

USER GUIDE

# Essential Studio for EJ2 React

---

Version - v25.1.35 | Release Date - March 15, 2024

Signature .....	29
Getting Started.....	29
Dependencies.....	29
Setup your development environment .....	29
Adding Syncfusion packages .....	29
Adding Style sheet to the Application.....	30
Add Signature to the project.....	30
Run the application .....	30
Customization in React Signature component .....	31
Stroke Width .....	31
Stroke Color .....	32
Background Color .....	33
Background Image .....	34
See Also .....	36
Open save in React Signature component.....	36
Open Signature .....	36
Save Signature.....	37
Save with Background.....	40
Draw in React Signature component .....	42
Draw .....	42
User interaction in React Signature component .....	44
Undo and Redo .....	44
Clear .....	44
Disabled.....	44
ReadOnly .....	44
Accessibility in React Signature component .....	48
Keyboard interaction .....	49
Ensuring accessibility .....	50
See also .....	50
How To .....	50
Integration toolbar in React Signature component .....	50
Skeleton .....	61
Getting Started.....	61
Dependencies.....	61
Setup your development environment .....	61

Adding Syncfusion packages .....	61
Adding style sheet to the Application .....	62
Add Skeleton to the Application .....	62
Run the application .....	62
Shapes in React Skeleton component.....	63
Circle skeleton shape .....	63
Square skeleton shape .....	63
Rectangle skeleton shape .....	64
Text skeleton shape .....	64
Shimmer effect in React Skeleton component .....	66
Styles in React Skeleton component.....	68
cssClass.....	68
Visible .....	69
Accessibility in React Skeleton component .....	70
WAI-ARIA attributes.....	71
Ensuring accessibility .....	71
See also .....	71
Smithchart.....	71
Getting Started.....	71
Dependencies.....	71
Installation and configuration.....	72
Add Smith Chart to the Project.....	72
Module Injection.....	73
Add Series to Smithchart .....	74
Add title to SmithChart .....	76
Enable Marker to Smithchart.....	78
Enable DataLabel to Smithchart Marker.....	80
Enable Legend for Smithchart.....	83
Enable Tooltip for Smithchart Series .....	85
Working with data in React Smithchart component .....	87
Data Binding.....	87
Smithchart dimensions in React Smithchart component .....	89
Size for container .....	89
Size for Smith chart .....	91
Title subtitle in React Smithchart component .....	93

Enable title .....	93
Trim title.....	95
Smithchart axis in React Smithchart component.....	96
Labels customization.....	97
Gridlines .....	100
Axis line .....	102
Smithchart legend in React Smithchart component.....	105
Position and alignment .....	105
Customization .....	112
Toggle visibility.....	118
Smithchart tooltip in React Smithchart component.....	121
Smithchart marker in React Smithchart component.....	122
Marker.....	122
Data labels.....	126
Smithchart series in React Smithchart component .....	129
points or data source .....	129
Series customization .....	131
Smithchart print in React Smithchart component.....	132
Print.....	132
Export.....	134
Accessibility in React Smithchart component.....	135
WAI-ARIA attributes.....	136
Keyboard interaction .....	136
Ensuring accessibility .....	136
See also .....	136
Sparkline .....	137
Getting Started.....	137
Dependencies.....	137
Installation and Configuration .....	137
Add Sparkline to the Project .....	138
Module Injection.....	138
Bind data source to Sparkline .....	139
Change the type of Sparkline .....	140
Enable tooltip for Sparkline .....	141
Sparkline dimensions in React Sparkline component.....	142

Size for container .....	142
Size for sparkline .....	143
Sparkline types in React Sparkline component .....	146
Axis customization in React Sparkline component .....	151
Change value type of the sparkline.....	152
Change min and max values of axis .....	155
Change value of axis.....	157
Axis line customization .....	158
Special points customization in React Sparkline component .....	160
Range band in React Sparkline component .....	162
Range band customization.....	162
Multiple range band customization .....	163
Marker in React Sparkline component .....	164
Adding marker to the sparkline .....	164
Adding marker to special point.....	165
Customizing markers.....	166
Data labels in React Sparkline component .....	167
Enable data label.....	167
Customize data label.....	168
Format data label text.....	169
User interaction in React Sparkline component .....	171
Tooltip .....	171
Track line .....	175
Appearance in React Sparkline component.....	176
Sparkline border.....	176
Sparkline padding.....	177
Sparkline area customization.....	178
Sparkline theme .....	179
Localization in React Sparkline component .....	180
Tooltip format .....	180
Accessibility in React Sparkline component .....	181
WAI-ARIA attributes.....	182
Keyboard interaction .....	182
Ensuring accessibility .....	183
See also .....	183

Ej1 api migration in React Sparkline component.....	183
Sparkline Types .....	183
Databinding.....	183
Markers .....	184
Data labels.....	185
Range band .....	186
Special points customization .....	186
Axis customization .....	187
Appearance customization .....	188
Tooltip .....	190
Rendering.....	191
Localization .....	191
Methods.....	192
Events.....	192
SpeedDial .....	194
Getting Started with React Speed Dial Control.....	194
Dependencies.....	194
Installation and Configuration .....	194
Adding Syncfusion packages .....	195
Adding Speed Dial component to the Application.....	195
Adding CSS Reference .....	195
Running the application.....	195
Items in React Speed dial component .....	197
Icons in Speed Dial items .....	197
Animation.....	201
Template .....	202
Positions in React Speed dial component.....	202
Opens items on hover .....	204
Programmatically show/hide Speed Dial items .....	204
Programmatically refresh the position .....	206
Display modes in React Speed dial component.....	208
Linear display mode .....	208
Radial display mode (Radial Menu) .....	209
Radial menu in React Speed dial component .....	209
Radial menu direction .....	209

Radial menu start and end angle .....	210
Offset.....	211
Template in React Speed dial component .....	213
Item template .....	213
Popup template .....	215
Styles in React Speed dial component .....	216
SpeedDial button .....	217
Disabled.....	219
cssClass.....	220
Visible .....	221
Tooltip .....	221
Opens on hover.....	222
Modal in React Speed dial component .....	223
Event in React Speed dial component .....	224
clicked .....	225
created .....	225
beforeOpen .....	226
onOpen .....	227
beforeClose .....	227
onClose.....	228
beforeItemRender .....	229
Accessibility in React Speed dial component.....	231
WAI-ARIA attributes.....	232
Keyboard interaction .....	232
Ensuring accessibility .....	232
See also .....	233
Spinner .....	233
Getting Started.....	233
Create the Spinner globally.....	233
Template in React Spinner component .....	235
Types in React Spinner component .....	239
Style in React Spinner component.....	243
Customizing the spinner .....	243
SplitButton .....	244
Getting Started.....	244

Dependencies.....	244
Installation and configuration.....	244
Adding syncfusion packages .....	245
Adding CSS reference.....	245
Adding SplitButton component .....	245
Binding data source .....	246
Run the application .....	246
See Also .....	248
Icons and separator in React Split button component .....	248
SplitButton icons .....	248
Separator.....	250
See Also .....	252
Popup items in React Split button component.....	252
Icons .....	252
Template .....	253
See Also .....	256
Accessibility in React SplitButton component .....	256
WAI-ARIA attributes.....	257
Keyboard interaction .....	258
Ensuring accessibility .....	258
See also .....	258
Style and appearance in React Split button component .....	258
How To .....	258
Create right to left splitbutton in React Split button component .....	258
Group items in popup in React Split button component.....	260
Open a dialog on popup item click in React Split button component .....	262
Set the disabled state in React Split button component .....	264
Underline a character in a text in React Split button component .....	265
Ej1 api migration in React Split button component.....	267
Properties.....	267
Methods .....	268
Events.....	269
Splitter.....	270
Getting Started.....	270
Dependencies.....	270

Installation and configuration.....	271
Adding Splitter to the project .....	272
Orientation.....	273
Load content to the pane.....	274
See Also .....	277
Getting Started.....	277
Dependencies.....	277
Installation and configuration.....	277
Adding Splitter to the project .....	278
Orientation.....	280
Load content to the pane.....	280
See Also .....	283
Split panes in React Splitter component.....	283
Horizontal layout.....	283
Vertical layout.....	286
Multiple panes .....	290
Separator.....	295
Nested Splitter .....	298
Add or remove pane .....	306
See Also .....	314
Expand collapse in React Splitter component .....	314
Collapsible panes .....	314
Control the expand and collapse action in programmatic manner .....	318
Specify initial state to panes .....	320
See Also .....	324
Resize in React Splitter component .....	324
Min and Max validation .....	324
Prevent resizing.....	328
Refresh content on resizing .....	332
Customize the resize grip and cursor.....	332
See Also .....	335
Pane content in React Splitter component.....	335
Template .....	335
React UI components.....	339
Plain content .....	339

HTML Markup .....	341
Pane content using selector.....	343
Pane sizing in React Splitter component .....	346
Pane size in pixel .....	346
Pane size in percentage .....	347
Auto size panes .....	349
Fixed pane .....	352
Different layouts in React Splitter component .....	356
Code editor style layout.....	356
Outlook style layout.....	361
See Also .....	369
Style in React Splitter component .....	369
Customizing the split bar .....	369
Customizing the split bar resize handle .....	370
Customizing the split bar arrows .....	371
To hide the resize handle in Splitter .....	372
Globalization in React Splitter component .....	372
RTL.....	372
See Also .....	374
Accessibility in React Splitter component.....	374
Keyboard interaction .....	375
Ensuring accessibility .....	375
See also .....	375
Ej1 api migration in React Splitter component.....	375
Common.....	375
Accessibility and Localization.....	376
Control State .....	377
State Maintenance.....	377
Pane Properties.....	377
Animation.....	379
Spreadsheet .....	379
Overview of the React Spreadsheet component.....	379
Key features .....	379
Getting Started.....	381
Dependencies.....	381

Setup for Local Development.....	381
Adding Syncfusion packages .....	382
Adding CSS reference.....	382
Adding Spreadsheet component .....	382
Run the application .....	382
See Also .....	383
Creating a Next.js Application Using Syncfusion React Components.....	383
What is Next.js? .....	383
Prerequisites .....	383
Create a Next.js application .....	384
Install Syncfusion React packages.....	384
Import Syncfusion CSS styles .....	385
Add Syncfusion React component .....	385
Run the application .....	391
Data binding in React Spreadsheet component .....	391
Local data .....	391
Remote data.....	394
Cell data binding .....	455
Dynamic data binding and Datasource change event .....	478
Note .....	486
See Also .....	487
Open save in React Spreadsheet component.....	487
Open.....	487
Save .....	492
Server Configuration .....	596
Server Dependencies .....	597
Note .....	597
See Also .....	597
Worksheet in React Spreadsheet component .....	597
Add sheet .....	597
Delete sheet .....	601
Rename sheet .....	602
Headers .....	602
Gridlines .....	602
Sheet visibility .....	605

Note .....	610
See Also .....	610
Cell range in React Spreadsheet component.....	610
Wrap text .....	611
Merge cells.....	616
Data Validation.....	625
Auto Fill .....	632
Clear .....	637
Note .....	642
See Also .....	642
Editing in React Spreadsheet component.....	642
Edit cell.....	642
Save cell.....	642
Cancel editing.....	642
Limitations.....	648
Note .....	648
See Also .....	648
Context menu in React Spreadsheet component.....	648
Context Menu Items in Row Cell.....	649
Context Menu Items in Row Header / Column Header .....	649
Context Menu Items in Pager .....	649
Context Menu Customization .....	650
Note .....	653
See Also .....	653
Formulas in React Spreadsheet component.....	653
Usage.....	653
Culture-Based Argument Separator.....	653
Create User Defined Functions / Custom Functions.....	672
Formula bar .....	687
Named Ranges .....	687
Supported Formulas.....	695
Formula Error Dialog.....	697
Note .....	698
See Also .....	698
Formatting in React Spreadsheet component.....	698

Number Formatting .....	699
Text and cell formatting .....	705
Conditional Formatting .....	712
Note .....	717
See Also .....	717
Illustrations in React Spreadsheet component.....	717
Image.....	717
Chart.....	793
Note .....	804
See Also .....	805
Rows and columns in React Spreadsheet component.....	805
Insert .....	805
Delete.....	814
Limitations of insert and delete .....	819
Hide and show .....	819
Size .....	824
Changing text in column headers .....	864
Note .....	865
See Also .....	865
Sort in React Spreadsheet component .....	865
Sort by cell value .....	865
Data contains header .....	886
Case sensitive sort.....	886
Sort multiple columns .....	887
Custom sort comparer .....	908
Known error validations.....	908
Limitations.....	909
Note .....	909
See Also .....	909
Filter in React Spreadsheet component .....	909
Apply filter on UI .....	909
Filter by criteria.....	909
Filter by cell value .....	930
Clear filter.....	930
Clear filter on a field.....	930

Reapply filter.....	930
Known error validations.....	930
Limitations.....	930
Note .....	931
See Also .....	931
Link in React Spreadsheet component .....	931
Insert Link.....	931
Edit Hyperlink.....	931
Remove Hyperlink.....	931
How to change target attribute .....	932
Limitations.....	938
Note .....	938
See Also .....	938
Clipboard in React Spreadsheet component .....	938
Cut.....	938
Copy .....	938
Paste.....	939
Prevent the paste functionality .....	960
Limitations.....	981
Note .....	981
Selection in React Spreadsheet component .....	981
Cell selection .....	982
Row selection .....	982
Column selection .....	986
How to remove selection in the spreadsheet.....	991
Limitations.....	995
Note .....	995
Scrolling in React Spreadsheet component .....	995
Finite Scrolling.....	995
Virtual Scrolling.....	995
Finite scrolling with defined rows and columns .....	996
Note .....	999
Protect sheet in React Spreadsheet component .....	999
Protect Sheet .....	1000
Unprotect Sheet.....	1006

Unlock the particular cells in the protected sheet.....	1006
Protect Workbook.....	1013
Unprotect Workbook.....	1019
Note .....	1020
See Also.....	1020
Searching in React Spreadsheet component.....	1020
Find.....	1020
Replace.....	1020
Go to.....	1021
Limitations.....	1026
Note .....	1026
Undo redo in React Spreadsheet component.....	1026
Undo.....	1026
Redo .....	1027
Update custom actions in UndoRedo collection.....	1027
Note .....	1048
See Also .....	1048
Accessibility in React Spreadsheet component .....	1048
WAI-ARIA attributes.....	1049
Keyboard interaction .....	1050
Ensuring accessibility .....	1051
See also .....	1052
Keyboard shortcuts in React Spreadsheet component .....	1052
Note .....	1053
See Also.....	1054
Ribbon in React Spreadsheet component .....	1054
Ribbon Customization.....	1054
Note .....	1064
See Also.....	1064
Global local in React Spreadsheet component.....	1064
Localization .....	1064
Internationalization.....	1079
Right to left (RTL) .....	1082
Note .....	1087
See Also.....	1087

Freeze pane in React Spreadsheet component .....	1087
Apply freezepanes on UI .....	1087
FrozenRows .....	1087
FrozenColumns .....	1087
Limitations.....	1108
Note .....	1108
See Also .....	1108
Template in React Spreadsheet component .....	1108
Note .....	1115
See Also .....	1115
Use Cases .....	1115
Collaborative editing in React Spreadsheet component .....	1115
How To .....	1122
Sort a range by custom list in React Spreadsheet component .....	1122
Print in React Spreadsheet component .....	1143
Create a object structure in React Spreadsheet component .....	1153
Mobile responsiveness in React Spreadsheet component .....	1197
Feature list in React Spreadsheet component.....	1198
See Also .....	1199
Stepper .....	1199
Getting Started.....	1199
Dependencies.....	1199
Installation and Configuration .....	1200
Adding Syncfusion packages .....	1200
Adding CSS Reference .....	1201
Adding Stepper component to the application .....	1201
Running the application .....	1202
Configure icon and label .....	1203
Steps in React Stepper component.....	1206
Adding steps.....	1206
Optional steps .....	1211
Disabling steps .....	1214
Setting active step.....	1217
Step status.....	1220
Step styling.....	1223

Step validation .....	1226
Step types in React Stepper component .....	1226
Default type .....	1226
Label type.....	1229
Indicator type.....	1236
Orientations in React Stepper component .....	1239
Horizontal.....	1239
Vertical .....	1242
Linear flow in React Stepper component .....	1245
Steps validation in React Stepper component.....	1248
Template in React Stepper component .....	1251
Tooltip in React Stepper component .....	1254
Tooltip template .....	1257
Animation in React Stepper component.....	1261
Globalization in React Stepper component .....	1262
Localization .....	1262
RTL.....	1265
Accessibility in React Stepper component.....	1268
WAI-ARIA attributes.....	1269
Keyboard interaction .....	1269
Ensuring accessibility .....	1270
See also .....	1270
Events in React Stepper component.....	1270
created .....	1270
stepChanged .....	1271
stepChanging.....	1273
stepClick .....	1274
beforeStepRender.....	1275
Stock Chart.....	1277
Getting Started.....	1277
Dependencies.....	1277
Installation and configuration.....	1277
Add Stock Chart to the Project.....	1278
Module Injection.....	1280
Populate Chart with Data.....	1281

Add Stock Chart Title.....	1284
Add Crosshair .....	1286
Add Trackball.....	1288
Working with data in React Stock chart component .....	1290
Local Data.....	1290
See Also .....	1292
Chart dimensions in React Stock chart component.....	1293
Size for Container.....	1293
Size for Stock Chart .....	1295
Axis types in React Stock chart component.....	1299
DateTime axis.....	1299
DateTimeCategory axis .....	1301
Logarithmic axis .....	1303
See also .....	1305
Axis customization in React Stock chart component.....	1305
Axis Crossing .....	1305
Title .....	1307
Tick Lines Customization.....	1308
Grid Lines Customization .....	1310
Multiple Axis .....	1312
Inversed Axis .....	1314
Opposed Position .....	1315
Series types in React Stock chart component.....	1317
Line.....	1317
Spline.....	1317
Hilo .....	1317
HiloOpenClose.....	1317
HollowCandle .....	1317
Candle .....	1318
Trend lines in React Stock chart component .....	1319
Linear.....	1319
Exponential .....	1319
Logarithmic .....	1320
Polynomial .....	1320
Power .....	1320

Moving Average .....	1320
Technical indicators in React Stock chart component .....	1322
Accumulation Distribution .....	1322
Average True Range (ATR) .....	1322
Exponential Moving Average (EMA) .....	1322
Momentum .....	1322
Moving Average Convergence Divergence (MACD) .....	1322
Relative Strength Index (RSI).....	1322
Simple Moving Average (SMA) .....	1322
Stochastic .....	1323
Triangular Moving Average (TMA).....	1323
Bollinger Band.....	1323
Tool tip in React Stock chart component.....	1325
Default tooltip.....	1325
Format the tooltip.....	1327
Position the tooltip .....	1329
Customize the appearance of the tooltip .....	1331
Cross hair in React Stock chart component .....	1333
Tooltip for axis .....	1334
Customization .....	1336
Legend in React Stock chart component .....	1338
Position and Alignment.....	1338
Customization .....	1343
Collapsing Legend Item .....	1349
Legend Title.....	1350
Period selector in React Stock chart component.....	1352
Periods .....	1352
Visibility of period selector .....	1355
Range selector in React Stock chart component .....	1356
Export print in React Stock chart component.....	1358
Disable Export and print .....	1360
Appearance in React Stock chart component.....	1362
Stock Chart Title .....	1362
Stock Chart Theme .....	1366
See Also .....	1368

Stock events in React Stock chart component.....	1368
See Also .....	1379
Accessibility in React Stock chart component .....	1379
WAI-ARIA attributes.....	1380
Keyboard interaction .....	1380
Ensuring accessibility .....	1380
See also .....	1381
Switch.....	1381
Getting Started.....	1381
Dependencies.....	1381
Installation and Configuration .....	1381
Adding Syncfusion packages .....	1381
Adding CSS Reference .....	1382
Adding Switch component to the Application .....	1382
Run the application .....	1382
See Also .....	1383
Accessibility in React Switch component.....	1383
WAI-ARIA attributes.....	1384
Keyboard interaction .....	1384
Ensuring accessibility .....	1385
See also .....	1385
Style and appearance in React Switch component.....	1385
How To .....	1385
Set text in React Switch component .....	1385
Change size in React Switch component .....	1386
Customize the appearance of a switch in React Switch component .....	1387
Enable ripple for switch label in React Switch component.....	1390
Enable rtl in React Switch component.....	1391
Set disabled state in React Switch component.....	1392
Submit name and value in form in React Switch component.....	1393
Change switch state using toggle method in React Switch component.....	1394
Tab .....	1395
Getting Started.....	1395
Dependencies.....	1395
Setup for Local Development.....	1396

Adding Syncfusion packages .....	1397
Adding CSS reference.....	1397
Initialize the Tab using JSON items collection.....	1397
Initialize the Tab using HTML elements .....	1399
See Also .....	1402
Adaptive in React Tab component.....	1402
Scrollable.....	1402
Popup .....	1408
See Also .....	1414
Header in React Tab component .....	1414
Styles .....	1414
Icon positions .....	1418
See Also .....	1422
Localization in React Tab component .....	1422
Loading translations.....	1422
Orientation in React Tab component .....	1425
Drag and drop in React Tab component.....	1432
Drag and drop item between tabs.....	1435
Drag and drop items to external source .....	1442
Drag and drop items from external source.....	1446
Accessibility in React Tab component .....	1451
ARIA attributes.....	1452
Keyboard interaction .....	1453
Ensuring accessibility .....	1453
See also .....	1453
Style in React Tab component .....	1453
Customizing Tab.....	1453
Customizing the Tab items.....	1454
Customizing Tab's header .....	1454
Customizing Tab's header icon .....	1454
Customizing Tab's content.....	1454
Customizing the hover state of Tab control.....	1455
Customizing selected item of Tab control .....	1455
How To .....	1456
Load content through post in React Tab component .....	1456

Prevent content swipe selection in React Tab component .....	1458
Customize selected tab styles in React Tab component.....	1461
Customize tab scroll step in React Tab component.....	1464
Create wizard using tab in React Tab component .....	1469
Load tab with data source in React Tab component .....	1496
Add nested tabs in React Tab component.....	1498
Set state persistence of the tab component in React Tab component .....	1506
Set custom animation in React Tab component.....	1509
Load tab items dynamically in React Tab component .....	1513
Create collapsible tabs in React Tab component.....	1517
Customize tab content height in React Tab component .....	1522
Render other components in tab using template in React Tab component .....	1526
Adding dynamic items with content reuse in React Tab component.....	1531
Reorder active tab in React Tab component .....	1535
Display tool tip on tab header in React Tab component .....	1543
Tab selection in React Tab component.....	1546
React hooks tab in React Tab component .....	1553
Tab key navigation in React Tab component.....	1554
Ej1 api migration in React Tab component.....	1560
Accessibility and Localization.....	1560
AjaxSettings.....	1561
Animation.....	1561
Header.....	1562
Items .....	1562
Common.....	1564
TextArea .....	1566
Getting Started with React TextArea Component .....	1566
Dependencies.....	1566
Installation and configuration.....	1566
Adding TextArea to the application .....	1567
Running the application .....	1568
Getting and setting values .....	1568
Floating Label in React TextArea Component.....	1571
Placeholder with localization .....	1572
Rows and Columns in React TextArea Component .....	1574

Resize in React TextArea Component.....	1575
Width of react TextArea component .....	1576
Maximum Length in React TextArea Component.....	1577
Form Support in React TextArea Component.....	1578
Integration of react TextArea component with FormValidator component .....	1579
Sizing in React TextArea Component.....	1582
Filled and outline mode .....	1583
Custom styling with cssClass API in TextArea .....	1584

## Signature

### Getting Started

The following section explains the required steps to build the Signature component with its basic usage in step-by-step procedure.

To get start quickly with Signature Component using React, you can check on this video:

### Dependencies

The following list of dependencies are required to use the Signature component in your application.

```
`javascript
|-- @syncfusion/ej2-react-base
`
```

### Setup your development environment

You can use [Create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
`
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash
npx create-react-app my-app
cd my-app
npm start
`
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

You can choose the component that you want to install. For this application, we are going to use Signature component.

To install Signature component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-inputs --save
```

The above command installs [Signature dependencies](#) which are required to render the component in the **React** environment.

### Adding Style sheet to the Application

Add Signature component's styles as given below in **App.css**.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
```

### Add Signature to the project

Now, you can create **Signature** component in the application. Add **Signature** component in **src/App.tsx** file using the following code snippet.

```
`ts
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
function App() {
  return (<div style={{marginTop: '150px'}}>
    <SignatureComponent id='signature'></SignatureComponent>
  </div>);
}
export default App;
```

### Run the application

Use the **npm run start** command to run the application in the browser.

```
npm run start
```

The following example shows the default Signature.

### **INDEX.JSX**

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// initializes Signature component.
function App() {
  return (<div id='container'>
    <div id='signature-control'>
```

```

        <h4>Sign here</h4>
        <SignatureComponent id='signature' />
      </div>
    </div>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### INDEX.TSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
// initializes Signature component.
function App() {
  return (
    <div id='container'>
      <div id='signature-control'>
        <h4>Sign here</h4>
        <SignatureComponent id='signature' />
      </div>
    </div>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### Customization in React Signature component

The Signature component draws stroke/path using `moveTo()` and `lineTo()` methods to connect one or more points while drawing in canvas. The stroke width can be modified by using its color and width. And the background can be modified by using its background color and background image.

#### Stroke Width

The variable stroke width is based on the values of [maxStrokeWidth](#), [minStrokeWidth](#) and [velocity](#) for smoother and realistic signature. The default value of minimum stroke width is set as 0.5, maximum stroke width is set as 2.5 and velocity is set as 0.7.

In the following example, minimum stroke width is set as 0.5, maximum stroke width is set as 3 and velocity is set as 0.7.

### INDEX.JSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<div id='container'>
    <div className='signature-control'>
      <h4>Sign here</h4>
      <SignatureComponent id='signature' maxStrokeWidth={3}
minStrokeWidth={0.5} velocity={0.7}/>
    </div>
  </div>);
}
```

```
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### INDEX.TSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (
        <div id='container'>
            <div className='signature-control'>
                <h4>Sign here</h4>
                <SignatureComponent id='signature' maxStrokeWidth= {3}
minStrokeWidth= {0.5} velocity= {0.7}/>
            </div>
        </div>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### Stroke Color

Color of the stroke can be specified by using [strokeColor](#) property and it accepts hexadecimal code, RGB, and text. The default value of this property is “#000000”.

### INDEX.JSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    function clickEventHandler() {
        let signature = getComponent(document.getElementById('signature'),
'signature');
        let color = document.getElementById('text').value;
        signature.strokeColor = color;
    }
    return (<div id='container'>
        <div id="signature-base-control">
            <div id="input">
                <input type="text" id="text" placeholder="Enter the
Stroke Color Value"></input>
                <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Stroke Color</ButtonComponent>
            </div>
            <div id="signature-control">
                <SignatureComponent id='signature' />
            </div>
        </div>
    </div>);
}
```

```
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### INDEX.TSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  function clickEventHandler(): void {
    let signature: SignatureComponent =
      getComponent(document.getElementById('signature'), 'signature');
    let color: string = document.getElementById('text').value;
    signature.strokeColor = color;
  }
  return (
    <div id='container'>
      <div id="signature-base-control">
        <div id="input">
          <input type="text" id="text" placeholder="Enter the
Stroke Color Value"></input>
          <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Stroke Color</ButtonComponent>
        </div>
        <div id="signature-control">
          <SignatureComponent id='signature' />
        </div>
      </div>
    </div>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### Background Color

Background color of a signature can be specified by using [backgroundColor](#) property and it accepts hexadecimal code, RGB, and text. The default value of this property is "#ffffff".

### INDEX.JSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  function clickEventHandler() {
    let signature = getComponent(document.getElementById('signature'),
'signature');
    let bgColor = document.getElementById('text').value;
    signature.backgroundColor = bgColor;
  }
}
```

```

    return (<div id='container'>
      <div id="signature-base-control">
        <div id="input">
          <input type="text" id="text" placeholder="Enter the
Background Color Value"></input>
          <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Background Color</ButtonComponent>
        </div>
        <div id="signature-control">
          <SignatureComponent id='signature' />
        </div>
      </div>
    </div>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  function clickEventHandler(): void {
    let signature: SignatureComponent =
getComponent(document.getElementById('signature'), 'signature');
    let bgColor: string = document.getElementById('text').value;
    signature.backgroundColor = bgColor;
  }
  return (
    <div id='container'>
      <div id="signature-base-control">
        <div id="input">
          <input type="text" id="text" placeholder="Enter the
Background Color Value"></input>
          <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Background Color</ButtonComponent>
        </div>
        <div id="signature-control">
          <SignatureComponent id='signature' />
        </div>
      </div>
    </div>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### Background Image

Background image of a signature can be specified by using [backgroundImage](#) property. The background image can be set by either hosting the image in our local IIS or online image.

**INDEX.JSX**

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    function clickEventHandler() {
        let signature = getComponent(document.getElementById('signature'),
'signature');
        let url = document.getElementById('text').value;
        signature.backgroundImage = url;
    }
    return (<div id='container'>
        <div id="signature-base-control">
            <div id="input">
                <input type="text" id="text" placeholder="Enter the URL
of the background Image"></input>
                <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Background Image</ButtonComponent>
            </div>
            <div id="signature-control">
                <SignatureComponent id='signature' />
            </div>
        </div>
    </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

**INDEX.TSX**

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    function clickEventHandler(): void {
        let signature: SignatureComponent =
getComponent(document.getElementById('signature'), 'signature');
        let url: string = document.getElementById('text').value;
        signature.backgroundImage = url;
    }
    return (
        <div id='container'>
            <div id="signature-base-control">
                <div id="input">
                    <input type="text" id="text" placeholder="Enter the URL
of the background Image"></input>
                    <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Set Background Image</ButtonComponent>
                </div>
                <div id="signature-control">

```

```

        <SignatureComponent id='signature' />
      </div>
    </div>
  </div>
);
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

See Also

- [Save With Background](#)

### Open save in React Signature component

The Signature component supports to open the signature by using hosted/online URL or base64. And it also supports various save options like image, base64, and blob.

### Open Signature

The signature component opens a pre-drawn signature as either base64 or hosted/ online URL using the [load](#) method. It supports the PNG, JPEG, and SVG image's base64.

### INDEX.JSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  function clickEventHandler() {
    let signature = getComponent(document.getElementById('signature'),
'signature');
    let sign = document.getElementById('text').value;
    signature.load(sign);
  }
  return (<div id='container'>
    <div id="signature-base-control">
      <div id="input">
        <input type="text" id="text" placeholder="Enter the
Base64 or URL of signature"></input>
        <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Open</ButtonComponent>
      </div>
      <div id="signature-control">
        <SignatureComponent id='signature' />
      </div>
    </div>
  </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    function clickEventHandler(): void {
        let signature: SignatureComponent =
getComponent(document.getElementById('signature'), 'signature');
        let sign: string = document.getElementById('text').value;
        signature.load(sign);
    }
    return (
        <div id='container'>
            <div id="signature-base-control">
                <div id="input">
                    <input type="text" id="text" placeholder="Enter the
Base64 or URL of signature"></input>
                    <ButtonComponent onClick={clickEventHandler}
isPrimary={true}>Open</ButtonComponent>
                </div>
                <div id="signature-control">
                    <SignatureComponent id='signature' />
                </div>
            </div>
        </div>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

### Save Signature

The Signature component saves the signature as base64, blob, and image like PNG, JPEG, and SVG.

#### Save as Base64

The `getSignature` method is used to get the signature as base64 with the PNG, JPEG, and SVG type. This can be loaded to signature using [load](#) method.

### INDEX.JSX

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogComponent } from '@syncfusion/ej2-react-popups';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    let dialogInstance;
    const animationSettings = { effect: 'Zoom', duration: 400, delay: 0 };
    function getSign() {
        let signature = getComponent(document.getElementById('signature'),
'signature');
        dialogInstance.content = signature.getSignature();
        dialogInstance.show();
    }
    return (<div id='container'>
```

```

        <div id="signature-control">
            <SignatureComponent id='signature' />
        </div>
        <ButtonComponent id="save" cssClass='e-primary' content='Save as
Base64' onClick={getSign}/>
        <DialogComponent id="defaultdialog" showCloseIcon={true}
animationSettings={animationSettings} ref={dialog => dialogInstance =
dialog} height='auto' header='Base64 of the signature' visible={false}
width='80%' />
        </div>);
    }
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

## INDEX.TSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogComponent } from '@syncfusion/ej2-react-popups';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    let dialogInstance: DialogComponent;
    const animationSettings: any = { effect: 'Zoom', duration: 400, delay:
0 };
    function getSign() {
        let signature: Signature =
getComponent(document.getElementById('signature'), 'signature');
        dialogInstance.content = signature.getSignature();
        dialogInstance.show();
    }
    return (
        <div id='container'>
            <div id="signature-control">
                <SignatureComponent id='signature' />
            </div>
            <ButtonComponent id="save" cssClass='e-primary' content='Save as
Base64' onClick={getSign}/>
            <DialogComponent id="defaultdialog" showCloseIcon={true}
animationSettings={animationSettings} ref={dialog => dialogInstance =
dialog} height='auto' header='Base64 of the signature' visible={false}
width='80%' />
            </div>
        );
    };
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### Save as Blob

The [saveAsBlob](#) method is used to save the signature as Blob. It is defined as the chunk of binary data stored as a single entity in a database system.

*Save as Image*

The [save](#) method is used to save the signature as an image. And it accepts file name and file type as parameter. The file type parameter supports PNG, JPEG, and SVG and the default file type is PNG.

**INDEX.JSX**

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";

function App() {
  let items;
  items = [
    {
      text: 'Png'
    },
    {
      text: 'Jpeg'
    },
    {
      text: 'Svg'
    }
  ];
  function onSelect(args) {
    let signature = getComponent(document.getElementById('signature'),
    'signature');
    signature.save(args.item.text, 'Signature');
  }
  return (<div id='container'>
    <div>
      <span>Sign here</span>
      <SplitButtonComponent content="Save" iconCss='e-sign-icons
e-save' items={items} select={onSelect}/>
    </div>
    <div id="signature-control">
      <SignatureComponent id='signature' />
    </div>
  </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

**INDEX.TSX**

```
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { MenuEventArgs, SplitButton, SplitButtonComponent } from
 '@syncfusion/ej2-react-splitbuttons';
import { getComponent, closest } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  let items: { text: string; }[];
  items = [
    {
```

```

        text: 'Png'
      },
      {
        text: 'Jpeg'
      },
      {
        text: 'Svg'
      }
    ]];
    function onSelect(args: MenuEventArgs ): void {
      let signature: Signature =
        getComponent(document.getElementById('signature'), 'signature');
      signature.save(args.item.text as SignatureFileType, 'Signature');
    }
    return (
      <div id='container'>
        <div>
          <span>Sign here</span>
          <SplitButtonComponent content="Save" iconCss='e-sign-icons
e-save' items={items} select={onSelect} />
        </div>
        <div id="signature-control">
          <SignatureComponent id='signature' />
        </div>
      </div>
    );
  };
  export default App;
  ReactDOM.render(<App />, document.getElementById('element'));
```

### Save with Background

The [saveWithBackground](#) property is used to save the signature with its background and its default value is true. So, by default the signature is saved with its background.

In the following sample, the background color is set as 'rgb(103 58 183)' and save with background as true.

### INDEX.JSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {

export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

## Draw in React Signature component

### Draw

The [draw](#) method is used to draw a text as signature with different font families like Arial, Serif, with different font sizes. It accepts text, font family, font size as its parameters. The default font family is "Arial", and the default font size is "30".

### INDEX.JSX

```

import { SignatureComponent } from '@syncfusion/ej2-react-inputs';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import { getComponent } from '@syncfusion/ej2-base';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    const fontData = ['Arial', 'Serif', 'Sans-serif', 'Cursive', 'Fantasy'];
    const sizeData = [20, 30, 40, 50];
    function clickEventHandler() {
        let signature = getComponent(document.getElementById('signature'),
        'signature');
        let text = document.getElementById('text').value;
        let font = document.getElementById("font").value;
        let size = document.getElementById("size").value;
        signature.draw(text, font, size);
    }
    return (
        <div id='container'>
            <div className='signature-control'>

```

### User interaction in React Signature component

The below interactions were available in Signature, and we can walk through one by one.

- Undo and Redo
- Clear
- Disabled
- ReadOnly

#### Undo and Redo

In the Signature, every action can be maintained as a snap for undo and redo operations. And maintained SnapIndex for indexing the snap collection.

The [undo](#) method reverts the last action of signature by decreasing SnapIndex value to index previous snap. Here, [canUndo](#) method is used to ensure whether undo can be performed or not.

The [redo](#) method reverts the last undo action of the signature by increasing the SnapIndex to get the next snap. Here, [canRedo](#) method is used to ensure whether redo can be performed or not.

#### Clear

The [clear](#) method is used to clear the signature and makes the canvas empty. This is also considered in Undo/ Redo. Here, [isEmpty](#) method is used to ensure whether the signature is empty or not.

#### Disabled

The [disabled](#) property is used to enable/disable the signature component. In the disabled state, the user is not allowed to draw signature. And it can't be focused until the user enabled the signature.

#### ReadOnly

The [isReadOnly](#) property is used to enable/disable the ReadOnly Signature. It can be focused but it prevents drawing in Signature.

The following sample explains about user interactions available in signature.

#### INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { SignatureComponent } from '@syncfusion/ej2-react-inputs';

```

```
import { ButtonComponent, CheckBoxComponent } from '@syncfusion/ej2-react-buttons';
import { getComponent } from '@syncfusion/ej2-base';
function App() {
    function undoBtnCreated() {
        document.getElementById('undo').addEventListener('click',
undoBtnClick);
    }
    function undoBtnClick() {
        let signature = getComponent(document.getElementById('signature'),
'signature');

## Accessibility in React Signature component

The Signature component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Signature component is outlined below.

| Accessibility Criteria | Compatibility |

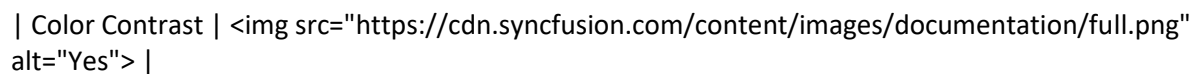

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes"> |

| [Section 508](#) Support |  alt="Yes"> |

| Screen Reader Support |  alt="Yes"> |

| Right-To-Left Support | Not Applicable |

| Color Contrast |  alt="Yes"> |

| Mobile Device Support |  alt="Yes"> |

| Keyboard Navigation Support |  alt="Yes"> |

| [Accessibility Checker](#) Validation |  alt="Yes"> |

| [Axe-core](#) Accessibility Validation |  alt="Yes"> |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### Keyboard interaction

The Signature component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Signature component.

| **Press** | **To do this** |

| --- | --- |

| Ctrl + Z | Undo the last action. |

| Ctrl + Y | Redo the last action. |

| Ctrl + S | To save the signature. |

| delete | Erases all the signature strokes signed by user. |

### Ensuring accessibility

The Signature component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Signature component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Signature component with accessibility tools.

### How To

#### Integration toolbar in React Signature component

The Signature component integrates with the toolbar and the interaction performed using the `change` event of the toolbar.

In that, [canUndo](#), [canRedo](#) and [Link to the Video](#) methods were used to enable/disable undo, redo, and clear buttons.

      </div>
    </div>
  )
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

## Skeleton

### Getting Started

This section explains how to create a simple Skeleton, and configure its available functionalities in React.

To get started quickly with the React Skeleton component, you can check out this video.

### Dependencies

The following list of dependencies are required to use the Skeleton component in your application.

```
`js
|-- @syncfusion/ej2-react-notifications
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-notifications
|-- @syncfusion/ej2-base
`
```

### Setup your development environment

You can use [Create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`
```

Start a new project using create-react-app command as follows

```
`bash
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
`
```

```
`bash
create-react-app quickstart
cd quickstart
`
```

'react-scripts-ts' is used for creating React app with typescript.

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install `Skeleton` component, use the following command

```
`bash
npm install @syncfusion/ej2-react-notifications --save
`
```

The above command installs [Skeleton dependencies](#) which are required to render the component in the **React** environment.

#### Adding style sheet to the Application

Add Skeleton component's styles as given below in **App.css**.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-notifications/styles/material.css";
`
```

#### Add Skeleton to the Application

Now, you can create **Skeleton** component in the application. Add **Skeleton** component in **src/App.tsx** file using the following code snippet.

```
`ts
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
  return (
    <SkeletonComponent height='15px'></SkeletonComponent>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
`
```

#### Run the application

Run the application in the browser using the following command:

```
`
npm start
`
```

The following example shows a basic Skeleton component.

#### **INDEX.JSX**

```
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
```

```
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
    return (<SkeletonComponent height='15px'></SkeletonComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

**INDEX.TSX**

```
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
    return (
        <SkeletonComponent height='15px'></SkeletonComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

[Shapes in React Skeleton component](#)

The Skeleton control support various built-in shape variants to design layout of the page. You can use the [shape](#) property to create a preview of any layout.

The Skeleton component supports the following content shapes:

[Circle skeleton shape](#)

```
`ts
```

```
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
    return (
        <SkeletonComponent shape= 'Circle' width= "48px"></SkeletonComponent>
    );
}
export default App;
```

[Square skeleton shape](#)

```
`ts
```

```
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
    return (
        <SkeletonComponent shape= 'Square' width= "48px"></SkeletonComponent>);
```

```

}
export default App;
`ts

Rectangle skeleton shape
`ts
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
return (
<SkeletonComponent shape= 'Rectangle' width= "50px" height='32px'></SkeletonComponent>);
}
export default App;
`ts

```

#### Text skeleton shape

```

`ts
import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
return (
<SkeletonComponent shape= 'Text' width= "50%" height="15px"></SkeletonComponent>);
}
export default App;
`ts

```

Below example demonstrates the above functionalities of a Skeleton component.

#### INDEX.JSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
return (
<div id="skeletonCard">
<div className='cardProfile'>
<SkeletonComponent id='cardProfile' shape='Circle'
width="60px"></SkeletonComponent>
</div>
<div className="cardinfo">
<SkeletonComponent id="text1" width="30%"
height='15px'></SkeletonComponent><br />
<SkeletonComponent id="text2" width="15%"
height='15px'></SkeletonComponent>

```

```

        </div>
        <div className="cardContent">
            <SkeletonComponent id="cardImage" shape="Rectangle"
width="100%" height='150px'></SkeletonComponent>
        </div>
        <div className="cardoptions">
            <SkeletonComponent id="rightOption" shape="Rectangle"
width="20%" height='32px'></SkeletonComponent>
            <SkeletonComponent id="leftOption" shape="Rectangle"
width="20%" height='32px'></SkeletonComponent>
        </div>
    </div>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
    return (
        <div>
            <div id="skeletonCard">
                <div className='cardProfile'>
                    <SkeletonComponent id='cardProfile' shape= 'Circle' width=
"60px"></SkeletonComponent>
                </div>
                <div className="cardinfo">
                    <SkeletonComponent id="text1" width="30%"
height='15px'></SkeletonComponent><br/>
                    <SkeletonComponent id="text2" width="15%"
height='15px'></SkeletonComponent>
                </div>
                <div className="cardContent">
                    <SkeletonComponent id="cardImage" shape="Rectangle"
width="100%" height='150px'></SkeletonComponent>
                </div>
                <div className="cardoptions">
                    <SkeletonComponent id="rightOption" shape="Rectangle"
width="20%" height='32px'></SkeletonComponent>
                    <SkeletonComponent id="leftOption" shape="Rectangle"
width="20%" height='32px'></SkeletonComponent>
                </div>
            </div>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.CSS

```

/* Represents the styles for loader */
#loader {

```

```

        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    #skeletonCard {
        padding: 10px;
        line-height: inherit;
        height: 330px;
    }
    #skeletonCard .cardProfile {
        float: left;
        margin-right: 15px;
    }
    #skeletonCard .cardinfo {
        margin-top: 10px;
        overflow: hidden;
    }
    #skeletonCard .cardContent {
        margin: 20px 0px 20px;
    }
    #skeletonCard .cardoptions {
        display: flex;
        justify-content: space-between;
    }
}

```

### Shimmer effect in React Skeleton component

You can use the [shimmerEffect](#) property to change animation effect in the skeleton control. Skeleton supports **Wave**, **Pulse** and **Fade** effects and by default, the **shimmerEffect** is set to **Wave** effect.

`ts

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
    return (
        <SkeletonComponent shape= 'Circle' width= "60px" shimmerEffect= 'Pulse'></SkeletonComponent>;
    )
}
export default App;
`

```

Below example demonstrates a list with pulse effect skeleton.

#### INDEX.JSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
    return <div>

```

```

        <ul id="skeleton-list" className="e-card">
          <li>
            <div className='cardProfile'>
              <SkeletonComponent shape="Circle" width="40px"
shimmerEffect='Pulse'></SkeletonComponent>
            </div>
            <div>
              <SkeletonComponent width="60%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent><br></br>
              <SkeletonComponent width="40%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent>
            </div>
          </li>
          <li>
            <div className='cardProfile'>
              <SkeletonComponent shape="Circle" width="40px"
shimmerEffect='Pulse'></SkeletonComponent>
            </div>
            <div>
              <SkeletonComponent width="60%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent><br></br>
              <SkeletonComponent width="40%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent>
            </div>
          </li>
        </ul>
      </div>);
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('element'));

```

## INDEX.TSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
  return (
    <div>
      <ul id="skeleton-list" className="e-card">
        <li>
          <div className='cardProfile'>
            <SkeletonComponent shape="Circle" width="40px"
shimmerEffect='Pulse'></SkeletonComponent>
          </div>
          <div>
            <SkeletonComponent width="60%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent><br></br>
            <SkeletonComponent width="40%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent>
          </div>
        </li>
        <li>
          <div className='cardProfile'>
            <SkeletonComponent shape="Circle" width="40px"
shimmerEffect='Pulse'></SkeletonComponent>

```

```

        </div>
        <div>
          <SkeletonComponent width="60%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent><br></br>
          <SkeletonComponent width="40%" height='15px'
shimmerEffect='Pulse'></SkeletonComponent>
        </div>
      </li>
    </ul>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
#skeleton-list {
  padding-left: 12px;
  padding-top: 7px;
  line-height: inherit;
}
#skeleton-list li {
  list-style: none;
  display: flow-root;
  margin-bottom: 9px;
}
.cardProfile {
  float: left;
  margin-right: 15px;
}

```

### Styles in React Skeleton component

You can customize skeleton control in the below ways.

#### cssClass

You can customize the style of a Skeleton control by using [cssClass](#). The appearance of React Skeleton can be customized by changing the wave color, background color, width, and height. For detailed information, refer [index.css](#) file below.

### INDEX.JSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {

```

```

    return (<SkeletonComponent shape='Circle' width="60px" cssClass='e-
customize'></SkeletonComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
    return (
        <SkeletonComponent shape= 'Circle' width= "60px" cssClass='e-
customize'></SkeletonComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
/* Represents the styles for shimmer-wave */
.e-customize.e-skeleton.e-shimmer-wave::after{
    background-image: linear-gradient(90deg, transparent calc(50% - 100px),
    rgb(30 128 234 / 50%) 50%,
    transparent calc(50% + 100px));
}
/* Represents the background-color for skeleton-circle */
.e-customize.e-skeleton.e-skeleton-circle{
    background-color: #a8c1f2;
}

```

### Visible

You can use the [visible](#) property which defines the visible state of Skeleton.

`ts

```

import { SkeletonComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
    return (
        <SkeletonComponent shape= 'Circle' width= "60px" visible={false}></SkeletonComponent>);
}

```

```

}
export default App;
`

```

### Accessibility in React Skeleton component

The Skeleton component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Skeleton component is outlined below.

