to the [Internationalization Date Time Format](#) section.

The following example demonstrates the DateTimePicker with the custom format (yyyy-MM-dd hh:mm).

INDEX.JS

```

var datetimepicker = new ej.calendars.DateTimePicker({
    placeholder: 'Choose a date',
    value: new Date(),
    // sets the format.
    format: 'yyyy-MM-dd hh:mm'
});
datetimepicker.appendTo('#element');

```

INDEX.HTML

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Date time masking in ##Platform_Name## Datetimepicker control

DateTimePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the `MaskedDateTime` module to enable the masking support.

INDEX.JS

```

var datetimepickerObject = new ej.calendars.DateTimePicker({
    enableMask: true
});
datetimepickerObject.appendTo('#mask');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>Essential JS 2 DateTimePicker control</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="styles.css" rel="stylesheet">

```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
calendars/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <input id="mask">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The mask pattern is defined based on the provided date format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| **Keys | Actions |**

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the date and time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of DateTimePicker component with mask.

INDEX.JS

```

var datetimepickerObject = new ej.calendars.DateTimePicker({
    enableMask: true
});
datetimepickerObject.appendTo('#mask');
var datetimepickerFormat = new ej.calendars.DateTimePicker({
    enableMask: true,
    format: "M/d/yyyy hh:mm a",
});

```

```
datetimepickerFormat.appendTo('#format');
```

INDEX.HTML

```

="text/javascript"></script>
</head>
  <body>

    <div id="container" style="margin:50px auto 0; width:250px;">
      <br><br>
      <label class="custom-input-label">Mask support with default
format</label>
      <br><br>
      <input id="mask">
      <br><br><br>
      <label class="custom-input-label">Mask support with custom
format</label>
      <br><br>
      <input id="format">
    </div>

    <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
    </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Configure Mask Placeholder

You can change mask placeholder value through property `maskPlaceholder`. By default , it takes the full name of date and time co-ordinates such as `day`, `month`, `year`, `hour` etc.

While changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through load method of `L10n` class for mask placeholder values like below.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized mask placeholder value
L10n.load({
  'de': {
    'datetimepicker': { day: 'Tag' , month: 'Monat', year: 'Jahr', hour: 'Stunde' ,minute: 'Minute',
    second:'Sekunden' }
  }
});
`
```

The following example demonstrates default and customized mask placeholder value.

INDEX.JS

```
var datetimepickerObject = new ej.calendars.DateTimePicker({
  enableMask: true
});
datetimepickerObject.appendTo('#mask');
var datetimeplaceholder = new ej.calendars.DateTimePicker({
  enableMask: true,
  maskPlaceholder: {day: 'd', month: 'M', year: 'y', hour: 'h', minute:
  'm', second: 's'}
});
datetimeplaceholder.appendTo('#placeholder');
```

```

Customization in ##Platform_Name## Datetimepicker control

The DateTimePicker is available for UI customization that can be achieved by using available properties and events in the component.

Day and Time Cell format

The DateTimePicker is available for UI customization based on your application requirements. It can be achieved by using [renderDayCell](#) event that provides an option to customize each day cell on rendering.

The following example disables the weekends of every month by using `renderDayCell` event.

INDEX.JS

```

var datetimepicker = new ej.calendars.DateTimePicker({
    placeholder: 'Select a date and time'
});
datetimepicker.appendTo('#element');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84 /* t */) {
        // press alt+t to focus the component.
        datetimepicker.element.focus();
    }
}

```

```

    }
};

```

INDEX.HTML

```

Accessibility in ##Platform_Name## Datetimepicker control

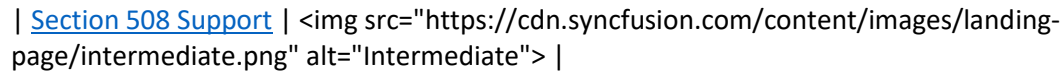

The DateTimePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

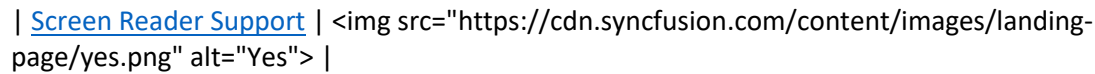

The accessibility compliance for the DateTimePicker component is outlined below.

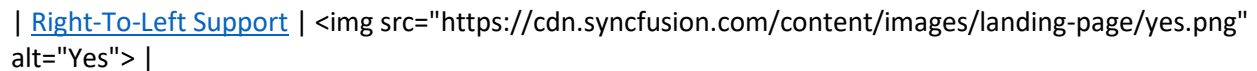

| Accessibility Criteria | Compatibility |

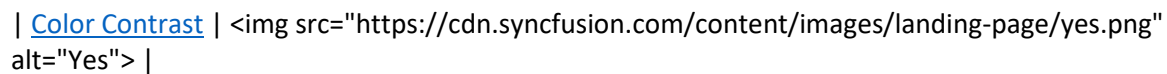

| -- | -- |

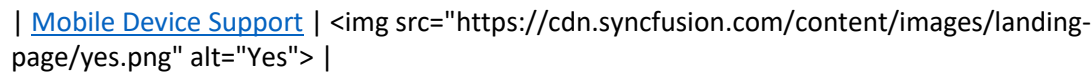

| [WCAG 2.2 Support](#) |  |

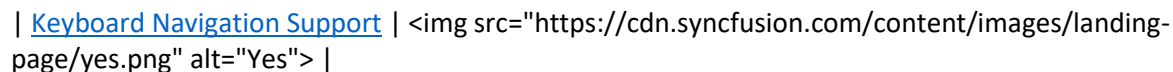

| [Section 508 Support](#) |  |

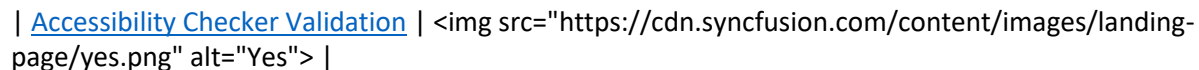

| [Screen Reader Support](#) |  |

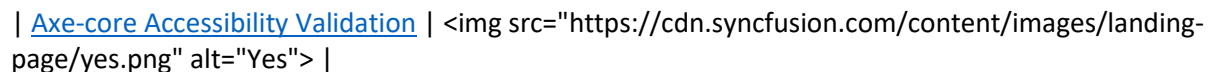

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
```

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Web accessibility defines a way to make web content and web applications more accessible to disabled people. It especially helps the dynamic content change and advanced user interface controls developed with Ajax, HTML, JavaScript, and related technologies.

DateTimePicker provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA supports is achieved through the attributes like `aria-expanded`, `aria-disabled`, `aria-activedescendant` applied to the input element.

To know about the accessibility of Calendar refer to the Calendar's [Accessibility](#) section.

It helps to provide information about the widget for assistive technology to the disabled person in screen reader.

- **Aria-expanded:** attributes indicates the state of a collapsible element.
- **Aria-disabled:** attribute indicates the disabled state of this DateTimePicker component.
- **Aria-activedescendent:** attribute helps in managing the current active child of the DateTimePicker component.

Keyboard Interaction

You can use the following keys to interact with the DateTimePicker. The component implements the keyboard navigation support by following the [WAI-ARIA practices](#).

DateTimePicker supports the below list of shortcut keys.

Input Navigation

Before opening the popup, use the below list of keys to `DateTimePicker` control the popup element.

| **Press** | **To do this** |

| --- | --- |

| **Alt + Down Arrow** | **Open the select popup** |

| **Alt + Down Arrow + Alt + Down Arrow** | **Toggle between two popups** |

Calendar Navigation

Use the below list of keys to interact with the Calendar after the DatePicker popup has opened.

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Focus the previous week date.** |

| **Down Arrow** | **Focus the next week date.** |

| **Left Arrow** | **Focus the previous date.** |

| **Right Arrow** | **Focus the next date.** |

| **Home** | **Focus the first date in the month.** |

| **End** | **Focus the last date in the month.** |

| **Page Up** | **Focus the same date in the previous month.** |

| **Page Down** | **Focus the same date in the next month.** |

| **Enter** | **Select the currently focused date.** |

| **Shift + Page Up** | **Focus the same date in the previous year.** |

| Shift + Page Down | Focus the same date in the previous year. |

| Control + Upper Arrow | Moves into the inner level of view like month-year, year-decade |

| Control + Down Arrow | Moves out from the depth level view like decade-year, year-month |

| Control + Home | Focus the starting date in the current year. |

| Control + End | Focus the ending date in the current year. |

Use the below list of shortcut keys to interact with the TimePicker after the TimePicker Popup has opened.

| Press | To do this |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

To focus the DateTimePicker component use the `alt+t` keys.

INDEX.JS

```
var datetimepicker = new ej.calendars.DateTimePicker({
  placeholder: 'Select a date and time'
});
datetimepicker.appendTo('#element');
document.onkeyup = function (e) {
  if (e.altKey && e.keyCode === 84 /* t */) {
    // press alt+t to focus the component.
    datetimepicker.element.focus();
  }
};
```

```

Ensuring accessibility

The DateTimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the DateTimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the DateTimePicker component with accessibility tools.

- [Accessibility in Syncfusion components](#)

Style appearance in ##Platform_Name## Datetimepicker control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of DateTimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

`

/ To specify height and font size /

```
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input {  
font-size: 20px;  
height: 40px;  
}  
`
```

Customizing the DateTimePicker icons element

Use the following CSS to customize the DateTimePicker icons element

`

/ To specify background color and font size /

```
.e-datetime-wrapper .e-input-group-icon.e-date-icon, .e-datetime-wrapper .e-input-group-icon.e-time-  
icon {  
font-size: 16px;  
background-color: blanchedalmond;  
}  
`
```

Customizing the time picker popup in the DateTimePicker

Use the following CSS to customize the time picker popup in the DateTimePicker

`

/ To specify height /

```
.e-datetimepicker.e-popup {  
height: 100px;  
}  
`
```

Customizing the Calendar popup of the DateTimePicker

Please check the below section, to customize the style and appearance of the Calendar component in the DateTimePicker

[Customizing Calendar's style and appearance](#)

Full screen mode support in mobiles and tablets

The DateTimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the DateTimePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the calendar and time popup element to occupy the entire screen on mobile devices.

```
import { DateTimePicker } from '@syncfusion/ej2-calendars';  
// creates a datetimepicker with fullScreenMode property  
let datetimepickerObject: DateTimePicker = new DateTimePicker({  
  // Enable Full Screen Mode  
  fullScreenMode: true,  
});  
datetimepickerObject.appendTo('#element');  
`
```

Default Sample

How To

Disable the datetimepicker component in ##Platform_Name## Datetimepicker control

To disable the DateTimePicker, use its [enable](#) property to `false`.

INDEX.JS

```
ej.base.enableRipple(true);
var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var datetimepicker = new ej.calendars.DateTimePicker({
  min: new Date(currentYear, currentMonth, 7, 10),
  max: new Date(currentYear, currentMonth, 27, 22, 30),
  value: new Date(currentYear, currentMonth, 14, 10, 30),
  placeholder: 'Choose a datetime'
});
datetimepicker.appendTo('#element');
```

INDEX.HTML

```

</body></html>

```

Set the placeholder in `##Platform_Name##` Datetimepicker control

The following example demonstrates how to set [placeholder](#) in the DateTimePicker component.

Using `placeholder` you can display a short hint in the input element.

INDEX.JS

```

ej.base.enableRipple(true);
var today = new Date();
var currentYear = today.getFullYear();
var currentMonth = today.getMonth();
var currentDay = today.getDate();
var datetimepicker = new ej.calendars.DateTimePicker({
    min: new Date(currentYear, currentMonth, 7, 10),
    max: new Date(currentYear, currentMonth, 27, 22, 30),
    value: new Date(currentYear, currentMonth, 14, 10, 30),
    placeholder: 'Choose a datetime'
});
datetimepicker.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 DateTimePicker control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>

```

Customize the datetimepicker day header in ##Platform_Name## Datetimepicker control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
----- -----	
Short	Sets the short format of day name (like Su) in day header.
Narrow	Sets the single character of day name (like S) in day header.
Abbreviated	Sets the min format of day name (like Sun) in day header.
Wide	Sets the long format of day name (like Sunday) in day header.

INDEX.JS

```

var datetimepickerObj = new ej.calendars.DateTimePicker({
  dayHeaderFormat: "Short"
});
datetimepickerObj.appendTo('#element');
var formatLabel = new ej.dropdowns.DropDownList({
  // set the height of the popup element
  popupHeight: '200px',
  // bind the change event
  change: function(args) {
    datetimepickerObj.dayHeaderFormat = args.value;
  }
});
formatLabel.appendTo('#select');

```

INDEX.HTML

Diagram

Getting started in ##Platform_Name## Diagram control

This section explains the steps required to create a simple diagram and demonstrates the basic usage of the diagram control.

<!-- markdownlint-disable MD033 -->

Dependencies

The following list of dependencies are required to use the **Diagram** component in your application.

```
|-- @syncfusion/ej2-diagrams
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-splitbuttons
\
```

Installation and Configuration

- To get started with the diagram component, clone the [Essential JS 2 quickStart](#) project and install necessary packages by using the following commands.

```
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart
cd quickstart
npm install
\
```

- Diagram packages should be mapped in the `system.config.js` configuration file.

```
System.config({
  paths: {
    'syncfusion:': './node_modules/@syncfusion/',
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
  }
});
```

```
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"@syncfusion/ej2-diagrams": "syncfusion:ej2-diagrams/dist/ej2-diagrams.umd.min.js",
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' }
}
});
`
```

The [project](#) is preconfigured with common settings (`src/styles/styles.css`, `system.config.js`) to start with all Essential JS 2 components.

Add diagram to the project

Add the HTML div element for the diagram into your `index.html`. [`src/index.html`]

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>EJ2 Diagram</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="description" content="Typescript UI Controls" />
<meta name="author" content="Syncfusion" />
<link href="index.css" rel="stylesheet" />
<script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>
<script src="systemjs.config.js"></script>
</head>
<body>
<!--container which is going to render the Diagram-->
<div id='container'>
</div>
</body>
</html>
`
```

Now, import the diagram component into your `app.ts` to instantiate a diagram and append the diagram instance to the `#container`. [src/app/app.ts]

The following example shows a basic diagram.

INDEX.JS

```
var diagram = new ej.diagrams.Diagram({ width: '100%', height: '600px' });
diagram.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Now, the `npm run start` command is used to run the application in the browser.

npm run start

,

Module Injection

The diagram component is divided into individual feature-wise modules. In order to use a particular feature, inject the required module. The following list describes the module names and their description.

- **BpmnDiagrams**: Inject this provider to add built-in BPMN shapes to diagrams.
- **ConnectorBridging**: Inject this provider to add bridges to connectors.
- **ConnectorEditing**: Inject this provider to edit the segments for connector.
- **ComplexHierarchicalTree**: Inject this provider to complex hierarchical tree like structure.
- **DataBinding**: Inject this provider to populate nodes from given data source.
- **DiagramContextMenu**: Inject this provider to manipulate context menu.
- **HierarchicalTree**: Inject this provider to use hierarchical tree like structure.
- **LayoutAnimation**: Inject this provider animation to layouts.
- **MindMap**: Inject this provider to use mind map.
- **PrintAndExport**: Inject this provider to print or export the objects.
- **RadialTree**: Inject this provider to use radial tree like structure.
- **Snapping**: Inject this provider to snap the objects.
- **SymmetricLayout**: Inject this provider to render layout in symmetrical method.
- **UndoRedo**: Inject this provider to revert and restore the changes.

These modules should be imported and injected into the Diagram component using **Diagram.Inject** method as follows.

```
import { Diagram, HierarchicalTree, MindMap, RadialTree, ComplexHierarchicalTree, DataBinding, Snapping, PrintAndExport, BpmnDiagrams, SymmetricLayout, ConnectorBridging, UndoRedo, LayoutAnimation, DiagramContextMenu, ConnectorEditing } from '@syncfusion/ej2-diagrams';
```

```
Diagram.Inject(BpmnDiagrams, ConnectorBridging, ConnectorEditing, ComplexHierarchicalTree, DataBinding, DiagramContextMenu, HierarchicalTree, LayoutAnimation, MindMap, PrintAndExport, RadialTree, Snapping, SymmetricLayout, UndoRedo);
```

,

Flow Diagram

Create and add node

Create and add a **node** (JSON data) with specific position, size, label, and shape.

INDEX.JS

```
var nodes = [
  {
    id: 'Start', width: 140, height: 50, offsetX: 300, offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: { type: 'Flow', shape: 'Terminator' }
  }
]
```

```

];
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: nodes
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: The **annotations** property is an array, which indicates that more than one label can be added to a node.

Connect Nodes

Add two node to the diagram as shown in the previous example. Connect these nodes by adding a connector using the **connector** property and refer the source and target end by using the **sourceNode** and **targetNode** properties.

INDEX.JS

```

var nodes = [
  {
    id: 'Start', width: 140, height: 50, offsetX: 300, offsetY: 50,
    annotations: [{
      id: 'label1',
      content: 'Start'
    }],
    shape: { type: 'Flow', shape: 'Terminator' }
  },
  {
    id: 'Init', width: 140, height: 50, offsetX: 300, offsetY: 140,
    shape: { type: 'Flow', shape: 'process' },
    annotations: [{ content: 'var i = 0;' }]
  }
];
var connector = {
  id: "connector1",
  sourceID: "Start",
  targetID: "Init",
  type: 'Orthogonal'
};
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '350px', nodes: nodes, connectors: [connector]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

```

```

    <div id="container">
      <div id="element"></div>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Default values for all **nodes** and **connectors** can be set using the **getNodeDefaults** and **getConnectorDefaults** properties, respectively. For example, if all nodes have the same width and height, such properties can be moved into **getNodeDefaults**.

[Complete flow diagram](#)

Similarly, the required nodes and connectors can be added to form a complete flow diagram.

INDEX.JS

```

var nodes = [
  { id: 'Start', offsetY: 50, annotations: [{ content: 'Start' }], shape:
  { type: 'Flow', shape: 'Terminator' } },
  { id: 'Init', offsetY: 140, annotations: [{ content: 'var i = 0;' }],
  shape: { type: 'Flow', shape: 'Process' } },
  { id: 'Condition', offsetY: 230, annotations: [{ content: 'i < 10?' }],
  shape: { type: 'Flow', shape: 'Decision' } },
  { id: 'Print', offsetY: 320, annotations: [{ content:
  'print(\'Hello!!\');' }], shape: { type: 'Flow', shape: 'PreDefinedProcess'
  } },
  { id: 'Increment', offsetY: 410, annotations: [{ content: 'i++;' }],
  shape: { type: 'Flow', shape: 'Process' } },
  { id: 'End', offsetY: 500, annotations: [{ content: 'End' }], shape: {
  type: 'Flow', shape: 'Terminator' } },
];
var connector = [
  { id: 'connector1', sourceID: 'Start', targetID: 'Init' },
  { id: 'connector2', sourceID: 'Init', targetID: 'Condition' },
  { id: 'connector3', sourceID: 'Condition', targetID: 'Print',
  annotations: [{ content: 'Yes' }] },
  {
    id: 'connector4', sourceID: 'Condition', targetID: 'End',
    annotations: [{ content: 'No' }],
    type: 'Orthogonal',
    segments: [
      { type: 'Orthogonal', length: 30, direction: "Right" },
      { type: 'Orthogonal', length: 300, direction: "Bottom" }
    ]
  },
  { id: 'connector5', sourceID: 'Print', targetID: 'Increment' },
  {
    id: 'connector6', sourceID: 'Increment', targetID: 'Condition',
    type: 'Orthogonal',
    segments: [

```

```

        { type: 'Orthogonal', length: 30, direction: "Left" },
        { type: 'Orthogonal', length: 200, direction: "Top" }
    ]
}
];
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: nodes, connectors: connector
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Automatic organization chart

In the 'Flow Diagram' section, how to create a diagram manually was discussed. This section explains how to create and position the diagram automatically.

Business object (Employee information)

Define Employee Information as JSON data. The following code example shows an employee array whose, `Name` is used as a unique identifier and `ReportingPerson` is used to identify the person to whom an employee report to, in the organization.

```
`ts
//Initialize data source...
let data: object[] = [{Name: "Elizabeth", Role: "Director" },
{ Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
{ Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];
`
```

Map data source

You can configure the above "Employee Information" with diagram, so that the nodes and connectors are automatically generated using the mapping properties. The following code example show how `dataSourceSettings` is used to map ID and parent with property name identifiers for employee information.

```
`ts
//Initialize data source...
let data: object[] = [{Name: "Elizabeth", Role: "Director" },
{ Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
{ Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
{ Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
{ Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];

let items: DataManager = new DataManager(data as JSON[], new Query().take(7));
//Initialize data source...
let diagram: Diagram = new Diagram({
width: '100%', height: '600px',
//Configure data source for diagram
```

```

dataSourceSettings: {
  id: 'Name', parentId: 'ReportingPerson', dataManager: items
}
});
`

```

Visualize employee

The following code examples indicate how to define the default appearance of nodes and connectors. The `setNodeTemplate` is used to update each node based on employee data.

INDEX.JS

```

ej.diagrams.Diagram.Inject(ej.diagrams.DataBinding,
ej.diagrams.HierarchicalTree);

var data = [
  { Name: "Elizabeth", Role: "Director" },
  { Name: "Christina", ReportingPerson: "Elizabeth", Role: "Manager" },
  { Name: "Yoshi", ReportingPerson: "Christina", Role: "Lead" },
  { Name: "Philip", ReportingPerson: "Christina", Role: "Lead" },
  { Name: "Yang", ReportingPerson: "Elizabeth", Role: "Manager" },
  { Name: "Roland", ReportingPerson: "Yang", Role: "Lead" },
  { Name: "Yvonne", ReportingPerson: "Yang", Role: "Lead" }
];
var codes = {
  Director: "rgb(0, 139,139)",
  Manager: "rgb(30, 30,113)",
  Lead: "rgb(0, 100,0)"
};
function getNodeTemplate(node) {
  node.annotations[0].content = node.data.Name;
  node.style.fill = codes[node.data.Role];
}

var items = new ej.data.DataManager(data, new ej.data.Query().take(7));
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '350px',
  mode: 'SVG', snapSettings: { constraints:
ej.diagrams.SnapConstraints.None },
  dataSourceSettings: {
    id: 'Name', parentId: 'ReportingPerson', dataManager: items
  },
  layout: {
    type: 'OrganizationalChart',
    margin: { left: 10, top: 10 },
    horizontalSpacing: 50,
    verticalSpacing: 50,
    orientation: 'TopToBottom',
    getLayoutInfo: function (node, tree) {
      if (!tree.hasSubTree) {
        tree.orientation = 'Vertical';
        tree.type = 'Alternate';
      }
    }
  }
});

```

```

    },
    getNodeDefaults: function (obj, diagram) {
        obj.height = 30;
        obj.width = 70;
        obj.shape = { type: 'Basic', shape: 'Rectangle' };
        obj.annotations = [{
            id: "label1",
            style: {
                fontSize: 11,
                bold: true,
                fontFamily: "Segoe UI",
                color: "white"
            }
        }];
        return obj;
    },
    getConnectorDefaults: function (connector, diagram) {
        connector.targetDecorator.shape = 'Arrow';
        connector.type = 'Orthogonal';
        return connector;
    },
    setNodeTemplate: function (node) {
        return getNodeTemplate(node);
    }
});
diagram.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Shapes in ##Platform_Name## Diagram control

Diagram provides support to add different kind of nodes. They are as follows:

- Text node
- Image node
- HTML node
- Native node
- Basic shapes
- Flow shapes

<!-- markdownlint-disable MD033 -->

<!-- markdownlint-disable MD010 -->

Text

Texts can be added to the diagram as [text](#) nodes. The shape property of the node allows you to set the type of node and for text nodes, it should be set as **text**. In addition, define the content object that is used to define the text to be added and style is used to customize the appearance of that text. The following code illustrates how to create a text node.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    //Sets type of the node
    shape: { type: 'Text', content: 'Text Element' },
    //Customizes the appearances such as text, font, fill, and stroke.
    style: { strokeColor: 'none', fill: 'none', color: 'black', textAlign:
'Center' }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');

```

INDEX.HTML

```

Image

Diagram allows to add images as [image](#) nodes. The shape property of node allows you to set the type of node and for image nodes, it should be set as **image**. In addition, the source property of shape enables you to set the image source.

