[Adding Backstage events](#)

Ribbon contextual tabs

The Ribbon Contextual tabs are similar to the Ribbon tabs that are displayed on demand based on their needs, such as an image or a table tabs. It supports adding all built-in and custom ribbon items to perform specific actions.

Visible tabs

You can utilize the [visible](#) property to control the visibility of each contextual tab.

Adding contextual tabs

You can utilize the `RibbonContextualTabsDirective` to add contextual tabs in the Ribbon where you can add multiple tabs based on your needs.

Methods

Show tab

You can use the [showTab](#) method to make the specific Contextual tab visible in the Ribbon.

Hide tab

You can use the [hideTab](#) method to hide specific Contextual tab in the Ribbon.

Ribbon Keytips in React Ribbon component

The Ribbon supports keyboard navigations to interact the ribbon items using the keytips which can be enabled by setting the [enableKeyTips](#) property.

The keytips will be shown when the **Alt + Windows/Command** keys are pressed.

Ribbon items keytip

You can add keytips to all the ribbon items by using the [keyTip](#) property.

Methods

Show keytips

You can use the [showKeyTips](#) method to shown the keytips dynamically.

In order to show specific keytips, pass the key string as an argument in the `showKeyTips('H')` method.

Hide keytips

You can use the [hideKeyTips](#) method in Ribbon to remove the keytips dynamically. This will remove all the visible keytips.

Guidelines for adding keytips

Before adding keytips to the ribbon items consider the following:

- Avoid using the same keytip setting on multiple items.

For example: When you add the keytip text `H` or `HF` for the same items, it activates the first item occurrence of `H`, while any subsequent instances of `H` or `HF` are ignored.

- Do not use the same first letter for the single and double keytip items.

For example: When accessing keytip text `F`, `FP` and `FPF` added for the different ribbon items and pressing `F` key, only the `F` key tip associated item will be activated while the `FP`, `FPF` configured ribbon items will be ignored.

Gallery Items in React Ribbon component

The Ribbon supports Gallery view which allows users to perform specific actions by displaying a collection of related items, including icons, content, or images. You can render the gallery Ribbon items by using the `RibbonItemDirective` tag, by specifying the [type](#) property to `Gallery` and customize it by using the [RibbonGallerySettingsModel](#), which provides options such as `groups`, `itemCount`, `popupHeight`, `popupWidth` and more.

Groups

You can render the groups inside the gallery items by using [groups](#) property and customize the groups using [RibbonGalleryGroupModel](#), which provides options such as `items`, `cssClass`, `header` and more.

Adding items

You can render the gallery items by using [items](#) property and customize using the [RibbonGalleryItemModel](#), which provides options such as `content`, `iconCss`, `disabled` and more.

                                </RibbonCollectionsDirective>
                                </RibbonGroupDirective>
                                </RibbonGroupsDirective>
                                </RibbonTabDirective>
                                </RibbonTabsDirective>
                                <Inject services={[RibbonGallery]} />
                                </RibbonComponent>
                                </div>
                                );
                                }
                                export default App;
                                ReactDOM.render(<App />, document.getElementById("element"));
                                {% endraw %}

```

Adding html attributes

You can use the [htmlAttributes](#) property to add HTML attributes to the Ribbon gallery item.

The following sample showcases how to add title attribute to the gallery item using `htmlAttributes` property.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective, Inject,
RibbonGallery } from '@syncfusion/ej2-react-ribbon';
function App() {
    const pasteOptions = [{ text: "Keep Source Format" }, { text: "Merge
Format" }, { text: "Keep Text Only" }];
    const gallerySettings = (
        {
            groups: [{

```

```

        header: 'Styles',
        items: [
            {
                content: 'Normal',
                htmlAttributes: { title: "Normal" }
            }, {
                content: 'No Spacing',
                htmlAttributes: { title: "No Spacing" }
            }, {
                content: 'Heading 1',
                htmlAttributes: { title: "Heading 1" }
            }, {

Css class

You can use the [cssClass](#) property to customize the gallery item.

The following sample showcases how to customize the appearance of each gallery item using the `cssClass` property .

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective, Inject,
RibbonGallery } from '@syncfusion/ej2-react-ribbon';
function App() {
    const pasteOptions = [{ text: "Keep Source Format" }, { text: "Merge
Format" }, { text: "Keep Text Only" }];
    const gallerySettings = (
        {
            groups: [{
                header: 'Good, Bad and Neutral',
                items: [{
                    content: 'Normal',
                    cssClass: 'normal'
                }, {
                    content: 'Bad',
                    cssClass: 'bad'
                }, {
                    content: 'Good',
                    cssClass: 'good'
                }, {
                    content: 'Neutral',
                    cssClass: 'neutral'
                }
            ]
        }
    ]);
    return (
        <div>
            <RibbonComponent id='ribbon'>
                <RibbonTabsDirective>
                    <RibbonTabDirective header='Home'>
                        <RibbonGroupsDirective>
                            <RibbonGroupDirective header="Clipboard"

[% endraw %]

```

Setting item width

You can use the [itemWidth](#) property to specify the width of gallery items.

Setting item height

You can use the [itemHeight](#) property to set the height of the gallery items. If the [itemHeight](#) of the gallery item is smaller the remaining gallery items are aligned based on the [itemCount](#) specified.

The provided example demonstrates how to customize gallery items using the [itemWidth](#) and [itemHeight](#) properties.

Group styling

You can use the [cssClass](#) property to customize the appearance of gallery groups.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective, Inject,
RibbonGallery } from '@syncfusion/ej2-react-ribbon';
function App() {
  const pasteOptions = [{ text: "Keep Source Format" }, { text: "Merge
Format" }, { text: "Keep Text Only" }];
  const gallerySettings = (
    {
      groups: [{
        header: 'Styles',
        cssClass: "custom-group",
        items: [
          {
            content: 'Normal'
          }, {
            content: 'No Spacing'
          }, {
            content: 'Heading 1'
          }, {
            content: 'Heading 2'
          }
        ]
      }
    ]
  );
  return (

);

```

```

        <Inject services={[RibbonGallery]} />
      </RibbonComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.custom-group {
  font-style: italic;
}

```

Setting item count

You can customize the number of items to be displayed in Ribbon gallery by using the [itemCount](#) property. By default the `itemCount` will be 3.

The following example showcases the utilization of the `itemCount` property, displaying a ribbon gallery with 4 items.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective, Inject,
RibbonGallery } from '@syncfusion/ej2-react-ribbon';
function App() {
  const pasteOptions = [{ text: "Keep Source Format" }, { text: "Merge
Format" }, { text: "Keep Text Only" }];
  const gallerySettings = (
    {
      itemCount: 4,
      groups: [{
        header: 'Styles',
        items: [
          {
            content: 'Normal'
          }, {
            content: 'No Spacing'
          }, {
            content: 'Heading 1'

```

```

        }, {
            content: 'Heading 2'
        }
    ]
}
}
];
};
return (
    <div>
        <RibbonComponent id='ribbon'>
            <RibbonTabsDirective>
                <RibbonTabDirective header='Home'>
                    <RibbonGroupsDirective>
                        <RibbonGroupDirective header="Clipboard"
groupIconCss="e-icons e-paste">
                            <RibbonCollectionsDirective>
                                <RibbonCollectionDirective>
                                    <RibbonItemsDirective>
                                        <RibbonItemDirective

```

Setting popup height

You can specify the height of the gallery popup by using the [popupHeight](#) property.

Setting popup width

you can specify the width of the gallery popup by using the [popupWidth](#) property.

The example demonstrates the customization of popup with `popupHeight` and `popupWidth` properties.

```

To know more about the built-in Ribbon items, please refer to the [Ribbon Items](#) section.

Help Pane

The help pane is dedicated area where the users can define help contents like controlling document permissions, sharing features, and more which appears on the right side of the Ribbon. You can use the [helpPaneTemplate](#) property to set the help pane contents.

INDEX.JSX

```

Tooltip

The Ribbon component supports tooltip to show additional information in the Ribbon items. The tooltip appears when the user hovers over a Ribbon item.

Adding Title

You can use the [title](#) property to set the tooltip title for each Ribbon item.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective,
RibbonItemSize } from "@syncfusion/ej2-react-ribbon";
function App() {

```

```

const cutOptions = { title: "Cut" };
const copyOptions = { title: "Copy" };
const pasteOptions = { title: "Paste" };
const painterOptions = { title: "Format Painter" };
const pasteOption = [{ text: "Keep Source Format" }, { text: "Merge
format" }, { text: "Keep text only" }];
return (
  <RibbonComponent id="ribbon">
    <RibbonTabsDirective>
      <RibbonTabDirective header="Home">
        <RibbonGroupsDirective>
          <RibbonGroupDirective header="Clipboard">
            <RibbonCollectionsDirective>
              <RibbonCollectionDirective>
                <RibbonItemsDirective>

ribbon-tooltip-content {
  font-size: 11px;
}

```

Ribbon Resizing

The Ribbon effectively resizes the ribbon elements while being resized. It extends when the ribbon size is increased and collapses when the ribbon size is decreased. The resizing can be performed in both the classic and simplified modes. Also, we have an option to resize the ribbon elements in the custom order.

In classic mode on resizing, the items size will be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

In simplified mode on resizing, the items size will be changed based on the available width of the tab content from the order of Medium-> Small and viceversa.

Defining items allowed size

You can use the [allowedSizes](#) property to maintain a constant size for an item. If `allowedSizes` is set, it keeps the size constant even when being resized.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective,
RibbonItemSize } from "@syncfusion/ej2-react-ribbon";
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
          <RibbonGroupsDirective>
            <RibbonGroupDirective header="Clipboard">
              <RibbonCollectionsDirective>
                <RibbonCollectionDirective>
                  <RibbonItemsDirective>
                    <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Large} buttonSettings={{ iconCss: "e-icons e-
cut", content: "Cut" }}>

                </RibbonTabsDirective>
            </RibbonComponent>
        );
    }
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

INDEX.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
```

Defining items active size

You can use the [activeSize](#) property to define the item size initially, before it is being resized. When resized the [activeSize](#) property is updated based on the ribbon's overflow state, which is determined by the [allowedSizes](#) property being configured. By default, the value is [Medium](#).

Events

This section describes the ribbon events that will be triggered when appropriate actions are performed. The following events are available in the ribbon component.

[tabSelected](#)

The [tabSelected](#) event is triggered after selecting the tab item.

```
{% raw %}
`ts
import * as React from "react";
import * as ReactDOM from "react-dom";

import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,
RibbonItemDirective, TabSelectedEventArgs } from "@syncfusion/ej2-react-ribbon";

function App() {
function tabSelected ( args: TabSelectedEventArgs) {
// Your required actions here
}
return (
<RibbonComponent id="ribbon" tabSelected = { tabSelected }>
<RibbonTabsDirective>
<RibbonTabDirective header="Home" >
<RibbonGroupsDirective>
<RibbonGroupDirective header="Clipboard">
<RibbonCollectionsDirective>
<RibbonCollectionDirective>
<RibbonItemsDirective>
<RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
</RibbonItemDirective>
</RibbonItemsDirective>
</RibbonCollectionDirective>
</RibbonCollectionsDirective>
</RibbonGroupDirective>
</RibbonGroupsDirective>
</RibbonTabDirective>
</RibbonTabsDirective>
</RibbonComponent>
);
}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
`
```

```
{% endraw %}
```

tabSelecting

The [tabSelecting](#) event is triggered before selecting the tab item.

```
{% raw %}
```

```
`ts
```

```
import * as React from "react";
```

```
import * as ReactDOM from "react-dom";
```

```
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,
RibbonItemDirective, TabSelectingEventArgs } from "@syncfusion/ej2-react-ribbon";
```

```
function App() {
```

```
function tabSelectingEvent ( args: TabSelectingEventArgs) {
```

```
// Your required actions here
```

```
}
```

```
return (
```

```
<RibbonComponent id="ribbon" tabSelecting = { tabSelectingEvent }>
```

```
<RibbonTabsDirective>
```

```
<RibbonTabDirective header="Home" >
```

```
<RibbonGroupsDirective>
```

```
<RibbonGroupDirective header="Clipboard">
```

```
<RibbonCollectionsDirective>
```

```
<RibbonCollectionDirective>
```

```
<RibbonItemsDirective>
```

```
<RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
```

```
</RibbonItemDirective>
```

```
</RibbonItemsDirective>
```

```
</RibbonCollectionDirective>
```

```
</RibbonCollectionsDirective>
```

```
</RibbonGroupDirective>
```

```
</RibbonGroupsDirective>
```

```
</RibbonTabDirective>
```

```

</RibbonTabsDirective>
</RibbonComponent>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
`

```

```
{% endraw %}
```

ribbonCollapsing

The [ribbonCollapsing](#) event is triggered before collapsing the ribbon.

```
{% raw %}
```

```
`ts
```

```
import * as React from "react";
```

```
import * as ReactDOM from "react-dom";
```

```
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,
RibbonItemDirective, ExpandCollapseEventArgs } from "@syncfusion/ej2-react-ribbon";
```

```
function App() {
```

```
function ribbonCollapsing ( args: ExpandCollapseEventArgs) {
```

```
// Your required actions here
```

```
}
```

```
return (
```

```
<RibbonComponent id="ribbon" ribbonCollapsing = { ribbonCollapsing }>
```

```
<RibbonTabsDirective>
```

```
<RibbonTabDirective header="Home" >
```

```
<RibbonGroupsDirective>
```

```
<RibbonGroupDirective header="Clipboard">
```

```
<RibbonCollectionsDirective>
```

```
<RibbonCollectionDirective>
```

```
<RibbonItemsDirective>
```

```
<RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
```

```
</RibbonItemDirective>
```

```
</RibbonItemsDirective>
```

```
</RibbonCollectionDirective>
```

```

</RibbonCollectionsDirective>
</RibbonGroupDirective>
</RibbonGroupsDirective>
</RibbonTabDirective>
</RibbonTabsDirective>
</RibbonComponent>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
`

```

```
{% endraw %}
```

[ribbonExpanding](#)

The [ribbonExpanding](#) event is triggered before expanding the ribbon.

```
{% raw %}
```

```
`ts
```

```
import * as React from "react";
```

```
import * as ReactDOM from "react-dom";
```

```
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,
RibbonItemDirective, ExpandCollapseEventArgs } from "@syncfusion/ej2-react-ribbon";
```

```
function App() {
```

```
function ribbonExpanding ( args: ExpandCollapseEventArgs) {
```

```
// Your required actions here
```

```
}
```

```
return (
```

```
<RibbonComponent id="ribbon" ribbonExpanding = { ribbonExpanding }>
```

```
<RibbonTabsDirective>
```

```
<RibbonTabDirective header="Home" >
```

```
<RibbonGroupsDirective>
```

```
<RibbonGroupDirective header="Clipboard">
```

```
<RibbonCollectionsDirective>
```

```
<RibbonCollectionDirective>
```

```
<RibbonItemsDirective>
```

```

<RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
</RibbonItemDirective>
</RibbonItemsDirective>
</RibbonCollectionDirective>
</RibbonCollectionsDirective>
</RibbonGroupDirective>
</RibbonGroupsDirective>
</RibbonTabDirective>
</RibbonTabsDirective>
</RibbonComponent>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
`

```

```
{% endraw %}
```

[launcherIconClick](#)

The [launcherIconClick](#) event is triggered when the launcher icon of the group is clicked.

```
{% raw %}
```

```
`ts
```

```
import * as React from "react";
```

```
import * as ReactDOM from "react-dom";
```

```
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,
RibbonItemDirective, LauncherClickEventArgs } from "@syncfusion/ej2-react-ribbon";
```

```
function App() {
```

```
function launchClick ( args: LauncherClickEventArgs) {
```

```
// Your required actions here
```

```
}
```

```
return (
```

```
<RibbonComponent id="ribbon" launcherIconClick = { launchClick }>
```

```
<RibbonTabsDirective>
```

Accessibility in React Ribbon component

The Ribbon component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Ribbon component is outlined below.

| [Accessibility Criteria](#) | [Compatibility](#) |

| -- | -- |

| [WCAG 2.2](#) Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |`

| [Section 508](#) Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

| Screen Reader Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/partial.png" alt="Intermediate"> |`

| Right-To-Left Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

| Color Contrast | ` |`

| Mobile Device Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

| Keyboard Navigation Support | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

| [Accessibility Checker](#) Validation | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

| [Axe-core](#) Accessibility Validation | `<img`

`src="https://cdn.syncfusion.com/content/images/documentation/full.png" alt="Yes"> |`

`<style>`

`.post .post-content img {`

`display: inline-block;`

`margin: 0.5em 0;`

`}`

`</style>`

`<div> - All features of the component meet the requirement.</div>`

`<div> - Some features of the component do not meet the requirement.</div>`

`<div> - The component does not meet the requirement.</div>`

[WAI-ARIA attributes](#)

The Ribbon component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Ribbon component:

| [Attributes](#) | [Purpose](#) |

| --- | --- |

| **role=tablist** | Used to identify the element that serves as the container for a set of tabs. |

| **role=tab** | Indicates an interactive element within a tablist that, when activated, displays its associated tab panel. |

| **role=tabpanel** | Specifies the role for the content associated with an active tab, describing its role in presenting the active content. |

| **role=button** | Represents a clickable element that trigger a response when activated by the user. |

| **role=menu** | Represents an item that have sub menu. |

| **role=menuitem** | Indicates an option in a set of choices within a menu. |

| **role=combobox** | Identifies an element as an input that controls another element, commonly used for dropdowns. |

| **role=option** | Used for selectable items in a combobox. |

| **role=gridcell** | Specified as gridcell for the tiles in the color palette. |

| **aria-orientation** | Indicates the element's orientation as horizontal, vertical, or unknown/ambiguous. |

| **aria-selected** | Indicates the current "selected" state of various widgets. |

| **aria-labelledby** | Sets to the Tab content element to indicates the associated Tab header for the content. |

| **aria-controls** | Indicates the associated tabpanel for the header by setting the attribute on Tab items. |

| **aria-haspopup** | Indicates availability and type of interactive popup triggered by the element it's set on. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, making it not editable or operable. |

| **aria-expanded** | Indicates whether a component is expanded or collapsed, set on the respective element. |

| **aria-label** | Defines a string value that labels an interactive element for accessibility. |

| **aria-checked** | Indicates the current "checked" state of checkboxes, radio buttons, and other widgets. |

| **aria-owns** | Identifies an element or elements, establishing a relationship when DOM hierarchy can't represent it. |

| **aria-readonly** | Indicates that the element is not editable but is otherwise operable. |

| **aria-activedescendent** | Identifies the currently active element when focus is on a combobox, textbox, group, or application. |

| **aria-autocomplete** | Indicates whether inputting text could trigger display of predictions and specifies how predictions will be presented for a combobox, searchbox, or textbox. |

Keyboard interaction

The Ribbon component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Ribbon component.

| Press | To do this |

| --- | --- |

Ribbon Tab| |

| Tab | To focus the ribbon tabs. |

| Right Arrow | Moves focus to the next Tab. |

| Left Arrow | Moves focus to the previous Tab. |

| Enter / Space | To select the currently focussed ribbon tab. |

Ribbon Items| |

| Tab | To focus the ribbon Items. |

| Right Arrow | Focuses the next item. |

| Left Arrow | Focuses the previous item. |

| Enter / Space | To select the currently focussed ribbon item. |

Ribbon Dropdown Items/ Ribbon Split button| |

| Esc | Closes the popup. |

| Enter / Space | Opens the popup, or activates the highlighted item and closes the popup. |

| Arrow Up | Focuses the next item. |

| Arrow Down | Focuses the previous item. |

| Alt + Arrow Up | Closes the popup. |

| Alt + Arrow Down | Opens the popup |

Ribbon File menu| |

| Tab | To focus the ribbon file menu. |

| Esc | Closes the popup. |

| Enter | Opens the popup, or activates the highlighted item and closes the popup. |

| Arrow Up | Focuses the previous action item. |

| Arrow Down | Focuses the next action item. |

| Alt + Arrow Down | Opens the popup |

Ribbon Combobox| |

| Arrow Down | Selects the first item in the ComboBox when no item selected. Otherwise, selects the item next to the currently selected item. |

- | Arrow Up | Selects the item previous to the currently selected one. |
- | Page Down | Scrolls down to the next page and selects the first item when popup list opens. |
- | Page Up | Scrolls up to the previous page and selects the first item when popup list opens. |
- | Enter | Selects the focused item and popup list closes when it is in open state. |
- | Tab | Focuses on the next TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |
- | Shift + tab | Focuses on the previous TabIndex element on the page when the popup is closed. Otherwise, closes the popup list and remains the focus of the component. |
- | Alt + Down | Open the popup list |
- | Alt + Up | Close the popup list |
- | Esc(Escape) | Closes the popup list when it is in an open state and the currently selected item remains the same. |
- | Home | Cursor moves to before of first character in input |
- | End | Cursor moves to next of last character in input |

Ensuring accessibility

The Ribbon component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Ribbon component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Ribbon component with accessibility tools.

RichTextEditor

Getting Started with React Rich Text Editor Component

This article provides a step-by-step introduction to get started with the Syncfusion React Rich Text Editor component.

Prerequisites

[System requirements for Syncfusion React UI components](#)

Dependencies

The following list of dependencies are required to use the Rich Text Editor component in the application.

```
`javascript
|-- @syncfusion/ej2-react-richtexteditor
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
```

```
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-filemanager
|-- @syncfusion/ej2-richtexteditor
|-- @syncfusion/ej2-react-base
\
```

Create the React application

To set-up, a React application, choose any of the following ways. The best and easiest way is to use the [Create-react-app](#). It sets up the development environment in JavaScript and improvises the application for production. Refer to the [installation instructions](#) of the `Create-react-app`

```
`bash
npx create-react-app my-app
cd my-app
npm start
\
```

or

```
`bash
yarn create react-app my-app
cd my-app
yarn start
\
```

To set-up a React application in the `TypeScript` environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
\
```

Besides using the [npm](#) package runner tool, also create an application from the `npm init`. To begin with `npm init`, upgrade the `npm` version to `npm 6+`.

```
`bash
```

```
npm init react-app my-app
```

```
cd my-app
```

```
npm start
```

```
,
```

Add Syncfusion React packages

Once you have created the React application, install the required Syncfusion React component package in the application. All Syncfusion React (Essential JS 2) packages are published on the [npmjs](https://www.npmjs.com/) public registry.

To install the RichTextEditor component package, use the following command.

```
`bash
```

```
npm install @syncfusion/ej2-react-richtexteditor --save
```

```
,
```

or

```
`bash
```

```
yarn add @syncfusion/ej2-react-richtexteditor
```

```
,
```

Import the Syncfusion CSS styles

After installing the Syncfusion component packages in the application, import the required themes based on the components used.

The Syncfusion React component comes with built-in [themes](#), which are available in installed packages. It is quite simple to adapt the Syncfusion React components based on the application style by referring to any of the built-in themes. Import the **Material** theme for the Rich Text Editor component.

Import the CSS styles for the Rich Text Editor component and its dependencies in the `src/App.css` file.

```
`css
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-icons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-richtexteditor/styles/material.css';
```

```
,
```

Check out the [Themes topic](#) to know more about built-in themes and different ways to refer to themes in React applications.

Add Rich Text Editor component to the application

Initialize from React element

Start adding the required components to the application. Add the Rich Text Editor component in the `src/App.js` or `src/App.tsx` file using the following code.

- Before adding the Rich Text Editor component to the markup, import the Rich Text Editor component in the `src/App.js` or `src/App.tsx` file.

```
`bash
```

```
import { RichTextEditorComponent } from '@syncfusion/ej2-react-richtexteditor';
```

```
`
```

- Then, add the Rich Text Editor component in the application using the following code sample.

```
`ts
```

```
/
```

- Initilaize Rich Text Editor from React element

```
*/
```

```
import { HtmlEditor, Image, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
```

```
import * as React from 'react';
```

```
import './App.css';
```

```
function App() {
```

```
  return (
```

```
    <RichTextEditorComponent>
```

```
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides the best user experience to create and update the content. Users can format their content using standard toolbar commands.</p>
```

```
    <p><b>Key features:</b></p>
```

```
    <ul>
```

```
    <li>
```

```
    <p>Provides <IFRAME> and <DIV> modes</p>
```

```
    </li>
```

```
    <li>
```

```
    <p>Capable of handling markdown editing.</p>
```

```
</li>
<li>
<p>Contains a modular library to load the necessary functionality on demand.</p>
</li>
<li>
<p>Provides a fully customizable toolbar.</p>
</li>
<li>
<p>Provides HTML view to edit the source directly for developers.</p>
</li>
<li>
<p>Supports third-party library integration.</p>
</li>
<li>
<p>Allows preview of modified content before saving it.</p>
</li>
<li>
<p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
</li>
<li>
<p>Contains undo/redo manager.</p>
</li>
<li>
<p>Creates bulleted and numbered lists.</p>
</li>
</ul>
<Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
export default App;
`
```

Initialize from `<IFRAME>` element

The Rich Text Editor's content is placed in an iframe and isolated from the rest of the page.

Initialize the Rich Text Editor on div element and set the enable field of `iframeSettings` property to true.

Place the following Rich Text Editor code in the `app.tsx`.

```
`ts
/

    • Rich Text Editor Iframe Samples

*/

import { HtmlEditor, Image, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {
const iframeSetting: object = { enable: true };
return (
<RichTextEditorComponent iframeSettings={iframeSetting}>
<p>The Rich Text Editor component is WYSIWYG ("what you see is what you get") editor that provides
the best user experience to create and update the content. Users can format their content using
standard toolbar commands.</p>
<p><b>Key features:</b></p>
<ul>
<li>
<p>Provides <IFRAME> and <DIV> modes</p>
</li>
<li>
<p>Capable of handling markdown editing.</p>
</li>
<li>
<p>Contains a modular library to load the necessary functionality on demand.</p>
</li>
<li>
<p>Provides a fully customizable toolbar.</p>
</li>
<li>
```

```

<p>Provides HTML view to edit the source directly for developers.</p>
</li>
<li>
<p>Supports third-party library integration.</p>
</li>
<li>
<p>Allows preview of modified content before saving it.</p>
</li>
<li>
<p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
</li>
<li>
<p>Contains undo/redo manager.</p>
</li>
<li>
<p>Creates bulleted and numbered lists.</p>
</li>
</ul>
<Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
export default App;
`

```

Module Injection

To create Rich Text Editor with additional features, inject the required modules. The following modules are used to extend Rich Text Editor's basic functionality.

- **Toolbar** - Inject this module to use Toolbar feature.
- **Link** - Inject this module to use link feature in Rich Text Editor.
- **Image** - Inject this module to use image feature in Rich Text Editor.
- **Table** - Inject this module to use table feature in Rich Text Editor.
- **Count** - Inject this module to use character count in Rich Text Editor.
- **HtmlEditor** - Inject this module to use Rich Text Editor as html editor.
- **MarkdownEditor** - Inject this module to use Rich Text Editor as markdown editor.
- **QuickToolbar** - Inject this module to use quick toolbar feature for the target element.

- **Resize** - Inject this module to use resize feature in Rich Text Editor.
- **FileManager** - Inject this module to use file browser feature in Rich Text Editor.
- **PasteCleanup** - Inject this module to use paste cleanup feature in Rich Text Editor.

These modules should be inject by using services.

Run the application

All are set. Now, run the application using the following command.