Accessibility Criteria	Compatibility
<a href="#">WCAG 2.2</a> Support 	
<a href="#">Section 508</a> Support 	
Screen Reader Support 	
Right-To-Left Support 	
Color Contrast 	
Mobile Device Support 	
Keyboard Navigation Support 	
<a href="#">Accessibility Checker</a> Validation 	
<a href="#">Axe-core</a> Accessibility Validation 	

```

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Skeleton component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Skeleton component:

- | Properties | Functionality |
- | ----- | ----- |
- | **role=alert** | Used to convey important, time-sensitive or contextual message to the user. |
- | **aria-label** | Attribute provides the text label for the Skeleton. |
- | **aria-live** | Attributes which indicates the content changes which are not interactable are live regions. |
- | **aria-busy** | Set to true until loading is complete, then set to false. |

### Ensuring accessibility

The Skeleton component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Skeleton component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Skeleton component with accessibility tools.

## Smithchart

### Getting Started

This section explains you the steps required to create a simple Smith Chart and demonstrate the basic usage of the Smith Chart control.

To get start quickly with React Smith Chart, you can check on this video:

### Dependencies

Below is the list of minimum dependencies required to use the Smith Chart.

```
`ts
|-- @syncfusion/ej2-react-charts
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-file-utils
```

```
|-- @syncfusion/ej2-react-base  
,
```

### Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
,
```

```
npm install -g create-react-app
```

```
,
```

- To set-up a React application in TypeScript environment, run the following command.

```
,
```

```
create-react-app quickstart --template typescript
```

```
cd quickstart
```

```
npm start
```

```
,
```

- To set-up a React application in JavaScript environment, run the following command.

```
,
```

```
create-react-app quickstart
```

```
cd quickstart
```

```
npm start
```

```
,
```

- Install Syncfusion packages using below command.

```
,
```

```
npm install @syncfusion/ej2-react-charts --save
```

```
,
```

### Add Smith Chart to the Project

Now, you can start adding Smith Chart component in the application. For getting started, add the Smith Chart component in `src/App.tsx` file using following code.

```
`ts
```

```
import * as React from "react";
```

```
import { SmithchartComponent } from '@syncfusion/ej2-react-charts';
```

```
function App() {
```

```
return ( <SmithchartComponent></SmithchartComponent> );
}
export default App;
```

Now use the `npm start` command to run the application in the browser.

```
npm start
```

The below example shows basic Smithchart.

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return (<SmithchartComponent id="smithchart"></SmithchartComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

### INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SmithchartComponent id="smithchart"></SmithchartComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

## Module Injection

Smithchart component are segregated into individual feature-wise modules. In order to use a particular feature,

you need to inject its feature module using `<Inject services={} />` method. In the current application, we are

going to modify the above basic smithchart to visualize transmission lines.

For this application we are going to use tooltip and legend feature of the smithchart. Please find relevant

feature module name and description as follows.

- SmithchartLegend - Inject this provider to use legend feature.
- TooltipRender - Inject this provider to use tooltip feature.

Now import the above mentioned modules from smithchart package and inject it into the Smithchart component using

`<Inject services={} />` method.

```
`ts
import * as React from "react";
import { SmithchartComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SmithchartComponent>
    <Inject services={[SmithchartLegend, TooltipRender]} />
  </SmithchartComponent> );
}
export default App;
`
```

### Add Series to Smithchart

Smithchart had two type of specification for adding series.

- **dataSource** - Using this, Data object can bind directly by specifying the resistance and reactance values, series add to smithchart.
- **points** - Using this, collection of resistance and reactance values can bind directly to render series.

Below sample demonstrate adding two series to smithchart both ways.

- First series Transmission1 shows dataSource bound series.
- Second series Transmission2 shows points bound series.

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  return (<SmithchartComponent id='smithchart'>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
```

```

        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
    ]] name='Transmission1'>
        </SmithchartSeriesDirective>
        <SmithchartSeriesDirective points=[
        { resistance: 20, reactance: -50 }, { resistance: 10, reactance:
-10 },
        { resistance: 9, reactance: -4.5 }, { resistance: 8, reactance:
-3.5 },
        { resistance: 7, reactance: -2.5 }, { resistance: 6, reactance:
-1.5 },
        { resistance: 5, reactance: -1 }, { resistance: 4.5, reactance:
-0.5 },
        { resistance: 3.5, reactance: 0 }, { resistance: 2.5, reactance:
0.4 },
        { resistance: 2, reactance: 0.5 }, { resistance: 1.5, reactance:
0.5 },
        { resistance: 1, reactance: 0.4 }, { resistance: 0.5, reactance:
0.2 },
        { resistance: 0.3, reactance: 0.1 }, { resistance: 0, reactance:
0.05 },
    ]] name='Transmission2'>
        </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
</SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective
                points=[
                    { resistance: 10, reactance: 25 }, {

### Enable Marker to Smithchart

To use series marker and its customization in smithchart, use series `marker`. To display marker for particular series, need to specify `marker visible` as true. Below sample marker enabled for first series only.

#### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  return (<SmithchartComponent id='smithchart' title={{
    visible: true,
    text: 'Transmission lines applied for both impedance and
admittance'
  }}>

```

```

        <SmithchartSeriesCollectionDirective>
          <SmithchartSeriesDirective points=[
            { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
          },
            { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
            { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
            { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
            { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
            { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
          ] name='Transmission1'>
        </SmithchartSeriesDirective>
        <SmithchartSeriesDirective points=[
          { resistance: 20, reactance: -50 }, { resistance: 10, reactance:
-10 },
          { resistance: 9, reactance: -4.5 }, { resistance: 8, reactance:
-3.5 },
          { resistance: 7, reactance: -2.5 }, { resistance: 6, reactance:
-1.5 },
          { resistance: 5, reactance: -1 }, { resistance: 4.5, reactance:
-0.5 },
          { resistance: 3.5, reactance: 0 }, { resistance: 2.5, reactance:
0.4 },
          { resistance: 2, reactance: 0.5 }, { resistance: 1.5, reactance:
0.5 },
          { resistance: 1, reactance: 0.4 }, { resistance: 0.5, reactance:
0.2 },
          { resistance: 0.3, reactance: 0.1 }, { resistance: 0, reactance:
0.05 },
        ] name='Transmission2' marker={{ shape: 'Circle', visible: true,
border: { width: 2 } }}>
        </SmithchartSeriesDirective>
      </SmithchartSeriesCollectionDirective>
    </SmithchartComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
{% enddraw %}

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SmithchartComponent id='smithchart'
    title = { {

resistance: 2.5, reactance: 0.4 },
        { resistance: 2, reactance: 0.5 }, {
resistance: 1.5, reactance: 0.5 },
        { resistance: 1, reactance: 0.4 }, {
resistance: 0.5, reactance: 0.2 },
        { resistance: 0.3, reactance: 0.1 }, {
resistance: 0, reactance: 0.05 },
        ]} name='Transmission2' marker={ { shape:
'Circle', visible: true, border: { width: 2 } } }
      >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Enable DataLabel to Smithchart Marker

To use marker dataLabel and it's customization in smithchart, use marker dataLabel. To display dataLabel for particular series marker, need to specify dataLabel visible as true in that series marker. Below sample dataLabel enabled for first series.

### INDEX.JSX

```

{% raw %}
import * as React from "react";

```

```

import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return (<SmithchartComponent id='smithchart' title={{
        visible: true,
        text: 'Transmission lines applied for both impedance and
admittance'
    }}>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective points=([
                { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
},
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
            ]] name='Transmission1' marker={{ shape: 'Circle', dataLabel: {
visible: true }, visible: true, border: { width: 2 } }}>
                </SmithchartSeriesDirective>
                <SmithchartSeriesDirective points=([
-10 },
                { resistance: 9, reactance: -4.5 }, { resistance: 8, reactance:
-3.5 },
                { resistance: 7, reactance: -2.5 }, { resistance: 6, reactance:

} }
      >
    </SmithchartSeriesDirective>
    <SmithchartSeriesDirective
      points=[
        { resistance: 20, reactance: -50 }, {
resistance: 10, reactance: -10 },
        { resistance: 9, reactance: -4.5 }, {
resistance: 8, reactance: -3.5 },
        { resistance: 7, reactance: -2.5 }, {
resistance: 6, reactance: -1.5 },
        { resistance: 5, reactance: -1 }, {
resistance: 4.5, reactance: -0.5 },
        { resistance: 3.5, reactance: 0 }, {
resistance: 2.5, reactance: 0.4 },
        { resistance: 2, reactance: 0.5 }, {
resistance: 1.5, reactance: 0.5 },
        { resistance: 1, reactance: 0.4 }, {
resistance: 0.5, reactance: 0.2 },
        { resistance: 0.3, reactance: 0.1 }, {
resistance: 0, reactance: 0.05 },
      ]} name='Transmission2'
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Enable Legend for Smithchart

Smithchart had a legend feature, which is used to denote the correspond series. To enable the legend, need to inject `SmithchartLegend` module using `Smithchart.Inject(SmithchartLegend)` method and `smithchart legendSettings visible` as `true`. Following example sample shows enabling legend for smithchart. Series name can customize using series `name`.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective, Inject, SmithchartLegend } from '@syncfusion/ej2-react-charts';
function App() {
    return (<SmithchartComponent id='smithchart' legendSettings={{ visible:
true, shape: 'Circle' }} title={{
        visible: true,

```

### Enable Tooltip for Smithchart Series

Smithchart had a tooltip feature, which is used to show the current point's values. To enable the tooltip, need to inject `TooltipRender` module using `Smithchart.Inject(TooltipRender)` method and smithchart series `tooltip visible` as true. Following example sample shows enabling tooltip for smithchart series collection.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective, Inject, SmithchartLegend, TooltipRender } from
'@syncfusion/ej2-react-charts';
function App() {
  return (<SmithchartComponent id='smithchart' legendSettings={{ visible:
true, shape: 'Circle' }} title={{
    visible: true,
    text: 'Transmission lines applied for both impedance and
admittance'
  }}>
    <Inject services={[SmithchartLegend,
TooltipRender]}/>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },

resistance: 0, reactance: 0.05 },
      ]} name='Transmission2' tooltip={ { visible:
true } }
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Working with data in React Smithchart component

The Smith chart can visualize the data bound from local data. The data bound for the Smith chart should be an array of object and should contain the field resistance and rectangle. This data should be bound to points or data source in the Smith chart.

#### Data Binding

You can bind simple JSON data to Smith chart using the point property in series. The JSON data should contain [resistance] and [reactance] fields. This JSON data should be bound to points or data source in the Smith chart. You can add any number of JSON or data source to points.

**INDEX.JSX**

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return (<SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective points=[
                { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
            },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
            ]] name='Transmission1'>
                </SmithchartSeriesDirective>
                <SmithchartSeriesDirective points=[
                    { resistance: 20, reactance: -50 }, { resistance: 10, reactance:

export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Smithchart dimensions in React Smithchart component

You can render the Smith chart corresponding to its container size. To set the size for the Smith chart, use the width and height properties.

#### Size for container

To render the Smith chart to its container size, specify the width and height of the Smith chart's container using inline or CSS as demonstrated in the following code sample.

```
`ts
<div id='container'>

<div id='smithchart' style="width:650px; height:350px;"></div>

</div>
`
```

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return (<SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective points=[
                { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
            },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
            ] name='Transmission1'>
            </SmithchartSeriesDirective>
        </SmithchartSeriesCollectionDirective>
    </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

### INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective
                points=[
                    { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
                    { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },
                    { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
```

```

        { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
        { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
      ]} name='Transmission1'
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Size for Smith chart

<!-- markdownlint-disable MD036 -->

You can also set the size for Smith chart in pixels or percentage directly using the `[width]` and `[height]` properties.

#### *In pixel*

In the width and height properties of Smith chart, directly set the values in pixels as demonstrated in the following code sample.

#### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  return (<SmithchartComponent id='smithchart' width="650px"
height="300px">
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points={[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
},
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
      ]} name='Transmission1'>
      </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
  </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

**INDEX.TSX**

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SmithchartComponent id='smithchart' width="650px"
height="300px">
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective
                points=[
                    { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
                    { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },
                    { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
                    { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
                    { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
                    { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
                ]} name='Transmission1'
            >
        </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

*In percentage*

You can also specify the width and height properties of the Smith chart in percentage. If you mention the width and height in percentage, then Smith chart will be rendered to its container size. The following code sample demonstrates how to set the width and height properties of the Smith chart in percentage.

**INDEX.JSX**

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,

## Title subtitle in React Smithchart component

### Enable title

The title and subtitle are used to describe the information about the data being plotted in the Smith chart. You can set the title and subtitle of the Smith chart using the `[text]` property. By default, the visibility of the title and subtitle is enabled. The following code sample demonstrates how to simply set text to title and subtitle.

**INDEX.JSX**

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    function load(args) {
        args.smithchart.title.text = 'Impedance Transmission';
        args.smithchart.title.visible = true;
        args.smithchart.title.subtitle.text = 'Transmission';
    }
    return (<SmithchartComponent id='smithchart' load={load.bind(this)}>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective points=[
                { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
            },
                { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
                { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
                { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
                { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
            ] name='Transmission1'>
            </SmithchartSeriesDirective>
        </SmithchartSeriesCollectionDirective>
    </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

**INDEX.TSX**

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    function load(args: ISmithchartLoadedEventArgs): void {
        args.smithchart.title.text = 'Impedance Transmission';
        args.smithchart.title.visible = true;
        args.smithchart.title.subtitle.text = 'Transmission';
    }
    return ( <SmithchartComponent id='smithchart' load={load.bind(this)}>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective
                points=[
                    { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
                    { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },

```

```

        { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
        { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
        { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
      ]} name='Transmission1'
    >
      </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
  </SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Trim title

Both the title and subtitle of the Smith chart can be trimmed if they exceed the certain length. Trimming is enabled using the [enableTrim] property for title and subtitle. The length for title and subtitle can be changed using the [maximumWidth] property. You can also customize the font, alignment, and visibility of title and subtitle using the [font], [textAlignment], and [visibility] properties.

### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';

};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

## Smithchart axis in React Smithchart component

Like chart, Smith chart also has support for two types of axis:

- Horizontal axis: Axis drawn as straight line in horizontal direction of the chart.
- Radial axis: Axis drawn as circular path.

### Labels customization

Axis labels are used to denote the kind of data that is bound to Smith chart. Using axis labels, you can easily identify the interval, in which the chart is rendered. The following properties are used to customize the axis labels for horizontal and radial axes:

- `[labelPosition]`: Places the labels either inside or outside the axis line.
- `[labelIntersectAction]`: Hides the labels when intersect with other labels.
- `[labelStyle]`: Customizes the properties such as font size, family, weight, and opacity.

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  function load(args) {
    args.smithchart.radialAxis = {
      labelPosition: 'Inside',
      labelIntersectAction: 'Hide',
      labelStyle: {
        fontFamily: 'Times New Roman',
        fontWeight: 'bold',
        fontStyle: 'Italic',
        opacity: 0.75,
        size: '14px'
      }
    };

    </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Gridlines

To make the data easier to read in a chart that displays axes, display horizontal axis and radial axis gridlines. Gridlines are extended from any horizontal axis or radial axis across the plot area of the Smith chart.

Both horizontal and radial axes have support for major and minor gridlines. Major gridlines are drawn from the position in which labels are rendered. Minor gridlines are drawn between two major gridlines as per the count you set in settings.

You can customize the major and minor gridlines using the following properties:

- `[width]`: Customizes the width of gridlines.
- `[dashArray]`: Decides whether the gridlines have to be rendered as normal line or dashed line.
- `[visible]`: Enables or disables the visibility of the gridlines.
- `[opacity]`: Customizes the opacity of the major gridlines.
- `[count]`: Customizes the count of the minor gridlines.

### INDEX.JSX

### Axis line

Axis line is a line in Smith chart that can be configured to denote the axis. You can customize the axis line using the following properties:

- **[width]**: Customize the width of the axis line.
- **[dashArray]**: Renders the axis line as dashed line.
- **[visible]**: Enables or disable the visibility of the axis line.

By default, visibility of the axis line is true. You can customize its visibility by using the visible property in axis line.

## Smithchart legend in React Smithchart component

Legend is a key used in smithchart; it contains symbols and descriptions. The legends provide a valuable information for interpreting what the Smith chart displays. They can be represented in various colors, shapes, or other identifiers based on the data. The legends are used to denote the series rendered in the Smith chart.

### Position and alignment

#### Position

By default, the visibility of the legend is false. To enable the legend, set the visible property to true in legendSettings. The default position for the legend is bottom. By using the [position] property, you can either place the legend at the bottom, top, right, or left of the Smith chart. To use the legend in Smith chart, import and inject the SmithchartLegend from chart.

#### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartLegend,
SmithchartSeriesCollectionDirective, SmithchartSeriesDirective } from
'@syncfusion/ej2-react-charts';
function App() {
  function load(args) {
    args.smithchart.legendSettings = {
      visible: true,
      position: 'Top'
    };
  }
  return (<SmithchartComponent id='smithchart' load={load.bind(this)}>
    <Inject services={[SmithchartLegend]} />
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },

export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

## Customization

### Legend shape

By default, the legends are rendered in a circle shape. The color of the shape will be same as the series color. Using the [shape] property in legend settings, you can change the shape of the legend to rectangle, triangle, and so on.

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartLegend,
SmithchartSeriesCollectionDirective, SmithchartSeriesDirective } from
'@syncfusion/ej2-react-charts';
function App() {
  function load(args) {
    args.smithchart.legendSettings = {
      visible: true,
      position: 'Top',
      shape: 'Rectangle'
    };
  }
  return (<SmithchartComponent id='smithchart' load={load.bind(this)}>
    <Inject services={[SmithchartLegend]}/>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },

resistance: 0, reactance: 0.05 },
    ]} name='Transmission2'
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Legend size

By default, a legend takes 20 to 25% of the chart's height horizontally when it is placed at the top or bottom position and 20 to 25% of the width vertically when placing at the left or right. You can change the legend size using the `[width]` and `[height]` properties of the `legendSettings`.

### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartLegend,
SmithchartSeriesCollectionDirective, SmithchartSeriesDirective } from
'@syncfusion/ej2-react-charts';

    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Padding

You can customize the space between two legend items and space between legend shape and text as needed. For customizing the space between two legend items, use the `[itemPadding]` property. To control the space between legend shape and text, use the `[shapePadding]` property.

### INDEX.JSX

```

```

### Toggle visibility

By default, the series name is displayed in the legend. You can collapse the visibility of a series by clicking the legend for the particular series and toggle the series visibility to true or false using the `toggleVisibility` property. By default, this property is set to true.

**INDEX.JSX**

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartLegend,
SmithchartSeriesCollectionDirective, SmithchartSeriesDirective } from
'@syncfusion/ej2-react-charts';

### Smithchart tooltip in React Smithchart component

The Smith chart displays details about the points using tooltip when the mouse is hovered over the points. By default, the tooltips are disabled. To enable the tooltips, import and inject the TooltipRender module from Smith chart, and set the visible property to true in tooltip settings. You can customize the visibility and appearance of tooltips for each series in the Smith chart.

#### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective, TooltipRender } from '@syncfusion/ej2-react-
charts';
function App() {
    function load(args) {
        args.smithchart.series[0].tooltip = {
            visible: true
        };
        args.smithchart.series[0].marker = {
            visible: true
        };
    }

<!-- markdownlint-disable MD036 -->

### Smithchart marker in React Smithchart component

The markers and data labels are used to provide information about the data points in the series. You can add a shape to adorn each data point. By default, both the marker and data label are disabled in Smith chart. You can enable them by setting the visible property to true in marker and data label settings.

#### Marker

By default, the visibility of marker is false. You can enable marker by setting the visible property to true in marker settings. Using marker settings, you can customize marker differently for each series in Smith chart.

**INDEX.JSX**

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective, TooltipRender } from '@syncfusion/ej2-react-
charts';
function App() {
  function load(args) {
    args.smithchart.series[0].marker = {
      visible: true
    };
  }
  return (<SmithchartComponent id='smithchart' load={load.bind(this)}>
    <Inject services={[TooltipRender]}/>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
      ] name='Transmission1'>
        </SmithchartSeriesDirective>
      </SmithchartSeriesCollectionDirective>
    </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { Inject, SmithchartComponent, SmithchartLegend,
SmithchartSeriesCollectionDirective, SmithchartSeriesDirective,
TooltipRender } from '@syncfusion/ej2-react-charts';
function App() {
  function load(args: ISmithchartLoadedEventArgs): void {
    args.smithchart.series[0].marker = {
      visible: true
    };
  }
  return ( <SmithchartComponent id='smithchart' load={load.bind(this)}>
    <Inject services={[TooltipRender]} />
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective
        points=[
          { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },

```

```

resistance: 4.5, reactance: 2 }, { resistance: 6, reactance: 4.5 }, {
resistance: 2.5, reactance: 1.3 }, { resistance: 3.5, reactance: 1.6 }, {
resistance: 1.5, reactance: 1 }, { resistance: 2, reactance: 1.2 }, {
resistance: 0.5, reactance: 0.4 }, { resistance: 1, reactance: 0.8 }, {
resistance: 0, reactance: 0.15 }, { resistance: 0.3, reactance: 0.2 }, {
    ]} name='Transmission1'
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Marker customization

Using marker settings in series, you can customize the marker for each series differently. You can customize the markers using the following properties differently for each series in the Smith chart:

- **[width]**: Controls the width of the marker.
- **[height]**: Controls the height of the marker.
- **[fill]**: Customizes the fill color of the marker.
- **[opacity]**: Customizes the opacity of the marker.
- **[border]**: Controls the width and color of the marker's border.
- **[shape]**: Changes the shape of the marker.

### INDEX.JSX

```

resistance: 8, reactance: 6 },
                { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },
                { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
                { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
                { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
                { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
            ] name='Transmission1'
        >
    </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
    </SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));

```

### Smithchart series in React Smithchart component

You can add any number of series to Smith chart as needed. By using the series setting, you can add or customize the data. For the points and data source added in the series, line can be drawn. You can customize the each series with marker, data label, animation, opacity, and so on.

#### points or data source

For adding values in the Smith chart, you can use either points or data source in the series. Both the points and data source should be an array of object, which should contain the field names resistance and rectangle.

#### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';

```

```
function App() {
  return (<SmithchartComponent id='smithchart'>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
      ]} name='Transmission1'>
      </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
  </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

## INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SmithchartComponent id='smithchart'>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective
        points=[
          { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
          { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },
          { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
          { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
          { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
          { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
        ]} name='Transmission1'
      >
      </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
  </SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

### Series customization

Using the following options in series settings, you can customize the each series in Smith chart:

- `[fill]`: Customizes the fill color for the series.
- `[enableSmartLabels]`: Places the data labels on Smith chart without overlapping with each other.
- `[visibility]`: Handles the visibility of the series.
- `[opacity]`: Controls the opacity of the series line.
- `[width]`: Customizes the width of the series line.

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  function load(args) {
    args.smithchart.series[0].fill = '#009933';
    args.smithchart.series[0].visibility = 'visible';
    args.smithchart.series[0].opacity = 0.75;
    args.smithchart.series[0].width = 2.5;
    args.smithchart.series[0].marker = { dataLabel: { visible: true } };
  }
  return (<SmithchartComponent id='smithchart' load={load.bind(this)}>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
      2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
      reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
      1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
      0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
      0.15 },
      ]} name='Transmission1'>
        </SmithchartSeriesDirective>
      </SmithchartSeriesCollectionDirective>
    </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
```

### INDEX.TSX

            >
        </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
    </SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
{% enddraw %}

```

## Smithchart print in React Smithchart component

### Print

The rendered Smith chart can be printed directly from browser by calling the public method print. The ID of the Smith chart's div element must be passed as an argument to the public method.

### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    let smithchartInstance;
    return (<SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective points=[
                { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
},

```

```

        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
    ]] name='Transmission1'>
        </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
</SmithchartComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
document.getElementById('print').onclick = () => {
    App.smithchartInstance.print();
};

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
    let smithchartInstance: SmithchartComponent;
    return ( <SmithchartComponent id='smithchart'>
        <SmithchartSeriesCollectionDirective>
            <SmithchartSeriesDirective
                points=[
                    { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
                    { resistance: 6, reactance: 4.5 }, {
resistance: 4.5, reactance: 2 },
                    { resistance: 3.5, reactance: 1.6 }, {
resistance: 2.5, reactance: 1.3 },
                    { resistance: 2, reactance: 1.2 }, {
resistance: 1.5, reactance: 1 },
                    { resistance: 1, reactance: 0.8 }, {
resistance: 0.5, reactance: 0.4 },
                    { resistance: 0.3, reactance: 0.2 }, {
resistance: 0, reactance: 0.15 },
                ]] name='Transmission1'
            >
        </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
document.getElementById('print').onclick = () => {
    App.smithchartInstance.print();
};

```

```
};
```

## Export

The rendered Smith chart can be exported to JPEG, PNG, SVG, or PDF format using the export method. The input parameters for this method are Export Type for format and fileName for result.

## INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  let smithchartInstance;
  return (<SmithchartComponent id='smithchart'>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective points=[
        { resistance: 10, reactance: 25 }, { resistance: 8, reactance: 6
      },
        { resistance: 6, reactance: 4.5 }, { resistance: 4.5, reactance:
2 },
        { resistance: 3.5, reactance: 1.6 }, { resistance: 2.5,
reactance: 1.3 },
        { resistance: 2, reactance: 1.2 }, { resistance: 1.5, reactance:
1 },
        { resistance: 1, reactance: 0.8 }, { resistance: 0.5, reactance:
0.4 },
        { resistance: 0.3, reactance: 0.2 }, { resistance: 0, reactance:
0.15 },
      ] name='Transmission1'>
      </SmithchartSeriesDirective>
    </SmithchartSeriesCollectionDirective>
  </SmithchartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
document.getElementById('print').onclick = () => {
  App.smithchartInstance.export();
};
```

## INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { SmithchartComponent, SmithchartSeriesCollectionDirective,
SmithchartSeriesDirective } from '@syncfusion/ej2-react-charts';
function App() {
  let smithchartInstance: SmithchartComponent;
  return ( <SmithchartComponent id='smithchart'>
    <SmithchartSeriesCollectionDirective>
      <SmithchartSeriesDirective
        points=[
          { resistance: 10, reactance: 25 }, {
resistance: 8, reactance: 6 },
```

```

resistance: 4.5, reactance: 2 }, { resistance: 6, reactance: 4.5 }, {
resistance: 2.5, reactance: 1.3 }, { resistance: 3.5, reactance: 1.6 }, {
resistance: 1.5, reactance: 1 }, { resistance: 2, reactance: 1.2 }, {
resistance: 0.5, reactance: 0.4 }, { resistance: 1, reactance: 0.8 }, {
resistance: 0, reactance: 0.15 }, { resistance: 0.3, reactance: 0.2 }, {
    ]} name='Transmission1'
    >
    </SmithchartSeriesDirective>
  </SmithchartSeriesCollectionDirective>
</SmithchartComponent> );
};
export default App;
ReactDOM.render(<App />, document.getElementById('smithchart'));
document.getElementById('print').onclick = () => {
  App.smithchartInstance.export();
};

```

### Accessibility in React Smithchart component

The Smith chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Smith chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Smith chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Smith chart component:

- `img (role)`
- `region (role)`
- `aria-label (attribute)`
- `aria-hidden (attribute)`

### Keyboard interaction

The Smith chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Smith chart component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the next element in the Smith chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Smith chart. |

| **Ctrl + P** | Prints the Smith chart. |

### Ensuring accessibility

The Smith chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Smith chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Smith chart component with accessibility tools.

## Sparkline

### Getting Started

This section explains you the steps required to create a sparkline and demonstrate its basic usage.

### Dependencies

The following list of minimum dependencies are required to use the sparkline:

```
`ts
|-- @syncfusion/ej2-react-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
`,`
```

### Installation and Configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`
npm install -g create-react-app
`,`
```

- To set-up a React application in TypeScript environment, run the following command.

```
`
create-react-app quickstart --template typescript
cd quickstart
npm start
`,`
```

- To set-up a React application in JavaScript environment, run the following command.

```
`
create-react-app quickstart
cd quickstart
`,`
```

npm start

,

- Install Syncfusion packages using below command.

,

npm install @syncfusion/ej2-react-charts --save

,

### Add Sparkline to the Project

Now, you can start adding Sparkline component in the application. For getting started, add the Sparkline component in `src/index.tsx` file using following code.

```
`ts
```

```
import * as React from 'react';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
class App extends React.Component {
  render() {
    return ( <SparklineComponent></SparklineComponent> );
  }
}
export default App;
```

,

Now run the `npm start` command in the console, it will run your application and open the browser window.

,

npm start

,

Since the data source has not been specified to the sparkline, no shape will be rendered. Only an empty SVG element is appended to the sparkline container.

### Module Injection

The sparkline component is segregated into individual feature-wise modules. To use a particular feature, inject its feature module using the `<Inject services={} />` method. The module available in sparkline and its descriptions is as follows.

- SparklineTooltip - Inject this provider to use tooltip series.

In the current application, the above basic sparkline is modified to visualize the types of sparkline.

In this application, tooltip feature of the sparkline is used. Now, import the SparklineTooltip module from the sparkline package, and inject it into the sparkline control using the `Sparkline.Inject` method.

```
`ts
import * as React from 'react';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
class App extends React.Component {
  render() {
    return ( <SparklineComponent><Inject services={[SparklineTooltip]} /></SparklineComponent> );
  }
}
export default App;
```

### Bind data source to Sparkline

The `dataSource` property is used for binding data source to the sparkline. This property takes the collection value as input. For example, the list of objects can be provided as input.

#### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='100px'
width='70%' dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] xName='xval' yName='yval'>
    </SparklineComponent> );
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

#### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
height='100px' width='70%'
dataSource=[
```

```

    { x: 0, xval: '2005', yval: 20090440 },
    { x: 1, xval: '2006', yval: 20264080 },
    { x: 2, xval: '2007', yval: 20434180 },
    { x: 3, xval: '2008', yval: 21007310 },
    { x: 4, xval: '2009', yval: 21262640 },
    { x: 5, xval: '2010', yval: 21515750 },
    { x: 6, xval: '2011', yval: 21766710 },
    { x: 7, xval: '2012', yval: 22015580 },
    { x: 8, xval: '2013', yval: 22262500 },
    { x: 9, xval: '2014', yval: 22507620 },
  ]}
  xName='xval' yName='yval'>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Change the type of Sparkline

You can change the sparkline type by setting the [type] property to [Line], [Column], [WinLoss], [Pie], or [Area]. Here, the sparkline type has been set to [area].

#### INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (
      <SparklineComponent id='sparkline' height='100px'
        width='70%' dataSource=[
          { x: 0, xval: '2005', yval: 20090440 },
          { x: 1, xval: '2006', yval: 20264080 },
          { x: 2, xval: '2007', yval: 20434180 },
          { x: 3, xval: '2008', yval: 21007310 },
          { x: 4, xval: '2009', yval: 21262640 },
          { x: 5, xval: '2010', yval: 21515750 },
          { x: 6, xval: '2011', yval: 21766710 },
          { x: 7, xval: '2012', yval: 22015580 },
          { x: 8, xval: '2013', yval: 22262500 },
          { x: 9, xval: '2014', yval: 22507620 },
        ] xName='xval' yName='yval' type='Area'>
      </SparklineComponent>);
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

#### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return (
    <SparklineComponent id='sparkline'
      height='100px' width='70%'

```

```

    dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ]
    xName='xval' yName='yval' type='Area'>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Enable tooltip for Sparkline

The sparkline displays additional information through tooltip when the mouse is hovered over the sparkline. You can enable tooltip by setting the `[visible]` property to true in `[tooltipSettings]` and injecting `SparklineTooltip` module using the `Sparkline.Inject(SparklineTooltip)` method.

#### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent, Inject, SparklineTooltip } from
 '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (
      <SparklineComponent id='sparkline' height='100px'
        width='70%' tooltipSettings={{
          visible: true, format: '${xval} : ${yval}',
        }} dataSource=[
          { x: 0, xval: '2005', yval: 20090440 },
          { x: 1, xval: '2006', yval: 20264080 },
          { x: 2, xval: '2007', yval: 20434180 },
          { x: 3, xval: '2008', yval: 21007310 },
          { x: 4, xval: '2009', yval: 21262640 },
          { x: 5, xval: '2010', yval: 21515750 },
          { x: 6, xval: '2011', yval: 21766710 },
          { x: 7, xval: '2012', yval: 22015580 },
          { x: 8, xval: '2013', yval: 22262500 },
          { x: 9, xval: '2014', yval: 22507620 },
        ] xName='xval' yName='yval' type='Area'>
        <Inject services={[SparklineTooltip]} />
      </SparklineComponent>);
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip }
  from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='100px' width='70%'
    tooltipSettings={ {
      visible: true, format: '${xval} : ${yval}',
    } }
    dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },

    ]
    xName='xval' yName='yval' type='Area'>
    <Inject services={ [SparklineTooltip] } />
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## Sparkline dimensions in React Sparkline component

## Size for container

Sparkline can be rendered to its container size. You can set the size through inline or CSS as shown in the following code.

```
,
<div id='container'>
  <div id='element' style="width:650px; height:350px;"></div>
</div>
,
```

**INDEX.JSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='350px'
      width='650px' dataSource=[
        { x: 0, xval: '2005', yval: 20090440 },
        { x: 1, xval: '2006', yval: 20264080 },

```

```

        { x: 2, xval: '2007', yval: 20434180 },
        { x: 3, xval: '2008', yval: 21007310 },
        { x: 4, xval: '2009', yval: 21262640 },
        { x: 5, xval: '2010', yval: 21515750 },
        { x: 6, xval: '2011', yval: 21766710 },
        { x: 7, xval: '2012', yval: 22015580 },
        { x: 8, xval: '2013', yval: 22262500 },
        { x: 9, xval: '2014', yval: 22507620 },
      ]}
      // Assign the dataSource values to series of sparkline 'xName and
      yName'
      xName='xval' yName='yval'>
    </SparklineComponent>;
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

**INDEX.TSX**

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='350px' width='650px'
    dataSource= { [
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'xval' yName= 'yval'>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

<!-- markdownlint-disable MD036 -->

[Size for sparkline](#)

<!-- markdownlint-disable MD036 -->

You can also set the size for sparkline directly using the [width](#) and [height](#) properties.

**In pixel**

You can set the size for sparkline in pixel as demonstrated in the following code.

**INDEX.JSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='150' width='350'
    dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ]
    // Assign the dataSource values to series of sparkline 'xName and
    yName'
    xName='xval' yName='yval'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
  height='150' width='350'
  dataSource= { [
    { x: 0, xval: '2005', yval: 20090440 },
    { x: 1, xval: '2006', yval: 20264080 },
    { x: 2, xval: '2007', yval: 20434180 },
    { x: 3, xval: '2008', yval: 21007310 },
    { x: 4, xval: '2009', yval: 21262640 },
    { x: 5, xval: '2010', yval: 21515750 },
    { x: 6, xval: '2011', yval: 21766710 },
    { x: 7, xval: '2012', yval: 22015580 },
    { x: 8, xval: '2013', yval: 22262500 },
    { x: 9, xval: '2014', yval: 22507620 },
  ] }
  // Assign the dataSource values to series of sparkline 'xName and yName'
  xName= 'xval' yName= 'yval'>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## In percentage

By setting values in percentage, sparkline gets its dimension with respect to its container. For example, when the height is set to '50%', sparkline is rendered to half of its container height.

### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='50%' width='350%'
    dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ]
    // Assign the dataSource values to series of sparkline 'xName and
    yName'
    xName='xval' yName='yval'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
  height='50%' width='350%'
  dataSource= { [
    { x: 0, xval: '2005', yval: 20090440 },
    { x: 1, xval: '2006', yval: 20264080 },
    { x: 2, xval: '2007', yval: 20434180 },
    { x: 3, xval: '2008', yval: 21007310 },
    { x: 4, xval: '2009', yval: 21262640 },
    { x: 5, xval: '2010', yval: 21515750 },
    { x: 6, xval: '2011', yval: 21766710 },
    { x: 7, xval: '2012', yval: 22015580 },
    { x: 8, xval: '2013', yval: 22262500 },
    { x: 9, xval: '2014', yval: 22507620 },
  ] }
  // Assign the dataSource values to series of sparkline 'xName and yName'
  xName= 'xval' yName= 'yval'>
  </SparklineComponent> );
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## Sparkline types in React Sparkline component

Different types of shapes can be used to represent the sparkline. You can change the sparkline type by setting the type property. Sparkline supports the following types:

- Line
- Column
- Win-Loss
- Pie
- Area

The following code sample shows different types of sparklines.

<!-- markdownlint-disable MD036 -->

### Line

The [Line] type is used to render the sparkline series as line.

#### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='100px'
width='70%' dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ]
    // Assign the dataSource values to series of sparkline 'xName and
yName'
    xName='xval' yName='yval'
    // Assign 'Line' as type of the sparkline
    type='Line'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

#### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='100px' width='70%'
    dataSource= { [
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'xval' yName= 'yval'
    // Assign 'Line' as type of the sparkline
    type= 'Line' >
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## Column

The [Column] type is used to render the sparkline series as column.

### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='150px'
    width='200px' dataSource=[
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName='xval' yName='yval'
    // Assign 'Column' as type of the sparkline
    type='Column'>
  </SparklineComponent>);
}
}
```

```
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='150px' width='200px'
    dataSource= { [
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'xval' yName= 'yval'
    // Assign 'Column' as type of the sparkline
    type= 'Column' >
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Pie

The [Pie] type is used to render the sparkline series as pie.

### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
    width='70%' dataSource={ [
      { x: 0, xval: '2005', yval: 20090440 },
      { x: 1, xval: '2006', yval: 20264080 },
      { x: 2, xval: '2007', yval: 20434180 },
      { x: 3, xval: '2008', yval: 21007310 },
      { x: 4, xval: '2009', yval: 21262640 },
      { x: 5, xval: '2010', yval: 21515750 },
      { x: 6, xval: '2011', yval: 21766710 },
      { x: 7, xval: '2012', yval: 22015580 },
      { x: 8, xval: '2013', yval: 22262500 },
      { x: 9, xval: '2014', yval: 22507620 },
    ] }
    type= 'Pie' >
  </SparklineComponent> );
  }
}
```

```
// Assign the dataSource values to series of sparkline 'xName and
yName'
xName='xval' yName='yval'
// Assign 'Pie' as type of the sparkline
type='Pie'>
</SparklineComponent>;
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'

}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

**Axis customization in React Sparkline component**

You can customize axis value types and min and max values of the sparkline.

### Change value type of the sparkline

You can change the sparkline value type by setting the `valueType` property to `Numeric`, `Category`, or `DateTime`.

<!-- markdownlint-disable MD036 -->

### DateTime

You can assign date-time values to the sparkline by setting the `valueType` property to `DateTime`.

### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (
      <SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[
        { xDate: new Date(2018, 0, 1), x: 0, yval: 4 },
        { xDate: new Date(2018, 0, 2), x: 1, yval: 4.5 },
        { xDate: new Date(2018, 0, 3), x: 2, yval: 8 },
        { xDate: new Date(2018, 0, 4), x: 3, yval: 7 },
        { xDate: new Date(2018, 0, 5), x: 4, yval: 6 },
        { xDate: new Date(2018, 0, 8), x: 5, yval: 8 },
        { xDate: new Date(2018, 0, 9), x: 6, yval: 8 },
        { xDate: new Date(2018, 0, 10), x: 7, yval: 6.5 },
        { xDate: new Date(2018, 0, 11), x: 8, yval: 4 },
        { xDate: new Date(2018, 0, 12), x: 9, yval: 5.5 }
      ]
      // Assign the dataSource values to series of sparkline 'xName and
yName'
      xName='xDate' yName='yval'
      // Assign the "Column" as type of the sparkline
      type='Column'
      // Assign the "DateTime" as value type to the sparkline
      valueType='DateTime'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return (
    <SparklineComponent id='sparkline'
height='150px' width='130px'
dataSource= { [
      { xDate: new Date(2018, 0, 1), x: 0, yval: 4 },

  type= 'Column'
  // Assign the "DateTime" as value type to the sparkline
  valueType= 'DateTime'>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

<!-- markdownlint-disable MD036 -->

### Category

You can assign category values to the sparkline by setting [valueType] to [Category].

#### INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[
      { x: 0, xval: 'Robert', yval: 60 },
      { x: 1, xval: 'Andrew', yval: 65 },
      { x: 2, xval: 'Suyama', yval: 70 },
      { x: 3, xval: 'Michael', yval: 80 },
      { x: 4, xval: 'Janet', yval: 55 },
      { x: 5, xval: 'Davolio', yval: 90 },
      { x: 6, xval: 'Fuller', yval: 75 },
      { x: 7, xval: 'Nancy', yval: 85 }
    ]>
      // Assign the dataSource values to series of sparkline 'xName and
yName'
      xName='xval' yName='yval'
      // Assign the "Column" as type of the sparkline
      type='Column'
      // Assign the "Category" as value type to the sparkline
      valueType='Category'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

#### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";

```

```
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='150px' width='130px'
    dataSource= { [
      { x: 0, xval: 'Robert', yval: 60 },
      { x: 1, xval: 'Andrew', yval: 65 },
      { x: 2, xval: 'Suyama', yval: 70 },
      { x: 3, xval: 'Michael', yval: 80 },
      { x: 4, xval: 'Janet', yval: 55 },
      { x: 5, xval: 'Davolio', yval: 90 },
      { x: 6, xval: 'Fuller', yval: 75 },

    type= 'Column'
    // Assign the "Category" as value type to the sparkline
    valueType= 'Category'>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Numeric

You can assign numeric values to the sparkline by setting `[valueType]` to `[Numeric]`.

### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='150px'
    width='130px' dataSource=[
      { x: 1, xval: 2010, yval: 190 },
      { x: 2, xval: 2011, yval: 165 },
      { x: 3, xval: 2012, yval: 158 },
      { x: 4, xval: 2013, yval: 175 },
      { x: 5, xval: 2014, yval: 200 },
      { x: 6, xval: 2015, yval: 180 },
      { x: 7, xval: 2016, yval: 210 }
    ]}
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName='xval' yName='yval'
    // Assign the "Column" as type of the sparkline
    type='Column'
    // Assign the "Numeric" as value type to the sparkline
    valueType='Numeric'>
  </SparklineComponent>);
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='150px' width='130px'
    dataSource= { [
      { x: 1, xval: 2010, yval: 190 },
      { x: 2, xval: 2011, yval: 165 },
      { x: 3, xval: 2012, yval: 158 },
      { x: 4, xval: 2013, yval: 175 },
      { x: 5, xval: 2014, yval: 200 },
      { x: 6, xval: 2015, yval: 180 },
      { x: 7, xval: 2016, yval: 210 }
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'xval' yName= 'yval'
    // Assign the "Column" as type of the sparkline
    type= 'Column'
    // Assign the "Numeric" as value type to the sparkline
    valueType= 'Numeric'>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

<!-- markdownlint-disable MD036 -->

**Change min and max values of axis**

You can change the min and max values of x-axis by setting the [minX] and [maxX] values to the [axisSettings] property. You can also change the min and max values of y-axis by setting the [minY] and [maxY] values to the [axisSettings] property.

**INDEX.JSX**

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='150px'
    width='130px' dataSource={ [
      { x: 0, yval: 50 },
      { x: 1, yval: 30 },
      { x: 2, yval: 20 },
      { x: 3, yval: 30 },
      { x: 4, yval: 50 },
      { x: 5, yval: 40 },
      { x: 6, yval: 20 },
      { x: 7, yval: 10 },
      { x: 8, yval: 30 },
    ] }>
```

```

        { x: 9, yval: 10 },
        { x: 10, yval: 40 }
    ]}
    // Assign the dataSource values to series of sparkline 'xName and
yName'
    xName='x' yName='yval'
    // Set min and max values to the y-axis of sparkline
    axisSettings={ {
        minY: 0, maxY: 150
    } }
    // Assign the "Column" as type of the sparkline
    type='Column'
    // Assign the "Numeric" as value type to the sparkline
    valueType='Numeric'>
</SparklineComponent>;
    }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SparklineComponent id='sparkline'
        height='150px' width='130px'
        dataSource= { [
            { x: 0, yval: 50 },
            { x: 1, yval: 30 },
            { x: 2, yval: 20 },
            { x: 3, yval: 30 },
            { x: 4, yval: 50 },
            { x: 5, yval: 40 },
            { x: 6, yval: 20 },
            { x: 7, yval: 10 },
            { x: 8, yval: 30 },
            { x: 9, yval: 10 },
            { x: 10, yval: 40 }
        ] }
        // Assign the dataSource values to series of sparkline 'xName and yName'
        xName= 'x' yName= 'yval'
        // Set min and max values to the y-axis of sparkline
        axisSettings= { {
            minY: 0, maxY: 150
        } }
        // Assign the "Column" as type of the sparkline
        type= 'Column'
        // Assign the "Numeric" as value type to the sparkline
        valueType= 'Numeric'>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Change value of axis

You can set horizontal axis line value of the sparkline by setting `[value]` to the `[axisSettings]` property. The following code example shows this.

#### INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[
      { x: 0, yval: 50 },
      { x: 1, yval: 30 },
      { x: 2, yval: 20 },
      { x: 3, yval: 30 },
      { x: 4, yval: 50 },
      { x: 5, yval: 40 },
      { x: 6, yval: 20 },
      { x: 7, yval: 10 },
      { x: 8, yval: 30 },
      { x: 9, yval: 10 },
      { x: 10, yval: 40 }
    ]
    // Assign the dataSource values to series of sparkline 'xName and
yName '
    xName='x' yName='yval'
    // Set min and max values to the y-axis of sparkline
    axisSettings={{
      value: 25
    }}
    // Assign the "Column" as type of the sparkline
    type='Column'
    // Assign the "Numeric" as value type to the sparkline
    valueType='Numeric'>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}
```

#### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='150px' width='130px'
    dataSource= { [
      { x: 0, yval: 50 },
      { x: 1, yval: 30 },
      { x: 2, yval: 20 },
      { x: 3, yval: 30 },
    ]
  }
  >
  </SparklineComponent>);
}
```

```

        { x: 4, yval: 50 },
        { x: 5, yval: 40 },
        { x: 6, yval: 20 },
        { x: 7, yval: 10 },
        { x: 8, yval: 30 },
        { x: 9, yval: 10 },
        { x: 10, yval: 40 }
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'x' yName= 'yval'
    // Set min and max values to the y-axis of sparkline
    axisSettings= { {
        value: 25
    } }
    // Assign the "Column" as type of the sparkline
    type= 'Column'
    // Assign the "Numeric" as value type to the sparkline
    valueType= 'Numeric'>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Axis line customization

Axis of the sparkline can be collapsed using the `visible` property in `lineSettings`; this is not applicable for win-loss. You can customize the `color`, `width`, `opacity`, and `dashArray` of axis line.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
    render() {
        return (<SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[
            { x: 0, yval: 50 },
            { x: 1, yval: 30 },
            { x: 2, yval: 20 },
            { x: 3, yval: 30 },
            { x: 4, yval: 50 },
            { x: 5, yval: 40 },
            { x: 6, yval: 20 },
            { x: 7, yval: 10 },
            { x: 8, yval: 30 },
            { x: 9, yval: 10 },
            { x: 10, yval: 40 }
        ]>
            // Assign the dataSource values to series of sparkline 'xName and
yName'
            xName='x' yName='yval'
            // Set min and max values to the y-axis of sparkline
            axisSettings={
                // To configure axis line settings
                lineSettings: {

```

```

        visible: true,
        color: "#ff14ae",
        dashArray: 5
      }
    })
    // Assign the "Numeric" as value type to the sparkline
    valueType='Numeric'>
  </SparklineComponent>;
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='150px' width='130px'
    dataSource= { [
      { x: 0, yval: 50 },
      { x: 1, yval: 30 },
      { x: 2, yval: 20 },
      { x: 3, yval: 30 },

      lineSettings: {
        visible: true,
        color: "#ff14ae",
        dashArray:5
      }
    } }
    // Assign the "Numeric" as value type to the sparkline
    valueType= 'Numeric'>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Special points customization in React Sparkline component

You can customize the points by initializing the point colors. The customization options allows to differentiate the [start], [end], [positive], [negative], and [low] points. This customization is only applicable for line, column, and area type sparklines.

<!-- markdownlint-disable MD036 -->

#### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (
      <SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[
      { x: 0, xval: 'AUDI', yval: 1 },
      { x: 1, xval: 'BMW', yval: 5 },
      { x: 2, xval: 'BUICK', yval: -1 },
      { x: 3, xval: 'CETROEN', yval: -6 },

      { x: 8, xval: 'HYUNDAI', yval: -9 },
      { x: 9, xval: 'JEEP', yval: 0 },
      { x: 10, xval: 'KIA', yval: -10 },
      { x: 11, xval: 'MAZDA', yval: 3 },
    ] }
    // Assign the dataSource values to series of sparkline 'xName and yName'
    xName= 'xval' yName= 'yval'
    // Assign 'Column' as type of the sparkline
    type= 'Column'
    // Assign "Category" as the value type of the sparkline
    valueType= 'Category'
    // To configure sparkline series highest y value point color.
    highPointColor= 'blue'
    // To configure sparkline series lowest y value point color.
    lowPointColor= 'orange'
    // To configure sparkline series first x value point color.
    startPointColor= 'green'
    // To configure sparkline series last x value point color.
    endPointColor= 'green'
    // To configure sparkline series negative y value point color.
    negativePointColor= 'red' >
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Tie point color

Tie point color is used to configure the win-loss series type sparkline's y-value point color. The following code sample shows the tie point color of sparkline series.

#### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='150px'
width='130px' dataSource=[12, 15, -10, 13, 15, 6, -12, 17, 13, 0, 8, -10]
    // Assign the 'WinLoss' as type of Sparkline
    type='WinLoss'
    // Assign "Numeric" as the value type of the sparkline
    valueType='Numeric' tiePointColor='blue'>
```

```

        </SparklineComponent>;
    }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SparklineComponent id='sparkline'
        height='150px' width='130px'
        dataSource= { [12, 15, -10, 13, 15, 6, -12, 17, 13, 0, 8, -10] }
        // Assign the 'WinLoss' as type of Sparkline
        type= 'WinLoss'
        // Assign "Numeric" as the value type of the sparkline
        valueType= 'Numeric'
        tiePointColor= 'blue' >
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

## Range band in React Sparkline component

This section explains how to customize the sparkline with multiple range bands.

### Range band customization

The range band feature is used to highlight a particular range along with the y-axis using the [startRange] and [endRange] properties. You can also customize the [color] and [opacity] of the range band.

### INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
    render() {
        return ( <SparklineComponent id='sparkline' height='200px'
width='150px' lineWidth={2} fill='#0d3c9b' dataSource=[0, 6, 4, 1, 3, 2,
5]]
        // To configure range band settings
        rangeBandSettings=[
            {
                startRange: 1,
                endRange: 3,
                color: '#bfd4fc',
                opacity: 0.4
            }
        ]>
        </SparklineComponent>;
    }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='150px'
    lineWidth= { 2 }
    fill= '#0d3c9b'
    dataSource= { [0, 6, 4, 1, 3, 2, 5] }
    // To configure range band settings
    rangeBandSettings= { [
      {
        startRange: 1,
        endRange: 3,
        color: '#bfd4fc',
        opacity:0.4
      }
    ] }>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

**Multiple range band customization**

You can define multiple range bands to a sparkline as shown in the following code sample.

**INDEX.JSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='150px' lineWidth={2} fill='#0d3c9b' dataSource=[0, 6, 4, 1, 3, 2,
5]
    // To configure range band settings
    rangeBandSettings=[
      {
        startRange: 1,
        endRange: 3,
        color: '#bfd4fc',
        opacity: 0.4
      },
      {
        startRange: 4,
        endRange: 5,
        color: 'red',
        opacity: 0.4
      }
    ]>
</SparklineComponent>);
  }
}
```

```
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='150px'
    lineWidth= { 2 }
    fill= '#0d3c9b'
    dataSource= { [0, 6, 4, 1, 3, 2, 5] }
    // To configure range band settings
    rangeBandSettings= { [
      {
        startRange: 1,
        endRange: 3,
        color: '#bfd4fc',
        opacity:0.4
      },
      {
        startRange: 4,
        endRange: 5,
        color: 'red',
        opacity:0.4
      }
    ] }>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## Marker in React Sparkline component

This section explains how to add markers to the sparkline.

### Adding marker to the sparkline

To add marker to the sparkline, specify the **visible** of **markerSettings** as following values. The **visible** will accept multiple values too.

- All - Enables markers for all points.
- Start - Enables marker for the start point.
- End - Enables marker for the end point.
- High - Enables marker for the high point.
- Low - Enables marker for the low point.
- Negative - Enables markers for the negative points.

The following code example shows enabling markers for all points.

## INDEX.JSX

```
{% raw %}
```

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='350px' axisSettings={{
      minX: -1, maxX: 7, maxY: 7, minY: -1
    }} dataSource=[0, 6, 4, 1, 3, 2, 5]}
// To enable markers for all points
markerSettings={{
  visible: ['All']
}}>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}
```

### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
height='200px' width='350px'
axisSettings= { {
  minX: -1, maxX: 7, maxY: 7, minY: -1
} }
dataSource= { [0, 6, 4, 1, 3, 2, 5] }
// To enable markers for all points
markerSettings= { {
  visible: ['All']
} }>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Adding marker to special point

In sparkline, markers can be enabled for particular points such as the start, end, low, high, or negative. The following code examples shows enabling markers for the high and low points.

### INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='350px' axisSettings={{
      minX: -1, maxX: 7, maxY: 7, minY: -1
```

```

    }} dataSource=[3, 6, 4, 1, 3, 2, 5]}
    // To enable marker for high and low points with color customization
    highPointColor='blue' lowPointColor='red' markerSettings={{
      visible: ['High', 'Low']
    }}>
  </SparklineComponent>;
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    axisSettings= { {
      minX: -1, maxX: 7, maxY: 7, minY: -1
    } }
    dataSource= { [3, 6, 4, 1, 3, 2, 5] }
    // To enable marker for high and low points with color customization
    highPointColor= 'blue'
    lowPointColor= 'red'
    markerSettings= { {
      visible: ['High', 'Low']
    } }>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

## Customizing markers

Sparkline markers can be customized in terms of fill color, border color, width, opacity, and size. The following code example shows customizing marker's fill, border, and size.

## INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='350px' axisSettings={{
  minX: -1, maxX: 7, maxY: 7, minY: -1
}} dataSource=[3, 6, 4, 1, 3, 2, 5]}
    // To enable marker for high and low points with color customization
    fill='blue' markerSettings={{
      visible: ['All'],
      size: 5, fill: 'white', border: { color: 'blue', width: 2 }
    }}>

```

```

        </SparklineComponent>;
    }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SparklineComponent id='sparkline'
        height='200px' width='350px'
        axisSettings= { {
            minX: -1, maxX: 7, maxY: 7, minY: -1
        } }
        dataSource= { [3, 6, 4, 1, 3, 2, 5] }
        // To enable marker for high and low points with color customization
        fill= 'blue'
        markerSettings= { {
            visible: ['All'],
            size: 5, fill: 'white', border: { color: 'blue', width: 2}
        } }>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

## Data labels in React Sparkline component

Data labels are used to display values of data points to improve the readability.

### Enable data label

To enable data label for sparkline series, provide **visible** of the **dataLabelSettings** as following possible values:

- All - Enables data label of all points.
- Start - Enables data label of the start point.
- End - Enables data label of the end point.
- High - Enables data label of the high point.
- Low - Enables data label of the low point.
- Negative - Enables data labels of the negative points.

The following example shows enabling sparkline data label for all points.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
    render() {

```

```

    return (<SparklineComponent id='sparkline' height='200px'
width='350px' axisSettings={{
    minX: -1, maxX: 7, maxY: 7, minY: -1
  }} fill='blue' dataSource=[0, 6, 4, 1, 3, 2, 5]]
  // To enable data label for all points
  dataLabelSettings={{
    visible: ['All']
  }}>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return (<SparklineComponent id='sparkline'
    height='200px' width='350px'
    axisSettings= { {
      minX: -1, maxX: 7, maxY: 7, minY: -1
    } }
    fill= 'blue'
    dataSource= { [ 0, 6, 4, 1, 3, 2, 5 ] }
    // To enable data label for all points
    dataLabelSettings= { {
      visible: ['All']
    } }>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Customize data label

Data labels can be customized using the fill, border, opacity, and textStyle. The following code example shows customizing data label border, text color, and fill color.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='350px' axisSettings={{
    minX: -1, maxX: 7, maxY: 7, minY: -1
  }} fill='blue' dataSource=[0, 6, 4, 1, 3, 2, 5]]
  // To customize data label fill, border, and text color
  dataLabelSettings={{
    visible: ['All'],

```

```

        border: { color: 'blue', width: 1 },
        fill: 'blue', opacity: 0.4,
        textStyle: {
            color: 'white'
        }
    }
}
</SparklineComponent>);
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
    return ( <SparklineComponent id='sparkline'
        height='200px' width='350px'
        axisSettings= { {
            minX: -1, maxX: 7, maxY: 7, minY: -1
        } }
        fill= 'blue'
        dataSource= { [ 0, 6, 4, 1, 3, 2, 5 ] }
        // To customize data label fill, border, and text color
        dataLabelSettings= { {
            visible: ['All'],
            border: { color: 'blue', width: 1},
            fill: 'blue', opacity: 0.4,
            textStyle: {
                color: 'white'
            }
        } }
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Format data label text

The text of data labels can be formatted using the `format` API in the sparkline `dataLabelSettings`. By default, data label shows the y-value of point. The following code example shows how to display x and y-values for points.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
    render() {
        return ( <SparklineComponent id='sparkline' height='200px'
            width='500px' axisSettings={{
                minX: -1, maxX: 7, maxY: 7, minY: -1
            }}

```

```

    }} fill='blue' valueType='Category' xName='x' yName='y'
dataSource=[
    { x: 'Mon', y: 3 },
    { x: 'Tue', y: 5 },
    { x: 'Wed', y: 2 },
    { x: 'Thu', y: 4 },
    { x: 'Fri', y: 6 },
  ]
  // To enable data label for all points
  dataLabelSettings={
    format: '${x} : ${y}',
    visible: ['All'],
    border: { color: 'blue', width: 1 },
    fill: 'blue', opacity: 0.4,
    textStyle: {
      color: 'white'
    }
  }
}>
</SparklineComponent>;
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% enddraw %}

```

**INDEX.TSX**

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return (
    <SparklineComponent id='sparkline'
      height='200px' width='500px'
      axisSettings= { {
        minX: -1, maxX: 7, maxY: 7, minY: -1
      } }
      fill= 'blue'
      valueType= 'Category'
      xName= 'x' yName= 'y'
      dataSource= { [
        {x: 'Mon', y: 3 },
        {x: 'Tue', y: 5 },
        {x: 'Wed', y: 2 },
        {x: 'Thu', y: 4 },
        {x: 'Fri', y: 6 },
      ] }
      // To enable data label for all points
      dataLabelSettings= { {
        format: '${x} : ${y}',
        visible: ['All'],
        border: { color: 'blue', width: 1},
        fill: 'blue', opacity: 0.4,
        textStyle: {
          color: 'white'
        }
      } }
    >
    </SparklineComponent> );
}

```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

## User interaction in React Sparkline component

Sparkline has two user interaction features: tooltip and tracker line.

### Tooltip

The sparkline provides options to display details about values of data points through tooltips when hovering the mouse over data point. To use tooltip in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

The following code example shows enabling tooltip for sparkline with format.

#### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
 '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='500px' axisSettings={{
  minX: -1, maxX: 7, maxY: 8, minY: -1
}} fill='blue' valueType='Category' xName='x' yName='y'
dataSource=[
  { x: 'Mon', y: 3 },
  { x: 'Tue', y: 5 },
  { x: 'Wed', y: 2 },
  { x: 'Thu', y: 4 },
  { x: 'Fri', y: 6 },
]
// To enable tooltip for sparkline
tooltipSettings={{
  visible: true,
  // formatting tooltip text
  format: '${x} : ${y}'
}}>
    <Inject services={[SparklineTooltip]} />
    </SparklineComponent>;
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

#### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip
} from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'

```

```

height='200px' width='500px'
axisSettings= { {
  minX: -1, maxX: 7, maxY: 8, minY: -1
} }
fill= 'blue'
valueType= 'Category'
xName= 'x' yName= 'y'
dataSource= { [
  {x: 'Mon', y: 3 },
  {x: 'Tue', y: 5 },
  {x: 'Wed', y: 2 },
  {x: 'Thu', y: 4 },
  {x: 'Fri', y: 6 },
] }
// To enable tooltip for sparkline
tooltipSettings= { {
  visible: true,
  // formatting tooltip text
  format: '${x} : ${y}'
} }>
<Inject services={[SparklineTooltip]} />
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Tooltip customization

The fill color, text styles, format, and border of the tooltip can be customized. The following code example shows customization of tooltip's fill color and text style.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
 '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='500px' axisSettings={{
  minX: -1, maxX: 7, maxY: 8, minY: -1
}} fill='#033e96' valueType='Category' xName='x' yName='y'
dataSource=[
  { x: 'Mon', y: 3 },
  { x: 'Tue', y: 5 },
  { x: 'Wed', y: 2 },
  { x: 'Thu', y: 4 },
  { x: 'Fri', y: 6 },
] }
// To enable tooltip for sparkline with fill color customization
tooltipSettings={{
  visible: true,
  format: '${x} : ${y}',
  fill: '#033e96',
  textStyle: {

```

```

        color: 'white'
      },
    } }>
    <Inject services={[SparklineTooltip]} />
  </SparklineComponent>;
}
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='500px'
    axisSettings= { {
      minX: -1, maxX: 7, maxY: 8, minY: -1
    } }
    fill= '#033e96'
    valueType= 'Category'
    xName= 'x' yName= 'y'
    dataSource= { [
      {x: 'Mon', y: 3 },
      {x: 'Tue', y: 5 },
      {x: 'Wed', y: 2 },
      {x: 'Thu', y: 4 },
      {x: 'Fri', y: 6 },
    ] }
    // To enable tooltip for sparkline with fill color customization
    tooltipSettings= { {
      visible: true,
      format: '${x} : ${y}',
      fill: '#033e96',
      textStyle: {
        color: 'white'
      },
    },
  } }>
    <Inject services={[SparklineTooltip]} />
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Tooltip template

Sparkline tooltip has template support. By using tooltip template, you can customize tooltips. The following code example shows more customization options provided to `sparktooltip` css class that is used in tooltip template div. Using this template, images also can be added to tooltip.

## INDEX.JSX

```
{% raw %}
```

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
'@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='500px' axisSettings={{
      minX: -1, maxX: 7, maxY: 8, minY: -1
    }} fill='#033e96' valueType='Category' xName='x' yName='y'
dataSource=[
      { x: 'Mon', y: 3 },
      { x: 'Tue', y: 5 },
      { x: 'Wed', y: 2 },
      { x: 'Thu', y: 4 },
      { x: 'Fri', y: 6 },
    ]
    // To enable tooltip template for sparkline with fill color, border
radius and padding customization
    tooltipSettings={{
      visible: true,
      template: '<div id="sparktooltip" style="border-radius:
5px;background: #008cff;" +
        'color: #FFFFFF !important;font-size: 16px;font-style:
italic;padding: 8px;">' +
        '${x} : ${y} </div>'
    }}>
    <Inject services={[SparklineTooltip]}>
    </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip
} from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
height='200px' width='500px'
axisSettings= { {
  minX: -1, maxX: 7, maxY: 8, minY: -1
} }
fill= '#033e96'
valueType= 'Category'
xName= 'x' yName= 'y'
dataSource= { [
  {x: 'Mon', y: 3 },
  {x: 'Tue', y: 5 },
  {x: 'Wed', y: 2 },
  {x: 'Thu', y: 4 },
  {x: 'Fri', y: 6 },
] }

```

```
// To enable tooltip template for sparkline with fill color, border
radius and padding customization
tooltipSettings= { {
  visible: true,
  template: '<div id="sparktooltip" style="border-radius:
5px;background: #008cff;" +
  'color: #FFFFFF !important;font-size: 16px;font-style:
italic;padding: 8px;">' +
  '${x} : ${y} </div>'
} }>
<Inject services={[SparklineTooltip]} />
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Track line

The track line tracks data points that are closer to the mouse position or touch contact.

To enable track lines for sparkline, specify the `visible` option of `trackLineSettings` to true. Based on theme, tracker color will be changed. The default value of tracker color is black.

To use track line in sparkline, inject the `SparklineTooltip` module to sparkline using the inject method.

### INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
'@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return (<SparklineComponent id='sparkline' height='200px'
width='500px' axisSettings={{
      minX: -1, maxX: 46, maxY: 10, minY: -1
    }} fill='#033e96' dataSource=[5, 3, 4, 6, 8, 7, 9, 1, 3, 5, 3,
4, 6, 8, 7, 9, 1, 3, 5, 2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7, 4, 2, 5, 2, 4, 6,
7, 9, 5, 8, 3, 6, 1, 7, 4, 2]]
      // To enable tooltip template for sparkline with fill color, border
radius and padding customization
      tooltipSettings={{
        trackLineSettings: {
          visible: true,
          color: '#033e96',
          width: 1
        }
      }}>
      <Inject services={[SparklineTooltip]} />
      </SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}
```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip }
  from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='500px'
    axisSettings= { {
      minX: -1, maxX: 46, maxY: 10, minY: -1
    } }
    fill= '#033e96'
    dataSource= [5, 3, 4, 6, 8, 7, 9, 1, 3, 5, 3, 4, 6, 8, 7, 9, 1, 3, 5,
2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7, 4, 2, 5, 2, 4, 6, 7, 9, 5, 8, 3, 6, 1, 7,
4, 2] ]
    // To enable tooltip template for sparkline with fill color, border
    radius and padding customization
    tooltipSettings= { {
      trackLineSettings: {
        visible: true,
        color: '#033e96',
        width: 1
      }
    } } >
    <Inject services={[SparklineTooltip]} />
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

**Appearance in React Sparkline component**

The appearance of the sparkline can be customized using margin, container Area border, and container Area background.

**Sparkline border**

The **containerArea border** of the sparkline is used to render border to cover sparkline area.

The following code example shows the sparkline with overall border.

**INDEX.JSX**

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='350px' containerArea={ {
      border: { color: '#033e96', width: 2 }
    } } border= { {
      color: '#033e96', width: 1
    } } type='Area' fill='b2cfff' dataSource= [3, 6, 4, 1, 3, 2,
5] ] >
    </SparklineComponent> );
  }
}
```

```

    }
  }
  ReactDOM.render(<App />, document.getElementById('sparkline'));
  {% endraw %}

```

### INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    containerArea= { {
      border: { color: '#033e96', width: 2 }
    }}
    border= { {
      color: '#033e96', width: 1
    }}
    type= 'Area'
    fill= '#b2cfff'
    dataSource=[ [ 3, 6, 4, 1, 3, 2, 5]]>
    </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

### Sparkline padding

Padding is used to specify padding value between container and sparkline. By default, padding value of the sparkline is 5. Sparkline padding values are specified by the left, right, top, and bottom.

The following code example shows the sparkline with overall padding is set to 20.

### INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
    width='350px' containerArea={{
      border: { color: '#033e96', width: 2 }
    }}
    // To render sparkline with padding
    padding={{ left: 20, right: 20, bottom: 20, top: 20 }} border={{
      color: '#033e96', width: 1
    }} type='Area' fill='#b2cfff' dataSource=[ [3, 6, 4, 1, 3, 2,
5]]>
    </SparklineComponent> );
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    containerArea= { {
      border: { color: '#033e96', width: 2 }
    }}
    // To render sparkline with padding
    padding= { { left: 20, right: 20, bottom: 20, top: 20 } }
    border= { {
      color: '#033e96', width: 1
    }}
    type= 'Area'
    fill= '#b2cfff'
    dataSource=[ [ 3, 6, 4, 1, 3, 2, 5 ] ]>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

## Sparkline area customization

The background color of the sparkline area can be customized using the `containerArea` background color. By default, the sparkline background color is transparent.

**INDEX.JSX**

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='350px' containerArea={{
      border: { color: '#033e96', width: 2 },
      // To render sparkline with background
      background: '#eff1f4',
    }} padding={{ left: 20, right: 20, bottom: 20, top: 20 }}
border={{
      color: '#033e96', width: 1
    }} type='Area' fill='#b2cfff' dataSource=[ [ 3, 6, 4, 1, 3, 2,
5 ] ]>
</SparklineComponent>);
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}
```

**INDEX.TSX**

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent } from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    containerArea= { {
      border: { color: '#033e96', width: 2 },
      // To render sparkline with background
      background: '#eff1f4',
    }}
    padding= { { left: 20, right: 20, bottom: 20, top: 20} }
    border= { {
      color: '#033e96', width: 1
    }}
    type= 'Area'
    fill= '#b2cfff'
    dataSource=[ [ 3, 6, 4, 1, 3, 2, 5] ]>
</SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Sparkline theme

Datalabel and track line colors of the sparkline will be changed based on theme. For example, for dark theme, the color of datalabel and track line should be white; for light theme, their value should be black. The possible values for sparkline theme are **Material**, **Fabric**, **Bootstrap**, and **Highcontrast**.

The following code example shows the color for datalabel and track line is set to white for dark theme.

### INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
 '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='350px'
  // To specify theme
  theme='Highcontrast' dataLabelSettings={{ visible: ['All'] }}
  tooltipSettings={{
    trackLineSettings: { visible: true }
  }} axisSettings={{
    minX: -1, maxX: 7
  }} lineWidth={3} border={{
    color: 'transparent', width: 2
  }} type='Line' fill='#007dd1' dataSource=[ [3, 6, 4, 1, 3, 2,
5] ]>
    <Inject services=[ [SparklineTooltip] ]/>
    </SparklineComponent> );
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

```
{% endraw %}
```

### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip }
  from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    // To specify theme
    theme= 'Highcontrast'
    dataLabelSettings= { { visible: ['All'] } }
    tooltipSettings= { {
      trackLineSettings: { visible: true }
    } }
    axisSettings= { {
      minX: -1, maxX: 7
    } }
    lineWidth= { 3 }
    border= { {
      color: 'transparent', width: 2
    } }
    type= 'Line'
    fill= '#007dd1'
    dataSource=[ [ 3, 6, 4, 1, 3, 2, 5 ] ]>
    <Inject services={[SparklineTooltip]} />
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));
```

### Localization in React Sparkline component

The sparkline control supports localization. The default culture for localization is **en-US**. You can change the culture using the **setCulture** method.

#### Tooltip format

Sparkline tooltip supports localization. The following code sample shows tooltip text with currency format based on culture.

### INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SparklineComponent, Inject, SparklineTooltip } from
  '@syncfusion/ej2-react-charts';
export class App extends React.Component {
  render() {
    return ( <SparklineComponent id='sparkline' height='200px'
width='350px' containerArea={{
      border: { color: '#033e96', width: 2 }
    }} tooltipSettings={{
      visible: true
    }} /> );
  }
}
```

```

    }}
    // To specify currency format
    format={"c0"} useGroupingSeparator={true} lineWidth={3} padding={{
left: 20, right: 20, bottom: 20, top: 20 }} border={{ color: '#033e96',
width: 2 }} type='Area' fill='#b2cfff' dataSource=[30000, 60000, 40000,
10000, 30000, 20000, 50000]]>
    <Inject services={[SparklineTooltip]}/>
    </SparklineComponent>;
  }
}
ReactDOM.render(<App />, document.getElementById('sparkline'));
{% endraw %}

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SparklineComponent, Inject, SparklineTooltip }
  from '@syncfusion/ej2-react-charts';
function App() {
  return ( <SparklineComponent id='sparkline'
    height='200px' width='350px'
    containerArea= { {
      border: { color: '#033e96', width: 2 }
    } }
    tooltipSettings= { {
      visible: true
    } }
    // To specify currency format
    format= { "c0" }
    useGroupingSeparator= { true }
    lineWidth= { 3 }
    padding= { { left: 20, right: 20, bottom: 20, top: 20 } }
    border= { { color: '#033e96', width: 2 } }
    type= 'Area'
    fill= '#b2cfff'
    dataSource= { [30000, 60000, 40000, 10000, 30000, 20000, 50000] }>
    <Inject services={[SparklineTooltip]}/>
  </SparklineComponent> );
}
export default App;
ReactDOM.render(<App />, document.getElementById('sparkline'));

```

## Accessibility in React Sparkline component

The Sparkline component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sparkline component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

```

| Section 508 Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>

.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}

</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Sparkline component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Sparkline component:

- `img` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)

### Keyboard interaction

The Sparkline component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Sparkline component.

| **Press** | **To do this** |

| --- | --- |

| **Ctrl + P** | **Prints the Sparkline.** |

### Ensuring accessibility

The Sparkline component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sparkline component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sparkline component with accessibility tools.

### Ej1 api migration in React Sparkline component

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

### Sparkline Types

{% raw %}

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Type| **Property:** `type`<br/><br/> <EJ.Sparkline id="sparkline" type="line"> </EJ.Sparkline>, document.getElementById('sparkline') | **Property:** `type`<br/><br/> <SparklineComponent id='sparkline' type='Line'></SparklineComponent> ><br/><br/>document.getElementById('sparkline'); |

### Databinding

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Datasource| **Property:** `dataSource`<br/><br/> <EJ.Sparkline id="sparkline" dataSource={dataSource1}> </EJ.Sparkline>, document.getElementById('sparkline') | **Property:** `dataSource`<br/><br/> <SparklineComponent id='sparkline' dataSource={{ {x:0,yval:50},{x:1,yval:30}}}></SparklineComponent> ><br/><br/>document.getElementById('sparkline'); |

|Binding X values with datasource| **Property:** `xName`<br/><br/> <EJ.Sparkline id="sparkline" xName="x"> </EJ.Sparkline>, document.getElementById('sparkline') | **Property:** `xName`<br/><br/> <SparklineComponent id='sparkline' xName='xValue'></SparklineComponent> ><br/><br/>document.getElementById('sparkline'); |

|Binding Y values with datasource| **Property:** `yName`<br/><br/> <EJ.Sparkline id="sparkline" yName="yval"> </EJ.Sparkline>, document.getElementById('sparkline') | **Property:**

```
yName<br/><br/> <SparklineComponent id='sparkline' yName='yValue'></SparklineComponent>
>,<br><br>document.getElementById('sparkline');|
```

```
<!-- markdownlint-disable MD038 -->
```

## Markers

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable markers | **Property:** *markerSettings.visible*<br/><br/> var markerSettings = { visible:true }  
<br/> <EJ.Sparkline id="sparkline" markerSettings={markerSettings}> </EJ.Sparkline>,  
document.getElementById('sparkline') | **Property:** *markerSettings.visible*<br/><br/>  
<SparklineComponent id='sparkline' markerSettings={ visible: ['All']}></SparklineComponent>  
>,<br><br>document.getElementById('sparkline');|

| Color | **Property:** *markerSettings.fill*<br/><br/> var markerSettings = { fill:"green" } <br/>  
<EJ.Sparkline id="sparkline" markerSettings={markerSettings}> </EJ.Sparkline>,  
document.getElementById('sparkline') | **Property:** *markerSettings.fill*<br/><br/>  
<SparklineComponent id='sparkline' markerSettings={ fill:'green'}></SparklineComponent>  
>,<br><br>document.getElementById('sparkline');|

| Size | **Property:** *markerSettings.width*<br/><br/> var markerSettings = { width:2 } <br/>  
<EJ.Sparkline id="sparkline" markerSettings={markerSettings}> </EJ.Sparkline>,  
document.getElementById('sparkline') | **Property:** *markerSettings.size*<br/><br/>  
<SparklineComponent id='sparkline' markerSettings={ size:10}></SparklineComponent>  
>,<br><br>document.getElementById('sparkline');|

| Opacity | **Property:** *markerSettings.opacity*<br/><br/> var markerSettings = { opacity:0.5 } <br/>  
<EJ.Sparkline id="sparkline" markerSettings={markerSettings}> </EJ.Sparkline>,  
document.getElementById('sparkline') | **Property:** *markerSettings.opacity*<br/><br/>  
<SparklineComponent id='sparkline' markerSettings={ opacity:0.5}></SparklineComponent>  
>,<br><br>document.getElementById('sparkline');|

| Border color | **Property:** *markerSettings.border.color*<br/><br/> var markerSettings = { border:{  
color: "red" } } <br/> <EJ.Sparkline id="sparkline" markerSettings={markerSettings}>  
</EJ.Sparkline> , document.getElementById('sparkline') | **Property:**  
*markerSettings.border.color*<br/><br/> <SparklineComponent id='sparkline' markerSettings={  
border:{color:'green'}}></SparklineComponent>  
>,<br><br>document.getElementById('sparkline');|

| Border width | **Property:** *markerSettings.border.width*<br/><br/> var markerSettings = {  
border:{width:2 } } <br/> <EJ.Sparkline id="sparkline" markerSettings={markerSettings}>  
</EJ.Sparkline> , document.getElementById('sparkline') | **Property:**  
*markerSettings.border.width*<br/><br/> <SparklineComponent id='sparkline' markerSettings={  
border:{width:2}}></SparklineComponent> >,<br><br>document.getElementById('sparkline');|

| Border opacity | **Property:** *markerSettings.border.opacity*<br/><br/> var markerSettings = {  
border:{opacity:0.5 } } <br/> <EJ.Sparkline id="sparkline" markerSettings={markerSettings}>  
</EJ.Sparkline> , document.getElementById('sparkline') | Not applicable |

## Data labels

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable data labels | Not applicable | **Property:** *dataLabelSettings.visible*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } visible:['All'] ></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Color | Not applicable | **Property:** *dataLabelSettings.fill*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } color:'green'></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Opacity | Not applicable | **Property:** *dataLabelSettings.opacity*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } opacity:0.5></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Border color | Not applicable | **Property:** *dataLabelSettings.border.color*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } border:{color:'green'}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Border width | Not applicable | **Property:** *dataLabelSettings.border.width*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } border:{width:2}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Format | Not applicable | **Property:** *dataLabelSettings.format*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } format:'${xval}: ${yval}'></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Horizontal Offset | Not applicable | **Property:** *dataLabelSettings.offset.x*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } offset:{x:10}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Vertical Offset | Not applicable | **Property:** *dataLabelSettings.offset.y*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } offset:{y:10}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Font color | Not applicable | **Property:** *dataLabelSettings.textStyle.color*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } textStyle:{color:'red'}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Font family | Not applicable | **Property:** *dataLabelSettings.textStyle.fontFamily*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } textStyle:{fontFamily:'Arial'}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

| Font style | Not applicable | **Property:** *dataLabelSettings.textStyle.fontStyle*  
`<SparklineComponent id='sparkline' dataLabelSettings={ } textStyle:{fontStyle:'Normal'}></SparklineComponent >`  
`>, <br><br>document.getElementById('sparkline');`

|Font weight| Not applicable | **Property:** *dataLabelSettings.textStyle.fontWeight*<br/><br/>  
 <SparklineComponent id='sparkline' dataLabelSettings={  
 textStyle:{fontWeight:'Bold'}}></SparklineComponent  
 >,<br><br>document.getElementById('sparkline');|

|Font opacity| Not applicable | **Property:** *dataLabelSettings.textStyle.opacity*<br/><br/>  
 <SparklineComponent id='sparkline' dataLabelSettings={  
 textStyle:{opacity:0.5}}></SparklineComponent  
 >,<br><br>document.getElementById('sparkline');|

|Font size| Not applicable | **Property:** *dataLabelSettings.textStyle.fontSize*<br/><br/>  
 <SparklineComponent id='sparkline' dataLabelSettings={  
 textStyle:{fontSize:'10px'}}></SparklineComponent  
 >,<br><br>document.getElementById('sparkline');|

### Range band

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

|Color| **Property:** *rangeBandSettings.color*<br/><br/>var rangeBandSettings = { color:"green" }  
 <br/> <EJ.Sparkline id="sparkline" rangeBandSettings={rangeBandSettings}> </EJ.Sparkline>,  
 document.getElementById('sparkline') | **Property:** *rangeBandSettings.color*<br/><br/>  
 <SparklineComponent id='sparkline' rangeBandSettings={  
 color:'green'}></SparklineComponent >,<br><br>document.getElementById('sparkline');|

|Opacity| **Property:** *rangeBandSettings.opacity*<br/><br/> var rangeBandSettings = { opacity:0.5 }  
 <br/> <EJ.Sparkline id="sparkline" rangeBandSettings={rangeBandSettings}> </EJ.Sparkline>,  
 document.getElementById('sparkline') | **Property:** *rangeBandSettings.opacity*<br/><br/>  
 <SparklineComponent id='sparkline' rangeBandSettings={ opacity:0.5}></SparklineComponent  
 >,<br><br>document.getElementById('sparkline');|

|Start range| **Property:** *rangeBandSettings.startRange*<br/><br/> var rangeBandSettings = {  
 startRange: 4 } <br/> <EJ.Sparkline id="sparkline" rangeBandSettings={rangeBandSettings}>  
 </EJ.Sparkline>, document.getElementById('sparkline') | **Property:**  
*rangeBandSettings.startRange*<br/><br/> <SparklineComponent id='sparkline'  
 rangeBandSettings={ startRange:4}></SparklineComponent  
 >,<br><br>document.getElementById('sparkline');|

|End range| **Property:** *rangeBandSettings.endRange*<br/><br/> var rangeBandSettings = {  
 endRange:30 } <br/> <EJ.Sparkline id="sparkline" rangeBandSettings={rangeBandSettings}>  
 </EJ.Sparkline>, document.getElementById('sparkline') | **Property:**  
*rangeBandSettings.endRange*<br/><br/> <SparklineComponent id='sparkline' rangeBandSettings={  
 endRange:30}></SparklineComponent >,<br><br>document.getElementById('sparkline');|

### Special points customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| High point color | **Property:** *highPointColor*  
`highPointColor="green"> </EJ.Sparkline>, document.getElementById('sparkline') | Property:  
highPointColor  
highPointColor='green'></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| Low point color | **Property:** *lowPointColor*  
`lowPointColor="green"> </EJ.Sparkline>, document.getElementById('sparkline') | Property:  
lowPointColor  
lowPointColor='green'></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| Negative point color | **Property:** *negativePointColor*  
`negativePointColor="green"> </EJ.Sparkline>, document.getElementById('sparkline') | Property:  
negativePointColor  
negativePointColor='green'></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| Start point color | **Property:** *startPointColor*  
`startPointColor="green"> </EJ.Sparkline>, document.getElementById('sparkline') | Property:  
startPointColor  
startPointColor='green'></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| End point color | **Property:** *endPointColor*  
`endPointColor="green"> </EJ.Sparkline>, document.getElementById('sparkline') | Property:  
endPointColor  
endPointColor='green'></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| Tie point color | **Property:** *tiePointColor*  
`<SparklineComponent id='sparkline' tiePointColor='green'></SparklineComponent`  
`>,<br><br>document.getElementById('sparkline');`;

#### Axis customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Show axis line | **Property:** *axisSettings.visible*  
`var axisLineSettings = { visible : true};<br><EJ.Sparkline id="sparkline" axisLineSttings={axisLineSettings}> </EJ.Sparkline>,<br>  
document.getElementById('sparkline') | Property: axisSettings.lineSettings.visible  
<SparklineComponent id='sparkline' axisSettings={} lineSettings:{ visible: true }></SparklineComponent  
>,<br><br>document.getElementById('sparkline');;`

| Line color | **Property:** *axisSettings.color*  
`var axisLineSettings = { color : "red"};<br><EJ.Sparkline id="sparkline" axisLineSttings={axisLineSettings}> </EJ.Sparkline>,<br>  
document.getElementById('sparkline') | Property: axisSettings.lineSettings.color  
<br><br>`

```
<SparklineComponent id='sparkline' axisSettings={} lineSettings:{ color: 'green' }
></SparklineComponent >,<br><br>document.getElementById('sparkline');|
```

| Line width | **Property:** *axisSettings.width*<br><br> var axisLineSettings = { width : 2};<br><EJ.Sparkline id="sparkline" axisLineSttings={axisLineSettings}> </EJ.Sparkline>,<br>document.getElementById('sparkline') | **Property:** *axisSettings.lineSettings.width*<br><br><SparklineComponent id='sparkline' axisSettings={} lineSettings:{ width: 2 }></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| Dash array | **Property:** *axisSettings.dashArray*<br><br> var axisLineSettings = { dashArray : 1,2};<br><EJ.Sparkline id="sparkline" axisLineSttings={axisLineSettings}> </EJ.Sparkline>,<br>document.getElementById('sparkline') | **Property:** *axisSettings.lineSettings.dashArray*<br><br><SparklineComponent id='sparkline' axisSettings={} lineSettings:{ dashArray: 1,2 }></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| X axis minimum value | Not applicable | **Property:** *axisSettings.minX*<br><br> <SparklineComponent id='sparkline' axisSettings={} minX: 2 ></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| X axis maximum value | Not applicable | **Property:** *axisSettings.maxX*<br><br><SparklineComponent id='sparkline' axisSettings={} maxX:10 ></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| Y axis minimum value | Not applicable | **Property:** *axisSettings.minY*<br><br> <SparklineComponent id='sparkline' axisSettings={ {minY: 5 }></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| Y axis maximum value | Not applicable | **Property:** *axisSettings.maxY*<br><br><SparklineComponent id='sparkline' axisSettings={} maxY: 10 ></SparklineComponent >,<br><br>document.getElementById('sparkline');|

| Horizontal axis line position | Not applicable | **Property:** *axisSettings.value*<br><br><SparklineComponent id='sparkline' axisSettings={} value: 10 ></SparklineComponent >,<br><br>document.getElementById('sparkline');|

#### Appearance customization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Background color | **Property:** *background*<br><br> <EJ.Sparkline id="sparkline" background="grey"> </EJ.Sparkline>,<br>document.getElementById('sparkline') | **Property:** *containerArea.background*<br><br> <SparklineComponent id='sparkline' background='grey'></SparklineComponent >,<br><br>document.getElementById('sparkline');|

```

## SpeedDial

### Getting Started with React Speed Dial Control

This section explains how to create a simple Speed Dial and demonstrate the basic usage of the Speed Dial component in an React environment.

#### Dependencies

The list of dependencies required to use the Speed Dial component in your application is given below:

```

`js
|-- @syncfusion/ej2-react-buttons
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
,

```

#### Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```

`bash
npm install -g create-react-app
,

```

Start a new project using create-react-app command as follows

```

,
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
,
create-react-app quickstart

```

cd quickstart

,

'react-scripts-ts' is used for creating React app with typescript.

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install Speed Dial component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-buttons --save
```

,

### Adding Speed Dial component to the Application

To include the Speed Dial component in your application import the `SpeedDialComponent` from `ej2-react-buttons` package in `App.tsx`.

Add the Speed Dial component in application as shown in below code example.

```
`ts
```

```
{ / Import the Speed Dial. / }
```

```
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
```

```
import * as React from 'react';
```

```
import './App.css';
```

```
{ / To render Speed Dial. / }
```

```
function App() {
```

```
  return (
```

```
<SpeedDialComponent id='speeddial'></SpeedDialComponent>
```

```
);
```

```
}
```

```
export default App;
```

,

### Adding CSS Reference

Import the Speed Dial component's required CSS references as follows in `src/App.css`.

```
`css
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
```

,

### Running the application

Run the application in the browser using the following command:

npm start

The following example shows a basic Speed Dial component.

### APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    const items = [
        { text: 'Cut' },
        { text: 'Copy' },
        { text: 'Paste' }
    ];
    return (<div id="targetElement" style={{ position: 'relative',
minHeight: '350px', border: '1px solid' }}>
        { /* Initialize the SpeedDial component. */ }
        <SpeedDialComponent id='speeddial' items={items} content='Edit'
target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    const items: SpeedDialItemModel[] = [
        { text: 'Cut' },
        { text: 'Copy' },
        { text: 'Paste' }
    ];
    return (
        <div id="targetElement" style={{position:'relative', minHeight:'350px',
border:'1px solid'}}>
            { /* Initialize the SpeedDial component. */ }
            <SpeedDialComponent id='speeddial' items={items} content='Edit'
target="#targetElement"></SpeedDialComponent>
        </div>
    );
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

## Items in React Speed dial component

The React Speed Dial action items can be added by using [items](#) property.

Fields	Type	Description
<a href="#">text</a>	string	Defines the text content of SpeedDialItem.
<a href="#">iconCss</a>	string	Defines one or more CSS classes to include an icon or image in Speed Dial item.
<a href="#">disabled</a>	boolean	Defines whether to enable or disable the SpeedDialItem.
<a href="#">id</a>	string	Defines a unique value for the SpeedDialItem which can be used to identify the item in event args.
<a href="#">title</a>	string	Defines the title of SpeedDialItem to display tooltip.

## Icons in Speed Dial items

You can customize the icon and text of Speed Dial action items using [iconCss](#) and [text](#) properties.

### Icon only

You can show icon only in Speed Dial items by setting [iconCss](#) property. You can show tooltip on hover to show additional details to end-user by setting [title](#) property.

## APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items}
target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

## APP.TSX

```
{% raw %}
```

```

{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items}
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Text only

You can show only text in Speed Dial items by setting [text](#) property.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    <SpeedDialComponent id='speeddial' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### Icon with text

You can show icon along with text in Speed Dial items by setting [iconCss](#) and [text](#) properties.

### APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items = [
    { text: 'Cut', iconCss: 'e-icons e-cut' },
    { text: 'Copy', iconCss: 'e-icons e-copy' },
    { text: 'Paste', iconCss: 'e-icons e-paste' }
  ];
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**APP.TSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut', iconCss: 'e-icons e-cut' },
    { text: 'Copy', iconCss: 'e-icons e-copy' },
    { text: 'Paste', iconCss: 'e-icons e-paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

*Disabled*

You can disable Speed Dial items by setting [disabled](#) property as `true`.

**APP.JSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items = [
    { text: 'Cut', disabled: true },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    <SpeedDialComponent id='speeddial' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**APP.TSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
    const items: SpeedDialItemModel[] = [
        { text: 'Cut', disabled: true },
        { text: 'Copy' },
        { text: 'Paste' }
    ];
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            <SpeedDialComponent id='speeddial' content='Edit' items={items}
target="#targetElement"></SpeedDialComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**Animation**

The Speed Dial items can be animated during the opening and closing of the popup action items. You can customize the animation's effect, delay, and duration by setting [animation](#) property. By default, Speed Dial animates with a [fade](#) effect and supports all [speeddialanimation](#) effects.

Below example demonstrates the Speed Dial items with applied Zoom effect.

**APP.JSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
    const items = [
        { text: 'Cut', iconCss: 'e-icons e-cut' },
        { text: 'Copy', iconCss: 'e-icons e-copy' },
        { text: 'Paste', iconCss: 'e-icons e-paste' }
    ];
    const animation = { effect: 'Zoom' };
    return <div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    </div>

```

```

    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
    closeIconCss='e-icons e-close' content='Edit' items={items}
    animation={animation} target="#targetElement"></SpeedDialComponent>
    </div>;
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('button'));
  {% endraw %}

```

## APP.TSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel,
SpeedDialAnimationSettingsModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut', iconCss: 'e-icons e-cut' },
    { text: 'Copy', iconCss: 'e-icons e-copy' },
    { text: 'Paste', iconCss: 'e-icons e-paste' }
  ];
  const animation: SpeedDialAnimationSettingsModel =
    { effect: 'Zoom' };
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' content='Edit' items={items}
animation={animation} target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

## Template

The Speed Dial supports to customize the action items and entire pop-up container by setting [itemTemplate](#) and [popupTemplate](#) properties. For more details about templates, check out the link [here](#).

## Positions in React Speed dial component

The Speed dial control can be positioned anywhere on the [target](#) using the [position](#) property. If the [target](#) is not defined, then Speed Dial is positioned based on the browser viewport.

The position values of Speed Dial are as follows:

- TopLeft
- TopCenter
- TopRight

- MiddleLeft
- MiddleCenter
- MiddleRight
- BottomLeft
- BottomCenter
- BottomRight

**APP.JSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    return (<div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
        <SpeedDialComponent id='speeddial' content='Add' position='BottomLeft'
target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**APP.TSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            <SpeedDialComponent id='speeddial' content='Add' position='BottomLeft'
target="#targetElement"></SpeedDialComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**INDEX.CSS**

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
```

```

left: 45%;
position: absolute;
top: 45%;
width: 30%;
}

```

### Opens items on hover

You can open the Speed Dial action items on mouse hover by setting the [opensOnHover](#) property.

`ts

*{/ Import the Speed Dial. /}*

```
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
```

```
import * as React from 'react';
```

*{/ To render Speed Dial./}*

```
function App() {
```

```
  const items: SpeedDialItemModel[] = [
```

```
    { iconCss: 'e-icons e-cut' },
```

```
    { iconCss: 'e-icons e-copy' },
```

```
    { iconCss: 'e-icons e-paste' }
```

```
  ];
```

```
  return (
```

*{/ Initialize the SpeedDial component. /}*

```
<SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close'
  items={items} opensOnHover= {true} target="#targetElement"></SpeedDialComponent>
```

```
);
```

```
}
```

```
export default App;
```

```
`
```

### Programmatically show/hide Speed Dial items

You can open/close the Speed Dial action items programmatically using [show](#) and [hide](#) methods.

Below example demonstrates open/close action items on button click.

#### **APP.JSX**

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { ButtonComponent, SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {

```

```

let speeddialObj;
const items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
function showClick() {
  speeddialObj.show();
}
function hideClick() {
  speeddialObj.hide();
}
return (<div>
  <div id="targetElement" style={{ position: 'relative', minHeight:
'340px', border: '1px solid', padding: '10px' }}>
    <ButtonComponent id="show" cssClass="e-primary" onClick={showClick}>
Show </ButtonComponent>
    <ButtonComponent id="hide" cssClass="e-primary" onClick={hideClick}>
Hide </ButtonComponent></div>
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} opensOnHover={true}
target="#targetElement" ref={(scope) => { speeddialObj = scope;
}}></SpeedDialComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```

{% raw %}
{/* Import the Speed Dial. */}
import { ButtonComponent, SpeedDialComponent, SpeedDialItemModel } from
'@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/* To render Speed Dial.*/}
function App() {
  let speeddialObj: SpeedDialComponent;
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  function showClick() :void {
    speeddialObj.show();
  }
  function hideClick() :void {
    speeddialObj.hide();
  }
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'340px', border:'1px solid', padding:'10px'}}>

```

```

    <ButtonComponent id="show" cssClass="e-primary" onClick={ showClick
  }> Show </ButtonComponent>
    <ButtonComponent id="hide" cssClass="e-primary" onClick={ hideClick
  }> Hide </ButtonComponent></div>
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
  closeIconCss='e-icons e-close' items={items} opensOnHover= {true}
  target="#targetElement" ref={(scope) => { speeddialObj = scope;
  }}></SpeedDialComponent>
  </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
/* Represents the styles for button */
#hide{
  float: right;
}

```

### Programmatically refresh the position

You can refresh the position of the Speed Dial using [refreshPosition](#) method when the **target** position is changed.

The following sample demonstrates the above functionalities of a Speed Dial to refresh the position of speed dial.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { ButtonComponent, SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  let speeddialObj;
  const items = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  function refresh() {

```

```

        document.getElementById("targetElement").style.minHeight = "300px";
        speeddialObj.refreshPosition();
    }
    return (<div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'340px', border: '1px solid', padding: '10px' }}>
            <ButtonComponent id="refresh" cssClass="e-primary" onClick={refresh}>
Refresh </ButtonComponent></div>
            <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} position='MiddleRight'
target="#targetElement" ref={scope => { speeddialObj = scope;
}}></SpeedDialComponent>
        </div>);
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('button'));
    {% endraw %}

```

### APP.TSX

```

{% raw %}
/* Import the Speed Dial. */
import { ButtonComponent, SpeedDialComponent, SpeedDialItemModel } from
'@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
/* To render Speed Dial.*/
function App() {
    let speeddialObj: SpeedDialComponent;
    const items: SpeedDialItemModel[] = [
        { iconCss: 'e-icons e-cut' },
        { iconCss: 'e-icons e-copy' },
        { iconCss: 'e-icons e-paste' }
    ];
    function refresh():void {
        document.getElementById("targetElement").style.minHeight = "300px";
        speeddialObj.refreshPosition();
    }
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'340px', border:'1px solid', padding:'10px'}}>
                <ButtonComponent id="refresh" cssClass="e-primary" onClick={refresh}>
Refresh </ButtonComponent></div>
                <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} position='MiddleRight'
target="#targetElement" ref={scope =>{ speeddialObj = scope
}}></SpeedDialComponent>
            </div>
        );
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('button'));
    {% endraw %}

```

**INDEX.CSS**

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

## Display modes in React Speed dial component

The action items in React Speed Dial can be displayed in **Linear** and **Radial** display modes by setting [mode](#) property.