The following code illustrates how an image node is created.

INDEX.JS

```
var node = {
```

```

// Position of the node
offsetX: 250,
offsetY: 250,
// Size of the node
width: 100,
height: 100,
shape: { type: 'Image', source:
'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png' },
//Customizes the appearances such as text, font, fill, and stroke.
style: { fill: 'none' }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
width: '100%', height: '600px', nodes: [node]
}, '#element');

```

  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: Deploy your HTML file in the web application and export the diagram (image node) or else the image node will not be exported in the Chrome and Firefox due to security issues. Refer to the following link.

Link 1: <http://asked.online/draw-images-on-canvas-locally-using-chrome/2546077/>

Link 2: <http://stackoverflow.com/questions/4761711/local-image-in-canvas-in-chrome>

Image alignment

Stretch and align the image content anywhere but within the node boundary.

The scale property of the node allows to stretch the image as you desired (either to maintain proportion or to stretch). By default, the [scale](#) property of the node is set as **meet**.

The following code illustrates how to scale or stretch the content of the image node.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: { type: 'Image', source:
'https://ej2.syncfusion.com/demos/src/diagram/employees/image16.png',
scale: 'None' },
  //Customizes the appearances such as text, font, fill, and stroke.
  style: { fill: 'none' }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table illustrates all the possible scale options for the image node.

| Values | Images |

|-----| -----|

HTML

Html elements can be embedded in the diagram through [Html](#) type node. The shape property of node allows you to set the type of node and to create a HTML node it should be set as **HTML**. The following code illustrates how an Html node is created.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  shape: {
    type: 'HTML',
    content: '<div
style="background:#6BA5D7;height:100%;width:100%;"><button type="button"
style="width:100px"> Button</button></div>'
  }
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <script id="nodetemplate" type="text/x-template">
    <input type="button" id="button" value="${id}">
  </script>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: HTML node cannot be exported to image format, like JPEG, PNG, and BMP. It is by design, while exporting the diagram is drawn in a canvas. Further, this canvas is exported into image formats. Currently, drawing in a canvas equivalent from all possible HTML is not feasible. Hence, this limitation.

HTML Node With Template

Html elements can be embedded in the diagram using [Html](#) type node. The shape property of the node allows you to set the type of node. The following code shows how an Html node is created with a template.

INDEX.JS

```

var node = {
  // Id of the node
  id: "Node",
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'HTML'
  }
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node], nodeTemplate:
  '#nodetemplate'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Native

Diagram provides support to embed SVG element into a node. The shape property of node allows you to set the type of node. To create a [native](#) node, it should be set as **native**. The following code illustrates how a native node is created.

INDEX.JS

```

var node = {
  // Position of the node

```

```

offsetX: 250,
offsetY: 250,
// Size of the node
width: 100,
height: 100,
shape: {
  type: 'Native',
  content: '<g xmlns="http://www.w3.org/2000/svg"> <g

Note: Like HTML node, the native node also cannot be exported to image format. Fill color of native node can be overridden by the inline style or fill of the SVG element specified in the template.

SVG content alignment

Stretch and align the svg content anywhere but within the node boundary.

The scale property of the node allows to stretch the svg content as you desired (either to maintain proportion or to stretch). By default, the **scale** property of node is set as **meet**.

The following code illustrates how to scale or stretch the content of the node.

The following tables illustrates all the possible scale options for the node.

| Values | Images |

| ----- | ----- |

Basic shapes

- The [Basic](#) shapes are common shapes that are used to represent the geometrical information visually. To create basic shapes, the type of the shape should be set as **basic**. Its shape property can be set with any one of the built-in shape.
- To render a rounded rectangle, you need to set the type as basic and shape as rectangle. Set the [cornerRadius](#) property to specify the radius of rounded rectangle.

The following code example illustrates how to create a basic shape.

INDEX.JS

```
var node = {
```

```

// Position of the node
offsetX: 250,
offsetY: 250,
// Size of the node
width: 100,
height: 100,
style: { fill: '#6BA5D7', strokeColor: 'white' },
shape: { type: 'Basic', shape: 'Rectangle', cornerRadius: 10 },
// Text(label) added to the node
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px'
}, '#element');
diagram.add(node);

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

    <div id="element"></div>
  </div>
</script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: By default, the **shape** property of the node is set as **basic**.

Default property for shape is Rectangle.

Note: When the **shape** is not set for a basic shape, it is considered as a **rectangle**.

The list of basic shapes are as follows.

Path

The [Path](#) node is a commonly used basic shape that allows visually to represent the geometrical information. To create a path node, specify the shape as **path**. The path property of node allows you to define the path to be drawn. The following code illustrates how a path node is created.

INDEX.JS

```

var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: { type: 'Path', data: 'M35.2441,25 L22.7161,49.9937
L22.7161,0.00657536 L35.2441,25 z M22.7167,25 L-0.00131226,25
M35.2441,49.6337 L35.2441,0.368951 M35.2441,25 L49.9981,25'},
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');

```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Flow Shapes

The [flow](#) shapes are used to represent the process flow. It is used for analyzing, designing, and managing for documentation process. To create a flow shape, specify the shape type as **flow**. Flow shapes and by default, it is considered as **process**. The following code example illustrates how to create a flow shape.

INDEX.JS

```

var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: { type: 'Flow', shape: 'Document' },
  style: { fill: '#6BA5D7', strokeColor: 'white' },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');

```

```
diagram.select([diagram.nodes[0]]);
```

INDEX.HTML

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The list of flow shapes are as follows.

Bpmn shapes in ##Platform_Name## Diagram control

BPMN shapes are used to represent the internal business procedure in a graphical notation and enable you to communicate the procedures in a standard manner. To create a BPMN shape, in the node property shape, type should be set as “bpmn” and its shape should be set as any one of the built-in shapes. The following code example illustrates how to create a simple business process.

Note: If you want to use BPMN shapes in diagram, you need to inject BpmnDiagrams in the diagram.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Event',
    event: { event: 'End' }
  },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px'
}, '#element');
diagram.add(node);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note : The default value for the property **shape** is “event”.

The list of BPMN shapes are as follows:

| Shape | Image |

| ----- | ----- |

| Event |

| Gateway |

| Task |

The BPMN shapes and its types are explained as follows.

<!-- markdownlint-disable MD033 -->

Event

An [event](#) is notated with a circle and it represents an event in a business process. The type of events are as follows:

- Start
- End
- Intermediate

The [event](#) property of the node allows you to define the type of the event. The default value of the event is **start**. The following code example illustrates how to create a BPMN event.

INDEX.JS

```
var node = {  
  // Position of the node  
  offsetX: 250,  
  offsetY: 250,  
  // Size of the node  
  width: 100,  
  height: 100,  
  shape: {  
    type: 'Bpmn', shape: 'Event',  
    event: { event: 'End', trigger: 'None' }  
  },  
};  
// initialize Diagram component
```

```
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px'
}, '#element');
diagram.add(node);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Event triggers are notated as icons inside the circle and they represent the specific details of the process. The [trigger](#) property of the node allows you to set the type of trigger and by default, it is set as **none**. The following table illustrates the type of event triggers.

| Triggers | Start | Non-Interrupting Start | Intermediate | Non-Interrupting Intermediate | Throwing Intermediate | End |

| ----- | ----- | ----- | ----- | ----- | ----- | ----- |

Gateway

Gateway is used to control the flow of a process and it is represented as a diamond shape. To create a gateway, the shape property of the node should be set as [gateway](#) and the gateway property can be set with any of the appropriate gateways. The following code example illustrates how to create a BPMN Gateway.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Gateway',
    gateway: { type: 'None' }
  },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
diagram.select([diagram.nodes[0]]);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: By default, the **gateway** will be set as **none**.

There are several types of gateways as tabulated:

Shape	Image
-----	-----
Exclusive	
Parallel	
Inclusive	
Complex	
EventBased	
ExclusiveEventBased	

| ParallelEventBased |

Activity

The [activity](#) is the task that is performed in a business process. It is represented by a rounded rectangle.

There are two types of activities. They are listed as follows:

- Task: Occurs within a process and it is not broken down to a finer level of detail.
- Subprocess: Occurs within a process and it is broken down to a finer level of detail.

To create a BPMN activity, set the shape as **activity**. You also need to set the type of the BPMN activity by using the activity property of the node. By default, the type of the activity is set as **task**. The following code example illustrates how to create an activity.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Activity', activity: {
      activity: 'Task'
    },
  },
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>

        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The different activities of BPMN process are listed as follows.

Tasks

The [task](#) property of the node allows you to define the type of task such as sending, receiving, user based task, etc. By default, the type property of task is set as **none**. The following code illustrates how to create different types of

BPMN tasks. The [type](#) property of tasks allows to represent these results as an event attached to the task.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'Task', task: {
                type: 'Send'
            }
        },
    },
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]

```

```
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The various types of BPMN tasks are tabulated as follows.

| Shape | Image |

| ----- | ----- |

Subprocess

A [sub-process](#) is a group of tasks, which is used to hide or reveal details of additional levels using the [collapsed](#) property.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Activity', activity: {
      activity: 'SubProcess',
      subprocess: { collapsed: true }
    }
  },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The different types of subprocess are as follows:

- Event subprocess
- Transaction

Event subprocess

A subprocess is defined as an event subprocess, when it is triggered by an event. An event subprocess is placed within another subprocess which is not part of the normal flow of its parent process. You can set event to a subprocess with the [event](#) and [trigger](#) property of the subprocess. The [type](#) property of subprocess allows you to define the type of subprocess whether it should be event subprocess or transaction subprocess.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'SubProcess',
            subprocess: {
                collapsed: true, type: 'Event',

```

```

        event: { event: 'Start', trigger: 'Message' }
    },
    },
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');

```

```

Transaction subprocess

- [transaction](#) is a set of activities that logically belong together, in which all contained activities must complete their parts of the transaction; otherwise the process is undone. The execution result of a transaction is one of Successful Completion, Unsuccessful Completion (Cancel), and Hazard (Exception). The [events](#) property of subprocess allows to represent these results as an event attached to the subprocess.
- The event object allows you to define the type of event by which the subprocess will be triggered. The name of the event can be defined to identify the event at runtime.
- The event's offset property is used to set the fraction/ratio (relative to parent) that defines the position of the event shape.
- The trigger property defines the type of the event trigger.
- You can also use define ports and labels to subprocess events by using event's ports and labels properties.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Activity', activity: {
      activity: 'SubProcess',
      subprocess: {
        collapsed: true, type: 'Transition',
        event: [ { event: 'Intermediate', trigger: 'Cancel', offset:
{ x: 0.25, y: 1 } },
{ event: 'Intermediate', trigger: 'Error', offset: { x:
0.25, y: 1 } }, ]
      }
    },
  },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

```

Process

Processes is an array collection that defines the children values for BPMN subprocess.

Loop

[Loop](#) is a task that is internally being looped. The loop property of task allows you to define the type of loop. The default value for `loop` is **none**. You can define the loop property in subprocess BPMN shape as shown in the following code.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'Task', task: {
                loop: 'Standard'
            }
        },
    },
},

```

```

    };
    var node2 = {
        // Position of the node
        offsetX: 300,
        offsetY: 100,
        // Size of the node
        width: 100,
        height: 100,
        shape: {
            type: 'Bpmn', shape: 'Activity', activity: {
                activity: 'SubProcess', subProcess: { collapsed: true, loop:
'Standard' }
            },
        },
    };
    // initialize Diagram component
    var diagram = new ej.diagrams.Diagram({
        width: '100%', height: '600px', nodes: [node, node2]
    }, '#element');

```

INDEX.HTML

```

```

The following table contains various types of BPMN loops.

Loops	Task	Subprocess
-----	-----	-----

Compensation

[Compensation](#) is triggered, when operation is partially failed and enabled it with the compensation property of the task and the subprocess.

INDEX.JS

```

var node = {
  // Position of the node
  offsetX: 100,
  offsetY: 100,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Activity', activity: {
      activity: 'Task', task: {
        compensation : true
      }
    }
  }
}

```

```

    },
    },
    };
var node2 = {
    // Position of the node
    offsetX: 300,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'SubProcess', subProcess: { collapsed: true,
compensation : true }
        },
    },
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node, node2]
}, '#element');
```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Call

A [call](#) activity is a global subprocess that is reused at various points of the business flow and set it with the call property of the task.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'Task', task: {
                call: true
            }
        },
    },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');

```

    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Adhoc

An adhoc subprocess is a group of tasks that are executed in any order or skipped in order to fulfill the end condition and set it with the [adhoc](#) property of subprocess.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'SubProcess', subProcess: { collapsed: true, adhoc :
true }
        },
    },
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
}, '#element');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Boundary

Boundary represents the type of task that is being processed. The [boundary](#) property of subprocess allows you to define the type of boundary. By default, it is set as **default**.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn', shape: 'Activity', activity: {
            activity: 'SubProcess', subProcess: { collapsed: true, boundary:
'Call' }
        },
    },
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({

```

```
width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

</body></html>
```

The following table contains various types of BPMN boundaries.

Boundary	Image
-----	-----

| Call |

| Event |

| Default |

Data

A data object represents information flowing through the process, such as data placed into the process, data resulting from the process, data that needs to be collected, or data that must be stored. To define a [data object](#), set the shape as **DataObject** and the type property defines whether data is an input or an output. You can create multiple instances of data object with the collection property of data.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'DataObject',
    dataObject: { collection: true, type: 'Input' }
  }
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
```

```
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The following table contains various representation of BPMN data object.

| Boundary | Image |

| ----- | ----- |

| Collection Data Object | |

| Data Input | |

| Data Output |

Datasource

Datasource is used to store or access data associated with a business process. To create a datasource, set the shape as **datasource**. The following code example illustrates how to create a datasource.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node

Artifact

Artifact is used to show additional information about a process in order to make it easier to understand. There are two types of artifacts in BPMN.

- Text annotation
- Group

Text annotation

- A BPMN object can be associated with a text annotation which does not affect the flow but gives details about objects within a flow. The annotation property of the node is used to connect an annotation element to the BPMN node.
- The annotation element can be displaced into a different position interactively by dragging the annotation to a particular position.
- The annotation element can be switched from a BPMN node to another BPMN node simply by dragging the source end of the annotation connector into the other BPMN node.
- The annotation angle property is used to set the angle between the BPMN shape and the annotation.
- The annotation direction property is used to set the direction of the text annotation.
- To set the size for text annotation, use width and height properties.
- The annotation length property is used to set the distance between the BPMN shape and the annotation.
- The annotation text property defines the additional information about the flow object in a BPMN process.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 100,
    offsetY: 100,
    // Size of the node
    width: 100,
    height: 100,
    shape: {
        type: 'Bpmn',

```

```

    shape: 'DataObject',
    dataObject: {
      collection: true,
      type: 'Input'
    },
    annotations: [{
      id: 'left',
      angle: 45,
      length: 150,
      text: 'Left',
    }]
  }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');

```

Group

A group is used to frame a part of the diagram, shows that elements included in it are logically belong together and does not have any other semantics other than organizing elements. To create a group, the shape property of the node should be set as **group**. The following code example illustrates how to create a BPMN group.

INDEX.JS

```

var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  shape: {
    type: 'Bpmn', shape: 'Group',
  }
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');

```

BPMN flows

[BPMN Flows](#) are lines that connects BPMN flow objects.

Association

[BPMN Association](#) flow is used to link flow objects with its corresponding text or artifact. An association is represented as a dotted graphical line with opened arrow. The types of association are as follows:

- Directional
- BiDirectional
- Default

The `association` property allows you to define the type of association. The following code example illustrates how to create an association.

INDEX.JS

```

var connector = {
    // Position of the node
    sourcePoint: { x: 100, y: 200 }, targetPoint: { x: 300, y: 200 }, type:
    'Orthogonal',
    shape: {
type: 'Bpmn',
flow: 'Association',
association: 'BiDirectional'
    },
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', connectors: [connector]
}, '#element');

```

INDEX.HTML

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table demonstrates the visual representation of association flows.

Association	Image
Default	
Directional	
BiDirectional	

Note : The default value for the property **association** is **default**.

Sequence

A [sequence](#) flow shows the order in which the activities are performed in a BPMN process and is represented by a solid graphical line. The types of sequence are as follows:

- Normal
- Conditional
- Default

The sequence property allows you to define the type of sequence. The following code example illustrates how to create a sequence flow.

INDEX.JS

```
var connector = {
  // Position of the node
  sourcePoint: { x: 100, y: 200 }, targetPoint: { x: 300, y: 200 }, type:
  'Orthogonal',
  shape: {
    type: 'Bpmn',
    flow: 'Sequence',
    sequence: 'Conditional'
  },
};

// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', connectors: [connector]
}, '#element');
```

INDEX.HTML

if(ele) {
```

```

    ele.style.visibility = "visible";
  }
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table contains various representation of sequence flows.

Sequence	Image
Default	
Conditional	
Normal	

Note: The default value for the property `sequence` is **normal**.

Message

A [message](#) flow shows the flow of messages between two participants and is represented by dashed line. The types of message are as follows:

- InitiatingMessage
- NonInitiatingMessage
- Default

The message property allows you to define the type of message. The following code example illustrates how to define a message flow.

INDEX.JS

```

var connector = {
  // Position of the node
  sourcePoint: { x: 100, y: 200 }, targetPoint: { x: 300, y: 200 }, type:
  'Orthogonal',
  shape: {
    type: 'Bpmn',
    flow: 'Message',
    message: 'InitiatingMessage'
  },
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({

UML diagram in ##Platform_Name## Diagram control

UML Class Diagram

A class diagram visually depicts the static structure of an application and is extensively employed in modeling object-oriented systems. It holds a unique position in UML diagrams, as it directly aligns with object-oriented languages. The diagram also facilitates the automatic generation of class diagram

shapes based on business logic, streamlining the translation from conceptual models to practical implementation.

UML Class Diagram Shapes

The UML class diagram shapes are explained as follows.

Class

- A class defines a group of objects that share common specifications, features, constraints, and semantics. To create a class object, the classifier should be defined using the [class] ([../api/diagram/umlClassifierShapeModel#class](#)) notation. This notation serves as a foundational element in object-oriented programming, encapsulating the essential characteristics and behavior that objects belonging to the class will exhibit.
- Also, define the [name](#), [attributes](#), and [methods](#) of the class using the class property of node.
- The attribute's [name](#), [type](#), and [scope](#) properties allow you to define the name, data type, and visibility of the attribute.
- The method's [name](#), [parameters](#), [type](#), and [scope](#) properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameters object properties allow you to define the name and type of the parameter.
- The following code example illustrates how to create a class.

INDEX.JS

```
/**
 * Tooltip sample
 */
var diagram;
var nodes = [
  {
    id: "Patient",
    style: {
      fill: '#26A0DA',
    },
    shape: {
      type: "UmlClassifier",
      classShape: {
        name: "Patient",
        attributes: [
          createProperty("allergies", "String[*]")
        ],
        methods: [createMethods("getHistory", "History")]
      },
      classifier: "Class"
    },
    offsetX: 200,
    offsetY: 250
  }
];
function createProperty(name, type) {
  return { name: name, type: type };
}
function createMethods(name, type) {
  return { name: name, type: type };
}
```

```

}
diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  nodes: nodes,
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Interface

- An interface is a specific type of classifier that signifies a declaration of a cohesive set of public features and obligations. When creating an interface, involves defining the classifier property

using the [interface](#) notation. This essential concept in object-oriented programming outlines a contract for classes to adhere to, specifying the required methods and behaviors without delving into the implementation details.

- Also, define the [name](#), [attributes](#), and [methods](#) of the interface using the interface property of the node.
- The attribute's name, type, and scope properties allow you to define the name, data type, and visibility of the attribute.
- The method's name, parameter, type, and scope properties allow you to define the name, parameter, return type, and visibility of the methods.
- The method parameter object properties of name and type allow you to define the name and type of the parameter.
- The following code example illustrates how to create an interface.

INDEX.JS

```
/**
 * Tooltip sample
 */
var node = {
  id: 'node',
  offsetX: 400,
  offsetY: 300,
  style: {
    fill: '#26A0DA',
  },
  shape: {
    type: 'UmlClassifier',
    interfaceShape: {
      name: "Bank Account",
      property: [{
        name: "owner",
        type: "String[*]", style: {}
      },
      {
        name: "balance",
        type: "Dollars"
      }
    ],
    methods: [{
      name: "deposit", style: {},
      parameters: [{
        name: "amount",
        type: "Dollars",
        style: {}
      }
    ]
  }
],
  },
  classifier: 'Interface'
},
];
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  nodes: [node],
}, '#element');
```

INDEX.HTML

```

  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Enumeration

- To establish an enumeration, designate the classifier property of the node as [enumeration](#). Additionally, define the name and enumerate the members of the enumeration using the appropriate enumeration property of the node. This process encapsulates a set of distinct values within the enumeration, allowing for a clear representation of specific, and named constants within a system.
- You can set a name for the enumeration members collection using the name property of the members collection.