```
`bash
```

```
npm start
```

```
`
```

or

```
`bash
```

```
yarn start
```

```
`
```

The output will appear as follows.

APP.JSX

```
/**
 * Rich Text Editor - Getting Started Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {
  const toolbarSettings = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  };
  const quickToolbarSettings = {
    image: ['Replace', 'Align', 'Caption', 'Remove', 'InsertLink',
      'OpenImageLink', '-', 'EditImageLink', 'RemoveImageLink', 'Display',
      'AltText', 'Dimension'],
    link: ['Open', 'Edit', 'UnLink']
  };
  return (
    <RichTextEditorComponent height={450}
      toolbarSettings={toolbarSettings}
      quickToolbarSettings={quickToolbarSettings}>
      <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>
      <p><b>Key features:</b></p>
      <ul>
```

```

        <li>
          <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
        </li>

on demand.</p>
        </li>
        <li>
          <p>Provides a fully customizable toolbar.</p>
        </li>
        <li>
          <p>Provides HTML view to edit the source directly for
developers.</p>
        </li>
        <li>
          <p>Supports third-party library integration.</p>
        </li>
        <li>
          <p>Allows preview of modified content before saving it.</p>
        </li>
        <li>
          <p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
        </li>
        <li>
          <p>Contains undo/redo manager.</p>
        </li>
        <li>
          <p>Creates bulleted and numbered lists.</p>
        </li>
      </ul>
      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}>/>
    </RichTextEditorComponent>;
  }
  export default App;

```

APP.TSX

```

/**
 * Rich Text Editor - Getting Started Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
function App() {
  const toolbarSettings: object = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
'LowerCase', 'UpperCase', '|',
'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
'Outdent', 'Indent', '|',
'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']

```

```

    }
    const quickToolbarSettings: object = {
      image: ['Replace', 'Align', 'Caption', 'Remove', 'InsertLink',
'OpenImageLink', '-', 'EditImageLink', 'RemoveImageLink', 'Display',
'AltText', 'Dimension'],
      link: ['Open', 'Edit', 'UnLink']
    }
  }
  return (
    <RichTextEditorComponent height={450} toolbarSettings={toolbarSettings}
quickToolbarSettings={quickToolbarSettings}>
      <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content. Users can format their content using standard toolbar commands.</p>
      <p><b>Key features:</b></p>
      <ul>
        <li>
          <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
        </li>
        <li>
          <p>Capable of handling markdown editing.</p>
        </li>
        <li>
          <p>Contains a modular library to load the necessary functionality
on demand.</p>
        </li>
        <li>
          <p>Provides a fully customizable toolbar.</p>
        </li>
        <li>
          <p>Provides HTML view to edit the source directly for
developers.</p>
        </li>
        <li>
          <p>Supports third-party library integration.</p>
        </li>
        <li>
          <p>Allows preview of modified content before saving it.</p>
        </li>
        <li>
          <p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
        </li>
        <li>
          <p>Contains undo/redo manager.</p>
        </li>
        <li>
          <p>Creates bulleted and numbered lists.</p>
        </li>
      </ul>
      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
    </RichTextEditorComponent>
  );
}
export default App;

```

Configure the Toolbar

Configure the toolbar with the tools using items field of the toolbarSettings property as your application requires.

APP.JSX

```
/**
 * Rich Text Editor - Toolbar Config Sample
 */
import { HtmlEditor, Inject, RichTextEditorComponent, Toolbar } from
'syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {
  const toolbarSettings = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  };
  return (<RichTextEditorComponent height={450}
toolbarSettings={toolbarSettings}>
  <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content.
  Users can format their content using standard toolbar commands.</p>
  <p><b>Key features:</b></p>
  <ul>
    <li>
      <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
    </li>
    <li>
      <p>Capable of handling markdown editing.</p>
    </li>
    <li>
      <p>Contains a modular library to load the necessary functionality
on demand.</p>
    </li>
    <li>
      <p>Provides a fully customizable toolbar.</p>
    </li>
    <li>
      <p>Provides HTML view to edit the source directly for
developers.</p>
    </li>
    <li>
      <p>Supports third-party library integration.</p>
    </li>
    <li>
      <p>Allows preview of modified content before saving it.</p>
    </li>
    <li>
      <p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
    </li>
  </ul>

```

```

        <p>Contains undo/redo manager.</p>
      </li>
      <li>
        <p>Creates bulleted and numbered lists.</p>
      </li>
    </ul>
    <Inject services={[Toolbar, HtmlEditor]}/>
  </RichTextEditorComponent>);
}
export default App;

```

APP.TSX

```

/**
 * Rich Text Editor - Toolbar Config Sample
 */
import { HtmlEditor, Inject, RichTextEditorComponent, Toolbar } from
'@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {
  const toolbarSettings: object = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  }
  return (
    <RichTextEditorComponent height={450} toolbarSettings={toolbarSettings}>
      <p>The Rich Text Editor component is WYSIWYG ("what you see is what you
get") editor that provides the best user experience to create and update the
content.
      Users can format their content using standard toolbar commands.</p>
      <p><b>Key features:</b></p>
      <ul>
        <li>
          <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
        </li>
        <li>
          <p>Capable of handling markdown editing.</p>
        </li>
        <li>
          <p>Contains a modular library to load the necessary functionality
on demand.</p>
        </li>
        <li>
          <p>Provides a fully customizable toolbar.</p>
        </li>
        <li>
          <p>Provides HTML view to edit the source directly for
developers.</p>
        </li>
        <li>
          <p>Supports third-party library integration.</p>

```

```

        </li>
        <li>
          <p>Allows preview of modified content before saving it.</p>
        </li>
        <li>
          <p>Handles images, hyperlinks, video, hyperlinks, uploads, etc.</p>
        </li>
        <li>
          <p>Contains undo/redo manager.</p>
        </li>
        <li>
          <p>Creates bulleted and numbered lists.</p>
        </li>
      </ul>
      <Inject services={[Toolbar, HtmlEditor]} />
    </RichTextEditorComponent>
  );
}
export default App;

```

The `|` and `-` can insert a vertical and horizontal separator lines in the toolbar.

Retrieve the formatted content

To retrieve the editor contents, use the `value` property of Rich Text Editor.

```

`ts
const rteValue: string = this.rteObj.value;
`

```

Or you can use the public method `getContent` to retrieve the RTE content.

```

`ts
const rteValue: string = this.rteObj.getContent();
`

```

To fetch the RichTextEditor's text content, use the `textContent` property of RTE `EditPanel`.

```

`ts
const rteValue: string = this.rteObj.contentModule.getEditPanel().textContent;
`

```

Insert images and links

The image module inserts an image into Rich Text Editor's content area, and the link module links external resources such as website URLs, to selected text in the Rich Text Editor's content, respectively.

The link inject module adds a link icon to the toolbar and the image inject module adds an image icon to the toolbar.

Specifies the items to be rendered in the quick toolbar based on the target element such image, link, and text element. The quick toolbar opens to customize the element by clicking the target element.

APP.JSX

```

/**
 * Rich Text Editor - Insert Image Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
function App() {
  const toolbarSettings = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  };
  const quickToolbarSettings = {
    image: ['Replace', 'Align', 'Caption', 'Remove', 'InsertLink',
'OpenImageLink', '-', 'EditImageLink', 'RemoveImageLink', 'Display',

You can refer to our [React Rich Text Editor](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Rich Text Editor example](#) that shows how to render the rich text editor tools.

Editor modes in React Rich text editor component

The Rich Text Editor component used to create and edit the content and return valid HTML markup or markdown (MD) of the content. It supports the following two editing formation.

- HTML editor
- Markdown editor

HTML editor

Rich Text Editor is a WYSIWYG editing control for formatting the word content as HTML.

The HTML editing mode is the default mode in Rich Text Editor to format the content through the available toolbar items to return the valid HTML markup. Set the [editorMode](#) property as **HTML**.

To create Rich Text Editor with HTML editing feature, inject the **HtmlEditor** module to the RTE using the **RichTextEditor.Inject(HtmlEditor)** method.

Markdown editor

Set the [editorMode](#) property as **Markdown**, to create or edit the content and apply formatting to view markdown formatted content.

The third-party library such as **Marked** or any other library is used to convert markdown into HTML content.

- Supported tags are **h6, h5, h4, h3, h2, h1, blockquote, pre, p, OL, and UL.**
- Supported selection tags are **Bold, Italic, StrikeThrough, InlineCode, SubScript, SuperScript, UpperCase, and LowerCase.**

{% enddraw %}

```

To create Rich Text Editor with Markdown editing feature, inject the `MarkdownEditor` module to the RTE using the `RichTextEditor.Inject(MarkdownEditor)` method.

For further details on Markdown editing, refer to the [Markdown](#) section.

Toolbar in React Rich text editor component

The Rich Text Editor toolbar contains a collection of tools such as bold, italic, and text alignment buttons that are used to format the content. However, in most integrations, you can customize the toolbar configurations easily to suit your needs.

To create Rich Text Editor with Markdown editing feature, inject the toolbar module to the RTE using the `RichTextEditor.Inject(Toolbar)` method.

The Rich Text Editor allows you to configure the different types of toolbar using the `toolbarSettings.type` property. The types of toolbar are:

- Expand
- MultiRow

Expand Toolbar

The default mode of `toolbarSettings.type` is Expand to hide the overflowing items in the next row. By clicking the expand arrow, view the overflowing toolbar items.

Floating toolbar

By default, the toolbar is floating at the top of the Rich Text Editor on scrolling. It can be customized by specifying the offset of the floating toolbar from documents top position using [floatingToolbarOffset](#).

Enable or disable the floating toolbar using [enableFloating](#) of the toolbarSetting property.

Toolbar items

The following table lists the tools available in the toolbar.

Name	Icons	Summary	Initialization
---	---	---	---

- | Undo |  | Allows to undo the actions. | toolbarSettings: {
 items: ['Undo']
 } |
- | Redo |  | Allows to redo the actions. | toolbarSettings: {
 items: ['Redo']
 } |
- | Alignment |  | Align the content with left, center, and right margin. | toolbarSettings: {
 items: ['Alignments']
 } |
- | OrderedList |  | Create a new list item (numbered). | toolbarSettings: {
 items: ['OrderedList']
 } |
- | UnorderedList |  | Create a new list item (bulleted). | toolbarSettings: {
 items: ['UnorderedList']
 } |
- | Indent |  | Allows to increase the indent level of the content. | toolbarSettings: {
 items: ['Indent']
 } |
- | Outdent |  | Allows to decrease the indent level of the content. | toolbarSettings: {
 items: ['Outdent']
 } |
- | Hyperlink |  | Creates a hyperlink to a text or image to a specific location in the content. | toolbarSettings: {
 items: ['CreateLink']
 } |
- | Images |  | Inserts an image from an online source or local computer. | toolbarSettings: {
 items: ['Image']
 } |
- | LowerCase |  | Change the case of selected text to lower in the content. | toolbarSettings: {
 items: ['LowerCase']
 } |
- | UpperCase |  | Change the case of selected text to upper in the content. | toolbarSettings: {
 items: ['UpperCase']
 } |
- | SubScript |  | Makes the selected text as subscript (lower). | toolbarSettings: {
 items: ['SubScript']
 } |
- | SuperScript |  | Makes the selected text as superscript (higher). | toolbarSettings: {
 items: ['SuperScript']
 } |
- | Print |  | Allows to print the editor content. | toolbarSettings: {
 items: ['Print']
 } |
- | FontName |  | Defines the fonts that appear under the Font Family DropDownList from the Rich Text Editor's toolbar. | toolbarSettings: {
 items: ['FontName']
 } |
- | FontSize |  | Defines the font sizes that appear under the Font Size DropDownList from the Rich Text Editor's toolbar. | toolbarSettings: {
 items: ['FontSize']
 } |

| FontColor |  | Specifies an array of colors can be used in the colors pop-up for font color. |
 toolbarSettings: {
 items: ['FontColor']
 } |

| BackgroundColor |  | Specifies an array of colors can be used in the colors pop-up for background color. | toolbarSettings: {
 items: ['BackgroundColor']
 } |

| Format |  | An object with the options that will appear in the paragraph format drop-down from the toolbar. | toolbarSettings: {
 items: ['Formats']
 } |

| StrikeThrough |  | Apply double line strike through formatting for the selected text. |
 toolbarSettings: {
 items: ['StrikeThrough']
 } |

| ClearFormat |  | The clear format tool is used to remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. As a result, all the formatting text will be cleared and return to its default formatting styles. | toolbarSettings: {
 items: ['ClearFormat']
 } |

| FullScreen |  | Stretches the editor to the maximum width and height of the browser window. |
 toolbarSettings: {
 items: ['FullScreen']
 } |

| SourceCode |  | The RichTextBox includes the ability for users to directly edit the HTML code via Source View. If you made any modification in source view directly, synchronize with design view. |
 toolbarSettings: {
 items: ['SourceCode']
 } |

| NumberFormatList |  | Allows to create list items with various list style types(numbered).| toolbarSettings: {
 items: ['NumberFormatList']
 } |

| BulletFormatList |  | Allows to create list items with various list style types(bulleted).| toolbarSettings: {
 items: ['BulletFormatList']
 } |

| JustifyLeft |  | Allows each line to begin at the same distance from the editor's left-hand side. |
 toolbarSettings: {
 items: ['JustifyLeft']
 } |

| JustifyCenter |  | There is an even space on each side of each line since the text is not aligned to the left or right margins. | toolbarSettings: {
 items: ['JustifyCenter']
 } |

| JustifyRight |  | Allows each line to end at the same distance from the editor's right-hand side. |
 toolbarSettings: {
 items: ['JustifyRight']
 } |

| JustifyFull |  | The text is aligned with both right and left margins. | toolbarSettings: {
 items: ['JustifyFull']
 } |

| Bold |  | Text that is thicker and darker than usual. | toolbarSettings: {
 items: ['Bold']
 } |

| Italic |  | Shows a text that is leaned to the right. | toolbarSettings: {
 items: ['Italic']
 } |

| Underline |  | The underline is added to the selected text. | toolbarSettings: {
 items: ['Underline']
 } |

| ClearAll |  | Removes all styles that have been applied to the selected text. | toolbarSettings: {
 items: ['ClearAll']
 } |

| Cut |  | Removes the text from its current location and places it into the clipboard. | toolbarSettings: {
 items: ['Cut']
 } |

| Copy |  | The selected item is copied and pasted into the clipboard. | toolbarSettings: {
 items: ['Copy']
 } |

| Paste |  | Allows you to insert a clipboard item into a specific location. | toolbarSettings: {
 items: ['Paste']
 } |

| OpenLink |  | To open the URL link that is attached to the selected text. | toolbarSettings: {
 items: ['OpenLink']
 } |

| EditLink |  | Allows you to change the URL that has been attached to a specific item. | toolbarSettings: {
 items: ['EditLink']
 } |

| CreateTable |  | Create a table with defined columns and rows. | toolbarSettings: {
 items: ['CreateTable']
 } |

| RemoveTable |  | Removes the selected table and its contents. | toolbarSettings: {
 items: ['TableRemove']
 } |

| Replace |  | Replace the selected image with another image. | toolbarSettings: {
 items: ['Replace']
 } |

| Align |  | The image can be aligned to the right, left, or center. | toolbarSettings: {
 items: ['Align']
 } |

| Remove |  | Allows to remove the selected image from the editor. | toolbarSettings: {
 items: ['Remove']
 } |

| OpenImageLink |  | Opens the link that is attached to the selected image. | toolbarSettings: {
 items: ['OpenImageLink']
 } |

 | EditImageLink | Allows to edit the link that is attached to the selected image. | toolbarSettings: {
 items: ['EditImageLink']
 } |

 | RemoveImageLink | Removes the link that is attached to the selected image. | toolbarSettings: {
 items: ['RemoveImageLink']
 } |

 | InsertLink | Allows users to add a link to a particular item. | toolbarSettings: {
 items: ['InsertLink']
 } |

 | Display | Allows you to choose whether an image should be shown inline or as a block. | toolbarSettings: {
 items: ['Display']
 } |

 | AltText | To display image description when an image on a Web page cannot be displayed. | toolbarSettings: {
 items: ['AltText']
 } |

 | Dimension | Allows you to customize the image's height and width. | toolbarSettings: {
 items: ['Dimension']
 } |

 | Maximize | Stretches the editor to the maximum width and height of the browser window. | toolbarSettings: {
 items: ['Maximize']
 } |

 | Minimize | Shrinks the editor to the default width and height. | toolbarSettings: {
 items: ['Minimize']
 } |

 | Preview | Allows to see how the editor's content looks in a browser. | toolbarSettings: {
 items: ['Preview']
 } |

 | InsertCode | Represents preformatted text which is to be presented exactly as written in the HTML file. | toolbarSettings: {
 items: ['InsertCode']
 } |

 | RemoveLink | Allows you to remove the applied link from the selected item. | toolbarSettings: {
 items: ['RemoveLink']
 } |

 | TableHeader | Allows you to add a table header. | toolbarSettings: {
 items: ['TableHeader']
 } |

 | TableColumns | Shows the dropdown to insert a column or delete the selected column. | toolbarSettings: {
 items: ['TableColumns']
 } |

 | TableRows | Shows the dropdown to insert a row or delete the selected row. | toolbarSettings: {
 items: ['TableRows']
 } |

| TableCellHorizontalAlign |  | Allows the table cell content to be aligned horizontally. |
 toolbarSettings: {
 items: ['TableCellHorizontalAlign']
 } |

| TableCellVerticalAlign |  | Allows the table cell content to be aligned vertically. |
 toolbarSettings: {
 items: ['TableCellVerticalAlign']
 } |

| TableEditProperties |  | Allows you to change the table width, padding, and cell spacing styles. |
 toolbarSettings: {
 items: ['TableEditProperties']
 } |

By default, tools will be arranged in the following order.

```
` javascript
items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments', 'OrderedList', 'UnorderedList', '|',
'CreateLink', 'Image', '|', 'SourceCode', 'Undo', 'Redo']
`
```

The tools order can be customized as our application requirement. If you are not specifying any tools order, the editor will create the toolbar with default items.

Custom tool

The Rich Text Editor allows you to configure your own commands to its toolbar using the [toolbarSettings](#) property. The command can be plain text, icon, or HTML template. The order and the group can also be defined where the command should be included. Bind the action to the command by getting its instance.

This sample shows how to add your own commands to the toolbar of the Rich Text Editor. The **Ω** command is added to insert special characters in the editor. By clicking the **Ω** command, it will show the special characters list, and then choose the character to be inserted in the editor.

The following code snippet illustrates custom tool with tooltip text which will be included in [items](#) field of the toolbarSettings property.

In the following sample, once Rich Text Editor control is [created](#), the concern event will be created; the Dialog component can be rendered and target as RTE content.

```
` javascript
{
template: '<button class="e-tbar-btn e-btn" tabindex="-1" id="custom_tbar" style="width:100%"><div
class="e-tbar-btn-text" style="font-weight: 500;"> Ω</div></button>',
undo: true,
click: this.onClick.bind(this),
tooltipText: 'Insert Symbol'
}
`
```

```

The focus will be lost while rendering the required component for the custom toolbar, causing it to render outside the Rich Text Editor and triggering a blur event. During that time, proper functionality will not be achievable. Therefore, it is recommended to set the cssClass property or class as `e-rte-elements` in the dependency component.

Quick inline toolbar

Quick commands are opened as context-menu on clicking the corresponding element. The commands must be passed as string collection to image, text, and link attributes of the [quickToolbarSettings](#) property.

| **Target element** | **Default quick toolbar items** |

| --- | --- |

| Image | 'Replace', 'Align', 'Caption', 'Remove', 'InsertLink', 'Display', 'AltText', and 'Dimension' |

| Link | 'Open', 'Edit', and 'UnLink' |

| Text | null
 (Any toolbar [items](#) in the Rich Text Editor can be configured here). |

| Table | 'TableHeader', 'TableRows', 'TableColumns', 'BackgroundColor', 'TableRemove', 'Alignments', 'TableCellVerticalAlign' and 'Styles' |

Custom tool can be added to the corresponding quick toolbar, using the [quickToolbarSettings](#) property.

The following sample demonstrates the option to insert the image to the Rich Text Editor content as well as option to rotate the image through the quick toolbar. The image rotation functionalities have been achieved through the [toolbarClick](#) event.

Rich Text Editor features are segregated into individual feature-wise modules. To use quick toolbar, inject the quick toolbar module using the `RichTextEditor.Inject(image, link)`.

Styling in React Rich text editor component

Font name and size

By default, the editor is initialized with font name as **Segoe UI** and font size as **10pt**. To change it, select a different font name and font size from the drop-down in the editor's toolbar.

To apply different font style for section of the content, select the text that you would like to change, and select a required font style from the drop-down to apply the changes to the selected text.

FontName DropDowns

The following table lists the default font name and width of the fontname drop-down and available list of font names.

Property	Default value
---	---
Default font name	'Segoe UI'
Width	65px
Items	{ text: 'Segoe UI', value: 'Segoe UI' }, { text: 'Arial', value: 'Arial,Helvetica,sans-serif' }, { text: 'Courier New', value: 'Courier New,Courier,monospace' }, { text: 'Georgia', value: 'Georgia,serif' }, { text: 'Impact', value: 'Impact,Charcoal,sans-serif' }, { text: 'Lucida Console', value: 'Lucida Console,Monaco,monospace' }, { text: 'Tahoma', value: 'Tahoma,Geneva,sans-serif' }, { text: 'Times New Roman', value: 'Times New Roman,Times,serif' }, { text: 'Trebuchet MS', value: 'Trebuchet MS,Helvetica,sans-serif' }, { text: 'Verdana', value: 'Verdana,Geneva,sans-serif' }

FontSize DropDowns

The following table list the default font size and width of the fontsize dropdown and available list of font size.

Property	Default value
---	---

| Default font size | 10 |

| Width | 35px |

| Items | { text: '8', value: '8pt' },
 { text: '10', value: '10pt' },
 { text: '12', value: '12pt' },
 { text: '14', value: '14pt' },
 { text: '18', value: '18pt' },
 { text: '24', value: '24pt' },
 { text: '36', value: '36pt' } |

The following sample demonstrates the option to add the font name and font size tools to the toolbar as well as modify the default width of the tools.

Custom font and size

Rich Text Editor supports to provide custom font and size with existing list.

If you want to add additional font names and font sizes to font drop-down, pass the font information as JSON data to the items field of the [fontSize](#) and the [fontFamily](#) property.

[Class-component]

APP.JSX

```
/**
 * Rich Text Editor - Custom FontName and FontSize Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';

Font and Background color

To apply font color or background color for a selected content of RTE, use font color and background color tools.

Rich Text Editor supports to provide customs font color and background color with existing list through the [colorCode](#) field of `fontColor` and `backgroundColor`.

The `FontColor` and the `BackgroundColor` property has two [mode](#) Picker and Palette. Palette mode has predefined set of `colorCode` and in the picker mode, more colors has been provided. Through [modeSwitcher](#), you can able to switch between these two options.

Editor content styles

By default, The content styles of Rich Text Editor are not returned while retrieving HTML value from the editor. So, the styles are not applied when using the HTML value outside of the editor. To get the styles to Rich Text Editor's content for your application, You can copy and use the below styles directly in your application. The styles listed below which used in the UI elements of the Rich Text Editor.

Make sure to add a CSS class 'e-rte-content' to the content container.

```

`css

Image in React Rich text editor component

Rich Text Editor allows to insert images from online sources as well as local computer where you want to insert the image in your content. For inserting the image to the Rich Text Editor, the following list of options have been provided in the [insertImageSettings](#).

| Options | Description |

| --- | --- |

| allowedTypes | Specifies the extensions of the image types allowed to insert on bowering and passing the extensions with comma separators.

 For example, pass allowedTypes as .jpg and .png. |

| display | Sets the default display for an image when it is inserted into the Rich Text Editor.

 Possible options are: 'inline' and 'block'. |

| width | Sets the default width of the image when it is inserted in the Rich Text Editor. |

| height | Sets the default height of the image when it is inserted in the Rich Text Editor. |

| saveUrl | Provides URL to map the action result method to save the image. |

| path | Specifies the location to store the image. |

Rich Text Editor features are segregated into individual feature-wise modules. To use image and link tool, inject image module using the `RichTextEditor.Inject(image)`.

Upload options

Through the 'browse' option, select the image from the local machine and insert into the Rich Text Editor content.

If the path field is not specified in the [insertImageSettings](#), the image will be transferred into base 64 and blob url for the image will be created and the generated url will be set to the src property of img tag.

```
`javascript
```

```

```

```
`
```

If you want to insert a lot of tiny images in the editor and don't want a specific physical location for saving images, you can opt to save format as Base64.

In the following sample, the image has been loaded from the local machine and it will be saved in the given location.

Image delete

To remove an image from the Rich Text Editor content, select the image and click **Remove** tool from the quick toolbar. It will delete the image from the RTE content as well as from the service location if the `saveUrl` is given.

Once you select the image from the local machine, the URL for the image will be generate. From there, you can remove the image from the service location by clicking the cross icon.

The following sample explains, how to configure `removeUrl` to remove a saved image from the remote service location, when the following image remove actions are performed:

- `delete` key action.
- `backspace` key action.
- Removing uploaded image file from the insert image dialog.
- Deleting image using the quick toolbar `remove` option.

```

Insert from web

To insert an image from the online source like Google, Ping, etc., you should enable the image tool on the editor's toolbar. By default, the image tool opens a simple dialog which allows you to insert an image from online source.

Dimension

Sets the default width and height of the image when it is inserted in the Rich Text Editor using [width](#) and [height](#) of the `insertImageSettings`.

Through the quick toolbar, change the width and height using **Change Size** option. Once you click, the Image Size dialog box will open as follows. In that, you can specify the width and height of the image in pixel.

Caption and Alt Text

Image caption and alternative text can be specified for the inserted image in the Rich Text Editor through the quick toolbar options such as, Image Caption and Alternative Text.

Through the Alternative Text option, set the alternative text for the image, when the image is not upload successfully into the Rich Text Editor.

By clicking the Image Caption, the image will get wrapped in an image element with a caption. Then, you can type caption content inside the Rich Text Editor.

Display position

Sets the default display for an image when it is inserted in the Rich Text Editor using [display](#) field in [insertImageSettings](#). It has two possible options: 'inline' and 'block'.

`ts

```
let defaultRTE: RichTextEditor = new RichTextEditor({  
  insertImageSettings: {  
    display: 'inline'  
  }  
});  
defaultRTE.appendTo('#defaultRTE');  
`
```

Image with link

The hyperlink itself can be an image in Rich Text Editor. If the image given as hyperlink, the remove, edit, and open link will be added to the quick toolbar of image. For further details about link, see the [link](#) documentation.

Resize

Rich Text Editor has a built-in image inserting support. The resize points will be appearing on each corner of image when focus. So, users can resize the image using mouse points or thumb through the resize points easily. Also, the resize calculation will be done based on aspect ratio.

Drag and Drop

By default, the Rich Text Editor allows you to insert images by drag-and-drop from the local file system such as Windows Explorer into the content editor area. And, you can upload the images to the server before inserting into the editor by configuring the `saveUrl` property. The images can be repositioned anywhere within the editor area by dragging and dropping the image.

In the following sample, you can see feature demo.

[Class-component]

APP.JSX

```

/**

      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}
/>
    </RichTextEditorComponent>
  );
}
export default App;

```

Drag and drop with specific extension images

You can allow the specific images alone to be uploaded using the the `allowedTypes` property. By default, the Rich Text Editor allows the JPG, JPEG, and PNG formats. You can configure this formats as follows.

