You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations.

You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Exporting filtered data in React Treegrid component

You can export the filtered data by defining the resulted data in [PdfExportProperties.dataSource](#) before export.

In the below Pdf exporting demo, We have gotten the filtered data from the filteredResult of TreeGrid filterModule and then defines the resulted data in [PdfExportProperties.dataSource](#) and pass it to [pdfExport](#) method.

APP.JSX

```
import * as React from 'react';
import { projectData } from './datasource';
```

```

import { ColumnsDirective, ColumnDirective, TreeGridComponent, Inject } from
 '@syncfusion/ej2-react-treegrid';
import { Filter, Toolbar, Page, PdfExport } from '@syncfusion/ej2-react-
treegrid';

function App() {
  const toolbarOptions = ['PdfExport'];
  let treegrid;
  const pageOptions = { pageSize: 5, pageCount: 5 };

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Exporting selected data in React Treegrid component

You can export the selected records data by passing it to [PdfExportProperties.dataSource](#) or [ExcelExportProperties.dataSource](#) property in the [toolbarClick](#) event.

In the below exporting demo, we can get the selected records using [getSelectedRecords](#) method and pass the selected data to [pdfExport](#) or [excelExport](#) methods using respective export properties..

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Show spinner while exporting in React Treegrid component

You can show/ hide spinner component while exporting the treegrid using [showSpinner/](#) [hideSpinner](#) methods. You can use [toolbarClick](#) event to show spinner before exporting and hide a spinner in the [pdfExportComplete](#) or [excelExportComplete](#) event after the exporting.

In the [toolbarClick](#) event, based on the parameter **args.item.text** as **PDF Export** or **Excel Export** we can call the [showSpinner](#) method from grid instance.

In the [pdfExportComplete](#) or [excelExportComplete](#) event, We can call the [hideSpinner](#) method.

In the below demo, we have rendered the default spinner component when exporting the treegrid.

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Passing parameter to server exporting in React Treegrid component

You can pass the additional parameter in the [query](#) property by invoking [addParams](#) method. In the [toolbarClick](#) event, you can define params as key and value pair so it will receive at the server side when exporting.

In the below example, we have passed *recordcount* as 12 using [addParams](#) method.

APP.JSX

```
import * as React from 'react';
import { projectData } from '../datasource';
import { Query } from '@syncfusion/ej2-data';
import { ColumnsDirective, ColumnDirective, TreeGridComponent, Inject } from

```

```

import { Toolbar, Page, PdfExport, ExcelExport } from '@syncfusion/ej2-react-treegrid';
/* tslint:disable */
function App() {
    const toolbarOptions = ['PdfExport', 'ExcelExport'];
    let treegrid;

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations.

You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Customize pager drop down in React Treegrid component

To customize default values of pager dropdown, you need to define [pageSizes](#) as array of strings.

APP.JSX

```
import * as React from 'react';
import { sampleData } from './datasource';

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

Add params for filtering in React Treegrid component

You can customize the default settings of the components which are used in Menu filter by using params of filter property in column definition.

In the below sample, TaskID and Duration Columns are numeric columns, while open the filter dialog then you can see that NumericTextBox with spin button is displayed to change/set the filter value. Now using the params option we hide the spin button in NumericTextBox for TaskID Column.

You can refer to our [React Tree Grid](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Tree Grid example](#) to know how to present and manipulate data.

TreeMap

Getting Started

This section explains you the steps required to create a TreeMap control and demonstrate its basic usage.

Dependencies

The following list of minimum dependencies are required to use the TreeMap control:

```

`ts
|-- @syncfusion/ej2-react-treemap
|-- @syncfusion/ej2-treemap
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-react-base
,

```

Installation and configuration

To get started with the React application, [create-react-app](#) can be used to setup the application. To install **create-react-app** run the following command.

`

```
npm install -g create-react-app
```

`

To create basic React application, run the following command.

`

```
create-react-app quickstart
```

`

Now, the application is created in the **quickstart** folder. Run the following command to navigate to the **quickstart** folder, and install the required **npm** packages.

`

```
cd quickstart
```

`

In the **quickstart** application, the Syncfusion component is added in the JavaScript file.

Creating a React application with TypeScript

To create React application with TypeScript, use the following command.

`

```
create-react-app quickstart --template typescript
```

`

Now, the application is created in the **quickstart** folder. Run the following command to navigate to the **quickstart** folder, and install the required **npm** packages.

`

```
cd quickstart
```

`

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. To install TreeMap package, use the following command.

`

```
npm install @syncfusion/ej2-react-treemap --save
```

`

Add TreeMap to project

Now, the TreeMap component can be added in the application. To initialize the TreeMap control in the React application, import the TreeMap control in the **src/App.js**

or **src/App.tsx** as per the application. Please use the below code to include the TreeMap component in the application.

```
`ts
```

```
import * as React from 'react';
```

```
import * as ReactDOM from "react-dom";
import { TreeMapComponent } from '@syncfusion/ej2-react-treemap';
export function App() {
  return ( <TreeMapComponent
    height= '350px'
    dataSource=[
      { Title: 'State wise International Airport count in South America', State: "Brazil", Count: 25 },
      { Title: 'State wise International Airport count in South America', State: "Colombia", Count: 1 },
      { Title: 'State wise International Airport count in South America', State: "Argentina", Count: 9 },
      { Title: 'State wise International Airport count in South America', State: "Ecuador", Count: 7 },
      { Title: 'State wise International Airport count in South America', State: "Chile", Count: 6 },
    ]
    weightValuePath='Count'
    leafItemSettings= { {
      labelPath: 'State'
    }}
  >
</TreeMapComponent> );
}
export default App;
,
```

Run the application

The **TreeMap** control is now included in the **quickstart** application. Use the following command to run the application.

```
,
npm start
,
```

Module injection

The **TreeMap** control is segregated into individual feature-wise modules. To use a particular feature, inject its feature module using the `<Inject services={} />` method. You can find the modules available in **TreeMap** and their descriptions below.

- **TreeMapHighlight** - Inject this provider to use highlight feature.
- **TreeMapSelection** - Inject this provider to use selection feature.
- **TreeMapLegend** - Inject this provider to use legend feature.
- **TreeMapTooltip** - Inject this provider to use tooltip series.

Render TreeMap

This section explains how to render the TreeMap with data source. In the below example, TreeMap is modified to visualize international airport count in South America.

INDEX.JSX

```
{% raw %}
import * as React from "react";

Here, the TreeMap is created with data source and the `weightValuePath` property is set to the data source's `count` field as the value. The leaf level items of TreeMap can be customized using `leafItemSettings`. `leafItemSettings` allows you to change properties such as `fill`, `border`, and `labelPosition`.

Apply color mapping

The color mapping feature supports customization of item colors based on the underlying value of item received from bound data source. Specify the field name from the values that have to be compared for the item in the `equalColorValuePath` or `rangeColorValuePath` property.

Enable tooltip

The tooltips are used when labels cannot display information due to space constraints. Tooltips can be enabled by setting the visible property to true in tooltipSettings object and injecting the `TreeMapTooltip` module using the `<Inject services={[TreeMapTooltip]} />`.

Data binding in React Treemap component

The TreeMap control supports data binding using the `dataSource` property.

Populate data

The [dataSource](#) property accepts collection values as input. For example, a list of objects can be provided as input. Data can be given as either flat or hierarchical collection to the [dataSource](#) property.

<!-- markdownlint-disable MD036 -->

Flat collection

The following code shows, how to bind a flat collection as data source to the TreeMap control.

Layout in React Treemap component

Determine the visual representation of nodes belonging to all the TreeMap levels using the [layoutType](#) property.

Types of layout

The available layout types are,

- Squarified
- SliceAndDiceVertical
- SliceAndDiceHorizontal
- SliceAndDiceAuto

Squarified

The **Squarified** layout displays the nested rectangles based on aspect ratio in the TreeMap. The rectangles will be split based on the height and width of the parent. The default rendering type of layout is **Squarified**.

Color mapping in React Treemap component

Color mapping is used to customize the color for each group or item based on the specified types. The following options are available to customize the group and leaf items in the TreeMap.

Range color mapping

Range color mapping is used to apply color to the items by giving specific ranges in the DataSource, and it should be specifying the data source properties to the [rangeColorValuePath](#). The color mapping ranges to be specified in the [from](#) and [to](#) properties of the [colorMapping](#).

Data label in React Treemap component

Data Labels are used to identify the name of items or groups in the TreeMap component. Data Labels will be shown by specifying the data source properties in the [labelPath](#) of the [leafItemSettings](#).