- The following code example illustrates how to create an enumeration.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var node = {
  id: 'node',
  offsetX: 300,
  offsetY: 200,
  style: {
    fill: '#26A0DA',
  },
  shape: {
    type: 'UmlClassifier',
    enumerationShape: {
      name: 'AccountType',
      members: [
        {
          name: 'Checking Account', style: {}
        },
        {
          name: 'Savings Account'
        },
        {
          name: 'Credit Account'
        }
      ]
    },
    classifier: 'Enumeration'
  },
};
diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  nodes: [node],
}, '#element');
```

UML Class Relationships

- A class may be involved in one or more relationships with other classes. A relationship can be one of the following types:

Association

Association is basically a set of links that connects elements of a UML model. The type of association is as follows.

1. Directional
2. BiDirectional

The association property allows you to define the type of association. The default value of association is "Directional". The following code example illustrates how to create an association.

INDEX.JS

```
/**
 * Tooltip sample
 */
var diagram;
var connector = {
  id: "connector",
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    relationship: "Association",
    association: "BiDirectional"
  }
};
diagram = new ej.diagrams.Diagram({
  width: '650px',
  height: '350px',
  connectors: [connector],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

<body>

    <div id="container">
        <div id="element"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Aggregation

Aggregation is a binary association between a property and one or more composite objects that group together a set of instances. Aggregation is decorated with a hollow diamond. To create an aggregation shape, define the relationship as “aggregation”.

The following code example illustrates how to create an aggregation.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var connector = {
    id: "connector",
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
        type: "UmlClassifier",
        relationship: "Aggregation"
    }
};
diagram = new ej.diagrams.Diagram({
    width: '650px',
    height: '350px',
    connectors: [connector],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">

<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">

type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Composition

Composition is a “strong” form of “aggregation”. The composition is decorated with a black diamond. To create a composition shape, define the relationship property of the connector as “composition”.

The following code example illustrates how to create a composition.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var connector = {
    id: "connector",
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
        type: "UmlClassifier",
        relationship: "Composition"
    }
}

```

```
};
diagram = new ej.diagrams.Diagram({
  width: '650px',
  height: '350px',
  connectors: [connector],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Dependency

Dependency is a directed relationship, which is used to show that some UML elements need or depend on other model elements for specifications. Dependency is shown as a dashed line with an opened arrow. To create a dependency, define the relationship property of the connector as “dependency”.

The following code example illustrates how to create a dependency.

INDEX.JS

```
/**
 * Tooltip sample
 */
var diagram;
var connector = {
  id: "connector",
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    relationship: "Dependency"
  }
};
diagram = new ej.diagrams.Diagram({
  width: '650px',
  height: '350px',
  connectors: [connector],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Inheritance

Inheritance is also called a “generalization”. Inheritance is a binary taxonomic directed relationship between a more general classifier (superclass) and a more specific classifier (subclass). Inheritance is shown as a line with a hollow triangle.

To create an inheritance, define the relationship as “inheritance”.

The following code example illustrates how to create an inheritance.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var connector = {
    id: "connector",
    sourcePoint: { x: 100, y: 100 },
    targetPoint: { x: 300, y: 300 },
    type: "Straight",
    shape: {
        type: "UmlClassifier",
        relationship: "Inheritance"
    }
};
diagram = new ej.diagrams.Diagram({
    width: '650px',
    height: '350px',
    connectors: [connector],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Multiplicity

Multiplicity is a definition of an inclusive interval of non-negative integers to specify the allowable number of instances of a described element. The type of multiplicity are as follows.

1. OneToOne
2. ManyToOne
3. OneToMany
4. ManyToMany
 - By default the multiplicity will be considered as “OneToOne”.
 - The multiplicity property in UML allows you to specify large number of elements or some collection of elements.
 - The shape multiplicity’s source property is used to set the source label to the connector and the target property is used to set the target label to the connector.
 - To set an optionality or cardinality for the connector source label, use the optional property.
 - The [lowerBounds](#) and [upperBounds](#) could be natural constants or constant expressions evaluated to a natural (non negative) number. The upper bound could also be specified as an asterisk ‘*’ which denotes an unlimited number of elements. The upper bound should be greater than or equal to the lower bound.
 - The following code example illustrates how to customize the multiplicity.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var connector = {
  id: "connector",
  sourcePoint: { x: 100, y: 100 },
  targetPoint: { x: 300, y: 300 },
  type: "Straight",
  shape: {
    type: "UmlClassifier",
    relationship: "Dependency",
    multiplicity: {
      type: "OneToMany",
      source: {
        optional: true,
        lowerBounds: 89,
        upperBounds: 67
      },
      target: {
        optional: true,
        lowerBounds: 78,
        upperBounds: 90
      }
    }
  }
};
diagram = new ej.diagrams.Diagram({
  width: '650px',
  height: '350px',
  connectors: [connector],
}, '#element');

```

INDEX.HTML

How to add UML child at runtime

In UML nodes, child elements such as members, methods and attributes can be added either programmatically or interactively.

Adding UML child through code

The [addChildToUmlNode](#) method is employed for dynamically adding a child to the UML node during runtime, providing flexibility in modifying the diagram structure programmatically.

The following code illustrates how to add methods to UML nodes in the diagram.

```

`ts
let node = diagram.selectedItems.nodes[0];

let methods = { name: 'getHistory', style: { color: "red", }, parameters: [{ name: 'Date', style: {} }], type:
'History' };

diagram.addChildToUmlNode(node, methods, 'Methods');
`

```

The following code illustrates how to add attributes to UML nodes in the diagram.

```

`ts
let node = diagram.selectedItems.nodes[0];

let attributes = { name: 'accepted', type: 'Date', style: { color: "red", } };

diagram.addChildToUmlNode(node, attributes, "Attributes");
`

```

The following code illustrates how to add members to UML nodes in the diagram.

```

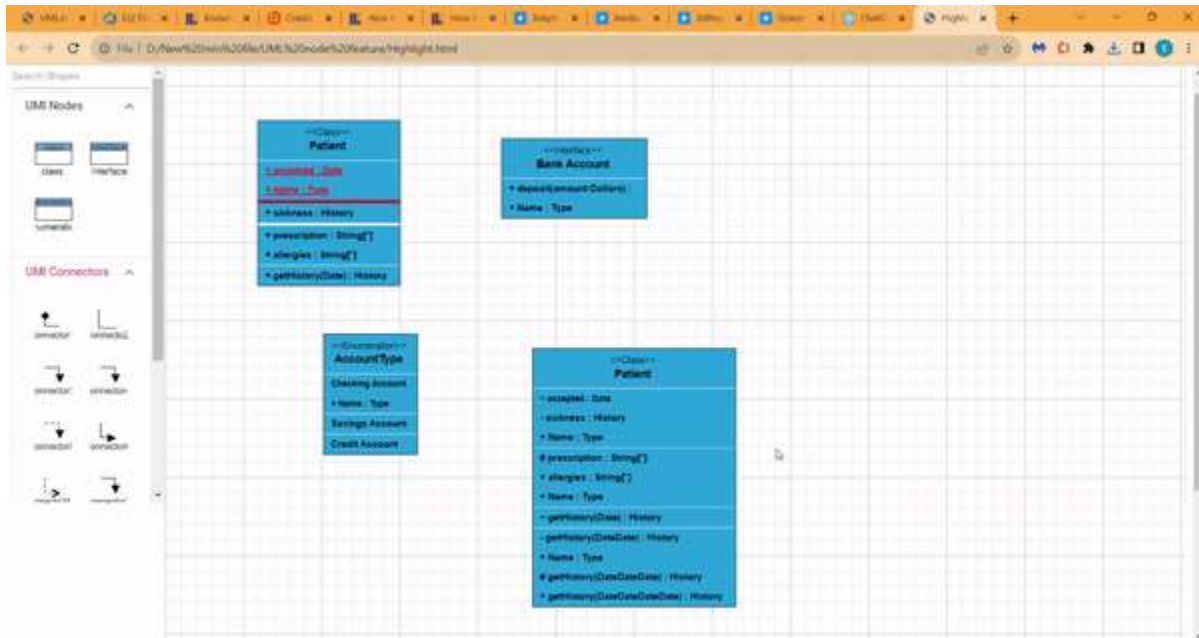

`ts

```

```
let node = diagram.selectedItems.nodes[0];
let members = { name: 'Checking new', style: { color: "red", }, isSeparator: true };
diagram.addChildToUmlNode(node, members, "Members");
`
```

Adding UML child through user interaction

To include a child, select a node, move the mouse outside it, and position the pointer near the right side. A highlighter emerges between the two child elements. Click the highlighter to add a child type to the chosen UML node seamlessly. The following gif illustrates how to add a Child through user interaction.

Adding UML Nodes in Symbol palette

UML built-in shapes are efficiently rendered in a symbol palette. The `symbols` property is utilized to define UML symbols with the necessary classes and methods. By incorporating this feature, you can seamlessly augment the palette with a curated collection of predefined UML symbols, thereby enhancing the versatility of your UML diagramming application.

The following code example showcases the rendering of UML built-in shapes in a symbol palette

INDEX.JS

```
//Initialize the flowshapes for the symbol palette
function getUmlShapes() {
  var flowShapes = [
    {
      id: 'class',
      style: {
        fill: '#26A0DA',
      },
      borderColor: 'white',
      shape: {
        type: 'UmlClassifier',
        classShape: {
          attributes: [
```

```

        { name: 'accepted', type: 'Date', style: { color:
"red", fontFamily: "Arial", textDecoration: 'Underline', italic: true
}, isSeparator: true },
        ],
        methods: [{ name: 'getHistory', style: {}, parameters:
[ { name: 'Date', style: {} } ], type: 'History' }],
        name: 'Patient'
    },
    classifier: 'Class'
},
{
    id: 'Interface',
    style: {
        fill: '#26A0DA',
    }, borderColor: 'white',
    shape: {
        type: 'UmlClassifier',
        interfaceShape: {
            name: "Bank Account",
        },
        classifier: 'Interface'
    },
},
{
    id: 'Enumeration',
    style: {
        fill: '#26A0DA',
    }, borderColor: 'white',
    shape: {
        type: 'UmlClassifier',
        enumerationShape: {
            name: 'AccountType',
            members: [
                {
                    name: 'Checking Account', style: {}
                },
            ],
        },
        classifier: 'Enumeration'
    },
},
];
return flowShapes;
}
function setPaletteNodeDefaults(node) {
    node.width = 100;
    node.height = 100;
}
var palette = new ej.diagrams.SymbolPalette({
    palettes: [
        { id: 'UML', expanded: true, symbols: getUmlShapes(), title:
'UMLClass Nodes' },
    ],
    width: '100%', height: '100%', symbolHeight: 90, symbolWidth: 90,
    getNodeDefaults: setPaletteNodeDefaults,
    //Defines the symbol description for the symbols in the palette

```

```

    getSymbolInfo: function (symbol) {
        return { fit: true, description: { text: symbol.id, }};
    }
});
palette.appendTo('#element');

```

```

Editing in UML nodes

You can edit the name, attributes, and methods of the class diagram shapes just double clicking, similar to editing a node annotation.

The following image illustrates how the text editor looks in an edit mode.

UML Activity diagram

An Activity diagram functions as a visual flowchart, illustrating the progression from one activity to the next within a system. Each activity corresponds to a system operation, providing a clear depiction of the sequential flow in a dynamic process..

The purpose of an activity diagram can be described as follows.

1. Draw the activity flow of a system.
2. Describe the sequence from one activity to another.
3. Describe the parallel, branched, and concurrent flow of the system.

UML Activity diagram Shapes

To create a UmlActivity, define the type as "UmlActivity" and the list of built-in shapes as demonstrated as follows and it should be set in the "shape" property.

Shape	Image	
-----	-----	

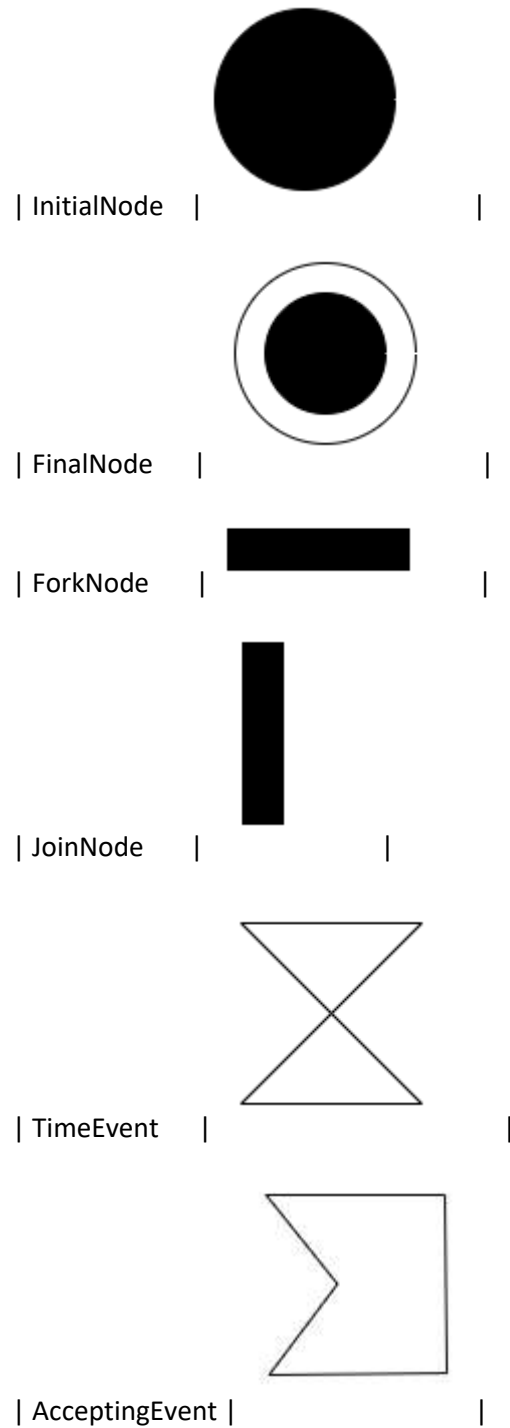

Action		
--------	--	--

Decision		
----------	--	--

MergeNode		
-----------	--	--

| SendSignal |

| ReceiveSignal |

| StructuredNode |

| Note |

The following code illustrates how to create a UmlActivity shapes.

INDEX.JS

```
/**
 * Tooltip sample
 */
var node = {
  id: "UmlDiagram",
  //Set node size
  width: 100,
  height: 100,
  //position the node
  offsetX: 200,
  offsetY: 200,
  shape: {
    type: "UmlActivity",
    //Define UmlActivity shape
```

```

        shape: "Action"
    }
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    nodes: [node]
}, '#element');
```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

UML Activity connector

To establish a UML Activity connector, specify the type as "UmlActivity" and define the flow as either "Exception," "Control," or "Object." This configuration delineates the nature of the connection, allowing for a precise representation of the interaction within the activity diagram.

The following code illustrates how to create a UmlActivity connector.

INDEX.JS

```
/**
 * UmlActivity sample
 */
var diagram;
var connector = {
  id: 'connector',
  type: 'Straight',
  //Define connector start and end points
  sourcePoint: { x: 100, y: 700 },
  targetPoint: { x: 200, y: 800 },
  shape: { type: 'UmlActivity', flow: 'Exception' }
};
diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  connectors: [connector],
}, '#element');
```

Group in ##Platform_Name## Diagram control

Group is used to cluster multiple nodes and connectors into a single element. It acts like a container for its children (nodes, groups, and connectors). Every change made to the group also affects the children. Child elements can be edited individually.

Create group

Add group when initializing diagram

A group can be added to the diagram model through [nodes](#) collection. To define an object as group, add the child objects to the [children](#) collection of the group. The following code illustrates how to create a group node.

- The [padding](#) property of a group node defines the spacing between the group node's edges and its children.
- While creating group, its child node need to be declared before the group declaration.
- Add a node to the existing group child by using the `diagram.group` method.
- The group's `diagram.unGroup` method is used to define whether the group can be ungrouped or not.
- A group can be added into a child of another group.

INDEX.JS

```

var nodes = [{
    id: "rectangle1",
    offsetX: 100,
    offsetY: 100,
    width: 100,
    height: 100,
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    },
    annotations: [{
        content: 'rectangle1'
    }]
}, {
    id: "rectangle2",
    offsetX: 200,

```

```

        offsetY: 200,
        width: 100,
        height: 100,
        style: {
            strokeColor: '#6BA5D7',
            fill: '#6BA5D7'
        },
        annotations: [{
            content: 'rectangle2'
        }]
    },
    {
        id: 'group',
        children: ['rectangle1', 'rectangle2'],
        padding: {left: 10, right: 10, top: 10, bottom: 10}
    },
];
var diagram = new ej.diagrams.Diagram({
    width: '1500px',
    height: '600px',
    getNodeDefaults: function(node) {
        node.height = 100;

Add group at runtime

A group node can be added at runtime by using the client-side method `diagram.add`.

The following code illustrates how a group node is added at runtime.

INDEX.JS

```
var nodes = [{
  id: "rectangle1",
  offsetX: 100,
  offsetY: 100,
  width: 100,
  height: 100,
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7'
  },
  annotations: [{
    content: 'rectangle1'
  }]
}, {
  id: "rectangle2",
  offsetX: 200,
  offsetY: 200,
  width: 100,
  height: 100,
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7'
  },
  annotations: [{
    content: 'rectangle2'
  }]
},
];

var group = {
  id: 'group',
  children: ['rectangle1', 'rectangle2']
};

var diagram = new ej.diagrams.Diagram({
  width: '1500px',
  height: '600px',
  getNodeDefaults: function(node) {
    node.height = 100;
    node.width = 100;
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
  },
  nodes: nodes,
}, '#element');

diagram.add(group);
```

Add children To group at runtime

A childNode can be added to the specified Group at runtime by utilizing the client-side method `diagram.addChildToGroup`.

This functionality is achieved by passing the group and existing children as arguments to the method.

The following code illustrates how a child node and a group node can be passed as arguments to the method and executed at runtime.

```
`html
```

```
diagram.addChildToGroup(groupNode, childNode);
```

```
,
```

Remove children from group at runtime

A specific child from a group node can be removed at runtime by utilizing the client-side method `diagram.removeChildFromGroup`.

This functionality is achieved by passing the group and its children as arguments to the method.

The following code illustrates how a child node is removed from a group at runtime.

`html

diagram.removeChildFromGroup (groupNode, childNode);

`

INDEX.JS

```
var diagram;
var node = {
  id: 'node1', width: 150, height: 100, offsetX: 100, offsetY: 100,
  annotations: [{ content: 'Node1' }]
};
var node2 = {
  id: 'node2', width: 80, height: 130, offsetX: 200, offsetY: 200,
  annotations: [{ content: 'Node2' }]
};
var group = {
  id: 'group1', children: ['node1', 'node2']
};
var node3 = {
  id: 'node3', width: 100, height: 100, offsetX: 300, offsetY: 300,
  annotations: [{ content: 'Node3' }]
};
//Initializes diagram control
diagram = new ej.diagrams.Diagram({
  width: 900,
  height: 900,
  nodes: [node, node2, node3, group],
}, '#element');
//To Add child to specific group at Runtime
diagram.addChildToGroup(group, 'node3');
//To remove the specific children from group at runtime
diagram.removeChildFromGroup(group, 'node3');
```

Container

Containers are used to automatically measure and arrange the size and position of the child elements in a predefined manner. There are two types of containers available.

Canvas

- The canvas panel supports absolute positioning and provides the least layout functionality to its contained diagram elements.
- Canvas allows you to position its contained elements by using the margin and alignment properties.
- Rendering alone possible in canvas container.
- It allows elements to be either vertically or horizontally aligned.
- Child can be defined with the collection [canvas.children](#) property.
- Basic element can be defined with the collection of [basicElements](#).

The following code illustrates how to add canvas panel.

INDEX.JS

```

var diagram;
var canvas;
var child1;
var child2;
canvas = new ej.diagrams.Canvas();
canvas.pivot = {
    x: 0,
    y: 0
};
canvas.offsetX = 200;
canvas.offsetY = 100;

```

```

canvas.style.fill = '#6BA5D7';
child1 = new ej.diagrams.DiagramElement();
child1.width = 100;
child1.height = 100;
child1.margin.left = child1.margin.top = 10;
child2 = new ej.diagrams.DiagramElement();
child2.width = 100;
child2.height = 100;
child2.margin.left = 190;
child2.margin.top = 190;
canvas.children = [child1, child2];
diagram = new ej.diagrams.Diagram({
    mode: 'SVG',
    width: '1000px',
    height: '600px',
    basicElements: [canvas]
}, '#element');
```

  ele.style.visibility = "visible";
}
  </script>
```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Stack

- Stack panel is used to arrange its children in a single line or stack order, either vertically or horizontally.
- It controls spacing by setting margin properties of child and padding properties of group. By default, a stack panel's [orientation](#) is vertical.

The following code illustrates how to add a stack panel.

INDEX.JS

```

var diagram;
var nodes = [{
  id: "node5",
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
  style: {
    strokeColor: "#6BA5D7",
    fill: "#6BA5D7"
  },
  annotations: [{
    content: "Custom Template",
    offset: {
      y: 1
    },
    verticalAlignment: "Top"
  }]
}];
var count = 11;
var getTextElement = function(text) {
  var textElement = new ej.diagrams.TextElement();
  textElement.id = "text" + count;
  textElement.width = 50;
  textElement.height = 20;
  textElement.content = text;
  count++;
  return textElement;
};
var addRows = function(column) {
  column.children.push(getTextElement("Row1"));
  column.children.push(getTextElement("Row2"));
  column.children.push(getTextElement("Row3"));
  column.children.push(getTextElement("Row4"));
};
//Initializes diagram control
diagram = new ej.diagrams.Diagram({
  width: 900,
  height: 900,
  nodes: nodes,

```

```

setNodeTemplate: function(obj, diagram) {
    if (obj.id.indexOf("node5") !== -1) {
        var table = new ej.diagrams.StackPanel();
        table.orientation = "Horizontal";
        var column1 = new ej.diagrams.StackPanel();
        column1.children = [];
        column1.children.push(getTextElement("Column1"));
        addRows(column1);
        var column2 = new ej.diagrams.StackPanel();
        column2.children = [];
        column2.children.push(getTextElement("Column2"));
        addRows(column2);
        table.children = [column1, column2];
        return table;
    }
    return null;
},
}, '#element');

```

Difference between a basic group and containers

| Group | Container |

| ----- | ----- |

| It arranges the child elements based on the child elements position and size properties. | Each container has a predefined behavior to measure and arrange its child elements. Canvas and stack containers are supported in the diagram. |

| The Padding, Min, and Max Size properties are not applicable for basic group. | It is applicable for container. |

| The Children's margin and alignment properties are not applicable for basic group. | It is applicable for container. |

Interaction

You can edit the group and its children at runtime. For more information about how to interact with a group, refer to [Edit Groups](#).

Swim lane in ##Platform_Name## Diagram control

Swimlane is a type of diagram nodes, which is typically used to visualize the relationship between a business process and the department responsible for it by focusing on the logical relationships between activities.

Create a swimlane

To create a swimlane, the type of shape should be set as [swimlane](#). By Default swimlane's are arranged vertically.

The following code example illustrates how to define a swimlane object.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
      },
    ],
  },
}

```

```

        ],
        phases: [
            {
                id: 'phase1', offset: 170,
                header: { annotation: { content: 'Phase' } }
            },
        ],
        phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');

```

INDEX.HTML

```

```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Headers

Header was the primary element for swimlanes. The [header](#) property of swimlane allows you to define its textual description and to customize its appearance.