```

`ts
insertImageSettings: {
  allowedTypes: ['.jpg']
}
`

```

Prevent drag and drop action

You can prevent drag-and-drop action by setting the `actionBegin` argument cancel value to true. The following code shows how to prevent the drag-and-drop.

```

`ts
actionBegin: function (args: any): void {

```

```

if(args.type === 'drop' || args.type === 'dragstart') {
  args.cancel = true;
}
}
`

```

Audio in React Rich text editor component

The Rich Text Editor allows you to insert audio from online sources and local computers and then insert them into your content. You can insert the audio with the following list of options in the [insertAudioSettings](#) property.

Options	Description
-----	-----
allowedTypes	Specifies the extensions of the audio types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as <code>.mp3</code> , <code>.wav</code> , <code>.m4a</code> and <code>.wma</code> .
layoutOption	Sets the default display for audio when it is inserted into the Rich Text Editor. Possible options are <code>Inline</code> and <code>Break</code> .
saveFormat	Sets the default save format of the audio element when inserted. Possible options are: <code>Blob</code> and <code>Base64</code> .
saveUrl	Provides URL to map the action result method to save the audio.
removeUrl	Provides URL to map the action result method to remove the audio.
path	Specifies the location to store the audio.

Configure audio tool in the toolbar

You can add an `audio` tool in the Rich Text Editor toolbar using the `toolbarSettings.items` property.

Rich Text Editor features are segregated into individual feature-wise modules. To use audio, inject the `Audio` module in `services`.

To configure the `Audio` toolbar item, refer to the below code.

[Class-component]

APP.JSX

```

import * as React from 'react';
import { HtmlEditor, Audio, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
class App extends React.Component {
  toolbarSettings = {
    items: ['Audio']
  };
  insertAudioSettings = {
    saveUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Save',
    removeUrl: 'https://ej2.syncfusion.com/services/api/uploadbox/Remove'
  };
}

```

```

render() {

```

Insert audio from the web

You can insert audio from either the hosted link or the local machine, by clicking the audio button in the editor's toolbar. On clicking the audio button, a dialog opens, which allows you to insert audio from the web URL.

Insert from web URL

By default, the audio tool opens the audio dialog, allowing you to insert audio from an online source. Inserting the URL will be added to the `src` attribute of the `<source>` tag.

Insert audio from local machine

You can use the `browse` option on the audio dialog, to select the audio from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [insertAudioSettings](#), the audio will be converted into the `Blob` URL or `Base64` and inserted inside the Rich Text Editor.

Restrict audio upload based on size

You can restrict the audio uploaded from the local machine when the uploaded audio file size is greater than the allowed size by using the [fileUploading](#) event.

The file size in the argument will be returned in `bytes`.

In the following illustration, the audio size has been validated before uploading, and it is determined whether the audio has been uploaded or not.

[Class-component]

```

`ts

import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';

import * as React from 'react';

import { UploadingEventArgs } from '@syncfusion/ej2-inputs';

class App extends React.Component<{},{}> {
  private toolbarSettings: object = {
    items: ['Audio']
  }

  private insertAudioSettings: object = {
    saveUrl: "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
    path: "../Files/"
  }

  private onFileUpload (args: UploadingEventArgs): void {
    alert("RTE")

    let sizeInBytes: number = args.fileData.size;
    let fileSize: number = 500000;

    if (fileSize < sizeInBytes) {
      args.cancel = true;
    }
  }

  public render() {
    return (

```

```

<RichTextEditorComponent height={450} toolbarSettings={this.toolbarSettings} insertAudioSettings={
this.insertAudioSettings} fileUploading={this.onFileUpload}>
<Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
}
export default App;
`

```

[Functional-component]

```

`ts
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
import { UploadingEventArgs } from '@syncfusion/ej2-inputs';
function App() {
let toolbarSettings: object = {
items: ['Audio']
}
let insertAudioSettings: object = {
saveUrl: "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
path: "../Files/"
}
function onFileUpload (args: UploadingEventArgs): void {
alert("RTE")
let sizeInBytes: number = args.fileData.size;
let fileSize: number = 500000;
if (fileSize < sizeInBytes) {
args.cancel = true;
}
}
return (
<RichTextEditorComponent height={450} toolbarSettings={toolbarSettings}
insertAudioSettings={insertAudioSettings} fileUploading={onFileUpload}>

```

```

}
export default App;
`

```

Server-side action

The selected audio can be uploaded to the required destination using the controller action below. Map this method name in [insertAudioSettings.saveUrl](#) and provide the required destination path through [insertAudioSettings.path](#) properties.

If you want to insert lower-sized audio files in the editor and don't want a specific physical location for saving the audio, you can opt to save the format as **Base64**.

In the following code blocks, the audio module has been injected and can insert the audio files saved in the specified path.

[Class-component]

```

`ts
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component<{},{}> {

public IActionResult Error()
{
return View(new ErrorViewModel { RequestId = Activity.Current?.Id ?? HttpContext.TraceIdentifier });
}
}
}
,

```

Audio save format

The audio files can be saved as **Blob** or **Base64** url by using the [insertAudioSettings.saveFormat](#) property, which is of enum type and the generated url will be set to the **src** attribute of the **<source>** tag.

By default, the files are saved in the **Blob** format.

```
`ts
```

```
<audio>
```

```
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"
type="audio/mp3" >
```

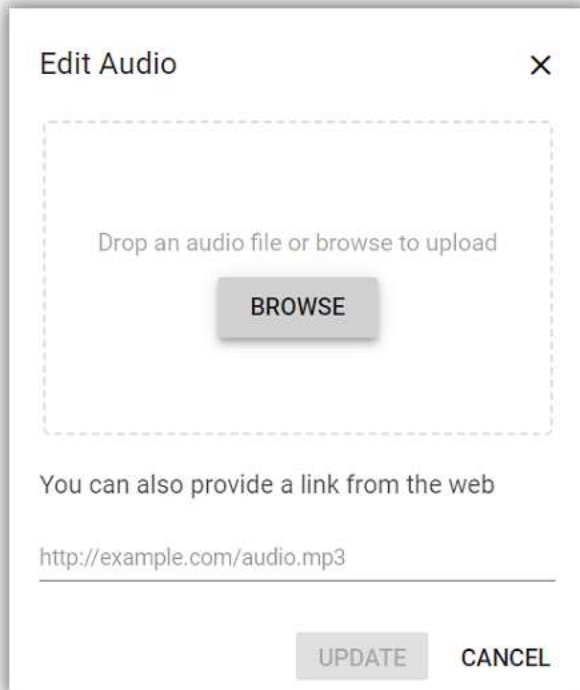

```
</audio>
```

```
<audio>
```

```
<source src="data:audio/mp3;base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA"
type="audio/mp3" >
</audio>
`
```

Replacing audio

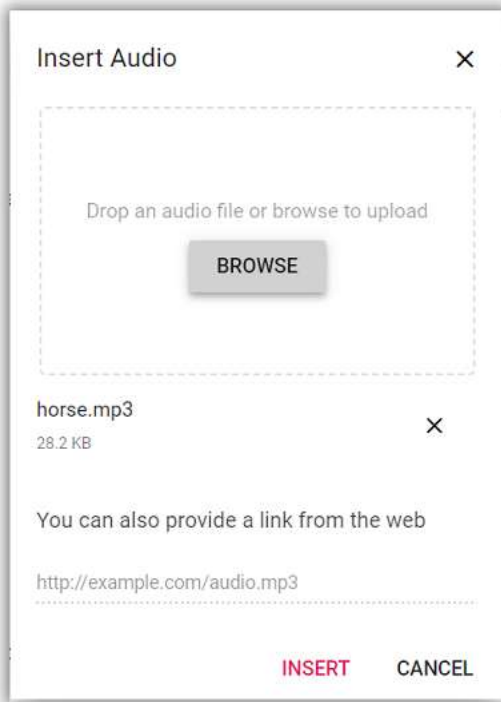

Once an audio file has been inserted, you can change it using the Rich Text Editor [quickToolbarSettings](#) `audioReplace` option. You can replace the audio file using the web URL or the browse option in the audio dialog.

Delete audio

To remove audio from the Rich Text Editor content, select the audio and click the `audioRemove` button from the quick toolbar. It will delete the audio from the Rich Text Editor content as well as from the service location if the [insertAudioSettings.removeUrl](#) is given.

Once you select the audio from the local machine, the URL for the audio will be generated. You can remove the audio from the service location by clicking the cross icon.

Display position

Sets the default display property for audio when it is inserted in the Rich Text Editor using the [insertAudioSettings.layoutOption](#) property. It has two possible options: **Inline** and **Break**. When updating the display positions, it updates the audio elements' layout position.

The default **layoutOption** property is set to **Inline**.

[Class-component]

```
`ts
import * as React from 'react';

import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';

class App extends React.Component<{},{}> {
  private insertAudioSettings: object = {
    layoutOption: 'Inline',
  }

  public render() {
    return (
      <RichTextEditorComponent height={450} insertAudioSettings = {this.insertAudioSettings} >
        <Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar]} />
      </RichTextEditorComponent>
    );
  }
}
```

```

}
}
`

```

[Functional-component]

```

`ts
import * as React from 'react';
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
function App() {
let insertAudioSettings: object = {
layoutOption: 'Inline',
}
return (
<RichTextEditorComponent height={450} insertAudioSettings = {insertAudioSettings} >
<Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
`

```

Rename audio before inserting

You can use the [insertAudioSettings](#) property, to specify the server handler to upload the selected audio. Then by binding the [fileUploadSuccess](#) event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert audio dialog.

[Class-component]

```

`ts
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component<{},{}> {
private toolbarSettings: object = {
items: ['Audio']
}
private insertAudioSettings: object = {
saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
path: "[SERVICEHOSTEDPATH]/Files/"
}
}

```

```

}
private onFileUploadSuccess (args: any) {
  alert("Get the new file name here");
  if (args.e.currentTarget.getResponseHeader('name') != null) {
    args.file.name = args.e.currentTarget.getResponseHeader('name');
    let filename: any = document.querySelectorAll(".e-file-name")[0];
    filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML,
    "");
    filename.title = args.file.name;
  }
}
public render() {
  return (
    <RichTextEditorComponent height={450} toolbarSettings={this.toolbarSettings}
    fileUploadSuccess={this.onFileUploadSuccess} insertAudioSettings={this.insertAudioSettings} >
    <Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar]} />
    <p>The Rich Text Editor is WYSIWYG ("what you see is what you get") editor useful to create and edit
    content, and return the valid <a href="https://ej2.syncfusion.com/home/" target="blank">HTML
    markup</a> or <a href="https://ej2.syncfusion.com/home/" target="blank">markdown</a> of the
    content</p>
    </RichTextEditorComponent>
  );
}
export default App;

```

[Functional-component]

```

`ts
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App (){
  let toolbarSettings: object = {
    items: ['Audio']
  }
}

```

```

let insertAudioSettings: object = {
  saveUrl: "[SERVICEHOSTEDPATH]/api/uploadbox/Rename",
  path: "[SERVICEHOSTEDPATH]/Files/"
}

function onFileUploadSuccess (args: any) {
  alert("Get the new file name here");
  if (args.e.currentTarget.getResponseHeader('name') != null) {
    args.file.name = args.e.currentTarget.getResponseHeader('name');
    let filename: any = document.querySelectorAll(".e-file-name")[0];
    filename.innerHTML = args.file.name.replace(document.querySelectorAll(".e-file-type")[0].innerHTML,
    "");
    filename.title = args.file.name;
  }
}

return (
  <RichTextEditorComponent height={450} toolbarSettings={toolbarSettings}
  fileUploadSuccess={this.onFileUploadSuccess} insertAudioSettings={insertAudioSettings} >
  <Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar]} />

}

export default App;
`

```

To configure server-side handler, refer to the below code.

```

`csharp
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Rename()
{
  try

```

```
{
var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
fileName = httpPostedFile.FileName;
if (httpPostedFile != null)
{
var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
if (!Directory.Exists(fileSave))
{
Directory.CreateDirectory(fileSave);
}
var fileName = Path.GetFileName(httpPostedFile.FileName);
var fileSavePath = Path.Combine(fileSave, fileName);
while (System.IO.File.Exists(fileSavePath))
{
fileName = "rteFiles" + x + "-" + fileName;
fileSavePath = Path.Combine(fileSave, fileName);
x++;
}
if (!System.IO.File.Exists(fileSavePath))
{
httpPostedFile.SaveAs(fileSavePath);
HttpResponse Response = System.Web.HttpContext.Current.Response;
Response.Clear();
Response.Headers.Add("name", fileName);
Response.ContentType = "application/json; charset=utf-8";
Response.StatusDescription = "File uploaded succesfully";
Response.End();
}
}
}
catch (Exception e)
{
HttpResponse Response = System.Web.HttpContext.Current.Response;
```

```

Response.Clear();
Response.ContentType = "application/json; charset=utf-8";
Response.StatusCode = 204;
Response.Status = "204 No Content";
Response.StatusDescription = e.Message;
Response.End();
}
}
`

```

Upload audio with authentication

You can add additional data with the audio uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the [fileUploading](#) event and its `customFormData` argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the `UseDefaultCredentials` property; we need to manually append the default credentials with the upload request.

[Class-component]

```

`ts
import { HtmlEditor, Audio, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
import { UploadingEventArgs } from '@syncfusion/ej2-inputs';

Video in React Rich text editor component

The Rich Text Editor allows you to insert videos from online sources and local computers and then insert them into your content. You can insert the video with the following list of options in the [insertVideoSettings](#) property.

Options	Description
----- -----	
allowedTypes	Specifies the extensions of the video types allowed to insert on bowering and passing the extensions with comma separators. For example, pass allowedTypes as <code>.mp4</code> , <code>.mov</code> , <code>.wmv</code> and <code>.avi</code> .
layoutOption	Sets the default display for a video when it is inserted into the Rich Text Editor. Possible options are: <code>Inline</code> and <code>Break</code> .
saveFormat	Sets the default save format of the video element when inserted. Possible options are: <code>Blob</code> and <code>Base64</code> .
width	Sets the default width of the video when it is inserted in the Rich Text Editor.
minWidth	Sets the minWidth of the video element when it is inserted in the Rich Text Editor.
maxWidth	Sets the maxWidth of the video element when it is inserted in the Rich Text Editor.
height	Sets the default height of the video when it is inserted in the Rich Text Editor.
minHeight	Sets the minHeight of the video element when it is inserted in the Rich Text Editor.
maxHeight	Sets the maxHeight of the video element when it is inserted in the Rich Text Editor.
saveUrl	Provides URL to map the action result method to save the video.
removeUrl	Provides URL to map the action result method to remove the video.

| path | Specifies the location to store the video. |

| resize | Sets the resizing action for the video element. |

| resizeByPercent | Sets the percentage values for the video element with the resizing action. |

Configure the video tool in the toolbar

You can add the **video** tool in the Rich Text Editor toolbar using the **toolbarSettings** [items](#) property.

Rich Text Editor features are segregated into individual feature-wise modules. To use audio, inject the **Video** module in **services**.

To configure the **Video** toolbar item, refer to the below code.

[Class-component]

APP.JSX

```
import * as React from 'react';
import { HtmlEditor, Video, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';

Insert a video from the web

You can insert a video from either the hosted link or the local machine by clicking the video button in the editor's toolbar. On Clicking the Video button, a dialog opens which allows you to insert video from the Embedded URL or web URL.

Insert from embed URL

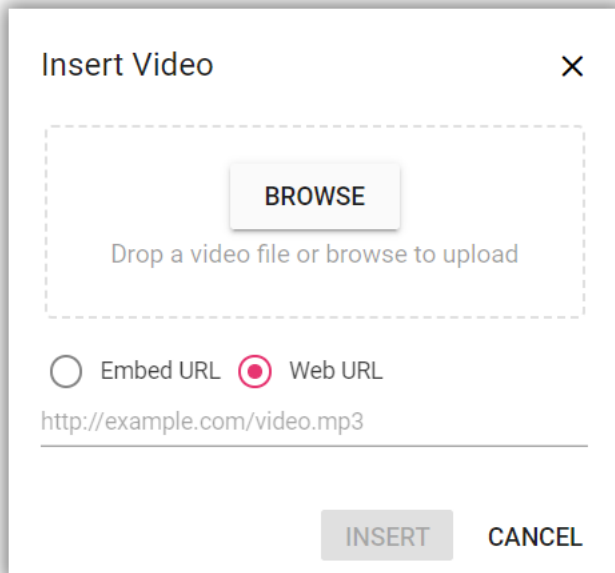

The insert video dialog opens with the **Embed URL** option as default which allows you to insert an embedded URL.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed border area for dropping a video file, with a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" (which is selected) and "Web URL". Under the "Embed URL" option, there is a text input field with the placeholder text "Paste Embed URL here". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

Insert from web URL

You can switch to **Web URL** by selecting the web URL check box. Inserting with the web URL option will add the video URL as the `src` attribute of the `<source>` tag.

The dialog box is titled "Insert Video" with a close button (X) in the top right corner. It features a dashed border area for dropping a video file, with a "BROWSE" button and the text "Drop a video file or browse to upload". Below this, there are two radio buttons: "Embed URL" and "Web URL" (which is selected). Under the "Web URL" option, there is a text input field containing the example URL "http://example.com/video.mp3". At the bottom of the dialog, there are two buttons: "INSERT" and "CANCEL".

Insert video from local machine

You can use the **browse** option on the video dialog, to select the video from the local machine and insert it into the Rich Text Editor content.

If the path field is not specified in the [insertVideoSettings](#), the video will be converted into the **Blob** URL or **Base64** and inserted inside the Rich Text Editor.

Restrict video upload based on size

You can restrict the video uploaded from the local machine when the uploaded video file size is greater than the allowed size by using the [fileUploading](#) event.

The file size in the argument will be returned in **bytes**.

In the following example, the video size has been validated before uploading and determined whether the video has been uploaded or not.

[Class-component]

```
`ts
import { HtmlEditor, Video, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';

```
,
```

Server-side action

The selected video can be uploaded to the required destination using the controller action below. Map this method name in [insertVideoSettings.saveUrl](#) and provide the required destination path through [insertVideoSettings.path](#) properties.

If you want to insert lower-sized video files in the editor and don't want a specific physical location for saving the video, you can save the format as `Base64`.

In the following code blocks, the video module has been injected and can insert the video files saved in the specified path.

[Class-component]

```
`ts
```

```
import { HtmlEditor, Video, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from

}
}
[ResponseCache(Duration = 0, Location = ResponseCacheLocation.None, NoStore = true)]
public IActionResult Error()
{
return View(new ErrorViewModel { RequestId = Activity.Current?.Id ?? HttpContext.TraceIdentifier });
}
}
}
}
`

```

Video save format

The video files can be saved as **Blob** or **Base64** URL by using the [insertVideoSettings.saveFormat](#) property, which is of enum type, and the generated URL will be set to the **src** attribute of the **<source>** tag.

The default **saveFormat** property is set to **Blob** format.

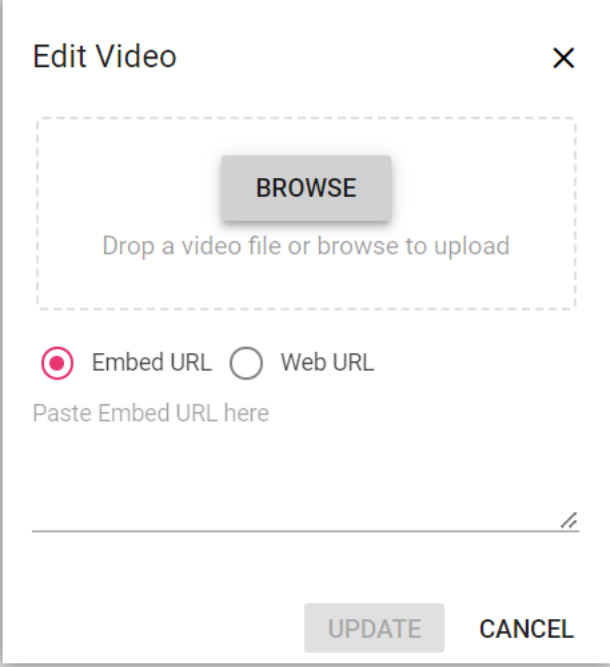

```

`html
<video>
<source src="blob:http://ej2.syncfusion.com/3ab56a6e-ec0d-490f-85a5-f0aeb0ad8879"
type="video/mp4" >
</video>
<video>
<source src="data:video/mp4;base64,iVBORw0KGgoAAAANSUhEUgAAADAAAAAwCAYAAABXAvmHA"
type="video/mp4" >
</video>
`

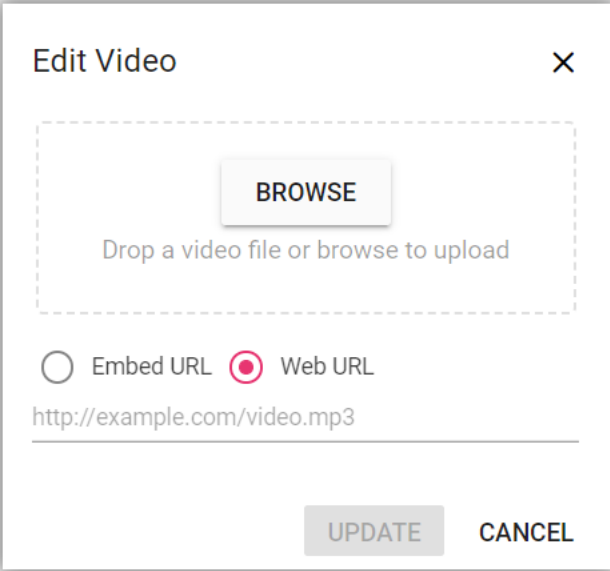

```

Replacing video

Once a video file has been inserted, you can replace it using the Rich Text Editor [quickToolbarSettings](#) `videoReplace` option. You can replace the video file either by using the embedded URL or the web URL and the browse option in the video dialog.

The 'Edit Video' dialog box features a close button (X) in the top right corner. It contains a dashed rectangular area with a 'BROWSE' button and the text 'Drop a video file or browse to upload'. Below this, there are two radio buttons: 'Embed URL' (which is selected) and 'Web URL'. A text input field is positioned below the radio buttons with the placeholder text 'Paste Embed URL here'. At the bottom of the dialog are 'UPDATE' and 'CANCEL' buttons.

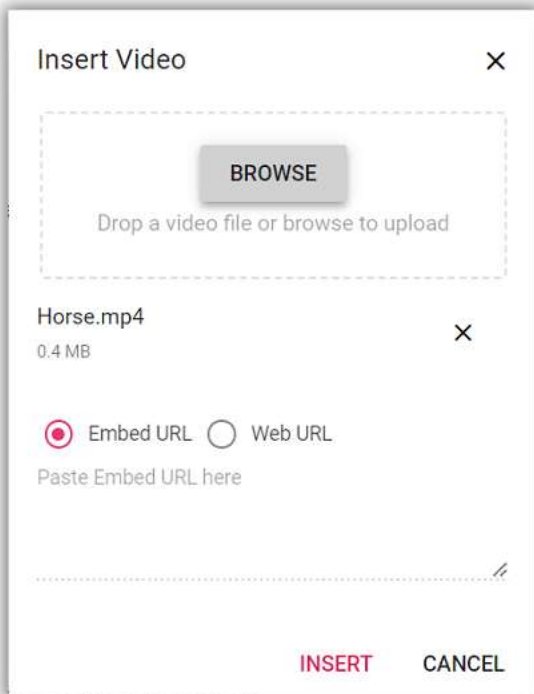

The 'Edit Video' dialog box is identical to the one above, but with the 'Web URL' radio button selected. The text input field below the radio buttons contains the example URL 'http://example.com/video.mp3'. The 'UPDATE' and 'CANCEL' buttons are at the bottom.

Delete video

To remove a video from the Rich Text Editor content, select the video and click the `videoRemove` button from the quick toolbar. It will delete the video from the Rich Text Editor content as well as from the service location if the [insertVideoSettings.removeUrl](#) is given.

Once you select the video from the local machine, the URL for the video will be generated. You can remove the video from the service location by clicking the cross icon.

Dimension

Set the default width, minWidth, height, and minHeight of the video element, when it is inserted in the Rich Text Editor using the [width](#), [minWidth](#), [height](#), [minHeight](#) properties.

Through the [quickToolbarSettings](#), also you can change the width and height using the **Change Size** button. Once you click on the button, the video size dialog will open as below. In that, specify the width and height of the video in pixels.

Display position

Sets the default display property for the video when it is inserted in the Rich Text Editor using the [insertVideoSettings.layoutOption](#) property. It has two possible options: **Inline** and **Break**. When updating the display positions, it updates the video elements' layout position.

The default **layoutOption** property is set to **Inline**.

[Class-component]

```
`ts
import * as React from 'react';

import { HtmlEditor, Video, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';

class App extends React.Component<{},{}> {
  private insertVideoSettings: object = {
    layoutOption: 'Inline',
  }

  public render() {
    return (
      <RichTextEditorComponent height={450} insertVideoSettings = {this.insertVideoSettings} >
        <Inject services={[Toolbar, Video, Link, HtmlEditor, QuickToolbar]} />
      </RichTextEditorComponent>
    );
  }
}
```

[Functional-component]

```
`ts
import * as React from 'react';

import { HtmlEditor, Video, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';

function App(){
  let insertVideoSettings: object = {
    layoutOption: 'Inline',
  }

  return (
    <RichTextEditorComponent height={450} insertVideoSettings = {insertVideoSettings} >
```

```
<Inject services={[Toolbar, Video, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
`
```

Resize video

The Rich Text Editor has built-in video resizing support, which is enabled for the video elements added. The resize points will appear on each corner of the video when focusing so users can easily resize the video using mouse points or thumb through the resize points. Also, the resize calculation will be done based on the aspect ratio.

You can disable the resize action by configuring `false` for the [insertVideoSettings.resize](#) property.

If the [minWidth](#) and [minHeight](#) properties are configured, the video resizing does not shrink below the specified values.

Rename video before inserting

You can use the [insertVideoSettings](#) property, to specify the server handler to upload the selected video. Then by binding the [fileUploadSuccess](#) event, you can receive the modified file name from the server and update it in the Rich Text Editor's insert video dialog.