Format

Customize the labels for each item using the [labelFormat](#) property in the [leafItemSettings](#).

Legend in React Treemap component

Legend is used to provide valuable information for interpreting what the TreeMap displays. The legends can be represented in various colors, shapes or other identifiers based on the data.

Position and alignment

Legend position is used to place legend in various positions. Based on the legend position, the legend item will be aligned. For example, if the position is top or bottom, the legend items are placed by rows. If the position is left or right, the legend items are placed by columns.

The following options are available to customize the legend position:

- Top
- Bottom
- Left
- Right
- Float

Legend mode

The TreeMap control supports two different types of legend rendering modes such as **Default** and **Interactive**.

Default mode

In default mode, the legends have symbols with legend labels that are used to identify the items in the TreeMap.

Drilldown in React Treemap component

The TreeMap supports drill-down to expose the hierarchy, achieved by clicking a node. If an item is clicked in the TreeMap, it will be moved to the next level or sub level hierarchy and returned back to the previous level by clicking the node.

Perform drill-down action

The TreeMap items can be drilled by setting the [enableDrillDown](#) property to **true**.

Tooltip in React Treemap component

Tooltip is used to display details about the items in the TreeMap. When space constraints prevent us from displaying the information using Data Labels, the tooltip comes in handy.

Default tooltip

The tooltip is not visible by default, to make it visible, set the [visible](#) property in the [tooltipSettings](#) to **true** and injecting the `TreeMapTooltip` module.

Selection and highlight in React Treemap component

Selection

Selection is used to select a particular group or item to differentiate from other items. Each item or each group can be selected and deselected while interacting with the items. The corresponding Treemap items are also selected while tapping a specific legend item, and vice versa.

The [fill](#) property is used to change the selected item color. The [color](#) and the [width](#) properties are used to customize the selected item border, and the selection is enabled by using the [enable](#) property to **true** in the [selectionSettings](#).

Print and export in React Treemap component

We can get the image file as base64 string for the JPEG and PNG formats. The treemap can be exported to image as a base64 string using the [export](#) method. There are four parameters required: image type, file name, orientation of the exported PDF document which must be set as **null** for image export and finally **allowDownload** which should be set as **false** to return base64 string.

Accessibility in React TreeMap component

The TreeMap component follows commonly used accessibility guidelines and standards, such as [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#).

The accessibility compliance for the TreeMap component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The TreeMap component follows the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeMap component:

| Attributes | Purpose |

| --- | --- |

| **role=region** | It specifies the TreeMap areas that do not support interactive functions like selection and highlight. |

| **role=button** | It specifies the TreeMap areas where interactive functions such as selection and highlight are available. |

| **aria-label** | Provides an accessible name for the title, subtitle, data labels, legend title, and legend item labels. |

Screen reading in TreeMap

Accessibility in the TreeMap component ensures that all users, regardless of ability or disability, can use screen reading. The following TreeMap elements will be read aloud using screen reading software, such as Narrator for Windows.

| Elements | Description |

| --- | --- |

| Data labels | Reads the labels displayed on leaf items of the TreeMap. |

| Title | Reads the title in the TreeMap. |

| Subtitle | Reads the title below the main title content in the TreeMap. |

| Legend title | Reads the title of the legend in the TreeMap. |

| Legend item label | Reads the label of the legend item in the TreeMap. |

Ensuring accessibility

The TreeMap component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeMap component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeMap component with accessibility tools.

Internationalization in React Treemap component

The TreeMap control supports internationalization for the following elements:

- Data label
- Tooltip

For more information about number and date formatter, refer to [internationalization](#).

<!-- markdownlint-disable MD036 -->

Globalization

Globalization is the process of designing and developing a component that works in different cultures/locales. Internationalization library is used to globalize number, date, and time values in the TreeMap control using the [format](#) property in the TreeMap.

Numeric format

In the following code example, tooltip is globalized to Deutsch culture.

How To

Drilldown in React Treemap component

Customize the header for treemap drilldown

You can add a header element as `<div>` and customize it to show the population of a particular country or continent on treemap drill-down.

To customize the header for treemap drill-down, follow the given steps:

Step 1:

```
<!-- markdownlint-disable MD031 -->
```

Initialize the treemap and enable the drill-down option.

```
{% raw %}
```

```
`ts
```

```
import { TreeMapComponent, LevelDirective, LevelsDirective, ILoadedEventArgs, IDrillEndEventArgs }
from '@syncfusion/ej2-react-treemap';
```

```
import * as React from 'react';
```

```
import * as ReactDOM from "react-dom";
```

```
import { DrillDown } from './datasource';
```

```
export function App() {
```

```
  return (
```

```
    <TreeMapComponent palette={ ['#9999ff', '#CCFF99', '#FFFF99', '#FF9999', '#FF99FF', '#FFCC66']}
      enableDrillDown={true} format={"n"} useGroupingSeparator={true} dataSource={DrillDown}
      weightValuePath='Population' leafItemSettings={ {
```

```
        labelPath: 'Name',
```

```
        showLabels: false,
```

```
        labelStyle: { size: '0px' },
```

```
        border: { color: 'black', width: 0.5 }
      } }>
```

```
    <LevelsDirective>
```

```
      <LevelDirective groupPath='Continent' fill='#336699' border={ { color: 'black', width: 0.5 } } />
```

```

<LevelDirective groupPath='States' fill='#336699' border={ { color: 'black', width: 0.5 } } />
<LevelDirective groupPath='Region' showHeader={false} fill='#336699' border={ { color: 'black', width:
0.5 } } />
</LevelsDirective>
</TreeMapComponent>
);
}
const root = ReactDOM.createRoot(document.getElementById('container'));
root.render(<App />);
`js
{% enddraw %}

```

Step 2:

Show the population of a particular continent in the treemap **loaded** event. In this event, you can get the header element.

```

`js
function loaded(args: ILoadedEventArgs): void {
let header: Element = document.getElementById('header') as Element;
let population: number = 0;
for (let i: number = 0; i < args.treemap.layout.renderItems[0]['parent'].Continent.length; i++) {
population += +(args.treemap.layout.renderItems[0]['parent'].Continent[i]['data'].Population);
}
header.innerHTML = 'Continent - Population : ' + population
}
`

```

Step 3:

Customize the population for drilled countries or states in the header element when drill-down the treemap. The **drillEnd** event will be triggered when treemap is drilled.

Drilldown with label in React Treemap component

You can add a label template as `<div>` element to the treemap control when using the label template. To add a label template to the tree map control, you have to hide another labels by setting the `showLabels` property to **false** in `leafItemSettings` to show only the label template.

To add label template to tree map drilldown, follow the given steps:

Step 1:

Create a treemap control and enable the drill-down option.

```

{% raw %}
`ts
import { TreeMapComponent, LevelDirective, LevelsDirective, ILoadedEventArgs, IDrillEndEventArgs }
from '@syncfusion/ej2-react-treemap';
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { CarSales } from './datasource';
export function App() {
    return (
        <TreeMapComponent weightValuePath='Sales' palette={['white']} enableDrillDown={true}
        dataSource={CarSales}
        leafItemSettings={ {
            showLabels: false,
            labelTemplate: '<div style="background-color: red">{:Company}</div>',
            templatePosition: 'Center'
        }
    }
    </TreeMapComponent>
    );
}

```

```

}}>
<LevelsDirective>
<LevelDirective groupPath='Continent' fill='#336699' border={ { color: 'black', width: 0.5 } } />
<LevelDirective groupPath='Company' fill='#336699' border={ { color: 'black', width: 0.5 } } />
</LevelsDirective>
</TreeMapComponent>
);
}

const root = ReactDOM.createRoot(document.getElementById('container'));
root.render(<App />);
`

{% enddraw %}

```

Step 2:

Add the label template in the `leafItemSettings` options, and then set the `showLabels` property to [Link to the Video](#) to hide another labels and show only label template.

Getting Started

Getting started

This section explains you the steps required to create a simple Grid and demonstrate the basic usage of the Grid component in React environment.

To get start quickly with React Grid, you can check on this video:

[Setup for Local Development](#)

To set-up a React application, choose any of the following ways. The best and easiest way is to use the [create-react-app](#). It sets up your development environment in JavaScript and improvise your application for production. Refer to the [installation instructions](#) of [create-react-app](#).

```
`bash
```

```
npx create-react-app my-app
```

```
cd my-app
```

```
npm start
```

`

or

```
`bash
```

```
yarn create react-app my-app
```

```
cd my-app
```

```
yarn start
```

`

To set-up a React application in **TypeScript** environment, run the following command.

```
`bash
```

```
npx create-react-app my-app --template typescript
```

```
cd my-app
```

```
npm start
```

`

Besides using the [npx](#) package runner tool, also create an application from the **npm init**. To begin with the **npm init**, upgrade the **npm** version to **npm 6+**.

```
`bash
```

```
npm init react-app my-app
```

```
cd my-app
```

```
npm start
```

`

Adding Syncfusion Grid packages

All the available Essential JS 2 packages are published in [npmjs.com](#) public registry.