Note: By using this header, the swimlane interaction will be performed, like selection, dragging, etc.

The following code example illustrates how to define a swimlane header.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } }
      },
    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization of headers

The height and width of swimlane header can be customized with [weight](#) and [height](#) properties of swimlane header. set fill color of header by using the [style](#) property. The orientation of swimlane can be customized with the [orientation](#) property of the header.

Note: By default the swimlane orientation has Horizontal.

The following code example illustrates how to customize the swimlane header.

INDEX.JS

```

var node = {
    shape: {
        type: 'SwimLane',
        orientation: 'Horizontal',
        // customize the swimlane header
        header: {
            annotation: { content: 'SALES PROCESS FLOW CHART', },
            height: 70, style: { fontSize: 11 }, style: { fill: 'pink' }
        },
    },
},

```

```

        lanes: [
            {
                id: 'stackCanvas1',
                height: 100,
            },
        ],
        phases: [
            {
                id: 'phase1', offset: 170,
                header: { annotation: { content: 'Phase' } }
            },
        ],
        phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');

```

INDEX.HTML

```

```

Dynamic customization of swimlane header

You can customize the swimlane header style and text properties dynamically. The following code illustrates how to dynamically customize the lane header.

INDEX.JS

```

var node = {
    shape: {
        type: 'SwimLane',
        orientation: 'Horizontal',
        // customize the swimlane header
        header: {
            annotation: { content: 'SALES PROCESS FLOW CHART', },
            height: 70, style: { fontSize: 11 }, style: { fill: 'pink' }
        },
        lanes: [
            {
                id: 'stackCanvas1',
                height: 100,
            },
            {
                phases: [
                    {
                        id: 'phase1', offset: 170,
                        header: { annotation: { content: 'Phase' } }
                    },
                ],
                phaseSize: 20,
            },
        ],
        offsetX: 300, offsetY: 200,
        height: 200,
        width: 350
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
diagram.nodes[0].shape.header.style.fill = 'red'
diagram.dataBind();

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

Header editing

Diagram provides the support to edit swimlane headers at runtime. We achieve the header editing by double click event. Double clicking the header label will enables the editing of that. The following image illustrates how to edit the swimlane header.

Lanes

Lane is a functional unit or a responsible department of a business process that helps to map a process within the functional unit or in between other functional units.

The number of [lanes](#) can be added to swimlane. The lanes are automatically stacked inside swimlane based on the order they are added.

Create an empty lane

- The lane `id` is used to define the name of the lane and its further used to find the lane at runtime and do any customization.
- We can provide additional information to the lane by using the [addInfo](#) property of the lane.

The following code example illustrates how to define a swimlane with lane.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },

```

```

    },
    // initialize the lane of swimlane
    lanes: [
        {
            id: 'stackCanvas1',
            // set the lane height
            height: 100,
        },
    ],
    phases: [
        {
            id: 'phase1', offset: 170,
            header: { annotation: { content: 'Phase' } }
        },
    ],
    phaseSize: 20,
},
offsetX: 300, offsetY: 200,
height: 200,
width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');

```

INDEX.HTML

```

```

Create lane header

- The [header](#) property of lane allows you to textually describe the lane and to customize the appearance of the description.

The following code example illustrates how to define a lane header.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } } },
      height: 50, style: { fontSize: 11 },
    },
    // Intialize lane to swimlane
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
        // Intialize header to lane
        header: {
          annotation: { content: 'CUSTOMER' }, width: 50,
          style: { fontSize: 11 }
        },
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } } }
    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
}

```

```

    };
    // initialize Diagram component
    var diagram = new ej.diagrams.Diagram({
        width: '100%', height: '600px', nodes: [node]
    });
    diagram.appendTo('#element');

```

INDEX.HTML

```

```

Customizing lane header

- The size of lane can be controlled by using [width](#) and [height](#) properties of lane.
- The appearance of lane can be set by using the [style](#) properties.

The following code example illustrates how to customize the lane header.

INDEX.JS

```
var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
        // customization of lane header
        header: {
          annotation: { content: 'Online Consumer' }, width:
30,
          style: { fontSize: 11 },style: { fill: 'red' }
        },
      },
    ],
    phases: [
      {
        id: 'phase1', offset: 170,
        header: { annotation: { content: 'Phase' } }
      },
    ],
    phaseSize: 20,
  },
  offsetX: 300, offsetY: 200,
  height: 200,
  width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
```

INDEX.HTML

```

Dynamic customization of lane header

You can customize the lane header style and text properties dynamically. The following code illustrates how to dynamically customize the lane header.

INDEX.JS

```

var node = {
    shape: {
        type: 'SwimLane',
        orientation: 'Horizontal',
        //Intialize header to swimlane
        header: {
            annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
            height: 50, style: { fontSize: 11 },
        },
        lanes: [
            {
                id: 'stackCanvas1',
                height: 100,
                // customization of lane header
                header: {
                    annotation: { content: 'Online Consumer' }, width:
30,
                    style: { fontSize: 11 },style: { fill: 'red' }
                },
            },
        ],
    },
};

```

```

        },
        ],
        phases: [
            {
                id: 'phase1', offset: 170,
                header: { annotation: { content: 'Phase' } }
            },
        ],
        phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
var lane = diagram.nodes[0];
lane.shape.lanes[0].header.style.fill = 'blue';
diagram.dataBind();

```

INDEX.HTML

```

```

Add lane at runtime

You can add the a lane at runtime by using the client side API method called `addLanes`. The following code illustrates how to dynamically add lane to swimlane.

You can customize the lane header style and text properties dynamically. The following code illustrates how to dynamically customize the lane header.

INDEX.JS

```
var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        addInfo:{name:'lane1'},
        height: 100,
        header: {
          annotation: { content: 'CUSTOMER' }, width: 50,
          style: { fontSize: 11 }
        },
        // Set the children of lane
        children: [
          {
            id: 'node1',
            annotations: [
              {
                content: 'Consumer learns \n of
product',
                style: { fontSize: 11 }
              }
            ],
            margin: { left: 60, top: 30 },
            height: 40, width: 100,
          }, {
            id: 'node2',
            shape: { type: 'Flow', shape: 'Decision' },
            annotations: [
              {
```

```

        content: 'Does \n Consumer want \nthe
product',
        style: { fontSize: 11 }
    }
    ],
    margin: { left: 200, top: 20 },
    height: 60, width: 120,
    },
    ],
    },
    ],
    phases: [
        {
            id: 'phase1', offset: 170,
            header: { annotation: { content: 'Phase' } }
        },
    ],
    phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
var lane = [{id:"lane1",height:100,}];
diagram.addLanes(diagram.nodes[0],lane,1);

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Add children to lane

To add nodes to lane, you should add [children](#) collection of the lane.

The following code example illustrates how to add nodes to lane.

INDEX.JS

```

var node = {
    shape: {
        type: 'SwimLane',
        orientation: 'Horizontal',
        //Intialize header to swimlane
        header: {
            annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
            height: 50, style: { fontSize: 11 },
        },
        lanes: [
            {
                id: 'stackCanvas1',
                addInfo:{name:'lane1'},
                height: 100,
                header: {
                    annotation: { content: 'CUSTOMER' }, width: 50,
                    style: { fontSize: 11 }
                },
                // Set the children of lane
                children: [
                    {
                        id: 'node1',
                        annotations: [
                            {
                                content: 'Consumer learns \n of
product',
                                style: { fontSize: 11 }
                            }
                        ],
                        margin: { left: 60, top: 30 },
                        height: 40, width: 100,

```

```

        }, {
            id: 'node2',
            shape: { type: 'Flow', shape: 'Decision' },
            annotations: [
                {
                    content: 'Does \n Consumer want \nthe
product',
                    style: { fontSize: 11 }
                }
            ],
            margin: { left: 200, top: 20 },
            height: 60, width: 120,
        },
    ],
    },
    ],
    phases: [
        {
            id: 'phase1', offset: 170,
            header: { annotation: { content: 'Phase' } }
        },
    ],
    phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
var lane = [{id:"lane1",height:100,}];
diagram.addLanes(diagram.nodes[0],lane,1);

```

INDEX.HTML

```

```

Lane interaction

Resizing lane

- Lane can be resized in the bottom and left direction.
- Lane can be resized by using resize selector of the lane.
- Once you can resize the lane, the swimlane will be resized automatically.
- The lane can be resized either resizing the selector or the tight bounds of the child object. If the child node move to edge of the lane it can be automatically resized. The following image

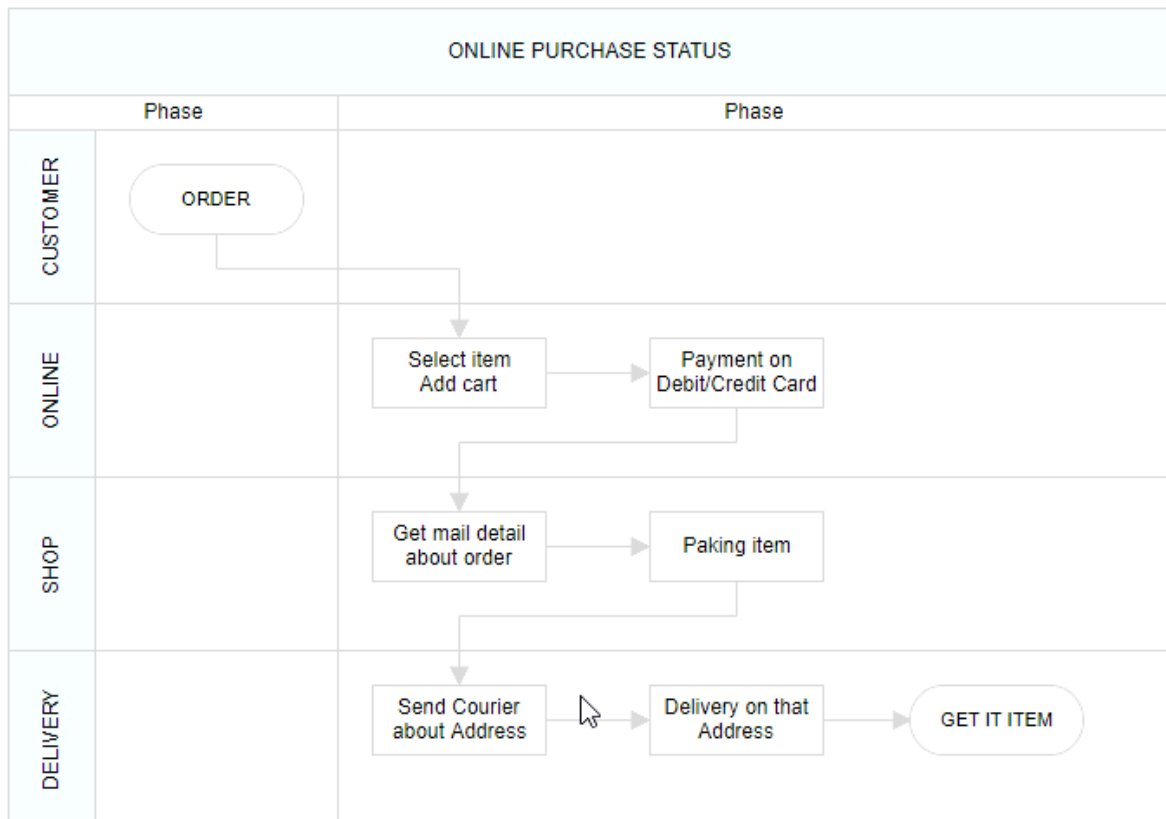

illustrates how resize the lane.

Lane swapping

- Lanes can be swapped using drag the lanes over another lane.

- Helper should intimate the insertion point while lane swapping. The following image illustrates how swapping the lane.

Disable Swimlane Lane swapping

You can disable swimlane lane swapping by using the property called `canMove`.

The following code illustrates how to disable swimlane lane swapping.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
        header: {
          annotation: { content: 'CUSTOMER' }, width: 50,
          style: { fontSize: 11 }
        },
      },
    ],
  },
}

```

```

        canMove: false,
        // Set the children of lane
        children: [
            {
                id: 'node1',
                annotations: [
                    {
                        content: 'Consumer learns \n of
product',
                        style: { fontSize: 11 }
                    }
                ],
                margin: { left: 60, top: 30 },
                height: 40, width: 100,
            }, {
                id: 'node2',
                shape: { type: 'Flow', shape: 'Decision' },
                annotations: [
                    {
                        content: 'Does \n Consumer want \nthe
product',
                        style: { fontSize: 11 }
                    }
                ],
                margin: { left: 200, top: 20 },
                height: 60, width: 120,
            },
        ],
    },
    ],
    phases: [
        {
            id: 'phase1', offset: 170,
            header: { annotation: { content: 'Phase' } }
        },
    ],
    phaseSize: 20,
},
offsetX: 300, offsetY: 200,
height: 200,
width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({

<script src="index.js" type="text/javascript"></script>
</body></html>

```

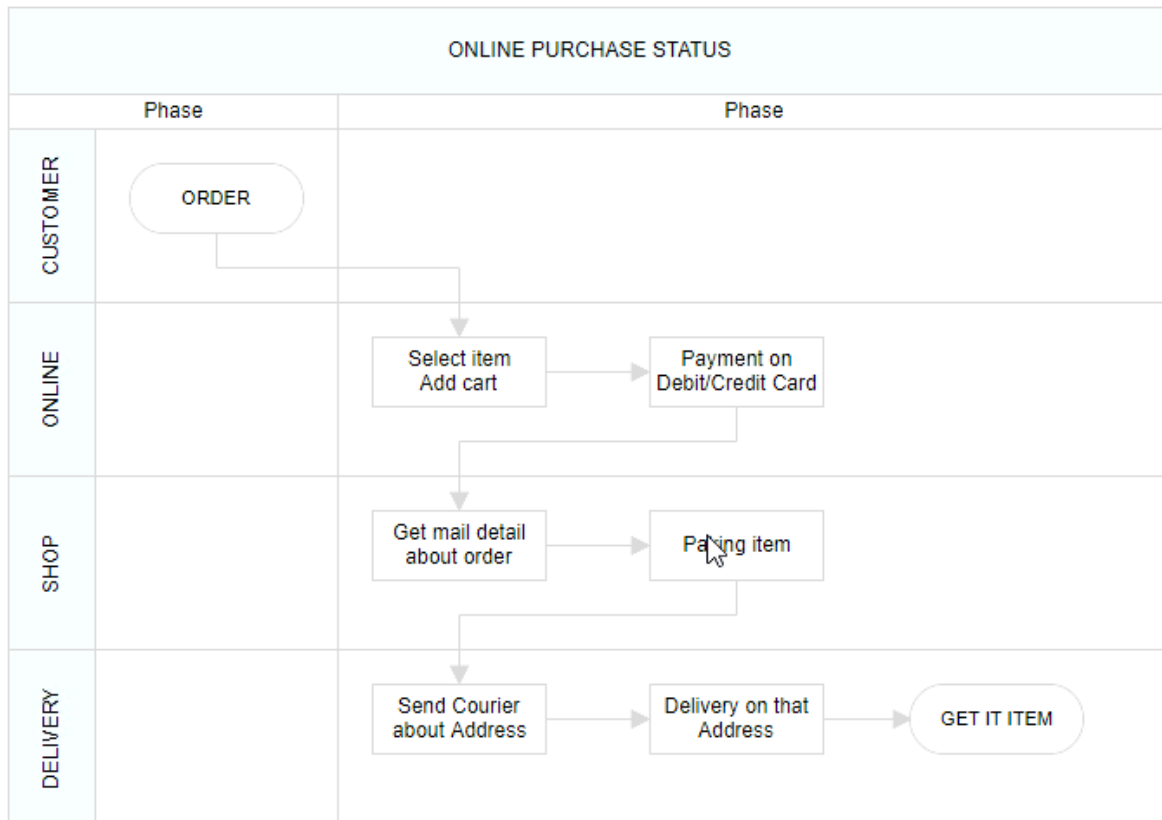

Resize helper

- The special resize helper will be used to resize the lanes.
- The resize cursor will be available on the left and bottom direction alone.
- Once resize the lane the swimlane will be resized automatically

Children interaction in lanes

- You can resize the child node within swimlanes.
- You can drag the child nodes within lane.
- Interchange the child nodes from one lane to another lane.
- Drag and drop the child nodes from lane to diagram.
- Drag and drop the child nodes from diagram to lane.
- Based on the child node interactions, the lane size should be updated.

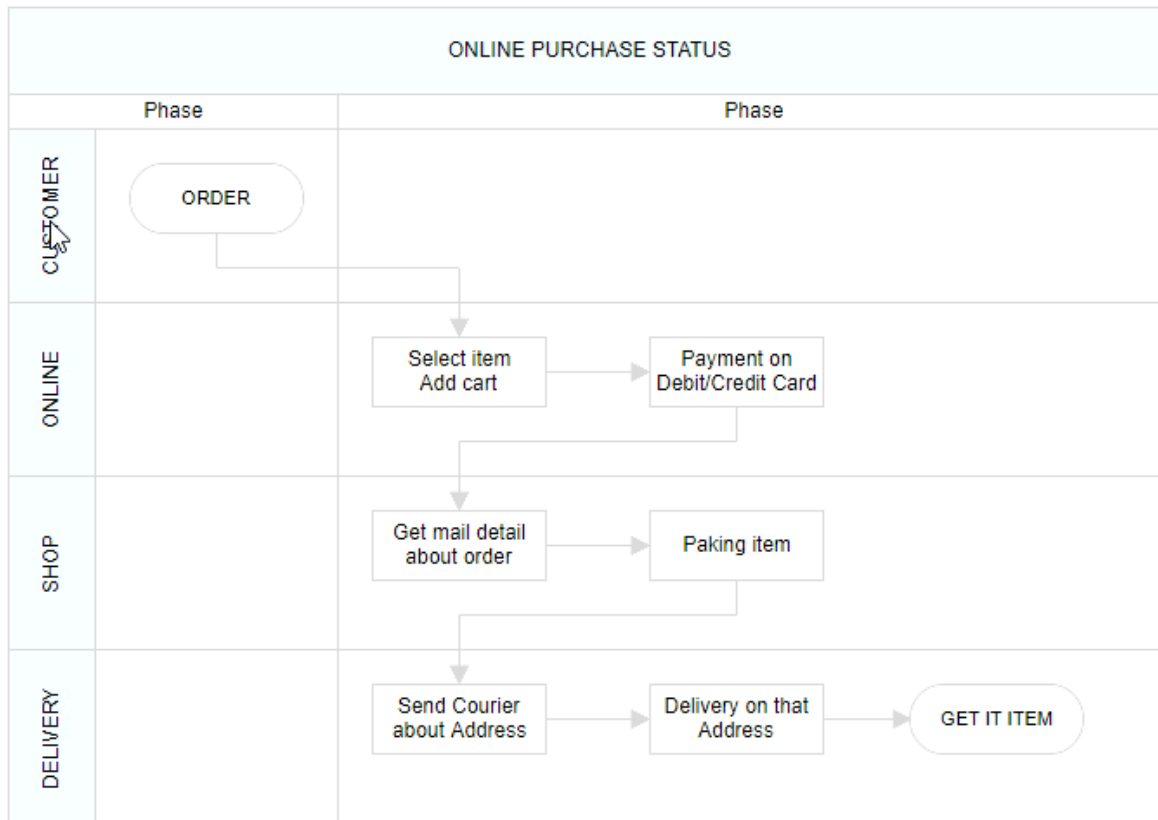

The following image illustrates children interaction in lane.

Lane header editing

Diagram provides the support to edit Lane headers at runtime. We achieve the header editing by double click event. Double clicking the header label will enables the editing of that.

The following image illustrates how to edit the lane header.

Phase

Phase are the subprocess which will split each lanes as horizontally or vertically based on the swimlane orientation. The multiple number of [Phase](#) can be added to swimlane.