[Class-component]

```
`ts
```

```
import { HtmlEditor, Video, Inject, Link, QuickToolbar, RichTextEditorComponent, Toolbar } from
 '@syncfusion/ej2-react-richtexteditor';
```

```
import * as React from 'react';
```

```
class App extends React.Component<{},{}> {

```

Upload video with authentication

You can add additional data with the video uploaded from the Rich Text Editor on the client side, which can even be received on the server side by using the [fileUploading](#) event and its [customFormData](#) argument, you can pass parameters to the controller action. On the server side, you can fetch the custom headers by accessing the form collection from the current request, which retrieves the values sent using the POST method.

By default, it doesn't support the [UseDefaultCredentials](#) property, you can manually append the default credentials with the upload request.

[Class-component]

```

Link in React Rich text editor component

A hyperlink can be insert into the editor for quick access to the related information. The hyperlink itself can be a text or an image.

Insert link

Point the cursor anywhere within the editor where you would like to insert the link. It is also possible to select a text or an image within the editor and can be converted to the hyperlink. Click the Insert HyperLink tool on the toolbar. The Insert Link Dialog will be open. The dialog has the following options.

Rich Text Editor features are segregated into individual feature-wise modules. To use image and link tool, inject link module using the `RichTextEditor.Inject(link)`.

The image shows a modal dialog box titled "Insert Link" with a close button (X) in the top right corner. It contains three input fields: "Web Address" with the text "http://example.com", "Display Text" with the placeholder "Enter Text", and "Tooltip" with the placeholder "Title". Below these fields is a checkbox labeled "Open Link in New Window" which is checked. At the bottom right are two buttons: "INSERT" in red and "CANCEL" in gray.

| Options | Description |

| --- | --- |

| Web Address | Types or paste the destination for the link you are creating. |

| Display Text | Types or edit the required text that you want to display text for the link. |

| Tooltip | Displays additional helpful information when you place the pointer on the hyperlink, type the required text in the "Tooltip" field. |

| Open Link in New Window | Specifies whether the given link will be open in new window or not. |

The Rich Text Editor link tool validates the URLs, as you type in the Web Address. URLs considered invalid will be highlighted with red color by clicking the insert button in the **Insert Link** dialog.

Remove link

If you want to remove a hyperlink from a text or image, select the text or image with the hyperlink and click Remove Hyperlink tool from the toolbar. It will keep the text or image.

Auto-link

When you type URL, and Enter key to the Rich Text Editor, the typed URL will be automatically changed into the hyperlink.

Manipulation

Add the custom tools on the selected link inside the Rich Text Editor through the quick toolbar.

The quick toolbar for the link has the following options.

Name	Description
Open	The given link page, will be open in new window.
Edit Link	Used to edit the link in the Rich Text Editor content.
Remove Link	Used to remove link from the content of Rich Text Editor.
Custom Tool	Used to add the custom options in the quick toolbar.

Table in React Rich text editor component

Rich Text Editor allows to insert table of content in edit panel and provide options to add, edit, and remove the table as well as perform other table related action. For inserting the table to the Rich Text Editor, the following list of options have been provided in the [tableSettings](#)

Options	Description	Default Value
minWidth	Sets the default minWidth of the table.	0
maxWidth	Sets the default maxWidth of the table.	null
resize	Enable resize feature in table.	true
styles	This is an array of key value pair, on each pair, key should be name of styling and value is class name. this list will be shown on quick toolbar options to change the styles of table on designing like dashed, double bordered.	TableStyleItems
width	Sets the default width of the table.	100%

Rich Text Editor features are segregated into individual feature-wise modules. To use table tool, inject table module using the `<Inject services=[[Table]] />`.

Insert table

Using the **table** toolbar option, select a number of rows and columns to be inserted over the table grid and insert table into Rich Text Editor content using the mouse.

Tables can also be inserted through the **Insert Table** option in the pop-up where the number of rows and columns can be provided manually, and this is the default way in devices.

In the following sample, the table has been injected from table module.

[Class-component]

Quick Toolbar

Quick toolbar is opened by clicking the table. It has different sets of commands to be performed on the table which increases the feasibility to edit the table easily.

To use quick toolbar, inject the quick toolbar module using the `<Inject services={[QuickToolbar]} />`.

Table Header

Table Header command is available with quick toolbar option through which the header row can be added or removed from the inserted table. The following image illustrates the table header.

Insert Rows

Rows can be inserted above or below the required table cell through the quick toolbar. Also, focused row can be deleted. The following screenshot shows the available options of the row item.

Insert Columns

Columns can be inserted to the left or right side of the required table cell through the quick toolbar. Also, the focused column can be deleted. The following screenshot shows the available options of the column item.

Set Color

The background color can be set for each table cell through the **background color** command available with quick toolbar.

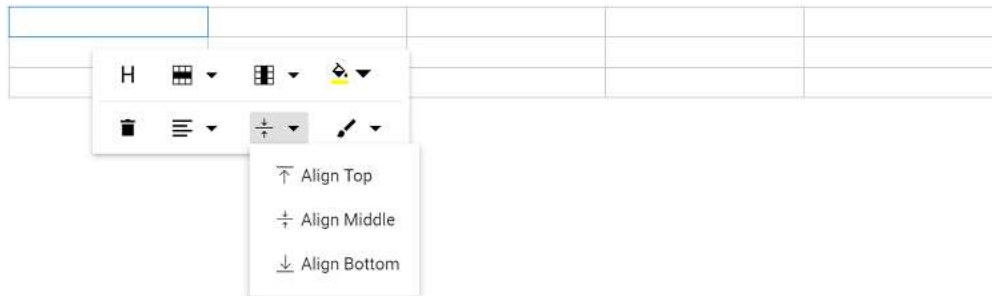

Delete Table

Using the delete item in the quick toolbar, users can delete the entire table.

Vertical Align

Text inside the table can be aligned to top, middle, or bottom using the **tableCellVerticalAlign** tool of the quick toolbar.

Horizontal Align

Text inside the table can be aligned left, right, or center using the `tableCellHorizontalAlign` tool of the quick toolbar.

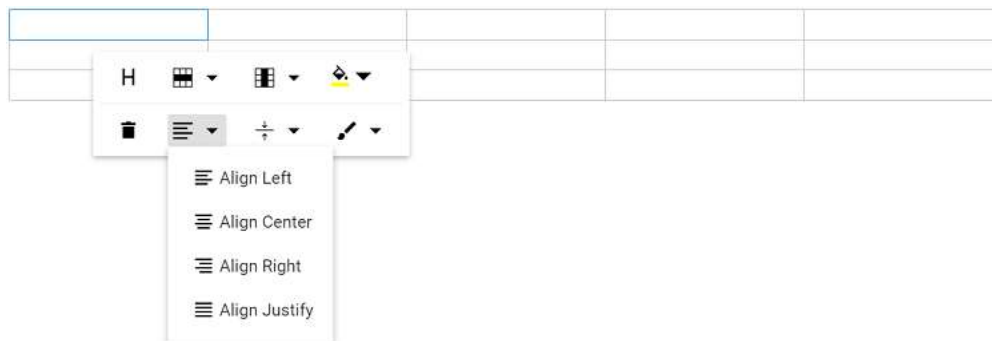

Table Styles

Table styles provided for class name should be appended to a table element. It helps to design the table in specific CSS styles when inserting in the editor.

By Default, provides Dashed border and Alternate rows.

Dashed border: Applies the dashed border to the table.

Alternate border: Applies the alternative background to the table.

Table Properties

Sets the default width of the table when it is inserted in the Rich Text Editor using the width of `tableSettings`.

Using the quick toolbar, users can change the width, cell padding, and cell spacing in the selected table using the properties option.

Table cell merge and split

The Rich Text Editor allows users to change the appearance of the tables by splitting or merging the table cells.

TableCell item should be configured in the Table [quickToolbarSettings](#) Property to show the merge/split icons while selecting the table cells

Table cell merge

The table cell merge feature allows you to merge two or more row and column cells into a single cell with its contents.

The following image explains the table merge action.

Table cell split

The table cell split feature allows you to a selected cell can be split both horizontally and vertically.

The following image explains the table split action.

Table]} />
  </RichTextEditorComponent>
);
}
export default App;

```

Emoji Picker in React RichTextEditor Component

An emoji picker is a tool that allows users to add emojis or emoticons to their text easily. Typically, it is a small window or panel that displays a variety of emojis arranged in different categories, such as smileys, animals, food, and so on. Users can select the desired emoji by clicking on it or by typing its name in a search bar.

Enabling the toolbar option and custom emojis.

Add the `EmojiPicker` tool to the toolbar of the `RichTextEditor` by utilizing the `toolbarSettings` [items](#) property.

By default, a predefined set of emojis is configured. However, you can customize these icons according to your needs. To achieve this, utilize the [emojiPickerSettings](#) property.

```
`ts
```

```
import { RichTextEditorComponent, Inject, Toolbar, HtmlEditor, Image, QuickToolbar, Link, EmojiPicker }
from '@syncfusion/ej2-react-richtexteditor';
```

```
import * as React from 'react';
```

```
class App extends React.Component<{},{}> {
  private toolbarSettings: object = {
    items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments', 'OrderedList',
    'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode', 'EmojiPicker', '|', 'Undo', 'Redo'
  ]
}

  private emojiPickerSettings: object = {
    iconsSet: [{name: 'Smilies & People', code: '1F600', iconCss: 'e-emoji',
    icons: [{ code: '1F600', desc: 'Grinning face' },
    { code: '1F603', desc: 'Grinning face with big eyes' },
    { code: '1F604', desc: 'Grinning face with smiling eyes' },
    { code: '1F606', desc: 'Grinning squinting face' },
    { code: '1F605', desc: 'Grinning face with sweat' },
    { code: '1F602', desc: 'Face with tears of joy' },
    { code: '1F923', desc: 'Rolling on the floor laughing' },
    { code: '1F60A', desc: 'Smiling face with smiling eyes' } ]
  }, {

```

```

{ code: '1F6AD', desc: 'No smoking' }}
}}
}

public render() {
return (
<RichTextEditorComponent height={450} toolbarSettings={this.toolbarSettings} emojiPickerSettings={
this.emojiPickerSettings}>
<Inject services={[Toolbar, Audio, Link, HtmlEditor, QuickToolbar, EmojiPicker]} />
</RichTextEditorComponent>
);
}
}

export default App;
`

```

Additionally, you have the option to customize the icons of toolbar items using the [iconCSS](#) and [code](#) properties. The `iconCSS` property allows you to define a custom CSS class for the toolbar item icon, while the `code` property enables you to specify the Unicode character code for the icon.

When both `iconCSS` and `code` properties are provided, the `iconCSS` property takes precedence in determining the appearance of the toolbar item icon.

Additionally, you have the option to enhance the user experience by implementing a filtering feature for efficiently managing a large dataset of emojis. By setting the [showSearchBox](#) property to true (which is the default value), users will be able to utilize a search box to filter the displayed emojis according to their preferences.

The following code example shows how to add the emoji picker tool in the RichTextEditor.

APP.JSX

```

import * as React from 'react';
import { RichTextEditorComponent, Inject, Toolbar, HtmlEditor, Image,
QuickToolbar, Link, EmojiPicker } from '@syncfusion/ej2-react-
richtexteditor';
class App extends React.Component {
  toolbarSettings = {
    items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments',
'OrderedList',
'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode',
'EmojiPicker', '|', 'Undo', 'Redo']
  };
  render() {
    return (
      <RichTextEditorComponent height={450}
      toolbarSettings={this.toolbarSettings}>
        <p>An emoji picker in a Rich Text Editor is a tool that allows
users to easily add emojis or emoticons to their text.</p>

```

```

        <p>Typically, it is a small window or panel that displays a variety
of emojis, arranged in different categories, such as smileys, animals, food,
and so on. Users can select the desired emoji by clicking on it or by typing
its name in a search bar.</p>
        <Inject services={[Toolbar, HtmlEditor, Image, QuickToolbar, Link,
EmojiPicker]} />
    </RichTextEditorComponent>);
    }
}
export default App;

```

APP.TSX

```

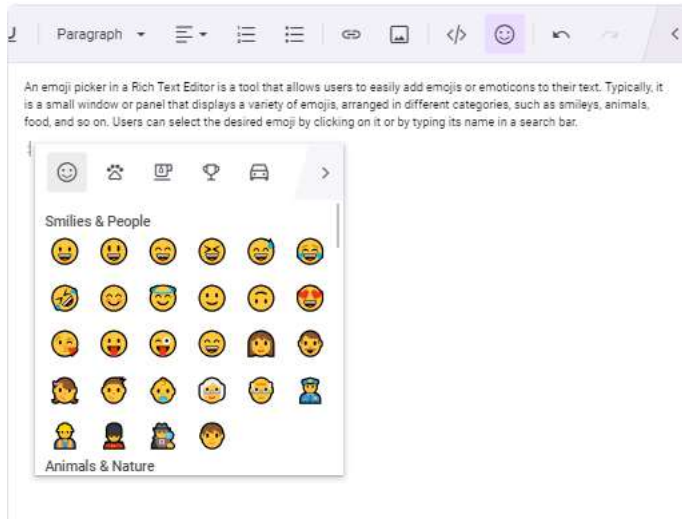

import * as React from 'react';
import { RichTextEditorComponent, Inject, Toolbar, HtmlEditor, Image,
QuickToolbar, Link, EmojiPicker } from '@syncfusion/ej2-react-
richtexteditor';
class App extends React.Component<{}, {}> {
    private toolbarSettings: object = {
        items: ['Bold', 'Italic', 'Underline', '|', 'Formats', 'Alignments',
'OrderedList',
'UnorderedList', '|', 'CreateLink', 'Image', '|', 'SourceCode',
'EmojiPicker', '|', 'Undo', 'Redo']
    }
    public render() {
        return (
            <RichTextEditorComponent height={450}
toolbarSettings={this.toolbarSettings} >
                <p>An emoji picker in a Rich Text Editor is a tool that allows users
to easily add emojis or emoticons to their text.</p>
                <p>Typically, it is a small window or panel that displays a variety
of emojis, arranged in different categories, such as smileys, animals, food,
and so on. Users can select the desired emoji by clicking on it or by typing
its name in a search bar.</p>
                <Inject services={[Toolbar, HtmlEditor, Image, QuickToolbar, Link,
EmojiPicker]} />
            </RichTextEditorComponent>
        );
    }
}
export default App;

```

Rich Text Editor features are segregated into individual feature-wise modules. To use emojis, inject the `EmojiPicker` module in `services`.

Using the shortcut key to open the emoji picker

Quickly access the emoji picker by pressing the colon (:) key while typing a word prefix in an editor, allowing instant emoji selection and display. Moreover, continue typing in the editor after the colon (:) to filter and refine your search for the desired emojis.

Navigating and selecting emojis using the keyboard

The emoji picker popup offers keyboard navigation options, allowing you to move the emoji focus from one emoji to another. The following keys are used for navigation:

Arrow keys: Use the arrow keys (up, down, left, right) to move the emoji focus in the corresponding direction.

Enter: Press Enter key to select the currently focused emoji.

Escape: Press Escape to close the emoji picker popup without selecting an emoji.

Markdown in React Rich text editor component

When you format the word in Markdown format, you should add Markdown syntax to the word to indicate the words and phrases that looks different from each other.

Rich Text Editor supports markdown editing when the `editorMode` set as **markdown** and using both *keyboard interaction* and *toolbar action*, you can apply the formatting to text.

To create Rich Text Editor with Markdown editing feature, inject the MarkdownEditor module to the RTE using the `RichTextEditor.Inject(MarkdownEditor)` method.

Supported Commands

The React Markdown editor supports the following commands to format the markdown content:

Commands	Syntax	Description
----------	--------	-------------

--	--	--

Bold	Sample content for bold text .	For bold, add <code></code> or <code></code> to front and back of the text.
-------------	---------------------------------------	--

<i>Italic</i>	Sample content for <i>Italic text</i> .	For Italic, add <code><i></code> or <code></code> to front and back of the text.
---------------	---	--

<i>Bold and Italics</i>	Sample content for <i>bold and Italic text</i> .	For bold and Italics, add <code></code> or <code></code> to the front and back of the text.
--------------------------------	---	--

Heading 1	# Heading 1 content	For heading 1, add <code><h1></code> to start of the line.
-----------	---------------------	--

Heading 2	## Heading 2 content	For heading 2, add <code><h2></code> to start of the line.
-----------	----------------------	--

| Heading 3 | **###** Heading 3 content | For heading 3, add **###** to start of the line. |

| Heading 4 | **####** Heading 4 content | For heading 4, add **####** to start of the line. |

| Heading 5 | **#####** Heading 5 content | For heading 5, add **#####** to start of the line. |

| Heading 6 | **#####** Heading 6 content | For heading 6, add **#####** to start of the line. |

| Line Break | First line **
**Second line | For line break, press enter two times (or) add **
** in between the first and the second line. |

| Blockquotes | **>** Blockquotes text | For blockquotes, add **>** to start of the line. |

| Strike Through | Sample content for **~~strike through text~~**. | For strike through, add **~~** to front and back of the text. |

| Code (Single line) | **\Single line code** | For single line code, add **`** to front and back of the text. |

| Code block (Multi Line) | **\\\
Multi line code text
Multi line code text
** | For multiple line code, add **\\`** in the new line before and after the content. |

| Subscript | **_{**Subscript text**}** | For subscript, add **_{** to the front and **}** to the back of the text. |

| Superscript | **^{**Superscript text**}** | For superscript, add **^{** to the front and **}** to the back of the text. |

| Ordered List | **1.** First**
1.** Second | For ordered list, preceding one or more lines of text with **1.** |

| Unordered List | **First
second | For unordered list, preceding one or more lines of text with ***. |

| Links | **Link text without title text
`** Link text **`
Link text with title text
[** Link text **](URL , "title text")** | Create an inline link by wrapping link text in brackets **[]**, and then wrapping the URL as first parameter and title as second parameter in the parentheses **().****
Note:** The title text is optional, if needed it can be given manually. |

| Table | | Heading 1 | Heading 2 |**
|-----|-----|
| Col A1 | Col A2 |
**| Col B1 | Col B2 | | Create a table using the pipes and underscores as given in the syntax to create 2 x 2 table. |

| Horizontal Line | **(three asterix in new line)
(or)
(three underscores in new line) /**
For horizontal line, add or to the start of the new line. |

| Image | **** | Create an image by wrapping the image source in parentheses **().** |

| Image with alternate text | **![alternate text](URL path)** | Create an image with alternate text by wrapping an alternative text in brackets **[]**, and then link of the image source in parentheses **().****
Note:** When inserting the image using toolbar, the alternate text cannot be provided that needs to be given manually. |

| Escape tick marks supported | Sample text content with **bold and** not bold **text can be in the same line.** | In the syntax, the whole content is made as bold where the content not bold can be made as normal text by adding the bold syntax to the start and end of the respective text. Likewise you can do the same for various inline commands. |

| Escape Character | \ (any syntax) | Escape any markdown syntax by prefix \ to the syntax.
Example:
\Bold text

| HTML Entities | Copyright: © - ©
Trade mark: ™ - ™
Registered: ® - ®
Ampersand: & - &
Less than: < - <
Greater than: > - > | For HTML entities, add & and ; to the front and back of the respective entities. |

The above listed commands alone are supported in Syncfusion Markdown editor. For other unsupported commands, you can achieve using the HTML tags in Markdown editor. The foot notes, definitions, math, and check list markdown syntax are also not supported.

Markdown to HTML

The Rich Text Editor allows you to preview markdown changes immediately using preview. In this sample, the third-party library [Marked](#) is used to convert markdown into HTML content.

This sample demonstrates how to preview markdown changes in Rich Text Editor. Type or edit the display text, and apply format to view the preview of markdown. The [actionComplete](#) event can be used to convert Markdown to HTML.

[Class-component]

```

The Rich Text Editor component is **WYSIWYG** ("what you see is what you get") editor used to create and edit the content and **return** valid HTML markup or markdown (MD) of the content. The editor provides a standard toolbar to format content **using its** commands. Modular library features to load the necessary functionality on demand. The toolbar contains commands to align the text, insert link, insert image, insert list, undo/redo operation, HTML view, and more.

Key features

- *Mode*: Provides IFRAME and DIV mode.

```

- *Module*: Modular library to load the necessary functionality on demand.
- *Toolbar*: Provide a fully customizable toolbar.
- *Editing*: HTML view to edit the source directly for developers.
- *Third-party Integration*: Supports to integrate third-party library.
- *Preview*: Preview the modified content before saving it.
- *Tools*: Handling images, hyperlinks, video, uploads and more.
- *Undo and Redo*: Undo/redo manager.
- *Lists*: Creates bulleted and numbered list.`;

Table

Rich Text Editor allows to insert Markdown table in edit panel with 2 X 2 rows and columns along with the heading.

To use table tool, add the **CreateTable** item in toolbar items.

Insert table

To insert the table in Rich Text Editor, click the **table** toolbar option to insert the table into Rich Text Editor content and this is the default way in all the devices.

Please refer the below sample and code snippets to add the table in Markdown editor

```

The Rich Text Editor component **is WYSIWYG** ("what you see is what you get") editor used to create and edit the content and **return** valid HTML markup or markdown (MD) of the content. The editor provides a standard toolbar to format content **using its** commands. Modular library features to load the necessary functionality on demand. The toolbar contains commands to align the text, insert link, insert image, insert list, undo/redo operation, HTML view, and more.

Key features

- *Mode*: Provides IFRAME and DIV mode.
- *Module*: Modular library to load the necessary functionality on demand.
- *Toolbar*: Provide a fully customizable toolbar.
- *Editing*: HTML view to edit the source directly **for** developers.
- *Third-party Integration*: Supports to integrate third-party library.
- *Preview*: Preview the modified content before saving it.
- *Tools*: Handling images, hyperlinks, video, uploads and more.
- *Undo and Redo*: Undo/redo manager.
- *Lists*: Creates bulleted and numbered list.`;

```

Custom format

The Rich Text Editor allows you to customize the markdown syntax by overriding its default syntax. Configure the customized markdown syntax using the [formatter](#) property.

This sample demonstrates how to customize tags of markdown formatting.

For example, apply **+** to Unordered list, apply **1., 2., 3.** to Ordered list, for bold, , and for italic .

```

File browser in React Rich text editor component

Rich Text Editor allows to browse and insert images in the edit panel using the file browser. File browser allows the users to browse and select a file or folder from the file system and it supports various cloud services.

Required additional dependency

The following list of additional dependencies are required to use the file browser feature in the Rich Text Editor.

```

`js
|-- @syncfusion/ej2-react-richtexteditor
|-- @syncfusion/ej2-layouts
|-- @syncfusion/ej2-grids
|-- @syncfusion/ej2-filemanager

```

Additional CSS Reference

Additionally add the below styles in the `[src/App.css]` file.

```
`css
@import "../../node_modules/@syncfusion/ej2-layouts/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-grids/styles/material.css";
@import "../../node_modules/@syncfusion/ej2-filemanager/styles/material.css";
`
```

The following example explains about how to configure the file browser within the Rich Text Editor component.

- Configure the `FileManager` toolbar item in the `toolbarSettings` API `items` property.
- Set `enable` property as `true` on `fileManagerSettings` property to make the file browser in the Rich Text Editor to appear on the `FileManager` toolbar click action.

Rich Text Editor features are segregated into individual feature-wise modules. To use the file browser tool, inject the `FileManager` module using services.

Format Painter in React Rich Text Editor Component | Syncfusion

A format painter is a tool that allows you to copy the formatting from a piece of text and apply it to another one. Format Painter can be accessed via the toolbar or the keyboard shortcuts. The format painter can copy the formatting of a single word or a whole paragraph. The format painter can be customized using the [formatPainterSettings](#) property.

Enabling the toolbar option for Format Painter

You can add the `FormatPainter` tool in the Rich Text Editor using the `toolbarSettings.items` property.

Rich Text Editor features are segregated into individual feature-wise modules. To use the Format Painter feature, we need to import and inject the `FormatPainter` module in `services`.

By double-clicking the format painter toolbar button, sticky mode will be enabled. In sticky mode, the format painter will be disabled when the user clicks the `Escape` key again.

The following code example shows how to add the format painter tool in the Rich Text Editor.

[Class-component]

APP.JSX

```
import * as React from 'react';
import { RichTextEditorComponent, Inject, Toolbar, Link, Image, HtmlEditor,
QuickToolbar, FormatPainter } from '@syncfusion/ej2-react-richtexteditor';
class App extends React.Component {
  toolbarSettings = {
    items: ['FormatPainter', 'ClearFormat', 'Bold', 'Italic', 'Underline',
    '|', 'Formats', 'Alignments',
    'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|',
    'SourceCode', 'Undo', 'Redo']
  }
  render() {
    return (
      <RichTextEditorComponent toolbarSettings={this.toolbarSettings} >
        <h3>
          <strong>Format Painter</strong>
        </h3>
        <p>
          A Format Painter is a Rich Text Editor feature allowing users to
          quickly
          <span style={{ backgroundColor: "rgb(198, 140, 83)" }}>
            <strong>copy</strong>
          </span>
          and
          <span style={{ backgroundColor: "rgb(198, 140, 83)" }}>
            <strong>paste</strong>
          </span>
          formatting from one text to another. With a rich text editor,
          utilize the
          format painter as follows:
        </p>
        <ul>
          <li>Select the text whose format you want to copy.</li>
          <li>
            Click on the{" "}

```

```

        <strong>
          <em>Format Painter</em>
        </strong>{" "}
        button in the toolbar. It may look like a paintbrush icon.
      </li>
      <li>
        The cursor will change to a <strong>paintbrush</strong> icon.
Click and
        drag the cursor over the text you want to apply the copied
format.
      </li>
      <li>Release the mouse button to apply the format.</li>
    </ul>
    <p>
      Using the format painter in a rich text editor can save you time
when
      formatting a large document, You can quickly copy and apply
formatting to{" "}
      <span style={{ backgroundColor: "rgb(198, 140, 83)" }}>
        <strong>multiple sections</strong>
      </span>
      . It's a helpful tool for anyone who works with text editing
regularly, such
      as writers, editors, and content creators.
    </p>
    <Inject services={[ Toolbar, Link, Image, HtmlEditor, QuickToolbar,
FormatPainter ]} />
  </RichTextEditorComponent>
);
}
}
export default App;

  </RichTextEditorComponent>
);
}
export default App;
```

Customization of copy and paste format

You can customize the format painter tool in the Rich Text Editor using the `formatPainterSettings` property.

The `allowedFormats` property helps you to specify tag names that allow the formats to be copied from the selected text. For instance, you can include formats from the selected text using tags like `p`; `h1`; `h2`; `h3`; `div`; `ul`; `ol`; `li`; `span`; `strong`; `em`; `code`. The following example demonstrates how to customize this functionality.

Similarly, with the `deniedFormats` property, you can utilize the selectors to prevent specific formats from being pasted onto the selected text. The table below illustrates the selectors and their respective usage.

Type	Description	Selector	Usage
----- ----- ----- -----			
()	Class Selector	h3(e-rte-block-blue-text)	The class name e-rte-block-blue-text of H3 element is not copied.
[]	Attribute Selector	span\[title\]	The title attribute of span element is not copied.
{}	Style Selector	span{background-color, color}	The background-color and color styles of span element is not copied.

Using the `deniedFormats` property following styles are denied copying from the selected text such as `h3(e-rte-block-blue-text){background-color,padding}[title]`; `li{color}`; `span(e-inline-text-highlight)[title]`; `strong{color}(e-rte-strong-bg)`.

[Class-component]

APP.JSX

```

import * as React from 'react';
import { RichTextEditorComponent, Inject, Toolbar, Link, Image, HtmlEditor,
QuickToolbar, FormatPainter } from '@syncfusion/ej2-react-richtexteditor';
class App extends React.Component {
  toolbarSettings = {
```

```

        items: ['FormatPainter', 'ClearFormat', 'Bold', 'Italic', 'Underline',
        '|', 'Formats', 'Alignments',
        'OrderedList', 'UnorderedList', '|', 'CreateLink', 'Image', '|',
        'SourceCode', 'Undo', 'Redo']
    }
    formatPainterSettings = {
        allowedFormats: 'p;h1;h2;h3;div;ul;ol;li;span;strong;em;code;',
        deniedFormats: 'h3(e-rte-block-blue-text){background-
color,padding,color}[title]; li{color}; span(e-inline-text-
highlight){color}[title]; strong{color}(e-rte-strong-bg);',
    }
    render() {
        return (
            <RichTextEditorComponent toolbarSettings={this.toolbarSettings}
formatPainterSettings={this.formatPainterSettings} >
                <h3 className="e-rte-block-blue-text" title="Format Painter"
style={{ color: "#0079f3", backgroundColor: "#eff6ff", padding: 10 }}>

    <Inject services={[ Toolbar, Link, Image, HtmlEditor, QuickToolbar,
FormatPainter ]} />
    </RichTextEditorComponent>
    );
}
export default App;

```

Using the shortcut key to copy and paste the format

You can use the following shortcut keys to copy and paste the format in the Rich Text Editor.

Actions	Keyboard shortcuts	Description
-----	-----	-----
Copy the format	Alt + Shift + c	Copy the selection format or current range.
Pate the format	Alt + Shift + v	Paint the copied format.

Escape the sticky mode.	Esc	Remove the previously copied format and disable
----------------------------	-----	---

The format painter retains the formatting after application making it possible to apply the same formatting multiple times by using the Alt + Shift + v keyboard shortcut.

Additionally, You can perform the format painter actions programmatically using the [executeCommand](#) public method.

Form support in React Rich text editor component

The following sample demonstrates how to get the Rich Text Editor value in button click.

Render the Rich Text Editor in form.