To install Grid component, use the following command

`

```
npm install @syncfusion/ej2-react-grids --save
```

`

The `--save` will instruct NPM to include the Grid package inside of the **dependencies** section of the `package.json`.

Adding CSS reference

The following CSS files are available in `../node_modules/@syncfusion` package folder. This can be added as reference in **src/App.css**.

```
`css
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-notifications/styles/material.css';
@import "../node_modules/@syncfusion/ej2-react-grids/styles/material.css";
`
```

To refer **App.css** in the application then import it in the **src/App.tsx** file.

Adding Grid component

Now, you can start adding React Grid component in the application. For getting started, add the Grid component in **src/App.tsx** file using following code.

Place the following grid code in the **src/App.tsx**.

```
`ts
import { ColumnDirective, ColumnsDirective, GridComponent } from '@syncfusion/ej2-react-grids';
import * as React from 'react';
import { data } from './datasource';
function App() {
  return <GridComponent dataSource={data}>
    <ColumnsDirective>
      <ColumnDirective field='OrderID' width='100' textAlign="Right"/>
      <ColumnDirective field='CustomerID' width='100'/>
      <ColumnDirective field='EmployeeID' width='100' textAlign="Right"/>
      <ColumnDirective field='Freight' width='100' format="C2" textAlign="Right"/>
      <ColumnDirective field='ShipCountry' width='100'/>
    </ColumnsDirective>
  </GridComponent>
};
export default App;
`
```

Module Injection

React Grid component features are segregated into individual feature-wise modules.

In order to use a particular feature, you need to inject its feature service in the **App**.

In the current application, we are going to use paging, sorting, filtering and grouping feature of Grid.

Please find relevant feature service name and description as follows.

- **Page** - Inject this service to use paging feature.
- **Sort** - Inject this service to use sorting feature.
- **Filter** - Inject this service to use filtering feature.
- **Group** - Inject this service to use grouping feature.

These modules should be injected into the grid using the **Inject** directive.

Additional feature modules are available [here](#).

Enable Paging

The paging feature enables users to view the Grid record in a paged view.

It can be enabled by setting [allowPaging](#) property to true.

Inject the **Page** module in **Inject.services** as follows.

If the **Page** service is not injected, the pager will not be rendered in the grid.

Pager can be customized using [pageSettings](#) property.

APP.JSX

```
import { ColumnDirective, ColumnsDirective, Filter, GridComponent, Group,
Inject, Page, Sort } from '@syncfusion/ej2-react-grids';
import * as React from 'react';
import { data } from '../datasource';
function App() {
    const pageSettings = { pageSize: 6 };
    return <GridComponent dataSource={data} allowPaging={true}
pageSettings={pageSettings}>
        <ColumnsDirective>
            <ColumnDirective field='OrderID' width='100' textAlign="Right"/>
            <ColumnDirective field='CustomerID' width='100' />
            <ColumnDirective field='EmployeeID' width='100'
textAlign="Right"/>
            <ColumnDirective field='Freight' width='100' format="C2"
textAlign="Right"/>
            <ColumnDirective field='ShipCountry' width='100' />
        </ColumnsDirective>
        <Inject services={[Page, Sort, Filter, Group]}/>
    </GridComponent>;
}
;
export default App;
```

Inject, Page, PageSettingsModel, Sort } from '@syncfusion/ej2-react-grids';

    const pageSettings: PageSettingsModel = { pageSize: 6 }
```

```

    return <GridComponent dataSource={data} allowPaging={true} pageSettings={

Enable Sorting

The sorting feature enables you to order the records.

It can be enabled by setting the [allowSorting](#) property as true.

Inject the **Sort** module in the **Inject.services** as follows.

If the **Sort** module is not injected, you cannot sort when a header is clicked.

Sorting feature can be customized using [sortSettings](#) property.

APP.JSX

```

import { ColumnDirective, ColumnsDirective, Filter, GridComponent, Group }
from '@syncfusion/ej2-react-grids';
import { Inject, Page, Sort } from '@syncfusion/ej2-react-grids';

```

```
import { data } from './datasource';
function App() {
  const pageSettings = { pageSize: 6 };
  const sortSettings = { columns: [
    { field: 'EmployeeID', direction: 'Ascending' }
  ] };

Enable Filtering

It can be enabled by setting the [allowFiltering](#) property as true.

Inject the [Filter](#) module in the **Inject.services** as follows.

If [Filter](#) module is not injected, filter bar will not be rendered in Grid.

Filtering feature can be customized using [filterSettings](#) property.

Enable Grouping

The grouping feature enables you to view the grid record in a grouped view.

It can be enabled by setting [allowGrouping](#) property to true.

The [Group](#) module has to be injected as follows.

If [Group](#) module is not injected, the group drop area will not be rendered in Grid.

Grouping feature can be customized using [groupSettings](#) property.

Getting Started with the React TreeView Component in the Preact Framework

This article provides a step-by-step guide for setting up a [Preact](#) project and integrating the Syncfusion React TreeView component.

Preact is a fast and lightweight JavaScript library for building user interfaces. It's often used as an alternative to larger frameworks like React. The key difference is that Preact is designed to be smaller in size and faster in performance, making it a good choice for projects where file size and load times are critical factors.

Prerequisites

[System requirements for Syncfusion React UI components](#)

Set up the Preact project

To create a new **Preact** project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm init preact
```

```
,
```

or

```
`bash
```

```
yarn init preact
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project, as below:

1\ Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

```
T Preact - Fast 3kB alternative to React with the same modern API
```

```
|
```

- Project directory:

```
| my-project
```

```
—
```

```
,
```

2\ Choose **JavaScript** as the framework variant to build this Preact project using JavaScript and React.

```
`bash
```

```
T Preact - Fast 3kB alternative to React with the same modern API
```

```
|
```

- Project language:

```
| > JavaScript
```

```
| TypeScript
```

```
—
```

```
,
```

3\ Then configure the project as below for this article.

```
`bash
```

T Preact - Fast 3kB alternative to React with the same modern API

|

- Use router?

| Yes / > No

—

|

- Prerender app (SSG)?

| Yes / > No

—

|

- Use ESLint?

| Yes / > No

—

,

5\ Upon completing the aforementioned steps to create `my-project`, run the following command to jump into the project directory:

```
`bash
```

```
cd my-project
```

,

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

Add the Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

This article uses the [React TreeView component](#) as an example. To use the React TreeView component in the project, the `@syncfusion/ej2-react-navigations` package needs to be installed using the following command:

```
`bash
```

```
npm install @syncfusion/ej2-react-navigations --save
```

,

or

```
`bash
```

```
yarn add @syncfusion/ej2-react-navigations
```

Import Syncfusion CSS styles

You can import themes for the Syncfusion React component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to theme's in a React project.

In this article, the **Material 3** theme is applied using CSS styles, which are available in installed packages. The necessary **Material 3** CSS styles for the TreeView component and its dependents were imported into the **src/style.css** file.

~/SRC/STYLE.CSS

```
/* import the TreeView dependency styles */
@import "../node_modules/@syncfusion/ej2-base/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-react-navigations/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material3.css";
```

The order of importing CSS styles should be in line with its dependency graph.

Add the Syncfusion React component

Follow the below steps to add the React TreeView component to the Vite project:

1\ Before adding the TreeView component to your markup, import the TreeView component in the **src/index.jsx** file.

~/SRC/INDEX.JSX

```
import { TreeViewComponent } from '@syncfusion/ej2-react-navigations';
```

2\ Then, define the TreeView component with the [dataSource](#) property. Declare the values for the **dataSource** property.

~/SRC/INDEX.JSX

```
import { TreeViewComponent } from '@syncfusion/ej2-react-navigations';
import { render } from 'preact';
import './style.css';
function App() {
  // define the array of data
  const hierarchicalData = [
    {
      id: '01', name: 'Local Disk (C:)', expanded: true,
      subChild: [
        {
          id: '01-01', name: 'Program Files',
          subChild: [
            { id: '01-01-01', name: '7-Zip' },
            { id: '01-01-02', name: 'Git' },
            { id: '01-01-03', name: 'IIS Express' },
          ]
        }
      ]
    }
  ],
```

```

{

Data binding in React Treeview component

The TreeView component provides the option to load data either from local data sources or from remote data services. This can be done through `dataSource` property that is a member of the `fields` property. The `dataSource` property supports array of JavaScript objects and **DataManager**. It also supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of `DataManager` adaptors.