The following code example illustrates how to add phase at swimlane.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
        header: {
          annotation: { content: 'CUSTOMER' }, width: 50,
          style: { fontSize: 11 }
        },
        children: [

```

```

        {
            id: 'Order',
            margin: { left: 60, top: 20 },
            height: 40, width: 100
        }
    ],
    },
],
phases: [
    {
        id: 'phase1', offset: 120,
        header: { annotation: { content: 'Phase' } }
    }, {
        id: 'phase2', offset: 200,
        header: { annotation: { content: 'Phase' } }
    },
],
phaseSize: 20,
},
offsetX: 300, offsetY: 200,
height: 200,
width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
diagram.nodes[0].shape.header.style.fill = 'red'
diagram.dataBind();

```

INDEX.HTML

```

```

Dynamically add phase to Lane

You can add the a phase at runtime by using client side API method called **addPhases**. The following code example illustrates how to add phase at run time.

INDEX.JS

```

var node = {
    shape: {
        type: 'SwimLane',
        orientation: 'Horizontal',
        //Intialize header to swimlane
        header: {
            annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
            height: 50, style: { fontSize: 11 },
        },
        lanes: [
            {
                id: 'stackCanvas1',
                height: 100,
                header: {
                    annotation: { content: 'CUSTOMER' }, width: 50,
                    style: { fontSize: 11 }
                },
                children: [
                    {
                        id: 'Order',
                        margin: { left: 60, top: 20 },
                        height: 40, width: 100
                    }
                ]
            },
        ],
        phases: [
            {
                id: 'phase1', offset: 120,
                addInfo:{name:'phase1'},
                header: { annotation: { content: 'Phase' } }
            },
        ],
    },
}

```

```

        id: 'phase2', offset: 200,
        header: { annotation: { content: 'Phase' } }
    },
    ],
    phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
    };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
var phase = [{
    id: 'phase3', offset: 220,
    header: { annotation: { content: 'Phase' } }
}]
diagram.addPhases(diagram.nodes[0], phase);

```

Customizing phase

- The length of region can be set by using the [offset](#) property of the phase.
- Every phase region can be textually described with the [header](#) property of the phase.
- You can increase the width of phase by using [phaseSize](#) property of swimlane.
- We can provide additional information to the phase by using the [addInfo](#) property of the phase.

The following code example illustrates how to customize the phase in swimlane.

INDEX.JS

```

var node = {
  shape: {
    type: 'SwimLane',
    orientation: 'Horizontal',
    //Intialize header to swimlane
    header: {
      annotation: { content: 'ONLINE PURCHASE STATUS', style:
{ fill: '#111111' } },
      height: 50, style: { fontSize: 11 },
    },
    lanes: [
      {
        id: 'stackCanvas1',
        height: 100,
        header: {
          annotation: { content: 'CUSTOMER' }, width: 50,
          style: { fontSize: 11 }
        },
        children: [
          {
            id: 'Order',
            margin: { left: 60, top: 20 },
            height: 40, width: 100
          }
        ]
      },
    ],
  },
  phases: [
    {
      id: 'phase1', offset: 120,
      addInfo:{name:'phase1'},
      header: { annotation: { content: 'Phase' } }
    },{
      id: 'phase2', offset: 200,
      header: { annotation: { content: 'Phase' } }
    },
  ],
}

```

```

        phaseSize: 20,
    },
    offsetX: 300, offsetY: 200,
    height: 200,
    width: 350
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
    width: '100%', height: '600px', nodes: [node]
});
diagram.appendTo('#element');
var phase = [{
    id: 'phase3', offset: 220,
    header: { annotation: { content: 'Phase' } }
}]
diagram.addPhases(diagram.nodes[0], phase);

Phase interaction

Resizing

- The phase can be resized by using its selector.
- You must select the phase header to enable the phase selection.
- Once the phase can be resized, the lane size will be updated automatically.

Resizing helper

- The special resize selector will be used to resize the phase.
- The resize cursor will be available on the left and bottom direction for horizontal, and the top and bottom direction for vertical swimlane.

Phase header editing

Diagram provides the support to edit phase headers at runtime. We achieve the header editing by double click event. Double clicking the header label will enables the editing of that. The following image illustrates how to edit the swimlane header. The following image illustrates how to edit the phase header.

Add swimlane to palette

Diagram provides the support to add swimlane and phases to symbol palette. The following code sample illustrate how to add swimlane and phases to palette.

INDEX.JS

```
/**
 * Default symbol palette sample
 */
//Initialize the flowshapes for the symbol palatte
var swimlaneShapes = [
    {
        id: 'stackCanvas1',
        shape: {
            type: 'SwimLane', lanes: [
                {
                    id: 'lane1',
                    style: { strokeColor: 'black' }, height: 60,
width: 150,
                    header: { width: 50, height: 50, style: {
strokeColor: 'black', fontSize: 11 } },
                }
            ],
            orientation: 'Horizontal', isLane: true
        },
        height: 60,
        width: 140,
        offsetX: 70,
        offsetY: 30,
    }, {
        id: 'stackCanvas2',
        shape: {
            type: 'SwimLane',
            lanes: [
                {
                    id: 'lane1',
                    style: { strokeColor: 'black' }, height: 150,
width: 60,
                    header: { width: 50, height: 50, style: {
strokeColor: 'black', fontSize: 11 } },
                }
            ],
            orientation: 'Vertical', isLane: true
        },
        height: 140,
        width: 60,
        // style: { fill: '#f5f5f5' },
        offsetX: 70,
        offsetY: 30,
    }, {
        id: 'verticalPhase',
        shape: {
            type: 'SwimLane',
            phases: [{ style: { strokeWidth: 1, strokeDashArray:
'3,3', strokeColor: '#A9A9A9' } }, {}],
            annotations: [{ text: '' }],
            orientation: 'Vertical', isPhase: true
        }
    }
];
```

```

        },
        height: 60,
        width: 140
    }, {
        id: 'horizontalPhase',
        shape: {
            type: 'SwimLane',
            phases: [{ style: { strokeWidth: 1, strokeDashArray:

```

Drag and drop swimlane to palette

- The drag and drop support for swimlane shapes has been provided.
- When you drag and drop the lane shape, if the diagram already contains swimlane with the same orientation, the lane will be added and stacked inside a swimlane based on the order. Otherwise, it will be added a new swimlane.
- The phase will only drop on swimlane shape with same orientation. The following image illustrates how to drag symbol from palette.

Limitations

- Connectors cannot be canceled when added directly to swimlane. we must initialize the connector through connector collection.
- We cannot edit the phase line style.

Ports in ##Platform_Name## Diagram control

Diagram provides support to define custom ports for making connections.

<!-- markdownlint-disable MD033 -->

When a connector is connected between two nodes, its end points are automatically docked to the node's nearest boundary as shown in the following image.

Ports act as the connection points of the node and allows to create connections with only those specific points as shown in the following image.

Create port

Add ports when initializing nodes

To add a connection port, define the port object and add it to node's ports collection. The `offset` property of port accepts an object of fractions and used to determine the position of ports. The following code illustrates how to add ports when initializing the node.

INDEX.TS

```
import {
  Diagram,
  NodeModel,
  PortVisibility
} from '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  // Initialize port collection
  ports: [{
```

```

        // Sets the position for the port
        offset: {
            x: 0.5,
            y: 0.5
        },
        visibility: PortVisibility.Visible
    }]
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
```

INDEX.HTML

Add ports at runtime

Add ports at runtime by using the client-side method [addPorts](#). The following code illustrates how to add ports to node at runtime.

The port's ID property is used to define the unique ID for the port and its further used to find the port at runtime.

If ID is not set, then default ID is automatically set.

INDEX.TS

```

import { Diagram, NodeModel, PointPortModel, PortVisibility } from
 '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
};
// Initialize port collection
let port: PointPortModel[] = [{
  id: 'port1',
  offset: {
    x: 0,
    y: 0.5
  },
  visibility: PortVisibility.Visible
}, {
  id: 'port2',
  offset: {
    x: 1,
    y: 0.5
  },
  visibility: PortVisibility.Visible
},
{
  id: 'port3',
  offset: {
    x: 0.5,
    y: 0
  },
  visibility: PortVisibility.Visible
},
{
  id: 'port4',

```

```

        offset: {
            x: 0.5,
            y: 1
        },
        visibility: PortVisibility.Visible
    }
};
// initialize diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
// Method to add ports through run time
diagram.addPorts(diagram.nodes[0], port);

```

INDEX.HTML

```

Remove ports at runtime

Remove ports at runtime by using client-side method [removePorts](#). Refer to the following example which shows how to remove ports at runtime.

INDEX.TS

```
import { Diagram, NodeModel, PointPortModel, PortVisibility } from
 '@syncfusion/ej2-diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white'
  },
  // Initialize port collection
  ports: [{
    id: 'port1',
    offset: {
      x: 0,
      y: 0.5
    },
    visibility: PortVisibility.Visible
  },
  {
    id: 'port2',
    offset: {
      x: 1,
      y: 0.5
    },
    visibility: PortVisibility.Visible
  },
  {
    id: 'port3',
    offset: {
      x: 0.5,
      y: 0
    },
    visibility: PortVisibility.Visible
  },
  {
    id: 'port4',
    offset: {
      x: 0.5,
      y: 1
    },
    visibility: PortVisibility.Visible
  }
  ]
}
```

```

    }
  ]
};
// initialize diagram component
let diagram: Diagram = new Diagram({
  width: '100%',
  height: '600px',
  nodes: [node]
});
// render initialized diagram
diagram.appendTo('#element');
let ports: PointPortModel[] = [{
  id: 'port1',
}, {
  id: 'port2',
}, {
  id: 'port3',
}, {
  id: 'port4',
}]
diagram.removePorts(diagram.nodes[0], ports);

```

INDEX.HTML

```

Update port at runtime

You can change any port properties at runtime and update it through the client-side method [dataBind](#).

The following code example illustrates how to change the port properties.

INDEX.TS

```

import { Diagram, NodeModel, PortVisibility } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
        fill: '#6BA5D7',
        strokeColor: 'white'
    },
    // Initialize port collection
    ports: [{
        offset: {
            x: 0.5,
            y: 0.5
        },
        visibility: PortVisibility.Visible
    }]
};
// initialize Diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized Diagram
diagram.appendTo('#element');
diagram.nodes[0].ports[0].offset = {
    x: 1,
    y: 1
};
diagram.dataBind();

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

</body></html>

```

Appearance

- The shape of port can be changed by using its shape property. To explore the different types of port shapes, refer to Port Shapes. If you need to render a custom shape, then you can set shape as path and define path using path data property of port.
- The appearance of ports can be customized by using [strokeColor](#), [strokeWidth](#), and [fill](#) properties of the port.
- Customize the port size by using the [width](#) and [height](#) properties of port.
- The ports [visibility](#) property allows you to define, when the port should be visible.

The following code illustrates how to change the appearance of port.

INDEX.TS

```

import { Diagram, NodeModel, PortVisibility } from '@syncfusion/ej2-
diagrams';
// A node is created and stored in nodes array.
let node: NodeModel = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: {
        fill: '#6BA5D7',
        strokeColor: 'white'
    },
    // Initialize port collection
    ports: [{
        offset: {
            x: 1,
            y: 0.5
        },
        visibility: PortVisibility.Visible,
        //Set the style for the port
        style: {
            fill: 'red',
            strokeWidth: 2,
            strokeColor: 'black'
        },
        width: 12,
        height: 12,
        // Sets the shape of the port as Circle
        shape: 'Circle'
    }]
};
// initialize Diagram component
let diagram: Diagram = new Diagram({
    width: '100%',
    height: '600px',
    // Add node
    nodes: [node]
});
// render initialized Diagram
diagram.appendTo('#element');

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Offset

The offset property of port is used to align the port based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

Constraints

The constraints property allows to enable/disable certain behaviors of ports. For more information about port constraints, refer to [Port Constraints](#).

Grid lines in ##Platform_Name## Diagram control

Gridlines are the pattern of lines drawn behind the diagram elements. It provides a visual guidance while dragging or arranging the objects on the diagram surface.

The model's [snapSettings](#) property is used to customize the gridlines and control the snapping behavior in the diagram.

Customize the gridlines visibility

The [snapSettings.snapConstraints](#) enables you to show/hide the gridlines. The following code example illustrates how to show or hide gridlines.

If you need to enable snapping, then inject snapping module into the diagram.

INDEX.JS

```

var snapSettings = {
    constraints: (ej.diagrams.SnapConstraints.ShowLines)
};

```

```
var diagram = new ej.diagrams.Diagram({
  width: '800px',
  height: '500px',
  snapSettings: snapSettings
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
diagrams/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/fabric.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

To show only horizontal/vertical gridlines or to hide gridlines, refer to [Constraints](#).

Appearance

The appearance of the gridlines can be customized by using a set of predefined properties.

- The [horizontalGridLines](#) and the [verticalGridLines](#) properties allow to customize the appearance of the horizontal and vertical gridlines respectively.

- The horizontal gridlines [lineColor](#) and [lineDashArray](#) properties are used to customizes the line color and line style of the horizontal gridlines.
- The vertical gridlines [lineColor](#) and [lineDashArray](#) properties are used to customizes the line color and line style of the vertical gridlines.

The following code example illustrates how to customize the appearance of gridlines.

INDEX.JS

```
var snapSettings = {
  constraints: (ej.diagrams.SnapConstraints.ShowLines),
  horizontalGridlines: {
    lineColor: 'blue',
    lineDashArray: '2 2'
  },
  verticalGridlines: {
    lineColor: 'blue',
    lineDashArray: '2 2'
  }
};
var diagram = new ej.diagrams.Diagram({
  width: '800px',
  height: '500px',
  snapSettings: snapSettings
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Line intervals

Thickness and the space between gridlines can be customized by using horizontal gridlines's [linesInterval](#) and vertical gridlines's [linesInterval](#) properties. In the lines interval collections, values at the odd places are referred as the thickness of lines and values at the even places are referred as the space between gridlines.

The following code example illustrates how to customize the thickness of lines and the line intervals.

INDEX.JS

```

var snapSettings = {
  constraints: (ej.diagrams.SnapConstraints.ShowLines),
  horizontalGridlines: { lineIntervals:[1.25, 14, 0.25, 15, 0.25, 15,
0.25, 15, 0.25, 15],lineColor: 'blue', lineDashArray: '2 2' },
  verticalGridlines: { lineIntervals:[1.25, 14, 0.25, 15, 0.25, 15, 0.25,
15, 0.25, 15],lineColor: 'blue', lineDashArray: '2 2' }
};
var diagram = new ej.diagrams.Diagram({
  width: '800px', height: '500px',
  snapSettings: snapSettings
}, '#element');

```

INDEX.HTML

```

```

Snapping

Snap to lines

This feature allows the diagram objects to snap to the nearest intersection of gridlines while being dragged or resized. This feature enables easier alignment during layout or design.

Snapping to gridlines can be enabled/disabled with the [snapSettings.snapConstraints](#). The following code example illustrates how to enable/disable the snapping to gridlines.

INDEX.JS

```

let nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    }
}];
var snapSettings = {
    constraints: (ej.diagrams.SnapConstraints.SnapToLines) |
(ej.diagrams.SnapConstraints.ShowLines)
};
var diagram = new ej.diagrams.Diagram({
    width: '800px',
    height: '500px',
    nodes: nodes,
    getNodeDefaults: function(node) {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
    }
});

```

```

        return node;
    },
    snapSettings: snapSettings
}, '#element');
```

INDEX.HTML

</body></html>
```

Customization of snap intervals

By default, the objects are snapped towards the nearest gridline. The gridline or position towards where the diagram object snaps can be customized with the horizontal gridlines's [snapInterval](#) and the vertical gridlines's [snapInterval](#) properties.

INDEX.JS

```
let nodes = [{
```

```

    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    }
  }];
var snapSettings = {
  horizontalGridlines: {
    snapIntervals: [10]
  },
  verticalGridlines: {
    snapIntervals: [10]
  },
  constraints: (ej.diagrams.SnapConstraints.All)
};
var diagram = new ej.diagrams.Diagram({
  width: '800px',
  height: '500px',
  getNodeDefaults: function(node) {
    node.height = 100;
    node.width = 100;
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
  },
  nodes: nodes,
  snapSettings: snapSettings
}, '#element');
```

INDEX.HTML

Snap to objects

The snap to object provides visual cues to assist with aligning and spacing diagram elements. A node can be snapped with its neighboring objects based on certain alignments. Such alignments are visually represented as smart guides.

The [snapObjectDistance](#) property allows you to define minimum distance between the selected object and the nearest object.

The [snapAngle](#) property allows you to define the snap angle by which the object needs to be rotated.

The [snapConstraints](#) property allows you to enable or disable the certain features of the snapping, refer to [snapConstraints](#).

The [snapLineColor](#) property allows you to define the color of the snapline.

INDEX.JS

```

let nodes = [{
    id: 'node1',
    width: 100,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    }
}];
var snapSettings = {
    snapObjectDistance: 10,
    snapAngle: 10,
    snapLineColor: 'red'
};
var diagram = new ej.diagrams.Diagram({
    width: '800px',
    height: '500px',
    nodes: nodes,

```

```

getNodeDefaults: function(node) {
    node.height = 100;
    node.width = 100;
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
},
snapSettings: snapSettings
}, '#element');

```

Page settings in ##Platform_Name## Diagram control

Page settings enable to customize the appearance, width, and height of the diagram page.

Page size and appearance

- The size and appearance of the diagram pages can be customized with the page settings property.
- The [width](#) and [height](#) properties of page settings define the size of the page and based on the size, the [orientation](#) will be set for the page. In addition to that, the appearance of the page can be customized with [source](#) and set of appearance specific properties.
- The [color](#) property is used to customize the background color and border color of the page.
- The [margin](#) property is used to define the page margin.
- To explore those properties, refer to [Page Settings](#).

INDEX.JS

```
var diagram;
var connector = {
  id: 'connector1',
  sourceID: 'node1',
  targetID: 'node2',
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7'

```

Multiple page and page breaks

When multiple page is enabled, the size of the page dynamically increases or decreases in multiples of page width and height and completely fits diagram within the page boundaries. Page breaks is used as a visual guide to see how pages are split into multiple pages.

The [multiplePage](#) and [showPageBreak](#) properties of page settings allow you to enable/disable multiple pages and page breaks respectively.

The following code illustrates how to enable multiple page and page break lines.

INDEX.JS

```

var diagram;
var connector = {
    id: 'connector1',
    sourceID: 'node1',
    targetID: 'node2',
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    },
};
var node = {
    id: 'node1',

Boundary constraints

The diagram provides support to restrict/customize the interactive region, out of which the elements cannot be dragged, resized, or rotated. The [boundaryConstraints](#) property of page settings allows you to customize the interactive region. To explore the boundary constraints, refer to [Boundary Constraints](#).

The following code example illustrates how to define boundary constraints with respect to the page.

INDEX.JS

```

var diagram;
var connector = {
  id: 'connector1',
  sourcePoint: {
    x: 300,

```

```
        y: 100
      },
      targetPoint: {
        x: 400,
        y: 100
      }
    }
  };
  var node = {
    id: 'node1',
    width: 150,
    height: 100,
    offsetX: 100,
    offsetY: 100,
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7'
    },
  },
};
  var node2 = {
    id: 'node2',
    width: 80,
    height: 130,
    offsetX: 200,
    offsetY: 200,
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7'
    },
  },
};
  var node3 = {
    id: 'node3',
    width: 100,
    height: 75,
    offsetX: 300,
    offsetY: 350,
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7'
    },
  },
};
  diagram = new ej.diagrams.Diagram({
    width: 800,
    height: 800,
    nodes: [node, node2, node3],
    connectors: [connector],
    pageSettings: {
      boundaryConstraints: 'Page',
      width: 400,
      height: 400,
      getNodeDefaults: function(node) {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
      },
      getConnectorDefaults: function(obj) {
```

```

        obj.style.strokeColor = '#6BA5D7';
        obj.style.fill = '#6BA5D7';
        obj.style.strokeWidth = 2;
        obj.targetDecorator.style.fill = '#6BA5D7';
        obj.targetDecorator.style.strokeColor = '#6BA5D7';
        return obj;
    },
    showPageBreaks: true,
},
}, '#element');

```

INDEX.HTML

Scroll settings in ##Platform_Name## Diagram control

The diagram can be scrolled by using the vertical and horizontal scrollbars. In addition to the scrollbars, mousewheel can be used to scroll the diagram. Diagram's [scrollSettings](#) enable you to read the current scroll status, view port size, current zoom, and zoom factor. It also allows you to scroll the diagram programmatically.

Get current scroll status

Scroll settings allow you to read the scroll status, [viewPortWidth](#), [viewPortHeight](#), and [currentZoom](#) with a set of properties. To explore those properties, see [Scroll Settings](#).

Define scroll status

Diagram allows you to pan the diagram before loading, so that any desired region of a large diagram is made to view. You can programmatically pan the diagram with the [horizontalOffset](#) and [verticalOffset](#) properties of scroll settings. The following code illustrates how to set pan the diagram programmatically.

In the following example, the vertical scroll bar is scrolled down by 50 px and horizontal scroll bar is scrolled to right by 100 px.

INDEX.JS

```
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '700px', scrollSettings: {
    horizontalOffset: 100, verticalOffset: 50
  }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Update scroll status

You can programmatically change the scroll offsets at runtime by using the client-side method update. The following code illustrates how to change the scroll offsets and zoom factor at runtime.

INDEX.JS

```
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '700px', scrollSettings: {
    horizontalOffset:100, verticalOffset:50
  }
}, '#element');
//Updates scroll settings
diagram.scrollSettings.horizontalOffset=200;
diagram.scrollSettings.verticalOffset=30
diagram.dataBind();
```

INDEX.HTML

```

AutoScroll

Autoscroll feature automatically scrolls the diagram, whenever the node or connector is moved beyond the boundary of the diagram. So that, it is always visible during dragging, resizing, and multiple selection operations. Autoscroll is automatically triggered when any one of the following is done towards the edges of the diagram.

- Node dragging, resizing
- Connection editing
- Rubber band selection
- Label dragging

The diagram client-side event [ScrollChange](#) gets triggered when the autoscroll (scrollbars) is changed and you can do your own customization in this event.

The autoscroll behavior in your diagram can be enabled/disabled by using the [canAutoScroll](#) property of the diagram. The following code example illustrates how to set autoscroll.

INDEX.JS

```

var nodes = [{
    id: 'node1', width: 100, height: 100, offsetX: 100, offsetY: 100,
    annotations: [{ content: 'Start' }]
}];
var connectors = [{
    id: 'connector1', sourcePoint: { x: 300, y: 100 }, targetPoint: { x:
500, y: 200 },
    style: {
        strokeColor: '#6BA5D7',
        strokeWidth: 2
    },
    targetDecorator: {
        style: {
            fill: '#6BA5D7',
            strokeColor: '#6BA5D7'
        }
    }
}];

```

```

    },
  }];
  var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    nodes: nodes,
    connectors: connectors,
    // set the scroll settings
    scrollSettings: { canAutoScroll: true, scrollLimit: 'Infinity' },
    getNodeDefaults: (node) => {
      node.height = 100;
      node.width = 100;
      node.style.fill = '#6BA5D7';
      node.style.strokeColor = 'white';
      return node;
    }
  }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  }

```

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Autoscroll border

The autoscroll border is used to specify the maximum distance between the object and diagram edge to trigger autoscroll. The default value is set as 15 for all sides (left, right, top, and bottom) and it can be changed by using the [autoScrollBorder](#) property of page settings. The following code example illustrates how to set autoscroll border.

INDEX.JS

```

var nodes = [{
  id: 'Start',
  width: 140,
  height: 50,
  offsetX: 300,
  offsetY: 50,
  annotations: [{
    id: 'labell',
    content: 'Start'
  }],
  shape: {
    type: 'Flow',
    shape: 'Terminator'
  }
}];
var diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '600px',
  nodes: nodes,
  // set the autoScrollBorder
  scrollSettings: { canAutoScroll:
true, autoScrollBorder: { left: 100, right: 100, top: 100, bottom: 100 } },
  getNodeDefaults: (node) => {
    node.height = 100;
    node.width = 100;
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
  },
  '#element');

```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Scroll limit

The scroll limit allows you to define the scrollable region of the diagram. It includes the following options:

- Allows to scroll in all directions without any restriction.
- Allows to scroll within the diagram content.
- Allows to scroll within the specified scrollable area.
- The [scrollLimit](#) property of scroll settings helps to limit the scrolling.

The scrollSettings [scrollableArea](#) allow to extend the scrollable region that is based on the scroll limit.

The following code example illustrates how to specify the scroll limit.

INDEX.JS

```

var nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
        id: 'labell1',
        content: 'Start'
    }],
}],

```

```

    shape: {
        type: 'Flow',
        shape: 'Terminator'
    }
}];
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    nodes: nodes,
    // set the autoScrollBorder
    scrollSettings:{
        canAutoScroll: true,
        //Sets the scroll limit
        scrollLimit: 'infinity'
    },
    getNodeDefaults: (node) => {
        node.height = 100;
        node.width = 100;
        node.style.fill = '#6BA5D7';
        node.style.strokeColor = 'white';
        return node;
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Scroll Padding

The [padding](#) property of scroll settings allows you to extend the scrollable region that is based on the scroll limit.