```
`ts
<form id="myForm" class="form-vertical">
  <div class="form-group">
    <textarea id="defaultRTE" name="defaultRTE" required maxlength="100" minlength="20" data-msg-
    containerid="dateError"></textarea>
    <div id="dateError"></div>
  </div>
  <div class="form-btn-section">
    <button id="validateSubmit" class="sample-btn e-control e-btn" type="submit" data-
    ripple="true">Submit</button>
    <button id="resetbtn" class="sample-btn e-control e-btn" type="reset" data-
    ripple="true">Reset</button>
  </div>
</form>
`
```

Upon submitting the form, the `getValue` method will be triggered. Through the `FormData` class, get the Rich Text Editor value.

[Class-component]

APP.JSX

```
/**
 * Rich Text Editor - Form Sample
 */
import { FormValidator } from '@syncfusion/ej2-inputs';
import { Count, HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-

Validation in React Rich text editor component

Validation rules

The Rich Text Editor provides the functionality of character count and its validation. So, you can validate the Rich Text Editor's value on form submission by applying validationRules and validationMessage to the Rich Text Editor.

| Rules | Description |

| --- | --- |

| required | Requires the value for the Rich Text Editor control. |

| minlength | Requires the value to be of given minimum characters count. |

| maxlength | Requires the value to be of given maximum characters count. |

This sample is used to validate form using the obtrusive Validation. Type the values in Rich Text Editor and the form enables the validation with the formvalidator rules by clicking on the submit externally. All rules are validated by the formvalidator rules.

Validation message

The default error message for a rule can be customizable by defining it along with the concern rule object as follows.

In the following sample, customize the error message along with the concern rule.

[Class-component]

APP.JSX

```
{% raw %}
/**
 * Rich Text Editor - Form Validation Sample
 */
import { FormValidator } from '@syncfusion/ej2-inputs';
import { HtmlEditor, Image, Count, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
class App extends React.Component {
  formObject;
  button;
  componentDidMount() {
    const option = {
      rules: {
        'defaultRTE-value': {
          maxLength: [108, 'Maximum 100 character only'],
          minLength: [15, 'Need atleast 8 character length'],
          required: true
        }
      }
    };
    this.formObject = new FormValidator('#myForm', option);
    document.getElementById('validateSubmit').addEventListener('click',
(e) => {
      const form = document.forms.myForm;
      const formData = new FormData(form);
      const rteValue = formData.get('defaultRTE-value');
      // Use this value to the data base.
      alert(rteValue);
      e.preventDefault();
    });
  }
  onChange() {
    this.button.disabled = false;
  }
  render() {
    return (<form id="myForm" className="form-vertical">

Globalization in React Rich text editor component

Localization

The Rich Text Editor provides an option to localize its strings; it is used to adapting the editor to a particular local language. By default, the editor will use the US English (en-US) as its language. Please find the table with a list of keys and their corresponding values for the default language (en-US).

```

RTL

Specifies the direction of the Rich Text Editor component using the [enableRtl](#) property. For writing systems that require it like Arabic, Hebrew, etc., the direction can be switched to right-to-left.

Note: It will not change based on the locale property.

Miscellaneous in React Rich text editor component

Placeholder

Specifies the placeholder for the Rich Text Editor's content used when the Rich Text Editor body is empty through the [placeholder](#) property.

Through the `e-rte-placeholder` class to define our custom font family, font color, and styles to the placeholder text.

```

`css

.e-richtexteditor .e-rte-placeholder {
font-family: monospace;
}
`

```

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - Placeholder Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
  render() {
    return (
      <RichTextEditorComponent placeholder={'Type Something'}>
        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
      </RichTextEditorComponent>
    );
  }
}
export default App;

```

APP.TSX

```

/**

```

Character count

The Rich Text Editor automatically counts the number of characters in the content are while typing using the [showCharCount](#) property. The characters count displayed at the bottom of the editor. You can limit the number of characters in your content using the [maxLength](#) property. By default, the editor sets the characters limit value is infinity.

The character count color will be modified based on the characters in the Rich Text Editor.

| **Status** | **Description** |

| --- | --- |

| Normal | Till 70% of given maxLength value, character count color is black. |

| Warning | Once the number of character count in the Rich Text Editor reached 70% of given maxLength value, the character count color will be orange, indicating that, the count value going to reach the maximum count. |

| Error | Once the number of character count in the Rich Text Editor reached 90% of given maxLength value, the character count color will be red, indicating that, the count value reached the maximum count. |

To create Rich Text Editor with character count feature, inject the Count module to the RTE using the `RichTextEditor.Inject(Count)` method.

Code view

Rich Text Editor includes the ability for users to directly edit HTML code via **Source View** in the text area. If you made any modification in Source view directly, the changes will be reflected in the Rich Text Editor's content. So, the users will have more flexibility over the content they have created.

Undo/Redo manager

Undo and redo tools allow you to edit the text by disregard/cancel the recently made changes and restore it to previous state. It is a useful tool to restore the performed action which got changed by mistake. By default, upto 30 actions can be undo/redo in the editor.

To undo and redo operations, do one of the following:

- Press the undo/redo button on the toolbar.
- Press the **Ctrl + Z/Ctrl + Y** combination on the keyboard.

Customize the undo/redo step count using the [undoRedoSteps](#) property. By default, undo/redo actions take 300ms time interval for store the action to the undoRedoManager. The time interval can be customized by using the [undoRedoTimer](#).

Prevention of cross-site scripting (XSS)

The Rich Text Editor allow the users to edit the content with security by preventing cross-site scripting (XSS). By default, provided built-in support to remove the elements from editor content which cause XSS attack. The editor removes the elements based on the attributes if there is possible to execute script.

In the following sample, removed `script` tag and `onmouseover` attribute from content of the Rich Text Editor.

[Class-component]

APP.JSX

```

{% raw %}
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
  rteObj;
  template = `<div onmouseover='javascript:alert(1)'>Prevention of Cross
Sit Scripting (XSS) </div> <script>alert('hi')</script>`;
  render() {
    return (<div>
      <RichTextEditorComponent id="defaultRTE" ref={(richtexteditor) => {
this.rteObj = richtexteditor; }} valueTemplate={this.template}>
        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}/>
      </RichTextEditorComponent>
    </div>);
  }
}
export default App;
{% endraw %}

    />
    </RichTextEditorComponent>
  </div>;
}
export default App;
{% endraw %}

```

It's only applicable to editorMode as HTML.

Custom cross-site scripting

You can also filter the elements and attributes additionally which cause the XSS attack through [beforeSanitizeHtml](#) event. Return the value from the event argument `helper` function to apply in the editor. If you want to prevent the built-in support and make own cross-site scripting rules, set `cancel` argument as true.

The following sample demonstrate how to filter `script` tag from value.

[Class-component]

APP.JSX

```

{% raw %}
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import { detach } from '@syncfusion/ej2-base';
import * as React from 'react';
class App extends React.Component {
  template = `<div onmouseover='javascript:alert(1)'>Prevention of Cross
Sit Scripting (XSS) </div> <script>alert('hi')</script>`;
  rteObj;
  beforeSanitizeHtml(e) {
    e.helper = (value) => {
      e.cancel = true;
      let temp = document.createElement('div');
      temp.innerHTML = value;
      let scriptTag = temp.querySelector('script');
      if (scriptTag) {
        detach(scriptTag);
      }
      return temp.innerHTML;
    };
  }
  render() {
    return (<div>
      <RichTextEditorComponent id="defaultRTE" ref={(richtexteditor) => {
        this.rteObj = richtexteditor; }} valueTemplate={this.template}
        beforeSanitizeHtml={this.beforeSanitizeHtml} =
        this.beforeSanitizeHtml.bind(this)}>
        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}>/>
      </RichTextEditorComponent>
    </div>);
  }
}

```

```

}
export default App;

export default App;
{% enddraw %}

```

Resizable support

This feature allows the editor to be resized dynamically. The users can enable or disable this feature using the `enableResize` property in the Rich Text Editor. If `enableResize` is set to true, the Rich Text Editor component creates grip at the bottom right corner, which allows resizing the component in the diagonal direction. The following sample demonstrates the resizable feature.

Enabling the resizable support

To render the Rich Text Editor in the resizable mode, set the `enableResize` property to true. The above feature is built as module and hence the `Resize` module needs to be included in your application.

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - Resizable Sample
 */
import { HtmlEditor, Image, Inject, Link, Resize, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
  resize = true;
  render() {
    return (
      <RichTextEditorComponent enableResize={this.resize}>
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
        Users can format their content using standard toolbar commands.</p>
        <Inject services={[HtmlEditor, Toolbar, Image, Link, Resize,
QuickToolbar]}/>
      </RichTextEditorComponent>
    );
  }
}
export default App;

```

APP.TSX

```

/**
 * Rich Text Editor - Resizable Sample
 */
import { HtmlEditor, Image, Inject, Link, Resize, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component<{}, {}> {
  public resize: boolean = true;
  public render() {
    return (
      <RichTextEditorComponent enableResize={this.resize} >

```

```

    <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
    Users can format their content using standard toolbar commands.</p>
    <Inject services={[HtmlEditor, Toolbar, Image, Link, Resize,
QuickToolbar]} />
    </RichTextEditorComponent>
  );
}
}
export default App;

```

[Functional-component]

APP.JSX

```

/**
 * Rich Text Editor - Resizable Sample
 */
import { HtmlEditor, Image, Inject, Link, Resize, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
function App() {
  let resize = true;
  return (<RichTextEditorComponent enableResize={resize}>
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
    Users can format their content using standard toolbar
commands.</p>
    <Inject services={[HtmlEditor, Toolbar, Image, Link, Resize,
QuickToolbar]} />
    </RichTextEditorComponent>);
}
export default App;

```

APP.TSX

```

/**
 * Rich Text Editor - Resizable Sample
 */
import { HtmlEditor, Image, Inject, Link, Resize, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
function App() {
  let resize: boolean = true;
  return (
    <RichTextEditorComponent enableResize={resize} >
    <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
    Users can format their content using standard toolbar
commands.</p>

```

```

        <Inject services={[HtmlEditor, Toolbar, Image, Link, Resize,
QuickToolbar]} />
        </RichTextEditorComponent>
    );
}
export default App;

```

Specifying the Minimum and Maximum width and height for Resize

To have a restricted resizable area for the RichTextEditor, you need to specify the min-width, max-width, min-height, and max-height CSS properties for the control's wrapper element. By default, the control is capable of resizing upto the current viewport. The `e-richtexteditor` CSS class will be available in the component's wrapper and can be used for applying the above mentioned styles.

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - Resizable Sample
 */
import { HtmlEditor, Image, Inject, Link, Resize, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
    resize = true;
    render() {
        return (<RichTextEditorComponent enableResize={this.resize}>
            <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
            Users can format their content using standard toolbar commands.</p>
            <Inject services={[HtmlEditor, Toolbar, Image, Link, Resize,
QuickToolbar]} />
            </RichTextEditorComponent>);
    }
}
export default App;

```

APP.TSX

```

/**

}

```

```
);
}
export default App;
```

Number and Bullet Format Lists

This feature allows the user to change the appearance of the Numbered and Bulleted lists. Users can also apply different numbering or bullet formats lists such as lowercase greek, upper Alpha, square and circles. You can also customize the style type of the lists to be populated in the dropdown from the toolbar by using the `numberFormatList` and `bulletFormatList` properties in the Rich Text Editor.

[Class-component]

APP.JSX

```
/**
 * Rich Text Editor - Number/Bullet Format list Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
  toolbarSettings = {
    items: ['NumberFormatList', 'BulletFormatList']
  };
  render() {
    return (
      <div>
        <RichTextEditorComponent toolbarSettings={this.toolbarSettings}>
          <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
          Users can format their content using standard toolbar commands.</p>

Xhtml validation in React Rich text editor component

The editor provides an option to validate the source content of the Rich Text Editor against the XHTML standard using the 'enableXhtml' property. When you enter or modify content in the editor, it continuously checks the XHTML source content and removes elements and attributes that are not valid.

The editor checks the following settings on validation:

Attributes

- Must be specified in lowercase.
- Proper use of quotation marks around the attributes.
- Must be valid attributes for corresponding HTML element.
- All the required attributes must be included in the HTML element.

HTML Elements

- Must be in lowercase.
- All opening tags must be closed.
- Allows only the valid HTML elements.
- Elements must be properly nested.
- All elements must have one root element.
- Should not use inline elements inside the block elements.

Inline mode in React Rich text editor component

This is the inline example for the Rich Text Editor. For this you must set the [inlineMode](#) property.

Inline edition allows you to select any editable element or click the element on the page and edit it in-place.

Inline editing is a true WYSIWYG formation and on the contrary to Rich Text Editor HTML/MD editing, the styles that are used for edited content comes directly from the document stylesheet. This means that inline editors ignore the default Rich Text Editor content styles.

Show on select/click

Enabling the [onSelection](#) option of inlineMode makes the inline Rich Text Editor to appear. You can select the text in the editable area otherwise the inline Rich Text Editor will be appear once click into the editable area.

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - InlineMode Sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
  inlineMode = {
    enable: true,
    onSelection: true
  };
  toolbarSettings = {

```

```

        items: [
            'Bold', 'Italic', 'Underline', 'Formats', '-',
            'Alignments', 'OrderedList', 'UnorderedList', 'CreateLink'
        ]
    };
    render() {
        return (
            <RichTextEditorComponent height={450}
            inlineMode={this.inlineMode} toolbarSettings={this.toolbarSettings}>
                <p>The Rich Text Editor component is WYSIWYG ("what you see is what
                you get") editor that provides the best user experience to create and update
                the content. Users can format their content using standard toolbar
                commands.</p>

```

Paste cleanup in React Rich text editor component

The Rich Text Editor allows you to reduce the effort while converting the Microsoft Word content to HTML format with format and styles.

MS Word to HTML

By default, Rich Text Editor consider the following processes on paste content from Microsoft Word.

List conversion: The list elements copied from the Microsoft Word document contains paragraph tags with styles and classes. The list elements are converted to standard HTML list elements by referring the styles and class names in the paragraph tags.

Converting style: The styles of the elements copied from the Microsoft Word document are converted to standard CSS styles and added as inline styles for each respective element.

Tags and comments: The Microsoft Word specific XML tags and comments are removed when cleanup on paste.

Paste cleanup

You can control the formatting and styles on pasting the content to the editor using the pasteCleanup settings property. The following settings are available to clean up the content:

API	Description	Default Value	Type
prompt	To invoke prompt dialog with paste options on pasting the content in editor.	false	boolean
plainText	To paste the content as plain text.	false	boolean
keepFormat	To keep the same format with copied content.	true	boolean
deniedTags	To ignore the tags when pasting HTML content.	null	string[]
deniedAttrs	To paste the content by filtering out these attributes from the content.	null	string[]
allowedStyleProps	To paste the content by accepting these style attributes and removing other style attributes.	['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']	string[]

Rich Text Editor features are segregated into individual feature-wise modules. To use paste cleanup, inject paste cleanup module using the `RichTextEditor.Inject(PasteCleanup)`.

Prompt dialog

When `prompt` is set to true, pasting the content in the editor will open a dialog box that contains three options `Keep`, `Clean`, and `Plain Text` as radio buttons:

1. `Keep`: Radio button to keep the same format with copied content.
2. `Clean`: Radio button to clear all the style formats with copied content.
3. `Plain Text`: Radio button to paste the copied content as plain text without any formatting or style (including the removal of all tags).

When `prompt` value is set true, the API properties `plainText` and `keepFormat` will not be considered for processing when pasting the content.

Paste as plain text

When `plainText` is set to true, the copied content will be converted as plain text by removing all the HTML tags and styles applied to it and only the plain text is pasted in the editor.

When `plainText` value is set true, the API property `prompt` should be set to false, and `keepFormat` will not be considered for processing when pasting the content.

Keep format

When `keepFormat` is set to true, the copied content will maintain all the style formatting allowed in the `allowedStyleProps` on pasting the content in the editor.

When `keepFormat` is set to false, the style in the copied content will be removed without considering the allowed styles in the `allowedStyleProps` when pasting the content in the editor.

When `keepFormat` value is set true, the API property `prompt` and `plainText` should be set to false.

Denied tags

When `deniedTags` values are set, the tags that matches the 'denied tags' list will be removed on pasting the copied content in the editor. For Example,

1. `'a'`: Paste the content by filtering out anchor tags.
2. `'a[!href]'`: Paste the content by filtering out anchor tags that do not have the 'href' attribute.
3. `'a[href, target]'`: Paste the content by filtering out anchor tags that have the 'href' and 'target' attributes.

Denied attributes

When the `deniedAttrs` values are set, the attributes that matches the 'denied attributes' list will be removed on pasting the copied content in the editor. For Example,

`'id', 'title'`: This will remove the attributes 'id' and 'title' from all tags.

Allowed style properties

By default, the following basic styles are allowed on pasting the content to the editor.

`['background', 'background-color', 'border', 'border-bottom', 'border-left', 'border-radius', 'border-right', 'border-style', 'border-top', 'border-width', 'clear', 'color', 'cursor', 'direction', 'display', 'float', 'font', 'font-family', 'font-size', 'font-weight', 'font-style', 'height', 'left', 'line-height', 'margin', 'margin-top', 'margin-left', 'margin-right', 'margin-bottom', 'max-height', 'max-width', 'min-height', 'min-width', 'overflow', 'overflow-x', 'overflow-y', 'padding', 'padding-bottom', 'padding-left', 'padding-right', 'padding-top', 'position', 'right', 'table-layout', 'text-align', 'text-decoration', 'text-indent', 'top', 'vertical-align', 'visibility', 'white-space', 'width']`

When you configure `allowedStyleProps`, the styles, which matches the 'allowed style properties' list are allowed, all other style properties will be removed on pasting the content in the editor.

For Example,

`allowedStyleProps: ['color', 'margin']`: This will allow only the style properties 'color' and 'margin' in each pasted element.

In the following example, the paste cleanup related settings are explained with its module configuration

[Class-component]

APP.JSX

```
/**
 * Rich Text Editor - Paste Cleanup Sample
 */

Mention integration in React Rich text editor component

By integrating the [Mention](#) component with a Rich Text Editor, users can easily mention or tag other users or objects from the suggested list without having to manually type out their names or other identifying information.

The [target](#) property of the Mention component allows you to specify the ID of the content editable div element within the Rich Text Editor that you want to bind the Mention component to. This allows you to enable the Mention functionality within the Rich Text Editor, so that users can mention or tag other users or objects from the suggested list while editing the text.

When the user types the @ symbol followed by a character, the Rich Text Editor will display a list of suggestions for items that the user can select from. The user can then select an item from the list by clicking on it, or by typing the name of the item they want to tag.

In the following sample, configured the following properties with popup dimensions.

- [allowSpaces](#) - Allow to continue search action if user enter space after mention character while searching.
- [suggestionCount](#) - The maximum number of items that will be displayed in the suggestion list.
- [itemTemplate](#) - Used to display the customized appearance in suggestion list.

[Class-component]

APP.JSX

```
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import { MentionComponent } from '@syncfusion/ej2-react-dropdowns';
import * as React from 'react';

Enter key in React Rich text editor component

Rich Text Editor allows to customize the tag that is inserted when pressing the enter key and shift + enter key in the Rich Text Editor.

Enter key customization

By default, the `<p>` tag will be created while pressing the enter key. The enter key can be customized by using the [enterKey](#) property, where the possible tags that can be used to customize are `<p>`, `<div>`, and `
`.

When the enter key is customized with any of the possible values, pressing the enter key in the editor will create a new tag that is configured. Also, when the enter key is configured the default value of the Rich Text Editor will also change respectively with the configured values.

Shift-Enter key customization

By default, the `
` tag will be created while pressing the shift + enter key. The shift + enter key can be customized by using the [shiftEnterKey](#) property where the possible tags that can be used to customize are `
`, `<p>`, `<div>`.

When the shift + enter key is customized with any of the possible values, pressing the shift + enter key in the editor will create a new tag that is configured. Also, when the shift + enter key is configured the default value of the Rich Text Editor will change respectively with the configured values.

Iframe in React Rich text editor component

When the `iframeSettings` option is enabled, the Rich Text Editor creates the `iframe` element as the content area on control initialization; it is used to display and editing the content. In content area, the editor displays only the body tag of a `<iframe>` document.

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - IFrame sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
    iframeSettings = {
        enable: true
    };
    render() {
        return (<RichTextEditorComponent height={450}
iframeSettings={this.iframeSettings}>
            <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
            Users can format their content using standard toolbar commands.</p>

```

```

    <p><b>Key features:</b></p>
    <ul>
      <li>
        <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
      </li>
      <li>
        <p>Capable of handling markdown editing.</p>
      </li>
      <li>
        <p>Contains a modular library to load the necessary functionality
on demand.</p>
      </li>
      <li>
        <p>Provides a fully customizable toolbar.</p>
      </li>
      <li>
        <p>Provides HTML view to edit the source directly for
developers.</p>
      </li>
      <li>
        <p>Supports third-party library integration.</p>
      </li>
      <li>
        <p>Allows preview of modified content before saving it.</p>
      </li>
      <li>

Iframe attributes

The editor allows you to pass an additional attribute to body tag of a `<iframe>` element using attributes fields of the [iframeSettings](#) property. This property contains name/value pairs in string format. It is used to override the default appearance of the content area.

[Class-component]

APP.JSX

```
/**

Adding external CSS/Script file

The editor offers you to add external CSS file to style the `<iframe>` element. Easily change the appearance of editor's content using an external CSS file using [styles](#) field in the `iframeSettings` property.

Likewise, add the external script file to the `<iframe>` element using the [scripts](#) field of `iframeSettings` to provide the additional functionalities to the Rich Text Editor.

[Class-component]

APP.JSX

```

/**
 * Rich Text Editor - IFrame Resources sample
 */
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-

Third party integration in React Rich text editor component

The Rich Text Editor can be integrated with third-party to suite the application scenario.

CodeMirror Integration

Rich Text Editor comes with a basic HTML source editor through the view-source property. CodeMirror plugin can be used to highlight the syntax of HTML. CodeMirror plugin for Rich Text Editor makes editing of HTML source code with a pleasant experience.

Import necessary CSS and JS files of CodeMirror to the HTML page.

Required JS files of code mirror.

```
` javascript
```

```
<script src="scripts/CodeMirror/codemirror.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/javascript.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/css.js" type="text/javascript"></script>
<script src="scripts/CodeMirror/htmlmixed.js" type="text/javascript"></script>
```

Required CSS file of code mirror.