TreeView has `load on demand` (Lazy load), by default. It reduces the bandwidth size when consuming huge data. It loads first level nodes initially, and when parent node is expanded, loads the child nodes based on the `parentID/child` member.

By default, the `loadOnDemand` is set to true. By disabling this property, all the tree nodes are rendered at the beginning itself.

You can use the `dataBound` event to perform actions. This event will be triggered once the data source is populated in the TreeView.

Local data

To bind local data to the TreeView, you can assign a JavaScript object array to the `dataSource` property. The TreeView component requires three fields (ID, text, and parentID) to render local data source. When mapper fields are not specified, it takes the default values as the mapping fields. Local data source can also be provided as an instance of the `DataManager`.

It supports two kinds of local data binding methods.

- Hierarchical data
- Self-referential data

Hierarchical data

TreeView can be populated with hierarchical data source that contains nested array of JSON objects. You can directly assign hierarchical data to the `dataSource` property, and map all the field members with corresponding keys from the hierarchical data to `fields` property.

In the following example, **code**, **name**, and **countries** columns from hierarchical data have been mapped to **id**, **child**, and **text** fields, respectively.

Self-referential data

TreeView can be populated from self-referential data structure that contains array of JSON objects with **parentID** mapping.

You can directly assign self-referential data to the **dataSource** property, and map all the field members with corresponding keys from self-referential data to **fields** property.

To render the root level nodes, specify the **parentID** as null or no need to specify the **parentID** in **dataSource**.

In the following example, **ID**, **pid**, **hasChild**, and **name** columns from self-referential data have been mapped to **ID**, **parentID**, **hasChildren**, and **text** fields, respectively.

Remote data

TreeView can also be populated from a remote data service with the help of **DataManager** component and

Query property.

It supports different kinds of data services such as OData, OData V4, Web API, URL, and JSON with the help of **DataManager** adaptors.

You can assign service data as an instance of **DataManager** to the **dataSource** property. To interact with remote data source, you have to provide the endpoint **url**.

The **DataManager** that acts as an interface between the service endpoint and the TreeView requires the following information to interact with service endpoint properly.

- **DataManager->url**: Defines the service endpoint to fetch data.
- **DataManager->adaptor**: Defines the adaptor option. By default, **ODataAdaptor** is used for remote binding.

Adaptor is responsible for processing response and request from/to the service endpoint. The **@syncfusion/ej2-data** package provides some predefined adaptors designed to interact with service endpoints. They are,

- **UrlAdaptor**: Used to interact with remote services. This is the base adaptor for all remote based adaptors.
- **ODataAdaptor**: Used to interact with OData endpoints.
- **ODataV4Adaptor**: Used to interact with OData V4 endpoints.
- **WebApiAdaptor**: Used to interact with Web API created under OData standards.
- **WebMethodAdaptor**: Used to interact with web methods.

In the following example, **ODataV4Adaptor** is used to fetch data from remote services. The **EmployeeID**, **FirstName**, and **Title** columns from Employees table have been mapped to **ID**, **text**, and **hasChildren** fields respectively for first level nodes.

The **OrderID**, **EmployeeID**, and **ShipName** columns from orders table have been mapped to **ID**, **parentID**, and **text** fields respectively for second level nodes.

Check box in React Treeview component

The TreeView component allows you to check more than one node in TreeView without affecting the UI's appearance by enabling the [showCheckBox](#) property. When this property is enabled, checkbox appears before each TreeView node text.

- If one of the child nodes is not in a checked state, then the parent node will be in an intermediate state.
- If all the child nodes are in checked state, then the parent node's state will also be checked.
- If a parent node is checked, then all the child nodes' state will also be checked.

By default, the checkbox state of parent and child nodes are dependent on each other. If you need independent checked state, you can achieve it using the [autoCheck](#) property.

Using the [checkedNodes](#) property, you can set the nodes that need to be checked or get the ID of nodes that are currently checked in the TreeView component.

If you need to prevent the node check action for a particular node, the [nodeChecking](#) event can be used which is triggered before the TreeView node is checked/unchecked. The [nodeChecked](#) event will be triggered when the TreeView node is checked/unchecked successfully.

In the following example, the `showCheckBox` property is enabled.

Checked nodes

You can get or set the checked nodes in TreeView at initial rendering and dynamically by using the [checkedNodes](#) property. It returns the checked nodes' ID as an array.

In the following example, the **New South Wales** and **Western Australia** nodes are checked at initial rendering. If any more nodes are checked, the checked nodes' IDs will be displayed in alert.

Node editing in React Treeview component

The TreeView allows you to edit nodes by setting the [allowEditing](#) property to **true**.

To directly edit the nodes in place, **double click** the TreeView node or **select** the node and press **F2** key.

When editing is completed by focus out or by pressing the **Enter** key, the modified node's text saves automatically.

If you do not want to save the modified node's text in TreeView node, press **Escape** key. It does not save the edited text to the TreeView node.

- Node editing can also be performed programmatically by using the [beginEdit](#) method. On passing the node ID or element through this method, the edit textbox will be created for the particular node thus allowing us to edit it.
- If you need to validate or prevent editing, the [nodeEditing](#) event can be used which is triggered before the TreeView node is renamed. On successfully renaming a node the [nodeEdited](#) event will be triggered.

In the following example, the first level node's text cannot be changed, but all other level nodes' text can be changed.

Multiple selection in React Treeview component

Selection provides an interactive support and highlights the node that you select. Selection can be done through simple mouse down or keyboard interaction.

The TreeView also supports selection of multiple nodes by setting [allowMultiSelection](#) to **true**.

To multi-select, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes.

In the following example, the `allowMultiSelection` property is enabled.

Multi selection is not applicable through touch interactions.

Selected nodes

You can get or set the selected nodes in TreeView at initial rendering and dynamically by using the [selectedNodes](#) property. It will return the selected node's ID as an array.

- The [nodeselecting](#) event is triggered before a node is selected/unselected which can be used to prevent the selection.
- The [nodeSelected](#) event is triggered once a node is successfully selected/unselected.

In the following example, **New South Wales** and **Western Australia** nodes are selected at initial rendering. When a node is selected, the selected node's ID is displayed in alert.

Drag and drop in React Treeview component

The TreeView component allows you to drag and drop any node by setting [allowDragAndDrop](#) to **true**. Nodes can be dragged and dropped at all levels of the same TreeView.

The dragged nodes can be dropped at any level by indicator lines with **plus**, **minus/restrict**, and **in between** icons. It represents the exact position where the node is to be dropped as sibling or child.

The following table explains the usage of indicator icons.

Icons	Description
----- -----	

- | Plus icon | Indicates that the dragged node is to be added as child of target node. |
- | Minus or restrict icon | Indicates that the dragged node is not to be dropped at the hovered region. |
- | In between icon | Indicates that the dragged node is to be added as siblings of hovered region. |

- If you need to prevent dragging action for a particular node, the [nodeDragStart](#) event can be used which is triggered when the node drag is started. If you need to prevent dropping action for a particular node, the [nodeDragStop](#) event can be used which is triggered when the drag is stopped.
- The [nodeDragging](#) event is triggered when the TreeView node is being dragged. You can customize the cloned element in this event.
- The [nodeDropped](#) event is triggered when the TreeView node is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

Multiple-node drag and drop

To drag and drop more than one node, you should enable the [allowMultiSelection](#) property along with the [allowDragAndDrop](#) property.

To perform multi-selection, press and hold **CTRL** key and click the desired nodes. To select range of nodes, press and hold the **SHIFT** key and click the nodes.

In the following sample, the [allowMultiSelection](#) property is enabled along with the [allowDragAndDrop](#) property.

Template in React Treeview component

The TreeView component allows you to customize the look of TreeView nodes by using the [nodeTemplate](#) property. This property accepts either `template string` or HTML element ID.

In the following sample, employee information such as employee photo, name, and designation have been included using the `nodeTemplate` property.

The template expression should be provided inside the `${...}` interpolation syntax.