The following code example illustrates how to set scroll padding to diagram region.

INDEX.JS

```

var nodes = [{
    id: 'Start',
    visible: true,
    backgroundColor: 'black',
    offset: 0, side: 'Right', margin: { top: 0, bottom: 0, left: 25, right:
0 },
    shape: {
        type: 'Flow',
        shape: 'Terminator'
    }
}];
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    nodes: nodes,
    scrollSettings: {
        canAutoScroll: true,
        //Sets the scroll padding
        padding: { right: 50, bottom: 50 }
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Diagram</title>
    <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Scrollable Area

Scrolling beyond any particular rectangular area can be restricted by using the [scrollableArea](#) property of scroll settings. To restrict scrolling beyond any custom region, set the [scrollLimit](#) as “limited”. The following code example illustrates how to customize scrollable area.

INDEX.JS

```

var nodes = [{
    id: 'Start',
    width: 140,
    height: 50,
    offsetX: 300,
    offsetY: 50,
    annotations: [{
        id: 'label1',
        content: 'Start'
    }],
    shape: {
        type: 'Flow',
        shape: 'Terminator'
    }
}];
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '600px',
    nodes: nodes,
    scrollSettings: {
        canAutoScroll: true,
        //Sets the scroll limit
        scrollLimit: 'infinity',
    }
});

```

```

//Sets the scrollable Area
scrollableArea: {
    x: 0,
    y: 0,
    width: 500,
    height: 500
},
getNodeDefaults: (node) => {
    node.height = 100;
    node.width = 100;
    node.style.fill = '#6BA5D7';
    node.style.strokeColor = 'white';
    return node;
}, '#element');

```

INDEX.HTML

```

```

UpdateViewport

The [updateViewPort](#) method is used to update the diagram page and view size at runtime.

Accessibility in ##Platform_Name## Diagram control

Diagram provides built-in compliance with the [WAI-ARIA](#) specifications. WAI-ARIA Accessibility supports are achieved through the attributes like [aria-label](#). It helps to provides information about elements in a document for assistive technology.

The accessibility compliance for the diagram component is outlined below.

Accessibility Criteria	Compatibility
-----	-----
WCAG 2.2 Support	
Section 508 Support	
Screen Reader Support	
Right-To-Left Support	
Color Contrast	
Mobile Device Support	
Keyboard Navigation Support	
Accessibility Checker Validation	
Axe-core Accessibility Validation	
<style> .post .post-content img { display: inline-block; margin: 0.5em 0; } </style>	

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Diagram component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Diagram component:

| Attributes | Purpose |

| --- | --- |

| [aria-label](#) | Provides an accessible name for the Diagram Objects. |

Aria-label

Attribute provides the text label with some default description for below elements in diagram.

<!-- markdownlint-disable MD033 -->

Element	Default description
ResizeNorthWest	Thumb to resize the selected object on the top-left corner.
ResizeNorthEast	Thumb to resize the selected object on the top-right side direction.
ResizeSouthWest	Thumb to resize the selected object on the bottom-left side direction.
ResizeSouthEast	Thumb to resize the selected object on the bottom-right side direction.
ResizeNorth	Thumb to resize the selected object on the top side direction.
ResizeSouth	Thumb to resize the selected object on the bottom side direction.
ResizeWest	Thumb to resize the selected object on the left side direction.
ResizeEast	Thumb to resize the selected object on the right side direction.
ConnectorSourceThumb	Thumb to move the source point of the connector.
ConnectorTargetThumb	Thumb to move the target point of the connector.
RotateThumb	Thumb to rotate the selected object.

Mobile device support

Syncfusion Diagram component are more user-friendly and accessible to individuals using mobile devices, including those with disabilities. These are designed to be responsive, adaptable to various screen sizes and orientations, and touch-friendly.

Screen Reader Support

The Diagram component supports and its information was dictated properly by the screen readers based on the ARIA attributes and content.

Keyboard navigation support

Syncfusion Diagram component support keyboard navigation, allowing users who rely on alternate methods to effortlessly navigate and interact with the component.

Keyboard interaction

The Diagram component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Diagram component.

| **Command** | **Action** |

| --- | --- |

| Ctrl + A | Select All |

| Ctrl + X | Cut |

| Ctrl + C | Copy |

| Ctrl + V | Paste |

| Ctrl + Z | Undo |

| Ctrl + Y | Redo |

| Delete | Delete |

| Up Arrow | Move selected object to up |

| Down Arrow | Move selected object to down |

| Left Arrow | Move selected object to left |

| Right Arrow | Move selected object to right |

| Enter | Start Annotation Edit |

| Escape | End Annotation Edit |

Ensuring accessibility

The Diagram component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Diagram component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Diagram component with accessibility tools.

Tool tip in ##Platform_Name## Diagram control

<!-- markdownlint-disable MD010 -->

In Graphical User Interface (GUI), the tooltip is a message that is displayed when mouse hovers over an element. The diagram provides tooltip support while dragging, resizing, rotating a node, and when the mouse hovers any diagram element.

Default tooltip

By default, diagram displays a tooltip to provide the size, position, and angle related information while dragging, resizing, and rotating. The following images illustrate how the diagram displays the node information during an interaction.

| Drag | Resize | Rotate |

|---|---|---|

Common tooltip for all nodes and connectors

The diagram provides support to show tooltip when the mouse hovers over any node/connector. To show tooltip on mouse over, the [tooltip](#) property of diagram model needs to be set with the tooltip [content](#) and [position](#) as shown in the following example.

INDEX.JS

```
/**
 * Tooltip sample
 */
var diagram;
var node = {
  id: "node1",
  width: 100,
  height: 100,
  annotations: [{
    id: 'label',
    content: 'Rectangle',
    offset: {
      x: 0.5,
      y: 0.5
    },
    style: {
      color: 'white'
    }
  }],
  offsetX: 200,
  offsetY: 200,
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7'
  },
  constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Tooltip,
};
diagram = new ej.diagrams.Diagram({
```

```

width: '650px',
height: '350px',
constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
nodes: [node],
//Defines mouse over tooltip
tooltip: {
  content: 'Nodes',
  position: 'TopLeft'
}
}, '#element');

```

INDEX.HTML

```

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Disable tooltip at runtime

The tooltip on mouse over can be disabled by assigning the [tooltip](#) property as `null`. The following code example illustrates how to disable the mouse over tooltip at runtime.

```
`ts
//Initializes the diagram component
let diagram: Diagram = new Diagram({
width: '100%', height: '350px',
//Disables mouse over tooltip at runtime
tooltip: null
}, '#element');
`
```

Tooltip for a specific node/connector

The tooltip can be customized for each node and connector. Remove the **InheritTooltip** option from the [constraints](#) of that node/connector. The following code example illustrates how to customize the tooltip for individual elements.

INDEX.JS

```
/**
 * Tooltip sample
 */
var diagram;
var node = {
  id: "node1",
  width: 100,
  height: 100,
  annotations: [{
    id: 'label',
    content: 'Rectangle',
    offset: {
      x: 0.5,
      y: 0.5
    },
    style: {
      color: 'white'
    }
  }],
  offsetX: 200,
  offsetY: 200,
  style: {
    strokeColor: '#6BA5D7',
    fill: '#6BA5D7'
  },
  constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Tooltip,
  //Defines mouse over tooltip for a node
  tooltip: {
    //Sets the content of the Tooltip
    content: 'Node1',
    //Sets the position of the Tooltip
  }
}
```

```

        position: 'BottomRight',
        //Sets the tooltip position relative to the node
        relativeMode: 'Object'
    },
};
diagram = new ej.diagrams.Diagram({
    width: '650px',
    height: '350px',
    constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
    nodes: [node],
}, '#element');
```

INDEX.HTML

```

Tooltip for Ports

The tooltip feature has been implemented to support Ports, providing the ability to display information or descriptions when the mouse hovers over them.

To display tooltips on mouseover, set the desired tooltip [content](#) by utilizing the [tooltip](#) property.

Tooltips for Ports can be enabled or disabled using the [PortConstraints](#) Tooltip property.

```
`ts
let ports: [{
  offset: {x: 1,y: 0.5},
  tooltip: {content: 'Port Tootip'},
  //enable Port Tooltip Constraints
  constraints: PortConstraints.Default | PortConstraints.ToolTip,
  //disable Port Tooltip Constraints
  constraints: PortConstraints.Default ~& PortConstraints.ToolTip
}]
`
```

Dynamic modification of tooltip content is supported, allowing you to change the displayed tooltip content during runtime.

```
`ts
{
  //change tooltip content at run time
  diagram.nodes[0].ports[0].tooltip.content = 'New Tooltip Content';
  diagram.databind;
}
`
```

The following image illustrates how the diagram displays tooltips during an interaction with ports:

Here, the code provided below demonstrates the port tooltip Interaction.

INDEX.JS

```

/**Tooltip sample */
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  ports: [{
    offset: { x: 0.5, y: 0.5 }, visibility:
ej.diagrams.PortVisibility.Visible,
    constraints: ej.diagrams.PortConstraints.Default |
ej.diagrams.PortConstraints.Tooltip,
    //Defines mouse over tooltip for a node
    tooltip: {
      content: 'Port Tooltip',
    },
  ]
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip template content

Any text or image can be added to the tooltip, by default. To customize the tooltip layout or to create your own visualized element on the tooltip, template can be used.

The following code example illustrates how to add formatted HTML content to the tooltip.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var node = {
    id: "node1",
    width: 100,
    height: 100,

```

```

    annotations: [{
      id: 'label',
      content: 'Rectangle',
      offset: {
        x: 0.5,
        y: 0.5
      },
      style: {
        color: 'white'
      }
    }],
    offsetX: 200,
    offsetY: 200,
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7'
    },
    constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Tooltip,
    //Defines mouse over tooltip for a node
    tooltip: {
      //Sets the content of the Tooltip
      content: getContent(),
      //Sets the position of the Tooltip
      position: 'TopLeft',
      //Sets the tooltip position relative to the node
      relativeMode: 'Object'
    }
  };
  diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '350px',
    constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
    nodes: [node],
  }, '#element');
  function getContent() {
    var tooltipContent = document.createElement('div');
    tooltipContent.innerHTML = '<div> <rect style="background-color:
#f4f4f4; color: black; border-width:1px;border-style: solid;border-color:
#d3d3d3; border-radius: 8px;white-space: nowrap;"> Tooltip !!! </rect>
</div>';
    return tooltipContent;
  }

```

INDEX.HTML

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip alignments

Tooltip relative to object

The diagram provides support to show tooltip around the node/connector that is hovered by the mouse. The tooltip can be aligned by using the [position](#) property of the tooltip. The [relativeMode](#) property of the tooltip defines whether the tooltip has to be displayed around the object or at the mouse position.

The following code example illustrates how to position the tooltip around object.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var node = {
    id: "node1",
    width: 100,
    height: 100,
    annotations: [{
        id: 'label',
        content: 'Rectangle',
        offset: {
            x: 0.5,

```

```

        y: 0.5
      },
      style: {
        color: 'white'
      }
    }],
    offsetX: 200,
    offsetY: 200,
    style: {
      strokeColor: '#6BA5D7',
      fill: '#6BA5D7'
    },
    constraints: (ej.diagrams.NodeConstraints.Default &
~ej.diagrams.NodeConstraints.InheritTooltip) |
ej.diagrams.NodeConstraints.Tooltip,
    //Defines mouse over tooltip for a node
    tooltip: {
      //Sets the content of the Tooltip
      content: 'Node1',
      //Sets the position of the Tooltip
      position: 'BottomRight',
      //Sets the tooltip position relative to the node
      relativeMode: 'Object'
    },
  },
};
diagram = new ej.diagrams.Diagram({
  width: '100%',
  height: '350px',
  constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
  nodes: [node],
}, '#element');
```

INDEX.HTML

```

</body></html>

```

Tooltip relative to mouse position

To display the tooltip at mouse position, need to set **mouse** option to the [relativeMode](#) property of the tooltip.

The following code example illustrates how to show tooltip at mouse position.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
var node = {
    id: "node1",
    width: 100,
    height: 100,
    annotations: [{
        id: 'label',
        content: 'Rectangle',
        offset: {
            x: 0.5,
            y: 0.5
        },
        style: {
            color: 'white'
        }
    }],
    offsetX: 200,
    offsetY: 200,
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7'
    },
},

```

```

    constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Tooltip,
    //Defines mouse over tooltip for a node
    tooltip: {
        //Sets the content of the Tooltip
        content: 'Node1',
        //Sets the tooltip position relative to the node
        relativeMode: 'Mouse'
    },
};
diagram = new ej.diagrams.Diagram({
    width: '650px',
    height: '350px',
    constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
    nodes: [node],
}, '#element');
```

INDEX.HTML

if(ele) {
```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Tooltip animation

To animate the tooltip, a set of specific animation effects are available, and it can be controlled by using the [animation](#) property. The animation property also allows you to set delay, duration, and various other effects of your choice.

INDEX.JS

```

/**
 * Tooltip sample
 */
var diagram;
diagram = new ej.diagrams.Diagram({
    width: '650px',
    height: '350px',
    constraints: ej.diagrams.DiagramConstraints.Default |
ej.diagrams.DiagramConstraints.Tooltip,
    //Defines nodes
    nodes: [{
        id: "node1",
        width: 100,
        height: 100,
        annotations: [{
            id: 'label',
            content: 'Rectangle',
            offset: {
                x: 0.5,
                y: 0.5
            },
            style: {
                color: 'white'
            }
        }],
        offsetX: 200,
        offsetY: 200,

User handle in ##Platform_Name## Diagram control

- User handles are used to add some frequently used commands around the selector. To create user handles, define and add them to the [userHandles](#) collection of the [selectedItems](#) property.
- The name property of user handle is used to define the name of the user handle and its further used to find the user handle at runtime and do any customization.

Alignment

User handles can be aligned relative to the node boundaries. It has [margin](#), [offset](#), [side](#), [horizontalAlignment](#), and [verticalAlignment](#) settings. It is quite tricky when all four alignments are used together but gives more control over alignment.

Offset for user handle

The [offset](#) property of [userHandles](#) is used to align the user handle based on fractions. 0 represents top/left corner, 1 represents bottom/right corner, and 0.5 represents half of width/height.

Side

The [side](#) property of [userHandles](#) is used to align the user handle by using the [Top](#), [Bottom](#), [Left](#), and [Right](#) options.

Horizontal and vertical alignments

The [horizontalAlignment](#) property of [userHandles](#) is used to set how the user handle is horizontally aligned at the position based on the [offset](#). The [verticalAlignment](#) property is used to set how user handle is vertically aligned at the position.

Margin for the user handle

Margin is an absolute value used to add some blank space in any one of its four sides. The [userHandles](#) can be displaced with the [margin](#) property.

Appearance

The appearance of the user handle can be customized by using the [size](#), [borderColor](#), [backgroundColor](#), [visible](#), [pathData](#), and [pathColor](#) properties of the [userHandles](#).

INDEX.JS

```

var shape = { type: 'Basic', shape: 'Rectangle' };
var node1 = { id: 'node', offsetX: 100, offsetY: 100, shape: shape };

Fixed user handles

The fixed user handles are used to add some frequently used commands around the node and connector even without selecting it.

Initialization an fixed user handles

To create the fixed user handles, define and add them to the collection of nodes and connectors property. The following code example used to create an fixed user handles for the nodes and connectors.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  fixedUserHandles: [{ margin: { right: 20 }, pathData: 'M60.3,18H27.5c-
3,0-5.5,2.4-5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,0-5.5,2.4-
5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-
5.5V34.4C73.9,31.4,71.5,28.9,68.5,28.9z M68.5,72.5h-30V34.4h30V72.5z' }]
};
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Diagram</title>
  <meta charset="utf-8">

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

- The id property of fixed user handle is used to define the unique identification of the fixed user handle and it is further used to add custom events to the fixed user handle.
- The fixed user handle can be positioned relative to the node and connector boundaries. It has offset, padding and cornerRadius settings. It is used to position and customize the fixed user handle.
- The **Padding** is used to leave the space that is inside the fixed user handle between the icon and border.
- The corner radius allows to create fixed user handles with rounded corners. The radius of the rounded corner is set with the **cornerRadius** property.

Note: The PathData needs to be provided to render fixed user handle.

Size

Diagram allows you set size for the fixed user handles by using the **width** and **height** property. The default value of the width and height property is 10.

Style

- You can change the style of the fixed user handles with the specific properties of **borderColor**, **borderWidth**, and background color using the **handleStrokeColor**, **handleStrokeWidth**, and **fill** properties, and the icon **borderColor**, and **borderWidth** using the **iconStrokeColor** and **iconStrokeWidth**.
- The fixed user handle's **iconStrokeColor** and **iconStrokeWidth** property used to change the stroke color and stroke width of the given **pathData**.
- The fixed user handle **handleStrokeColor** and **fill** properties are used to define the background color and border color of the userhandle and the **handleStrokeWidth** property is used to define the border width of the fixed user handle.
- The **visible** property of the fixed user handle enables or disables the visibility of fixed user handle.

The following code explains how to customize the appearance of the fixed user handles.

INDEX.JS

```

var nodes = {
    id: 'node1', width: 100, height: 100, offsetX: 100, offsetY:
    150, isExpanded: true,

```

```

        fixedUserHandles: [{ offset: { x: 0, y: 0 }, margin: { right: 20
    }, fill: 'black', iconStrokeColor: 'white', handleStrokeWidth: 3, handleStrokeColor
    : 'black', width: 20, height: 20, id: 'user1', pathData: 'M60.3,18H27.5c-
    3,0-5.5,2.4-5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,0-5.5,2.4-
    5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-
    5.5V34.4C73.9,31.4,71.5,28.9,68.5,28.9z M68.5,72.5h-30V34.4h30V72.5z' }]
    };
    var connector = {
        id: 'connector1',
        type: 'Orthogonal',
        sourcePoint: { x: 300, y: 100 },
        targetPoint: { x: 400, y: 200 }, fixedUserHandles: [{ offset:
0.5, width:
20, fill: 'black', iconStrokeColor: 'white', handleStrokeWidth: 3, handleStrokeColor
: 'black', alignment: 'Before', height: 20, id: 'usercon1', displacement: {
x: 10, y: 10 }, pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: The fixed user handle id need to be unique.

Customizing the node fixed user handle

- The node fixed user handle can be aligned relative to the node boundaries. It has **margin** and **offset** settings. It is quite useful to position the node fixed userhandle and used together and gives you more control over the node fixed user handle positioning.

Margin for the node fixed user handle

Margin is an absolute value used to add some blank space in any one of its four sides. The fixed user handle can be displaced with the **margin** property.

Offset for the node fixed user handle

The **offset** property of fixed user handle is used to align the user handle based on the **x** and **y** points. (0,0) represents the top or left corner and (1,1) represents the bottom or right corner.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Offset	Margin	Output
(0,0)	Right = 20	
(0.5,0)	Bottom = 20	

| (0,0) | Right = 20 |

| (0.5,0) | Bottom = 20 |

| (1,1) | Left = 20 |

The following code explains how to customize the node fixed user handle.

INDEX.JS

```
var node = {
  // Position of the node
  offsetX: 250,
  offsetY: 250,
  // Size of the node
  width: 100,
  height: 100,
  style: { fill: '#6BA5D7', strokeColor: 'white' },
  fixedUserHandles: [{ offset: { x: 0, y: 0 }, margin: { right: 20 },
width: 20,height: 20, id: 'user1', pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-
5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,0-5.5,2.4-
5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-
5.5V34.4C73.9,31.4,71.5,28.9,68.5,28.9z M68.5,72.5h-30V34.4h30V72.5z' }]
  };
// initialize Diagram component
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px', nodes: [node]
}, '#element');
```

INDEX.HTML

```

```

Customizing the connector fixed user handle

- The connector fixed user handle can be aligned relative to the connector boundaries. It has alignment, displacement and offset settings. It is useful to position the connector fixed user handle and used together and gives you more control over the connector fixed user handle positioning.
- The **offset** and **alignment** properties of fixed user handle allows you to align the connector fixed user handles to the segments.

Offset for the connector fixed user handle

The **offset** property of connector fixed user handle is used to align the user handle based on fractions. 0 represents the connector source point, 1 represents the connector target point, and 0.5 represents the center point of the connector segment.

Alignment

The connector's fixed user handle can be aligned over its segment path using the **alignment** property of fixed user handle.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Offset	Alignment	Output
-----	-----	-----

0 Before	
------------	--

Displacement

- The **displacement** property allows you to specify the space to be left from the connector segment based on the x and y value provided.

The following table shows all the possible alignments visually shows the fixed user handle positions.

Displacement	Alignment	Output
-----	-----	-----

Note: Displacement will not be done if the alignment is set to be center.

The following code explains how to customize the connector fixed user handle.

INDEX.JS

```
var connector = {
  id: 'connector1',
  type: 'Orthogonal',
  sourcePoint: { x: 300, y: 100 },
  targetPoint: { x: 400, y: 200 }, fixedUserHandles: [{ offset:
0.5, width: 20, alignment: 'Before', height: 20, id: 'usercon1',

Tooltip support for User Handle

The diagram provides support to show tooltip when the mouse hovers over any user handle. To show the tooltip on mouse over, the [tooltip](#) property of diagram model needs to be set with the tooltip [content](#) and [position](#) as shown in the following example.