```
` javascript
<link href="scripts/CodeMirror/codemirror.min.css" rel="stylesheet" />
```

Add a custom icon for HTML source editor in the toolbar of Rich Text Editor using the template option of ToolbarSettings, define the code mirror plugins, and then pass the Rich Text Editor content as argument in the [actionComplete](#) event.

Embed.ly Integration

Rich Text Editor easily integrate with embed.ly which is probably the best service when it comes to embed the rich content such as Twitter, Facebook, Instagram, and lots of other publishing platform embeds.

` javascript

```
<script src="https://cdn.embedly.com/widgets/platform.js" charset="UTF-8"></script>
```

`

In the following sample, the Embed.ly class `embedly-card` has been added to a `a` tag in the [actionComplete](#) event.

Exec command in React Rich text editor component

In Rich Text Editor, `execCommand` used to perform commands for the modification of content in editable area.

The `execCommand` will perform the following commands.

Commands	Description	Code snippets
<code>bold</code>	Bold the selected content in the Rich Text Editor.	<code>rteObj.executeCommand('bold');</code>
<code>italic</code>	The selected text will be italics.	<code>rteObj.executeCommand('italic');</code>
<code>underline</code>	Underline the selected text in the Rich Text Editor.	<code>rteObj.executeCommand('underline');</code>
<code>strikeThrough</code>	Apply single line strike through formatting for the selected text.	<code>rteObj.executeCommand('strikeThrough');</code>
<code>superscript</code>	Makes the selected text as superscript (higher).	<code>rteObj.executeCommand('superscript');</code>
<code>subscript</code>	Makes the selected text as subscript (lower).	<code>rteObj.executeCommand('subscript');</code>
<code>uppercase</code>	Change the case of selected text to upper in the content.	<code>rteObj.executeCommand('uppercase');</code>
<code>lowercase</code>	Change the case of selected text to lower in the content.	<code>rteObj.executeCommand('lowercase');</code>
<code>fontColor</code>	Apply the specified font color for the selected text.	<code>rteObj.executeCommand('fontColor', 'yellow');</code>

| **fontName** | Apply the specified font name for the selected text.
`rteObj.executeCommand('fontName', 'Arial');`|

| **fontSize** | Apply the specified font size for the selected text. | `rteObj.executeCommand('fontSize', '10pt');`|

| **formatBlock** | Apply the specified format styles for the selected text.
`rteObj.executeCommand('formatBlock', 'H1');`|

| **backColor** | Apply the specified background color the selected text. |
`rteObj.executeCommand('backColor', 'red');`|

| **justifyCenter** | Align the content with center margin. | `rteObj.executeCommand('justifyCenter');`|

| **justifyFull** | Align the content with justify margin. | `rteObj.executeCommand('justifyFull');`|

| **justifyLeft** | Align the content with left margin. | `rteObj.executeCommand('justifyLeft');`|

| **justifyRight** | Align the content with right margin. | `rteObj.executeCommand('justifyLeft');`|

| **undo** | Allows to undo the actions. | `rteObj.executeCommand('undo');`|

| **createLink** | Creates a hyperlink to a text or image to a specific location in the content. |
`rteObj.executeCommand('createLink',{ text: 'Links', url: 'http://', title : 'Link' });` |

| **indent** | Allows to increase the indent level of the content. | `rteObj.executeCommand('indent');`|

| **insertHTML** | Insert the html content to the current cursor position. |
`rteObj.executeCommand('insertHTML', 'inserted an html');`|

| **insertOrderedList** | Create a new list item(numbered). |
`rteObj.executeCommand('insertOrderedList');`|

| **insertUnorderedList** | Create a new list item(bulleted).
`rteObj.executeCommand('insertUnorderedList');`|

| **outdent** | Allows to decrease the indent level of the content. |
`rteObj.executeCommand('outdent');`|

| **redo** | Allows to redo the actions | `rteObj.executeCommand('redo');`|

| **removeFormat** | remove all formatting styles (such as bold, italic, underline, color, superscript, subscript, and more) from currently selected text. | `rteObj.executeCommand('removeFormat');`|

| **insertText** | Insert text to the current cursor position. | `rteObj.executeCommand('insertText', 'inserted a text');` |

| **insertImage** | Insert an image to the current cursor position. |
`rteObj.executeCommand('insertImage', { url: 'https://ej2.syncfusion.com/javascript/demos/src/rich-text-editor/images/RTEImage-Feather.png', cssClass: 'rte-img' });`

| **copyFormatPainter** | Copy the format of selected text and apply it to another text. |
`rteObj.executeCommand('copyFormatPainter', formatPainterSettings);`|

| **applyFormatPainter** | Apply the copied format to the selected text. |
`rteObj.executeCommand('applyFormatPainter');`|

```
| escapeFormatPainter | Remove the previously copied format and disable the sticky mode |
rteObj.executeCommand('escapeFormatPainter');|
```

Note: The 'ExecuteCommand' public method is not supported in Syncfusion Markdown Editor

[Style in React Rich text editor component](#)

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

[Customizing the Rich Text Editor's content](#)

Use the following CSS to customize the default Rich Text Editor's content properties like font-family, font-size and color.

```
`css
/ To change font family and font size /
.e-richtexteditor .e-rte-content .e-content,
.e-richtexteditor .e-source-content .e-content {
font-size: 20px;
font-family: Segoe ui;
}
/ To change font color and content background /
.e-richtexteditor .e-rte-content,
.e-richtexteditor .e-source-content {
background: seashell;
color: blue;
}
`
```

[Customizing the Rich Text Editor's toolbar](#)

Use the following CSS to customize the default color in the Rich Text Editor's toolbar icon.

```
`css
/ To change font color for toolbar icon /
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons,
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-icons:active {
color: red;
}
/ To change font color for toolbar button /
.e-toolbar .e-tbar-btn,
.e-toolbar .e-tbar-btn:active,
.e-toolbar .e-tbar-btn:hover {
```

```
color: red;
}

/ To change font color for toolbar button in active state/
.e-richtexteditor .e-rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-icons, .e-richtexteditor .e-
rte-toolbar .e-toolbar-item .e-dropdown-btn.e-active .e-rte-dropdown-btn-text {
color: red;
}

/ To change font color for expanded toolbar items /
.e-richtexteditor .e-rte-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn .e-icons,
.e-toolbar.e-extended-toolbar .e-toolbar-extended .e-toolbar-item .e-tbar-btn {
color: red;
}
`
```

Customizing the Rich Text Editor's character count

Use the following CSS to customize the default color in the Rich Text Editor's character count.

```
`css

/ To change font color, font family, font size and opacity /
.e-richtexteditor .e-rte-character-count {
color: red;
font-family: segoe ui;
font-size: 18px;
opacity: 00.54;
padding-bottom: 2px;
padding-right: 14px;
}
`
```

Keyboard support in React Rich text editor component

The editor has full keyboard accessibility that includes shortcuts to open and other actions with toolbar items, drop-down lists, and dialogs.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| **Toolbar focus | Alt + f10 |**

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert audio | Ctrl + Shift + a |

| Insert video | Ctrl + Alt + v |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

| Copy | Ctrl + c |

| Cut | Ctrl + x |

| Paste | Ctrl + v |

| Bold | Ctrl + b |

| Italic | Ctrl + i |

| Underline | Ctrl + u |

| Strikethrough | Ctrl + Shift + s |

| Uppercase | Ctrl + Shift + u |

| Lowercase | Ctrl + Shift + l |

| Superscript | Ctrl + Shift + = |

| Subscript | Ctrl + = |

| Indents | Ctrl +] |

| Outdents | Ctrl + [|

| HTML source | Ctrl + Shift + h |

| Fullscreen | Ctrl + Shift + f |

| Exit Fullscreen | Esc |

| Justify center | Ctrl + e |

| Justify full | Ctrl + j |

| Justify left | Ctrl + l |

| Justify right | Ctrl + r |

| Clear format | Ctrl + Shift + r |

| Ordered list | Ctrl + Shift + o |

| Unordered list | Ctrl + Alt + o |

| Format Painter Copy | Alt + Shift + c |

| Format Painter Paste | Alt + Shift + v |

| Format Painter Escape | Esc |

Markdown formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode

| Actions | Keyboard shortcuts |

|-----|-----|

| **Toolbar focus** | **Alt + f10** |

| Insert link| Ctrl + k |

| Insert image| Ctrl + Shift + i |

| Insert table| Ctrl + Shift + e |

| Undo| Ctrl + z |

| Redo| Ctrl + y |

| Copy| Ctrl + c |

| Cut| Ctrl + x |

| Paste| Ctrl + v |

| Bold| Ctrl + b |

| Italic| Ctrl + i |

| Strikethrough| Ctrl + Shift + s |

| Uppercase| Ctrl + Shift + u |

| Lowercase| Ctrl + Shift + l |

| Superscript| Ctrl + Shift + = |

| Subscript| Ctrl + = |

| Fullscreen| Ctrl + Shift + f |

| Ordered list| Ctrl + Shift + o |

| Unordered list| Ctrl + Alt + o |

Accessibility in React Rich text editor component

The Rich Text Editor component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties. This component is characterized by complete ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The accessibility compliance for the Rich Text Editor component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  alt="Yes"> |

| [Section 508 Support](#) |  alt="Yes"> |

| [Screen Reader Support](#) |  alt="Yes"> |

| [Right-To-Left Support](#) |  alt="Yes"> |

| [Color Contrast](#) |  alt="Intermediate"> |

| [Mobile Device Support](#) |  alt="Yes"> |

| [Keyboard Navigation Support](#) |  alt="Yes"> |

```
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

ARIA attributes

The toolbar of Rich Text Editor, assigned the role of Toolbar and has the following list of ARIA attributes.

| Roles and Attributes | Functionalities |

| --- | --- |

| role="toolbar" | This attribute added to the toolbar element describes the actual role of the element. |

| aria-orientation | Indicates the toolbar orientation. Default value is horizontal. |

| aria-haspopup | Indicates the popup mode of the toolbar. The default value is false. When popup mode is enabled, attribute value has to be changed to true. |

| aria-disabled | Indicates the disabled state of the toolbar. |

| aria-owns | Identifies an element to define a visual, functional, or contextual parent/child relationship between DOM elements when the DOM hierarchy cannot represent the relationship. In the Rich Text Editor, the attribute contains the ID of the Rich Text Editor to indicate the popup as a child element. |

For further details of toolbar ARIA attributes, refer the accessibility of [Toolbar](#) documentation.

The Rich Text Editor element is assigned the role of application.

| Roles and Attributes | Functionalities |

| --- | --- |

| role="application" | This attribute added to the Rich Text Editor element describes the actual role of the element. |

| aria-disabled | Indicates the disabled state of the Rich Text Editor. |

```

Keyboard interaction

The Rich Text Editor component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Rich Text Editor component.

HTML formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with HTML edit mode.

| Actions | Keyboard shortcuts |

|-----|-----|

| Toolbar focus | Alt + f10 |

| Insert link | Ctrl + k |

| Insert image | Ctrl + Shift + i |

| Insert audio | Ctrl + Shift + a |

| Insert video | Ctrl + Alt + v |

| Insert table | Ctrl + Shift + e |

| Undo | Ctrl + z |

| Redo | Ctrl + y |

Copy	Ctrl + c
Cut	Ctrl + x
Paste	Ctrl + v
Bold	Ctrl + b
Italic	Ctrl + i
Underline	Ctrl + u
Strikethrough	Ctrl + Shift + s
Uppercase	Ctrl + Shift + u
Lowercase	Ctrl + Shift + l
Superscript	Ctrl + Shift + =
Subscript	Ctrl + =
Indents	Ctrl +]
Outdents	Ctrl + [
HTML source	Ctrl + Shift + h
Fullscreen	Ctrl + Shift + f
Exit Fullscreen	Esc
Justify center	Ctrl + e
Justify full	Ctrl + j
Justify left	Ctrl + l
Justify right	Ctrl + r
Clear format	Ctrl + Shift + r
Ordered list	Ctrl + Shift + o
Unordered list	Ctrl + Alt + o
Format Painter Copy	Alt + Shift + c
Format Painter Paste	Alt + Shift + v
Format Painter Escape	Esc

Markdown formation shortcut key

You can use the following key shortcuts when the Rich Text Editor renders with Markdown edit mode

Actions	Keyboard shortcuts
Toolbar focus	Alt + f10
Insert link	Ctrl + k

Insert image	Ctrl + Shift + i
Insert table	Ctrl + Shift + e
Undo	Ctrl + z
Redo	Ctrl + y
Copy	Ctrl + c
Cut	Ctrl + x
Paste	Ctrl + v
Bold	Ctrl + b
Italic	Ctrl + i
Strikethrough	Ctrl + Shift + s
Uppercase	Ctrl + Shift + u
Lowercase	Ctrl + Shift + l
Superscript	Ctrl + Shift + =
Subscript	Ctrl + =
Fullscreen	Ctrl + Shift + f
Ordered list	Ctrl + Shift + o
Unordered list	Ctrl + Alt + o

Ensuring accessibility

The Rich Text Editor component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Rich Text Editor component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Rich Text Editor component with accessibility tools.

How To

Add google fonts in React Rich text editor component

To use web fonts in RTE, it is not needed for the web fonts to be present in local machine. To add the web fonts to RTE, we need to refer the web font links and add the font names in the [fontFamily](#) property.

[Class-component]

APP.JSX

```

import { Count, HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
  fontFamily = {
    items: [
      { text: "Segoe UI", value: "Segoe UI", class: "e-segoe-ui",
command: "Font", subCommand: "FontName" },
      { text: "Roboto", value: "Roboto", command: "Font", subCommand:
"FontName" },
      { text: "Great vibes", value: "Great Vibes,cursive", command:
"Font", subCommand: "FontName" },
      { text: "Noto Sans", value: "Noto Sans", command: "Font",
subCommand: "FontName" },

The below font style links are referred in the page.

`ts

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Roboto">

<link rel="stylesheet" href="http://fonts.googleapis.com/css?family=Great+Vibes">

,

In the above sample, you can see that we have added two Google web fonts (Roboto and Great vibes) to RTE.

Change default font family in React Rich text editor component

By using [default](#) property, you can change the default font-family of the RTE. To change the font-family of the RTE content while loading, we need to give the font-family in the style section with the help of [cssClass](#) property.

Check image size in React Rich text editor component

By using the Rich text editor's `imageUploading` event, you can get the image size before uploading and restrict the image to upload, when the given image size is greater than the allowed size.

In the following, we have validated the image size before uploading and determined whether the image has been uploaded or not.

[Class-component]

APP.JSX

```

import { Count, HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
export class App extends React.Component {
  toolbarSettings = {
    items: ['Bold', 'Italic', 'Underline', 'StrikeThrough', '|',
      'FontName', 'FontSize', 'FontColor', 'BackgroundColor',
      'LowerCase', 'UpperCase', '|',
      'Formats', 'Alignments', 'OrderedList', 'UnorderedList',
      'Outdent', 'Indent', '|',
      'CreateLink', 'Image', '|', 'ClearFormat', 'Print',
      'SourceCode', 'FullScreen', '|', 'Undo', 'Redo']
  };
  insertImageSettings = {
    saveUrl:
      "https://aspnetmvc.syncfusion.com/services/api/uploadbox/Save",
    path: "../Images/"
  };
  onImageUploading = (args) => {
    console.log("file is uploading");
    let imgSize = 500000;
    let sizeInBytes = args.fileData.size;

```

```

        if (imgSize < sizeInBytes) {
            args.cancel = true;
        }
    };
    render() {
        return (<RichTextEditorComponent
toolbarSettings={this.toolbarSettings}
insertImageSettings={this.insertImageSettings}
imageUploading={this.onImageUploading.bind(this)}>
        <Inject services={[Toolbar, Count, Image, Link, HtmlEditor,
QuickToolbar]} />
        </RichTextEditorComponent>);
    }
}
export default App;

```

APP.TSX

Customize placeholder style in React Rich text editor component

By using `e-rte-placeholder` class, you can customize the placeholder style.

[Class-component]

APP.JSX

```

import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
  placeholder = "Type something";
  render() {
    return (<RichTextEditorComponent placeholder={this.placeholder}>
      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
    </RichTextEditorComponent>);
  }
}
export default App;

```

APP.TSX

```

import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component<{}, {}> {
  private placeholder: string = "Type something";
  public render() {

```

```

    return (
      <RichTextEditorComponent placeholder={this.placeholder}>
        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
      </RichTextEditorComponent>
    );
  }
}
export default App;

```

[Functional-component]

APP.JSX

```

import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {
  let placeholder = "Type something";
  return (<RichTextEditorComponent placeholder={placeholder}>
    <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
    </RichTextEditorComponent>);
}
export default App;

```

import * as React from 'react';
function App() {
  let placeholder: string = "Type something";
  return (
    <RichTextEditorComponent placeholder={placeholder}>
      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
    </RichTextEditorComponent>
  );
}
export default App;

```

Customize shortcut keys in React Rich text editor component

It can be achieved by using [formatter](#) property. We need to create `customformatterModel` to configure the `keyConfig` using `IHtmlFormatterModel` class and assign the same to the `formatter` property. Here, `ctrl+q` is configured to open the `Insert Hyperlink` dialog.

[Class-component]

APP.JSX

```

import { Count, HtmlEditor, HTMLFormatter, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';

```

```

class App extends React.Component {
  customHTMLModel = {
    // formatter is used to configure the custom key
    keyConfig: {
      'insert-link': 'ctrl+q', // confite the desired key
    }
  };
  formatter = new HTMLFormatter(this.customHTMLModel);
  // to configure custom key
  render() {

We need to import `IHtmlFormatterModel` and `HTMLFormatter` to configure the shortcut key.

Set the cursor at the specific range in React Rich text editor component

This can be achieved by using `setRange` method in the RTE using `NodeSelection` instance. In this below sample, we have passed the text node (specific location in RTE content) in `setStart` method and passed the range in `setRange` method of RTE.

[Class-component]

APP.JSX

```
{% raw %}
import { HtmlEditor, Image, Inject, Link, NodeSelection, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
  rteObj;
  onclick() {
    const element =
this.rteObj.contentModule.getDocument().getElementById("key");
    const selectioncursor = new NodeSelection();
    const range = document.createRange();
    range.setStart(element, 1); // to set the range
    selectioncursor.setRange(document, range); // to set the cursor
  }
  render() {
    return (<div>
      <RichTextEditorComponent ref={ (richtexteditor) => { this.rteObj =
richtexteditor; }}>
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
        Users can format their content using standard toolbar commands.</p>
        <p id="key"><b>Key features:</b></p>
        <ul>
          <li>
            <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
          </li>
        </ul>
        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}>
        </RichTextEditorComponent>
        <button id='btn' className="e-control e-btn" onClick={this.onclick =
this.onclick.bind(this)}> Set cursor position</button>
      </div>);
  }
}
export default App;
{% endraw %}
```

APP.TSX

```
{% raw %}
import { HtmlEditor, Image, Inject, Link, NodeSelection, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';

```

Update value in React Rich text editor component

To achieve this, we need to bind the **keydown** event to the RTE content and capture the **ctrl + s** key press using its keyCode.

In the **keydown** event handler, the **updateValue** method is called to update the **value** property and then we can save the content in the required database using the same.

[Class-component]

APP.JSX

```

{% raw %}
import { HtmlEditor, Image, Inject, Link, QuickToolbar,
RichTextEditorComponent, Toolbar } from '@syncfusion/ej2-react-
richtexteditor';
import * as React from 'react';
class App extends React.Component {
  rteObj;
  created() {
    const instance = this.rteObj;
    this.rteObj.contentModule.getDocument().addEventListener("keydown",
(e) => {
      if (e.key === 's' && e.ctrlKey === true) {
        e.preventDefault(); // to prevent default ctrl+s action
        instance.updateValue(); // to update the value after editing
        // const value: any= instance.value; // you can get the RTE
        content to save in the desired database
      }
    });
  }
  render() {
    return (<RichTextEditorComponent ref={(richtexteditor) => {
this.rteObj = richtexteditor; }} created={this.created =
this.created.bind(this)}>
      <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
      Users can format their content using standard toolbar commands.</p>
      <p><b>Key features:</b></p>
      <ul>
        <li>
          <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>

Rename images in server in React Rich text editor component

By using the [insertImageSettings](#) property, you can specify the server handler to upload the selected image. Then you can bind the [imageUploadSuccess](#) event, to receive the modified file name from the server and update it in the Rich Text Editor's insert image dialog.

</li>
</ul>
<Inject services={[Toolbar, Count, Image, Link, HtmlEditor, QuickToolbar]} />
</RichTextEditorComponent>
);
}
export default App;
`

```

To configure the server-side handler, refer the below code.

```
`csharp
[AcceptVerbs("Post")]
public void Rename()
{
    try
    {
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
        imageFile = httpPostedFile.FileName;
        if (httpPostedFile != null)
        {
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Images");
            if (!Directory.Exists(fileSave))
            {
                Directory.CreateDirectory(fileSave);
            }
            var fileName = Path.GetFileName(httpPostedFile.FileName);
            var fileSavePath = Path.Combine(fileSave, fileName);
            while (System.IO.File.Exists(fileSavePath))
            {
                imageFile = "rtelImage" + x + "-" + fileName;
                fileSavePath = Path.Combine(fileSave, imageFile);
                x++;
            }
            if (!System.IO.File.Exists(fileSavePath))
            {
                httpPostedFile.SaveAs(fileSavePath);
                HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
                Response.Clear();
                Response.Headers.Add("name", imageFile);
                Response.ContentType = "application/json; charset=utf-8";
                Response.StatusDescription = "File uploaded succesfully";
                Response.End();
            }
        }
    }
}
```

```

}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

File attachment in React Rich text editor component

The Rich Text Editor allows you to attach a file based on the file upload. You can attach your files using the file upload or drag-and-drop from your local path. When the file upload gets success, the attachment link inserts into the content.

In the below sample, configure the saveUrl and path properties to achieve file attachments.

1.saveUrl: Provides service URL to save the files. 2.path: Specifies the location to store the image.

The following sample illustrates how to attach a file in the Rich Text Editor.

[Class-component]

```

`html
import * as ReactDOM from 'react-dom';
import * as React from 'react';

import { RichTextEditorComponent, HtmlEditor, Inject, Toolbar, QuickToolbar, Image, Link,
NodeSelection, IHtmlFormatterModel } from '@syncfusion/ej2-react-richtexteditor';
import { SampleBase } from '../common/sample-base';

import { UploaderComponent } from '@syncfusion/ej2-react-inputs/src/uploader';

export class ImageSample extends SampleBase<{}, {}> {
    public rteObj: RichTextEditorComponent;
    public uploadObj: UploaderComponent;
    public selection: NodeSelection = new NodeSelection();

```

```

public range: Range;
public asyncSettings: object;
public insertImageSetting: object;
public saveSelection: NodeSelection;
customHTMLModel: IHtmlFormatterModel;
public dropElement;
constructor(props: {}) {
  this.asyncSettings = {
    saveUrl: '[SERVICEHOSTEDPATH]/api/uploadbox/Save'
  };
  this.insertImageSetting = {
    saveUrl: '[SERVICEHOSTEDPATH]/api/uploadbox/Save',
    path: '../Files/'
  };
  this.dropElement = '.e-richtexteditor'
}
public onUploadSuccess(args: any): void {
  (this.rteObj.contentModule.getEditPanel() as HTMLElement).focus();
  this.range = this.selection.getRange(document);
  this.saveSelection = this.selection.save(this.range, document);
  var fileUrl = document.URL + this.rteObj.insertImageSettings.path + args.file.name;
  if (this.rteObj.formatter.getUndoRedoStack().length === 0) {
    this.rteObj.formatter.saveData();
  }
  saveSelection.restore();
  this.rteObj.executeCommand('createLink', { url: fileUrl, text: fileUrl, selection: saveSelection });
  this.rteObj.formatter.saveData();
  this.rteObj.formatter.enableUndo(rteObj);
  this.uploadObj.clearAll();
}
render() {
  return (
    <div className='control-pane'>

```

```

<div className='control-section' id="rteTools">
  <div className='rte-control-section'>
    <RichTextEditorComponent id="defaultRTE" ref={{richtexteditor} => { this.rteObj = richtexteditor; }}
    insertImageSettings={this.insertImageSetting}>
    <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
  </RichTextEditorComponent>
  <UploaderComponent id='fileUpload' type='file' ref={{scope} => { this.uploadObj = scope }}
  asyncSettings={this.asyncSettings} dropArea={this.dropElement}
  success={this.onUploadSuccess.bind(this)}
</UploaderComponent>
</div>
</div>
</div>
);
}
}
`

```

[Functional-component]

```

`html
import * as ReactDOM from 'react-dom';
import * as React from 'react';

import { RichTextEditorComponent, HtmlEditor, Inject, Toolbar, QuickToolbar, Image, Link,
NodeSelection, IHtmlFormatterModel } from '@syncfusion/ej2-react-richtexteditor';
import { SampleBase } from '../common/sample-base';
import { UploaderComponent } from '@syncfusion/ej2-react-inputs/src/uploader';

function ImageSample(){
  let rteObj: RichTextEditorComponent;
  let uploadObj: UploaderComponent;
  let selection: NodeSelection = new NodeSelection();
  let range: Range;
  let asyncSettings: object;

};
insertImageSetting = {
  saveUrl: '[SERVICEHOSTEDPATH]/api/uploadbox/Save',
  path: '../Files/'
};
dropElement = '.e-richtexteditor'
function onUploadSuccess(args: any): void {
  (rteObj.contentModule.getEditPanel() as HTMLElement).focus();
  range = selection.getRange(document);
  saveSelection = selection.save(range, document);
  var fileUrl = document.URL + rteObj.insertImageSettings.path + args.file.name;
  if (rteObj.formatter.getUndoRedoStack().length === 0) {
    rteObj.formatter.saveData();
  }
  saveSelection.restore();
  rteObj.executeCommand('createLink', { url: fileUrl, text: fileUrl, selection: saveSelection });
  rteObj.formatter.saveData();
  rteObj.formatter.enableUndo(rteObj);
  uploadObj.clearAll();
}
return (
  <div className='control-pane'>
    <div className='control-section' id="rteTools">
      <div className='rte-control-section'>
        <RichTextEditorComponent id="defaultRTE" ref={{(richtexteditor) => { rteObj = richtexteditor; }}}
          insertImageSettings={insertImageSetting}>
          <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]} />
        </RichTextEditorComponent>
        <UploaderComponent id='fileUpload' type='file' ref={{(scope) => { uploadObj = scope }}}
          asyncSettings={asyncSettings} dropArea={dropElement} success={onUploadSuccess.bind(this)}

```

```
</UploaderComponent>
</div>
</div>
</div>
);
}
export default ImageSample;
`
```

To configure server-side handler, refer the below code.

```
` csharp
int x = 0;
string file;
[AcceptVerbs("Post")]
public void Save()
{
    try
    {
        var httpPostedFile = System.Web.HttpContext.Current.Request.Files["UploadFiles"];
        file = httpPostedFile.FileName;
        if (httpPostedFile != null)
        {
            Console.WriteLine(System.Web.HttpContext.Current.Server.MapPath("~/Files"));
            var fileSave = System.Web.HttpContext.Current.Server.MapPath("~/Files");
            if (!Directory.Exists(fileSave))
            {
                Directory.CreateDirectory(fileSave);
            }
            var fileName = Path.GetFileName(httpPostedFile.FileName);
            var fileSavePath = Path.Combine(fileSave, fileName);
            while (System.IO.File.Exists(fileSavePath))
            {
                file = "rte" + x + "-" + fileName;
                fileSavePath = Path.Combine(fileSave, file);
            }
        }
    }
}
```

```

x++;
}
if (!System.IO.File.Exists(fileSavePath))
{
    httpPostedFile.SaveAs(fileSavePath);
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.Headers.Add("name", file);
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusDescription = "File uploaded succesfully";
    Response.Headers.Add("url", fileSavePath);
    Response.End();
}
}
}
catch (Exception e)
{
    HttpResponseMessage Response = System.Web.HttpContext.Current.Response;
    Response.Clear();
    Response.ContentType = "application/json; charset=utf-8";
    Response.StatusCode = 204;
    Response.Status = "204 No Content";
    Response.StatusDescription = e.Message;
    Response.End();
}
}
,

```

[Format code block in React Rich text editor component](#)

You can configure code block formatting as a separate toolbar button by adding the **InsertCode** keyword within the [toolbarSettings](#) items property.

The InsertCode button has a toggle state to apply code block formatting to the editor and remove code block formatting from the editor.

The following sample demonstrates how to config the InsertCode button in toolbar and set the background color to “pre” tag for highlighting the code block.

[Class-component]**APP.JSX**

```
import { HtmlEditor, Inject, Link, Image, RichTextEditorComponent,
QuickToolbar, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component {
  tools = {
    items: ['InsertCode']
  };
  render() {
    return (<RichTextEditorComponent toolbarSettings={this.tools}>
      <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
      Users can format their content using standard toolbar commands.</p>
      <p><b>Key features:</b></p>
      <ul>
        <li>
          <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
        </li>
        <li>
          <p>Capable of handling markdown editing.</p>
        </li>
      </ul>
      <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}>
    </RichTextEditorComponent>);
  }
}
export default App;
```

APP.TSX

```
import { HtmlEditor, Inject, Link, Image, RichTextEditorComponent,
QuickToolbar, Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
class App extends React.Component<{}, {}> {
  private tools: object = {
    items: ['InsertCode']
  }
  public render() {
    return (
      <RichTextEditorComponent toolbarSettings={this.tools}>
        <p>The Rich Text Editor component is WYSIWYG ("what you see is what
you get") editor that provides the best user experience to create and update
the content.
        Users can format their content using standard toolbar commands.</p>
        <p><b>Key features:</b></p>
        <ul>
          <li>
            <p>Provides &#60;IFRAME&#62; and &#60;DIV&#62; modes</p>
          </li>
          <li>
            <p>Capable of handling markdown editing.</p>
          </li>
        </ul>
      </RichTextEditorComponent>);
  }
}
```

```

        <Inject services={[Toolbar, Image, Link, HtmlEditor, QuickToolbar]}
    />
    </RichTextEditorComponent>
  );
}
}
export default App;

```

[Functional-component]

APP.JSX

```

import { HtmlEditor, Inject, Link, RichTextEditorComponent, QuickToolbar,
Toolbar } from '@syncfusion/ej2-react-richtexteditor';
import * as React from 'react';
function App() {

```

        </li>
        <li>
            <p>Capable of handling markdown editing.</p>
        </li>
    </ul>
    <Inject services={[Toolbar, Link, HtmlEditor, QuickToolbar]}/>
</RichTextEditorComponent>);
}
export default App;

```

Schedule

Getting Started

Getting Started

This section briefly explains how to create [Link to the Video](#) component and configure its available functionalities in React environment, using Essential JS 2 [quickstart](#) seed repository.