Accessibility in React TreeView component

The TreeView component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the TreeView component is outlined below.

| Accessibility Criteria | Compatibility |

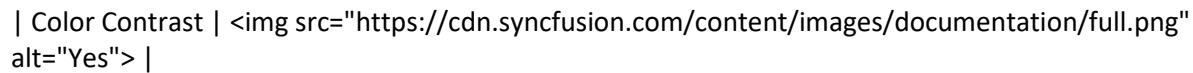

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes"> |

| [Section 508](#) Support |  alt="Yes"> |

WAI-ARIA attributes

The TreeView component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the TreeView component:

Attributes	Purpose
---	---
<code>role=tree</code>	All tree nodes are contained within the element.
<code>role=treeitem</code>	Specifies the role of each tree node in a selectable TreeView and its containment within the tree.
<code>role=group</code>	Specifies the role of each parent node container.
<code>role=checkbox</code>	Indicates checkbox control along with treeitem element.
<code>aria-multiselectable</code>	Indicates whether the TreeView enables multiple selection or not.
<code>aria-expanded</code>	Indicates whether the parent node has expanded or not.
<code>aria-selected</code>	Indicates the selected node.
<code>aria-grabbed</code>	Indicates the selected state on drag-and-drop of node.
<code>aria-level</code>	Indicates the level of node in TreeView.
<code>aria-checked</code>	Indicates the current checked state of TreeView checkbox.
<code>aria-label</code>	Indicates the contextual message for the TreeView checkbox.
<code>aria-activedescendant</code>	Identifies the currently active element when focusing on the TreeView.
<code>aria-disabled</code>	Indicates element is perceivable but disabled.

Keyboard interaction

The TreeView component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the TreeView component.

Interaction Keys	Description
----- -----	
Arrow Up	Goes to the previous node.
Arrow Down	Goes to the next node.

- | Arrow Right | Expands the current node. |
- | Arrow Left | Collapses the current node. |
- | Home | Goes to the first node. |
- | End | Goes to the last node. |
- | F2 | Edits the focused node. |
- | Esc | Focuses out the edit state without saving the edited text. |
- | Enter | Selects the focused node/saves the edited text. |
- | Space | Checks the current node. |
- | Ctrl + A | Selects all nodes. |

Ensuring accessibility

The TreeView component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TreeView component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TreeView component with accessibility tools.

How To

Customize the expand and collapse icons in React Treeview component

You can customize TreeView expand and collapse icons by using the `cssClass` property of TreeView. Refer to the sample to customize expand/collapse icons.

Process the tree node operations using context menu in React Treeview component

You can integrate the context menu with 'TreeView' component in order to perform the TreeView related operations like add, remove and renaming the node.

The following sample demonstrates the above cases which are used to manipulate TreeView operations in the 'select' event of context menu.

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

Restrict the drag and drop for particular tree nodes in React Treeview component

You can able to restrict to drag and drop files under folder only. These can be achieved by using 'nodeDragStop' and 'nodeDragging' event of TreeView.

Accordion tree in React Treeview component

Accordion is an interface where a list of items can be collapsed or expanded, but only one list can be collapsed or expanded at a time. You can customize the TreeView to make it behave as an accordion. Refer to the following code sample to create an accordion tree.

Filtering tree nodes in React Treeview component

You can filter the tree nodes based on their text using the **DataManager** plugin and the **fields** property of the TreeView.

The following code example demonstrates how to filter the tree nodes in a TreeView.

INDEX.JSX

```

{% raw %}
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { DataManager, Query, Predicate } from '@syncfusion/ej2-data';
import { MaskedTextBoxComponent } from "@syncfusion/ej2-react-inputs";
import { TreeViewComponent } from '@syncfusion/ej2-react-navigations';

Sorting treeview level wise in React Treeview component

You can sort the TreeView nodes based on their level. When using the `sortOrder` property, the whole TreeView is sorted. When you sort a particular level, you can use the following code sample. The following code sample demonstrates how to sort the parent node alone in TreeView.

Remove parent checkbox in React Treeview component

By enabling the `showCheckBox` property, you can render check box before each node of TreeView. However, some application needs to render check box in child nodes alone. In such case, you can remove the check box of the parent node by customizing the CSS.

Get dynamic icon in React Treeview component

In TreeView component, you can get the original bound data using the `getTreeData` method. For this method, if you pass the id of the tree node, it returns the corresponding node information, or otherwise the overall tree nodes information will be returned. You can use this method to get the bound `iconCss` class in the `nodeChecking` event. Please refer to the following sample.

Select one child in React Treeview component

TreeView allows both single and multiple selections. If your application needs to select one child at a time under one specific parent, refer to the following example. Here, you can achieve this in the `nodeSelecting` event of TreeView. However, you can reset the selected child and make another selection by pressing Ctrl + selected nodes.

Get all child nodes in React Treeview component

This section demonstrates how to get the child nodes from corresponding parent ID. Using the `getNode` method, you can get the node details of TreeView. Please refer to the following sample.

Disable checkbox of the tree node in React Treeview component

You can disable the check box alone in TreeView instead of disabling the whole node. You need to include the `e-checkbox-disabled` class into the check box element using the `drawNode` event. Please refer to the following sample to disable the check box of the tree nodes.

Ej1 api migration in React Treeview component

This article describes the API migration process of TreeView component from Essential JS 1 to Essential JS 2.

Add nodes

{% raw %}

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Add node | **Method:** `addNode`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.addNode("Node", "#book");` | **Method:** `addNodes`
`<TreeViewComponent fields={this.field} />`
`public tree: TreeViewComponent;`
`var object = [{ id: "temp", name: "New node" }, { id: "new", name: "New node 1" }];`
`tree.addNodes(object, "book");` |

| Triggers before adding node | **Event:** `beforeAdd`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, beforeAdd: this.beforeAdd});`
`beforeAdd: function(){} | Not Applicable |`

| Adding node after a particular node | **Method:**
`insertAfter`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.insertAfter("node", "book");` | **Can be achieved using**
`<TreeViewComponent fields={this.field} />`
`public tree: TreeViewComponent;`
`var object = [{ id: "1", name: "node" }];`
`var child = tree.element.querySelector("[data-uid="book"]);`
`var parent = child.parentElement.closest('.e-list-item');`
`var level = parseInt(parent.getAttribute('aria-level'))+1;`
`var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-'+level));`
`var index = childNodes.indexOf(child);`
`tree.addNodes(object, "book", index+1);` |

| Adding node before a particular node | **Method:**
`insertBefore`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.insertBefore("node", "book");` | **Can be achieved using**
`<TreeViewComponent fields={this.field} />`
`public tree: TreeViewComponent;`
`var object = [{ id: "1", name: "node" }];`
`var child = tree.element.querySelector("[data-uid="book"]);`
`var parent = child.parentElement.closest('.e-list-item');`
`var level = parseInt(parent.getAttribute('aria-level'))+1;`
`var childNodes = Array.from(parent.querySelectorAll('.e-list-item.e-level-'+level));`
`var index = childNodes.indexOf(child);`
`tree.addNodes(object, "book", index-1);` |

| Triggers when node is added successfully | **Event:**
`nodeAdd`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, nodeAdd: this.nodeAdd});`
`nodeAdd: function(){} | Event: dataSourceChanged`
`<TreeViewComponent fields={this.field} dataSourceChanged={this.dataSourceChanged.bind(this)} />`
`dataSourceChanged(): void {} |`

Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Keyboard Navigation | **Property:**

allowKeyboardNavigation
`allowKeyboardNavigation: false` | **Can be achieved using**
`<TreeViewComponent fields={this.field} keyPress={this.keyPress.bind(this)} />`
Script
`keyPress(args): void {args.cancel = true;}` |

| Triggers before node is cut | **Event:** *beforeCut*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, beforeCut: this.beforeCut});`
`beforeCut: function(){} | Not Applicable |`

| Triggers before node is deleted | **Event:** *beforeDelete*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, beforeDelete: this.beforeDelete});`
`beforeDelete: function(){} | Not Applicable |`

| Triggers before loading nodes | **Event:** *beforeLoad*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, beforeLoad: this.beforeLoad});`
`beforeLoad: function(){} | Not Applicable |`

| Triggers before node is pasted | **Event:** *beforePaste*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, beforePaste: this.beforePaste});`
`beforePaste: function(){} | Not Applicable |`

| Triggers when Treeview is created | **Event:** *create*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, create: this.onCreate});`
`onCreate: function(){} | Event: created
<TreeViewComponent fields={this.field} created={this.onCreated.bind(this)} />
onCreated(): void {} |`

| Css class | **Property:** *cssClass*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, cssClass: "custom"});` | **Property:** *cssClass*
`<TreeViewComponent fields={this.field} cssClass={'custom'} /> |`

| Triggers when Treeview is destroyed | **Event:** *destroy*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, destroy: this.onDestroy});`
`onDestroy: function(){} | Event: destroyed
<TreeViewComponent fields={this.field} destroyed={this.onDestroyed.bind(this)} />
onDestroyed(): void {} |`

| Destroy Treeview control | **Method:** *destroy*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.destroy();` | **Method:** *destroy*
`<TreeViewComponent fields={this.field} />`
`public tree: TreeViewComponent;`
`tree.destroy(); |`

| Disable Node | **Method:** *disableNode*
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.disableNode("1");` | **Method:** *disableNodes*
`<TreeViewComponent fields={this.field} />`
`public tree: TreeViewComponent;`
`tree.disableNodes(["1", "2"]); |`

| Enable Animation | **Property:** `enableAnimation`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, enableAnimation: false});` | **Property:** `animation`
`<TreeViewComponent fields={this.field}/>` | `public tree: TreeViewComponent;`
`tree.animation.expand.duration=0` | `tree.animation.collapse.duration=0` |

| Control state | **Property:** `enabled`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, enabled: false});` | Not Applicable |

| Enable Node | **Method:** `enableNode`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields});`
`var treeObj = $("#tree").data("ejTreeView");`
`treeObj.enableNode("1");` | **Method:** `enableNodes`
`<TreeViewComponent fields={this.field}/>` | `public tree: TreeViewComponent;`
`tree.enableNodes(["1", "2"]);` |

| Persistence | **Property:** `enablePersistence`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, enablePersistence: true});` | **Property:** `enablePersistence`
`<TreeViewComponent enablePersistence={true} fields={this.field}/>` |

| Right to Left | **Property:** `enableRTL`
`React.createElement(EJ.TreeView, {id: "tree", fields: fields, enableRTL: true});` | **Property:** `enableRtl`
`<TreeViewComponent enableRtl={true} fields={this.field}/>` |

| Ensure visibility | **Method:** `ensureVisible`

Uploader

Getting Started

Getting Started

This section explains how to create and configure the simple uploader component with its basic usage in step by step procedure.

To get start quickly with React Uploader component, you can check on this video:

Dependencies

The following are the dependencies required to use the uploader component in your application:

```
`javascript
|-- @syncfusion/ej2-react-inputs
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
、
```

Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
```

Start a new project using create-react-app command as follows

```
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
```

Adding Syncfusion Packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install uploader component, use the following command

```
`bash
npm install @syncfusion/ej2-react-inputs --save
```

Adding CSS Reference

Import the uploader component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-inputs/styles/material.css";
```

The [Custom Resource Generator \(CRG\)](#) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

Adding uploader to the application

Now, you can start adding uploader component to the application. We have added uploader component in `src/App.tsx`

file using following code.

```
[Class-component]
`ts
// import uploader component
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
import './App.css';
export default class App extends React.Component<{}, {}> {
  public render() {
    return <UploaderComponent id="uploader" />;
  }
}
```

[Functional-component]

```
`ts
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import './App.css';
function App() {
  return <UploaderComponent id="uploader" />;
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
```

From v16.2.41 version, the Essential JS2 AJAX library has been integrated for uploader server requests. Hence, use the third party **promise** library like blue-bird to use the uploader in Internet Explorer.

Run the application

After completing the configuration to render the basic uploader, run the following command to display the output in your default browser.

```
npm run start
```

From v16.2.41 version, the Essential JS2 AJAX library has been integrated for uploader server requests. Hence, use the third party **promise** library like blue-bird to use the uploader in Internet Explorer.

The following code example illustrates the output in your browser.

[Class-component]

INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```
export default class App extends React.Component {
  render() {
    return (<UploaderComponent />);
  }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
```

INDEX.TSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';

    return (
      <UploaderComponent />
    );
  }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
```

[Functional-component]

INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {

import * as ReactDOM from "react-dom";
function App(){
  return (
    <UploaderComponent />
  );
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
```

Adding drop area

By default, the uploader component allows to upload files by drag the files from file explorer and drop into the drop area. You can configure any other external element as drop target using **dropArea** property.

In the following sample, drop target is configured.

[Class-component]

INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
  uploadObj;
  path = {
    removeUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    saveUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  };
  dropAreaRef;
  onCreated() {
    this.uploadObj.dropArea = this.dropAreaRef;
    this.uploadObj.dataBind();
  }
  render() {
    return (<div id='container'>
      <div id='droparea' ref={dropAreaEle => this.dropAreaRef =
dropAreaEle}>
        Drop files here to upload
      </div>
      <div id='uploadfile'>
        <UploaderComponent autoUpload={false} ref={upload =>
this.uploadObj = upload} asyncSettings={this.path} created={this.onCreated =
this.onCreated.bind(this)} />
      </div>
    </div>);
  }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
```

INDEX.TSX

```

  public path: object = {
    removeUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    saveUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  }
  private dropAreaRef: HTMLElement;
  public onCreated(): void {
    this.uploadObj.dropArea = this.dropAreaRef;
    this.uploadObj.dataBind();
  }
  public render(): JSX.Element {
    return (
      <div id='container'>
        <div id='droparea' ref={dropAreaEle => this.dropAreaRef =
dropAreaEle!}>
          Drop files here to upload
        </div>
      </div>
    );
  }
}
```

```

        </div>
        <div id='uploadfile' >
            <UploaderComponent autoUpload={false} ref = { upload =>

        </div>
    </div>
    );
    }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

[Functional-component]

INDEX.JSX

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';

    };

```

```

    }
    let dropAreaRef: HTMLElement;
    function onCreate(): void {
        uploadObj.dropArea = dropAreaRef;

onCreated.bind(this)} />
            </div>
        </div>
    );
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

Configure asynchronous settings

The uploader component processes the files to upload in Asynchronous mode by default. Define the properties **saveUrl** and **removeUrl** to handle the save and remove action as follows.

[Class-component]

INDEX.JSX

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    path = {
        removeUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
        saveUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Save'
    };
    render() {
        return (<UploaderComponent autoUpload={false}
asyncSettings={this.path}/>);
    }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

INDEX.TSX

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
    public path: object = {
        removeUrl:
'https://services.syncfusion.com/react/production/api/FileUploader/Remove',

```

```

    saveUrl:
    'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  }
  public render(): JSX.Element {
    return (
      <UploaderComponent autoUpload={false} asyncSettings={this.path} />
    );
  }
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

[Functional-component]

INDEX.JSX

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
  const path = {
    removeUrl:
    'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    saveUrl:
    'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  };
  return (<UploaderComponent autoUpload={false} asyncSettings={path}/>);
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

INDEX.TSX

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
  const path: object = {
    removeUrl:
    'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    saveUrl:
    'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  }
  return (
    <UploaderComponent autoUpload={false} asyncSettings={path} />
  );
}
ReactDOM.render(<App />, document.getElementById('fileupload'));

```

Handle success and failed upload

You can handle the success and failure actions using the **success** and **failure** events. To handle these event, define the function and assign it to corresponding event as shown below.

[Class-component]

INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    path = {
        removeUrl:
        'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
        saveUrl:
        'https://services.syncfusion.com/react/production/api/FileUploader/Save'
    };
    onUploadSuccess(args) {
        if (args.operation === 'upload') {
            // window.console.log('File uploaded successfully');
        }
    }
    onUploadFailure(args) {
        // window.console.log('File failed to upload');
    }

Getting Started with the Uploader Component in the Preact Framework

This article provides a step-by-step guide for setting up a [Preact](#) project and integrating the Syncfusion React Uploader component.

Preact is a fast and lightweight JavaScript library for building user interfaces. It's often used as an alternative to larger frameworks like React. The key difference is that Preact is designed to be smaller in size and faster in performance, making it a good choice for projects where file size and load times are critical factors.

Prerequisites

[System requirements for Syncfusion React UI components](#)

Set up the Preact project

To create a new Preact project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm init preact
```

```
,
```

or

```
`bash
```

```
yarn init preact
```

```
,
```

Using one of the above commands will lead you to set up additional configurations for the project, as below:

1\ Define the project name: We can specify the name of the project directly. Let's specify the name of the project as `my-project` for this article.

```
`bash
```

```
T Preact - Fast 3kB alternative to React with the same modern API
```

```
|
```

- Project directory:

| my-project

—

`

2\ Choose JavaScript as the framework variant to build this Preact project using JavaScript and React.

`bash

T Preact - Fast 3kB alternative to React with the same modern API

|

- Project language:

| > JavaScript

| TypeScript

—

`

3\ Then configure the project as below for this article.