## Linear display mode

In **Linear** display mode, Speed Dial action items are displayed in a list-like format either horizontally or vertically. By default, Speed Dial items are displayed in **Linear** mode.

*Direction*

You can open the action items on the top, left, up, and down side of the Speed Dial button by setting [direction](#) property. The default value is **Auto** where the action items are displayed based on the [position](#) of the Speed Dial.

The **Linear** directions of Speed Dial are as follows:

- Left - Action items are displayed on the left side of the button.
- Right - Action items are displayed on the right side of the button.
- Up - Action items are displayed on the top of the button.
- Down - Action items are displayed on the bottom of the button.
- Auto - Action items display direction auto calculated based on **position** of the Speed Dial. If Speed Dial is position at bottom right, then action items displayed at top.

**APP.JSX**

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>

```

```

    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
    closeIconCss='e-icons e-close' items={items} mode='Linear' direction='Left'
    target="#targetElement"></SpeedDialComponent>
  </div>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% enddraw %}

```

### APP.TSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial. */ }
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} mode='Linear' direction=
'Left' target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Radial display mode (Radial Menu)

In **Radial** mode, Speed Dial action items are displayed in a circular pattern like a radial menu. For more details about radial mode, check out the link [here](#).

### Radial menu in React Speed dial component

The React Speed Dial action items can be displayed in a circular pattern like a radial menu by setting **mode** property. You can customize the **direction**, **startAngle**, **endAngle** and **offset** by setting **radialSettings** property.

### Radial menu direction

You can open the action items in either clockwise or anticlockwise by setting **direction** property. The default value is **Auto** where the action items are displayed based on the **position** property of the Speed Dial.

`ts

```

*/ Import the Speed Dial. */
import { SpeedDialComponent, SpeedDialItemModel, RadialSettingsModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
*/ To render Speed Dial.*/
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' },
    { iconCss: 'e-icons e-edit' },
    { iconCss: 'e-icons e-save' }
  ];
  const radialSettings: RadialSettingsModel = { direction: 'AntiClockwise' };
  return (
*/ Initialize the SpeedDial component. */
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close'
      items={items} mode= 'Radial' radialSettings= {radialSettings}
      target="#targetElement"></SpeedDialComponent>
  );
}
export default App;

```

### Radial menu start and end angle

You can modify the start and end angle of action items by setting [startAngle](#) and [endAngle](#) properties. If the angle is not defined, the action items are displayed based on the **position** property of the Speed Dial.

`ts

```

*/ Import the Speed Dial. */
import { SpeedDialComponent, SpeedDialItemModel, RadialSettingsModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
*/ To render Speed Dial.*/
function App() {
  const items: SpeedDialItemModel[] = [

```

```

{ iconCss: 'e-icons e-cut' },
{ iconCss: 'e-icons e-copy' },
{ iconCss: 'e-icons e-paste' },
{ iconCss: 'e-icons e-edit' },
{ iconCss: 'e-icons e-save' }
];

const radialSettings: RadialSettingsModel = { direction: 'AntiClockwise', startAngle: 180, endAngle: 360 };
return (
  // Initialize the SpeedDial component. //

  <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close'
    items={items} mode= 'Radial' radialSettings= {radialSettings} position='MiddleCenter'
    target="#targetElement"></SpeedDialComponent>

);
}

export default App;

ReactDOM.render(<App />,document.getElementById('button'));
`

```

### Offset

You can modify the offset distance between action items and Speed Dial button using [offset](#) property.

```

`ts

// Import the Speed Dial. //

import { SpeedDialComponent, SpeedDialItemModel, RadialSettingsModel } from '@syncfusion/ej2-react-buttons';

import * as React from 'react';

// To render Speed Dial.//

function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' },
    { iconCss: 'e-icons e-edit' },
    { iconCss: 'e-icons e-save' }
  ];

  const radialSettings: RadialSettingsModel = { offset: '80px' };

```

```

return (
  /* Initialize the SpeedDial component. */
  <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit' closeIconCss='e-icons e-close'
    items={items} mode='Radial' radialSettings= {radialSettings}
    target="#targetElement"></SpeedDialComponent>
);
}

export default App;

```

Below example demonstrates the radial menu settings of the Speed Dial.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' },
    { iconCss: 'e-icons e-edit' },
    { iconCss: 'e-icons e-save' }
  ];
  const radialSettings = { offset: '80px', direction: 'AntiClockwise',
    startAngle: 90, endAngle: 270 };
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
      '350px', border: '1px solid' }}></div>
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
      closeIconCss='e-icons e-close' items={items} mode='Radial'
      position='MiddleRight' radialSettings={radialSettings}
      target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel, RadialSettingsModel } from
  '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }

```

```
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' },
    { iconCss: 'e-icons e-edit' },
    { iconCss: 'e-icons e-save' }
  ];
  const radialSettings: RadialSettingsModel = { offset: '80px', direction:
  'AntiClockwise', startAngle: 90, endAngle: 270 };
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} mode= 'Radial' position=
'MiddleRight' radialSettings= {radialSettings}
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

## Template in React Speed dial component

This section explains available templates in SpeedDial component and its usage.

### Item template

You can use the [itemTemplate](#) property to set a template content for the SpeedDial items. The template content is defined as a child content of `itemTemplate` tag directive.

### APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items = [
    { iconCss: 'e-icons e-cut', text: 'Cut' },
    { iconCss: 'e-icons e-copy', text: 'Copy' },
    { iconCss: 'e-icons e-paste', text: 'Paste' }
  ];
  function itemTemplate(props) {
    let classname = "icon " + props.properties.iconCss;
    return (<div className="itemlist">
      <span className={classname}></span>
      <span className="text">{props.properties.text}</span>
    </div>);
  }
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
```

```

    /* Initialize the SpeedDial component */
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
content="Edit" items={items} itemTemplate={itemTemplate}
target="#targetElement"></SpeedDialComponent>
    </div>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

## APP.TSX

```

{% raw %}
/* Import the Speed Dial. */
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
/* To render Speed Dial.*/
function App() {
    const items: SpeedDialItemModel[] = [
        { iconCss: 'e-icons e-cut', text: 'Cut' },
        { iconCss: 'e-icons e-copy', text: 'Copy' },
        { iconCss: 'e-icons e-paste', text: 'Paste' }
    ];
    function itemTemplate(props: any): JSX.Element {
        let classname: string = "icon " + props.properties.iconCss;
        return (
            <div className="itemlist">
                <span className={classname}></span>
                <span className="text">{props.properties.text}</span>
            </div>);
    }
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            /* Initialize the SpeedDial component */
            <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
content="Edit" items={items} itemTemplate={itemTemplate}
target="#targetElement"></SpeedDialComponent>
            </div>
        );
    }
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

## INDEX.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;

```

```

    top: 45%;
    width: 30%;
  }
  /* Represents the styles for speeddial list items */
  .itemlist .text {
    padding: 0 5px;
  }
  .e-speeddial-li .itemlist {
    display: inherit;
    width: 100%;
    border: 1px solid transparent;
    align-items: center;
    padding: 5px;
    border-radius: 500px;
    background-color: rgba(104, 99, 104, 0.1);
    box-shadow: 0 0 4px grey;
  }
  .e-speeddial-li .itemlist:hover {
    background-color: rgb(224, 224, 224);
  }

```

### Popup template

You can use the [popupTemplate](#) property to set a template content for popup of SpeedDial component. The template content is defined as a child content of `popupTemplate` tag directive.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  function popupTemplate() {
    return (<div>
      <div className="speeddial-form">
        <p>Here you can customize your code.</p>
      </div>
    </div>);
  }
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    { /* Initialize the SpeedDial component */ }
    <SpeedDialComponent id='speeddial' content="Edit"
popupTemplate={popupTemplate} target="#targetElement"></SpeedDialComponent>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```
{% raw %}
{/* Import the Speed Dial. */}
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/* To render Speed Dial.*/}
function App() {
  function popupTemplate(): JSX.Element {
    return (
      <div>
        <div className="speeddial-form">
          <p>Here you can customize your code.</p>
        </div>
      </div>);
  }
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      {/* Initialize the SpeedDial component */}
      <SpeedDialComponent id='speeddial' content="Edit"
popupTemplate={popupTemplate} target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
/* Represents the styles for speeddial-form */
.speeddial-form {
  width: 200px;
  height: 80px;
  text-align: center;
  border-radius: 15px;
  box-shadow: rgb(0 0 0 / 10%) 0px 10px 15px -3px, rgb(0 0 0 / 5%) 0px 4px
6px -2px;
  background: #f5f5f5;
  padding: 15px;
}
```

## Styles in React Speed dial component

This section briefs different ways to style SpeedDial component.

### SpeedDial button

You can customize the icon and text of React Speed Dial button using [openIconCss](#), [closeIconCss](#) and [content](#) properties.

#### Icon only

You can use the [openIconCss](#) and [closeIconCss](#) properties to show icons in speed dial button. You can also show tooltip on hover to show additional details to end-user by setting `title` attribute.

#### APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    { /* Initialize the SpeedDial component with only icon */}
    <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

#### APP.TSX

```
{% raw %}
{ /* Import the Speed Dial. */}
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/}
function App() {
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      { /* Initialize the SpeedDial component with only icon */}
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('button'));
{% endraw %}
```

#### Text only

You can show only text in Speed Dial button by setting [content](#) property without setting icon properties..

**APP.JSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    return (<div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
        { /* Initialize the SpeedDial component with only text */ }
        <SpeedDialComponent id='speeddial' content='Edit'
target="#targetElement"></SpeedDialComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

**APP.TSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            { /* Initialize the SpeedDial component with only text */ }
            <SpeedDialComponent id='speeddial' content='Edit'
target="#targetElement"></SpeedDialComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

*Icon with text*

You show icon and text in SpeedDial button using [openIconCss](#), [closeIconCss](#) and [content](#) properties together.

**APP.JSX**

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
```

```
function App() {
  return (<div>
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    {/* Initialize the SpeedDial component with icon and text */}
    <SpeedDialComponent id='speeddial' content='Edit' openIconCss='e-icons
e-edit' target="#targetElement"></SpeedDialComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
{/* Import the Speed Dial. */}
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/* To render Speed Dial.*/}
function App() {
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      {/* Initialize the SpeedDial component with icon and text */}
      <SpeedDialComponent id='speeddial' content='Edit' openIconCss='e-icons
e-edit' target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### Disabled

You can enable or disable the SpeedDial component using [disabled](#) property.

`ts

*{/ Import the Speed Dial. /}*

import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';

import \* as React from 'react';

*{/ To render Speed Dial. /}*

function App() {

return (

*{/ Initialize the SpeedDial component in disabled state /}*

<SpeedDialComponent id='speeddial' content='Edit' disabled={true}  
target="#targetElement"></SpeedDialComponent>

```
);
}

export default App;
,
```

### cssClass

The React Speed Dial supports the following predefined styles that can be defined using the [cssClass](#) property. You can customize by setting the `cssClass` property with the below defined class.

cssClass	Description
-----	-----
e-primary	Used to represent a primary action.
e-outline	Used to represent an appearance of button with outline.
e-info	Used to represent an informative action.
e-success	Used to represent a positive action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.

### APP.JSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  return (
    <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
    { /* Initialize the SpeedDial component with applied warning style */ }
    <SpeedDialComponent id='speeddial' content='Edit' cssClass='e-warning'
target="#targetElement"></SpeedDialComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  return (
    <div>
```

```

    <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
    {/* Initialize the SpeedDial component with applied warning style */}
    <SpeedDialComponent id='speeddial' content='Edit' cssClass='e-warning'
target="#targetElement"></SpeedDialComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Visible

You can set the Speed Dial button to visible/hidden state using [visible](#) property.

`ts

```

{/ Import the Speed Dial. /}
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
{/ To render Speed Dial./}
function App() {
  return (
    {/ Initialize the SpeedDial component in hidden state /}
    <SpeedDialComponent id='speeddial' content='Edit' visible={false}
target="#targetElement"></SpeedDialComponent>
  );
}
export default App;
`

```

### Tooltip

You can show tooltip on hover to show additional details to end-user by setting [title](#) to Speed Dial button.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items = [
    { iconCss: 'e-icons e-cut', title: 'Cut' },
    { iconCss: 'e-icons e-copy', title: 'Copy' },
    { iconCss: 'e-icons e-paste', title: 'Paste' }
  ]

```

```

    ];
    return (<div>
      <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
      { /* Initialize the SpeedDial component */ }
      <SpeedDialComponent id='speeddial' items={items} openIconCss='e-icons
e-edit' target='#targetElement'></SpeedDialComponent>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('button'));
  {% endraw %}

```

### APP.TSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss:'e-icons e-cut', title:'Cut' },
    { iconCss:'e-icons e-copy', title:'Copy' },
    { iconCss:'e-icons e-paste', title:'Paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      { /* Initialize the SpeedDial component */ }
      <SpeedDialComponent id='speeddial' items={items} openIconCss='e-icons
e-edit' target='#targetElement'></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Opens on hover

You can use [opensOnHover](#) property to open actions items on hover itself. By default action items displayed only when clicking the speed dial button.

### APP.JSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {

```

```

const items = [
  { iconCss: 'e-icons e-cut' },
  { iconCss: 'e-icons e-copy' },
  { iconCss: 'e-icons e-paste' }
];
return (<div>
  <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
  /* Initialize the SpeedDial component */
  <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} opensOnHover={true}
target="#targetElement"></SpeedDialComponent>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```

{% raw %}
/* Import the Speed Dial. */
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
/* To render Speed Dial.*/
function App() {
  const items: SpeedDialItemModel[] = [
    { iconCss: 'e-icons e-cut' },
    { iconCss: 'e-icons e-copy' },
    { iconCss: 'e-icons e-paste' }
  ];
  return (
    <div>
      <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
      /* Initialize the SpeedDial component */
      <SpeedDialComponent id='speeddial' openIconCss='e-icons e-edit'
closeIconCss='e-icons e-close' items={items} opensOnHover= {true}
target="#targetElement"></SpeedDialComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Modal in React Speed dial component

You can use the [modal](#) property to set the Speed Dial as modal which adds an overlay to prevent the background interaction.

### APP.JSX

```
{% raw %}
```

```

{ /* Import the Speed Dial. */ }
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    const items = [
        { iconCss: 'e-icons e-cut' },
        { iconCss: 'e-icons e-copy' },
        { iconCss: 'e-icons e-paste' }
    ];
    return (<div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
        { /* Initialize the SpeedDial component with modal */ }
        <SpeedDialComponent id='speeddial' items={items} openIconCss='e-icons
e-edit' modal={true} target='#targetElement'></SpeedDialComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### APP.TSX

```

{% raw %}
{ /* Import the Speed Dial. */ }
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-
react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* To render Speed Dial.*/ }
function App() {
    const items: SpeedDialItemModel[] = [
        { iconCss:'e-icons e-cut'},
        { iconCss:'e-icons e-copy'},
        { iconCss:'e-icons e-paste'}
    ];
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            { /* Initialize the SpeedDial component with modal */ }
            <SpeedDialComponent id='speeddial' items={items} openIconCss='e-icons
e-edit' modal={true} target='#targetElement'></SpeedDialComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}

```

### Event in React Speed dial component

This section explains the Speed Dial events that will be triggered when appropriate actions are performed.

### clicked

The SpeedDial component triggers the [clicked](#) event with [SpeedDialItemEventArgs](#) argument when an action item is clicked. You can use this event to perform the required action.

```
`ts
```

```
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialItemEventArgs } from '@syncfusion/ej2-react-buttons';
```

```
import * as React from 'react';
```

```
{/ Initialize action items. /}
```

```
function App() {
```

```
  const items: SpeedDialItemModel[] = [
```

```
    { text: 'Cut' },
```

```
    { text: 'Copy' },
```

```
    { text: 'Paste' } 
```

```
  ];
```

```
  function itemClick(args:SpeedDialItemEventArgs){
```

```
    //Your required action here
```

```
  }
```

```
  return (
```

```
    {/ Initialize the SpeedDial component /}
```

```
    <SpeedDialComponent id='speeddial' items={items} content='Edit' clicked={ itemClick }></SpeedDialComponent>
```

```
  );
```

```
}
```

```
export default App;
```

```
`
```

### created

The Speed Dial component triggers the [created](#) event when SpeedDial component rendering is completed.

```
`ts
```

```
import { SpeedDialComponent, SpeedDialItemModel } from '@syncfusion/ej2-react-buttons';
```

```
import * as React from 'react';
```

```
{/ Initialize action items. /}
```

```
function App() {
```

```
  const items: SpeedDialItemModel[] = [
```

```
    { text: 'Cut' },
```

```

{ text: 'Copy' },
{ text: 'Paste' }
];
function created(){
//Your required action here
}
return (
  /* Initialize the SpeedDial component */
  <SpeedDialComponent id='speeddial' items={items} content='Edit' created={ created }></SpeedDialComponent>
);
}
export default App;
`

```

### beforeOpen

The SpeedDial component triggers the [beforeOpen](#) event with [SpeedDialBeforeOpenCloseEventArgs](#) argument before the SpeedDial popup is opened.

```

`ts
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialBeforeOpenCloseEventArgs } from
 '@syncfusion/ej2-react-buttons';
import * as React from 'react';
/* Initialize action items. */
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  function beforeOpen(args:SpeedDialBeforeOpenCloseEventArgs){
    //Your required action here
  }
  return (
    /* Initialize the SpeedDial component */
    <SpeedDialComponent id='speeddial' items={items} content='Edit' beforeOpen={ beforeOpen }></SpeedDialComponent>
  );
}

```

```
);
}
export default App;
`
```

### onOpen

The SpeedDial component triggers the [onOpen](#) event with [SpeedDialOpenCloseEventArgs](#) argument when SpeedDial popup is opened.

```
`ts
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialOpenCloseEventArgs } from
 '@syncfusion/ej2-react-buttons';
import * as React from 'react';
*/ Initialize action items. */
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  function onOpen(args:SpeedDialOpenCloseEventArgs){
    //Your required action here
  }
  return (
    */ Initialize the SpeedDial component */
    <SpeedDialComponent id='speeddial' items={items} content='Edit' onOpen={ onOpen
    }></SpeedDialComponent>
  );
}
export default App;
`
```

### beforeClose

The SpeedDial component triggers the [beforeClose](#) event with [SpeedDialBeforeOpenCloseEventArgs](#) argument before the SpeedDial popup is closed.

```
`ts
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialBeforeOpenCloseEventArgs } from
 '@syncfusion/ej2-react-buttons';
```

```

import * as React from 'react';
// Initialize action items. //
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  function beforeClose(args:SpeedDialBeforeOpenCloseEventArgs){
    //Your required action here
  }
  return (
    // Initialize the SpeedDial component //
    <SpeedDialComponent id='speeddial' items={items} content='Edit' beforeClose={ beforeClose }></SpeedDialComponent>
  );
}
export default App;
`

```

### onClose

The SpeedDial component triggers the [onClose](#) event with [SpeedDialOpenCloseEventArgs](#) argument when SpeedDial popup is closed.

`ts

```

import { SpeedDialComponent, SpeedDialItemModel, SpeedDialOpenCloseEventArgs } from
 '@syncfusion/ej2-react-buttons';
import * as React from 'react';
// Initialize action items. //
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  function onClose(args:SpeedDialOpenCloseEventArgs){

```

```
//Your required action here
}
return (
  {/ Initialize the SpeedDial component /}
  <SpeedDialComponent id='speeddial' items={items} content='Edit' onClose={ onClose
}></SpeedDialComponent>
);
}
export default App;
`
```

### [beforeItemRender](#)

The SpeedDial component triggers the [beforeItemRender](#) event with [SpeedDialItemEventArgs](#) argument for each **SpeedDialItem** once it is rendered.

```
`ts
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialItemEventArgs } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
{/ Initialize action items. /}
function App() {
  const items: SpeedDialItemModel[] = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  function beforeItemRender(args:SpeedDialItemEventArgs){
    //Your required action here
  }
  return (
    {/ Initialize the SpeedDial component /}
    <SpeedDialComponent id='speeddial' items={items} content='Edit' beforeItemRender={
      this.beforeItemRender=this.beforeItemRender.bind(this) }></SpeedDialComponent>
  );
}
export default App;
`
```

Below example demonstrates the clicked event of the Speed Dial component.

### APP.JSX

```
{% raw %}
import { SpeedDialComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* Initialize action items. */ }
function App() {
    const items = [
        { text: 'Cut' },
        { text: 'Copy' },
        { text: 'Paste' }
    ];
    function itemClick(args) {
        alert(args.item.text + " is clicked");
    }
    return (<div>
        <div id="targetElement" style={{ position: 'relative', minHeight:
'350px', border: '1px solid' }}></div>
        { /* Initialize the SpeedDial component */ }
        <SpeedDialComponent id='speeddial' items={items} content='Edit'
target='#targetElement' clicked={itemClick}></SpeedDialComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
import { SpeedDialComponent, SpeedDialItemModel, SpeedDialItemEventArgs }
from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{ /* Initialize action items. */ }
function App() {
    const items: SpeedDialItemModel[] = [
        { text: 'Cut' },
        { text: 'Copy' },
        { text: 'Paste' }
    ];
    function itemClick(args: SpeedDialItemEventArgs) {
        alert(args.item.text + " is clicked")
    }
    return (
        <div>
            <div id="targetElement" style={{position:'relative',
minHeight:'350px', border:'1px solid'}}></div>
            { /* Initialize the SpeedDial component */ }
            <SpeedDialComponent id='speeddial' items={items} content='Edit'
target='#targetElement' clicked={ itemClick }></SpeedDialComponent>
            </div>
        );
}
}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById('button')) ;
{% endraw %}
```

## Accessibility in React Speed dial component

The Speed Dial component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Speed Dial component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The Speed Dial component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Speed Dial component:

Attributes	Purpose
-----	-----
<code>role=menu</code>	Specifies that the SpeedDial item has a submenu.
<code>role=menuitem</code>	Indicates an actionable item within the SpeedDial submenu.
<code>aria-label</code>	Indicates the SpeedDial Popup item text.
<code>aria-expanded</code>	It indicates whether the SpeedDial current state is expanded or collapsed.
<code>aria-haspopup</code>	It indicates whether the SpeedDial has popup items or not.
<code>aria-controls</code>	Attribute is set to the SpeedDial button and it points to the corresponding content.
<code>aria-disabled</code>	Indicates the state of menu item whether it is disabled.

### Keyboard interaction

The Speed Dial component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Speed Dial component.

Press	To do this
-----	-----
<code>Enter</code>	Open/close the menu.
<code>Up-arrow</code>	Focuses the next menu item.
<code>Left-Arrow</code>	Focuses the previous menu item.
<code>Down-Arrow</code>	Focuses the previous menu item.
<code>Right-Arrow</code>	Focuses the next menu item.
<code>Home</code>	Focuses the first menu item.
<code>End</code>	Focuses the last menu item.
<code>Esc</code>	Closes the menu.

### Ensuring accessibility

The Speed Dial component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Speed Dial component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Speed Dial component with accessibility tools.

## Spinner

### Getting Started

Initialize the Spinner using `createSpinner` method.

You can show/hide Spinner by using `showSpinner` and `hideSpinner` methods accordingly. You need to set target to render based on specific target.

The following steps explains you on how to create and how to show/hide your Spinner.

\*Import the `createSpinner` method from `ej2-popups` library into your file as shown in below.

,

```
import { createSpinner } from '@syncfusion/ej2-popups';
```

,

\*Show and hide this spinner by using `showSpinner` and `hideSpinner` methods for loading in your page and import them in your file as shown in below.

,

```
import { showSpinner, hideSpinner } from '@syncfusion/ej2-popups';
```

,

### Create the Spinner globally

The Spinner can be render globally in a page using public exported functions of the `ej2-popups` package.

[Class-component]

### APP.JSX

```
import { createSpinner, showSpinner } from '@syncfusion/ej2-popups';
import * as React from 'react';
export default class App extends React.Component {
  componentDidMount(prevProps) {
    //createSpinner() method is used to create spinner
    createSpinner({
      // Specify the target for the spinner to show
      target: document.getElementById('container'),
    });
    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('container'));
  }
  render() {
    return (
      <div className="control-pane">
        <div id="container" className="control-section col-lg-12 spinner-
target"></div>
      </div>);
  }
}
```

**APP.TSX**

```
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
popups';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}>, {}> {
  componentDidMount(prevProps) {
    //createSpinner() method is used to create spinner
    createSpinner({
      // Specify the target for the spinner to show
      target: document.getElementById('container'),
    });
    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('container'));
  }
  render() {
    return (
      <div className="control-pane">
        <div id="container"
          className="control-section col-lg-12 spinner-target"
        ></div>
      </div>
    );
  }
}
```

**[Functional-component]****APP.JSX**

```
import { createSpinner, showSpinner } from '@syncfusion/ej2-popups';
import * as React from 'react';
import { useEffect } from "react";
function App() {
  useEffect(() => {
    componentDidMount();
  });
  function componentDidMount(prevProps) {
    //createSpinner() method is used to create spinner
    createSpinner({
      // Specify the target for the spinner to show
      target: document.getElementById('container'),
    });
    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('container'));
  }
  return (<div className="control-pane">
    <div id="container" className="control-section col-lg-12 spinner-
target"></div>
  </div>);
}
```

**APP.TSX**

```
import { createSpinner, showSpinner, hideSpinner } from '@syncfusion/ej2-
popups';
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { useEffect } from "react";
function App() {
  useEffect(() => {
    //createSpinner() method is used to create spinner
    createSpinner({
      // Specify the target for the spinner to show
      target: document.getElementById('container'),
    });
    // showSpinner() will make the spinner visible
    showSpinner(document.getElementById('container'));
  })
  return (
    <div className="control-pane">
      <div id="container"
        className="control-section col-lg-12 spinner-target"
      ></div>
    </div>
  );
}
export default App;
```

### Template in React Spinner component

You can use custom templates on the Spinner instead of the default Spinner by specifying the template in the `setSpinner` method.

The following steps explain you on how to define template for Spinner.

\*Import the `setSpinner` method from `ej2-react-popups` library into your `index.tsx` as shown in below.

```
import { setSpinner } from '@syncfusion/ej2-react-popups';
```

\*Pass your custom template to the `setSpinner` method like as below.

```
`ts
```

```
// Specify the template content to be displayed in the Spinner
```

```
setSpinner({ template: '<div style="width:100%;height:100%" class="custom-rolling"><div></div></div>'});
```

You should set the template to the Spinner before creating the respective Essential JS 2 component.

Also, until we replace `setSpinner` template, the further Essential JS 2 component rendering is created with given template only.

- Now, render the Essential JS 2 component. It's render the Spinner with the template specified in the `setSpinner` method.

In the below sample, we have rendered the Grid component with custom Spinner using `setSpinner` method.

You have to define the styles for the template in `index.html`.

[Class-component]

#### APP.JSX

```
import * as React from 'react';
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
export default class App extends React.Component {
  gridData = data.slice(0, 7);
  onFirstGridCreated() {
    this.hideSpinner = () => true;
    // Specify the template content to be displayed in the Spinner
    setSpinner({ template: '<div style="width:100%;height:100%"
class="custom-rolling"><div></div></div>' });
  }
  onSecondGridCreated() {
    this.hideSpinner = () => true;
  }
  render() {
    return (<div>
      <GridComponent id='grid1' dataSource={this.gridData}
created={this.onFirstGridCreated}>
        <ColumnsDirective>
          <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
          <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
          <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
          <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
        </ColumnsDirective>
      </GridComponent>
      <br /><br /><br />
      <GridComponent id='grid2' dataSource={this.gridData}
created={this.onSecondGridCreated}>
        <ColumnsDirective id='grid2' dataSource={this.gridData}>
          <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
          <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
          <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
          <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
        </ColumnsDirective>
      </GridComponent>
    </div>);
  }
}
```

**APP.TSX**

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
export default class App extends React.Component<{}, {}> {
    private gridData: Object[] = data.slice(0, 7);
    public onFirstGridCreated(): void {
        this.hideSpinner = () => true;
        // Specify the template content to be displayed in the Spinner
        setSpinner({ template: '<div style="width:100%;height:100%"
class="custom-rolling"><div></div></div>' });
    }
    public onSecondGridCreated(): void {
        this.hideSpinner = () => true;
    }
    render() {
        return (
            <div>
                <GridComponent id='grid1' dataSource={this.gridData}
created={this.onFirstGridCreated}>
                    <ColumnsDirective>
                        <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                        <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                        <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                        <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
                    </ColumnsDirective>
                </GridComponent>
                <br/><br/>
                <GridComponent id='grid2' dataSource={this.gridData}
created={this.onSecondGridCreated}>
                    <ColumnsDirective id='grid2' dataSource={this.gridData}>
                        <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                        <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                        <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                        <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
                    </ColumnsDirective>
                </GridComponent>
            </div>
        );
    }
}

```

**[Functional-component]****APP.JSX**

```

import * as React from 'react';
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
function App() {
    let gridData = data.slice(0, 7);
    const [status, setStatus] = React.useState({ hideSpinner: true });
    function onFirstGridCreated() {
        setStatus({ hideSpinner: true });
        // Specify the template content to be displayed in the Spinner
        setSpinner({ template: '<div style="width:100%;height:100%"
class="custom-rolling"><div></div></div>' });
    }
    function onSecondGridCreated() {
        setStatus({ hideSpinner: true });
    }
    return (<div>
        <GridComponent id='grid1' dataSource={gridData}
created={onFirstGridCreated}>
            <ColumnsDirective>
                <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
            </ColumnsDirective>
        </GridComponent>
        <br /><br /><br />
        <GridComponent id='grid2' dataSource={gridData}
created={onSecondGridCreated}>
            <ColumnsDirective id='grid2' dataSource={gridData}>
                <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
            </ColumnsDirective>
        </GridComponent>
    </div>);
}

```

**APP.TSX**

```

import * as React from 'react';
import * as ReactDOM from "react-dom";

```

```

import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
function App() {
    let gridData: Object[] = data.slice(0, 7);
    const [status, setStatus] = React.useState({ hideSpinner: true });
    function onFirstGridCreated(): void {
        setStatus({ hideSpinner: true });
        // Specify the template content to be displayed in the Spinner
        setSpinner({ template: '<div style="width:100%;height:100%"
class="custom-rolling"><div></div></div>' });
    }
    function onSecondGridCreated(): void {
        setStatus({ hideSpinner: true });
    }
    return (
        <div>
            <GridComponent id='grid1' dataSource={gridData}
created={onFirstGridCreated}>
                <ColumnsDirective>
                    <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                    <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                    <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                    <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
                </ColumnsDirective>
            </GridComponent>
            <br/><br/><br/>
            <GridComponent id='grid2' dataSource={gridData}
created={onSecondGridCreated}>
                <ColumnsDirective id='grid2' dataSource={gridData}>
                    <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
                    <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
                    <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C' textAlign='right' />
                    <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right' />
                </ColumnsDirective>
            </GridComponent>
        </div>
    );
}
export default App;

```

### Types in React Spinner component

By default, the Spinner is loaded in the applicable Essential JS 2 component based on the theme imported into the page. Based on the theme, the type is set to the Spinner.

The available types are:

- Material
- Fabric
- Bootstrap

You can change the Essential JS 2 component spinner type by passing the type of the spinner as parameter to the `setSpinner` method like as below.

```
`ts
// Specify the type of the Spinner to be displayed
setSpinner({ type: 'Bootstrap'});
`
```

After Essential JS 2 component creation only, you can change the Essential JS 2 component spinner type.

[Class-component]

#### APP.JSX

```
import * as React from 'react';
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
// By default, Spinner is rendered with specified theme inside the Grid
component.
export default class App extends React.Component {
  gridData = data.slice(0, 7);
  onGridCreated() {
    this.hideSpinner = () => true;
    // Specify the type of the Spinner to be displayed in the Grid.
    setSpinner({ type: 'Bootstrap' });
  }
  render() {
    return (
      <div>
        <GridComponent id='grid' dataSource={this.gridData}
        created={this.onGridCreated}>
          <ColumnsDirective>
            <ColumnDirective field='OrderID' headerText='Order
            ID' width='120' textAlign='right' type='number'></ColumnDirective>
            <ColumnDirective field='CustomerID'
            headerText='Customer ID' width='140' type='string'></ColumnDirective>
            <ColumnDirective field='Freight'
            headerText='Freight' width='120' format='C'
            textAlign='right'></ColumnDirective>
            <ColumnDirective field='OrderDate' headerText='Order
            Date' width='140' format='yMd' textAlign='right'></ColumnDirective>
          </ColumnsDirective>
        </GridComponent>
      </div>
    );
  }
}
```

#### APP.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
// By default, Spinner is rendered with specified theme inside the Grid
component.
export default class App extends React.Component<{}, {}> {
  private gridData: Object[] = data.slice(0, 7);
  public onGridCreated(): void {
    this.hideSpinner = () => true;
    // Specify the type of the Spinner to be displayed in the Grid.
    setSpinner({ type: 'Bootstrap' });
  }
  render() {
    return (
      <div>
        <GridComponent id='grid' dataSource={this.gridData}
created={this.onGridCreated}>
          <ColumnsDirective>
            <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
            <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
            <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C'
textAlign='right'></ColumnDirective>
            <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right'></ColumnDirective>
          </ColumnsDirective>
        </GridComponent>
      </div>
    );
  }
}

```

### [Functional-component]

#### APP.JSX

```

import * as React from 'react';
import { GridComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
// By default, Spinner is rendered with specified theme inside the Grid
component.
function App() {
  let gridData = data.slice(0, 7);
  const [status, setStatus] = React.useState({ hideSpinner: true });
  function onGridCreated() {
    setStatus({ hideSpinner: true });
    // Specify the type of the Spinner to be displayed in the Grid.
    setSpinner({ type: 'Bootstrap' });
  }
}

```

```

    return (<div>
      <GridComponent id='grid' dataSource={gridData}
created={onGridCreated}>
        <ColumnsDirective>
          <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
          <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
          <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C'
textAlign='right'></ColumnDirective>
          <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right'></ColumnDirective>
        </ColumnsDirective>
      </GridComponent>
    </div>);
  }
}

```

### APP.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { GridComponent, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-grids';
import { setSpinner } from '@syncfusion/ej2-react-popups';
import { data } from './datasource';
// By default, Spinner is rendered with specified theme inside the Grid
component.
function App() {
  let gridData: Object[] = data.slice(0, 7);
  const [status, setStatus] = React.useState({ hideSpinner: true });
  function onGridCreated(): void {
    setStatus({ hideSpinner: true });
    // Specify the type of the Spinner to be displayed in the Grid.
    setSpinner({ type: 'Bootstrap' });
  }

  return (
    <div>
      <GridComponent id='grid' dataSource={gridData}
created={onGridCreated}>
        <ColumnsDirective>
          <ColumnDirective field='OrderID' headerText='Order
ID' width='120' textAlign='right' type='number'></ColumnDirective>
          <ColumnDirective field='CustomerID'
headerText='Customer ID' width='140' type='string'></ColumnDirective>
          <ColumnDirective field='Freight'
headerText='Freight' width='120' format='C'
textAlign='right'></ColumnDirective>
          <ColumnDirective field='OrderDate' headerText='Order
Date' width='140' format='yMd' textAlign='right'></ColumnDirective>
        </ColumnsDirective>
      </GridComponent>
    </div>
  );
}
export default App;

```

### Style in React Spinner component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the spinner

Use the following CSS to customize the spinner stroke color.

##### *Material theme*

```
`css
.e-spinner-pane .e-spinner-inner .e-spin-material {
stroke: green;
}
`
```

##### *Fabric theme*

```
`css
.e-spinner-pane .e-spinner-inner .e-spin-fabric {
stroke: green;
}
`
```

##### *Bootstrap theme*

```
`css
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap {
fill: green;
stroke: green;
}
`
```

##### *Bootstrap4 theme*

```
`css
.e-spinner-pane .e-spinner-inner .e-spin-bootstrap4 {
stroke: green;
}
`
```

##### *High Contrast theme*

```
`css
.e-spinner-pane .e-spinner-inner .e-spin-high-contrast .e-path-arc {
stroke: green;
}
```

```
}  
,
```

## SplitButton

### Getting Started

This section briefly explains how to create a simple **SplitButton** component and configure its available functionalities in React.

### Dependencies

The following list of dependencies are required to use the **SplitButton** component in your application.

```
`js  
|-- @syncfusion/ej2-react-splitbuttons  
|-- @syncfusion/ej2-react-base  
|-- @syncfusion/ej2-base  
|-- @syncfusion/ej2-splitbuttons  
|-- @syncfusion/ej2-popups  
|-- @syncfusion/ej2-buttons  
,
```

### Installation and configuration

You can use [Create-react-app](#) to setup the applications.

To install **create-react-app** run the following command.

```
`bash  
npm install -g create-react-app  
,
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash  
npx create-react-app my-app --template typescript  
cd my-app  
npm start  
,
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash  
npx create-react-app my-app  
cd my-app  
npm start  
,
```

### Adding syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. You can choose the component that you want to install.

To install SplitButton component, use the following command

```
`bash
npm install @syncfusion/ej2-react-splitbuttons --save
`
```

### Adding CSS reference

Import the SplitButton component required CSS references as follows in `src/App.css`.

```
`css
/ import the SplitButton dependency styles /
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
`
```

### Adding SplitButton component

Now, you can start adding SplitButton component in the application. For getting started, add the SplitButton component in `src/App.tsx` file using following code.

Add the below code in the `src/App.tsx` to initialize the SplitButton.

```
`ts
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import './App.css';
enableRipple(true);
// To render SplitButton.
function App() {
  return (
    <div style={{marginTop: '150px'}}>
      <SplitButtonComponent id="element"/>
    </div>
  );
}
```

```
export default App;  
`
```

### Binding data source

After initialization, populate the SplitButton with data using the [items](#) property. Here, an array of string values is passed to the SplitButton component.

```
`ts  
import { enableRipple } from '@syncfusion/ej2-base';  
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';  
import * as React from 'react';  
import './App.css';  
enableRipple(true);  
// To render SplitButton.  
function App() {  
  let items: ItemModel[] = [  
    {  
      text: 'Cut',  
    },  
    {  
      text: 'Copy',  
    },  
    {  
      text: 'Paste',  
    }  
  ];  
  return (  
    <div style={{marginTop: '150px'}}><SplitButtonComponent id="element" items = {items}> Paste  
    </SplitButtonComponent>  
    </div>  
  );  
}  
export default App;  
`
```

### Run the application

After completing the configuration required to render a basic SplitButton, run the following command to display the output in your default browser.

`

npm start

`

The following example shows a basic SplitButton component.

#### **APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items = [
        {
            text: 'Cut',
        },
        {
            text: 'Copy',
        },
        {
            text: 'Paste',
        }
    ];
    return (<div>
        <SplitButtonComponent id="element" items={items}> Paste
    </SplitButtonComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

#### **APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items: ItemModel[] = [
        {
            text: 'Cut',
        },
        {
            text: 'Copy',
        },
        {
            text: 'Paste',
        }
    ];
    return (
        <div>
```

```

    <SplitButtonComponent id="element" items = {items}> Paste
  </SplitButtonComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### Icons and separator in React Split button component

#### SplitButton icons

SplitButton can have an icon to provide the visual representation of the action. To place the icon on a SplitButton, set the [iconCss](#) property to **e-icons** with the required icon CSS. By default, the icon is positioned to the left side of the SplitButton. You can customize the icon's position by using the [iconPosition](#) property

The following example illustrates how to place icon in SplitButton component.

#### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items = [
    {
      text: 'Cut',
    },
    {
      text: 'Copy',
    },
    {
      text: 'Paste',
    }
  ];
  return (
    <div>
      <SplitButtonComponent items={items} iconCss='e-sb-icons e-paste'>Paste</SplitButtonComponent>
      <SplitButtonComponent items={items} iconPosition="Top" iconCss='e-sb-icons e-paste'>Paste</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

#### APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';

```

```
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items: ItemModel[] = [
    {
      text: 'Cut',
    },
    {
      text: 'Copy',
    },
    {
      text: 'Paste',
    }
  ];
  return (
    <div>
      <SplitButtonComponent items = {items} iconCss= 'e-sb-icons e-paste'>Paste</SplitButtonComponent>
      <SplitButtonComponent items = {items} iconPosition= "Top" iconCss= 'e-sb-icons e-paste'>Paste</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element.

You can also use third party icons on the SplitButton using the [iconCss](#) property.

### Vertical button

Vertical Button in SplitButton can be achieved by adding **e-vertical** class using [cssClass](#) property.

The following example illustrates how to vertical support in SplitButton component.

### APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items = [
    {
      text: 'Cut',
    },
    {
      text: 'Copy',
    },
    {
      text: 'Paste',
    }
  ];
}
```

```

    }
    ];
    return (<div>
      <SplitButtonComponent cssClass='e-vertical' items={items} iconCss='e-
sb-icons e-paste' iconPosition='Top'>Paste</SplitButtonComponent>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('button'));

```

### APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items: ItemModel[] = [
    {
      text: 'Cut',
    },
    {
      text: 'Copy',
    },
    {
      text: 'Paste',
    }
  ];
  return (
    <div>
      <SplitButtonComponent cssClass= 'e-vertical' items = {items} iconCss=
'e-sb-icons e-paste' iconPosition='Top'>Paste</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

The Essential JS 2 provides a set of icons that can be loaded by applying **e-icons** class name to the element.

You can also use third party icons on the SplitButton using the [iconCss](#) property.

### Separator

SplitButton component has Separator support. This can be achieved by setting **separator** as **true**.

The following example illustrates how to enable separator support in SplitButton component.

### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

enableRipple(true);
// To render SplitButton.
function App() {
  let items = [
    {
      iconCss: 'e-sb-icons e-cut',
      text: 'Cut'
    },
    {
      iconCss: 'e-icons e-copy',
      text: 'Copy'
    },
    {
      iconCss: 'e-sb-icons e-paste',
      text: 'Paste'
    },
    {
      separator: true
    },
    {
      iconCss: 'e-sb-icons e-font',
      text: 'Font'
    },
    {
      iconCss: 'e-sb-icons e-paragraph',
      text: 'Paragraph'
    }
  ];
  return (<div>
    <SplitButtonComponent items={items} iconCss='e-sb-icons e-
paste'>Paste</SplitButtonComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**APP.TSX**

```

import { enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items: ItemModel[] = [
    {
      iconCss: 'e-sb-icons e-cut',
      text: 'Cut'
    },
    {
      iconCss: 'e-icons e-copy',
      text: 'Copy'
    },
    {

```

```

        iconCss: 'e-sb-icons e-paste',
        text: 'Paste'
    },
    {
        separator: true
    },
    {
        iconCss: 'e-sb-icons e-font',
        text: 'Font'
    },
    {
        iconCss: 'e-sb-icons e-paragraph',
        text: 'Paragraph'
    }
  ];
  return (
    <div>
      <SplitButtonComponent items = {items} iconCss= 'e-sb-icons e-paste'>Paste</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

## Popup items in React Split button component

### Icons

The Popup action item have an icon or image to provide visual representation of the action. To place the icon on a popup item, set the [iconCss](#) property to `e-icons` with the required icon CSS. By default, the icon is positioned to the left side of the popup action item.

In the following sample, the icons for Cut, Copy, and Paste menu items are added using the `iconCss` property

### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items = [
    {
      iconCss: 'e-sb-icons e-cut',
      text: 'Cut'
    },
    {
      iconCss: 'e-icons e-copy',
      text: 'Copy'
    }
  ];
}

```

```

    },
    {
      iconCss: 'e-sb-icons e-paste',
      text: 'Paste'
    }
  ];
  return (<div>
    <SplitButtonComponent items={items} iconCss='e-sb-icons e-
paste'>Paste</SplitButtonComponent>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**APP.TSX**

```

import { enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items: ItemModel[] = [
    {
      iconCss: 'e-sb-icons e-cut',
      text: 'Cut'
    },
    {
      iconCss: 'e-icons e-copy',
      text: 'Copy'
    },
    {
      iconCss: 'e-sb-icons e-paste',
      text: 'Paste'
    }
  ];
  return (
    <div>
      <SplitButtonComponent items = {items} iconCss= 'e-sb-icons e-
paste'>Paste</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**Template***Item Templating*

Popup items can be customized by using the [beforeItemRender](#) event. The item render event triggers while rendering each Popup action item. The event argument will be used to identify the action item and customize it based on the requirement.

**APP.JSX**

```

import { createElement, enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items = [
        {
            text: 'Cut',
        },
        {
            text: 'Copy',
        },
        {
            text: 'Paste',
        }
    ];
    function itemBeforeEvent(args) {
        const shortCutSpan = createElement('span');
        const text = args.item.text;
        args.element.appendChild(shortCutSpan);
        shortCutSpan.setAttribute('class', 'shortcut');
        const clsName = (text === 'Copy') ? 'e-icons' : 'e-sb-icons';
        shortCutSpan.classList.add(clsName);
        (text === 'Cut') ? shortCutSpan.classList.add('e-cut') : (text ===
        'Paste') ? shortCutSpan.classList.add('e-paste') :
        shortCutSpan.classList.add('e-copy');
    }
    return (<div>
        <SplitButtonComponent items={items} beforeItemRender={itemBeforeEvent}
        iconCss='e-sb-icons e-paste' />
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**APP.TSX**

```

import { createElement, enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, MenuEventArgs, SplitButtonComponent } from
 '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items: ItemModel[] = [
        {
            text: 'Cut',
        },
        {
            text: 'Copy',
        },
        {
            text: 'Paste',
        }
    ];

```

```

    }];
    function itemBeforeEvent(args: MenuEventArgs): void {
        const shortCutSpan = createElement('span');
        const text = args.item.text;
        args.element.appendChild(shortCutSpan);
        shortCutSpan.setAttribute('class', 'shortcut');
        const clsName = (text === 'Copy') ? 'e-icons' : 'e-sb-icons';
        shortCutSpan.classList.add(clsName);
        (text === 'Cut') ? shortCutSpan.classList.add('e-cut') : (text ===
        'Paste') ? shortCutSpan.classList.add('e-paste') :
        shortCutSpan.classList.add('e-copy');
    }
    return (
        <div>
            <SplitButtonComponent items = {items} beforeItemRender=
            {itemBeforeEvent} iconCss= 'e-sb-icons e-paste' />
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### Popup Templating

The whole popup can be customized as per the requirement. In the following example, the popup can be customized by handling it in [target](#) property.

### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    return <div>
        <div id='dropdowntarget'>
            <div id='first'>
                <div id='black' />
                <div id='red' />
                <div id='green' />
                <div id='gray' />
                <div id='blue' />
                <div id='violet' />
                <div id='brown' />
                <div id='darkgoldenrod' />
                <div id='aquamarine' />
            </div>
        </div>
        <SplitButtonComponent target='#dropdowntarget' iconCss='e-sb-icons
        e-color' />
    </div>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  return (
    <div>
      <div id='dropdowntarget'>
        <div id= "first">
          <div id='black' />
          <div id='red' />
          <div id='green' />
          <div id='gray' />
          <div id='blue' />
          <div id='violet' />
          <div id='brown' />
          <div id='darkgoldenrod' />
          <div id='aquamarine' />
        </div>
      </div>
      <SplitButtonComponent target='#dropdowntarget' iconCss= 'e-sb-icons
e-color' />
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

### Accessibility in React SplitButton component

The SplitButton component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the SplitButton component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

#### WAI-ARIA attributes

The SplitButton component followed the [WAI-ARIA] patterns to meet the accessibility. The following ARIA attributes are used in the SplitButton component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the SplitButton component as **button**, SplitButton popup as **menu**, and the SplitButton popup action items as **menuitem**. |

| **aria-haspopup** | Indicates the availability and type of interactive SplitButton popup element. |

| **aria-expanded** | Indicates whether the SplitButton popup can be expanded or collapsed, as well as indicates whether its current state is expanded or collapsed. |

| **aria-owns** | Identifies an elements in order to define a visual, functional, or contextual parent/child relationship between DOM elements where the DOM hierarchy cannot be used to represent the relationship. |

| `aria-disabled` | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

#### Keyboard interaction

The SplitButton component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the SplitButton component.

| **Press** | **To do this** |

| --- | --- |

| **Esc** | Closes the opened popup. |

| **Enter** | Opens the popup, or activates the highlighted item and closes the popup. |

| **Spacer** | Opens the popup. |

| **Up** | Navigates up or to the previous action item. |

| **Down** | Navigates down or to the next action item. |

| **Alt + Up Arrow** | Closes the popup. |

| **Alt + Down Arrow** | Opens the popup. |

#### Ensuring accessibility

The SplitButton component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the SplitButton component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the SplitButton component with accessibility tools.

- [Accessibility in Syncfusion React components](#)

#### Style and appearance in React Split button component

To modify the SplitButton appearance, you need to override the default CSS of SplitButton component. Please find the list of CSS classes and its corresponding section in SplitButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

| `.e-dropdown-btn` | To customize the button part in splitbutton

| `.e-split-btn` | To customize the dropdown part in split button

| `.e-dropdown-popup ul .e-item` | To customize the progress button list items

| `.e-dropdown-popup ul .e-item .e-menu-icon` | To customize the progress button list items icon

#### How To

##### Create right to left splitbutton in React Split button component

SplitButton component has RTL support. This can be achieved by setting `enableRtl` as `true`.

The following example illustrates how to enable right-to-left support in SplitButton component.

### **APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items = [
        {
            text: 'Autosum'
        },
        {
            text: 'Average'
        },
        {
            text: 'Count numbers'
        },
        {
            text: 'Min'
        },
        {
            text: 'Max'
        }
    ];
    return (<div>
        <SplitButtonComponent items={items} enableRtl={true} iconCss='e-sb e-sigma'>Autosum</SplitButtonComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

### **APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { ItemModel, SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items: ItemModel[] = [
        {
            text: 'Autosum'
        },
        {
            text: 'Average'
        },
        {
            text: 'Count numbers'
        },
        {

```

```

        text: 'Min'
      },
      {
        text: 'Max'
      }
    ];
    return (
      <div>
        <SplitButtonComponent items = {items} enableRtl = {true} iconCss= 'e-sb
e-sigma'>Autosum</SplitButtonComponent>
      </div>
    );
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### Group items in popup in React Split button component

Items in popup can be grouped in SplitButton by templating entire popup with ListView. To achieve grouping in ListView, check [ListView grouping](#) documentation. To template ListView in popup, create ListView with id `listview` and provide it as `target` for SplitButton.

The following example illustrates how to group items in popup using ListView component.

#### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { ListViewComponent } from '@syncfusion/ej2-react-lists';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  // Datasource for listview.
  let listItems = [
    {
      'category': 'Basic',
      'text': 'Cut'
    },
    {
      'category': 'Basic',
      'text': 'Copy',
    },
    {
      'category': 'Basic',
      'text': 'Paste'
    },
    {
      'category': 'Advanced',
      'text': 'Paste as Formula'
    },
    {
      'category': 'Advanced',
      'text': 'Paste as Hyperlink'
    },
  ];
  let field = { groupBy: 'category' };

```

```

    return (<div>
      <ListViewComponent id="listview" dataSource={listItems}
fields={field} sortOrder="Descending"/>
      <SplitButtonComponent
target="#listview">ClipBoard</SplitButtonComponent>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('button'));

```

### APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { ListViewComponent } from '@syncfusion/ej2-react-lists';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  // Datasource for listview.
  let listItems: Array<{ [key: string]: string; }> = [
    {
      'category': 'Basic',
      'text': 'Cut'
    },
    {
      'category': 'Basic',
      'text': 'Copy',
    },
    {
      'category': 'Basic',
      'text': 'Paste'
    },
    {
      'category': 'Advanced',
      'text': 'Paste as Formula'
    },
    {
      'category': 'Advanced',
      'text': 'Paste as Hyperlink'
    },
  ];
  let field: any = { groupBy: 'category' };
  return (
    <div>
      <ListViewComponent id="listview" dataSource={listItems}
fields={field} sortOrder="Descending"/>
      <SplitButtonComponent
target="#listview">ClipBoard</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### Open a dialog on popup item click in React Split button component

This section explains about how to open a dialog on SplitButton popup item click. This can be achieved by handling dialog open in [select](#) event of the SplitButton.

In the following example, Dialog will open while selecting **Update...** item.

#### APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { DialogComponent } from '@syncfusion/ej2-react-popups';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let dialogRef;
  let items = [
    {
      text: 'Help'
    },
    {
      text: 'About'
    },
    {
      text: 'Update...'
    }
  ];
  let alertDlgButtons = [{
    buttonModel: {
      content: 'Ok',
      isPrimary: true
    },
    'click': () => {
      hide();
    }
  },
  {
    buttonModel: {
      content: 'Cancel',
      isPrimary: true
    },
    'click': () => {
      hide();
    }
  }
  ];
  function hide() {
    dialogRef.hide();
  }
  function select(args) {
    if (args.item.text === 'Update...') {
      dialogRef.show();
    }
  }
  return (<div>
```

```

    <DialogComponent ref={dialog => dialogRef = dialog} width='250px'
    id='dialog' content='Are you sure want to update?' header='Software Update'
    buttons={alertDlgButtons} visible={false}/>
    <SplitButtonComponent items={items}
    select={select}>Help</SplitButtonComponent>
  </div>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { DialogComponent } from '@syncfusion/ej2-react-popups';
import { ItemModel, MenuEventArgs, SplitButtonComponent } from
 '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let dialogRef: DialogComponent;
  let items: ItemModel[] = [
    {
      text: 'Help'
    },
    {
      text: 'About'
    },
    {
      text: 'Update...'
    }
  ];
  let alertDlgButtons: any [] = [{
    buttonModel: {
      content: 'Ok',
      isPrimary: true
    },
    'click': () => {
      hide();
    }
  },
  {
    buttonModel: {
      content: 'Cancel',
      isPrimary: true
    },
    'click': () => {
      hide();
    }
  }
  ];
  function hide() {
    dialogRef.hide();
  }
  function select (args: MenuEventArgs) {
    if (args.item.text === 'Update...') {
      dialogRef.show();
    }
  }
}

```

```

    }
  }
  return (
    <div>
      <DialogComponent ref={dialog => dialogRef = dialog as
DialogComponent} width='250px' id='dialog' content='Are you sure want to
update?' header='Software Update' buttons={alertDlgButtons}
visible={false}/>
      <SplitButtonComponent items = {items}
select={select}>Help</SplitButtonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### Set the disabled state in React Split button component

SplitButton component can be enabled or disabled using [disabled](#) property. To disable SplitButton component, set the disabled property as true.

The following example illustrates how to set the disable state in SplitButton component.

#### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
  let items = [
    {
      text: 'Autosum'
    },
    {
      text: 'Average'
    },
    {
      text: 'Count numbers',
    },
    {
      text: 'Min'
    },
    {
      text: 'Max'
    }
  ];
  return (<div>
    <SplitButtonComponent items={items} disabled={true} iconCss='e-sb e-
sigma'>Autosum</SplitButtonComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

**APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent, ItemModel } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items: ItemModel[] = [
        {
            text: 'Autosum'
        },
        {
            text: 'Average'
        },
        {
            text: 'Count numbers',
        },
        {
            text: 'Min'
        },
        {
            text: 'Max'
        }
    ];
    return (
        <div>
            <SplitButtonComponent items = {items} disabled = {true} iconCss= 'e-sb
e-sigma'>Autosum</SplitButtonComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

Underline a character in a text in React Split button component

Underline a particular character in a text can be handled in [beforeItemRender](#) event by adding `<u>` tag in between the text and given as innerHTML in `li` rendering.

In the following example, **C** is underlined in the text **Copy**.

**APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items = [
        {
            text: 'Cut'
        },
        {
            text: 'Copy'
        },
        {
            text: 'Paste'
        }
    ];
    return (
        <div>
            <SplitButtonComponent items = {items} disabled = {true} iconCss= 'e-sb
e-sigma'>Autosum</SplitButtonComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));
```

```

        text: 'Copy'
    },
    {
        text: 'Paste'
    }
];
function itemRender(args) {
    if (args.item.text === 'Copy') {
        // To underline a particular text.
        args.element.innerHTML = '<u>C</u>opy';
    }
    return (<div>
        <SplitButtonComponent items={items}
beforeItemRender={itemRender}>Paste</SplitButtonComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

### APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { SplitButtonComponent, ItemModel, MenuEventArgs } from
 '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render SplitButton.
function App() {
    let items: ItemModel[] = [
        {
            text: 'Cut'
        },
        {
            text: 'Copy'
        },
        {
            text: 'Paste'
        }
    ];
    function itemRender(args: MenuEventArgs) {
        if (args.item.text === 'Copy') {
            // To underline a particular text.
            args.element.innerHTML = '<u>C</u>opy';
        }
    }
    return (
        <div>
            <SplitButtonComponent items = {items}
beforeItemRender={itemRender}>Paste</SplitButtonComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('button'));

```

## Ej1 api migration in React Split button component

This article describes the API migration process of SplitButton component from Essential JS 1 to Essential JS 2.

### Properties

{% raw %}

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Specifies the text of the splitbutton | **Property:** *text* <br/><br/> <EJ.SplitButton id="splitbutton" text="login"></EJ.SplitButton> | **Property:** *content* <br/><br/> <SplitButtonComponent id="splitbutton" content="Paste"></SplitButtonComponent> |

| Popup content | **Property:** *target* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target"></EJ.SplitButton> | **Property:** *target* <br/><br/> <SplitButtonComponent id="splitbutton" target="#target" content="SplitButton" ></SplitButtonComponent> |

| Popup items | Not applicable | **Property:** *items* <br/><br/> <SplitButtonComponent id="splitbutton" content="Paste" items={this.items}></SplitButtonComponent> <br/> constructor(props: {}) { <br/> &#160; this.items = [ <br/> &#160; { <br/> &#160; &#160; text: 'Cut' <br/> &#160; }, <br/> &#160; { <br/> &#160; &#160; text: 'Copy' <br/> &#160; }, <br/> &#160; { <br/> &#160; &#160; text: 'Paste' <br/> &#160; }]; <br/> } |

| Arrow position | **Property:** *arrowPosition* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" target="#target" arrowPosition="left"></EJ.SplitButton> | Not applicable |

| Button mode | **Property:** *buttonMode* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" target="#target" buttonMode="dropdown"></EJ.SplitButton> | Not applicable |

| Content type | **Property:** *contentType* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" contentType="textonly" target="#target"></EJ.SplitButton> | Not applicable |

| Icons | **Property:** *prefixIcon* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" contentType="textandimage" prefixIcon="e-icon e-handup" target="#target"></EJ.SplitButton> | **Property:** *iconCss* <br/><br/> <SplitButtonComponent id="splitbutton" content="Paste" items={this.items} iconCss="e-icons e-paste"></SplitButtonComponent> |

| Icon position | **Property:** *imagePosition* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" contentType="textandimage" prefixIcon="e-icon e-handup" target="#target" imagePosition="imagetop"></EJ.SplitButton> | **Property:** *iconPosition* <br/><br/> <SplitButtonComponent id="splitbutton" content="Paste" items={this.items} iconCss="e-icons e-paste" iconPosition="Top"></SplitButtonComponent> |

| Secondary icon | **Property:** *suffixIcon* <br/><br/> <EJ.SplitButton id="splitbutton" text="login" contentType="imagetextimage" prefixIcon="e-icon e-handup" suffixIcon="e-icon e-palette" target="#target"></EJ.SplitButton> | Not applicable |

| Adding custom class | **Property:** *cssClass* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" cssClass="custom-class"></EJ.SplitButton> | **Property:**

```
cssClass <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items}
cssClass="custom-class"></SplitButtonComponent> |
```

```
| Disabled state | Property: enabled <br/><br/> <EJ.SplitButton id="splitbutton" text="login"
target="#target" enabled={false}></EJ.SplitButton> | Property: disabled <br/><br/>
<SplitButtonComponent id="splitbutton" items={this.items}
disabled={true}></SplitButtonComponent> |
```

```
| RTL | Property: enableRTL <br/><br/> <EJ.SplitButton id="splitbutton" text="login"
target="#target" contentType="textandimage" prefixIcon="e-icon e-handup"
enableRTL={true}></EJ.SplitButton> | Property: enableRtl <br/><br/> <SplitButtonComponent
id="splitbutton" items={this.items} content="Paste" enableRtl={true} iconCss="e-icons e-
paste"></SplitButtonComponent> |
```

```
| Height | Property: height <br/><br/> <EJ.SplitButton id="splitbutton" text="login"
target="#target" height="30"></EJ.SplitButton> | Not applicable |
```

```
| Width | Property: width <br/><br/> <EJ.SplitButton id="splitbutton" text="login"
target="#target" width="100"></EJ.SplitButton> | Not applicable |
```

```
| HTML attributes | Property: htmlAttributes <br/><br/> var attributes = { disabled:"disabled" }; <br/>
<EJ.SplitButton id="splitbutton" text="login" target="#target"
htmlAttributes="attributes"></EJ.SplitButton> | Not applicable |
```

```
| Show rounded corner | Property: showRoundedCorner <br/><br/> <EJ.SplitButton id="splitbutton"
text="login" target="#target" showRoundedCorner={true}></EJ.SplitButton> | Not applicable |
```

```
| Size | Property: size <br/><br/> <EJ.SplitButton id="splitbutton" size="small" text="Small"
target="#target"></EJ.SplitButton> | Property: cssClass <br/><br/> <SplitButtonComponent
id="splitbutton" items={this.items} content="Small" cssClass="e-
small"></SplitButtonComponent> |
```

## Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

```
| Destroy method | Method: destroy <br/><br/> <EJ.SplitButton id="splitbutton"
text="SplitButton" target="#target"></EJ.SplitButton><br/>var splitButton =
$('#splitbutton').ejSplitButton('instance');<br/> splitButton.destroy(); | Method: destroy <br/><br/>
<SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" ref={{scope}}
=> {this.splitButton = scope}></SplitButtonComponent><br/> constructor(props: {}) { <br/> &#160;
this.splitButton.destroy(); <br/> } |
```

```
| Disable method | Method: disable <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton"
target="#target"></EJ.SplitButton><br/>var splitButton =
$('#splitbutton').ejSplitButton('instance');<br/> splitButton.disable(); | Not applicable |
```

```
| Enable method | Method: enable <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton"
target="#target"></EJ.SplitButton><br/>var splitButton =
$('#splitbutton').ejSplitButton('instance');<br/> splitButton.enable(); | Not applicable |
```

| Hide popup | **Method:** *hide* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target"></EJ.SplitButton><br/>var splitButton = \$('#splitbutton').ejSplitButton('instance');<br/> splitButton.hide(); | **Method:** *toggle* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" ref={{scope}}>=> {this.splitButton = scope}></SplitButtonComponent><br/> constructor(props: {}) { <br/> &#160; this.splitButton.toggle(); <br/> } |

| Show popup | **Method:** *show* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target"></EJ.SplitButton><br/>var splitButton = \$('#splitbutton').ejSplitButton('instance');<br/> splitButton.show(); | **Method:** *toggle* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" ref={{scope}}>=> {this.splitButton = scope}></SplitButtonComponent><br/> constructor(props: {}) { <br/> &#160; this.splitButton.toggle(); <br/> } |

## Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| BeforeOpen event | **Event:** *beforeOpen* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" beforeOpen={beforeOpen}></EJ.SplitButton><br/>function beforeOpen(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *beforeOpen* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" beforeOpen={this.beforeOpen.bind(this)}></SplitButtonComponent><br/> beforeOpen(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| Click event | **Event:** *click* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" click={click}></EJ.SplitButton> <br/>function click(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *click* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" click={this.click.bind(this)}></SplitButtonComponent><br/> click(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| Close event | **Event:** *close* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" close={close}></EJ.SplitButton> <br/>function close(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *close* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" close={this.close.bind(this)}></SplitButtonComponent><br/> close(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| Create event | **Event:** *create* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" create={create}></EJ.SplitButton> <br/>function create(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *created* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" created={this.created.bind(this)}></SplitButtonComponent><br/> created() {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| Destroy event | **Event:** *destroy* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" destroy={destroy}></EJ.SplitButton> <br/>function destroy(args) {<br/> &#160;&#160;&#160;&#160; / code block \*/ <br/>} | Not applicable |

| ItemMouseOut event | **Event:** *itemMouseOut* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" itemMouseOut={itemMouseOut}></EJ.SplitButton>  
<br/>function itemMouseOut(args) {<br/> &#160;&#160;&#160;&#160; / code block \*/ <br/>} | Not applicable |

| ItemMouseOver event | **Event:** *itemMouseOver* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" itemMouseOver={itemMouseOver}></EJ.SplitButton>  
<br/>function itemMouseOver(args) {<br/> &#160;&#160;&#160;&#160; / code block \*/ <br/>} | Not applicable |

| Item select event | **Event:** *itemSelected* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" itemSelected={itemSelected}></EJ.SplitButton>  
<br/>function itemSelected(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *select* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" select={this.select.bind(this)}></SplitButtonComponent> <br/> select(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| Open event | **Event:** *open* <br/><br/> <EJ.SplitButton id="splitbutton" text="SplitButton" target="#target" open={open}></EJ.SplitButton> <br/>function open(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} | **Event:** *open* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" open={this.open.bind(this)}></SplitButtonComponent> <br/>function open(args) {<br/> &#160;&#160;&#160;&#160; / code block / <br/>} |

| BeforeClose event | Not applicable | **Event:** *beforeClose* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" beforeClose={this.beforeClose.bind(this)}></SplitButtonComponent> <br/> beforeClose(args) {<br/> &#160;&#160;&#160;&#160; / code block \*/ <br/>} |

| BeforeItemRender event | Not applicable | **Event:** *beforeItemRender* <br/><br/> <SplitButtonComponent id="splitbutton" items={this.items} content="SplitButton" beforeItemRender={this.beforeItemRender.bind(this)}></SplitButtonComponent> <br/> beforeItemRender(args) {<br/> &#160;&#160;&#160;&#160; / code block \*/ <br/>} |

{% endraw %}

## Splitter

### Getting Started

The following section explains the steps required to build the Splitter component with step-by-step procedure.

### Dependencies

The following list of dependencies required to use the Splitter component in your application:

```
`js
|-- @syncfusion/ej2-layouts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-react-layouts
```

```
|-- @syncfusion/ej2-react-base  
,
```

### Installation and configuration

You can use [Create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash  
npm install -g create-react-app  
,
```

Start a new project using create-react-app command as follows

```
<div class='tsx'>  
,
```

```
create-react-app quickstart --scripts-version=react-scripts-ts  
cd quickstart  
,
```

```
</div>  
<div class='jsx'>  
,
```

```
create-react-app quickstart  
cd quickstart  
,
```

```
</div>
```

Install the below required dependency package in order to use the `Splitter` component in your application.

```
npm install @syncfusion/ej2-react-layouts --save  
,
```

- The Splitter CSS files are available in the `ej2-layouts` package folder.

This can be referred in your application using the following code.

```
[src/App.css]
```

```
`css  
@import '../..../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../..../node_modules/@syncfusion/ej2-layouts/styles/material.css';  
,
```

### Adding Splitter to the project

The Splitter can be initialized through `<SplitterComponent>` tag-directive with `<PanelsDirective>` and `<PaneDirective>` as child elements respectively.

Please refer the below code snippet,

```
`ts
import { PaneDirective, PanelsDirective, SplitterComponent } from '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public render() {
    return (
      <div className="App">
        <SplitterComponent id="splitter" height="250px" width="600px">
          <PanelsDirective>
            <PaneDirective/>
            <PaneDirective/>
            <PaneDirective/>
          </PanelsDirective>
        </SplitterComponent>
      </div>
    );
  }
}
export default App;
`
```

After completing the configurations to render the Splitter, use the following command to display the output in your default browser.

```
npm start
```

Output will be as follows:

### **APP.JSX**

```
import { PaneDirective, PanelsDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
```

```

    return (<div className="App">
      <SplitterComponent id="splitter" height="250px" width="600px">
        <PanelsDirective>
          <PanelDirective />
          <PanelDirective />
          <PanelDirective />
        </PanelsDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

### APP.TSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public render() {
    return (
      <div className="App">
        <SplitterComponent id="splitter" height="250px" width="600px">
          <PanelsDirective>
            <PanelDirective/>
            <PanelDirective/>
            <PanelDirective/>
          </PanelsDirective>
        </SplitterComponent>
      </div>
    );
  }
}
export default App;

```

### Orientation

Splitter supports both **Horizontal** and **Vertical** orientation for the panes. By default, it will be rendered in **Horizontal** orientation. You can change it by using [orientation](#) property.

### APP.JSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
    return (<div className="App">
      <SplitterComponent id="splitter-vertical" height="250px"
width="50%" orientation={ 'Vertical' }>
        <PanelsDirective>
          <PanelDirective />
          <PanelDirective />
        </PanelsDirective>
      </SplitterComponent>
    </div>);
  }
}

```

```

    }
  }
  export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public render() {
    return (<div className="App">
      <SplitterComponent id="splitter-vertical" height="250px"
width="50%" orientation = {'Vertical'}>
        <PanesDirective>
          <PaneDirective/>
          <PaneDirective/>
        </PanesDirective>
      </SplitterComponent>
    </div>
    );
  }
}
export default App;

```

### Load content to the pane

You can load the pane contents in either HTML element or string types using [content](#) property.

For detailed information, refer to the [Pane Content](#) section

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  firstPane() {
    return (<div>
      <div className="content">
        <h3 className="h3">HTML</h3>
        <div className="code-preview">
          &#60;<span>!DOCTYPE html&#62;</span></div>
          <div>&#60;<span>html&#62;</span></div>
          <div>&#60;<span>body&#62;</span></div>
          &#60;<span>div</span> id="custom-image"&#62;
          <div>&#60;<span>img</span> src="src/albert.png"&#62;</div>
          <div>&#60;<span>div</span>&#62;</div>
          <div>&#60;<span>/body&#62;</span></div>
          <div>&#60;<span>/html&#62;</span></div>
        </div>
      </div>
    </div>);
  }
  secondPane() {
    const openBrace = '{';
    const closeBrace = '}';

```

```

        return (<div>
<div className="content">
  <h3 className="h3">CSS</h3>
  <div className="code-preview">
    <span>img {openBrace} </span>
    <div id="code-text">margin:<span>0 auto;</span></div>
    <div id="code-text">display:<span>flex;</span></div>
    <div id="code-text">height:<span>70px;</span></div>
    <span>{closeBrace}</span>
  </div>
</div>
</div>);
}
thirdPane() {
  const openBrace = '{';
  const closeBrace = '}';
  return (<div>
<div className="content">
  <h3 className="h3">JavaScript</h3>
  <div className="code-preview">
    <span>var</span> image = document.getElementById("custom-image");
    <div>image.addEventListener("click", function() {openBrace}</div>
      <div> // Code block for click action</div>
      // Code block for click action</div>
    <span> {closeBrace}) </span>
  </div>
</div>
</div>);
}
render() {
  return (<div className="App">
<SplitterComponent id="splitter" height="250px" width="550px">
<PanelsDirective>
<PanelDirective content={this.firstPane}/>
<PanelDirective content={this.secondPane}/>
<PanelDirective content={this.thirdPane}/>
</PanelsDirective>
</SplitterComponent>
</div>);
}
}
export default App;

```

## APP.TSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public firstPane() {
    return (
      <div>
        <div className="content">
          <h3 className="h3">HTML</h3>
          <div className="code-preview">
            &#60;<span>!DOCTYPE html&#62;</span>

```

```

        <div>&#60;<span>html&#62;</span></div>
        <div>&#60;<span>body&#62;</span></div>
        &#60;<span>div</span> id="custom-image"&#62;
        <div>&#60;<span>img</span> src="src/albert.png"&#62;</div>
        <div>&#60;<span>div</span>&#62;</div>
        <div>&#60;<span>/body&#62;</span></div>
        <div>&#60;<span>/html&#62;</span></div>
    </div>
</div>
</div>
);
}
public secondPane() {
    const openBrace: string = '{';
    const closeBrace: string = '}';
    return (
        <div>
        <div className="content">
            <h3 className="h3">CSS</h3>
            <div className="code-preview">
                <span>img {openBrace} </span>
                <div id="code-text">margin:<span>0 auto;</span></div>
                <div id="code-text">display:<span>flex;</span></div>
                <div id="code-text">height:<span>70px;</span></div>
                <span>{closeBrace}</span>
            </div>
        </div>
        </div>
    );
}
public thirdPane() {
    const openBrace: string = '{';
    const closeBrace: string = '}';
    return (
        <div>
        <div className="content">
            <h3 className="h3">JavaScript</h3>
            <div className="code-preview">
                <span>var</span> image = document.getElementById("custom-image");
                <div>image.addEventListener("click", function() { openBrace }</div>
                <div>// Code block for click action</div>
                <span> {closeBrace }</span>
            </div>
        </div>
        </div>
    );
}
}
public render() {

        <SplitterComponent id="splitter" height="250px" width="550px">
        <PanelsDirective>
        <PanelDirective content = {this.firstPane}/>
        <PanelDirective content = {this.secondPane}/>
        <PanelDirective content = {this.thirdPane}/>
        </PanelsDirective>
        </SplitterComponent>
    </div>);
}

```

```
}  
}  
export default App;
```

### See Also

- [Construct different layouts using Splitter](#)

### Getting Started

The following section explains the steps required to build the Splitter component with step-by-step procedure.

### Dependencies

The following list of dependencies required to use the Splitter component in your application:

```
`js  
|-- @syncfusion/ej2-layouts  
|-- @syncfusion/ej2-base  
|-- @syncfusion/ej2-react-layouts  
|-- @syncfusion/ej2-react-base  
,
```

### Installation and configuration

You can use [Create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
,  
  
npm install -g create-react-app  
,
```

Start a new project using create-react-app command as follows

```
<div class='tsx'>  
,  
  
create-react-app quickstart --scripts-version=react-scripts-ts  
cd quickstart  
,  
  
</div>  
<div class='jsx'>  
,  
  
create-react-app quickstart  
cd quickstart
```

```
`
```

```
</div>
```

Install the below required dependency package in order to use the `Splitter` component in your application.

```
`bash
```

```
npm install @syncfusion/ej2-react-layouts --save
```

```
`
```

- The Splitter CSS files are available in the `ej2-layouts` package folder.

This can be referred in your application using the following code.

```
[src/App.css]
```

```
`css
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
```

```
`
```

### [Adding Splitter to the project](#)

The Splitter can be initialized through `<SplitterComponent>` tag-directive with `<PanesDirective>` and `<PaneDirective>` as child elements respectively.

Please refer the below code snippet,

```
`ts
```

```
import { PaneDirective, PanesDirective, SplitterComponent } from '@syncfusion/ej2-react-layouts';
```

```
import * as React from "react";
```

```
function App() {
```

```
  return (
```

```
    <div className="App">
```

```
      <SplitterComponent id="splitter" height="250px" width="600px">
```

```
        <PanesDirective>
```

```
          <PaneDirective/>
```

```
          <PaneDirective/>
```

```
          <PaneDirective/>
```

```
        </PanesDirective>
```

```
      </SplitterComponent>
```

```
    </div>
```

```
  );
```

```
}  
export default App;  
`
```

After completing the configurations to render the Splitter, use the following command to display the output in your default browser.

```
`  
npm start  
`
```

Output will be as follows:

#### **APP.JSX**

```
import { PaneDirective, PanesDirective, SplitterComponent } from  
'@syncfusion/ej2-react-layouts';  
import * as React from "react";  
function App() {  
    return (<div className="App">  
        <SplitterComponent id="splitter" height="250px" width="600px">  
            <PanesDirective>  
                <PaneDirective />  
                <PaneDirective />  
                <PaneDirective />  
            </PanesDirective>  
        </SplitterComponent>  
    </div>);  
}  
export default App;
```

#### **APP.TSX**

```
import { PaneDirective, PanesDirective, SplitterComponent } from  
'@syncfusion/ej2-react-layouts';  
import * as React from "react";  
function App() {  
    return (  
        <div className="App">  
            <SplitterComponent id="splitter" height="250px" width="600px">  
                <PanesDirective>  
                    <PaneDirective/>  
                    <PaneDirective/>  
                    <PaneDirective/>  
                </PanesDirective>  
            </SplitterComponent>  
        </div>  
    );  
}  
export default App;
```

### Orientation

Splitter supports both **Horizontal** and **Vertical** orientation for the panes. By default, it will be rendered in **Horizontal** orientation. You can change it by using [orientation](#) property.

#### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
    return (<div className="App">
        <SplitterComponent id="splitter-vertical" height="250px" width="50%"
orientation={ 'Vertical' }>
            <PanesDirective>
                <PaneDirective />
                <PaneDirective />
            </PanesDirective>
        </SplitterComponent>
    </div>);
}
export default App;
```

#### APP.TSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
    return (
        <div className="App">
            <SplitterComponent id="splitter-vertical" height="250px" width="50%"
orientation = { 'Vertical' }>
                <PanesDirective>
                    <PaneDirective/>
                    <PaneDirective/>
                </PanesDirective>
            </SplitterComponent>
        </div>
    );
}
export default App;
```

### Load content to the pane

You can load the pane contents in either HTML element or string types using [content](#) property.

For detailed information, refer to the [Pane Content](#) section

#### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
import { useState } from 'react';
function App() {
    const firstPaneContent = `<div>
        <div className="content">
```

```

    <h3 className="h3">HTML</h3>
    <div className="code-preview">
      &#60;<span>!DOCTYPE html&#62;</span>
      <div>&#60;<span>html&#62;</span></div>
      <div>&#60;<span>body&#62;</span></div>
      &#60;<span>div</span> id="custom-image"&#62;
      <div>&#60;<span>img</span> src="src/albert.png"&#62;</div>
      <div>&#60;<span>div</span>&#62;</div>
      <div>&#60;<span>/body&#62;</span></div>
      <div>&#60;<span>/html&#62;</span></div>
    </div>
  </div>
  </div>`;
  const secondPaneContent = `<div>
    <div className="content">
      <h3 className="h3">CSS</h3>
      <div className="code-preview">
        <span>img { </span>
        <div id="code-text">margin:<span>0 auto;</span></div>
        <div id="code-text">display:<span>flex;</span></div>
        <div id="code-text">height:<span>70px;</span></div>
        <span> }</span>
      </div>
    </div>
  </div>`;
  const thirdPaneContent = `<div>
    <div className="content">
      <h3 className="h3">JavaScript</h3>
      <div className="code-preview">
        <span>var</span> image = document.getElementById("custom-image");
        <div>image.addEventListener("click", function() { </div>
          <div>// Code block for click action</div>
        <span> }); </span>
      </div>
    </div>
  </div>`;
  const [panelContent] = useState(firstPaneContent);
  const [pane2Content] = useState(secondPaneContent);
  const [pane3Content] = useState(thirdPaneContent);
  return (<div className="App">
    <SplitterComponent id="splitter" height="250px" width="550px">
      <PanelsDirective>
        <PaneDirective content={panelContent}/>
        <PaneDirective content={pane2Content}/>
        <PaneDirective content={pane3Content}/>
      </PanelsDirective>
    </SplitterComponent>
  </div>);
}
export default App;

```

## APP.TSX

```

import { PaneDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";

```

```

import { useState } from 'react';
function App() {
  const firstPaneContent = `<div>
    <div className="content">
      <h3 className="h3">HTML</h3>
      <div className="code-preview">
        &#60;<span>!DOCTYPE html&#62;</span>
        <div>&#60;<span>html&#62;</span></div>
        <div>&#60;<span>body&#62;</span></div>
        &#60;<span>div</span> id="custom-image"&#62;
        <div>&#60;<span>img</span> src="src/albert.png"&#62;</div>
        <div>&#60;<span>div</span>&#62;</div>
        <div>&#60;<span>/body&#62;</span></div>
        <div>&#60;<span>/html&#62;</span></div>
      </div>
    </div>
  </div>`;
  const secondPaneContent = `<div>
    <div className="content">
      <h3 className="h3">CSS</h3>
      <div className="code-preview">
        <span>img { </span>
        <div id="code-text">margin:<span>0 auto;</span></div>
        <div id="code-text">display:<span>flex;</span></div>
        <div id="code-text">height:<span>70px;</span></div>
        <span> }</span>
      </div>
    </div>
  </div>`;
  const thirdPaneContent = `<div>
    <div className="content">
      <h3 className="h3">JavaScript</h3>
      <div className="code-preview">
        <span>var</span> image = document.getElementById("custom-image");
        <div>image.addEventListener("click", function() { </div>

## Split panes in React Splitter component

This section explain about split panes behaviors.

### Horizontal layout

By default, splitter will render in horizontal orientation. Splitter container will be split as panes in horizontal flow direction with vertical separator.

[Class-component]

#### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  leftContent() {
    return (<div>
      <div className="content">
        <h3>Grid </h3>
        The ASP.NET DataGrid control, or DataTable is a feature-rich
        control used to display data in a tabular format.
      </div>
    </div>);
  }
  middleContent() {
    return (<div>
      <div className="content">
        <h3>Schedule </h3>
        The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost
        all calendar features, thus allowing users to manage their time efficiently.
      </div>
    </div>);
  }
  rightContent() {
    return (<div>
      <div className="content">
        <h3>Chart </h3>
        ASP.NET charts, a well-crafted easy-to-use charting package, is
        used to add beautiful charts in web and mobile applications.
      </div>
    </div>);
  }
  render() {
    return (<div className="App">
      <SplitterComponent id="horizontal" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content={this.leftContent}/>
          <PaneDirective size='200px' content={this.middleContent}/>
          <PaneDirective size='200px' content={this.rightContent}/>
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
```

```

        </SplitterComponent>
    </div>);
    }
}
export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
    public leftContent(): JSX.Element {
        return (
            <div>
                <div className="content">
                    <h3>Grid </h3>
                    The ASP.NET DataGrid control, or DataTable is a feature-rich
                    control used to display data in a tabular format.
                </div>
            </div>
        );
    }
    public middleContent(): JSX.Element {
        return (
            <div>
                <div className="content">
                    <h3>Schedule </h3>
                    The ASP.NET Scheduler, a.k.a. event calendar, facilitates almost
                    all calendar features, thus allowing users to manage their time efficiently.
                </div>
            </div>
        );
    }
    public rightContent(): JSX.Element {
        return (
            <div>
                <div className="content">
                    <h3>Chart </h3>
                    ASP.NET charts, a well-crafted easy-to-use charting package, is
                    used to add beautiful charts in web and mobile applications.
                </div>
            </div>
        );
    }
    public render() {
        return (<div className="App">
            <SplitterComponent id="horizontal" height="250px" width='600px'>
                <PanesDirective>
                    <PaneDirective size='200px' content = {this.leftContent}/>
                    <PaneDirective size='200px' content = {this.middleContent}/>
                    <PaneDirective size='200px' content = {this.rightContent}/>
                </PanesDirective>
            </SplitterComponent>
        </div>);
    }
}

```

```
}
export default App;
```

## [Functional-component]

### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
  function leftContent() {
    return (<div>
      <div className="content">
        <h3>Grid </h3>

### Separator

By default, pane separator will be render with **1px** width/height. You can customize the separator size by using [separatorSize](#) property.

For Horizontal orientation, it will be considered as separator width.

For Vertical orientation, it will be considered as separator height.

### [Class-component]

#### APP.JSX

```

### Nested Splitter

Splitter provides support to render the nested pane to achieve the complex layouts. You can use the same `<div>` element for splitter pane and nested splitter.

Also you can render the nested splitter using direct child of the splitter pane. For this, nested splitter should have `100%` width and height to match with the parent pane dimensions.

[Class-component]

### APP.JSX

```
{% raw %}
import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
    innerSplitterInstance;
    splitterInstance;
    leftPaneContent() {
        return (<div>
            <div className="content">
                <a href="https://www.syncfusion.com/ebooks/neuralnetworks"
target="_blank">Neural Networks Using C# Succinctly</a>
                <p>Neural networks are an exciting field of software
development used to calculate outputs from input data.
                While the idea seems simple enough, the implications of such
networks are staggering—think optical character recognition,
                speech recognition, and regression analysis. With Neural
Networks Using C# Succinctly by James McCaffrey, you'll learn
                how to create your own neural network to solve classification
problems, or problems where the outcomes can only be one of
                several values. <br /><br />Learn about encoding and
normalizing data, activation functions and how to choose the right one, and
ultimately
                how to train a neural network to find weights and bias values
that provide accurate predictions.
                An artificial neural network (sometimes abbreviated ANN, or
shortened to just "neural network" when the context is clear) is
                a software system that loosely models biological neurons and
synapses. Before explaining exactly how neural networks work, it is
                useful to understand what types of problems they can solve.
            </p>
            </div>
        </div>);

### Add or remove pane

You can add or remove panes programmatically to the splitter. By using [addPane](#) and [removePane](#) methods.

#### Add pane

You can add the panes dynamically in the splitter by passing [pane properties](#) along with index to the addPane method.

[Class-component]

### APP.JSX

```

{% raw %}
import { PanelDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {

```

```

splitterInstance;
paneDetails = {
  content: 'New Pane',
  max: '250px',
  min: '30px',
  size: '150px',
};
firstPane() {
  return (<div>
    <div className="content">Panel</div>
  </div>);
}
secondPane() {
  return (<div>
    <div className="content">Pane2</div>
  </div>);
}
btnClick() {
  if (this.splitterInstance.allPanels.length > 1) {
    this.splitterInstance.addPane(this.paneDetails, 1);
  }
}
render() {
  return (<div className="App">
    <SplitterComponent id="separator" height="200px" width='580px'
    ref={ (splitter) => { this.splitterInstance = splitter; } }>
    <PanelsDirective>
      <PaneDirective size='200px' content={this.firstPane}/>
      <PaneDirective size='200px' content={this.secondPane}/>
    </PanelsDirective>
    </SplitterComponent>
    <div id='addButton'>
      <button className='e-control e-btn' onClick={this.btnClick =
this.btnClick.bind(this)}>Add Pane</button>
    </div>
  </div>);
}
}
export default App;
{% endraw %}

## Expand collapse in React Splitter component

### Collapsible panes

The Splitter panes can be configured with built-in expand and collapse functionalities. By default, the collapsible behavior is disabled. Enable the [collapsible](#) behavior in the paneSettings property to show or hide the expand or collapse icons in the panes. You can dynamically expand and collapse the panes by the corresponding icons.

The following code shows how to enable collapsible behavior.

[Class-component]

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
    firstPaneContent() {
        return <div>
            <div className='content'>
                <h3>PARIS </h3>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the romanticism...
            </div>
        </div>;
    }
    ;
    secondPaneContent() {
        return <div>
            <div className='content'>
                <h3>CAMEMBERT </h3>The village in the Orne département of Normandy
where the famous French cheese is originated from. </div>
            </div>;
    }
    ;
    thirdPaneContent() {
        return <div>
            <div className='content'>

```

```

        <h3>GRENOBLE </h3>The capital city of the French Alps and a major
        scientific center surrounded by many ski resorts, host of the Winter
        Olympics in 1968.
    </div>
    </div>);

Control the expand and collapse action in programmatic manner

The Splitter provides an option to control the expand and collapse behavior programmatically by using the `expand` and `collapse` methods. Refer to the following code sample.

[Class-component]

#### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  splitterInstance;
  expandClick() {
    this.splitterInstance.expand(0);
  }
  collapseClick() {
    this.splitterInstance.collapse(0);
  }
  render() {
    return (<div className="App">
      <SplitterComponent id="expand-method" height="250px" width='600px'
        ref={splitter => this.splitterInstance = splitter}>
        <PanesDirective>
          <PaneDirective size='200px' content='Left pane' collapsible={true}/>
          <PaneDirective size='200px' content='Middle pane' collapsible={true}/>
          <PaneDirective size='200px' content='Right pane' collapsible={true}/>
        </PanesDirective>
      </SplitterComponent>
      <div id='btn-container'>
        <button className="e-control e-btn" onClick={this.expandClick =
          this.expandClick.bind(this)} id="expand"> Expand </button>
        <button className="e-control e-btn" onClick={this.collapseClick =
          this.collapseClick.bind(this)} id="collapse"> Collapse </button>
      </div>
    </div>);
  }
}
export default App;
```

#### APP.TSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public splitterInstance: SplitterComponent;
  public expandClick(): void {
    this.splitterInstance.expand(0);
  }
  public collapseClick(): void {
    this.splitterInstance.collapse(0);
  }
}
```

```

public render() {
  return (<div className="App">
    <SplitterComponent id="expand-method" height="250px" width='600px'
    ref={splitter => this.splitterInstance = splitter!}>
      <PanelsDirective>
        <PanelDirective size='200px' content = 'Left pane' collapsible={true}
        />
        <PanelDirective size='200px' content = 'Middle pane'
        collapsible={true}/>
        <PanelDirective size='200px' content = 'Right pane'
        collapsible={true}/>
      </PanelsDirective>
    </SplitterComponent>
    <div id='btn-container'>
      <button className="e-control e-btn"
      onClick={this.expandClick=this.expandClick.bind(this)} id="expand"> Expand
    </button>
      <button className="e-control e-btn"
      onClick={this.collapseClick=this.collapseClick.bind(this)} id="collapse">
      Collapse </button>
    </div>
  </div>);
}
}
export default App;

```

### [Functional-component]

#### APP.JSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
  let splitterInstance;
  function expandClick() {
    splitterInstance.expand(0);
  }
  function collapseClick() {
    splitterInstance.collapse(0);
  }
  return (<div className="App">
    <SplitterComponent id="expand-method" height="250px" width='600px'
    ref={splitter => splitterInstance = splitter}>
      <PanelsDirective>
        <PanelDirective size='200px' content='Left pane'
        collapsible={true}/>
        <PanelDirective size='200px' content='Middle pane'
        collapsible={true}/>
        <PanelDirective size='200px' content='Right pane'
        collapsible={true}/>
      </PanelsDirective>
    </SplitterComponent>
    <div id='btn-container'>
      <button className="e-control e-btn" onClick={expandClick =
      expandClick.bind(this)} id="expand"> Expand </button>

```

```

        <button className="e-control e-btn" onClick={collapseClick =
collapseClick.bind(this) } id="collapse"> Collapse </button>
      </div>
    </div>);
  }
  export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App () {
  let splitterInstance: SplitterComponent;
  function expandClick(): void {
    splitterInstance.expand(0);
  }
  function collapseClick(): void {
    splitterInstance.collapse(0);
  }
  return (
    <div className="App">
      <SplitterComponent id="expand-method" height="250px" width='600px'
ref={splitter =>splitterInstance = splitter!}>
        <PanesDirective>
          <PaneDirective size='200px' content = 'Left pane'
collapsible={true} />
          <PaneDirective size='200px' content = 'Middle pane'
collapsible={true} />
          <PaneDirective size='200px' content = 'Right pane'
collapsible={true} />
        </PanesDirective>
      </SplitterComponent>
      <div id='btn-container'>
        <button className="e-control e-btn"
onClick={expandClick=expandClick.bind(this) } id="expand"> Expand </button>
        <button className="e-control e-btn"
onClick={collapseClick=collapseClick.bind(this) } id="collapse"> Collapse
      </button>
      </div>
    </div>
  );
}
export default App;

```

### Specify initial state to panes

You can render specific panes with collapsed state on page load. Specify a Boolean value to the [collapsed](#) property to control this behavior. The following code explains how to collapse panes on rendering (the second panes renders with collapsed state).

#### [Class-component]

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  firstPaneContent() {
    return (<div>
      <div className='content'>
        <h3>PARIS </h3>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the romanticism...
      </div>
    </div>);
  }
;
  secondPaneContent() {
    return (<div>
      <div className='content'>
        <h3>CAMEMBERT </h3>The village in the Orne département of Normandy
where the famous French cheese is originated from. </div>
      </div>);
  }
;
  thirdPaneContent() {
    return (<div>
      <div className='content'>
        <h3>GRENOBLE </h3>The capital city of the French Alps and a major
scientific center surrounded by many ski resorts, host of the Winter
Olympics in 1968.
      </div>
    </div>);
  }
;
  render() {
    return (<div className="App">
      <SplitterComponent id="collapsed" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content={this.firstPaneContent}/>
          <PaneDirective size='200px' content={this.secondPaneContent}
collapsed={true}/>
          <PaneDirective size='200px' content={this.thirdPaneContent}/>
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public firstPaneContent(): JSX.Element {
    return (<div>
      <div className='content'>

```

```

    <h3>PARIS </h3>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the romanticism...
    </div>
    </div>);
};
public secondPaneContent(): JSX.Element {

- [Resizable split panes](#)

### Resize in React Splitter component

By default, resizing will be enable for split panes. Resizing gripper element will be add to the separator to makes the resize easy.

Horizontal splitter will allows to resize in horizontal directions.

Vertical splitter will allows to resize in vertical directions.

While resizing, previous and next panes will be adjust its dimensions automatically.

### Min and Max validation

Splitter allows you to set the minimum and maximum sizes for each pane. Resizing will not be occur over the minimum and maximum values.

### [Class-component]

```

```
}
export default App;
```

Refresh content on resizing

While resizing the panes, you can refresh the pane contents by using either [resizeStart](#), [resizing](#) or [resizeStop](#) events.

Customize the resize grip and cursor

You can customize the resize gripper icon and cursor in CSS level.

[Class-component]

### APP.JSX

## Pane content in React Splitter component

This section explains how to provide plain text content or HTML markup or integrate other React UI controls as content of splitter.

### Template

You can render the HTML element directly to the splitter pane content using [content](#) template property.

[Class-component]

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  firstPaneContent() {
    return (<div>
      <div className='content'>
        <h3>PARIS </h3>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the romanticism...
      </div>
    </div>);
  }
;
  secondPaneContent() {
    return (<div>
      <div className='content'>
        <h3>CAMEMBERT </h3>The village in the Orne département of Normandy
where the famous French cheese is originated from. </div>
      </div>);
  }
;
  thirdPaneContent() {
    return (<div>
      <div className='content'>
        <h3>GRENOBLE </h3>The capital city of the French Alps and a major
scientific center surrounded by many ski resorts, host of the Winter
Olympics in 1968.
      </div>
    </div>);
  }
;
  render() {
    return (<div className="App">
      <SplitterComponent id="collapsed" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content={this.firstPaneContent}/>
          <PaneDirective size='200px' content={this.secondPaneContent}/>
          <PaneDirective size='200px' content={this.thirdPaneContent}/>
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

        </SplitterComponent>
    </div>
    );
}
export default App;

```

## React UI components

You can render any React UI controls along with their native and control events within splitter as pane content.

You can refer [Accordion within splitter](#) and [Listview within splitter](#) samples.