To get start quickly with React Scheduler using the Create React App, you can check on this video:

Dependencies

The following list of dependencies are required to use the Scheduler component in your application.

```

`ts
|-- @syncfusion/ej2-react-schedule
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-schedule
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-split-buttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-dropdowns
`

```

Installation and configuration

Setup for local development

To set-up a React application, choose any of the following ways. The best and easiest way is to use the [create-react-app](#). It sets up your development environment in JavaScript and improve your application for production. Refer to the [installation instructions](#) of `create-react-app`.

```
`bash
```

```
npx create-react-app my-app
```

```
cd my-app
```

```
npm start
```

```
,
```

or

```
`bash
```

```
yarn create react-app my-app
```

```
cd my-app
```

```
yarn start
```

```
,
```

To set-up a React application in `TypeScript` environment, run the following command.

```
`bash
```

```
npx create-react-app my-app --template typescript
```

```
cd my-app
```

```
npm start
```

```
,
```

Besides using the [npm](#) package runner tool, also create an application from the `npm init`. To begin with the `npm init`, upgrade the `npm` version to `npm 6+`.

```
`bash
```

```
npm init react-app my-app
```

```
cd my-app
```

```
npm start
```

```
,
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](#) public registry.

To install Scheduler component, use the following command

```
,
```

```
npm install @syncfusion/ej2-react-schedule --save
```

```
,
```

Adding CSS reference

Add scheduler component's styles as given below in `src/App.css`.

```

`
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-schedule/styles/material.css";
`

```

To refer `App.css` in the application then import it in the `src/App.tsx` file.

In case, if you want to make use of the combined CSS files of entire components, then you can avail it from the root folder of Essential JS 2 package and reference it with the code shown below.

```

`css
@import '../..../node_modules/@syncfusion/ej2/material.css';
`

```

Module injection

Each view types available in scheduler are maintained as individual modules and to work with those views, it is necessary to inject the required modules. The following modules are available in scheduler namely,

- `Day` - Inject this module to work with the day view.
- `Week` - Inject this module to work with the week view.
- `WorkWeek` - Inject this module to work with the work week view.
- `Month` - Inject this module to work with the month view.
- `Agenda` - Inject this module to work with the agenda view.
- `MonthAgenda` - Inject this module for displaying month agenda view.
- `TimelineViews` - Inject this module to work with the timeline day, timeline week, timeline work week view.
- `TimelineMonth` - Inject this module to work with the timeline month view.

These modules should be injected into the schedule using the `Inject` method within the `app.tsx` file as shown below. On doing so, only the injected views will be loaded and displayed on the schedule.

[src/app/app.tsx]

`ts

```
<Inject services={[Day, Week, WorkWeek, Month, Agenda, MonthAgenda, TimelineViews, TimelineMonth]} />
```

,

Initialize the schedule

Import the Scheduler component to your `app.tsx` file using following code.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
const App = () => {
  return (<ScheduleComponent>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
const App = () => {
  return (
    <ScheduleComponent>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));
```

Now, run the application in the browser using the following command.

,

npm start

,

Above demo will display the empty scheduler.

Populating appointments

- To populate the empty Scheduler with appointments, bind the event data to it by assigning the `dataSource` property either with valid JSON data or else with remote URL, from where the data will be fetched.

Here, the local JSON data is assigned to Scheduler's dataSource.

[src/app/app.tsx]

```
`ts
import * as React from 'react';
import {
  ScheduleComponent } from '@syncfusion/ej2-react-schedule';
const App = () => {
  const data: object [] = [
    {
      Id: 1,
      Subject: 'Meeting - 1',
      StartTime: new Date(2018, 1, 15, 10, 0),
      EndTime: new Date(2018, 1, 16, 12, 30),
      IsAllDay: false
    },
  ];
  const eventSettings = { dataSource: data }
  return (
    <ScheduleComponent height='550px' selectedDate= {new Date(2018, 1, 15)}
    eventSettings={eventSettings}>
    </ScheduleComponent>
  );
}
export default App;`
```

You can also provide different names to these default fields, for which the custom names of those fields must be mapped appropriately within fields property as shown below.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
  const data = [
    {
      Id: 2,
      Subject: 'Meeting',
```

```

        StartTime: new Date(2018, 1, 15, 10, 0),
        EndTime: new Date(2018, 1, 15, 12, 30),
        IsAllDay: false,
        Status: 'Completed',
        Priority: 'High'
    },
];
const fieldsData = {
    id: 'Id',
    subject: { name: 'Subject' },
    isAllDay: { name: 'IsAllDay' },
    startTime: { name: 'StartTime' },
    endTime: { name: 'EndTime' }
}
const eventSettings = { dataSource: data, fields: fieldsData }
return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
</ScheduleComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject
} from '@syncfusion/ej2-react-schedule';
const App = () => {
    const data: object[] = [
        {
            Id: 2,
            Subject: 'Meeting',
            StartTime: new Date(2018, 1, 15, 10, 0),
            EndTime: new Date(2018, 1, 15, 12, 30),
            IsAllDay: false,
            Status: 'Completed',
            Priority: 'High'
        },
    ],
];
const fieldsData = {
    id: 'Id',
    subject: { name: 'Subject' },
    isAllDay: { name: 'IsAllDay' },
    startTime: { name: 'StartTime' },
    endTime: { name: 'EndTime' }
}
const eventSettings = { dataSource: data, fields: fieldsData }
return (
    <ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)}
eventSettings={eventSettings} >
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
);

```

```
}  
export default App;  
ReactDOM.render(<App />, document.getElementById("schedule"));
```

INDEX.HTML

```

  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-navigations/styles/material.css" rel="stylesheet" />  
  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-popups/styles/material.css" rel="stylesheet" />  
  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-schedule/styles/material.css" rel="stylesheet" />  
  <link href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css" rel="stylesheet" />  
  <script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>  
  <script src="systemjs.config.js"></script>  
  <style>  
    #loader {  
      color: #008cff;  
      height: 40px;  
      left: 45%;  
      position: absolute;  
      top: 45%;  
      width: 30%;  
    }  
  </style>  
</head>  
<body>  
  <div id='schedule'>  
    <div id='loader'>Loading....</div>  
  </div>  
</body>  
</html>
```

The other fields available in Scheduler can be referred from [here](#).

Setting date

Scheduler usually displays the system date as its current date. To change the current date of Scheduler with specific date, define the `selectedDate` property.

[src/app/app.tsx]

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { defaultData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: defaultData }
  return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { defaultData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: defaultData }
  return (
    <ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));
```

INDEX.HTML

schedule/styles/material.css" rel="stylesheet" />
<link
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
rel="stylesheet" />
<script
src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></scr
ipt>
<script src="systemjs.config.js"></script>
<style>
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
</style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Setting view

Scheduler displays **week** view by default. To change the current view, define the applicable view name to the **currentView** property. The applicable view names are,

- Day
- Week
- WorkWeek
- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek

- TimelineMonth
- TimelineYear

```
`ts
import * as React from 'react';
import {
  ScheduleComponent, Day, Week, WorkWeek, Agenda, Month, Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import './App.css';
const App = () => {
  return (
    <ScheduleComponent width='100%' height='550px' currentView='Month'
      selectedDate={new Date(2017, 11, 15)}>
      <ViewsDirective>
        <ViewDirective option='Day' />
        <ViewDirective option='Week' />
        <ViewDirective option='WorkWeek' />
        <ViewDirective option='Month' />
        <ViewDirective option='Agenda' />
      </ViewsDirective>
      <Inject services={[Day, Week, WorkWeek, Agenda, Month]} />
    </ScheduleComponent>
  )
};
export default App;
```

Individual view customization

Each individual Scheduler views can be customized with its own options such as setting different start and end hour on Week and Work Week views, whereas hiding the weekend days on Month view alone. This can be achieved by defining views property to accept the array of object type, where each object depicts the individual view customization.

The output will display the Scheduler with the specified view configuration.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```
import { ScheduleComponent, WorkWeek, Week, Month, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { defaultData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: defaultData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='WorkWeek' startHour='10:00' endHour='18:00' />
      <ViewDirective option='Week' startHour='07:00' endHour='15:00' />
      <ViewDirective option='Month' showWeekend={false} />
    </ViewsDirective>
    <Inject services={[WorkWeek, Week, Month]} />
  </ScheduleComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById("schedule"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, WorkWeek, Week, Month, Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { defaultData } from './datasource';

</html>

```

You can also explore our [React Scheduler example](#) that shows how to use the toolbar buttons to play with Scheduler functionalities.

Creating a Next.js Application Using Syncfusion React Components

This section provides a step-by-step guide for setting up a Next.js application and integrating the Syncfusion React Schedule component.

What is Next.js?

[Next.js](#) is a React framework that makes it easy to build fast, SEO-friendly, and user-friendly web applications. It provides features such as server-side rendering, automatic code splitting, routing, and API routes, making it an excellent choice for building modern web applications.

Prerequisites

Before getting started with the Next.js application, ensure the following prerequisites are met:

- [Node.js 16.8](#) or later.
- The application is compatible with macOS, Windows, and Linux operating systems.

Create a Next.js application

To create a new Next.js application, use one of the commands that are specific to either NPM or Yarn.

NPM

```
npx create-next-app@latest
```

YARN

```
yarn create next-app
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: Users can specify the name of the project directly. Let's specify the name of the project as `ej2-nextjs-schedule`.

CMD

```
√ What is your project named? » ej2-nextjs-schedule
```

2. Select the required packages.

CMD

```
√ What is your project named? ... ej2-nextjs-schedule
√ Would you like to use TypeScript? ... No / `Yes`
√ Would you like to use ESLint? ... No / `Yes`
√ Would you like to use Tailwind CSS? ... `No` / Yes
√ Would you like to use `src/` directory? ... No / `Yes`
√ Would you like to use App Router? (recommended) ... No / `Yes`
√ Would you like to customize the default import alias? ... `No` / Yes
Creating a new Next.js app in D:\ej2-nextjs-schedule.
```

3. Once complete the above mentioned steps to create `ej2-nextjs-schedule`, navigate to the directory using the below command:

CMD

```
cd ej2-nextjs-schedule
```

The application is ready to run with default settings. Now, let's add Syncfusion components to the project.

Install Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

Here, the [React Schedule component](#) is used in the project. To install the React Schedule component, use the following command:

NPM

```
npm install @syncfusion/ej2-react-schedule --save
```

YARN

```
yarn add @syncfusion/ej2-react-schedule
```

Import Syncfusion CSS styles

Syncfusion React components come with [built-in themes](#), which are available in the installed packages. It's easy to adapt the Syncfusion React components to match the style of your application by referring to one of the built-in themes.

Import the **Material** theme into the **src/app/globals.css** file and removed the existing styles in that file, as shown below:

GLOBALS.CSS

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-schedule/styles/material.css";
```

To know more about built-in themes and CSS reference for individual components, refer to the [themes](#) section.

Add Syncfusion React component

Follow the below steps to add the React Schedule component to the Next.js project:

1. Before adding the Schedule component to your markup, create a **datasource.tsx** file within the **src/app/** folder and add the Schedule component data.

DATASOURCE.TSX

```
export let timelineResourceData: Object[] = [
{
  Id: 61,
  Subject: 'Decoding',
  StartTime: new Date(2018, 3, 4, 9, 30),
  EndTime: new Date(2018, 3, 4, 10, 30),
  IsAllDay: false,
  ProjectId: 2,
  TaskId: 2
}, {
```

```
Id: 62,
Subject: 'Bug Automation',
StartTime: new Date(2018, 3, 4, 13, 30),
EndTime: new Date(2018, 3, 4, 16, 30),
IsAllDay: false,
ProjectId: 2,
TaskId: 1
}, {
Id: 63,
Subject: 'Functionality testing',
StartTime: new Date(2018, 3, 4, 9),
EndTime: new Date(2018, 3, 4, 10, 30),
IsAllDay: false,
ProjectId: 1,
TaskId: 1
}, {
Id: 64,
Subject: 'Resolution-based testing',
StartTime: new Date(2018, 3, 4, 12),
EndTime: new Date(2018, 3, 4, 13),
IsAllDay: false,
ProjectId: 1,
TaskId: 1
}, {
Id: 65,
Subject: 'Test report Validation',
StartTime: new Date(2018, 3, 4, 15),
EndTime: new Date(2018, 3, 4, 18),
IsAllDay: false,
ProjectId: 1,
TaskId: 1
}, {
Id: 66,
Subject: 'Test case correction',
StartTime: new Date(2018, 3, 4, 14),
EndTime: new Date(2018, 3, 4, 16),
IsAllDay: false,
ProjectId: 1,
TaskId: 2
}, {
Id: 67,
Subject: 'Bug fixing',
StartTime: new Date(2018, 3, 4, 14, 30),
EndTime: new Date(2018, 3, 4, 18, 30),
IsAllDay: false,
ProjectId: 2,
TaskId: 2
}, {
Id: 68,
Subject: 'Run test cases',
StartTime: new Date(2018, 3, 4, 17, 30),
EndTime: new Date(2018, 3, 4, 19, 30),
IsAllDay: false,
ProjectId: 1,
TaskId: 2
}, {
Id: 70,
```

```

Subject: 'Bug Automation',
StartTime: new Date(2018, 3, 4, 18, 30),
EndTime: new Date(2018, 3, 4, 20),
IsAllDay: false,
ProjectId: 2,
TaskId: 1
}
];

```

2. Then, import and define the Schedule component in the **src/app/page.tsx** file, as shown below:

PAGE.TSX

```

'use client'
import {
  Week, Month, Agenda, ScheduleComponent, ViewsDirective, ViewDirective,
  EventSettingsModel, ResourcesDirective, ResourceDirective, Inject, Resize,
  DragAndDrop
} from '@syncfusion/ej2-react-schedule';
import { timelineResourceData } from './datasource';
export default function Home() {
  const eventSettings: EventSettingsModel = { dataSource: timelineResourceData
  }
  const group = { byGroupID: false, resources: ['Projects', 'Categories'] }
  const projectData: Object[] = [
    { text: 'PROJECT 1', id: 1, color: '#cb6bb2' },
    { text: 'PROJECT 2', id: 2, color: '#56ca85' },
    { text: 'PROJECT 3', id: 3, color: '#df5286' },
  ];
  const categoryData: Object[] = [
    { text: 'Development', id: 1, color: '#1aaa55' },
    { text: 'Testing', id: 2, color: '#7fa900' }
  ];
  return (
    <>
    <h2>Syncfusion React Schedule Component</h2>
    <ScheduleComponent width='100%' height='550px' currentView='Month'
    selectedDate={new Date(2018, 3, 4)} eventSettings={eventSettings}
    group={group} >
    <ViewsDirective>
    <ViewDirective option='Week' />
    <ViewDirective option='Month' />
    <ViewDirective option='Agenda' />
    </ViewsDirective>
    <ResourcesDirective>
    <ResourceDirective field='ProjectId' title='Choose Project' name='Projects'
    allowMultiple={false}
    dataSource={projectData} textField='text' idField='id' colorField='color'>
    </ResourceDirective>
    <ResourceDirective field='TaskId' title='Category' name='Categories'
    allowMultiple={true}
    dataSource={categoryData} textField='text' idField='id' colorField='color'>
    </ResourceDirective>
    </ResourcesDirective>
    <Inject services={[Week, Month, Agenda, Resize, DragAndDrop]} />
    </ScheduleComponent>
  )
}

```

```
</>
)
}
```

Run the application

To run the application, use the following command:

NPM

```
npm run dev
```

YARN

```
yarn run dev
```

To learn more about the functionality of the Schedule component, refer to the [documentation](#).

[View the NEXT.js Schedule sample in the GitHub repository.](#)

Getting Started with the React Schedule Component in the Preact Framework

This article provides a step-by-step guide for setting up a [Preact](#) project and integrating the Syncfusion React Schedule component.

Preact is a fast and lightweight JavaScript library for building user interfaces. It's often used as an alternative to larger frameworks like React. The key difference is that Preact is designed to be smaller in size and faster in performance, making it a good choice for projects where file size and load times are critical factors.

Prerequisites

[System requirements for Syncfusion React UI components](#)

Set up the Preact project

To create a new **Preact** project, use one of the commands that are specific to either NPM or Yarn.

```
`bash
```

```
npm init preact
```

```
`
```

or

```
`bash
```

```
yarn init preact
```

```
`
```

Using one of the above commands will lead you to set up additional configurations for the project, as below:

1\ Define the project name: We can specify the name of the project directly. Let's specify the name of the project as **my-project** for this article.

```
`bash
```

T Preact - Fast 3kB alternative to React with the same modern API

```
|
```

- Project directory:

```
| my-project
```

```
—
```

```
`
```

2\ Choose JavaScript as the framework variant to build this Preact project using JavaScript and React.

```
`bash
```

T Preact - Fast 3kB alternative to React with the same modern API

```
|
```

- Project language:

```
| > JavaScript
```

```
| TypeScript
```

```
—
```

```
`
```

3\ Then configure the project as below for this article.

```
`bash
```

T Preact - Fast 3kB alternative to React with the same modern API

```
|
```

- Use router?

```
| Yes / > No
```

```
—
```

```
|
```

- Prerender app (SSG)?

```
| Yes / > No
```

```
—
```

```
|
```

- Use ESLint?

```
| Yes / > No
```

```
—
```

5\ Upon completing the aforementioned steps to create `my-project`, run the following command to jump into the project directory:

```
`bash
cd my-project
`
```

Now that `my-project` is ready to run with default settings, let's add Syncfusion components to the project.

Add the Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

This article uses the [React Schedule component](#) as an example. To use the React Schedule component in the project, the `@syncfusion/ej2-react-schedule` package needs to be installed using the following command:

```
`bash
npm install @syncfusion/ej2-react-schedule --save
`
```

or

```
`bash
yarn add @syncfusion/ej2-react-schedule
`
```

Import Syncfusion CSS styles

You can import themes for the Syncfusion React component in various ways, such as using CSS or SASS styles from npm packages, CDN, CRG and [Theme Studio](#). Refer to [themes topic](#) to know more about built-in themes and different ways to refer to theme's in a React project.

In this article, the `Material 3` theme is applied using CSS styles, which are available in installed packages. The necessary `Material 3` CSS styles for the Schedule component and its dependents were imported into the `src/style.css` file.

~/SRC/STYLE.CSS

```
@import "../node_modules/@syncfusion/ej2-base/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material3.css";
@import "../node_modules/@syncfusion/ej2-react-
schedule/styles/material3.css";
```

The order of importing CSS styles should be in line with its dependency graph.

Add the Syncfusion React component

Follow the below steps to add the React Schedule component to the Vite project:

1\ Before adding the Schedule component to your markup, import the Schedule component in the **src/index.jsx** file.

~/SRC/INDEX.JSX

```
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
```

2\ Then, define the Schedule component in the **src/index.jsx** file, as shown below:

~/SRC/INDEX.JSX

```
import { render } from 'preact';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import './style.css';
export function App() {
  return (
    <ScheduleComponent>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  );
}
render(<App />, document.getElementById('app'));
```

Run the project

To run the project, use the following command:

``bash`

`npm run dev`

`,`

or

``bash`

`yarn run dev`

`,`

The output will appear as follows:

Module injection in React Schedule component

The crucial step on creating a Scheduler with required views, is to import and inject the required modules. The modules that are available on Scheduler to work with its related functionalities are as follows.

- **Day** - Inject this module to work with day view.
- **Week** - Inject this module to work with week view.
- **WorkWeek** - Inject this module to work with work week view.
- **Month** - Inject this module to work with month view.
- **Year** - Inject this module to work with year view.
- **Agenda** - Inject this module to work with agenda view.
- **MonthAgenda** - Inject this module to work with month agenda view.
- **TimelineViews** - Inject this module to work with timeline day, timeline week, and timeline work week views.
- **TimelineMonth** - Inject this module to work with timeline month view.
- **TimelineYear** - Inject this module to work with timeline year view.
- **DragAndDrop** - Inject this module to allow drag and drop of appointments on Scheduler.
- **Resize** - Inject this module for enabling the resize functionality of appointments on Scheduler.

Module injection

The required modules should be injected into the Scheduler using the **Inject** method of Schedule within the **app.ts** file as shown below. On doing so, only the injected module functionalities will be loaded and can be worked with Scheduler.

[src/app.tsx]

```
`ts
```

```
<Inject services={[Day, Week, WorkWeek, Month, Agenda, MonthAgenda ]} />
```

Note: If a Scheduler `currentView` is set to any one of the available views without injecting that respective view module, then a script error will occur and the Scheduler will not render.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Scheduler interactions in React Schedule component

The following table describes the Scheduler actions and also illustrates how those actions are carried out through mouse and touch interactions on Scheduler.

Actions	Mouse interaction	Touch interaction
-----	-----	-----
Single click or tap on cells	Single click on a cell to select a cell.	Single tapping on cells, will display a + icon on the cell. Tapping on it again will open the new event editor window.
Multiple cell selection	Single click on a cell and drag the selection to other cells to enable multiple cell selection.	No multiple cell selection is allowed using touch gestures.
Event selection	Single click on an event to select it.	Tap holding on events, select an event and opens a small popup at the top holding the options to edit or delete. The popup also displays the selected event's subject.
Multiple event selection and deletion	Pressing <code>Ctrl</code> key and altogether single clicking on multiple events one after the other will enable multiple event selection. Pressing <code>Delete</code> key after event selection will delete all the selected events.	Tap hold an event to select it, which opens a small popup at the top holding the options to edit or delete. As a continuation of this action, keep on single tapping on other events, to enable multiple event selection. Also, the popup displayed at the top remains in opened state, showing the count of the number of selected events. Pressing <code>Delete</code> option from the popup will delete all the selected events.
Date navigation	Clicking on the previous or next date navigation icons in the header bar allows you to navigate between dates.	Swiping the scheduler view port to the left or right will allow you to navigate between the dates on touch devices. You can prevent the swiping action by disabling <code>allowSwiping</code> property. NOTE: Swiping does not work when horizontal scroller present in the Scheduler. You can also make use of the previous and next navigation icons at the header bar to navigate.
View navigation	Click on an event and try moving it over the Scheduler to enable drag and drop action.	The view options are available within the popup options at the top right extreme end of the header bar and you can choose the view from it.
Drag and drop	Click on an event and try moving it over the Scheduler to enable drag and drop action.	Tap hold the event and try moving it over the Scheduler to enable drag and drop action.
Event resizing	Hover the mouse across the extremities or edges of the Scheduler events and when the mouse pointer changes into resize handler, now click and start resizing an event to the desired time range.	Touch the event extremities and start resizing the events directly.
Tooltip	Hover the mouse pointer over the events or resource header and the tooltip will be displayed.	Tap holding the events will open the tooltip on events.

| Open editor window | Double click on cells or events to open the editor window. | Double click on cells or events to open the editor window. Single tap on cells, which displays a + icon on the cell. Now, tap on it again to open the new event editor window. To open the editor on events, single tap on it and then click on the edit icon to open the editor window in **Edit** mode. |

| Open quick info popup | Single clicking on a cell will open a quick popup prompting for new event creation. Single clicking on an event will open a popup displaying event information along with the option to edit and delete it. | No quick info popup is available while single tapping on cells. Single tapping on events, opens the popup showing event information. |

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler exampleLink to the Video](#) to know how to present and manipulate data.

Appointments in React Schedule component

Appointments can be anything that are scheduled for a specific time period. It can be created on varied time range and each appointments are categorized based on this range. The Scheduler events can be categorized as,

- Normal events
- Spanned events
- All-day events
- Recurring events

To have a quick glance on how to add appointments to the React Scheduler and some of its advanced event-handling options, watch this video:

Normal events

Represents an appointment that is created for any specific time interval within a day.

Creating a normal event

The following example depicts how to define a event on the Scheduler, with event data being loaded from simple data.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
  const data = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2023, 1, 15, 10, 0),
    EndTime: new Date(2023, 1, 15, 12, 30),
  }];
  const eventSettings = { dataSource: data }
  return <ScheduleComponent height='550px' selectedDate={new Date(2023, 1,
15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>;
}
```

```
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
  EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
const App = () => {
  const data: object[] = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2023, 1, 15, 10, 0),
    EndTime: new Date(2023, 1, 15, 12, 30),
  }];
  const eventSettings: EventSettingsModel = { dataSource: data }
  return <ScheduleComponent height='550px' selectedDate={new Date(2023, 1,
15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

ipt>
<link href="index.css" rel="stylesheet" />
<script src="systemjs.config.js"></script>
<style>
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-past-app {
        background-color: chocolate !important;
    }
    .custom-class.e-schedule .e-vertical-view .e-all-day-appointment-
wrapper .e-appointment,
    .custom-class.e-schedule .e-vertical-view .e-day-wrapper .e-
appointment,
    .custom-class.e-schedule .e-month-view .e-appointment {
        background: green;
    }
</style>
</head>
<body>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Spanned events

Represents an appointment that is created for more than 24 hours, and usually displayed on the all-day row. Also, represents another type of appointment that is created for more than one day but less than 24 hours, and usually displayed appropriately on both the days.

For example, if an appointment is created for two days say from November 25, 2018 – 11.00 PM to November 26, 2018 2.00 AM but less than 24 hours time interval, then the appointment is split into two partitions and will be displayed on both the days.

All-day events

Represents an appointment that is created for an entire day such as holiday events. It is usually displayed separately in an all-day row, a separate row for all-day appointments below the date header section. In Timeline views, the all-day appointments displays in the working space area, and no separate all-day row is present in that view.

To change normal appointment into all-day event, set `isAllDay` field to true.

Hide all-day row events

You can make use of the CSS customization to prevent the display of all-day row appointments on the Scheduler UI.

`ts