INDEX.JS

```

var node = {
    // Position of the node
    offsetX: 250,
    offsetY: 250,
    // Size of the node
    width: 100,
    height: 100,
    style: { fill: '#6BA5D7', strokeColor: 'white' },
    tooltip: { content: 'node1', position: 'BottomRight', relativeMode:
'Object' },
    constraints: ej.diagrams.NodeConstraints.Default |
ej.diagrams.NodeConstraints.Tooltip,
};
var handle = [{
    name: 'clone', pathData: 'M60.3,18H27.5c-3,0-5.5,2.4-
5.5,5.5v38.2h5.5V23.5h32.7V18z M68.5,28.9h-30c-3,' +
'0-5.5,2.4-5.5,5.5v38.2c0,3,2.4,5.5,5.5,5.5h30c3,0,5.5-2.4,5.5-

```

Style in ##Platform_Name## Diagram control

Customizing the connector end point handle

Use the following CSS to customize the connector end point handle.

```
`scss
.e-diagram-endpoint-handle {
  fill: red;
  stroke: green;
}
`
```

Customizing the connector end point handle when connected

Use the following CSS to customize the connector end point handle when connected.

```
`scss
.e-diagram-endpoint-handle.e-connected {
  fill: red;
  stroke: green;
}
`
```

Customizing the connector end point handle when disabled

Use the following CSS to customize the connector end point handle when disabled.

```
`scss
.e-diagram-endpoint-handle.e-disabled {
  fill: red;
  opacity: 1;
  stroke: green;
}
`
```

Customizing the bezier connector handle

Use the following CSS to customize the bezier handle properties.

```
`scss
.e-diagram-bezier-handle {
  fill: red;
  stroke: green;
}
`
```

Customizing the bezier connector line

Use the following CSS to customize the bezier line properties.

```
`scss
.e-diagram-bezier-line {
stroke: black;
}
`
```

Customizing the resize handle

Use the following CSS to customize the resize handle.

```
`scss
.e-diagram-resize-handle {
fill: white;
opacity: 1;
stroke: white;
}
`
```

Customizing the selector pivot line

Use the following CSS to customize the line between the selector and rotate handle.

```
`scss
.e-diagram-pivot-line {
stroke: red;
}
`
```

Customizing the selector border

Use the following CSS to customize the selector border.

```
`scss
.e-diagram-border {
stroke: red;
}
`
```

Customizing the rotate handle

Use the following CSS to customize the rotate handle properties.

```
`scss
.e-diagram-rotate-handle {
```

```
fill: red;
stroke: green;
}
```

Customizing the symbolpalette while hovering

Use the following CSS to customize the symbolpalette while hovering.

```
`scss
.e-symbolpalette .e-symbol-hover:hover {
background: red;
}
```

Customizing the symbolpalette when selected

Use the following CSS to customize the symbolpalette when selected.

```
`scss
.e-symbolpalette .e-symbol-selected {
background: white;
}
```

Customizing the ruler

Use the following CSS to customize the ruler properties.

```
`scss
.e-diagram .e-ruler {
background-color: red;
font-size: 13px;
}
```

Customizing the ruler overlap

Use the following CSS to ruler overlap properties.

```
`scss
.e-diagram .e-ruler-overlap {
background-color: red;
}
```

Customizing the text edit

Use the following CSS to customize the text edit properties.

```
`scss
.e-diagram .e-diagram-text-edit {
background: white;
border-color: red;
border-style: dashed;
border-width: 1px;
box-sizing: content-box;
color: black;
min-width: 50px;
}
`
```

Customizing the text edit on selection

Use the following CSS to customize the text edit on selection properties.

```
`scss
.e-diagram-text-edit::selection {
background: red;
color: green;
}
`
```

Ruler in ##Platform_Name## Diagram control

The Ruler provides a horizontal and vertical guide for measuring in the Diagram control. The Ruler can be used to measure the diagram objects, indicate positions, and align diagram elements. This is especially useful in creating scale models.

Adding Rulers to the Diagram

- The [rulerSettings](#) property is used to control the visibility and appearance of the ruler in the diagram.
- The RulerSettings [showRulers](#) property is used to show or hide the rulers in the diagram.
- The RulerSettings [horizontalRuler](#) and [verticalRuler](#) properties are used to customize the rulers appearance in the diagram.

The following code shows how to add a ruler to the diagram.

INDEX.JS

```
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px',
  rulerSettings: {
```

```

        showRulers: true
    },
});
diagram.appendTo('#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customizing the Ruler

By default, the ruler segments are arranged based on pixel values.

- The `HorizontalRuler`'s [interval](#) property allows you to define the interval between ruler segments and the [segmentWidth](#) property allows you to define the segment width of the ruler. Similarly,

you can use the VerticalRuler's [interval](#) and [segmentWidth](#) properties are used to define the interval and segment width of the vertical ruler

- The HorizontalRuler's [tickAlignment](#) property is used to align the ruler tick either left or right side of the ruler. The VerticalRuler's [tickAlignment](#) property is used to align the ruler tick either top or bottom side of the ruler.
- The HorizontalRuler's [arrangeTick](#) and VerticalRuler's [arrangeTick](#) function is provided for the purpose of customizing the appearance of ruler ticks. It will be called for each tick rendering.
- The HorizontalRuler's [markerColor](#) and VerticalRuler's [markerColor](#) properties are used to define the ruler marker color and marker will be shown when performing the interaction in the diagram.

The following code shows how the diagram ruler can be customized.

INDEX.JS

```
var diagram = new ej.diagrams.Diagram({
  width: '100%', height: '600px',
  rulerSettings: {
    showRulers: true, horizontalRuler:{interval:8, segmentWidth:100,
    thickness:35, tickAlignment:"LeftOrTop"}, verticalRuler:{interval:10,
    segmentWidth:150, thickness:35, tickAlignment:"RightOrBottom"}
  },
});
diagram.appendTo('#element');
```

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note : The MarkerColor property can be customized using the [marker](#) CSS style.

Context menu in ##Platform_Name## Diagram control

<!-- markdownlint-disable MD010 -->

In graphical user interface (GUI), a context menu is a type of menu that appears when you perform right-click operation. Nested level of context menu items can be created. Diagram provides some in-built context menu items and allows to define custom menu items through the [contextMenuSettings](#) property.

Customize context menu

The [show](#) property helps you to enable/disable the context menu. Diagram provides some default context menu items to ease the execution of some frequently used commands. The following code illustrates how to enable the default context menu items.

INDEX.JS

```

var nodes = [{
  id: 'node1',
  width: 100,
  height: 100,
  offsetX: 100,
  offsetY: 100,
  style: {
    fill: '#6BA5D7',
    strokeColor: 'white',
    strokeWidth: 1
  },
  annotations: [{
    id: 'label1',
    content: 'Rectangle1',
    offset: {
      x: 0.5,
      y: 0.5
    },
    style: {
      color: 'white'
    }
  }]
},
{
  id: 'node2',
  width: 100,

```

```

        height: 100,
        offsetX: 300,
        offsetY: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',
            strokeWidth: 1
        },
        annotations: [{
            id: 'label2',
            content: 'Rectangle2',
            offset: {
                x: 0.5,
                y: 0.5
            },
            style: {
                color: 'white'
            }
        }]
    },
];
var connector = {
    id: 'connector1',
    sourceID: 'node1',
    targetID: 'node2',
    type: 'Straight',
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2,
        targetDecorator: {
            style: {
                fill: '#6BA5D7',
                strokeColor: '#6BA5D7'
            }
        }
    }
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '350px',
    nodes: nodes,
    connectors: [connector],
    //Enables the context menu
    contextMenuSettings: {
        show: true,
    }
}, '#element');
```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Context menu can be defined for individual node with the desired context menu items.

- Apart from the default context menu items, define some additional context menu items. Those additional items have to be defined and added to the [items](#) property of the context menu.
- Set text and ID for context menu item using the context menu [text](#) and [ID](#) properties respectively.
- Set an image for the context menu item using the context menu [url](#) property.
- The [iconCss](#) property defines the class/multiple classes separated by a space for the menu item that is used to include an icon. Menu item can include font icon and sprite image.
- The [target](#) property used to set the target to show the menu item.
- The [separator](#) property defines the horizontal lines that are used to separate the menu items. You cannot select the separators. You can enable separators to group the menu items using the separator property.

The following code example illustrates how to add custom context menu items.

INDEX.JS

```
var nodes = [{
```

```

        id: 'node1',
        width: 100,
        height: 100,
        offsetX: 100,
        offsetY: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',
            strokeWidth: 1
        },
        annotations: [{
            id: 'label1',
            content: 'Rectangle1',
            offset: {
                x: 0.5,
                y: 0.5
            },
            style: {
                color: 'white'
            }
        }]
    },
    {
        id: 'node2',
        width: 100,
        height: 100,
        offsetX: 300,
        offsetY: 100,
        style: {
            fill: '#6BA5D7',
            strokeColor: 'white',
            strokeWidth: 1
        },
        annotations: [{
            id: 'label2',
            content: 'Rectangle2',
            offset: {
                x: 0.5,
                y: 0.5
            },
            style: {
                color: 'white'
            }
        }]
    },
];
var connector = {
    id: 'connector1',
    sourceID: 'node1',
    targetID: 'node2',
    type: 'Straight',
    style: {
        strokeColor: '#6BA5D7',
        fill: '#6BA5D7',
        strokeWidth: 2,
        targetDecorator: {
            style: {

```

```

        fill : '#6BA5D7',
        strokeColor : '#6BA5D7'
    }
}
};
var diagram = new ej.diagrams.Diagram({
    width: '100%',
    height: '350px',
    nodes: nodes,
    connectors: [connector],
    contextMenuSettings: {
        //Enables the context menu
        show: true,
        // Defines the custom context menu items
        items: [{
            // Text to be displayed
            text: 'Save',
            id: 'save',
            target: '.e-elementcontent',
            // Sets the css icons for the item
            iconCss: 'e-save'
        },
        {
            text: 'Load',
            id: 'load',

```

To display the custom context menu items alone, set the [showCustomMenuOnly](#) property to true.

Template Support for Context menu

- Diagram provides template support for context menu. The context menu items can be customized by using the `contextMenuBeforeItemRender` event. The `contextMenuBeforeItemRender` event triggers while rendering each menu item.
- In the following sample, the menu item is rendered with key code for specified action in ContextMenu using the template. Here, the key code is specified for the cut and copy at right corner of the menu items by adding a span element in the `contextMenuBeforeItemRender` event.

Overview in ##Platform_Name## Diagram control

Overview control allows you to see a preview or an overall view of the entire content of a diagram. This helps you to look at the overall picture of a large diagram and also to navigate, pan, or zoom, on a particular position of the page.

When you work on a very large diagram, you may not know the part you are actually working on, or navigation from one part to another might be difficult. One solution for navigation is to zoom out the entire diagram and find where you are. Then, you can zoom in a particular area you want to. This solution is not suitable when you need some frequent navigation.

Overview control solves these problems by showing a preview, that is, an overall view of the entire diagram. A rectangle indicates viewport of the diagram. Navigation becomes easy by dragging this rectangle.

Create overview

The `sourceID` property of overview should be set with the corresponding diagram ID for the overall view.

The `width` and `height` properties of the overview allow you to define the size of the overview.

The following code illustrates how to create overview.

Zoom and Pan

In overview, the view port of the diagram is highlighted with a red colored rectangle. Diagram can be zoomed/panned by interacting with that. You can interact with overview as follows:

- Resize the rectangle: Zooms in/out the diagram.
- Drag the rectangle: Pans the diagram.
- Click at a position: Navigates to the clicked region.
- Choose a particular region by clicking and dragging: Navigates to the specified region.

The following image shows how the diagram is zoomed/panned with overview.

INDEX.JS

```

Dialog

Template in ##Platform_Name## Dialog control

In Dialog the template support is provided to the header and footer sections. So any text or HTML content can be appending in these sections.

Header

The Dialog header content can be provided through the [header](#) property, and it will allow both text and any HTML content as a string. Also in header, close button is provided as built-in support, and this can be enabled through the [showCloseIcon](#) property.

Footer

The Dialog footer can be enabled by adding built-in [buttons](#) or providing any HTML string through the [footerTemplate](#).

The [buttons](#) and [footerTemplate](#) properties can't be used at the same time.

Content

The Dialog content can be provided through the [content](#) property, and it accepts both text and HTML string as content.

The below example demonstrates the usage of header, footer and content templates in the Dialog control.

INDEX.JS

```

/**
 * Dialog template sample
 */
var icontemp = '<button id="sendButton" class="e-control e-btn e-primary"
data-ripple="true">' + 'Send</button>';
var headerimg = '';
var sendbutton = new ej.buttons.Button();
var proxy = this;
// Initialize Dialog component
var dialog = new ej.popups.Dialog({
    // Enables the header with template content

```

```

    header: headerimg + '<div class="dlg-template" title="Nancy" class="e-
icon-settings"> Nancy </div>',
    // Enables the footer with template content
    footerTemplate: ' <input id="inVal" class="e-input" type="text"
placeholder="Enter your message here!"/>' + icontemp,
    // Dialog content
    content: document.getElementById("dlgContent"),
    // Enables the close icon button in header
    showCloseIcon: true,
    // The Dialog shows within the target element
    target: document.getElementById("container"),
    //Dialog width
    width: '400px',
    height: '250px',
    beforeOpen: onBeforeopen
});
// Render initialized Dialog
dialog.appendTo('#dialog');
sendbutton.appendTo('#sendButton');
// Sample level code to handle the button click action
document.getElementById('targetButton').onclick = function () {
    // Call the show method to open the Dialog
    dialog.show();
};
document.getElementById('sendButton').onkeydown = function (e) {
    if (e.keyCode === 13) {
        updateTextValue();
    }
};
document.getElementById('inVal').onkeydown = function (e) {
    if (e.keyCode === 13) {
        updateTextValue();
    }
};
document.getElementById('sendButton').onclick = function () {
    updateTextValue();
};
function onBeforeopen() {
    document.getElementById('dlgContent').style.visibility = 'visible';
}
function updateTextValue() {
    var enteredVal = document.getElementById('inVal');
    var dialogTextElement =
document.getElementsByClassName('dialogText')[0];
    var dialogTextWrap =
document.getElementsByClassName('dialogContent')[0];
    if (enteredVal.value !== '') {
        dialogTextElement.innerHTML = enteredVal.value;
        enteredVal.value = '';
    }
}
}

Animation in ##Platform_Name## Dialog control

The Dialog can be animated during the open and close actions. Also, user can customize animation's [delay](#), [duration](#) and [effect](#) by using [animationSettings](#) property.

<!-- markdownlint-disable MD033 -->

delay	The Dialog animation will start with the mentioned delay
duration	Specifies the animation duration to complete with one animation cycle
effect	<p>Specifies the animation effects of Dialog open and close actions effect.</p> <p>List of supported animation effects: 'Fade' 'FadeZoom' 'FlipLeftDown' 'FlipLeftUp' 'FlipRightDown' 'FlipRightUp' 'FlipXDown' 'FlipXUp' 'FlipYLeft' 'FlipYRight' 'SlideBottom' 'SlideLeft' 'SlideRight' 'SlideTop' 'Zoom' 'None'</p> <p>If the user sets 'Fade' effect, then the Dialog will open with 'FadeIn' effect and close with 'FadeOut' effect</p>

In the below sample, **Zoom** effect is enabled. So, The Dialog will open with **ZoomIn** and close with **ZoomOut** effects.

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize Dialog component
var dialog = new ej.popups.Dialog({
  //Animation options
  animationSettings: {
    effect: 'Zoom',
    duration: 400,
    delay: 0
  },
  // Enables the header
  header: 'Dialog',
  // Dialog content
  content: 'Dialog enabled with Zoom effect',
  // Enables the footer buttons
  buttons: [
    {
      // Click the footer buttons to hide the Dialog
      'click': () => { dialog.hide(); },
      // Accessing button component properties by buttonModel property
      buttonModel: {
        content: 'OK',
        isPrimary: true
      }
    },
    {
      'click': () => { dialog.hide(); },
      buttonModel: {
        content: 'Cancel'
      }
    }
  ],
  // The Dialog shows within the target element
  target: document.getElementById("container"),
```

```

    // Dialog width
    width: '250px'
  });
  // Render initialized Dialog
  dialog.appendTo('#dialog');
  // Sample level code to handle the button click action
  document.getElementById('targetButton').onclick = function() {
    // Call the show method to open the Dialog
    dialog.show();
  }

```

Resize in ##Platform_Name## Dialog control

The Dialog supports resizing feature. To resize the dialog, we have to select and resize it by using its handle (grip) or hovering on any of the edges or borders of the dialog within the sample container.

The resizable dialog can be created by setting the [enableResize](#) property to true, which is used to change the size of a dialog dynamically and view its content with expanded mode. The [resizeHandles](#) property can also be configured for all the which directions in which the dialog should be resized. When you configure the target property along with the [enableResize](#) property, the dialog can be resized within its specified target container.

INDEX.JS

```
ej.base.enableRipple(true);
var dialog = new ej.popups.Dialog({
  // Enables the draggable option
  allowDragging: true,
  // Enables the resize option
  enableResize: true,
  // Enables resize in all the direction
  resizeHandles: ['All'],
  // Enables the header
  header: 'Dialog',
  // Dialog content
  content: 'This is a Dialog with resize enabled',
  // Enables the draggable option
  allowDragging: true,
  // Enables the footer buttons,
  buttons: [
    {
      // Click the footer buttons to hide the Dialog
      'click': () => {
        dialog.hide();
      },
      // Accessing button component properties by buttonModel property
      buttonModel: {
        // Enables the primary button
        isPrimary: true,
        content: 'OK'
      }
    },
    {
      'click': () => {
        dialog.hide();
      },
      buttonModel: {
        content: 'Cancel'
      }
    }
  ],
  // The Dialog shows within the target element
  target: document.getElementById("container"),
  // Dialog width
  width: '250px',
});
// Render initialized Dialog
dialog.appendTo('#dialog');

Dialog utility in ##Platform_Name## Dialog control

The dialog component provides built-in utility functions to render the alert and confirm dialogs with the minimal code. The following options are used as an argument on calling the utility functions:

Options	Description
---------	-------------

|-----|-----|

| title | Specifies the title of dialog like the [header](#) property. |

| content | Specifies the value that can be displayed in dialog's content area like the [content](#) property. |

| isModal | Specifies the Boolean value whether the dialog can be displayed as modal or non-modal. For more details, refer to the [isModal](#) property. |

| position | Specifies the value where the alert or confirm dialog is positioned within the document. For more details, refer to the [position](#) property { X: 'center', Y: 'center' } |

| okButton | Configures the OK button that contains button properties with the click events.
 okButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for OK button click', text: 'Yes' // <-- Default value is 'OK' } |

| cancelButton | Configures the Cancel button that contains button properties with the click events.
 cancelButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for 'Cancel' button click', text: 'No' // <-- Default value is 'Cancel' } |

| isDraggable | Specifies the value whether the alert or confirm dialog can be dragged by the user. |

| showCloseIcon | When set to true, the close icon is shown in the dialog component. |

| closeOnEscape | When set to true, you can close the dialog by pressing ESC key. |

| animationSettings | Specifies the animation settings of the dialog component. |

| cssClass | Specifies the CSS class name that can be appended to the dialog. |

| zIndex | Specifies the order of the dialog, that is displayed in front or behind of another component. |

| open | Event which is triggered after the dialog is opened. |

| Close | Event which is triggered after the dialog is closed. |

Alert dialog

An alert dialog box is used to display warning like messages to the users. Use the following code to render a simple alert dialog in an application.

INDEX.JS

```
ej.base.enableRipple(true);
document.getElementById('targetButton').onclick = function(){
    // Initialize and render alert dialog
    ej.popups.DialogUtility.alert('This is an Alert Dialog!');
}
```

Close utility dialog

When rendering an Alert and Confirmation dialog through utility methods, You can close the dialog using the following ways.

- By pressing the escape key if the "closeOnEscape" property is enabled.
- By clicking the close button if the "showCloseIcon" property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the "hide" method.

Below sample demonstrates the different ways of hiding the utility dialog.

INDEX.JS

```
ej.base.enableRipple(true);
document.getElementById('targetButton').onclick = function(){
  // Initialize and render confirm dialog with custom options
  ej.popups.DialogUtility.confirm({
    title: ' Confirmation Dialog',
    content: "This is a Confirmation Dialog!",
    okButton: { text: 'OK', click: okClick },
    cancelButton: { text: 'Cancel', click: cancelClick },
    showCloseIcon: true,
    closeOnEscape: true,
    animationSettings: { effect: 'Zoom' }
  });
};
function okClick(){
  alert('you clicked OK button');
  //Hide the dialog
  this.hide();
}
function cancelClick(){
  alert('you clicked Cancel button');
}
```

INDEX.HTML

Style in ##Platform_Name## Dialog control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the dialog header

Use the following CSS to customize the dialog header properties.

```

`css
.e-dialog .e-dlg-header {
color: green;
font-size: 20px;
font-weight: normal;
}
`

```

Customizing the dialog content

Use the following CSS to customize the dialog content properties.

```

`css
.e-dialog .e-dlg-content {
color: red;
font-size: 10px;
font-weight: normal;
line-height: normal;
}
`

```

Customizing modal dialog overlay

Use the following CSS to customize the modal dialog overlay.

```
`css
.e-dlg-overlay {
background-color: slategray;
opacity: 0.6;
}
`
```

Customizing the dialog resize icon

Use the following CSS to customize the dialog resize icon.

```
`css
/ To change the icon content /
.e-dialog .e-south-east::before, .e-dialog .e-south-west::before {
content: '\f047';
}
/ To set the icon pack /
.e-dialog .e-resize-handle {
font: normal normal normal 14px/1 FontAwesome;
}
`
```

The above CSS demonstration uses the font awesome icon.

Customizing the dialog close button

Use the following CSS to customize the dialog close button.

```
`css
/ To specify font size and color /
.e-dialog .e-btn .e-btn-icon.e-icon-dlg-close {
font-size: 12px;
color: red;
}
`
```

Customizing the dialog footer button

Use the following CSS to customize the dialog footer button.