## Plain content

You can add the plain text as a pane contents using either inner HTML or [content](#) API

## [Class-component]

### APP.JSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
    render() {
        return (<div className="App">
            <SplitterComponent id="plain" height="250px" width='600px'>
            <PanelsDirective>
                <PanelDirective size='200px' content='<div class="content"> Left pane
            </div>' />
                <PanelDirective size='200px' content='<div class="content"> Middle pane
            </div>' />
                <PanelDirective size='200px' content='<div class="content"> Right pane
            </div>' />
            </PanelsDirective>
            </SplitterComponent>
            </div>);
    }
}
export default App;

```

### APP.TSX

```

import { PanelDirective, PanelsDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
    public render() {
        return (<div className="App">
            <SplitterComponent id="plain" height="250px" width='600px'>
            <PanelsDirective>

```

```

    <PaneDirective size='200px' content = '<div class="content"> Left pane
</div>' />
    <PaneDirective size='200px' content = '<div class="content"> Middle pane
</div>' />
    <PaneDirective size='200px' content = '<div class="content"> Right pane
</div>' />
  </PanelsDirective>
</SplitterComponent>
</div>);
}
}
export default App;

```

### [Functional-component]

#### APP.JSX

```

import { PaneDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
  return (<div className="App">
    <SplitterComponent id="plain" height="250px" width='600px'>
      <PanelsDirective>
        <PaneDirective size='200px' content='<div class="content"> Left pane
</div>' />
        <PaneDirective size='200px' content='<div class="content"> Middle
pane </div>' />
        <PaneDirective size='200px' content='<div class="content"> Right
pane </div>' />
      </PanelsDirective>
    </SplitterComponent>
  </div>);
}
export default App;

```

#### APP.TSX

```

import { PaneDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
function App () {
  return (
    <div className="App">
      <SplitterComponent id="plain" height="250px" width='600px'>
        <PanelsDirective>
          <PaneDirective size='200px' content = '<div class="content"> Left
pane </div>' />
          <PaneDirective size='200px' content = '<div class="content"> Middle
pane </div>' />
          <PaneDirective size='200px' content = '<div class="content"> Right
pane </div>' />
        </PanelsDirective>
      </SplitterComponent>
    </div>
  );
}

```

```
}
export default App;
```

## HTML Markup

Splitter is a layout based container control. You can render the pane contents from existing HTML markup. Converting HTML markup as splitter pane is easy way to add the panes content dynamically.

## [Class-component]

### APP.JSX

```
import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
    return (<div className="App">
      <SplitterComponent id="plain" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content='<div class="content"><h3
class="h3">PARIS </h3>Paris, the city of lights and love - this short guide
is full of ideas for how to make the most of the romanticism...</div>'>

```

### Pane content using selector

You can set HTML element as pane [content](#) using the query selectors such as ID or CSS class selectors.

The following code demonstrates how to fetch an element from the document and load it to pane using its ID.

#### [Class-component]

##### APP.JSX

```

{% raw %}
import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
    return (<div className="App">
      { /* <!-- pane contents --> */ }
      <div id="left-pane-content" style={{ display: "none" }}>
        <div>Left pane<div id='panetext'>size: 25%</div>
        <div id='panetext'>min: 60px</div>
      </div>
      <div id="middle-pane-content" style={{ display: "none" }}>
        <span>Middle pane<div id="panetext">size: 50%</div>
        <div id="panetext">min: 60px</div>
      </span>
      </div>
      <div id="last-pane-content" style={{ display: "none" }}>
        <span>Right pane<div id="panetext">size: 25%</div>
        <div id="panetext">min: 60px</div>
      </span>
      </div>
      <SplitterComponent id="plain" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' min="60px" content='#left-pane-content' />
          <PaneDirective size='200px' min="60px" content='#middle-pane-
content' />
          <PaneDirective size='200px' min="60px" content='#last-pane-content' />
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;
{% endraw %}

```

## Pane sizing in React Splitter component

Splitter allows you to provide pane sizes either in pixel or percentage formats.

### Pane size in pixel

#### [Class-component]

##### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
    return (<div className="App">
      <SplitterComponent id="pixel_size" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content='Left pane' />
          <PaneDirective size='200px' content='Middle pane' />
          <PaneDirective size='200px' content='Right pane' />
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

##### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public render() {
    return (<div className="App">
      <SplitterComponent id="pixel_size" height="250px" width='600px'>
        <PanesDirective>
          <PaneDirective size='200px' content = 'Left pane' />
          <PaneDirective size='200px' content = 'Middle pane' />
          <PaneDirective size='200px' content = 'Right pane' />
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

#### [Functional-component]

**APP.JSX**

```
import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
    return (<div className="App">
        <SplitterComponent id="pixel_size" height="250px" width='600px'>
            <PanesDirective>
                <PaneDirective size='200px' content='Left pane' />
                <PaneDirective size='200px' content='Middle pane' />
                <PaneDirective size='200px' content='Right pane' />

import * as React from "react";
class App extends React.Component {
public render() {
    return (<div className="App">
        <SplitterComponent id="percentage" height="250px" width='600px'>
        <PanesDirective>
            <PaneDirective size='30%' content = 'Left pane' />
            <PaneDirective size='40%' content = 'Middle pane' />
            <PaneDirective size='30%' content = 'Right pane' />
        </PanesDirective>
        </SplitterComponent>
    </div>);
}
}
export default App;

```

### [Functional-component]

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
    return (<div className="App">
        <SplitterComponent id="percentage" height="250px" width='600px'>
        <PanesDirective>
            <PaneDirective size='30%' content='Left pane' />
            <PaneDirective size='40%' content='Middle pane' />
            <PaneDirective size='30%' content='Right pane' />
        </PanesDirective>
        </SplitterComponent>
    </div>);
}
export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";
function App () {
    return (
        <div className="App">
            <SplitterComponent id="percentage" height="250px" width='600px'>
            <PanesDirective>

```

```

        <PaneDirective size='30%' content = 'Left pane' />
        <PaneDirective size='40%' content = 'Middle pane' />
        <PaneDirective size='30%' content = 'Right pane' />
    </PanelsDirective>
</SplitterComponent>
</div>
);
}
export default App;

```

### Auto size panes

You can render the split panes without providing the size values. It will split up the sizes automatically.

### [Class-component]

#### APP.JSX

```

import { PaneDirective, PanelsDirective, SplitterComponent } from
'@syncfusion/ej2-react-layouts';
import * as React from "react";

## Different layouts in React Splitter component

By using splitter control, you can create the different layouts with multiple and nested panes.

### Code editor style layout

Create the element with two child to render the outer splitter and create the inner splitter from first pane of vertical splitter.

#### [Class-component]

```
`javascript
```

```
import { Splitter } from '@syncfusion/ej2-layouts';
```

```
import { PanelDirective, PanelsDirective, SplitterComponent } from '@syncfusion/ej2-react-layouts';
```

```
import * as React from "react";
```

```
class App extends React.Component {
```

```
    public splitterInstance: Splitter;
```

```
    public paneSize1 = "53%";
```

```
    public minimumSize1 = "30%";
```

```
    public content1 = `<div class="splitter-content">
```

```
<h3 class="h3">Preview of sample</h3>
```

```

<div class="splitter-image">
  
</div>
</div>`;

public onCreate(e: any): void {
  (this.splitterInstance as any).element.querySelector('.e-pane').setAttribute('id','splitter1');
  // Initialize Splitter component
  const splitterObj = new Splitter({
    height: '240px',
    paneSettings: [
      { content: `<div class="splitter-content">
        <h3 class="h3">HTML</h3>
        <div class="code-preview">
          <<span>!DOCTYPE html</span>
          <div><<span>html</span></div>
          <div><<span>body</span></div>
          <<span>div</span> id="custom-image">
            <div style="margin-left: 5px"><<span>img</span> src="src/albert.png"></div>
            <div><<span>div</span>></div>
            <div><<span>/body</span></div>
            <div><<span>/html</span></div>
          </div>
        </div>`,
        min: '23%', size: '29%' },
      { content: `<div class="splitter-content">
        <h3 class="h3">CSS</h3>
        <div class="code-preview">
          <span>img {</span>
            <div id="code-text">margin:<span>0 auto;</span></div>
            <div id="code-text">display:<span>flex;</span></div>
            <div id="code-text">height:<span>70px;</span></div>
            <span> }</span>

```

```

</div>
</div>`,min: '15%', size: '20%' },
{ content: `<div class="splitter-content">
<h3 class="h3">JavaScript</h3>
<div class="code-preview">
<span>var</span> image = document.getElementById("custom-image");
<div>image.addEventListener("click", function() {</div>
<div style="padding-left: 20px;"> // Code block for click action</div>
<span> }</span>
</div>
</div>`,
min: '35%', size: '35%' }
],
width: '100%'
});
splitterObj.appendTo('#splitter1');
}
public render(): JSX.Element {
return (
<div id="target" className="control-section code-editor" >
<SplitterComponent id="splitter2" height="400px" orientation="Vertical" ref={{(splitter) => {
this.splitterInstance = splitter! }} created={this.onCreate = this.onCreate.bind(this)}}>
<PanelsDirective>
<PanelDirective />
<PanelDirective size={this.paneSize1} min={this.minimumSize1} content={this.content1}/>
</PanelsDirective>
</SplitterComponent>
</div>
);
}
}
export default App;
`

```

**[Functional-component]**

```

`javascript
import { Splitter } from '@syncfusion/ej2-layouts';
import { PaneDirective, PanesDirective, SplitterComponent } from '@syncfusion/ej2-react-layouts';
import * as React from "react";

function App () {
  let splitterInstance: Splitter;
  let paneSize1 = "53%";
  let minimumSize1 = "30%";
  let content1 = `<div class="splitter-content">
<h3 class="h3">Preview of sample</h3>
<div class="splitter-image">

</div>
</div>`;
  function onCreate(e: any): void {
    (splitterInstance as any).element.querySelector('.e-pane').setAttribute('id','splitter1');
    // Initialize Splitter component
    const splitterObj = new Splitter({
      height: '240px',
      paneSettings: [
        { content:`<div class="splitter-content">
<h3 class="h3">HTML</h3>
<div class="code-preview">
<<span>!DOCTYPE html</span>
<div><<span>html</span></div>
<div><<span>body</span></div>
<<span>div</span> id="custom-image">
<div style="margin-left: 5px"><<span>img</span> src="src/albert.png"></div>
<div><<span>div</span></div>
<div><<span>/body</span></div>
<div><<span>/html</span></div>

```

```

</div>
</div>`,
min: '23%', size: '29%' },
{ content: `<div class="splitter-content">
<h3 class="h3">CSS</h3>
<div class="code-preview">
<span>img {</span>
<div id="code-text">margin:<span>0 auto;</span></div>
<div id="code-text">display:<span>flex;</span></div>
<div id="code-text">height:<span>70px;</span></div>
<span> }</span>
</div>
</div>`,min: '15%', size: '20%' },
{ content: `<div class="splitter-content">
<h3 class="h3">JavaScript</h3>
<div class="code-preview">
<span>var</span> image = document.getElementById("custom-image");
<div>image.addEventListener("click", function() {</div>
<div style="padding-left: 20px;">// Code block for click action</div>
<span> }</span>
</div>
</div>`,
min: '35%', size: '35%' }
],
width: '100%'
});
splitterObj.appendTo('#splitter1');
}
return (
<div id="target" className="control-section code-editor" >
<SplitterComponent id="splitter2" height="400px" orientation="Vertical" ref={{(splitter) => {
splitterInstance = splitter! }} created={onCreate = onCreate.bind(this)}>
<PanelsDirective>

```

```

<PaneDirective />
<PaneDirective size={paneSize1} min={minimumSize1} content={content1}/>
</PanelsDirective>
</SplitterComponent>
</div>
);
}
export default App;
`

```

Once the above configurations has been completed, you will get the output like [this](#)

### Outlook style layout

Create the element with three panes and place the elements within the pane to render **treeview**, **listview** and **RTE**.

### [Class-component]

```

'<span class="e-list-content">${content}</span>' +
'</div>'
// Set customized group-header template
let grouptemplate: string = '<div class="e-list-wrapper"><span class="e-list-item-
content"></span></div>';
// Map the appropriate columns to fields property
let listFields: object = { text: 'Name', groupBy: 'order' };
let mailBox: object[] = [
{ id: 1, name: 'Favorites', hasChild: true},
{ id: 2, pid: 1, name: 'Sales Reports', count: '4' },

```

```

{ id: 3, pid: 1, name: 'Sent Items'},
{ id: 4, pid: 1, name: 'Marketing Reports ', count: '6'},
{ id: 5, name: 'Andrew Fuller', hasChild: true, expanded: true },
{ id: 6, pid: 5, name: 'Inbox', selected: true , count: '20'},
{ id: 7, pid: 5, name: 'Drafts', count: '5'},
{ id: 15, pid: 5, name: 'Archive'},
{ id: 8, pid: 5, name: 'Deleted Items'},
{ id: 9, pid: 5, name: 'Sent Items'},
{ id: 10, pid: 5, name: 'Sales Reports' , count: '4'},
{ id: 11, pid: 5, name: 'Marketing Reports', count: '6' },
{ id: 12, pid: 5, name: 'Outbox'},
{ id: 13, pid: 5, name: 'Junk Email'},
{ id: 14, pid: 5, name: 'RSS Feed'},
{ id: 15, pid: 5, name: 'Trash' }
];

let treeFields: object = { dataSource: mailBox, id: 'id', parentID: 'pid', text: 'name', hasChildren:
'hasChild' };

function onCreate(e: any): void {
splitterInstance.element.querySelectorAll('.splitter-content')[0].appendChild(treeInstance.element);
splitterInstance.element.querySelectorAll('.splitter-content')[1].appendChild(listViewObj.element);
(splitterInstance as any).element.querySelector('#createpostholder').insertBefore(rteObj.element,
(splitterInstance as any).element.querySelector('#createpostholder').childNodes[0]);

(splitterInstance as any).element.querySelector('#firstname-
target').appendChild(textBox1.element.parentElement);
(splitterInstance as any).element.querySelector('#lastname-
target').appendChild(textBox2.element.parentElement);
(splitterInstance as any).element.querySelector('#subject-
target').appendChild(textBox3.element.parentElement);
}

function nodeTemplate(dataSource: any): JSX.Element {
return(<div>
<div className="treeviewdiv">
<div className="textcontent">
<span className="treeName">{dataSource.name}</span>
</div>

```

```

{ dataSource.count &&
<div className="countcontainer">
<span className="treeCount e-badge e-badge-primary" >{dataSource.count}</span>
</div>
}
</div>
</div>;
};
function onSplitterResize(): void {
rteObj.refresh();
}
return (
<div id="target" className="control-section outlook-style" >
<TextBoxComponent id="firstname" ref={{(textbox) => { textBox1 = textbox! }}}/>
<TextBoxComponent id="lastname" ref={{(textbox) => { textBox2 = textbox! }}}/>
<TextBoxComponent id="subject" ref={{(textbox) => { textBox3 = textbox! }}}/>
<RichTextEditorComponent id="defaultRTE" ref={{(richtexteditor) => { rteObj = richtexteditor! }} height =
"262px">
<Inject services={{[HtmlEditor, Toolbar, Image, Link, QuickToolbar]}} />
</RichTextEditorComponent>
<TreeViewComponent id='splitter-tree' fields= {treeFields} nodeTemplate = {nodeTemplate} ref={{(tree)
=> { treeInstance = tree! }}}/>
<ListViewComponent id='groupedList-split' fields = { listFields } className ='splitter-list' dataSource =
{dataSource}
cssClass = {'e-list-template'} groupTemplate = {grouptemplate} template = {listTemplate} ref={{(listview)
=> { listViewObj = listview! }}}/>
<SplitterComponent id="splitter1" height="493px" width="100%" ref={{(splitter) => { splitterInstance =
splitter! }} created={onCreate = onCreate.bind(this)}
resizeStop={onSplitterResize=onSplitterResize.bind(this)}>
<PanelsDirective>
<PanelDirective size={paneSize1} min={minimumSize1} content={content1}/>
<PanelDirective size={paneSize2} min={minimumSize2} content={content2}/>
<PanelDirective size={paneSize3} min={minimumSize3} content={content3}/>
</PanelsDirective>
</SplitterComponent>

```

```

</div>
);
}
export default App;
`

```

Refer below dependent styles in top of your App.css file.

```

`css
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-layouts/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
`

```

Once the above configurations has been completed, you will get the output like [this](#).

### Style in React Splitter component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the split bar

Use the following CSS to customize the split bar properties.

##### *Horizontal split bar*

```

`css
/ default split bar color /
.e-splitter .e-split-bar.e-split-bar-horizontal{
background: blue;
}
/ split bar color in hover and active state /
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active {
background: green;
}
`

```

```
}
,
```

#### Vertical split bar

```
`css

/ default split bar color /

.e-splitter .e-split-bar.e-split-bar-vertical {
background: blue;
}

/ split bar color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active {
background: green;
}
,
```

#### Customizing the split bar resize handle

Use the following CSS to customize the split bar resize handle.

#### Horizontal split bar resize handle

```
`css

/ default split bar resize handle color /

.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}

/ default split bar resize handle color in hover and active state /

.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-resize-handler {
color: green;
}
,
```

#### Vertical split bar resize handle

```
`css

/ default split bar resize handle color /

.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
color: rgba(20, 27, 233, 0.54);
}
,
```

*/ default split bar resize handle color in hover and active state /*

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-resize-handler,
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-resize-handler {
color: green;
}
`css
```

### Customizing the split bar arrows

Use the following CSS to customize the split bar arrows.

#### Horizontal split bar resize arrows

``css`

*/ split bar arrows /*

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-left::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::before, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right::after, .e-
splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-active .e-navigate-arrow.e-arrow-right::after {
background-color: green;
}
`css
```

*/ split bar arrows - circular border /*

```
.e-splitter .e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-left, .e-splitter
.e-split-bar.e-split-bar-horizontal.e-split-bar-hover .e-navigate-arrow.e-arrow-right {
border-color: rgba(33, 227, 22, 0.5);
}
`css
```

#### Vertical split bar resize arrows

``css`

*/ split bar arrows /*

```
.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::before, .e-
splitter .e-split-bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::before, .e-splitter
.e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-
bar.e-split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-up::after, .e-splitter .e-split-bar.e-
split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-
split-bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::before, .e-splitter .e-split-bar.e-
split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down::after, .e-splitter .e-split-bar.e-split-
bar-vertical.e-split-bar-active .e-navigate-arrow.e-arrow-down::after {
background-color: green;
}
`css
```

```

}

/ split bar arrows - circular border /

.e-splitter .e-split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-up, .e-splitter .e-
split-bar.e-split-bar-vertical.e-split-bar-hover .e-navigate-arrow.e-arrow-down {
border-color: rgba(33, 227, 22, 0.5);
}
`css

```

### To hide the resize handle in Splitter

Use the following CSS to hide the resize handler in the split bar

#### Hide the horizontal split bar resize arrow

```

`css

.e-splitter .e-split-bar.e-split-bar-horizontal .e-resize-handler {
display: none;
}
`css

```

#### Hide the vertical split bar resize arrow

```

`css

.e-splitter .e-split-bar.e-split-bar-vertical .e-resize-handler {
display: none;
}
`css

```

## Globalization in React Splitter component

### RTL

Specifies the direction of the Splitter component using the enableRtl property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

The following code shows how to enable RTL behavior.

### [Class-component]

#### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  render() {
    return (<div className="App">
      <SplitterComponent id="rtl" height="250px" enableRtl="true">
        <PanesDirective>
          <PaneDirective size='200px' content='Left pane' />
          <PaneDirective size='200px' content='Middle pane' />
          <PaneDirective size='200px' content='Right pane' />
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}

```

```

    </SplitterComponent>
    </div>);
  }
}
export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
class App extends React.Component {
  public render() {
    return (<div className="App">
      <SplitterComponent id="rtl" height="250px" enableRtl="true">
        <PanesDirective>
          <PaneDirective size='200px' content = 'Left pane' />
          <PaneDirective size='200px' content = 'Middle pane' />
          <PaneDirective size='200px' content = 'Right pane' />
        </PanesDirective>
      </SplitterComponent>
    </div>);
  }
}
export default App;

```

### [Functional-component]

### APP.JSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App() {
  return (<div className="App">
    <SplitterComponent id="rtl" height="250px" enableRtl="true">
      <PanesDirective>
        <PaneDirective size='200px' content='Left pane' />
        <PaneDirective size='200px' content='Middle pane' />
        <PaneDirective size='200px' content='Right pane' />
      </PanesDirective>
    </SplitterComponent>
  </div>);
}
export default App;

```

### APP.TSX

```

import { PaneDirective, PanesDirective, SplitterComponent } from
 '@syncfusion/ej2-react-layouts';
import * as React from "react";
function App () {
  return (
    <div className="App">
      <SplitterComponent id="rtl" height="250px" enableRtl="true">

```

```

    <PanelsDirective>
      <PanelDirective size='200px' content = 'Left pane' />
      <PanelDirective size='200px' content = 'Middle pane' />
      <PanelDirective size='200px' content = 'Right pane' />
    </PanelsDirective>
  </SplitterComponent>
</div>
);
}
export default App;

```

## Accessibility in React Splitter component

The Splitter component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Splitter component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### Keyboard interaction

You can use the following key shortcuts to access the splitter without interruptions:

| **Keyboard shortcuts** | **Actions** |

| --- | --- |

| Tab | Helps in focusing the splitter on the page and switching between the consecutive splitter bars. |

| Shift + Tab | Helps in focusing the previous splitter bar element on the splitter. |

| Right arrow | Helps in moving the active horizontal orientated splitter bar to its Right side. |

| Left arrow | Helps in moving the active horizontal orientated splitter bar to its Left side. |

| Up arrow | Helps in moving the active vertical orientated splitter bar to its Up side. |

| Down arrow | Helps in moving the active vertical orientated splitter bar to its Down side. |

| Enter | Helps to toggle between expand and collapse actions of the splitter bar when it is active. |

### Ensuring accessibility

The Splitter component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Splitter component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Splitter component with accessibility tools.

### Ej1 api migration in React Splitter component

This article describes the API migration process of Splitter component from Essential JS 1 to Essential JS 2.

### Common

```
{% raw %}
```

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Adding custom class | **Property:** *cssClass* `<br /><br /> <EJ.Splitter id="splitter" cssClass="customClass"><EJ.Splitter> | Property: cssClass <br /><SplitterComponent cssClass="customClass"></SplitterComponent> <br /> |`

| Adjusting Height | **Property:** *height* `<br /><br /> <EJ.Splitter id="splitter" height="100%"><EJ.Splitter> | Property: height <br /> <SplitterComponent height="100%"></SplitterComponent> |`

| Adjusting Width | **Property:** *width* `<br /><br /> <EJ.Splitter id="splitter" width="600"><EJ.Splitter> | Property: width <br /><br /> <SplitterComponent width="100%"></SplitterComponent> |`

| Orientation | **Property:** *orientation* `<br /><br /> <EJ.Splitter id="splitter" orientation={ej.Orientation.Vertical}><EJ.Splitter><br /> | Property: orientation <br /> <br /> <SplitterComponent orientation="Vertical"></SplitterComponent> |`

| Separator Size | Not Available | **Property:** *separatorSize* `<br /> <br /> <SplitterComponent separatorSize={4}></SplitterComponent> |`

| Adding HTML attributes | **Property:** *htmlAttributes* `<br /><br /> <EJ.Splitter id="splitter" htmlAttributes={htmlAttributes}><EJ.Splitter><br />var htmlAttributes = { class: "my-class", style: "border: 1px solid red"}<br /> | Not Available |`

| Customize expand/collapse icons | **Property:** `<br /> expanderTemplate <br /><br /> <EJ.Splitter id="splitter" expanderTemplate = ''><EJ.Splitter> | Not Available |`

| Make control flexible for mobile view | **Property:** *isResponsive* `<br /><br /> <EJ.Splitter id="splitter" isResponsive={true}><EJ.Splitter> | By default, Splitter works with mobile mode. |`

| Refresh the Splitter | **Method:** *refresh()* `<br /><br /> <EJ.Splitter id="splitter"><EJ.Splitter><br />$("#splitter").ejSplitter("refresh")<br /> | Method: refresh() <br /><br /> <SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}></SplitterComponent><br /> constructor(props: {}) { this.splitterInstance.refresh(); } <br /> |`

| Destroy the Control | **Method:** *destroy()* `<br /><br /> <EJ.Splitter id="splitter"><EJ.Splitter><br />$("#splitter").ejSplitter("destroy")<br /> | Method: destroy() <br /> <SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}></SplitterComponent><br /> constructor(props: {}) { this.splitterInstance.destroy(); } <br /> |`

| Event triggers after the Splitter created successfully | **Event:** *create* `<br /><br /> <EJ.Splitter id="splitter" create={create}><EJ.Splitter><br />function create(args) {}<br /> | Event: created <br /><br /> <SplitterComponent id="splitter" created={this.onCreated.bind(this)}></SplitterComponent><br />private onCreated() {}<br /> |`

| Event triggers when Splitter has been destroyed | **Event:** *destroy* `<br /><br /> <EJ.Splitter id="splitter" destroy={destroy}><EJ.Splitter> <br />function destroy(args) {}<br /> | Not Available |`

### Accessibility and Localization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Keyboard Navigation | **Property:** `allowKeyboardNavigation` `<br /><br />` `<EJ.Splitter id="splitter" allowKeyboardNavigation={true}><EJ.Splitter>` | No separate property for enable/disable keyboard navigation. Its enabled by default. |

| Right to Left | **Property:** `enableRTL` `<br /><br />` `<EJ.Splitter id="splitter" enableRTL={false}><EJ.Splitter>` | **Property:** `enableRtl` `<br /><br />` `<SplitterComponent enableRtl={true}></SplitterComponent>` |

### Control State

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Enable/Disable the control | Not Available | **Property:** `enabled` `<br /><br />` `<SplitterComponent enabled={true}></SplitterComponent>` |

### State Maintenance

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Save the model value in local storage or cookies | Not Available | **Property:** `enablePersistence` `<br /><br />` `<SplitterComponent enablePersistence={true}></SplitterComponent>` |

### Pane Properties

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** `properties` `<br /><br />` `<EJ.Splitter id="splitter" properties={property}><EJ.Splitter><br />` `var property = []; <br />` | **Property:** `paneSettings` `<br />` `<SplitterComponent>` `<PanelsDirective>` `<PaneDirective />` `</PanelsDirective></SplitterComponent><br />` |

| Pane Content | Not Available | **Property:** `content` `<br />` `<SplitterComponent>` `<PanelsDirective>` `<PaneDirective content="<div>First Pane Content</div>" />` `</PanelsDirective>` `</SplitterComponent><br />` |

| Change the size of the pane | **Property:** `paneSize` `<br />` `<EJ.Splitter id="splitter" properties={property}><EJ.Splitter>` `<br />` `var property = [{paneSize: "30px"}];<br />` | **Property:** `size` `<br />` `<SplitterComponent>` `<PanelsDirective>` `<PaneDirective size="25%" /></PanelsDirective></SplitterComponent><br />` |

| Minimum pane size | **Property:** `minSize` `<br />` `<EJ.Splitter id="splitter" properties={property}><EJ.Splitter><br />` `var property = [{minSize: 30}];<br />` | **Property:** `min` `<br /><br />` `<SplitterComponent>` `<PanelsDirective>` `<PaneDirective min="60px" /></PanelsDirective></SplitterComponent><br />` |

| Maximum pane size | **Property:** `maxSize` `<br /><br />` `<EJ.Splitter id="splitter" properties={property}><EJ.Splitter><br />` `var property = [{maxSize: 30}];<br />` | **Property:** `max` `<br`

```
</><br /><SplitterComponent><PanelsDirective><PanelDirective
max="60px"/></PanelsDirective></SplitterComponent><br /> |
```

| Enable/Disable the Pane Resizable behavior | **Property:** *resizable* <br /><br /><EJ.Splitter id="splitter" properties={property}><EJ.Splitter><br />var property = [{resizable: false }];<br /> | **Property:** *resizable* <br /><br /><SplitterComponent><PanelsDirective><PanelDirective resizable={false}/></PanelsDirective></SplitterComponent><br /> |

| Collapsible | **Property:** *collapsible* <br /><br /><EJ.Splitter id="splitter" properties={property}><EJ.Splitter><br />var property = [{collapsible: true }];<br /> | **Property:** *collapsible* <br /><br /><SplitterComponent><PanelsDirective><PanelDirective collapsible={true}/></PanelsDirective></SplitterComponent><br /> |

| Expandable | **Property:** *expandable* <br /><br /><EJ.Splitter id="splitter" properties={property}><EJ.Splitter> <br />var property = [{expandable: true }];<br /> | Not Available |

| Collapsed | Not Available | **Property:** *collapsed* <br /><br /><SplitterComponent><PanelsDirective><PanelDirective collapsed={true}/></PanelsDirective></SplitterComponent><br /> |

| Add Pane | **Method:** *addItem()* <br /><br /><EJ.Splitter id="splitter"><EJ.Splitter><br />\$("#splitter").ejSplitter("addItem", "New Pane 0", {paneSize:20, minSize:20, maxSize: 100}, 0);<br /> | **Method:** *addPane()* <br /><br /><SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}/></SplitterComponent><br />constructor(props: {}) {this.splitterInstance. addPane({size: "25%", content: "Pane"}, 0)}<br /> |

| Remove Pane | **Method:** *removeItem()* <br /><br /><EJ.Splitter id="splitter"><EJ.Splitter><br />\$("#splitter").ejSplitter("removeItem", 0);<br /> | **Method:** *removePane()* <br /><br /><SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}/></SplitterComponent><br />constructor(props: {}) { this.splitterInstance. removePane(0);}<br /> |

| Collapse Pane | **Method:** *collapse()* <br /><br /><EJ.Splitter id="splitter"><EJ.Splitter><br />\$("#splitter").ejSplitter("collapse", 0);<br /> | **Method:** *collapse()* <br /><br /><SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}/></SplitterComponent><br />constructor(props: {}) {this.splitterInstance.collapse(0);}<br /> |

| Expand Pane | **Method:** *expand()* <br /><br /><EJ.Splitter id="splitter"><EJ.Splitter><br />\$("#splitter").ejSplitter("expand", 0);<br /> | **Method:** *expand()* <br /><br /><SplitterComponent id="splitter" ref={splitter=>this.splitterInstance = splitter}/></SplitterComponent><br />constructor(props: {}) { this.splitterInstance.expand(0);}<br /> |

| Event triggers when before panes get expanded/collapsed | **Event:** *beforeExpandCollapse* <br /><br /><EJ.Splitter id="splitter" beforeExpandCollapse={ beforeExpandCollapse }><EJ.Splitter><br />function beforeExpandCollapse (args) {}<br /> | **Event:** *beforeExpand* <br /><br /><SplitterComponent id="splitter" beforeExpand ={this. onBeforeExpand.bind(this)}/></SplitterComponent><br />private onBeforeExpand () {}<br /> **Event:** *beforeCollapse* <br /><SplitterComponent id="splitter" beforeCollapse ={this. onBeforeCollapse.bind(this)}/></SplitterComponent><br />private onBeforeCollapse() {}<br /> |

| Event triggers when after panes get expanded/collapsed | **Event:** *expandCollapse* `<br /><br /><EJ.Splitter id="splitter" expandCollapse={expandCollapse}><EJ.Splitter><br />function expandCollapse (args) { }<br /> | Event: expand <br /><br /><SplitterComponent id="splitter" expand={this.onExpand.bind(this)}></SplitterComponent><br />private onExpand () { }<br /> Event: collapse <br /><SplitterComponent id="splitter" collapse={this.onCollapse.bind(this)}></SplitterComponent><br />private onCollapse () { }<br /> |`

| Event triggers when Resizing the pane | **Event:** *resize* `<br /><br /><EJ.Splitter id="splitter" resize={resize}><EJ.Splitter><br />function resize (args) { }<br /> | Event: resizing <br /><br /><SplitterComponent id="splitter" resizing={this.onResizing.bind(this)}></SplitterComponent><br />private onResizing() { }<br /> |`

| Event triggers when pane is started to resize | Not Available | **Event:** *resizeStart* `<br /><br /><SplitterComponent id="splitter" resizeStart={this.onResizeStart.bind(this)}></SplitterComponent><br />private onResizeStart () { }<br /> |`

| Event triggers when pane is stopped to resize | Not Available | **Event:** *resizeStop* `<br /><br /><SplitterComponent id="splitter" resizeStop={this.onResizeStop.bind(this)}></SplitterComponent><br />private onResizeStop () { }<br /> |`

| Event triggers when click template icon | **Event:** *clickOnExpander* `<br /><br /><EJ.Splitter id="splitter" clickOnExpander={clickOnExpander}><EJ.Splitter><br />function clickOnExpander (args) { }<br /> | Not Available |`

### Animation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| EnableAnimation | **Property:** *enableAnimation* `<br /><br /><EJ.Splitter id="splitter" enableAnimation={true}><EJ.Splitter><br /> &#160; | Not Available |`

| AnimationSpeed | **Property:** *animationSpeed* `<br /><br /><EJ.Splitter id="splitter" animationSpeed={150}><EJ.Splitter> <br />&#160; | Not Available |`

{% endraw %}

## Spreadsheet

### Overview of the React Spreadsheet component

The React Spreadsheet is an user interactive component to organize and analyze data in tabular format with configuration options for customization. It will load data by importing an Excel/CSV file or from local and remote data sources such as JSON, RESTful services, OData services, and more. The populated data can be exported as Excel with xlsx, xls, CSV and PDF formats.

#### Key features

- [Data sources](#): Bind the Spreadsheet component with an array of objects or data from a web service using `DataManager`.
- [Virtualization](#): Provides the option to load large amount of data without performance degradation.

- [Selection](#): Provides the option to select a cell or range of cells.
- [Editing](#): Provides the option to dynamically edit a cell.
- [Formulas](#): Provides built-in calculation library with pre-defined formulas and named range support.
- [Clipboard](#): Provides the option to perform clipboard operations.
- [Cell formatting](#): Provides the option to customize the appearance of cells.
- [Number formatting](#): Provides the option to format the cell value.
- [Open](#): Provides the option to open Excel and CSV files in Spreadsheet.
- [Save](#): Provides the option to save Spreadsheet data as Excel, CSV, and PDF documents.
- [Sorting](#): Helps you to arrange the data to particular order in a selected range of cells.
- [Filtering](#): Helps you to view specific rows in the Spreadsheet by hiding the other rows.
- [Undo Redo](#): Provides the option to perform undo redo operations in Spreadsheet.
- [Collaborative editing](#): Provides the option for real time changes across multiple users in the Spreadsheet.
- [Hyperlink](#): Provides the option to navigate to web link or cell reference within the sheet or to other sheet in Spreadsheet.
- [Resize](#): Allows you to change the row height and column width. Auto fit the rows and columns based on its content.
- [Wrap text](#): Provides the option to display the large content as multiple lines in a single cell.
- [Data validation](#): Provides the option to validate edited values based on data validation rules defined for a cell or range of cells.
- [Find and replace](#): Provides the option to find the data and replace it across all sheets in Spreadsheet.
- [Protect sheet](#): Provides the option to restrict user actions like cell editing, row and column insertion, deletion, and resizing.
- [Borders](#): Provides the option to customize cell gridlines such as color and its style for enhanced UI.
- [Show/hide](#): Provides the option to show/hide rows, columns and sheets.
- [Insert/delete](#): Provides the option to insert/delete rows, columns and sheets.
- [Merge cells](#): Provides the option to combine two or more cells located in the same row or column into a single cell.
- [Conditional formatting](#): Provides the option to format a cell or range of cells based on conditions applied.
- [Autofill](#): Provides the option to fill or copy a series or pattern of values and formats into adjacent cells in any direction.
- [Clear](#): Provides the option to clear the content, formats, and hyperlinks applied to a cell or range of cells in a Spreadsheet.
- [Aggregates](#): Provides the option to check the sum, average, count, and more for the selected cells or range in the sheet.
- [Picture](#): Allows you to view, insert, and modify a picture in a Spreadsheet with customizing options.
- [Chart](#): Transforms your Spreadsheet data to an intuitive overview for better understanding and to make smart business decisions.
- [Freeze panes](#): Allows you to keep the specified rows and columns always visible at the top and left side of the sheet while scrolling through the sheet.
- [Password protection](#): Allows you to protect the workbook with a password.
- [Multi-line editing](#): Allows you to insert a line break between paragraphs of the text within a cell in a Spreadsheet.

- [Calculate range selection](#): Helps you to select a range or multiple ranges when editing a formula in a cell.
- [Right-to-left \(RTL\)](#): Aligns content in the Spreadsheet component from right to left.
- [Templates](#): Templates can be used to create custom user experiences in the Spreadsheet.
- [Globalization](#): Personalize the Spreadsheet component with different languages, as well as culture-specific number, date, and time formatting.
- [AccessibilityLink to the Video](#): Provides with built-in accessibility support which helps to access all the Spreadsheet component features through the keyboard, screen readers, or other assistive technology devices.

## Getting Started

This section explains the steps to create a simple Spreadsheet component in a React application.

To get start quickly with React Spreadsheet, you can check on this video:

### Dependencies

The following list of dependencies are required to use the Spreadsheet component in your application:

```
`js
|-- @syncfusion/ej2-react-spreadsheet
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-spreadsheet
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
`,`
```

### Setup for Local Development

You can use [create-react-app](#) to setup the applications and run the following command to install create-react-app.

```
`
npm install -g create-react-app
`,`
```

Run the following command to setup the basic **React** samples.

```
`
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
npm install
`,`
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. To install Spreadsheet component use the following command.

```
npm install @syncfusion/ej2-react-spreadsheet --save
```

### Adding CSS reference

Add components style as given below in `src/App.css`.

```
`css
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-spreadsheet/styles/material.css';
```

To refer `App.css` in the application then import it in the `src/App.tsx` file.

### Adding Spreadsheet component

Now, you can import the spreadsheet component into your `src/App.tsx` file.

```
`ts
import * as React from 'react';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import './App.css';
export default function App() {
  return (<SpreadsheetComponent/>);
}
```

### Run the application

The [create-react-app](https://create-react-app.dev/) will pre-configure the project to compile and run the application in browser. Use the following command to run the application.

npm start

The following example shows a basic spreadsheet component.

#### **APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
export default function App() {
    return (<SpreadsheetComponent />);
}
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}
```

#### **APP.TSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
export default function App() {
    return (<SpreadsheetComponent />);
}
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}
```

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) that shows you how to present and manipulate data.

### Creating a Next.js Application Using Syncfusion React Components

This section provides a step-by-step guide for setting up a Next.js application and integrating the Syncfusion React Spreadsheet component.

What is Next.js?

[Next.js](#) is a React framework that makes it easy to build fast, SEO-friendly, and user-friendly web applications. It provides features such as server-side rendering, automatic code splitting, routing, and API routes, making it an excellent choice for building modern web applications.

Prerequisites

Before getting started with the Next.js application, ensure the following prerequisites are met:

- [Node.js 18.17](#) or later.

- The application is compatible with macOS, Windows, and Linux operating systems.

### Create a Next.js application

To create a new **Next.js** application, use one of the commands that are specific to either NPM or Yarn.

#### **NPM**

```
npx create-next-app@latest
```

#### **YARN**

```
yarn create next-app
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: Users can specify the name of the project directly. Let's specify the name of the project as **ej2-nextjs-spreadsheet**.

#### **CMD**

```
√ What is your project named? » ej2-nextjs-spreadsheet
```

2. Select the required packages.

#### **CMD**

```
√ What is your project named? ... ej2-nextjs-spreadsheet
√ Would you like to use TypeScript? ... No / `Yes`
√ Would you like to use ESLint? ... No / `Yes`
√ Would you like to use Tailwind CSS? ... `No` / Yes
√ Would you like to use `src/` directory? ... No / `Yes`
√ Would you like to use App Router? (recommended) ... No / `Yes`
√ Would you like to customize the default import alias? ... `No` / Yes
Creating a new Next.js app in D:\ej2-nextjs-spreadsheet.
```

3. Once complete the above mentioned steps to create **ej2-nextjs-spreadsheet**, navigate to the directory using the below command:

#### **CMD**

```
cd ej2-nextjs-spreadsheet
```

The application is ready to run with default settings. Now, let's add Syncfusion components to the project.

### Install Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

Here, the [React Spreadsheet component](#) is used in the project. To install the React Spreadsheet component, use the following command:

#### **NPM**

```
npm install @syncfusion/ej2-react-spreadsheet --save
```

## YARN

```
yarn add @syncfusion/ej2-react-spreadsheet
```

## Import Syncfusion CSS styles

Syncfusion React components come with [built-in themes](#), which are available in the installed packages. It's easy to adapt the Syncfusion React components to match the style of your application by referring to one of the built-in themes.

Import the **Material** theme into the **src/app/globals.css** file and removed the existing styles in that file, as shown below:

## GLOBALS.CSS

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-spreadsheet/styles/material.css';
```

To know more about built-in themes and CSS reference for individual components, refer to the [themes](#) section.

## Add Syncfusion React component

Follow the below steps to add the React Spreadsheet component to the Next.js project:

1. Before adding the Spreadsheet component to your markup, create a **datasource.tsx** file within the **src/app/** folder and add the Spreadsheet component data.

## DATASOURCE.TSX

```
export let defaultData: object[] = [
  {
    "Customer Name": "Romona Heaslip",
    "Model": "Taurus",
    "Color": "Aquamarine",
    "Payment Mode": "Debit Card",
    "Delivery Date": "07/11/2015",
    "Amount": "8529.22"
  },
  {
    "Customer Name": "Clare Batterton",
    "Model": "Sparrow",
    "Color": "Pink",
    "Payment Mode": "Cash On Delivery",
  }
]
```

```
"Delivery Date": "7/13/2016",
"Amount": "17866.19"
},
{
  "Customer Name": "Eamon Traise",
  "Model": "Grand Cherokee",
  "Color": "Blue",
  "Payment Mode": "Net Banking",
  "Delivery Date": "09/04/2015",
  "Amount": "13853.09"
},
{
  "Customer Name": "Julius Gorner",
  "Model": "GTO",
  "Color": "Aquamarine",
  "Payment Mode": "Credit Card",
  "Delivery Date": "12/15/2017",
  "Amount": "2338.74"
},
{
  "Customer Name": "Jenna Schoolfield",
  "Model": "LX",
  "Color": "Yellow",
  "Payment Mode": "Credit Card",
  "Delivery Date": "10/08/2014",
  "Amount": "9578.45"
},
{
  "Customer Name": "Marylynne Haring",
  "Model": "Catera",
  "Color": "Green",
  "Payment Mode": "Cash On Delivery",
  "Delivery Date": "7/01/2017",
  "Amount": "19141.62"
},
{
  "Customer Name": "Vilhelmina Leipelt",
  "Model": "7 Series",
  "Color": "Goldenrod",
  "Payment Mode": "Credit Card",
  "Delivery Date": "12/20/2015",
  "Amount": "6543.30"
},
{
  "Customer Name": "Barby Heisler",
  "Model": "Corvette",
  "Color": "Red",
  "Payment Mode": "Credit Card",
  "Delivery Date": "11/24/2014",
  "Amount": "13035.06"
},
{
  "Customer Name": "Karyn Boik",
  "Model": "Regal",
  "Color": "Indigo",
  "Payment Mode": "Debit Card",
  "Delivery Date": "05/12/2014",
```

```
"Amount": "18488.80"
},
{
  "Customer Name": "Jeanette Pamplin",
  "Model": "S4",
  "Color": "Fuscia",
  "Payment Mode": "Net Banking",
  "Delivery Date": "12/30/2014",
  "Amount": "12317.04"
},
{
  "Customer Name": "Cristi Espinos",
  "Model": "TL",
  "Color": "Aquamarine",
  "Payment Mode": "Credit Card",
  "Delivery Date": "12/18/2013",
  "Amount": "6230.13"
},
{
  "Customer Name": "Issy Humm",
  "Model": "Club Wagon",
  "Color": "Pink",
  "Payment Mode": "Cash On Delivery",
  "Delivery Date": "02/02/2015",
  "Amount": "9709.49"
},
{
  "Customer Name": "Tuesday Fautly",
  "Model": "V8 Vantage",
  "Color": "Crimson",
  "Payment Mode": "Debit Card",
  "Delivery Date": "11/19/2014",
  "Amount": "9766.10"
},
{
  "Customer Name": "Rosemaria Thomann",
  "Model": "Caravan",
  "Color": "Violet",
  "Payment Mode": "Net Banking",
  "Delivery Date": "02/08/2014",
  "Amount": "7685.49"
},
{
  "Customer Name": "Lyell Fuentez",
  "Model": "Bravada",
  "Color": "Violet",
  "Payment Mode": "Debit Card",
  "Delivery Date": "08/05/2016",
  "Amount": "18012.45"
},
{
  "Customer Name": "Raynell Layne",
  "Model": "Colorado",
  "Color": "Pink",
  "Payment Mode": "Credit Card",
  "Delivery Date": "05/30/2016",
  "Amount": "2785.49"
```

```
},
{
  "Customer Name": "Raye Whines",
  "Model": "4Runner",
  "Color": "Red",
  "Payment Mode": "Debit Card",
  "Delivery Date": "12/10/2016",
  "Amount": "9967.74"
},
{
  "Customer Name": "Virgina Aharoni",
  "Model": "TSX",
  "Color": "Pink",
  "Payment Mode": "Cash On Delivery",
  "Delivery Date": "10/23/2014",
  "Amount": "5584.33"
},
{
  "Customer Name": "Peta Cheshir",
  "Model": "Pathfinder",
  "Color": "Red",
  "Payment Mode": "Net Banking",
  "Delivery Date": "12/24/2015",
  "Amount": "5286.53"
},
{
  "Customer Name": "Jule Urion",
  "Model": "Charger",
  "Color": "Violet",
  "Payment Mode": "Debit Card",
  "Delivery Date": "11/20/2013",
  "Amount": "13511.91"
},
{
  "Customer Name": "Lew Gilyatt",
  "Model": "Bonneville",
  "Color": "Crimson",
  "Payment Mode": "Credit Card",
  "Delivery Date": "11/19/2013",
  "Amount": "6498.19"
},
{
  "Customer Name": "Jobey Fortun",
  "Model": "B-Series",
  "Color": "Blue",
  "Payment Mode": "Net Banking",
  "Delivery Date": "10/30/2014",
  "Amount": "10359.67"
},
{
  "Customer Name": "Blondie Crump",
  "Model": "Voyager",
  "Color": "Turquoise",
  "Payment Mode": "Credit Card",
  "Delivery Date": "04/06/2018",
  "Amount": "8118.39"
},
}
```

```
{
  "Customer Name": "Florentia Binns",
  "Model": "Grand Prix",
  "Color": "Orange",
  "Payment Mode": "Cash On Delivery",
  "Delivery Date": "10/13/2016",
  "Amount": "10204.37"
},
{
  "Customer Name": "Jaquelin Galtone",
  "Model": "Sunbird",
  "Color": "Red",
  "Payment Mode": "Net Banking",
  "Delivery Date": "10/22/2013",
  "Amount": "6528.06"
},
{
  "Customer Name": "Hakeem Easseby",
  "Model": "Mirage",
  "Color": "Crimson",
  "Payment Mode": "Debit Card",
  "Delivery Date": "9/12/2014",
  "Amount": "5619.25"
},
{
  "Customer Name": "Nickolaus Gidman",
  "Model": "XK",
  "Color": "Orange",
  "Payment Mode": "Debit Card",
  "Delivery Date": "05/12/2016",
  "Amount": "5091.43"
},
{
  "Customer Name": "Jenine Iglesia",
  "Model": "Accord",
  "Color": "Orange",
  "Payment Mode": "Debit Card",
  "Delivery Date": "09/03/2018",
  "Amount": "14566.08"
},
{
  "Customer Name": "Fax Witherspoon",
  "Model": "Range Rover Sport",
  "Color": "Orange",
  "Payment Mode": "Credit Card",
  "Delivery Date": "2/22/2018",
  "Amount": "5284.87"
}
];
```

2. Then, import and define the Spreadsheet component in the **src/app/page.tsx** file, as shown below:

#### **PAGE.TSX**

```
'use client'
```

```

import { SpreadsheetComponent, SheetsDirective, SheetDirective,
ColumnsDirective, RangesDirective, RangeDirective, RowsDirective,
RowDirective, CellsDirective, CellDirective, CellStyleModel, ColumnDirective
} from '@syncfusion/ej2-react-spreadsheet';
import { defaultData } from './datasource';
export default function Home(this: any) {
let spreadsheet!: SpreadsheetComponent;
const boldRight: CellStyleModel = { fontWeight: 'bold', textAlign: 'right'
};
const bold: CellStyleModel = { fontWeight: 'bold' };
function onCreated(): void {
spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center',
verticalAlign: 'middle' }, 'A1:F1');
spreadsheet.numberFormat('$#,##0.00', 'F2:F31');
}
return (
<>
<h2>Syncfusion React Spreadsheet Component</h2>
<SpreadsheetComponent
openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/op
en'
saveUrl='https://services.syncfusion.com/react/production/api/spreadsheet/sa
ve'
ref={(Obj) => { spreadsheet = Obj as SpreadsheetComponent }}
created={onCreated.bind(this)} >
<SheetsDirective>
<SheetDirective name="Car Sales Report">
<RangesDirective>
<RangeDirective dataSource={defaultData}></RangeDirective>
</RangesDirective>
<RowsDirective>
<RowDirective index={30}>
<CellsDirective>
<CellDirective index={4} value="Total Amount:"
style={boldRight}></CellDirective>
<CellDirective formula="=SUM(F2:F30)" style={bold}></CellDirective>
</CellsDirective>
</RowDirective>
</RowsDirective>
<ColumnsDirective>
<ColumnDirective width={180}></ColumnDirective>
<ColumnDirective width={130}></ColumnDirective>
<ColumnDirective width={130}></ColumnDirective>
<ColumnDirective width={180}></ColumnDirective>
<ColumnDirective width={130}></ColumnDirective>
<ColumnDirective width={120}></ColumnDirective>
</ColumnsDirective>
</SheetDirective>
</SheetsDirective>
</SpreadsheetComponent>
</>
)
}

```

### Run the application

To run the application, use the following command:

#### **NPM**

```
npm run dev
```

#### **YARN**

```
yarn run dev
```

To learn more about the functionality of the Spreadsheet component, refer to the [documentation](#).