`bash

T Preact - Fast 3kB alternative to React with the same modern API

|

- Use router?

| Yes / > No

—

|

- Prerender app (SSG)?

| Yes / > No

—

|

- Use ESLint?

| Yes / > No

—

`

5\ Upon completing the aforementioned steps to create `my-project`, run the following command to jump into the project directory:

```
`bash
cd my-project
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

Add the Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

This article uses the [React Uploader component](#) as an example. To use the React Uploader component in the project, the `@syncfusion/ej2-react-inputs` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-react-inputs --save
`
```

or

```
`bash
yarn add @syncfusion/ej2-react-inputs
`
```

Import Syncfusion CSS styles

You can import themes for the Syncfusion React component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to theme's in a React project.

In this article, the `Material 3` theme is applied using CSS styles, which are available in installed packages. The necessary `Material 3` CSS styles for the Uploader component and its dependents were imported into the `src/style.css` file.

~/SRC/STYLE.CSS

```
@import "../node_modules/@syncfusion/ej2-base/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-react-inputs/styles/material3.css";
```

The order of importing CSS styles should be in line with its dependency graph.

Add the Syncfusion React component

Follow the below steps to add the React Uploader component to the Vite project:

1\ Before adding the Uploader component to your markup, import the Uploader component in the `src/index.jsx` file.

~/SRC/INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
```

2\ Then, add the Uploader component in the **src/index.jsx** file.

~/SRC/INDEX.JSX

```
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
import { render } from 'preact';
import './style.css';
function App() {
  return (<UploaderComponent />);
}
render(<App />, document.querySelector('#app'));
```

Run the project

To run the project, use the following command:

```
`bash
```

```
npm run dev
```

```
,
```

or

```
`bash
```

```
yarn run dev
```

```
,
```

The output will appear as follows:

[Getting Started with the Syncfusion React UI Component](#)

[Async in React Uploader component](#)

The uploader component allows you to upload the files asynchronously. The upload process requires save and remove action URL to manage the upload process in the server.

- The save action is necessary to handle the upload operation.
- The remove action is optional, one which handle the removed files from server.

The File can be upload automatically or manually. For more information, you can refer to the **Auto Upload** section from the documentation.

[Multiple file upload](#)

By Default, the uploader component allows you to select and upload multiple files simultaneously.

The selected files are organized in a list for every file selection until you clear it by clicking clear button that is shown in footer. You can add the multiple attributes to original input element of file by enabling the `multiple` file selection.

The following example explains about multiple file upload settings.

Single file upload

You can select and upload a single file by disabling the multiple file selection property.

The file list item is removed for every selection and it always maintain a single file to upload.You can remove the multiple attributes form the original input element of file by enabling the single file upload property.

Save action

The save action handler upload the files that needs to be specified in the [saveUrl](#) property.

The save handler receives the submitted files and manages the save process in server. After uploading the files to server location, the color of the selected file name changes to green and the remove icon is changed as bin icon.

- When the file is uploaded successfully, the event “success” triggers to handle the

operation after upload.

- When the file is failed to upload, the event “failure” triggers with information,

which cause this failure

You can cancel the upload process by setting the upload event argument **eventargs.cancel** to true.

Server-side configuration for save action

```
`csharp
```

```

```

```
public void Save()
```

```
{
```

```
try
```

```
{
```

```
if (HttpContext.Current.Request.Files.AllKeys.Length > 0)
```

```
{
```

```
var httpPostedFile = HttpContext.Current.Request.Files["UploadFiles"];
```

```
if (httpPostedFile != null)
```

```
{
```

```
var fileSave = HttpContext.Current.Server.MapPath("UploadedFiles");
var fileSavePath = Path.Combine(fileSave, httpPostedFile.FileName);
if (!File.Exists(fileSavePath))
{
    httpPostedFile.SaveAs(fileSavePath);
    HttpResponseMessage Response = HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusDescription = "File uploaded succesfully";
    Response.End();
}
else
{
    HttpResponseMessage Response = HttpContext.Current.Response;
    Response.Clear();
    Response.Status = "400 File already exists";
    Response.StatusCode = 400;
    Response.StatusDescription = "File already exists";
    Response.End();
}
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 400;
    Response.Status = "400 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
```

```
}
,
```

Remove action

The remove action is optional. Specify the URL to handle remove process from server. The remove handler receives the posted files and handle the remove operation in server.

- When the files are removed successfully from server, the success event triggers to denote the process has completed.
- When remove action fails, the event “failure” triggers with information, which cause failure in remove process.

You can differentiate the file operation whether the success event triggers from save or remove action in its arguments **eventArgs.operation** .

You can remove the files which is not uploaded yet from locally by clicking the remove icon. In this case, the success or failure events will not be triggered.

Auto upload

By default, the uploader processes the files to upload once the files are selected and added in upload queue.

To upload manually, disable the **autoUpload** property. When you disable this property, you can use the action buttons to call upload all or clear all actions manually.

You can change those buttons text using the **buttons** property in the uploader component.

By default, the uploader component process multiple files to upload simultaneously. When you enable the [sequentialUpload](#) property, the selected files will process sequentially (one after the other) to the server. If the file uploaded successfully or failed, the next file will upload automatically in this sequential upload. This feature helps to reduce the upload traffic and reduce the failure of file upload.

Preload files

The uploader component allows you to preload the list of files that are uploaded in the server. The preloaded files are useful to view and remove the files from server that can be achieved by the **files** property. By default, the files are configured with uploaded successfully state on rendering file list.

The following properties are mandatory to configure the preloaded files:

- Name
- Size
- Type

Adding additional HTTP headers with upload action

The Uploader component allows you to add the additional headers with `save` and `remove` action requests using the `uploading` and `removing` events, which helps to send validation token on file upload. Access the current request and set the request header within these events.

The following code block shows how to add the additional headers with save and remove action request.

```
`ts

import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {

Chunk upload in React Uploader component

The Uploader sends the large file split into small chunks and transmits to the server using AJAX. You can also pause, resume, and retry the failed chunk file.

* The chunk upload works in asynchronous upload only.

- This feature is available from the Essential Studio Vol 2, 2018 release.

To enable the chunk upload, set the size to [chunkSize](#) option of the upload and it receives the value in **bytes**.

The chunk upload functionality separates the selected files into blobs of the data or chunks. These chunks are transmitted to the server using an AJAX request.

The chunks are sent in **sequential** order, and the next chunk can be sent to the server according to the [success](#) of the previous chunk. If any one of the chunk failed, then the remaining chunk cannot be sent to the server.

The [chunkSuccess](#) or [chunkFailure](#) event will

be triggered when the chunk is sent to the server successfully or failed. If all the chunks are sent to the server successfully, the uploader success event is triggered.

Chunk upload will work when the selected file size is greater than the specified chunk size. otherwise, it upload the files normally.

Additional configurations

To modify the chunk upload, the following options can be used.

- **RetryAfterDelay** - If error occurs while sending any chunk request from JavaScript, hold the operation for 500 milliseconds (by default), and retry the operation using chunk. This can be achieved by using the [asyncSettings.retryAfterDelay](#) property. You can modify the holding time interval in milliseconds.
- **RetryCount** - Specifies the number of retry actions performed when the file fails to upload. By default, [retry](#) action is performed 3 times. If the file fails to upload continuously, the request is aborted and the uploader [failure](#) event will trigger.

The following sample specifies the chunk upload delay with 3000 milliseconds and the retry count is 5. The failure event is triggered as the wrong saveUrl is used.

Cancel upload

The uploader component allows you to cancel the uploading file. This can be achieved by clicking the cancel icon or using the [cancel](#) method. The [cancelling](#) event will be fired whenever the file upload request is canceled. While canceling the upload request, the partially uploaded file is removed from the server.

When the request fails, the pause icon is changed to retry icon. By clicking the retry icon, sends the failed chunk request again to the server and upload started from where it is failed. You can retry the canceled upload request again using retry UI or [retry](#) methods. But, if you retry this, the file upload action again starts from initial.

The following example explains about chunk upload with cancel support.

The retry action has different working behavior for chunk upload and default upload.

- Chunk upload - Retries to upload the failed request where it is failed previously.
- Default upload - Retries to upload the failed file again from initial.