```
`css
/ To specify font color, background color and border color /
```

```
.e-btn.e-flat.e-primary, .e-css.e-btn.e-flat.e-primary {
background-color: transparent;
border-color: transparent;
color: blue;
}
,
```

Localization in ##Platform_Name## Dialog control

Localization library allows to localize the default text content of Dialog. In Dialog, The close button's tooltip text alone will be localize based on culture. By using [locale](#) property you can the culture dynamically in dialog component.

| Locale key | en-US (default) |

|-----|-----|

| close | Close |

Loading translations

To load translation object in an application use **load** function of **L10n** class.

In the below sample, **French** culture is set to Dialog and change the close button's tooltip text.

INDEX.JS

```
ej.base.enableRipple(true);
// Load French culture for Dialog close button tooltip text
ej.base.L10n.load({
  'fr-BE': {
    'dialog': {
      'close': "Fermer"
    }
  }
});
// Initialization of Dialog component
var dialog = new ej.popups.Dialog({
  // Set the locale culture
  locale: 'fr-BE',
  // Enables the header
  header: 'Dialogue',
  // Enables the close icon button in header
  showCloseIcon: true,
  // Dialog content
  content: 'Dialogue avec la culture française',
  // The Dialog shows within the target element
  target: document.getElementById("container"),
  // Dialog width
  width: '250px',
});
// Render initialized Dialog
dialog.appendTo('#dialog');
// Sample level code to handle the button click action
document.getElementById('targetButton').onclick = function() {
  // Call the show method to open the Dialog
```

```

    dialog.show();
}

```

Accessibility in ##Platform_Name## Dialog control

The Dialog component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Dialog component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The
component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Dialog characterized with complete ARIA Accessibility support which helps to accessible by on-screen readers and other assistive technology devices. This component designed with the reference of the guidelines document given in [WAI ARAI Accessibility Practices](#).

The Dialog component uses the **Dialog** role and following ARIA properties to its element based on its state.

| Property | Functionalities |

| --- | --- |

| aria-describedby | It indicates the Dialog content description is notified to the user through assistive technologies. |

| aria-labelledby | The Dialog title is notified to the user through assistive technologies. |

| aria-modal | For modal dialog it's value is true and non-modal dialog its value is false |

| aria-grabbed | Enable the draggable Dialog and starts dragging it is value is true and stopping the drag its value is false |

Keyboard interaction

Keyboard interaction of Dialog component has designed based on [WAI-ARIA Practices](#) described for Dialog. User can use the following shortcut keys to interact with the Dialog.

<!-- markdownlint-disable MD033 -->

Keyboard shortcuts	Actions
Esc	Closes the Dialog. This functionality can be controlled by using closeOnEscape
Enter	When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will trigger. Enter key is not working when the Dialog content contains any text area with initial focus
Ctrl + Enter	When the Dialog content contains text area and it is in focus state, and press the Ctrl + Enter key to call the click event function associated with primary button
Tab	Focus will be changed within the Dialog elements
Shift + Tab	The Focus will be changed previous focusable element within the Dialog elements. When focusing a first focusable element in the Dialog, then press the shift + tab key, it will change the focus to last focusable element

INDEX.JS

```
ej.base.enableRipple(true);
// Initialize Dialog component
var dialog = new ej.popups.Dialog({
  // Enables the header
  header: 'Feedback',
  // Dialog content
  content: document.getElementById("dlgContent"),
  // Enables the close icon in header
  showCloseIcon: true,
  // Enables the footer buttons
  buttons: [{
    // Accessing button component properties by buttonModel property
    buttonModel: {
      // Enables the primary button
      isPrimary: true,
      content: 'Submit'
    },
    // Click the footer buttons to hide the Dialog
    click: function () {
```

```

        this.hide();
    }
    }],
    // The Dialog shows within the target element
    target: document.getElementById("container"),
    // Dialog width
    width: '400px',
    // Dialog height
    height: '330px',
    beforeOpen: onBeforeopen
});
// Render initialized Dialog
dialog.appendTo('#dialog');
// Sample level code to handle the button click action
document.getElementById('targetButton').onclick = function () {
    // Call the show method to open the Dialog
    dialog.show();
};
function onBeforeopen() {
    document.getElementById('dlgContent').style.visibility = 'visible';
}

```

Ensuring accessibility

The Dialog component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Dialog component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Dialog component with accessibility tools.

How To

Create nested dialog in ##Platform_Name## Dialog control

A Dialog can be nested within another Dialog. The below sample contains parent and child Dialog (inner Dialog).

Step 1:

Create two div elements with id `#dialog` and `#innerDialog`.

Step 2:

Initialize the Dialog as mentioned in the below sample.

Step 3:

Set the inner Dialog target as `#dialog`.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize the Outer Dialog component

```

```

var dialog = new ej.popups.Dialog({
    // Enables the header
    header: 'Outer Dialog',
    // Enables the close icon button in header
    showCloseIcon: true,
    // The Dialog shows within the target element
    target: document.getElementById("container"),
    // Dialog content
    content: document.getElementById("dlgContent"),
    //Dialog height
    height: '300px',
    animationSettings: { effect: 'None' },
    // Disable the Esc key option to hide the Dialog
    closeOnEscape: false,
    //Dialog width
    width: '400px',
    // Dialog beforeOpen event
    beforeOpen: onBeforeopen
});
// Render initialized outer Dialog
dialog.appendTo('#dialog');
// Sample level code to handle the button click action
document.getElementById('targetButton').onclick = function () {
    // Call the show method to open the Dialog
    dialog.show();
};
// initialize the Inner Dialog component
var innerDialog = new ej.popups.Dialog({
    // Enables the header
    header: 'Inner Dialog',
    // Enables the close icon button in header
    showCloseIcon: true,
    animationSettings: { effect: 'None' },
    // Disable the Esc key option to hide the Dialog
    closeOnEscape: false,
    // Dialog content
    content: 'This is a Nested Dialog',
    // InnerDialog target as outerDialog
    target: document.getElementById("dialog"),
    // Dialog height
    height: '150px',
    // Dialog Width
    width: '250px'
});
document.getElementById('innerButton').onclick = function () {
    // Call the show method to open the Dialog
    innerDialog.show();
};
// Render initialized inner Dialog
innerDialog.appendTo('#innerDialog');
function onBeforeopen() {
    document.getElementById('dlgContent').style.visibility = 'visible';
}

```

```

Position the dialog on center of the page on scrolling in `##Platform_Name##` Dialog control

By default, when scroll the page/container Dialog also scrolled along with the page/container. When a user expects to display the Dialog in the same position without scrolling achieving this in sample level as like below. Here added 'e-fixed' class to Dialog element by using [cssClass](#) property and prevent the scrolling.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialize Dialog component
var dialog = new ej.popups.Dialog({
  // Enables the header
  header: 'Dialog',
  // Dialog content

```

```

        content: document.getElementById("dlgContent"),
        // Disable the Esc key to hide the Dialog
        closeOnEscape: false,
        // The Dialog shows within the target element
        target: document.getElementById("container"),
        // Dialog width
        width: '250px',
        beforeOpen: onBeforeopen
    });
    // Render initialized Dialog
    dialog.appendTo('#dialog');
    // Sample level code to prevent Dialog scrolling
    document.getElementById('targetButton').onclick = function() {
        dialog.cssClass = 'e-fixed';
    }
    function onBeforeopen() {
        document.getElementById('dlgContent').style.visibility = 'visible';
    }

```

<body>

    <div id="container">
        <div>
            <b>JavaScript:</b><br>
            JavaScript is a high-level, dynamic, untyped, and interpreted
programming language. It has been standardized in the ECMAScript
            language specification. Alongside HTML and CSS, it is one of the
three essential technologies of World Wide Web
            content production; the majority of websites employ it and it is
supported by all modern Web browsers without
            plug-ins. JavaScript is prototype-based with first-class
functions, making it a multi-paradigm language, supporting
            object - oriented , imperative, and functional programming
styles.

```

```

        <br><br><br>
        <b>MVC:</b><br>
        Model-view-controller (MVC) is a software architecture pattern
        which separates the representation of information from the user's
        interaction with it. The model consists of application data, business rules,
        logic, and functions. A view can be any output representation of data, such
        as a chart or a diagram. Multiple views of the same data are possible, such
        as a bar chart for management and a tabular view for accountants. The
        controller mediates input, converting it to commands for the model or
        view. The central ideas behind MVC are code reusability and in addition to
        dividing the application into three kinds of components, the MVC design
        defines the interactions between them.

        A controller can send commands to its associated view to change
        the view's presentation of the model (e.g., by scrolling through a
        document). It can also send commands to the model to update the model's
        state (e.g., editing a document).

        A model notifies its associated views and controllers when there
        has been a change in its state. This notification allows the views to
        produce updated output, and the controllers to change the available set of
        commands. A passive implementation of MVC omits these notifications, because
        the application does not require them or the software platform does not
        support them.

        A view requests from the model the information that it needs to
        generate an output representation to the user.
    </div>
    <div id="dialog"></div>
    <div id="dlgContent" style="visibility: hidden">
        <button class="e-control e-btn" id="targetButton"
        role="button">Prevent Dialog Scroll</button>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>

</body></html>

```

Load dialog content using ajax in ##Platform_Name## Dialog control

You can load dialog's content dynamically from external source like external file using AJAX library. The AJAX library can make the request and load dialog's content using its **success** event. Refer the following link to learn about how to load dialog content using AJAX.

[AJAX Content](#)

Render a dialog without header in ##Platform_Name## Dialog control

The dialog can be rendered without header by setting the [header](#) property value as empty string or null. By default, dialog is rendered without header.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialization of Dialog component
var dialog = new ej.popups.Dialog({

```

```

        buttons: [
            {
                // Click the footer buttons to hide the Dialog
                'click': function () {
                    dialog.hide();
                },
                // Accessing button component properties by buttonModel property
                buttonModel: {
                    // Enables the primary button
                    isPrimary: true,
                    content: 'OK'
                }
            },
            {
                'click': function () {
                    dialog.hide();
                },
                buttonModel: {
                    content: 'Cancel',
                    cssClass: 'e-flat'
                }
            }
        ],
        // Dialog content
        content: 'This is a dialog without header',
        // The Dialog shows within the target element
        target: document.getElementById("container"),
        // Dialog width
        width: '250px',
    });
    // Sample level code to handle the button click action
    document.getElementById('targetButton').onclick = function () {
        // Call the show method to open the Dialog
        dialog.show();
    };
    // Render initialized Dialog
    dialog.appendTo('#dialog');

```

Display a dialog with custom position in ##Platform_Name## Dialog control

By default, the dialog is displayed in the center of the target container. The dialog position can be set using the [position](#) property by providing custom X and Y coordinates. The dialog can be positioned inside the target based on the given X and Y values.

INDEX.JS

```

ej.base.enableRipple(true);
var firstDialog = new ej.popups.Dialog ({
    // Enables the header
    header: 'Position-01',
    // The Dialog shows within the target element
    target: document.getElementById("container"),
    // Dialog content
    content: 'The dialog is positioned at {X: 420, Y: 14} coordinates',
    //Dialog height
    height: '120px',
    //Dialog width
    width: '360px',
    position: { X: 420, Y: 14 },
    animationSettings: { effect: 'None' }
});
// Render initialized outer Dialog
firstDialog.appendTo('#firstDialog');
var secondDialog = new ej.popups.Dialog ({
    // Enables the header
    header: 'Position-02',
    animationSettings: { effect: 'None' },
    // Dialog content
    content: 'The dialog is positioned at {X: 420, Y: 240} coordinates',
    // The Dialog shows within the target element
    target: document.getElementById("container"),
    // Dialog height
    height: '120px',
    // Dialog Width
    width: '360px',
    position: { X: 420, Y: 240 }
});
// Render initialized inner Dialog
secondDialog.appendTo('#secondDialog');

```

Prevent closing of modal dialog in ##Platform_Name## Dialog control

You can prevent closing of modal dialog by setting the [beforeClose](#) event argument cancel value to true.

In the following sample, the dialog is closed when you enter the username value with minimum 4 characters. Otherwise, it will not be closed.

INDEX.JS

```

// To get the all input fields and its container.
var inputElement = document.querySelectorAll('.e-input-group .e-input, .e-
float-input.e-input-group input');
// Add 'e-input-focus' class to the input for achive ripple effect when
focus on the input field.
for (var i = 0; i < inputElement.length; i++) {
    inputElement[i].addEventListener("focus", function () {
        var parentElement = this.parentNode;
        if (parentElement.classList.contains('e-input-in-wrap')) {
            parentElement.parentNode.classList.add('e-input-focus');
        }
        else {

```

```

        this.parentNode.classList.add('e-input-focus');
    }
});
inputElement[i].addEventListener("blur", function () {
    var parentElement = this.parentNode;
    if (parentElement.classList.contains('e-input-in-wrap')) {
        parentElement.parentNode.classList.remove('e-input-focus');
    }
    else {
        this.parentNode.classList.remove('e-input-focus');
    }
});
});
}
// Add 'e-input-btn-ripple' class to the icon element for achive ripple
effect when click on the icon.
var inputIcon = document.querySelectorAll('.e-input-group-icon');
for (var i = 0; i < inputIcon.length; i++) {

```

Prevent the focus on the first element in ##Platform_Name## Dialog control

By default, the dialog focuses on the first elements of the content area which can be active and focusable. You can prevent this default focusing behavior using the [open](#) event and by enabling the `preventFocus` argument.

Bind the open event and enable the `preventFocus` argument within an event like the below sample.

INDEX.JS

```

ej.base.enableRipple(true);
// Initialization of Dialog component
var dialog = new ej.popups.Dialog({
    header: "Sign In",
    buttons: [{ buttonModel: { isPrimary: true, content: 'Yes' }, click:
btnClick }, { buttonModel: { content: 'No' }, click: btnClick }],
    target: document.getElementById("container"),
    height: 'auto',
    width: '300px',
    open: onOpen
});
// Render initialized Dialog

```

```

dialog.appendTo('#dialog');
// Sample level code to handle the button click action
document.getElementById('targetButton').onclick = function () {
    // Call the show method to open the Dialog
    dialog.show();
};
function btnClick() {
    dialog.hide();
}
function onOpen(args: OpenEventArgs) {
    //Preventing the default dialog focus
    args.preventDefault = true;
}

```

Read all the values from dialog on button click in `##Platform_Name##` Dialog control

You can read the dialog element values by binding the action handler to the footer buttons. The buttons property provides the options to bind events to the action buttons. For detailed information about buttons, refer to the [footer](#) section. In the below sample, value of input elements within the dialog has been checked in the footer button click event and send the values as the content of confirmation dialog.

INDEX.JS

```

ej.base.enableRipple(true);
var dlgObj = new ej.popups.Dialog({
  header: 'User details',
  content: document.getElementById("dlgContent"),
  showCloseIcon: true,
  visible: false,
  buttons: [{
    buttonModel: { isPrimary: true, content: 'Submit' }, click:
function() {
  createModalDialog();
},
}],
target: document.querySelector('body'),
width: '400px',
animationSettings: { effect: 'Zoom' },
beforeOpen: onBeforeopen
});
dlgObj.appendTo('#dialog');
var button = new ej.buttons.Button({});
button.appendTo('#dialogButton');
document.getElementById('openBtn').onclick = function () {
  dlgObj.show();
};
var modalObj;

Customize the dialog appearance in ##Platform_Name## Dialog control

You can customize the dialog appearance by providing dialog template as string or HTML element to the [content](#) property. In the following sample, dialog is customized as error window appearance.

INDEX.JS

```
ej.base.enableRipple(true);
var dlgObj = new ej.popups.Dialog({
  header: 'File and Folder Rename',
  content: document.getElementById("dlgContent"),
  showCloseIcon: true,
  visible: false,
  buttons: [{
    buttonModel: { isPrimary: true, content: 'close' }, click:
function() { this.hide() }
  }],
  target: document.querySelector('body'),
  width: '400px',
  animationSettings: { effect: 'Zoom' },
  beforeOpen: onBeforeopen
});
dlgObj.appendTo('#dialog');
var button = new ej.buttons.Button({});
button.appendTo('#dialogButton');
document.getElementById('openBtn').onclick = function () {
  dlgObj.show();
};
function onBeforeopen() {
  document.getElementById('dlgContent').style.visibility = 'visible';
}
```

INDEX.HTML

</body></html>

```

Close dialog while click on outside of dialog in ##Platform_Name## Dialog control

By default, dialog can be closed by pressing Esc key and clicking the close icon on the right of dialog header. It can also be closed by clicking outside of the dialog using `hide` method. Set the [CloseOnEscape](#) property value to false to prevent closing of the dialog when pressing Esc key.

In the following sample, dialog is closed when clicking outside the dialog area using [hide](#) method.

INDEX.TS

```

import { enableRipple } from '@syncfusion/ej2-base';
import { Button } from '@syncfusion/ej2-buttons';
import { Dialog } from '@syncfusion/ej2-popups';
let dialogObj: Dialog = new Dialog({
    header: 'Delete Multiple Items',
    content: "Are you sure you want to permanently delete all of these
items?",
    showCloseIcon: true,
    buttons: [{ buttonModel: { isPrimary: true, content: 'Yes' }, click:
btnClick }, { buttonModel: { content: 'No' }, click: btnClick }],
    target: document.body,
    height: 'auto',
    width: '300px',

```

```

        animationSettings: { effect: 'Zoom' },
        closeOnEscape: true
    });
    dialogObj.appendTo('#dialog');
    document.getElementById('openBtn').onclick = (): void => {
        dialogObj.show();
    };
    function btnClick() {
        dialogObj.hide();
    }
    document.onclick = (args: any) : void => {
        if(args.target.id === 'target') {
            dialogObj.hide();
        }
    }
}

```

Add an icons to dialog buttons in `##Platform_Name##` Dialog control

You can add icons to the dialog buttons using the [buttons](#) property or [footerTemplate](#) property . For detailed information about dialog buttons, refer to the [documentation](#) section.

In the following sample, dialog footer buttons are customized with icons using `buttons` property.

INDEX.JS

```

ej.base.enableRipple(true);
var dialogObj = new ej.popups.Dialog({
  header: 'Delete Multiple Items',
  content: "Are you sure you want to permanently delete all of these items?",
  showCloseIcon: true,
  buttons: [{ buttonModel: { isPrimary: true, content: 'Yes', iconCss: 'e-icons e-ok-icon' }, click: btnClick }, { buttonModel: { content: 'No', iconCss: 'e-icons e-close-icon' }, click: btnClick }],
  target: document.body,
  height: 'auto',
  width: '300px',
  animationSettings: { effect: 'Zoom' },
  closeOnEscape: true
});
dialogObj.appendTo('#dialog');
document.getElementById('openBtn').onclick = function () {
  dialogObj.show();
};
function btnClick() {
  dialogObj.hide();
}

```

INDEX.HTML

```

</body></html>
```

Add a minimize maximize buttons in ##Platform_Name## Dialog control

Dialog allows end users to either minimize or maximize the Dialog component. You can add minimize and maximize custom buttons near the close icon in the Dialog header using the [headerTemplate](#) property and handle the actions in the button click events, as shown in the following sample.

INDEX.JS

```
ej.base.enableRipple(true);
```

```

var dialogObj = new ej.popups.Dialog({
  header: `<span class='title'>Dialog</span>
  <span class='e-icons sf-icon-Maximize' id='max-btn'
title='Maximize'></span>
  <span class='e-icons sf-icon-Minimize' id='min-btn'
title='Minimize'></span>`,
  content: "This is a dialog with minimize and maximize buttons",
  showCloseIcon: true,
  buttons: [{ buttonModel: { isPrimary: true, content: 'Yes', iconCss: 'e-
icons e-ok-icon' }, click: btnClick }, { buttonModel: { content: 'No',
iconCss: 'e-icons e-close-icon' }, click: btnClick }],
  target: document.body,
  height: 'auto',
  width: '300px',
  animationSettings: { effect: 'Zoom' },
  closeOnEscape: true
});
dialogObj.appendTo('#dialog');
document.getElementById('openBtn').onclick = function () {
  dialogObj.show();
};
function btnClick() {
  dialogObj.hide();
}
let hide;
let isFullScreen;
let dialogOldPositions;
document.getElementById("max-btn").addEventListener("click", function() {
  let maximizeIcon;
  if (dialogObj.element.classList.contains('dialog-minimized')) {
    dialogObj.element.querySelector('#min-btn').classList.add('sf-icon-
Minimize');
    dialogObj.element.querySelector('#min-btn').classList.remove('sf-
icon-Restore');
    dialogObj.element.querySelector('#min-btn').setAttribute('title',
'Minimize');
  }
  if (!dialogObj.element.classList.contains('dialog-maximized') &&
!isFullScreen) {
    maximizeIcon = dialogObj.element.querySelector(".e-dlg-header-
content .sf-icon-Maximize");
  } else {
    maximizeIcon = dialogObj.element.querySelector(".e-dlg-header-
content .sf-icon-Restore");
  }
  if (!dialogObj.element.classList.contains('dialog-maximized')) {
    dialogObj.element.classList.add('dialog-maximized');
    dialogObj.show(true);
    maximizeIcon.classList.add('sf-icon-Restore');
    maximizeIcon.setAttribute('title', 'Restore');
    maximizeIcon.classList.remove('sf-icon-Maximize');
    dialogObj.element.querySelector('.e-dlg-
content').classList.remove('hide-content');
    isFullScreen = true;
  } else {
    dialogObj.element.classList.remove('dialog-maximized');
    dialogObj.show(false);
  }
});

```

```

        maximizeIcon.classList.remove('sf-icon-Restore');
        maximizeIcon.classList.add('sf-icon-Maximize');
        maximizeIcon.setAttribute('title', 'Maximize');
        dialogObj.element.querySelector('.e-dlg-
content').classList.remove('hide-content');
        dialogObj.position = dialogOldPositions;
        dialogObj.dataBind();
        isFullScreen = false;
    }
});

document.getElementById("min-btn").addEventListener("click", function()
{
    let minimizeIcon = dialogObj.element.querySelector(".e-dlg-header-
content .sf-icon-Minimize");
    if (!dialogObj.element.classList.contains('e-dlg-fullscreen')) {
        if (!dialogObj.element.classList.contains('dialog-minimized')) {
            dialogOldPositions = { X: dialogObj.position.X, Y:
dialogObj.position.Y }
            dialogObj.element.classList.add('dialog-minimized');