[View the NEXT.js spreadsheet sample in the GitHub repository.](#)

### Data binding in React Spreadsheet component

The Spreadsheet uses [DataManager](#), which supports both RESTful JSON data services and local JavaScript object array binding to a range. The `dataSource` property can be assigned either with the instance of [Link to the Video](#) or JavaScript object array collection.

To get start quickly with Data Binding, you can check on this video:

To bind data to a cell, use `cell data binding` support.

#### Local data

To bind local data to the Spreadsheet, you can assign a JavaScript object array to the `dataSource` property.

Refer to the following code example for local data binding.

#### **APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
  return (
    <SpreadsheetComponent>
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>
            <RangeDirective dataSource={data}></RangeDirective>
          </RangesDirective>
          <ColumnsDirective>
            <ColumnDirective width={100}></ColumnDirective>
            <ColumnDirective width={110}></ColumnDirective>
            <ColumnDirective width={100}></ColumnDirective>
            <ColumnDirective width={180}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
          </ColumnsDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  );
}
```

```

        </SheetsDirective>
      </SpreadsheetComponent>
    );
  };
  export default App;
  const root = createRoot(document.getElementById('root'));
  root.render(<App />);
  {% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
  return (
    <SpreadsheetComponent>
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>
            <RangeDirective dataSource={data}></RangeDirective>
          </RangesDirective>
          <ColumnsDirective>
            <ColumnDirective width={100}></ColumnDirective>
            <ColumnDirective width={110}></ColumnDirective>
            <ColumnDirective width={100}></ColumnDirective>
            <ColumnDirective width={180}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
          </ColumnsDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  );
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

### DATASOURCE.JSX

```

/**
 * Default data source
 */
export let data = [{
  OrderID: 10248,
  CustomerID: 'VINET',
  EmployeeID: 5,
  ShipName: 'Vins et alcools Chevalier',
  ShipCity: 'Reims',
  ShipAddress: '59 rue de l'Abbaye'
}];

```

```

    },
    {
      OrderID: 10249,
      CustomerID: 'TOMSP',
      EmployeeID: 6,
      ShipName: 'Toms Spezialitäten',
      ShipCity: 'Münster',
      ShipAddress: 'Luisenstr. 48'
    },
    {
      OrderID: 10250,
      CustomerID: 'HANAR',
      EmployeeID: 4,
      ShipName: 'Hanari Carnes',
      ShipCity: 'Rio de Janeiro',
      ShipAddress: 'Rua do Paço, 67'
    },
    {
      OrderID: 10251,
      CustomerID: 'VICTE',
      EmployeeID: 3,
      ShipName: 'Victuailles en stock',
      ShipCity: 'Lyon',
      ShipAddress: '2, rue du Commerce'
    },
    {
      OrderID: 10252,
      CustomerID: 'SUPRD',
      EmployeeID: 4,
      ShipName: 'Suprêmes délices',

```

The local data source can also be provided as an instance of the [DataManager](#). By default, [DataManager](#) uses [JsonAdaptor](#) for local data-binding.

### Remote data

To bind remote data to the Spreadsheet control, assign service data as an instance of [DataManager](#) to the `dataSource` property. To interact with remote data source, provide the service endpoint `url`.

Refer to the following code example for remote data binding.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { DataManager, Query } from '@syncfusion/ej2-data';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const query = new Query().select(['OrderID', 'CustomerID', 'ShipName',
'ShipCity', 'ShipCountry', 'Freight']).take(200);
  const data = new DataManager({
    url: 'https://services.syncfusion.com/react/production/api/Orders',
    crossDomain: true
  });
  return (
    <SpreadsheetComponent>
      <SheetsDirective>
        <SheetDirective name='Shipment Details'>
          <RangesDirective>

```

```

        <RangeDirective dataSource={data}
query={query}></RangeDirective>
    </RangesDirective>
    <ColumnsDirective>
        <ColumnDirective width={100}></ColumnDirective>
        <ColumnDirective width={110}></ColumnDirective>
        <ColumnDirective width={100}></ColumnDirective>

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

#### *Binding with OData services*

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

#### **APP.JSX**

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const data = (new DataManager({
    adaptor: new ODataAdaptor(),
    url: 'https://services.syncfusion.com/react/production/api/Orders'

```

```

    ));
    React.useEffect(() => {
        let spreadsheet = spreadsheetRef.current
        // Applies cell and number formatting to specified range of the
        active sheet
        if (spreadsheet) {
            spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:K1');
        }
    }, []);
    return (
        <SpreadsheetComponent ref={spreadsheetRef}>
            <SheetsDirective>
                <SheetDirective name='Order Details'>
                    <RangesDirective>
                        <RangeDirective dataSource={data}></RangeDirective>
                    </RangesDirective>
                    <ColumnsDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={280}></ColumnDirective>
                        <ColumnDirective width={180}></ColumnDirective>
                        <ColumnDirective width={80}></ColumnDirective>
                        <ColumnDirective width={180}></ColumnDirective>
                        <ColumnDirective width={180}></ColumnDirective>
                    </ColumnsDirective>
                </SheetDirective>
            </SheetsDirective>
        </SpreadsheetComponent>
    );
};
export default App;

### Web API

You can use WebApiAdaptor to bind spreadsheet with Web API created using OData endpoint.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const data = (new DataManager({ adaptor: new WebApiAdaptor(), url:
'https://services.syncfusion.com/react/production/api/Orders' }));
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    // Applies cell and number formatting to specified range of the
active sheet
    if (spreadsheet) {
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:K1');
    }
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef}>
      <SheetsDirective>

### Cell data binding

The Spreadsheet control can bind the data to individual cell in a sheet . To achieve this you can use the `value` property.

Refer to the following code example for cell data binding.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RowsDirective, CellsDirective, RowDirective, CellDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-
spreadsheet';
function App() {
  return (
    <SpreadsheetComponent>
      <SheetsDirective>
        <SheetDirective selectedRange='D13' name='PriceDetails'>
          <RowsDirective>

```

```

        <RowDirective>
          <CellsDirective>
            <CellDirective value='Item Name'
></CellDirective>
            <CellDirective value='Quantity'
></CellDirective>
            <CellDirective value='Price'
></CellDirective>
            <CellDirective value='Amount'
></CellDirective>
            <CellDirective value='Stock Detail'
></CellDirective>
            <CellDirective value='Website'
></CellDirective>
          </CellsDirective>
        </RowDirective>
        <RowDirective>
          <CellsDirective>
            <CellDirective value='Casual Shoes'
></CellDirective>
            <CellDirective value='10' ></CellDirective>

```

The cell data binding also supports formula, style, number format, and more.

#### Dynamic data binding and Datasource change event

You can dynamically change the datasource of the spreadsheet by changing the `dataSource` property of the `range` object of the `sheet`. The `dataSourceChanged` event handler will be triggered when editing, inserting, and deleting a row in the datasource range. This event will be triggered with a parameter named `action` which indicates the `edit`, `add` and `delete` actions for the respective ones.

The following table defines the arguments of the `dataSourceChanged` event.

Property	Type	Description
action	string	Indicates the type of action such as <code>edit</code> , <code>add</code> , and <code>delete</code> performed in the datasource range.
data	object[]	Modified data for <code>edit</code> action; New data for <code>add</code> action; Deleted data for <code>delete</code> action.
rangeIndex	number	Specifies the range index of the datasource.
sheetIndex	number	Specifies the sheet index of the datasource.

For `add` action, the value for all the fields will be `null` in the data. In the case that you do not want the primary key field to be null which needs to be updated in the backend service, you can use `edit` action after updating the primary key field to update in the backend service. <br><br>

For inserting a row at the end of the datasource range, you should insert a row below at the end of the range to trigger the `dataSourceChanged` event with action `add`.

#### APP.JSX

```

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## See Also

- [Filtering](#)
- [Sorting](#)
- [Hyperlink](#)
- [Link to the Video](#)

## Open save in React Spreadsheet component

In import an excel file, it needs to be read and converted to client side Spreadsheet model. The converted client side Spreadsheet model is sent as JSON which is used to render Spreadsheet. Similarly, when you save the Spreadsheet, the client Spreadsheet model is sent to the server as JSON for processing and saved. Server configuration is used for this process.

To get start quickly with Open and Save, you can check on this video:

## Open

The Spreadsheet control opens an Excel document with its data, style, format, and more. To enable this feature, set [allowOpen](#) as `true` and assign service url to the [openUrl](#) property.

## User Interface:

In user interface you can open an Excel document by clicking **File > Open** menu item in ribbon.

The following sample shows the **Open** option by using the [openUrl](#) property in the Spreadsheet control. You can also use the [beforeOpen](#) event to trigger before opening an Excel file.

## APP.JSX

```
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
    const beforeOpen = () => {};
    return (
        <SpreadsheetComponent allowOpen={true}
openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/open' beforeOpen={beforeOpen} />
    );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
```

## APP.TSX

```
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
    const beforeOpen = ():void => {};
    return (
        <SpreadsheetComponent allowOpen={true}
openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/open' beforeOpen={beforeOpen} />
    );
};
```

```
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
```

Please find the below table for the beforeOpen event arguments.

Parameter	Type	Description
file	FileList or string or File	To get the file stream. <b>FileList</b> - contains length and item index. <b>File</b> - specifies the file lastModified and file name.
cancel	boolean	To prevent the open operation.
requestData	object	To provide the Form data.

\* Use **Ctrl + O** keyboard shortcut to open Excel documents.

\* The default value of the [allowOpen](#) property is **true**. For demonstration purpose, we have showcased the [allowOpen](#) property in previous code snippet.

#### Open an external URL excel file while initial load

You can achieve to access the remote excel file by using the [created](#) event. In this event you can fetch the excel file and convert it to a blob. Convert this blob to a file and [open](#) this file by using Spreadsheet component open method.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  React.useEffect(() => {
    const fetchData = async () => {
      const response = await
fetch('https://cdn.syncfusion.com/scripts/spreadsheet/Sample.xlsx'); //
fetch the remote url
      const fileBlob = await response.blob(); // convert the excel
file to blob
      const file = new File([fileBlob], 'Sample.xlsx'); //convert the
blob into file
      let spreadsheet = spreadsheetRef.current;
      if (spreadsheet) {
        spreadsheet.open({ file }); // open the file into
Spreadsheet
      }
    };
    fetchData();
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef}
    openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/op
en' />
```

```

    );
  };
  export default App;
  const root = createRoot(document.getElementById('root'));
  root.render(<App />);
  {% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  React.useEffect(() => {
    const fetchData = async (): Promise<void> => {
      const response: Response = await
        fetch('https://cdn.syncfusion.com/scripts/spreadsheet/Sample.xlsx'); //
        fetch the remote url
      const fileBlob: Blob = await response.blob(); // convert the
      excel file to blob
      const file: File = new File([fileBlob], 'Sample.xlsx');
      //convert the blob into file
      let spreadsheet = spreadsheetRef.current;
      if (spreadsheet) {
        spreadsheet.open({ file }); // open the file into
        Spreadsheet
      }
    };
    fetchData();
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef}
      openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/open' />
    );
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

#### To add custom header during open

You can add your own custom header to the open action in the Spreadsheet. For processing the data, it has to be sent from server to client side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [beforeOpen](#) event, the custom header can be added to the request during open action.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';

```

```
function App() {
  const beforeOpen = (args) => {
    args.requestData = { Authorization: 'YOUR TEXT' };
  };
  return (
    <SpreadsheetComponent
      openUrl="https://services.syncfusion.com/react/production/api/spreadsheet/open"
      beforeOpen={beforeOpen} />
  );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}
```

### APP.TSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { BeforeOpenEventArgs, SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const beforeOpen = (args: BeforeOpenEventArgs): void => {
    args.requestData = { Authorization: 'YOUR TEXT' };
  };
  return (
    <SpreadsheetComponent
      openUrl="https://services.syncfusion.com/react/production/api/spreadsheet/open"
      beforeOpen={beforeOpen} />
  );
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}
```

### Open excel file into a read-only mode

You can open excel file into a read-only mode by using the [openComplete](#) event. In this event, you must protect all the sheets and lock its used range cells by using [protectSheet](#) and [lockCells](#) methods.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { getRangeAddress, SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const openComplete = () => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      let sheets = spreadsheet.sheets;
      for (let index = 0; index < sheets.length; index++) {

```

```

        let name = spreadsheet.sheets[index].name;
        let protectSetting = { selectCells: true, formatCells: false
    };

        //To protect the sheet using sheet name
        spreadsheet.protectSheet(name, protectSetting);
        let address = getRangeAddress([0, 0,
sheets[index].usedRange.rowIndex, sheets[index].usedRange.colIndex,]);
        //To lock the used range cells
        spreadsheet.lockCells(name + '!' + address, true);
    }
    }
};
return (
    <SpreadsheetComponent ref={spreadsheetRef}
openComplete={openComplete}

openUrl="https://services.syncfusion.com/react/production/api/spreadsheet/op
en" />
    );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { getRangeAddress, ProtectSettingsModel, SheetModel,
SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
    const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
    const openComplete = (): void => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            let sheets: SheetModel[] = spreadsheet.sheets;
            for (let index: number = 0; index < sheets.length; index++) {
                let name: string = spreadsheet.sheets[index].name as string;
                let protectSetting: ProtectSettingsModel = { selectCells: true,
formatCells: false };
                //To protect the sheet using sheet name
                spreadsheet.protectSheet(name, protectSetting);
                let address: string = getRangeAddress([0, 0,
sheets[index].usedRange.rowIndex as number, sheets[index].usedRange.colIndex
as number,]);
                //To lock the used range cells
                spreadsheet.lockCells(name + '!' + address, true);
            }
        }
    };
    return (
        <SpreadsheetComponent ref={spreadsheetRef} openComplete={openComplete}

```

```

openUrl="https://services.syncfusion.com/react/production/api/spreadsheet/open" />
);
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### External workbook confirmation dialog

When you open an excel file that contains external workbook references, you will see a confirmation dialog. This dialog allows you to either continue with the file opening or cancel the operation. This confirmation dialog will appear only if you set the `AllowExternalWorkbook` property value to **false** during the open request, as shown below. This prevents the spreadsheet from displaying inconsistent data.

```

`csharp
public IActionResult Open(IFormCollection openRequest)
{
    OpenRequest open = new OpenRequest();
    open.AllowExternalWorkbook = false;
    open.File = openRequest.Files[0];
    return Content(Workbook.Open(open));
}
`

```

This feature is only applicable when importing an Excel file and not when loading JSON data or binding cell data.

![External workbook confirmation dialog](./images/external-reference-dialog-alert%20.png)

### Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Excel Macro-Enabled Workbook (.xlsm)
- Excel Binary Workbook(.xlsb)

### Save

The Spreadsheet control saves its data, style, format, and more as Excel file document. To enable this feature, set `allowSave` as **true** and assign service url to the `saveUrl` property.

### User Interface:

In user interface, you can save Spreadsheet data as Excel document by clicking **File > Save As** menu item in ribbon.

The following sample shows the **Save** option by using the [saveUrl](#) property in the Spreadsheet control. You can also use the [beforeSave](#) event to trigger before saving the Spreadsheet as an Excel file.

#### APP.JSX

```
{% raw %}

]
```

Please find the below table for the beforeSave event arguments.

Parameter	Type	Description
-----------	------	-------------

| ---- | ---- | ---- |

| url | string | Specifies the save url. |

| fileName | string | Specifies the file name. |

| saveType | SaveType | Specifies the saveType like Xlsx, Xls, Csv and Pdf. |

| customParams | object | Passing the custom parameters from client to server while performing save operation. |

| isFullPost | boolean | It sends the form data from client to server, when set to true. It fetches the data from client to server and returns the data from server to client, when set to false. |

| needBlobData | boolean | You can get the blob data if set to true. |

| cancel | boolean | To prevent the save operations. |

\* Use **Ctrl + S** keyboard shortcut to save the Spreadsheet data as Excel file.

\* The default value of [allowSave](#) property is **true**. For demonstration purpose, we have showcased the [allowSave](#) property in previous code snippet.

\* Demo purpose only, we have used the online web service url link.

*To send and receive custom params from client to server*

Passing the custom parameters from client to server by using [beforeSave](#) event.

## APP.JSX

```

]

```

Server side code snippets:

`csharp

public IActionResult Save(SaveSettings saveSettings, string customParams)

{

Console.WriteLine(customParams); // you can get the custom params in controller side

return Workbook.Save(saveSettings);

}

`

*To add custom header during save*

You can add your own custom header to the save action in the Spreadsheet. For processing the data, it has to be sent from client to server side and adding customer header can provide privacy to the data with the help of Authorization Token. Through the [fileMenuItemSelect](#) event, the custom header can be added to the request during save action.

*To change the PDF orientation*

By default, the PDF document is created in **Portrait** orientation. You can change the orientation of the PDF document by using the `args.pdfLayoutSettings.orientation` argument settings in the [beforeSave](#) event.

The possible values are:

- **Portrait** - Used to display content in a vertical layout.
- **Landscape** - Used to display content in a horizontal layout.

**APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';

### Supported file formats

The following list of Excel file formats are supported in Spreadsheet:

- MS Excel (.xlsx)
- MS Excel 97-2003 (.xls)
- Comma Separated Values (.csv)
- Portable Document Format (.pdf)

### Methods

To save the Spreadsheet document as an `xlsx`, `xls`, `csv`, or `pdf` file, by using `save` method should be called with the `url`, `fileName` and `saveType` as parameters. The following code example shows to save the spreadsheet file as an `xlsx`, `xls`, `csv`, or `pdf` in the button click event.

### APP.JSX

### Server Configuration

In Spreadsheet control, Excel import and export support processed in **server-side**, to use importing and exporting in your projects, it is required to create a server with any of the following web services.

- WebAPI
- WCF Service
- ASP.NET MVC Controller Action

The following code snippets shows server configuration using **WebAPI** service.

```
`csharp  
[Route("api/[controller]")]  
public class SpreadsheetController : Controller  
{  
    //To open excel file  
    [AcceptVerbs("Post")]  
    [HttpPost]  
    [EnableCors("AllowAllOrigins")]  
    [Route("Open")]  
    public IActionResult Open(IFormCollection openRequest)  
    {  
        OpenRequest open = new OpenRequest();  
        open.File = openRequest.Files[0];  
        return Content(Workbook.Open(open));  
    }  
    //To save as excel file  
    [AcceptVerbs("Post")]
```

```
[HttpPost]
[EnableCors("AllowAllOrigins")]
[Route("Save")]
public IActionResult Save([FromForm]SaveSettings saveSettings)
{
    return Workbook.Save(saveSettings);
}
}
```

### Server Dependencies

Open and save helper functions are shipped in the Syncfusion.EJ2.Spreadsheet package, which is available in Essential Studio and [nuget.org](https://nuget.org). Following list of dependencies required for Spreadsheet open and save operations.

- Syncfusion.EJ2
- Syncfusion.EJ2.Spreadsheet
- Syncfusion.Compression.Base
- Syncfusion.XlsIO.Base

And also refer [this](#) for more information.

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## Worksheet in React Spreadsheet component

Worksheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data.

### Add sheet

You can dynamically add or insert a sheet by one of the following ways,

- Click the **Add Sheet** button in the sheet tab. This will add a new empty sheet next to current active sheet.
- Right-click on the sheet tab, and then select **Insert** option from the context menu to insert a new empty sheet before the current active sheet.
- Using [insertSheet](#) method, you can insert one or more sheets at your desired index.

The following code example shows the insert sheet operation in spreadsheet.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { data } from '../datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  React.useEffect(() => {
    const insSheetModel = [{
      index: 1,
      name: 'Inserted Sheet',
      ranges: [{ dataSource: data }],
      columns: [
        { width: 150 },
        { width: 110 },
        { width: 110 },
        { width: 85 },
        { width: 85 },
        { width: 85 },
        { width: 85 },
        { width: 85 },
        { width: 85 },
      ]
    }];
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      // Applies style formatting to the active sheet before inserting
      // a new sheet
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' }, 'A1:H1');
      spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:H11');
      // inserting a new sheet with data at 1st index
      // You can also insert empty sheets by specifying the start and
      // end sheet index instead of sheet model
      spreadsheet.insertSheet(insSheetModel);
      // Applies style formatting for the inserted sheet
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center' }, 'Inserted Sheet!A1:H1');
      spreadsheet.cellFormat({ textAlign: 'center' }, 'Inserted Sheet!D2:H11');
    }
  }, []);
  return (
    <SpreadsheetComponent showRibbon={false} ref={spreadsheetRef}
    showFormulaBar={true}>
      <SheetsDirective>
        <SheetDirective name="Price Details">
          <RangesDirective>
            <RangeDirective dataSource={data}></RangeDirective>
          </RangesDirective>
          <ColumnsDirective>

```

```

        <ColumnDirective width={150}></ColumnDirective>
        <ColumnDirective width={110}></ColumnDirective>
        <ColumnDirective width={110}></ColumnDirective>

```

### Delete sheet

The Spreadsheet has support for removing an existing worksheet. You can dynamically delete the existing sheet by the following way,

- Right-click on the sheet tab, and then select **Delete** option from context menu.

- Using [delete](#) method to delete the sheets.

### Rename sheet

You can dynamically rename an existing worksheet in the following way,

- Right-click on the sheet tab, and then select **Rename** option from the context menu.

### Headers

By default, the row and column headers are visible in worksheets. You can dynamically show or hide worksheet headers by using one of the following ways,

- Switch to **View** tab, and then select **Hide Headers** option to hide both the row and column headers.
- Set **showHeaders** property in **sheets** as **true** or **false** to show or hide the headers at initial load. By default, the **showHeaders** property is enabled in each worksheet.

### Gridlines

Gridlines act as a border like appearance of cells. They are used to distinguish cells on the worksheet. You can dynamically show or hide gridlines by using one of the following ways,

- Switch to **View** tab, and then select **Hide Gridlines** option to hide the gridlines in worksheet.
- Set **showGridLines** property in **sheets** as **true** or **false** to show or hide the gridlines at initial load. By default, the **showGridLines** property is enabled in each worksheet.

The following code example shows the headers and gridlines operation in spreadsheet.

55 }
];
```

**Sheet visibility**

Hiding a worksheet can help prevent unauthorized or accidental changes to your file.

There are three visibility state as like Microsoft Excel,

| State | Description |

|-----|-----|

| **Visible** | You can see the worksheet once the component is loaded. |

| **Hidden** | This worksheet is not visible, but you can unhide by selecting the sheet from **List All Sheets** dropdown menu. |

| **VeryHidden** | This worksheet is not visible and cannot be unhidden. Changing the state property to **Visible** is the only way to view this sheet. |

The following code example shows the three types of sheet visibility state.

### APP.JSX

```
{% raw %}
import * as React from 'react';

### Cell range in React Spreadsheet component

A group of cells in a sheet is known as cell range.

To get start quickly with Cell Range, you can check on this video:

### Wrap text

Wrap text allows you to display large content as multiple lines in a single cell. By default, the wrap text support is enabled. Use the [allowWrap](#) property to enable or disable the wrap text support in spreadsheet.

Wrap text can be applied or removed to a cell or range of cells in the following ways,

- Using the `wrap` property in `cell`, you can enable or disable wrap text to a cell at initial load.
- Select or deselect wrap button from ribbon toolbar to apply or remove the wrap text to the selected range.
- Using the `wrap` method, you can apply or remove the wrap text once the component is loaded.

The following code example shows the wrap text functionality in spreadsheet.

### Limitations of Wrap text

The following features have some limitations in wrap text:

- Sorting with wrap text applied data.
- Merge with wrap text

### Merge cells

Merge cells allows users to span two or more cells in the same row or column into a single cell. When cells with multiple values are merged, top-left most cell data will be the data for the merged cell. By default, the merge cells option is enabled. Use [allowMerge](#) property to enable or disable the merge cells option in spreadsheet.

You can merge the range of cells in the following ways,

- Set the `rowSpan` and `colSpan` property in `cell` to merge the number of cells at initial load.
- Select the range of cells and apply merge by selecting the desired option from ribbon toolbar.
- Use [merge](#) method to merge the range of cells, once the component is loaded.

The available merge options in spreadsheet are,

Type	Action
----- -----	
Merge All	Combines all the cells in a range in to a single cell (default).
Merge Horizontally	Combines cells in a range as row-wise.
Merge Vertically	Combines cells in a range as column-wise.
UnMerge	Splits the merged cells into multiple cells.

The following code example shows the merge cells operation in spreadsheet.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RowsDirective, RowDirective, CellsDirective, CellDirective

### Limitations of Merge

The following features have some limitations in Merge:

- Merge with filter.
- Merge with wrap text.

### Data Validation

Data Validation is used to restrict the user from entering the invalid data. You can use the [allowDataValidation](#) property to enable or disable data validation.

\* The default value for `allowDataValidation` property is `true`.

### Apply Validation

You can apply data validation to restrict the type of data or the values that users enter into a cell.

You can apply data validation by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Data Validation item.
- Use the [addDataValidation\(\)](#) method programmatically.

#### *Clear Validation*

Clear validation feature is used to remove data validations from the specified ranges or the whole worksheet.

You can clear data validation rule by one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Validation item.
- Use the [removeDataValidation\(\)](#) method programmatically.

#### *Highlight Invalid Data*

Highlight invalid data feature is used to highlight the previously entered invalid values.

You can highlight an invalid data by using one of the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Highlight Invalid Data item.
- Use the [addInvalidHighlight\(\)](#) method programmatically.

#### *Clear Highlighted Invalid Data*

Clear highlight feature is used to remove the highlight from invalid cells.

You can clear the highlighted invalid data by using the following ways,

- Select the Data tab in the Ribbon toolbar, and then choose the Clear Highlight item.
- Use the [removeInvalidHighlight\(\)](#) method programmatically.

### Limitations of Data validation

The following features have some limitations in Data Validation:

- Entire row data validation.
- Insert row between the data validation.
- Copy/paste with data validation.
- Delete cells between data validation applied range.

### Auto Fill

Auto Fill is used to fill the cells with data based on adjacent cells. It also follows a pattern from adjacent cells if available. There is no need to enter the repeated data manually. You can use `allowAutoFill` property to enable/disable the auto fill support. You can also use `showFillOptions` property to enable/disable the fill option and `fillType` property to change the default auto fill option which is available in `autoFillSettings`.

You can do this by one of the following ways,

- Using “AutoFillOptions” menu which is open, while drag and drop the cell using fill handle element.
- Use the `autoFill()` method programmatically.

The available parameters in `autoFill()` method are,

Parameter	Type	Description
-----------	------	-------------

|----|----|----|

| fillRange | string | Specifies the fill range. |

| dataRange | string | Specifies the data range. |

| direction | AutoFillDirection | Specifies the direction("Up","Right","Down","Left")to be filled. |

| fillType | AutoFillType | Specifies the fill type("CopyCells","FillSeries","FillFormattingOnly","FillWithoutFormatting") for autofill action. |

In Auto Fill we have following options,

- Copy Cells
- Fill Series
- Fill Formatting Only
- Fill Without Formatting

\* The default auto fill option is “FillSeries” which can be referred from fillType property.

### Copy Cells

To copy the selected cell content to the adjacent cells. You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Copy Cells” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “CopyCells” as fill type in autoFill method to fill the adjacent cells.

### Fill Series

To fill the series of numbers, characters, or dates based on selected cell content to the adjacent cells with their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Series” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillSeries” as fill type in autoFill method to fill the adjacent cells.

### Fill Formatting Only

To fill the cell style and number formatting based on the selected cell content to the adjacent cells without their content.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Formatting Only” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillFormattingOnly” as fill type in autoFill method to fill the adjacent cells.

### Fill Without Formatting

To fill series of numbers, characters, or dates based on the selected cells to the adjacent cells without their formats.

You can do this by one of the following ways,

- Using fill handle to select the adjacent cell range and “Fill Without Formatting” option in “AutoFillOptions” menu to fill the adjacent cells.
- Using “FillWithoutFormatting” as fill type in `autoFill` method to fill the adjacent cells.

In the following sample, you can enable/disable the fill option on the button click event by using the `showFillOptions` property in `autoFillSettings`.

```

### Limitations of Autofill

The following features have some limitations in Autofill:

- Flash Fill option in Autofill feature.
- Fill with Conditional Formatting applied cells.

### Clear

Clear feature helps you to clear the cell contents (formulas and data), formats (including number formats, conditional formats, and borders) in a spreadsheet. When you apply clear all, both the contents and the formats will be cleared simultaneously.

### Apply Clear Feature

You can apply clear feature by using one of the following ways,

- Select the clear icon in the Ribbon toolbar under the Home Tab.
- Using the [clear\(\)](#) method to clear the values.

Clear has the following types in the spreadsheet,

| Options | Uses |

|-----|-----|

| **Clear All** | Used to clear all contents, formats, and hyperlinks. |

| **Clear Formats** | Used to clear the formats (including number formats, conditional formats, and borders) in a cell. |

| **Clear Contents** | Used to clear the contents (formulas and data) in a cell. |

| **Clear Hyperlinks** | Used to clear the hyperlink in a cell. |

### Methods

Clear the cell contents and formats in the Spreadsheet document by using the [clear](#) method. The [clear](#) method has **type** and **range** as parameters. The following code example shows how to clear the cell contents and formats in the button click event.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
```

```

import { DropDownButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { SpreadsheetComponent, SheetsDirective, SheetDirective, RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    const items = [
        { text: "Clear All" },
        { text: "Clear Formats" },
        { text: "Clear Contents" },
        { text: "Clear Hyperlinks" }
    ];
    const handleItemSelect = (args) => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            if (args.item.text === 'Clear All')
                spreadsheet.clear({ type: 'Clear All', range: 'D1:D10' });
            // Clear the content, formats and hyperlinks applied in the provided range.
            if (args.item.text === 'Clear Formats')
                spreadsheet.clear({ type: 'Clear Formats', range: 'B1:B10' });
            // Clear the formats applied in the provided range
            if (args.item.text === 'Clear Contents')
                spreadsheet.clear({ type: 'Clear Contents', range: 'A1:A10' });
            // Clear the content in the provided range
            if (args.item.text === 'Clear Hyperlinks')
                spreadsheet.clear({ type: 'Clear Hyperlinks', range: 'F2:F6' });
            // Clear the hyperlinks applied in the provided range
        }
    };
    React.useEffect(() => {
        let spreadsheet = spreadsheetRef.current;

## Editing in React Spreadsheet component

You can edit the contents of a cell directly in the cell or by typing in the formula bar. By default, the editing feature is enabled in the spreadsheet. Use the [Link to the Video](#) property to enable or disable the editing feature.

To get started quickly with Editing, you can check on this video:

### Edit cell

You can start editing by one of the following ways,

- Double click a cell to start the edit mode.
- Press F2 key to edit the active cell.
- Use formula bar to perform editing.
- Use BACKSPACE or SPACE key to clear the cell content and start the edit mode.
- Using the [startEdit](#) method.

### Save cell

If the cell is in editable state, you can save the edited cell by one of the following ways,

- Perform mouse click on any other cell rather than the current editing cell.
- Press Enter or Tab keys to save the edited cell content.
- Using the [endEdit](#) method.

### Cancel editing

To cancel the editing without saving the changes, you can use one of the following ways,

- Press **ESCAPE** key, this will remove the editable state and update the unchanged cell content.
- Using the [closeEdit](#) method.

The following sample shows how to prevent the editing and cell save. Here **E** column prevent the editing by using cancel argument as true in [cellEdit](#) event. In **D** column, prevent saving the edited changes by using cancel argument as true in [beforeCellSave](#) and use [closeEdit](#) method in spreadsheet.

```

### Limitations

- Text overflow in cells is not supported in Editing.

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

### See Also

- [Cell range](#)
- [Formatting](#)
- [Hyperlink](#)
- [Undo and Redo](#)
- [Unlock the particular cells in the protected sheet](#)

### Context menu in React Spreadsheet component

Context Menu is used to improve user interaction with Spreadsheet using the popup menu. This will open when right-clicking on Cell/Column Header/Row Header/ Pager in the Spreadsheet. You can use [enableContextMenu](#) property to enable/disable context menu.

The default value for the `enableContextMenu` property is `true`.

#### Context Menu Items in Row Cell

Please find the table below for default context menu items and their actions.

Context Menu items	Action
----- -----	
<a href="#">Cut</a>	Cut the selected cells data to the clipboard, you can select a cell where you want to move the data.
<a href="#">Copy</a>	Copy the selected cells data to the clipboard, so that you can paste it to somewhere else.
<a href="#">Paste</a>	Paste the data from clipboard to spreadsheet.
<a href="#">Paste Special</a>	<a href="#">Values</a> - Paste the data values from clipboard to spreadsheet. <a href="#">Formats</a> - Paste the data formats from   clipboard to spreadsheet.
<a href="#">Filter</a>	Perform filtering to the selected cells based on an active cell's value.
<a href="#">Sort</a>	Perform sorting to the selected range of cells by ascending or descending.
<a href="#">Hyperlink</a>	Create a link in the spreadsheet to navigate to web links or cell reference within the sheet or other sheets   in the Spreadsheet.

#### Context Menu Items in Row Header / Column Header

Please find the table below for default context menu items and their actions.

Context Menu items	Action
----- -----	
<a href="#">Cut</a>	Cut the selected row/column header data to the clipboard, you can select a cell where you want to move the data.
<a href="#">Copy</a>	Copy the selected row/column header data to the clipboard, so that you can paste it to somewhere else.
<a href="#">Paste</a>	Paste the data from clipboard to spreadsheet.
<a href="#">Paste Special</a>	<a href="#">Values</a> - Paste the data values from clipboard to spreadsheet. <a href="#">Formats</a> - Paste the data formats from   clipboard to spreadsheet.
<a href="#">Insert Columns</a>	Insert new rows or columns into the worksheet.
<a href="#">Delete Columns</a>	Delete existing rows or columns from the worksheet.
<a href="#">Hide Columns</a>	Hide the rows and columns.
<a href="#">UnHide Columns</a>	Show the hidden rows and columns.

#### Context Menu Items in Pager

Please find the table below for default context menu items and their actions.

Context Menu items	Action
----- -----	
<a href="#">Insert</a>	Insert a new worksheet in front of an existing worksheet in the spreadsheet.

- | **Delete** | Delete the selected worksheet from the spreadsheet. |
- | **Rename** | Rename the selected worksheet. |
- | [Protect Sheet](#) | Prevent unwanted changes from others by limiting their ability to edit. |
- | [Hide](#) | Hide the selected worksheet. |

### Context Menu Customization

You can perform the following context menu customization options in the spreadsheet

- Add Context Menu Items
- Remove Context Menu Items
- Enable/Disable Context Menu Items

#### Add Context Menu Items

You can add the custom items in context menu using the [addContextMenuItems](#) in `contextmenuBeforeOpen` event

In this demo, Custom Item is added after the Paste item in the context menu.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const onContextMenuBeforeOpen = (args) => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet && args.element.id === spreadsheet.element.id +
    '_contextmenu') {
      spreadsheet.addContextMenuItems([{ text: 'Custom Item' }],
      'Paste Special', false); //To pass the items, Item before / after that the
      element to be inserted, Set false if the items need to be inserted before
      the text.
    }
  };
  return (<SpreadsheetComponent ref={spreadsheetRef}
  contextMenuBeforeOpen={onContextMenuBeforeOpen} />);
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}
```

#### APP.TSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { BeforeOpenCloseMenuEventArgs } from '@syncfusion/ej2-react-splitbuttons';
function App() {
```

```

const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
const onContextMenuBeforeOpen = (args: BeforeOpenCloseMenuEventArgs) =>
{
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet && args.element.id === spreadsheet.element.id +
'_contextmenu') {
        spreadsheet.addContextMenuItems([
            { text: 'Custom Item' } ],
            'Paste Special', false); //To pass the items, Item before / after that the
element to be inserted, Set false if the items need to be inserted before
the text.
    }
};
return (<SpreadsheetComponent ref={spreadsheetRef}
contextMenuBeforeOpen={onContextMenuBeforeOpen} />);
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

### Remove Context Menu Items

You can remove the items in context menu using the [removeContextMenuItems](#) in `contextmenuBeforeOpen` event

In this demo, Insert Column item has been removed from the row/column header context menu.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
    const spreadsheetRef = React.useRef(null);
    const onContextMenuBeforeOpen = () => {
        let spreadsheet = spreadsheetRef.current;
        // To remove existing context menu items.
        if (spreadsheet) {
            spreadsheet.removeContextMenuItems(['Insert Column'], false);
        }
    };
    return (<SpreadsheetComponent ref={spreadsheetRef}
contextMenuBeforeOpen={onContextMenuBeforeOpen} />);
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {

```

```

const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
const onContextMenuBeforeOpen = (): void => {
  let spreadsheet = spreadsheetRef.current;
  // To remove existing context menu items.
  if (spreadsheet) {
    spreadsheet.removeContextMenuItems(['Insert Column'], false);
  }
};
return (<SpreadsheetComponent ref={spreadsheetRef}
contextMenuBeforeOpen={onContextMenuBeforeOpen} />);
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

### Enable/Disable Context Menu Items

You can enable/disable the items in context menu using the [enableContextMenuItems](#) in `contextmenuBeforeOpen` event

In this demo, Rename item is disabled in the pager context menu.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const onContextMenuBeforeOpen = (args) => {
    let spreadsheet = spreadsheetRef.current;
    //To enable / disable context menu items.
    if (spreadsheet && args.element.id === spreadsheet.element.id +
    '_contextmenu') {
      spreadsheet.enableContextMenuItems(['Rename'], false, false); //
      Contextmenu Items that needs to be enabled / disabled, Set true / false to
      enable / disable the menu items, Set true if the given text is a unique id.
    }
  };
  return (<SpreadsheetComponent ref={spreadsheetRef}
contextMenuBeforeOpen={onContextMenuBeforeOpen} />);
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

## Formulas in React Spreadsheet component

Formulas are used for calculating the data in a worksheet. You can refer the cell reference from same sheet or from different sheets.

### Usage

You can set formula for a cell in the following ways,

- Using the `formula` property from `cell`, you can set the formula or expression to each cell at initial load.
- Set the formula or expression through data binding.
- You can set formula for a cell by [editing](#).
- Using the [updateCell](#) method, you can set or update the cell formula.

### Culture-Based Argument Separator

Previously, although you could import culture-based Excel files into the Spreadsheet component, the formulas wouldn't calculate correctly. This was due to the absence of culture-based argument separators and support for culture-based formatted numeric values as arguments. However, starting from version 25.1.35, you can now import culture-based Excel files into the Spreadsheet component.

Before importing culture-based Excel files, ensure that the Spreadsheet component is rendered with the corresponding culture. Additionally, launch the import/export services with the same culture to ensure compatibility.

When loading spreadsheet data with culture-based formula argument separators using cell data binding, local/remote data, or JSON, ensure to set the [listSeparator](#) property value as the culture-based list separator from your end. Additionally, note that when importing an Excel file, the [listSeparator](#) property will be updated based on the culture of the launched import/export service.

In the example below, the Spreadsheet component is rendered with the **German culture (de)**. Additionally, you can find references on how to set the culture-based argument separator and culture-based formatted numeric value as arguments to the formulas.

### Create User Defined Functions / Custom Functions

The Spreadsheet includes a number of built-in formulas. For your convenience, a list of supported formulas can be found [here](#).

You can define and use an unsupported formula, i.e. a user defined/custom formula, in the spreadsheet by using the [addCustomFunction](#) function. Meanwhile, remember that you should define a user defined/custom formula whose results should only return a single value. If a user-defined/custom formula returns an array, it will be time-consuming to update adjacent cell values.

The following code example shows an unsupported formula in the spreadsheet.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RowsDirective, RowDirective, CellDirective, CellsDirective
} from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const styles = { textAlign: 'center', fontWeight: 'bold', verticalAlign:
'middle', fontStyle: 'italic', fontSize: '15pt' };
  const cellStyle = { fontStyle: 'italic', fontWeight: 'bold' };
  const fontStyle = { fontWeight: 'bold', textAlign: 'right' };
  // Custom function to calculate percentage between two cell values.
  const calculatePercentage = (firstCell, secondCell) => {
    return Number(firstCell) / Number(secondCell);
  };
  // Custom function to calculate round down for values.
  const roundDownHandler = (value, digit) => {
    let multiplier = Math.pow(10, digit);
    return Math.floor(value * multiplier) / multiplier;
  }
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
}, 'A2:F2');
      spreadsheet.numberFormat('$#,##0', 'B3:D12');
      spreadsheet.numberFormat('0%', 'E3:E12');
    }
  });
}

```

```

        // Adding custom function for calculating the percentage between
        two cells.
        spreadsheet.addCustomFunction(calculatePercentage,
        'PERCENTAGE');
        // Adding custom function for calculating round down for the
        value.
        spreadsheet.addCustomFunction(roundDownHandler, 'ROUNDDOWN');
        // Calculate percentage using custom added formula in E12 cell.
        spreadsheet.updateCell({ formula: '=PERCENTAGE(C12,D12)' },
        'E12');
        // Calculate round down for average values using custom added
        formula in F12 cell.
        spreadsheet.updateCell({ formula: '=ROUNDDOWN(F11,1)' }, 'F12');
    }
    }, []);

    'Percentage Change': '=C11/D11',
    'Average Change': '=7.9/E11',
  },
],
];

```

Second, if you want to directly compute any formula or expression, you can use the [computeExpression](#) method. This method will work for both built-in and used-defined/custom formula.

The following code example shows how to use `computeExpression` method in the spreadsheet.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RowsDirective, RowDirective, CellDirective, CellsDirective
} from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    const styles = { textAlign: 'center', fontWeight: 'bold', verticalAlign:
'middle', fontStyle: 'italic', fontSize: '15pt' };
    const cellStyle = { fontStyle: 'italic', fontWeight: 'bold' };
    const fontStyle = { fontWeight: 'bold', textAlign: 'right' };
    // Custom function to calculate percentage between two cell values.
    const calculatePercentage = (firstCell, secondCell) => {
        return Number(firstCell) / Number(secondCell);
    };
    React.useEffect(() => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
}, 'A2:E2');
            spreadsheet.numberFormat('$#,##0', 'B3:D12');
            spreadsheet.numberFormat('0%', 'E3:E12');
            // Adding custom function for calculating the percentage between
two cells.
            spreadsheet.addCustomFunction(calculatePercentage,
'PERCENTAGE');
            // Calculate percentage using custom added formula in E11 cell.
            spreadsheet.updateCell({ formula: '=PERCENTAGE(C11,D11)' },
'E11');
            // Calculate expressions using computeExpression in E10 cell.
            spreadsheet.updateCell({ value:
spreadsheet.computeExpression('C10/D10') }, 'E10');
            // Calculate custom formula values using computeExpression in

```

### Formula bar

Formula bar is used to edit or enter cell data in much easier way. By default, the formula bar is enabled in the spreadsheet. Use the [showFormulaBar](#) property to enable or disable the formula bar.

### Named Ranges

You can define a meaningful name for a cell range and use it in the formula for calculation. It makes your formula much easier to understand and maintain. You can add named ranges to the Spreadsheet in the following ways,

- Using the [definedNames](#) collection, you can add multiple named ranges at initial load.
- Use the [addDefinedName](#) method to add a named range dynamically.
- You can remove an added named range dynamically using the [removeDefinedName](#) method.
- Select the range of cells, and then enter the name for the selected range in the name box.

The following code example shows the usage of named ranges support.