Server-Side configurations

The server-side implementation entirely depends on the application requirements and logic. The following code snippet provides the server-side logic to handle the chunk upload using the uploader components.

```
`csharp
// Server configuration for upload a file.
public void Save()
{
    try
    {
        if (HttpContext.Current.Request.Files.AllKeys.Length > 0)
        {
            var httpPostedChunkFile = HttpContext.Current.Request.Files["chunkFile"];
            if (httpPostedChunkFile != null)
            {
                var saveFile = HttpContext.Current.Server.MapPath("UploadingFiles");

File source in React Uploader component

Paste to upload

The uploader component allows you to upload the files using the select or drop files option from the file explorer. It also supports pasting to upload the image files. You can upload any currently copied images in the clipboard.

When you paste the image, it will be saved in the server with the filename as `image.png`. The file name can be renamed in the server end. You can generate a random name for the file name using `getUniqueID` method.

Refer to the following example.

Directory upload

The uploader component allows you to upload all files in the folders to server by using the [directoryUpload](#) property. When this property is enabled, the uploader component processes the files by iterating through the files and sub-directories in a directory. It allows you to select only folders instead of files to upload.

The directory upload is available only in browsers that supports **HTML5 directory**. The uploader will process directory upload by dragging and dropping in the Edge browser. Refer to the following example to upload files to the server.

Drag and drop

The uploader component allows you to drag and drop the files to upload. You can drag the files from file explorer and drop into the drop area. By default, the uploader component act as drop area element. The drop area gets highlighted when you drag the files over drop area.

Custom drop area

The uploader component allows you to set external target element as drop area using the **dropArea** property. The element can be represented as HTML element or element's id.

Validation in React Uploader component

The uploader component validate the selected files size and extension using the **allowedExtensions**, **minFileSize** and **maxFileSize** properties.

The files can be validated before uploading to the server and can be ignored on uploading. Also, you can validate the files by setting the HTML attributes to the original input element. The validation process occurs on drag-and-drop the files also.

File type

You can allow the specific files alone to upload using the **allowedExtensions** property. The extension can be represented as collection by comma separators.

The uploader component filters the selected or dropped files to match against the specified file types and processes the upload operation. The validation happens when you specify value to inline attribute to accept the original input element.

File size

The uploader component allows you to validate the files based on its size. The validation helps to restrict uploading large files or empty files to the server.

The size can be represented in bytes. By default, the uploader component allows to upload minimum file size as **0 byte** and maximum file size as **28.4 MB** using `minFileSize` and `maxFileSize` properties.

Form support in React Uploader component

The uploader component works with HTML form like default file input. The following configuration must to make the uploader works inside form.

- `saveUrl` and `removeUrl` must be null.
- `autoUpload` must be disabled.
- `name` attribute must be added in input element.

The selected or dropped files are received as a collection in form action when the form is submitted. The form action handles the server-side operations that manage the file upload process. When you reset the form, the file list and data will be cleared.

Template in React Uploader component

You can customize the default appearance of the uploader using a template along with buttons.

File list template

The **template** property is used to customize the default appearance of each file in the list. It can be represented as the HTML element or string. The selected or dropped files are displayed as per the template layout provided. The remove and progress bar action is handled using the corresponding events when the template is defined.

For example, you can display file type icon along with the default UI elements.

Custom template

You can design the own template by preventing the default file list including buttons. When you use custom template to upload or remove the files, pass the custom UI argument as true to call **upload/remove** public method as follows:

- UploaderObj.**upload**(filesData, true);
- UploaderObj.**remove**(filesData, true);

Refer to the following code sample.

Localization in React Uploader component

The Localization library allows you to localize static text content of the uploader. The static text contains default text content of action buttons, file status, clear icon title, tooltips, and text content of drag area. Define the locale object for a culture and assign it to L10n load method.

The following list of keys and its values which are used in the uploader component:

Key	Description
-----	-----
Browse	To customize the browse button text.
Clear	To customize the clear button text.
Upload	To customize the upload button text.
dropFilesHint	To customize the drop area text.
uploadFailedMessage	To customize the status text when the file is failed to upload.
uploadSuccessMessage	To customize the status text when the file is uploaded successfully.
removedSuccessMessage	To customize the status text when the file is removed the successfully from the serve.
removedFailedMessage	To customize the status text while the file is failed to remove.
inProgress	To customize the status text while the upload is in progress.
pauseUpload	To customize the status text while the uploading is paused.
fileUploadCancel	To customize the status text when uploading is cancelled.
readyToUploadMessage	To customize the status text when the file is selected and ready to upload.
invalidMaxFileSize	To customize the status text when the file size is greater than the maximum file size.
invalidFileType	To customize the status text when the file type is invalid.
invalidMinFileSize	To customize the status text when the file size is less than the minimum file size.
remove	To customize tooltip text for remove icon.
cancel	To customize tooltip text for cancel icon.
delete	To customize tooltip text for delete icon.
totalFiles	To customize tooltip text for total files.
size	To customize tooltip text for size.

Preview images before uploading in React Uploader component

The uploader component allows to create preview images before uploading. The preview images can be created by reading the file using selected event. Also, the user can create preview images after uploading to server using success event. Refer to the following link to learn about how to create image preview.

Add additional data on upload in React Uploader component

The uploader component allows you to add additional data on file upload, which is used to get in the server-side. By using the [uploading](#) event and its customFormData argument, you can achieve this behavior. Refer to the following example.

In the following code snippet, explains about how to add additional data on file upload.

`ts

```
import { UploaderComponent, UploadingEventArgs } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
  public uploadObj: UploaderComponent;
  public path: object = {
    removeUrl: 'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    saveUrl: 'https://services.syncfusion.com/react/production/api/FileUploader/Save'
  }
  private dropAreaRef: HTMLElement;
  public onCreate(): void {
    this.uploadObj.dropArea = this.dropAreaRef;
    this.uploadObj.dataBind();
  }
  public onFileUpload(args: UploadingEventArgs) {
    // add addition data as key-value pair.
    args.customFormData = [{ 'name': 'Syncfusion INC' }];
  }
  public render(): JSX.Element {
    return (
      <div className = 'control-pane' ref={dropAreaEle => this.dropAreaRef = dropAreaEle!}>
        <div className='control-section row uploadpreview'>
          <div className='col-lg-9'>
            <div className='upload_wrapper'>
              {/ Render Uploader /}
              <UploaderComponent id='fileUpload' type='file' ref = {upload => {this.uploadObj = upload !}}
                asyncSettings = {this.path}
                uploading={this.onFileUpload = this.onFileUpload.bind(this)} created={this.onCreate =
                this.onCreate.bind(this)} />
            </div>
          </div>
        </div>
      </div>);
  }
}
```

```
}
ReactDOM.render(<App />, document.getElementById('fileupload'));
`
```

Server side for adding additional data

```
`csharp
// Get the additional data in server end by corresponding key.
var data = HttpContext.Current.Request.Form["name"];

Validate image on drop in React Uploader component

The uploader component allows you to upload all type of images by setting **image/*** to [allowedExtensions](#) property.

By default, the behavior is working with select a file using browse button. But, this behavior doesn't support on drag and drop the files. You can handle this behavior manually using **selected** event by filtering the file types from application.

In the following example, validated image files using images/*. You are able to drag and drop the image files with extension of PNG, JPG, BPG, GIF and TIFF to upload it.

Achieve file upload programmatically in React Uploader component

You can upload a file programmatically using the [upload](#) method. Get the selected files data from the [getFilesData](#) public method in uploader.

- If this method receives any files as arguments, those files only start to upload.

Open and edit the uploaded files in React Uploader component

The uploader component allows you to modify the file after uploading to the server, which can be achieved using success event of the uploader.

You can retrieve the saved file path in the uploader success event and assign it to custom attribute (data-file-name) value of the respective file list element to open the uploaded file. Click the respective file element to create a new request along with saved file path using http header. In the server-side, get the file path from the header and open the file using `process.start` method.

`ts

```

import { UploaderComponent } from '@syncfusion/ej2-react-inputs';

Resize images before uploading it to the server in Uploader component

You can customize the dimension of the images before uploading it to the server.

By using selected event, you can get the selected file information as type of an object. From the obtained image file information, create a new canvas and render an image with the custom dimensions. Refer the corresponding code snippet as follows.

Convert image into binary format after uploading in React Uploader component

By default, the file upload component saves the uploaded image files in physical directories. Also, you can convert the images into binary format at server-side before saving the uploaded images. To retrieve binary format of image files, convert the posted file's input stream into binary reader and read as bytes using ReadBytes method.

Refer to the below server-side code snippet

```
`csharp  
[AcceptVerbs("Post")]  
public void Save()  
{  
try  
{  
if (System.Web.HttpContext.Current.Request.Files.AllKeys.Length > 0)  
{  
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];  
if (httpPostedFile != null)  
{  
byte[] fileBytes;  
using (BinaryReader br = new BinaryReader(httpPostedFile.InputStream))  
{  
fileBytes = br.ReadBytes((int)httpPostedFile.InputStream.Length);  
// bytes will be stored in variable fileBytes  
}  
HttpResponse Response = System.Web.HttpContext.Current.Response;  
Response.Clear();  
Response.ContentType = "application/json; charset=utf-8";  
Response.StatusCode = 200;  
}
```

```

Response.Status = "200 Success";
Response.End();
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,