### Supported Formulas

The following are the list of formulas supported in spreadsheet,

Formula	Description
-----	-----
ABS	Returns the value of a number without its sign.
ADDRESS	Returns a cell reference as text, given specified row and column numbers.
AND	Returns TRUE if all the arguments are TRUE, otherwise returns FALSE.
AVERAGE	Calculates average for the series of numbers and/or cells excluding text.
AVERAGEA	Calculates the average for the cells evaluating TRUE as 1, text and FALSE as 0.
AVERAGEIF	Clears content of the active cell and enables edit mode.
AVERAGEIFS	Calculates average for the cells based on specified conditions.
CEILING	Rounds a number up to the nearest multiple of a given factor.
CHOOSE	Returns a value from list of values, based on index number.
CHAR	Returns the character from the specified number.
CODE	Returns the numeric code for the first character in a given string.
CONCAT	Concatenates a list or a range of text strings.
CONCATENATE	Combines two or more strings together.
COUNT	Counts the cells that contain numeric values in a range.
COUNTA	Counts the cells that contains values in a range.
COUNTBLANK	Returns the number of empty cells in a specified range of cells.
COUNTIF	Counts the cells based on specified condition.
COUNTIFS	Counts the cells based on specified conditions.
DATE	Returns the date based on given year, month, and day.
DATEVALUE	Converts a date string into date value.
DAY	Returns the day from the given date.
DAYS	Returns the number of days between two dates.
DECIMAL	Converts a text representation of a number in a given base into a decimal number.
DEGREES	Converts radians to degrees.
DOLLAR	Converts the number to currency formatted text.
EDATE	Returns a date with given number of months before or after the specified date.
EOMONTH	Returns the last day of the month that is a specified number of months before or after an initially supplied start date.
EVEN	Rounds a positive number up and negative number down to the nearest even integer.
EXACT	Checks whether a two text strings are exactly same and returns TRUE or FALSE.

| EXP | Returns e raised to the power of the given number. |

| FACT | Returns the factorial of a number. |

| FIND | Returns the position of a string within another string, which is case sensitive. |

| FLOOR | Rounds a number down to the nearest multiple of a given factor. |

| HLOOKUP | Looks for a value in the top row of the array of values and then returns a value in the same column from a row in the array that you specify. |

| HOUR | Returns the number of hours in a specified time string. |

| IF | Returns value based on the given expression. |

| IFERROR | Returns value if no error found else it will return specified value. |

| IFS | Returns value based on the given multiple expressions. |

| INDEX | Returns a value of the cell in a given range based on row and column number. |

| INT | Rounds a number down to the nearest integer. |

| INTERCEPT | Calculates the point of the Y-intercept line via linear regression. |

| ISNUMBER | Returns true when the value parses as a numeric value. |

| LARGE | Returns the **k-th** largest value in a given array. |

| LEN | Returns a number of characters in a given string. |

| LN | Returns the natural logarithm of a number. |

| LOG | Returns the logarithm of a number to the base that you specify. |

| LOOKUP | Looks for a value in a one-row or one-column range, then returns a value from the same position in a second one-row or one-column range. |

| MATCH | Returns the relative position of a specified value in given range. |

| MAX | Returns the largest number of the given arguments. |

| MEDIAN | Returns the median of the given set of numbers. |

| MINUTE | Returns the number of minutes in a specified time string. |

| MIN | Returns the smallest number of the given arguments. |

| MOD | Returns a remainder after a number is divided by divisor. |

| MONTH | Returns the number of months in a specified date string. |

| NOT | Returns the inverse of a given logical expression. |

| NOW | Returns the current date and time. |

| ODD | Rounds a positive number up and negative number down to the nearest odd integer. |

| OR | Returns TRUE if any of the arguments are TRUE, otherwise returns FALSE. |

| PI | Returns the value of pi. |

| POWER | Returns the result of a number raised to power. |

| PRODUCT | Multiplies a series of numbers and/or cells. |

| RADIANS | Converts degrees into radians. |

| RAND | Returns a random number between 0 and 1. |

| RANDBETWEEN | Returns a random integer based on specified values. |

| ROUND | Rounds a number to the specified number of digits. |

| ROUNDDOWN | Rounds a number down, toward zero. |

| ROUNDUP | Rounds a number up, away from zero. |

| RSQ | Returns the square of the Pearson product moment correlation coefficient based on data points in *knowny's* and *knownx's*. |

| SECOND | Returns the number of seconds in a specified time string. |

| SMALL | Returns the **k-th** smallest value in a given array. |

| SLOPE | Returns the slope of the line from linear regression of the data points. |

| SORT | Sorts the contents of a column, range, or array in ascending or descending order. |

| SQRT | Returns the square root of a positive number. |

| SUBTOTAL | Returns subtotal for a range using the given function number. |

| SUM | Adds a series of numbers and/or cells. |

| SUMIF | Adds the cells based on specified condition. |

| SUMIFS | Adds the cells based on specified conditions. |

| SUMPRODUCT | Returns the sum of the products of the corresponding array in given arrays. |

| T | Checks whether a value is text or not and returns the text. |

| TEXT | Converts the supplied value into text by using the user-specified format. |

| TIME | Converts hours, minutes, seconds to the time formatted text. |

| TODAY | Returns the current date. |

| TRUNC | Truncates a supplied number to a specified number of decimal places. |

| UNIQUE | Returns a unique values from a range or array. |

| VLOOKUP | Looks for a specific value in the first column of a lookup range and returns a corresponding value from a different column within the same row. |

### Formula Error Dialog

If you enter an invalid formula in a cell, an error dialog with an error message will appear. For instance, a formula with the incorrect number of arguments, a formula without parenthesis, etc.

| Error Message | Reason |

|-----|-----|

| We found that you typed a formula with an invalid arguments | Occurs when passing an argument even though it wasn't needed. |

| We found that you typed a formula with an empty expression | Occurs when passing an empty expression in the argument. |

| We found that you typed a formula with one or more missing opening or closing parenthesis | Occurs when an open parenthesis or a close parenthesis is missing. |

| We found that you typed a formula which is improper | Occurs when passing a single reference but a range was needed. |

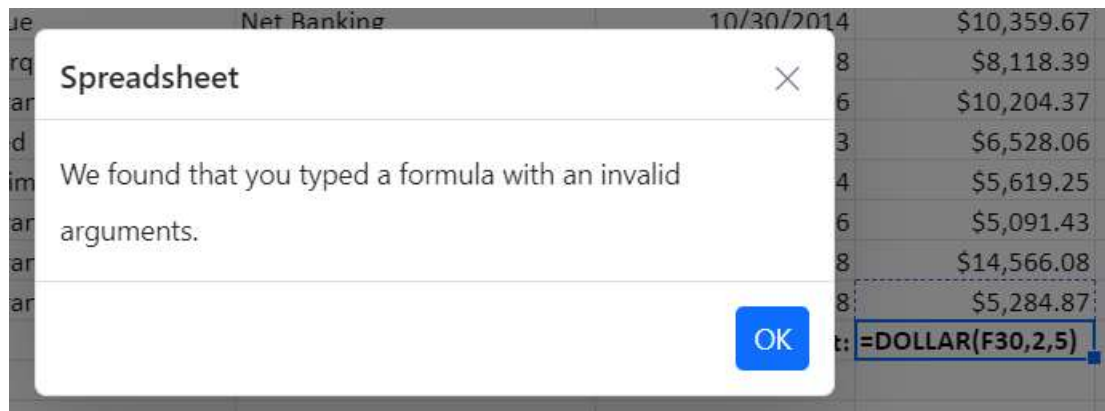

| We found that you typed a formula with a wrong number of arguments | Occurs when the required arguments were not passed. |

| We found that you typed a formula which requires 3 arguments | Occurs when the required 3 arguments were not passed. |

| We found that you typed a formula with a mismatched quotes | Occurs when passing an argument with mismatched quotes. |

| We found that you typed a formula with a circular reference | Occurs when passing a formula with circular cell reference. |

| We found that you typed a formula which is invalid | Except in the cases mentioned above, all other errors will fall into this broad category. |

#### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

#### Formatting in React Spreadsheet component

Formatting options make your data easier to view and understand. The different types of formatting options in the Spreadsheet are,

- Number Formatting
- Text Formatting
- Cell Formatting

To get start quickly with Formatting, you can check on this video:

### Number Formatting

Number formatting provides a type for your data in the Spreadsheet. Use the [allowNumberFormatting](#) property to enable or disable the number formatting option in the Spreadsheet. The different types of number formatting supported in Spreadsheet are,

Types	Format
-----	-----
General(default)	NA
Number	0.00
Currency	\$#,##0.00
Accounting	(\$ #,##0.00);(\$ (#,##0.00);(\$* "-"??);(@_)
ShortDate	mm-dd-yyyy
LongDate	dddd, mmmm dd, yyyy
Time	h:mm:ss AM/PM
Percentage	0.00%
Fraction	# ?/?
Scientific	0.00E+00
Text	@

Number formatting can be applied in following ways,

- Using the `format` property in `cell`, you can set the desired format to each cell at initial load.
- Using the [numberFormat](#) method, you can set the number format to a cell or range of cells.
- Selecting the number format option from ribbon toolbar.

### Custom Number Formatting

Spreadsheet supports custom number formats to display your data as numbers, dates, times, percentages, and currency values. If the pre-defined number formats do not meet your needs, you can set your own custom formats using custom number formats dialog or `numberFormat` method.

The different types of custom number formatting supported in Spreadsheet are,

Types	Format
-----	-----
General(default)	NA
Number	0
Number	0.00
Number	#,##0
Number	#,##0.00

Number	#,##0\_);(#,##0)
Number	`#,##0\_);Red`
Number	#,##0.00\_);(#,##0.00)
Number	`#,##0.00\_);Red`
Currency	\$#,##0\_);(\$#,##0)
Currency	`\$#,##0\_);Red`
Currency	\$#,##0.00\_);(\$#,##0.00)
Currency	`\$#,##0.00\_);Red`
Percentage	0%
Percentage	0.00%
Scientific	0.00E+00
Scientific	##0.0E+0
Fraction	# ?/?
Fraction	# ??/??
ShortDate	dd-mm-yy
Custom	dd-mmm-yy
Custom	dd-mmm
Custom	mmm-yy
Custom	h:mm AM/PM
Custom	h:mm:ss AM/PM
Custom	h:mm
Custom	h:mm:ss
Custom	dd-mm-yy h:mm
Custom	mm:ss
Custom	mm:ss.0
Text	@
Custom	[h]:mm:ss
Accounting	(\$ #,##0);(\$ (#,##0);(\$\* "-");(@\_)
Accounting	( #,##0);( (#,##0);(\* "-");(@\_)
Accounting	(\$ #,##0.00);(\$ (#,##0.00);(\$\* "-"?);(@\_)
Accounting	( #,##0.00);( (#,##0.00);(\* "-"?);(@\_)

Custom Number formatting can be applied in following ways,

- Using the [numberFormat](#) method, you can set your own custom number format to a cell or range of cells.
- Selecting the custom number format option from custom number formats dialog or type your own format in dialog input and then click apply button. It will apply the custom format for selected cells.

The following code example shows the number formatting in cell data.

#### APP.JSX

```
{% raw %}

### Text and cell formatting

Text and cell formatting enhances the look and feel of your cell. It helps to highlight a particular cell or range of cells from a whole workbook. You can apply formats like font size, font family, font color, text alignment, border etc. to a cell or range of cells. Use the [allowCellFormatting](#) property to enable or disable the text and cell formatting option in Spreadsheet. You can set the formats in following ways,

- Using the `style` property, you can set formats to each cell at initial load.
- Using the `cellFormat` method, you can set formats to a cell or range of cells.
- You can also apply by clicking the desired format option from the ribbon toolbar.

### Fonts

Various font formats supported in the spreadsheet are font-family, font-size, bold, italic, strike-through, underline and font color.

### Text Alignment

You can align text in a cell either vertically or horizontally using the `textAlign` and `verticalAlign` property.

### Indents

To enhance the appearance of text in a cell, you can change the indentation of a cell content using `textIndent` property.

### Fill color

To highlight cell or range of cells from whole workbook you can apply background color for a cell using `backgroundColor` property.

### Borders

You can add borders around a cell or range of cells to define a section of worksheet or a table. The different types of border options available in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Top Border | Specifies the top border of a cell or range of cells. |

| Left Border | Specifies the left border of a cell or range of cells. |

| Right Border | Specifies the right border of a cell or range of cells. |

| Bottom Border | Specifies the bottom border of a cell or range of cells. |

| No Border | Used to clear the border from a cell or range of cells. |

| All Border | Specifies all border of a cell or range of cells. |

| Horizontal Border | Specifies the top and bottom border of a cell or range of cells. |

| Vertical Border | Specifies the left and right border of a cell or range of cells. |

| Outside Border | Specifies the outside border of a range of cells. |

| Inside Border | Specifies the inside border of a range of cells. |

You can also change the color, size, and style of the border. The size and style supported in the spreadsheet are,

| Types | Actions |

|-----|-----|

| Thin | Specifies the `1px` border size (default). |

| Medium | Specifies the `2px` border size. |

- | Thick | Specifies the **3px** border size.
- | Solid | Used to create the **solid** border (default).
- | Dashed | Used to create the **dashed** border.
- | Dotted | Used to create the **dotted** border.
- | Double | Used to create the **double** border.

Borders can be applied in the following ways,

- Using the **border**, **borderLeft**, **borderRight**, **borderBottom** properties, you can set the desired border to each cell at initial load.
- Using the **setBorder** method, you can set various border options to a cell or range of cells.
- Selecting the border options from ribbon toolbar.

The following code example shows the style formatting in text and cells of the spreadsheet.

#### **APP.JSX**

### *Limitations of Formatting*

The following features are not supported in Formatting:

- Insert row/column between the formatting applied cells.
- Formatting support for row/column.

### Conditional Formatting

Conditional formatting helps you to format a cell or range of cells based on the conditions applied. You can enable or disable conditional formats by using the [allowConditionalFormat](#) property.

\* The default value for the `allowConditionalFormat` property is `true`.

### Apply Conditional Formatting

You can apply conditional formatting by using one of the following ways,

- Select the conditional formatting icon in the Ribbon toolbar under the Home Tab.
- Using the [conditionalFormat\(\)](#) method to define the condition.
- Using the `conditionalFormats` in sheets model.

Conditional formatting has the following types in the spreadsheet,

### Highlight cells rules

Highlight cells rules option in the conditional formatting enables you to highlight cells with a preset color depending on the cell's value.

The following options can be given for the highlight cells rules as type,

\* 'GreaterThan', 'LessThan', 'Between', 'EqualTo', 'ContainsText', 'DateOccur', 'Duplicate', 'Unique'.

The following preset colors can be used for formatting styles,

- \* `"RedFT"` - Light Red Fill with Dark Red Text,
- \* `"YellowFT"` - Yellow Fill with Dark Yellow Text,
- \* `"GreenFT"` - Green Fill with Dark Green Text,
- \* `"RedF"` - Red Fill,
- \* `"RedT"` - Red Text.

### Top bottom rules

Top bottom rules option in the conditional formatting allows you to apply formatting to the cells that satisfy a statistical condition with other cells in the range.

The following options can be given for the top bottom rules as type,

\* 'Top10Items', 'Bottom10Items', 'Top10Percentage', 'Bottom10Percentage', 'BelowAverage', 'AboveAverage'.

### Data Bars

You can apply data bars to represent the data graphically inside a cell. The longest bar represents the highest value and the shorter bars represent the smaller values.

The following options can be given for the data bars as type,

\* 'BlueDataBar', 'GreenDataBar', 'RedDataBar', 'OrangeDataBar', 'LightBlueDataBar', 'PurpleDataBar'.

### Color Scales

Using color scales, you can format your cells with two or three colors, where different color shades represent the different cell values. In the Green-Yellow-Red(GYR) Color Scale, the cell that holds the minimum value is colored as red. The cell that holds the median is colored as yellow, and the cell that holds the maximum value is colored as green. All other cells are colored proportionally.

The following options can be given for the color scales as type,

\* 'GYRColorScale', 'RYGColorScale', 'GWRColorScale', 'RWGColorScale', 'BWRColorScale', 'RWBColorScale', 'WRCColorScale', 'RWColorScale', 'GWColorScale', 'WGColorScale', 'GYColorScale', 'YGColorScale'.

### Icon Sets

Icon sets will help you to visually represent your data with icons. Every icon represents a range of values. In the Three Arrows(colored) icon, the green arrow icon represents the values greater than 67%, the yellow arrow icon represents the values between 33% to 67%, and the red arrow icon represents the values less than 33%.

The following options can be given for the icon sets as type,

\* 'ThreeArrows', 'ThreeArrowsGray', 'FourArrowsGray', 'FourArrows', 'FiveArrowsGray', 'FiveArrows', 'ThreeTrafficLights1', 'ThreeTrafficLights2', 'ThreeSigns', 'FourTrafficLights', 'FourRedToBlack', 'ThreeSymbols', 'ThreeSymbols2', 'ThreeFlags', 'FourRating', 'FiveQuarters', 'FiveRating', 'ThreeTriangles', 'ThreeStars', 'FiveBoxes'.

### Custom Format

Using the custom format for conditional formatting you can set cell styles like color, background color, font style, font weight, and underline.

In the MAY and JUN columns, we have applied conditional formatting custom format.

\* In the Conditional format, custom format supported for Highlight cell rules and Top bottom rules.

### Clear Rules

You can clear the defined rules by using one of the following ways,

- Using the “Clear Rules” option in the Conditional Formatting button of HOME Tab in the ribbon to clear the rule from selected cells.
- Using the [clearConditionalFormat\(\)](#) method to clear the defined rules.

### Limitations of Conditional formatting

The following features have some limitations in Conditional Formatting:

- Insert row/column between the conditional formatting.
- Conditional formatting with formula support.
- Copy and paste the conditional formatting applied cells.
- Custom rule support.

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

### See Also

- [Rows and columns](#)

- [Sorting](#)
- [Filtering](#)
- [Ribbon customization](#)

## Illustrations in React Spreadsheet component

Illustrations help you to insert an image, shapes, and graphic objects in the Essential JS 2 spreadsheet.

### Image

Adding images to a spreadsheet can enhance the visual appeal and help to convey information more clearly.

\* The default value for the `allowImage` property is `true`.

### Insert Image

You can insert the image by using one of the following ways,

- Selecting the Insert tab in the Ribbon toolbar, and then choose the Image tab.
- Use the `insertImage()` method programmatically.

The available parameters in `insertImage()` method are,

Parameter	Type	Description
images	<code>ImageModel</code>	Specifies the options to insert image in spreadsheet.
range(optional)	<code>string</code>	Specifies the range in spreadsheet.

The available arguments in `ImageModel` are:

- `src`: Specifies the image source.
- `id`: Specifies the image element id.
- `height`: Specifies the height of the image.

- width: Specifies the width of the image.
- top: Specifies the top position of the image.
- left: Specifies the left side of the image.

\* In a spreadsheet, you can add many types of image files, including IMAGE, JPG, PNG, GIF, and JPEG files.

#### Delete Image

- If you want to delete the image, just select the image, and then press the Delete key.
- Use the `deleteImage()` method programmatically.

The available parameters in `deleteImage()` method are,

Parameter	Type	Description
id	string	Specifies the id of the image element to be deleted.
range(optional)	string	Specifies the range in spreadsheet.

#### Image Customization

Image feature allows you to view and insert an image in a spreadsheet, and you can change the height and width of the image by resizing and moving it to another position.

#### Height and Width

- You can change the height and width of the image by resizing.
- Use the `height` and `width` property in the `insertImage()` method programmatically.

#### Top and Left

- You can change the position of the image by drag and drop.
- Use the `top` and `left` property in the `insertImage()` method programmatically.

### Limitations of Image

The following features have some limitations in Image:

- Corner resizing option in the image element.
- Copy and paste the external image.

### Chart

A chart is a graphical representation of data, that organizes and represents a set of numerical or qualitative data. It mostly displays the selected range of data in terms of **x-axis** and **y-axis**. You can use the [allowChart](#) property to enable or disable the chart functionality.

\* The default value for the [allowChart](#) property is `true`.

### Types of chart

The following types of charts are available in the Spreadsheet.

- \* Column Chart
- \* Bar Chart
- \* Area Chart
- \* Line Chart
- \* Pie Chart
- \* Scatter Chart

### Insert Chart

You can insert the chart by using one of the following ways,

- Select the chart icon in the Ribbon toolbar under the Insert Tab.
- Use the [insertChart\(\)](#) method programmatically.

The available parameter in the [insertChart\(\)](#) method is,

Parameter	Type	Description
chart	<b>ChartModel</b>	Specifies the options to insert a chart in the spreadsheet.

The available arguments in the **ChartModel** are:

- type: Specifies the type of chart.
- theme: Specifies the theme of a chart.
- isSeriesInRows: Specifies to switch the row or a column.
- range: Specifies the selected range or specified range.
- id: Specifies the chart element id.
- markerSettings: Specifies the marker settings. The marker is used to provide information about the data points in the series and is currently only applicable to the line chart.

```

### Delete Chart

- If you want to delete the chart, just select the chart, and then press the Delete key.
- Use the [deleteChart\(\)](#) method programmatically.

The available parameter in the [deleteChart\(\)](#) method is,

Parameter	Type	Description
id	string	Specifies the id of the chart element to be deleted.

*Chart Customization*

Chart feature allows you to view and insert a chart in a spreadsheet, and you can change the height and width of the chart by resizing and moving it to another position.

- You can change the height and width of the chart by resizing.
- You can change the position of the chart by drag and drop.

### Customization of line chart markers

Using the [actionBegin](#) event, you can change the shape, size, fill color, and border of the line chart marker. In the following example, you can see the modified marker appearance, such as shape and size, while creating the line chart with UI interaction.

### APP.JSX

```

### Limitations of Chart

The following features have some limitations in the Chart:

- Insert row/delete row between the chart data source will not reflect the chart.
- Copy/paste into the chart data source will not reflect the chart.
- Corner resizing option in chart element.

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## See Also

## Rows and columns in React Spreadsheet component

Spreadsheet is a tabular format consisting of rows and columns. The intersection point of rows and columns are called as cells. The list of operations that you can perform in rows and columns are,

- Insert
- Delete
- Show and Hide

## Insert

You can insert rows or columns anywhere in a spreadsheet. Use the [allowInsert](#) property to enable or disable the insert option in Spreadsheet.

## Row

The rows can be inserted in the following ways,

- Using [insertRow](#) method, you can insert the rows once the component is loaded.
- Using context menu, insert the empty rows in the desired position.

The following code example shows the options for inserting rows in the spreadsheet.

**APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    const rowsModel = [{
        index: 9, // Need to specify the index for the first row collection,
        the specified rows will be inserted in this index.
        cells: [{ value: '' }, { value: '8' }, { value: 'Northwoods
Cranberry Sauce' }, { value: '3' }, { value: '12 - 12 oz jars' },
{ value: '40.00' }, { value: '6' }, { value: 'false' }]
    },
    {
        cells: [{ value: '' }, { value: '9' }, { value: 'Mishi Kobe Niku' },
{ value: '4' }, { value: '18 - 500 g pkgs.' }, { value: '97.00' }, { value:
'29' }, { value: 'true' }]
    }
    ];
    const onCreate = () => {
```

```

    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
        // Applies style formatting before inserting the rows
        spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
    }, 'B1:H1');
        // inserting a empty row at 0th index
        spreadsheet.insertRow();
        // inserting 2 rows at the 9th index with data
        spreadsheet.insertRow(rowsModel);
        // Applies style formatting after the rows are inserted
        spreadsheet.cellFormat({ textAlign: 'center' }, 'B3:B12');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'D3:D12');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'F3:H12');
    }
};
return (

```

### Column

The columns can be inserted in the following ways,

- Using [insertColumn](#) method, you can insert the columns once the component is loaded.
- Using context menu, insert the empty columns in the desired position.

The following code example shows the options for inserting columns in the spreadsheet.

### APP.JSX

```

{% raw %}
import * as React from 'react';

```

```

### Delete

Delete support provides an option for deleting the rows and columns in the spreadsheet. Use [allowDelete](#) property to enable or disable the delete option in Spreadsheet.

The rows and columns can be deleted dynamically in the following ways,

- Using [delete](#) method, you can delete the loaded rows and columns.
- Using context menu, you can delete the selected rows and columns.

The following code example shows the delete operation of rows and columns in the spreadsheet.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const onCreated = () => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
    }, 'A1:H1');
    }
  };

```

```

        // deleting the rows from 8th to 10th index. To delete row, the
        // third argument of enum type is passed as 'Row', the last argument specifies
        // the sheet name or index in which the delete operation will perform. By
        // default, active sheet will be considered. It is applicable only for model
        // type Row and Column.
        spreadsheet.delete(8, 10, 'Row', 0); // startIndex, endIndex,
        // Row, sheet index
        // deleting the 2nd and 5th indexed columns
        spreadsheet.delete(2, 2, 'Column', 'Sheet2');
        spreadsheet.delete(5, 5, 'Column');
        spreadsheet.delete(0, 0, "Sheet"); // delete the first sheet.
        // sheet index starts from 0
        // Applies style formatting after deleted the rows and columns
        spreadsheet.cellFormat({ textAlign: 'center' }, 'A2:A8');
        spreadsheet.cellFormat({ textAlign: 'center' }, 'D2:G8');
    }
};
return (
    <div>
        <SpreadsheetComponent ref={spreadsheetRef} created={onCreated}

```

### Limitations of insert and delete

The following features have some limitations in Insert/Delete:

- Insert row/column between the formatting applied cells.
- Insert row/column between the data validation.
- Insert row/column between the conditional formatting applied cells.
- Insert/delete row/column between the filter applied cells.

### Hide and show

You can show or hide the rows and columns in the spreadsheet through property binding, method, and context menu.

#### Row

The rows can be hidden or shown through the following ways,

- Using `hidden` property in row, you can hide/show the rows at initial load.
- Using `hideRow` method, you can hide the rows by specifying the start and end row index, set the last argument `hide` as `false` to unhide the hidden rows.
- Right-click on the row header and select the desired option from context menu

### Column

The columns can be hidden or shown through following ways,

- Using `hidden` property in columns, you can hide/show the columns at initial load.
- Using `hideColumn` method, you can hide the columns by specifying the start and end column index, set the last argument `hide` as `false` to unhide the hidden columns.
- Right-click on the column header and select the desired option from context menu

The following code example shows the hide/show rows and columns operation in the spreadsheet.

### Size

You can change the size of rows and columns in the spreadsheet by using [setRowsHeight](#) and [setColumnsWidth](#) methods.

### Row

You can change the height of single or multiple rows by using the [setRowsHeight](#) method.

You can provide the following type of ranges to the method:

- Single row range: ['2:2']
- Multiple rows range: ['1:100']
- Multiple rows with discontinuous range: ['1:10', '15:25', '30:40']
- Multiple rows with different sheets: [Sheet1!1:50, 'Sheet2!1:50', 'Sheet3!1:50']

The following code example shows how to change the height for single/multiple rows in the spreadsheet.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, } from '@syncfusion/ej2-react-spreadsheet';
import { defaultData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      // To change height for single row
      spreadsheet.setRowsHeight(40, ['2:2']);
      // To change height for multiple rows
      spreadsheet.setRowsHeight(40, ['4:8', '10:12']);
    }
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef} >
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>
            <RangeDirective dataSource={defaultData}></RangeDirective>
          </RangesDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}
```

**APP.TSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, } from '@syncfusion/ej2-react-spreadsheet';
import { defaultData } from '../datasource';
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      // To change height for single row
      spreadsheet.setRowsHeight(40, ['2']);
      // To change height for multiple rows
      spreadsheet.setRowsHeight(40, ['4:8', '10:12']);
    }
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef} >
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>

```

### Column

You can change the width of single or multiple columns by using the [setColumnsWidth](#) method.

You can provide the following type of ranges to the method:

- Single column range: ['F:F']
- Multiple columns range: ['A:F']
- Multiple columns with discontinuous range: ['A:C', 'G:I', 'K:M']
- Multiple columns with different sheets: [Sheet1!A:H, 'Sheet2!A:H', 'Sheet3!A:H']

The following code example shows how to change the width for single/multiple columns in the spreadsheet.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective } from '@syncfusion/ej2-react-spreadsheet';
import { defaultData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      // To change width of single column
      spreadsheet.setColumnsWidth(100, ['F']);
      // To change width of multiple columns
      spreadsheet.setColumnsWidth(120, ['A:C', 'G:I', 'K:M']);
    }
  }, []);
  return (
    <SpreadsheetComponent ref={spreadsheetRef}>
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>
            <RangeDirective dataSource={defaultData}></RangeDirective>
          </RangesDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  );
};
export default App;
const root = createRoot(document.getElementById('root'));

```

```
root.render(<App />);
{% endraw %}
```

### APP.TSX

```
{% raw %}
import * as React from 'react';

### Changing text in column headers

Using the [beforeCellRender](#) event, you can change the text in the column headers. In that event, you can use the `e-header-cell` class to identify the header cell element and update its text value.

The following code example shows how to change the text in the column headers.

#### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
    const spreadsheetRef = React.useRef(null);
    const beforeCellRenderHandler = (args) => {
        // Condition to check whether the rendered element is header cell.
        if (
            args.colIndex >= 0 &&
            args.colIndex <= 10 &&
            args.element.classList.contains('e-header-cell')
        ) {
            const text = 'custom header ' + args.colIndex.toString();
            // Add the custom text to the innerText of the element.
            args.element.innerText = text;
        }
    };
    return (
        <SpreadsheetComponent ref={spreadsheetRef}
        beforeCellRender={beforeCellRenderHandler}>
        </SpreadsheetComponent>
    );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

#### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, CellRenderEventArgs } from '@syncfusion/ej2-
react-spreadsheet';
function App() {

```

```

const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
const beforeCellRenderHandler = (args: CellRenderEventArgs): void => {
  // Condition to check whether the rendered element is header cell.
  if (
    args.colIndex >= 0 &&
    args.colIndex <= 10 &&
    args.element.classList.contains('e-header-cell')
  ) {
    const text = 'custom header ' + args.colIndex.toString();
    // Add the custom text to the innerText of the element.
    args.element.innerText = text;
  }
}
return (
  <SpreadsheetComponent ref={spreadsheetRef}
beforeCellRender={beforeCellRenderHandler}>
    </SpreadsheetComponent>
  );
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% enddraw %}

```

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

### See Also

- [Filtering](#)

## Sort in React Spreadsheet component

Sorting helps arranging the data to a specific order in a selected range of cells. You can use the [allowSorting](#) property to enable or disable sorting functionality.

\* The default value for `allowSorting` property is `true`.

By default, the `sort` module is injected internally into Spreadsheet to perform sorting.

### Sort by cell value

In the active Spreadsheet, select a range of cells to sort by cell value. The range sort can be done by any of the following ways:

- Select the sort item in the Ribbon toolbar and choose the ascending or descending item.
- Right-click the sheet, select the sort item in the context menu and choose the ascending/descending item.
- Use the [sort\(\)](#) method programmatically.

The cell values can be sorted in the following orders:

- Ascending
- Descending

\* Ascending is the default order for sorting.

The `sort()` method with empty arguments will sort the selected range by active cell's column as sort column in ascending order.

\* The `beforeSort` event will be triggered before sorting the specified range.

\* The `sortComplete` event will be triggered after the sort action is completed successfully.

The following code example shows `sort` functionality in the Spreadsheet control.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, SortEventArgs } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';

### Data contains header

You can specify whether the selected range of cells contains header. To specify, you need to set the [containsHeader](#) property to `true` and pass it as `sortOption` arguments of the `sort()` method.

\* If the `containsHeader` property is not set and active cell column's first cell value type is differed from the second cell value type, the first row data in the range are marked as column headers.

You can also enable or disable this property using `beforeSort` event arguments,

```

`ts
const beforeSort = (args: BeforeSortEventArgs): void => {
  args.sortOptions.containsHeader = true;
}
`

```

In the custom sort dialog, the `Data contains header` checkbox is checked on load. Thus, the default value for `containsHeader` is `true` in custom sort dialog.

### Case sensitive sort

The default sort functionality of Spreadsheet is a case insensitive sorting. When you want to perform sorting with case sensitive, you need to set the [caseSensitive](#) property to `true` and pass it as `sortOption` arguments of the `sort()` method.

Case sensitive sorting is applicable only for cells with alphabets. In ascending order sorting with case sensitive enabled, the cells with lower case text will be placed above the cells with upper case text.

\* The default value for the `caseSensitive` property is `false`.

You can also enable or disable this property using `beforeSort` event arguments,

```
`ts
const beforeSort = (args: BeforeSortEventArgs): void => {
  args.sortOptions.caseSensitive = true;
}
`
```

In the custom sort dialog, the `Case sensitive` checkbox is unchecked on load as the default value is `false`.

### Sort multiple columns

When you want to perform sorting on multiple columns, it can be done by any of the following ways:

- Select the `Custom sort...` menu item from the Ribbon toolbar item or context menu item.
- Use the `sort()` method programmatically by providing sort criteria.

\* The current sorting functionality supports sorting based on cell values only.

### Custom sort dialog

The custom sort dialog helps sorting multiple columns in the selected range by utilizing the rich UI. This dialog will be appeared while choosing the `Custom sort...` from the Ribbon item or context menu item. By default, sort criteria with the first column name from the selected range will be appeared in the dialog on initial load and it cannot be removed.

You can add multiple criteria using the `Add Column` button at the bottom of the dialog. Thus, multiple columns can be specified with different sort order. The newly added sort criteria items can be removed using the `delete` icons at the end of each items.

You can refer to the [Data contains header](#) topic to learn more about `Data contains header` checkbox. To learn more about `Case sensitive` checkbox, you can refer to [Case sensitive sort](#) topic.

### Passing sort criteria manually

The multi-column sorting can also be performed manually by passing sort options to the `sort()` method programmatically. The `sortOption` have the following arguments:

- [sortDescriptors](#) – Sort criteria collection that holds the collection of field name, sort order, and [sortComparer](#).
- `containsHeader` – Boolean argument that specifies whether the range has headers in it.
- `caseSensitive` – Boolean argument that specifies whether the range needs to consider case.

\* All the arguments are optional.

\* When a `sortDescriptor` is specified without field, the field of the first `sortDescriptor` from the collection will be assigned from active cell's column name and others will be ignored. Hence, it will act as single column sorting.

### Custom sort comparer

The [sortDescriptor](#) holds the [sortComparer](#) property, which is a function and it is used to customize the sort comparer for specific sort criteria. Each `sortDescriptor` can be customized using the custom sort comparer function.

By customizing sort comparer, you can define the sort action as desired.

\* The `sortComparer` is an optional property of `sortDescriptor`.

For custom sort comparer example, refer to the [Sort a range by custom list](#) in the `how-to` section.

### Known error validations

The following errors have been handled for sorting,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message `Select a cell or range inside the used range and try again` will be displayed. No sort will be performed if the range is invalid.
- *Empty field validation:* When the sort criteria does not have a column selected (empty) in the custom sort dialog, it will become invalid, and an error message `Sort criteria column should not be empty` will be displayed on `OK` button click.
- *Duplicate field validation:* When the column names of added sort criteria are repeated more than once in the custom sort dialog, it will become invalid and an error message `is mentioned more than once. Duplicate columns must be removed` will be displayed on `OK` button click.

## Limitations

- Sorting is not supported with formula contained cells.

## Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## See Also

- [Sort a range by custom list](#)
- [Hyperlink](#)
- [Filtering](#)
- [Undo Redo](#)

## Filter in React Spreadsheet component

Filtering helps you to view specific rows in the spreadsheet by hiding the other rows. You can use the [allowFiltering](#) property to enable or disable filtering functionality.

\* The default value for `allowFiltering` property is `true`.

By default, the `Filter` module is injected internally into Spreadsheet to perform filtering.

## Apply filter on UI

In the active sheet, select a range of cells to filter by value of the cell. The filtering can be done by any of the following ways:

- Select the filter item in the Ribbon toolbar.
- Right-click the sheet, select the filter item in the context menu.
- Use the [applyFilter\(\)](#) method programmatically.
- Use `Ctrl + Shift + L` keyboard shortcut to apply the filter.

\* Use `Alt + Up/Down` keyboard shortcut to open the filter dialog.

## Filter by criteria

The [applyFilter\(\)](#) method will apply the filter UI, based on the predicate and range given in the arguments.

\* The [beforeFilter](#) event will be triggered before filtering the specified range.

\* The [filterComplete](#) event will be triggered after the filter action is completed successfully.

The following code example shows `filter` functionality in the Spreadsheet control.

## APP.JSX

### Filter by cell value

To apply a filter for a cell value, right-click the cell and choose filter -> **Filter By Selected Cell's Value** option from the menu. It applies the filter based on the value of the selected cell in the current sheet.

### Clear filter

After applying filter to a certain column, you may want to clear it to make all filtered rows visible again. It can be done in the following ways,

- Choose **Clear** option in ribbon toolbar under **Filter and Sort**. It clears the filters applied in the spreadsheet for all fields.
- Use the [clearFilter\(\)](#) method programmatically, to clear the applied filters in spreadsheet for all fields.

### Clear filter on a field

After filtering, you can clear/reset the filter for a field alone. It can be done in the following ways,

- Click filter icon in the column's header and then choose **Clear Filter** option from the filter dialog.
- You can right-click on a filtered column cell and choose **Clear Filter from** . option from the context menu.
- Use the [clearFilter\(field\)](#) method programmatically, to clear the filter in a particular column.

### Reapply filter

When you want to reapply the filter after some changes happened in the rows. It can be done in the following ways,

- You can choose **Reapply** option in ribbon toolbar under **Filter and Sort** to reapply the filtered columns again.
- You can right-click on a filtered cell and choose **Reapply** option from the context menu. It reapplies the filters again in the Spreadsheet for all the fields.

### Known error validations

The following errors have been handled for filtering,

- *Out of range validation:* When the selected range is not a used range of the active sheet, it is considered as invalid and the out of range alert with the message **Select a cell or range inside the used range and try again** will be displayed. No filter will be performed if the range is invalid.

### Limitations

The following features have some limitations in Filter:

- Insert/delete row/column between the filter applied cells.
- Merge cells with filter.
- Copy/cut paste the filter applied cells.

#### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

#### See Also

- [Sorting](#)
- [Hyperlink](#)
- [Undo Redo](#)

#### Link in React Spreadsheet component

Hyperlink is used to navigate to web links or cell reference within the sheet or to other sheets in Spreadsheet. You can use the [allowHyperlink](#) property to enable or disable hyperlink functionality.

\* The default value for `allowHyperlink` property is `true`.

#### Insert Link

You can insert a hyperlink in a worksheet cell for quick access to related information.

##### User Interface:

In the active spreadsheet, click the cell where you want to create a hyperlink. Insert hyperlink can be done by any of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Hyperlink item in the context menu, or you can press Ctrl+K.
- Use the [addHyperlink\(\)](#) method programmatically.

#### Edit Hyperlink

You can change an existing hyperlink in your workbook by changing its destination or the text that is used to represent it.

##### User Interface:

In the active spreadsheet, Select the cell that contains the hyperlink that you want to change. Editing the hyperlink while opening the dialog can be done by any one of the following ways:

- Select the INSERT tab in the Ribbon toolbar and choose the `Link` item.
- Right-click the cell and then click Edit Hyperlink item in the context menu, or you can press Ctrl+K.

In the Edit Link dialog box, make the changes that you want, and click UPDATE.

#### Remove Hyperlink

Performing this operation remove a single hyperlink without losing the display text.

**User Interface:**

In the active spreadsheet, click the cell where you want to remove a hyperlink. remove hyperlink can be done by any of the following ways:

- Right-click the cell and then click Remove Hyperlink item in the context menu.
- Use the [removeHyperlink\(\)](#) method programmatically.

**How to change target attribute**

There is an event named `beforeHyperlinkClick` which triggers only on clicking hyperlink. You can customize where to open the hyperlink by using the `target` property in the arguments of that event.

```

## Limitations

- Inserting hyperlink not supported for multiple ranges.

## Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## See Also

- [Sorting](#)
- [Filtering](#)
- [Undo Redo](#)

## Clipboard in React Spreadsheet component

The Spreadsheet provides support for the clipboard operations (cut, copy, and paste). Clipboard operations can be enabled or disabled by setting the [enableClipboard](#) property in Spreadsheet.

By default, the `enableClipboard` property is true.

## Cut

It is used to cut the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

### User Interface:

Cut can be done in one of the following ways.

- Using Cut button in the Ribbon's HOME tab to perform cut operation.
- Using Cut option in the Context Menu.
- Using `Ctrl + X` | `Command + X` keyboard shortcut.
- Using the [cut](#) method.

## Copy

It is used to copy the data from selected range of cells, rows or columns in a spreadsheet and make it available in the clipboard.

### User Interface:

Copy can be done in one of the following ways.

- Using Copy button in the Ribbon's HOME tab to perform copy operation.
- Using Copy option in the Context Menu.
- Using **Ctrl + C** | **Command + C** keyboard shortcut.
- Using the [copy](#) method.

### Paste

It is used to paste the clipboard data to the selected range, rows or columns. You have the following options in Paste,

- **Paste Special** - You can paste the values with formatting.
- **Paste** - You can paste only the values without formatting.

It also performs for external clipboard operation. If you perform cut and paste, clipboard data will be cleared, whereas in copy and paste the clipboard contents will be maintained. If you perform paste inside the copied range, the clipboard data will be cleared.

### User Interface:

Paste can be done in one of the following ways.

- Using Paste button in the Ribbon's HOME tab to perform paste operation.
- Using Paste option in the Context Menu.
- Using **Ctrl + V** | **Command + V** keyboard shortcut.
- Using the [paste](#) method.

If you use the Keyboard shortcut key for cut (**Ctrl + X**) / copy (**Ctrl + C**) from other sources, you should use **Ctrl + V** shortcut while pasting into the spreadsheet.

### Prevent the paste functionality

The following example shows, how to prevent the paste action in spreadsheet. In [actionBegin](#) event, you can set `cancel` argument as false in paste request type.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { DropDownButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import { defaultData } from '../datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const items = [
    { text: 'Cut' },
    { text: 'Copy' },
    { text: 'Paste' }
  ];
  const onActionBegin = (pasteArgs) => {
    if (pasteArgs.args.action === 'clipboard' &&
    pasteArgs.args.eventArgs.requestType === 'paste') {
      pasteArgs.args.eventArgs.cancel = true;
    }
  };
  const itemSelect = (args) => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      if (args.item.text === 'Cut')

```

```

        spreadsheet.cut();
        if (args.item.text === 'Copy')
            spreadsheet.copy();
        if (args.item.text === 'Paste')
            spreadsheet.paste();
    }
};
React.useEffect(() => {
    if (spreadsheetRef.current) {
        spreadsheetRef.current.cellFormat({ fontWeight: 'bold',
textAlign: 'center', verticalAlign: 'middle' }, 'A1:H1');
    }
}, []);
return (
    <div>
        <DropDownButtonComponent items={items} select={itemSelect}>
Clipboard </DropDownButtonComponent>
        <SpreadsheetComponent ref={spreadsheetRef}

```

## Limitations

- External clipboard is not fully supported while copying data from another source and pasting into a spreadsheet, it only works with basic supports (Values, Number, cell, and Text formatting).
- If you copy =SUM(A2,B2) and paste, the formula reference will change depending on the pasted cell address but we don't have support for nested formula(formula reference will be same).
- Clipboard is not supported with conditional formatting (values only pasting).
- We have limitation while copying the whole sheet data and pasting it into another sheet.

## Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## Selection in React Spreadsheet component

Selection provides interactive support to highlight the cell, row, or column that you select. Selection can be done through Mouse, Touch, or Keyboard interaction. To enable selection, set `mode` as `Single` / `Multiple` in [selectionSettings](#). If you set `mode` to `None`, it disables the UI selection.

\* The default value for `mode` in `selectionSettings` is `Multiple`.

You have the following options in Selection,

- Cell selection
- Row selection

- Column selection

### Cell selection

Cell selection is used to select a single or multiple cells. It can be performed using the [selectRange](#) method.

#### User Interface:

- Click on a cell to select it (or) use the **arrow** keys to navigate to it and select it.
- To select a range, select a cell, then use the left mouse button to select and drag over to other cells (or) use the **Shift + arrow** keys to select the range.
- To select non-adjacent cells and cell ranges, hold **Ctrl** and select the cells.

You can quickly locate and select specific cells or ranges by entering their names or cell references in the Name box, which is located to the left of the formula bar, and also select named or unnamed cells or ranges by using the Go To (**Ctrl+G**) command.

### Row selection

Row selection is used to select a single or multiple rows.

#### User Interface:

You can perform row selection in any of the following ways,

- By clicking the row header.
- To select multiple rows, select a row header with the left mouse button and drag over to other row headers (or) use the **Shift + arrow** keys to select multiple rows.
- To select non-adjacent rows, hold **Ctrl** and select the row header.
- You can also use the [selectRange](#) method for row selection.

The following sample shows the row selection in the spreadsheet, here selecting the 5th row using the [selectRange](#) method.

#### APP.JSX

```

### Column selection

Column selection is used to select a single or multiple columns.

#### User Interface:

You can perform column selection in any of the following ways,

- By clicking the column header.
- To select multiple columns, select a column header with the left mouse button and drag over to other column headers (or) use the **Shift + arrow** keys to select the multiple columns.
- To select non-adjacent columns, hold **Ctrl** and select the column header.
- You can also use the **selectRange** method for row selection.

The following sample shows the column selection in the spreadsheet, here selecting the 3rd column using the **selectRange** method.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, getRangeAddress } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { budgetData } from '../datasource';
function App() {
  const spreadsheetRef = React.useRef(null);

### How to remove selection in the spreadsheet

The following sample shows, how to remove the selection in the spreadsheet. Here changing the **mode** as **None** in [selectionSettings](#) to disable's the UI selection.

#### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { budgetData } from '../datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    React.useEffect(() => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            spreadsheet.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:D1');
        }
    }, []);
    const onEdit = (args) => {
        args.cancel = true;
    };
    return (
        <div>
            <SpreadsheetComponent ref={spreadsheetRef} cellEdit={onEdit}
selectionSettings={{ mode: 'None' }}>
                <SheetsDirective>
                    <SheetDirective>
                        <RangesDirective>
                            <RangeDirective
dataSource={budgetData}></RangeDirective>
                        </RangesDirective>

}  
];
```

## Limitations

- We have a limitation while performing the Select All(ctrl + A). You can do this only by clicking the Select All button at the top left corner.

## Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## Scrolling in React Spreadsheet component

Scrolling helps you to move quickly to different areas of the worksheet. It moves faster if we use horizontal and vertical scroll bars. Scrolling can be enabled by setting the [allowScrolling](#) as true.

By default, the [allowScrolling](#) property is true.

You have the following options in Scrolling by using [scrollSettings](#).

- Finite scrolling.
- Virtual scrolling.

## Finite Scrolling

Finite scrolling supports two type of modes in scrolling. You can use the [isFinite](#) property in [scrollSettings](#) to specify the mode of scrolling.

- Finite - This mode does not create a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as true.
- Infinite - This mode creates a new row/column when the scrollbar reaches the end. This can be achieved by setting the [isFinite](#) property as false.

By Default, the [isFinite](#) property is false.

## Virtual Scrolling

- Virtual scrolling allows you to load data that you require (load data based on viewport size) without buffering the entire huge database. You can set the [enableVirtualization](#) property in [scrollSettings](#) as true.

In virtual scrolling [enableVirtualization](#) is set to true means, it allows you to load the spreadsheet data while scrolling.

By Default, the [enableVirtualization](#) property is true.

**User Interface:**

You can scroll through the worksheet using one of the following ways,

- Using the **arrow** keys.
- Using the Horizontal and Vertical **scroll** bars.
- Using the **mouse** wheel.

**Finite scrolling with defined rows and columns**

If you want to perform scrolling with defined rows and columns, you must define **rowCount** and **colCount** in the **sheets** property and set **isFinite** as true and **enableVirtualization** as false in **scrollSettings**.

The following code example shows the finite scrolling with defined rows and columns in the spreadsheet. Here, we used **rowCount** as 20 and **colCount** as 20, after reaching the 20th row or 20th column you can't able to scroll.

**APP.JSX**

```

**Note**

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

**Protect sheet in React Spreadsheet component**

Sheet protection helps you to prevent the users from modifying the data in the spreadsheet.

## Protect Sheet

Protect sheet feature helps you to prevent the unknown users from accidentally changing, editing, moving, or deleting data in a spreadsheet. And you can also protect the sheet with password. You can use the [isProtected](#) property to enable or disable the Protecting functionality.

\* The default value for `isProtected` property is `false`.

By default in protected sheet, selecting, formatting, inserting, deleting functionalities are disabled. To enable some of the above said functionalities

the `protectSettings` options are used in a protected spreadsheet.

The available `protectSettings` options in spreadsheet are,

Options	Uses
-----	-----
Select Cells	Used to perform Cell Selection.
Format Cells	Used to perform Cell formatting.
Format Rows	Used to perform Row formatting.
Format Columns	Used to perform Column formatting.
Insert Link	Used to perform Hyperlink Insertions.

\* The default value for all `protectSettings` options are `false`.

By default, the `Protect Sheet` module is injected internally into the Spreadsheet to perform sheet protection function.

### User Interface:

In the active Spreadsheet, the sheet protection can be done by any of the following ways:

- Select the Protect Sheet item in the Ribbon toolbar under the Data Tab, and then select your desired options.
- Right-click the sheet tab, select the Protect Sheet item in the context menu, and then select your desired options.
- Use the [protectSheet\(\)](#) method programmatically.

The following example shows `Protect Sheet` functionality in the Spreadsheet control.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { budgetData, salaryData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
```

```

const dataBound = () => {
  let spreadsheet = spreadsheetRef.current;
  if (spreadsheet) {
    spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
}, 'A1:D1');
    spreadsheet.cellFormat({ fontWeight: 'bold' }, 'A11:D11');
    spreadsheet.protectSheet(1, { selectCells: false },
"syncfusion"); // protect sheet with password
  }
};
return (
  <div>
    <SpreadsheetComponent ref={spreadsheetRef} dataBound={dataBound}