```

<style>
.e-schedule .e-date-header-wrap .e-schedule-table thead {
display: none;
}
</style>
`

```

Expand all day appointments view on initial load

When you have larger number of appointments in all-day view, you can show all all-day events using **dataBound** event on at initial load. So, user don't have to click the toggle to expand all-day events.

INDEX.JSX

```

import { useRef, useEffect } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
Resize, DragAndDrop } from '@syncfusion/ej2-react-schedule';

            background: green;
        }
    </style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Customize the rendering of the spanned events

By default, Scheduler will renders the spanned events (appointment with more than 24 hours duration) in the all-day row by setting `AllDayRow` will the default type renders to the `spannedEventPlacement` option within the `eventSettings` property. Now we can customize rendering of the that events inside the work cells itself by modifying the `spannedEventPlacement` option as `TimeSlot`. In this following example, shows how to render the spanned appointments inside the work cells as follows.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
    const data = [{
        Id: 1,
        Subject: 'Paris',
        StartTime: new Date(2018, 1, 15, 10, 0),
        EndTime: new Date(2018, 1, 17, 12, 30),
        IsAllDay: false
    }, {
        Id: 2,
        Subject: 'London',
        StartTime: new Date(2018, 1, 16, 12, 0),

```

Recurring events

Represents an appointment that is created for a certain time interval and occurring repeatedly on a daily, weekly, monthly or yearly basis at the same time interval based on the provided recurrence rule. Usually, the recurring events are indicated by a repeat marker added at the bottom-right position.

Creating a recurring event

The following example depicts how to create a recurring event on Scheduler with the specific recurrence rule. In the following example, an event is made to repeat on daily mode and ends after 5 occurrences.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
    const data = [{
        Id: 2,
        Subject: 'Paris',
        StartTime: new Date(2018, 1, 15, 10, 0),

```

```

        EndTime: new Date(2018, 1, 15, 12, 30),
        IsAllDay: false,
        RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=5',
    }];
    const eventSettings = { dataSource: data };
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
    EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
const App = () => {
    const data: object[] = [{
        Id: 2,
        Subject: 'Paris',
        StartTime: new Date(2018, 1, 15, 10, 0),
        EndTime: new Date(2018, 1, 15, 12, 30),
        IsAllDay: false,

</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Adding exceptions

A few instance of the recurrence series can be excluded on specific dates, by adding those exceptional dates to the `recurrenceException` field. These date values should be given in the ISO date time format with no hyphens(-) separating the date elements.

For example, 22nd February 2018 can be represented as 20180222. Also, the time part being represented in UTC format needs to add "Z" after the time portion with no space. "07:30:00 UTC" is therefore represented as "073000Z".

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
  const data = [{
    Id: 1,
    Subject: 'Paris',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException: '20180129T043000Z,20180131T043000Z,20180202T043000Z'
  }];
  const eventSettings = { dataSource: data };
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 0,
28)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>;
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

Editing an occurrence from a series

To dynamically edit a particular occurrence from an event series and display it on the initial load of Scheduler, the edited occurrence needs to be added as a new event to the dataSource collection, with an additional `recurrenceID` field defined to it. The `recurrenceID` field of edited occurrence usually maps the ID value of the parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 is edited with different timings. Therefore, this particular date is excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by adding the `recurrenceException` field with the excluded date value on the parent event. Also, the edited occurrence event which is created as a new event should carry the `recurrenceID` field pointing to the parent event's `Id` value.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
  const data = [{
    Id: 1,
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 28, 10, 0),
    EndTime: new Date(2018, 0, 28, 12, 30),
    IsAllDay: false,
    RecurrenceRule: 'FREQ=DAILY;INTERVAL=1;COUNT=8',
    RecurrenceException: '20180130T043000Z'
  },
  {
    Id: 2,
    Subject: 'Scrum Meeting',
    StartTime: new Date(2018, 0, 30, 9, 0),
    EndTime: new Date(2018, 0, 30, 10, 30),
    Description: "Meeting time changed based on team activities.",
    RecurrenceID: 1
  }
  ];
  const eventSettings = { dataSource: data };
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 0,
28)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

</body>
</html>

```

Edit only the current and following events

To edit only the current and following events enable the property `editFollowingEvents` within `eventSettings` property. The edited occurrence needs to be added as a new event to the `dataSource` collection, with an additional `followingID` field defined to it. The `followingID` field of edited occurrence usually maps the ID value of the immediate parent event.

In this example, a recurring instance that displays on the date 30th Jan 2018 and its following dates are edited with different subject. Therefore, this particular date and its following dates are excluded from the parent recurring event that repeats from 28th January 2018 to 4th February 2018. This can be done by updating the `recurrenceRule` field with the until date value on the parent event. Also, the edited events which is created as a new event should carry the `followingID` field pointing to the immediate parent event's `Id` value.

Recurrence options and rules

Events can be repeated on a daily, weekly, monthly or yearly basis based on the recurrence rule which accepts the string value. The following details should be assigned to the `recurrenceRule` property to generate the recurring instances.

- Repeat type - daily/weekly/monthly/yearly.
- How many times it needs to be repeated?
- The interval duration.
- The time period to render the appointment, etc.

There are four repeat types available namely,

- **Daily** - Creates the recurring instances on daily basis.
- **Weekly** - Creates the recurring instances on weekly basis for the selected days.
- **Monthly** - Creates the recurring instances on monthly basis for the selected months and other provided recurrence criteria.
- **Yearly** - Creates the recurring instances on yearly basis.

Recurrence properties

The properties based on which the recurrence appointments are created with its respective time period are depicted in the following table. Also, the valid rule string can be referred from [iCalendar](#) specifications.

Refer [iCalendar](#) specifications for valid recurrence rule string.

Property	Purpose	Example
FREQ	Maintains the repeat type (Daily, Weekly, Monthly, Yearly) value of the appointment.	FREQ=DAILY;INTERVAL=1
INTERVAL	Maintains the interval value of the appointments. When you create the daily appointment at an interval of 2, the appointments are rendered on the days Monday, Wednesday and Friday (Creates an appointment on all days by leaving the interval of one day gap).	FREQ=DAILY;INTERVAL=2

| COUNT | It holds the appointment's count value. When the COUNT value is 10, then 10 instances of appointments are created in the recurrence series. | FREQ=DAILY;INTERVAL=1;COUNT=10|

| UNTIL | This property holds the end date value (in ISO format) denoting when the recurrence actually ends. | FREQ=DAILY;INTERVAL=1;UNTIL=20180530T041343Z;|

| BYDAY | It holds the day value(s), representing on which the appointments actually renders. Create the weekly appointment, and select the day(s) from the day options (Monday/Tuesday/Wednesday/Thursday/Friday/Saturday/Sunday). When Monday is selected, the first two letters of the selected day "MO" is saved in the BYDAY property. When multiple days are selected, the values are separated by commas. | FREQ=WEEKLY;INTERVAL=1;BYDAY=MO,WE;COUNT=10|

| BYMONTHDAY | This property is used to store the date value of the Month, while creating the Month recurrence appointment. When you create a Monthly recurrence appointment for every 3rd day of the month, then BYMONTHDAY holds the value 3 and creates the appointment on 3rd day of every month. | FREQ=MONTHLY;BYMONTHDAY=3;INTERVAL=1;COUNT=10|

| BYMONTH | This property is used to store the index value of the selected Month while creating the yearly appointments. When you create the yearly appointment on June month, the index value of June month 6 will get stored in the BYMONTH field. The appointment is created on every 6th month of a year. | FREQ=YEARLY;BYMONTHDAY=16;BYMONTH=6;INTERVAL=1;COUNT=10|

| BYSETPOS | This property is used to store the index value of the week. When you create the monthly appointment in second week of a month, the index value of the second week (2) is stored in BYSETPOS. | FREQ=MONTHLY;BYDAY=MO;BYSETPOS=2;COUNT=10|

The default recurrence related validation has been included for recurrence appointments similar to the one available in Outlook. The validation usually occurs during the recurrence appointment creation, editing, drag and drop or resizing of the recurrence appointments and also if any single occurrence changes.

Daily Frequency

| Description | Example |

|-----|-----|

| Daily recurring event that never ends | FREQ=DAILY; INTERVAL=1 |

| Daily recurring event that ends after 5 occurrences | FREQ=DAILY; INTERVAL=1; COUNT=5 |

| Daily recurring event that ends exactly on 12/12/2018 | FREQ=DAILY; INTERVAL=1; UNTIL=20181212T041343Z |

| Daily event that recurs on alternative days and repeats for 10 occurrences | FREQ=DAILY; INTERVAL=2; COUNT=10 |

| Daily recurring appointment ends on 12/12/2018 by excluding single occurrence on 12/10/2018 | FREQ=DAILY; INTERVAL=2; UNTIL=20181212T041343Z; |

Weekly Frequency

| Description | Example |

|-----|-----|

| Weekly recurring event that repeats on every Monday, Wednesday and Friday and never ends | FREQ=WEEKLY; INTERVAL=1; BYDAY=MO,WE,FR |

| Repeats every week Thursday and ends after 10 occurrences | FREQ=WEEKLY; INTERVAL=1; BYDAY=TH; COUNT=10 |

| Repeats every week Monday and ends on 12/12/2018 | FREQ=WEEKLY; INTERVAL=1; BYDAY=MO; UNTIL=20181212T041343Z |

| Repeats on Monday, Wednesday and Friday of alternative weeks and ends after 10 occurrences | FREQ=WEEKLY; INTERVAL=2; BYDAY=MO, WE, FR; COUNT=10 |

| Repeats every week on weekdays and ends after 12/12/2018 by excluding single occurrence on 12/10/2018 | FREQ=WEEKLY; BYDAY=MO, TU, WE, TH, FR; UNTIL=20181212T041343Z; |

Monthly Frequency

| Description | Example |

|-----|-----|

| Monthly recurring event that repeats on every 15th day of a month and never ends | FREQ=MONTHLY; BYMONTHDAY=15; INTERVAL=1 |

| Monthly recurring event that repeats on every 16th day of a month and ends after 10 occurrences | FREQ=MONTHLY; BYMONTHDAY=16; INTERVAL=1; COUNT=10 |

| Repeats every 17th day of a month and ends on 12/12/2018 | FREQ=MONTHLY; BYMONTHDAY=17; INTERVAL=1; UNTIL=20181212T041343Z |

| Repeats every 2nd Friday of a month and never ends | FREQ=MONTHLY; BYDAY=FR; BYSETPOS=2; INTERVAL=1 |

| Repeats every 4th Wednesday of a month and ends after 10 occurrences | FREQ=MONTHLY; BYDAY=WE; BYSETPOS=4; INTERVAL=1; COUNT=10 |

| Repeats every 4th Friday of a month and ends on 12/12/2018 | FREQ=MONTHLY; BYDAY=FR; BYSETPOS=4; INTERVAL=1; UNTIL=20181212T041343Z |

Yearly Frequency

| Description | Example |

|-----|-----|

| Yearly event that repeats on every 15th day of December month and never ends | FREQ=YEARLY; BYMONTHDAY=15; BYMONTH=12; INTERVAL=1 |

| Event that repeats on every 10th day of December month and ends after 10 occurrences | FREQ=YEARLY; BYMONTHDAY=10; BYMONTH=12; INTERVAL=1; COUNT=10 |

| Repeats on every 12th day of December month and ends on 12/12/2025 | FREQ=YEARLY; BYMONTHDAY=12; BYMONTH=12; INTERVAL=1; UNTIL=20251212T041343Z |

| Repeats on every 3rd Friday of December month and never ends | FREQ=YEARLY; BYDAY=FR; BYMONTH=12; BYSETPOS=3; INTERVAL=1 |

| Repeats on every 3rd Tuesday of December month and ends after 10 occurrences | FREQ=YEARLY; BYDAY=TU; BYMONTH=12; BYSETPOS=3; INTERVAL=1; COUNT=10 |

| Repeats on every 4th Wednesday of December month and ends on 12/12/2028 | FREQ=YEARLY; BYDAY=WE; BYMONTH=12; BYSETPOS=4; INTERVAL=1; UNTIL=20181212T041343Z |

Recurrence Validation

The built-in validation support has been added by default for recurring appointments during its creation, edit, drag and drop or resize action. The following are the possible validation alerts that displays on Scheduler while creating or editing the recurring events.

Validation messages	Description
---------------------	-------------

----- -----	
-------------	--

The recurrence pattern is not valid. This alert will raise, when the selected recurrence rule value is not a valid one. For example, when you try to select the end date value (using Until option) for a recurring event, which occurs before the start date, an alert will popup out saying that the chosen pattern is invalid.
--

The changes made to specific instances of this series will be cancelled and those events will match the series again. This alert will raise, when you try to edit the whole series, whose occurrence might have been already edited. For example, If there are five occurrences and one of the occurrence is already edited. Now, when you try to edit the entire series, you will get this validation alert.

The duration of the event must be shorter than how frequently it occurs. Shorten the duration, or change the recurrence pattern in the recurrence event editor. This validation will occur, if the event duration is longer than the selected frequency. For example, if you create a recurring appointment with two days duration in Daily frequency with no intervals set to it, you may get this alert.

Some months have fewer than the selected date. For these months, the occurrence will fall on the last date of the month. When you try to create a recurring appointment on 31st of every month, where few months won't have 31 days and in this scenario, you will get this alert.
--

Two occurrences of the same event cannot occur on the same day. This validation will occur, when you try to edit or move any single occurrence to some other date, where another occurrence of the same event is already present.

Event fields

The Scheduler dataSource usually holds the event instances, where each of the instance includes a collection of appropriate [fields](#). It is mandatory to map these fields with the equivalent fields of database, when remote data is bound to it. When the local JSON data is bound, then the field names defined within the instances needs to be mapped with the scheduler event fields correctly.

To create an event on Scheduler, it is enough to define the **startTime** and **endTime**. Also **id** field becomes mandatory to process CRUD actions on appropriate events.

Built-in fields

The built-in fields available on Scheduler event object are as follows.

Field name	Description
------------	-------------

----- -----	
-------------	--

id The id field needs to be defined as mandatory and this field usually assigns a unique ID value to each of the events.

subject The subject field is optional, and usually assigns the summary text to each of the events.

startTime The startTime field defines the start time of an event and it is mandatory to provide it for any of the valid event objects.

| **endTime** | The **endTime** field defines the end time of an event and it is mandatory to provide the end time for any of the valid event objects. |

| **startTimezone** | It maps the **startTimezone** field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the **startTime** field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler. |

| **endTimezone** | It maps the **endTimezone** field from the dataSource and usually accepts the valid IANA timezone names. It is assumed that the value provided for this field is taken into consideration while processing the **endTime** field. When this field is not mapped with any timezone names, then the events will be processed based on the timezone assigned to the Scheduler. |

| **location** | It maps the **location** field from the dataSource and the location text value will be displayed over the events. |

| **description** | It maps the **description** field from the dataSource and denotes the event description which is optional. |

| **isAllDay** | The **isAllDay** field is mapped from the dataSource and is used to denote whether an event is created for an entire day or for specific time alone. Usually, an event with **isAllDay** field set to true will be considered as an all-day event. |

| **recurrenceID** | It maps the **recurrenceID** field from dataSource and usually holds the ID value of the parent recurrence event. This field is applicable only for the edited occurrence events. |

| **recurrenceRule** | It maps the **recurrenceRule** field from dataSource and holds the recurrence rule value in a string format. Also, it uniquely identifies whether the event belongs to a recurring type or normal ones. |

| **recurrenceException** | It maps the **recurrenceException** field from dataSource and is used to hold the collection of exception dates, on which the recurring occurrences needs to be excluded. The **recurrenceException** should be specified in UTC format. |

| **isReadOnly** | It maps the **isReadOnly** field from dataSource. It is mainly used to make specific appointments as readonly when set to **true**. |

| **isBlock** | It maps the **isBlock** field from dataSource. It is used to block the particular time ranges in the Scheduler and prevents the event creation on those time slots. |

Binding different field names

When the fields of event instances has the default mapping name, it is not mandatory to map them manually. If a Scheduler's dataSource holds the events collection with different field names, then it is necessary to map them with its equivalent field name within the **eventSettings** property.

    </div>
</body>
</html>

```

The mapper field `id` is of string type and has no additional validation options, whereas all other fields are of `Object` type and has additional options.

Event field settings

Each field of the Scheduler events are provided with additional settings such as options to set default value, to map with appropriate data source fields, to validate every event fields and to provide label values for those fields in the event window.

Options	Description
default	Accepts the default value to the applicable fields (Subject, Location and Description), when no values are provided to them from dataSource.
name	Accepts the field name to be mapped from the dataSource fields.
title	Accepts the label values to be displayed for the fields of event editor.
validation	Defines the validation rules to be applied on the event fields within the event editor.

In following example, the Subject field in event editor will display its appropriate label as **Summary**. When no subject value is provided while saving an event, then the appointment will be saved with the default subject value as **Add Summary**.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';

</head>

```

```
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>
```

Adding Custom fields

Apart from the default Scheduler fields, the user can include 'n' number of custom fields for appointments. The following code example shows how to include two custom fields namely **Status** and **Priority** within event collection. It is not necessary to bind the custom fields within the `eventSettings`. However, those additional fields can be accessed easily, for internal processing as well as from application end.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
const App = () => {
  const data = [{
    Id: 2,
    Subject: 'Meeting',
    StartTime: new Date(2018, 1, 15, 10, 0),
    EndTime: new Date(2018, 1, 15, 12, 30),
    IsAllDay: false,
    Status: 'Completed',
    Priority: 'High'
  }];
  const fieldsData = {
    id: 'Id',
    subject: { name: 'Subject' },
    isAllDay: { name: 'IsAllDay' },
    startTime: { name: 'StartTime' },
    endTime: { name: 'EndTime' }
  }
  const eventSettings = { dataSource: data, fields: fieldsData }
  return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {

```

Customize the order of the overlapping events

By default, the scheduler will render the overlapping events based on the start and end time. Now we can customize the order of the overlapping events based on the custom fields by using the `sortComparer` property grouped under the `eventSettings` property. The following code example shows how to sort the appointments based on the custom field as follows.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject
} from '@syncfusion/ej2-react-schedule';
const App = () => {
    const comparerFun = (args) => {
        args.sort((event1, event2) => event1.RankId.localeCompare(event2.RankId,
            undefined, { numeric: true }));
        return args;
    }
    const data = [{
        Id: 1,
        Subject: 'Rank 1',
    },
    {
        Id: 2,
        Subject: 'Rank 2',
    },
    {
        Id: 3,
        Subject: 'Rank 3',
    },
    {
        Id: 4,
        Subject: 'Rank 4',
    },
    {
        Id: 5,
        Subject: 'Rank 5',
    },
    {

    </div>
</body>
</html>

```

Drag and drop appointments

Appointments can be rescheduled to any time by dragging and dropping them onto the desired location. To work with drag and drop functionality, it is necessary to inject the module **DragAndDrop** and make sure that [Link to the Video](#) is set to true on Scheduler. In mobile mode, you can drag and drop the events by tap holding an event and dropping them on to the desired location.

Learn the advanced options of Drag and Resize actions for React Scheduler from this video:

By default, drag and drop action is applicable on all Scheduler views, except Agenda, Month-Agenda and Year view.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, TimelineViews, TimelineMonth, Month,
Agenda, DragAndDrop, ViewsDirective, ViewDirective, Inject } from
'@syncfusion/ej2-react-schedule';

```

```
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='TimelineDay' />
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='TimelineMonth' />
      <ViewDirective option='Month' />
      <ViewDirective option='Agenda' />
    </ViewsDirective>
    <Inject services={[Day, Week, TimelineViews, TimelineMonth, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';

</body>
</html>

```

Drag and drop multiple appointments

We can drag and drop multiple appointments by enabling the `allowMultiDrag` property. We can select multiple appointments by holding the CTRL key. Once the events are selected, we can leave the CTRL key and start dragging the event.

We can also drag multiple events from one resource to another resource. In this case, if all the selected events are in the different resources, then all the events should be moved to the single resource that is related to the target event.

Note: Multiple events drag and drop is not supported on mobile devices.

INDEX.JSX

Disable the drag action

By default, you can drag and drop the events within any of the applicable scheduler views, and to disable it, set `false` to the `allowDragAndDrop` property.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData }
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} allowDragAndDrop={false} eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
    </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

```

Preventing drag and drop on specific targets

It is possible to prevent the drag action on particular target, by passing the target to be excluded in the `excludeSelectors` option within `dragStart` event. In the following example, we have prevented the drag action on all-day row.

INDEX.JSX

```
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onDragStart = (args) => {
    args.excludeSelectors = 'e-header-cells,e-header-day,e-header-date,e-all-
day-cells';
  }
  const eventSettings = { dataSource: scheduleData };
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} dragStart={onDragStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop, Inject,
  DragEventArgs, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onDragStart = (args: DragEventArgs): void => {
    args.excludeSelectors = 'e-header-cells,e-header-day,e-header-date,e-all-
day-cells';
  }
  const eventSettings: EventSettingsModel = { dataSource: scheduleData };
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} dragStart={onDragStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.HTML

```

```

Disable scrolling on drag action

By default, while dragging an appointment to the edges, either top or bottom of the Scheduler, scrolling action takes place automatically. To prevent this scrolling, set `false` to the `scroll` value within the `dragStart` event arguments.

INDEX.JSX

```
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onDragStart = (args) => {
    args.scroll = { enable: false };
  }
  const eventSettings = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} dragStart={onDragStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop, Inject,
  DragEventArgs, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onDragStart = (args: DragEventArgs): void => {
    args.scroll = { enable: false };
  }
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} dragStart={onDragStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Controlling scroll speed while dragging an event

The speed of the scrolling action while dragging an appointment to the Scheduler edges, can be controlled within the `dragStart` event by setting the desired value to the `scrollBy` and `timeDelay` option whereas its default value is 30 minutes and 100ms.

INDEX.JSX

```

Auto navigation of date ranges on dragging an event

When an event is dragged either to the left or right extreme edges of the Scheduler and kept hold for few seconds without dropping, the auto navigation of date ranges will be enabled allowing the Scheduler to navigate from current date range to back and forth respectively. This action is set to `false` by default and to enable it, you need to set `navigation` to true within the `dragStart` event.

By default, the navigation delay is set to 2000ms. The navigation delay decides how long the user needs to drag and hold the appointments at the extremities. You can also set your own delay value for letting the users to navigate based on it, using the `timeDelay` within the `dragStart` event.

Setting drag time interval

By default, while dragging an appointment, it moves at an interval of 30 minutes. To change the dragging time interval, pass the appropriate values to the `interval` option within the `dragStart` event.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onDragStart = (args) => {
    args.interval = 10;
  }
  const eventSettings = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} dragStart={({ onDragStart })}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

Drag and drop items from external source

It is possible to drag and drop the unplanned items from any of the external source into the scheduler, by manually saving those dropped item as a new appointment data through `addEvent` method of Scheduler.

In this example, we have used the tree view control as an external source and the child nodes from the tree view component are dragged and dropped onto the Scheduler. Therefore, it is necessary to make

use of the `nodeDragStop` event of the `TreeView` component, where we can form an event object and save it using the [Link to the Video](#) method.

Learn how to drag an external item into the React Scheduler by watching this video:

Opening the editor window on drag stop

There are scenarios where you want to open the editor filled with data on newly dropped location and may need to proceed to save it, only when **Save** button is clicked on the editor. On clicking the cancel button should revert these changes. This can be achieved using the **dragStop** event of Scheduler.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {

```

```

const scheduleObj = useRef(null);
const onDragStop = (args) => {
  args.cancel = true; //cancels the drop action
  scheduleObj.current.openEditor(args.data, "Save"); //open the event window with updated start and end time
}
const eventSettings = { dataSource: scheduleData }
return <ScheduleComponent height='550px' ref={scheduleObj}
selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
dragStop={onDragStop}>
  <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop]} />
</ScheduleComponent>;
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

Inline Appointment

In Scheduler, another easier way for **adding** or **editing** the appointment's subject alone can be achieved by using the inline Add/Edit support. It allows the user to add and edit the appointments inline. To get familiar with the inline Add mode, single click on any of the Scheduler cells or press enter key on the selected cells.

When the inline adding mode is ON, a text box will get created within the clicked Scheduler cells with a blinking cursor in it, requiring the user to enter the subject of an appointment. Once the subject is entered, the appointment will be saved on pressing the enter key.

To enable the inline edit mode, single click on any of the existing appointment's subject, so that the user can edit the subject of that appointment. The edited subject of that appointment will be updated on pressing the enter key.

The inline option can be enabled/disabled on the Scheduler by using the `allowInline` API, whereas its default value is set to `false`.

While using the `allowInline` the `showQuickInfo` will be turned off. The `quickPopup` will not show on clicking the work cell or clicking the appointment when the `allowInline` property is set to `true`.

In work cells, select multiple cells using keyboard, and then press enter key. The appointment wrapper will be created, and focus will be on the subject field. Also, consider the overlapping scenarios when creating an inline event.

Normal Event

While editing appointments, single-click the appointment subject, the `editable` option will be enabled in UI and the cursor will focus at the end of the text. Inline editing will be considered for all possible views.

Recurrence Event

While editing the occurrence from the recurrence series, it is only possible to edit a `single occurrence`, not an entire series.

Appointment Resizing

Another way of rescheduling an appointment can be done by resizing it through either of its handlers. To work with resizing functionality, it is necessary to inject the module `Resize` and make sure that `allowResizing` property is set to true.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, TimelineViews, TimelineMonth, Month,
Agenda, Resize, ViewsDirective, ViewDirective, Inject } from
'@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData }
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Day' />
            <ViewDirective option='TimelineWeek' />
            <ViewDirective option='Week' />
            <ViewDirective option='TimelineMonth' />
            <ViewDirective option='Month' />
            <ViewDirective option='Agenda' />
        </ViewsDirective>
    </ScheduleComponent>

```

```

    <Inject services={[Day, Week, TimelineViews, TimelineMonth, Month,
    Agenda, Resize]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, TimelineViews, TimelineMonth, Month, Agenda,
  Resize, ViewsDirective, ViewDirective, Inject, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='TimelineWeek' />
      <ViewDirective option='Week' />
      <ViewDirective option='TimelineMonth' />
      <ViewDirective option='Month' />
      <ViewDirective option='Agenda' />
    </ViewsDirective>
    <Inject services={[Day, Week, TimelineViews, TimelineMonth, Month,
    Agenda, Resize]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Disable scrolling on resize action

By default, while resizing an appointment, when its handler reaches the extreme edges of the Scheduler, scrolling action will take place along with event resizing. To prevent this scrolling action, set false to **scroll** value within the **resizeStart** event.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const onResizeStart = (args) => {
        args.scroll = { enable: false };
    }
    const eventSettings = { dataSource: scheduleData }
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={onResizeStart}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
    </ScheduleComponent>

```

```

    </ScheduleComponent>;
  }
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
  ResizeEventArgs, Inject, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onResizeStart = (args: ResizeEventArgs): void => {
    args.scroll = { enable: false };
  }
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={onResizeStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

    </div>
</body>
</html>

```

Controlling scroll speed while resizing an event

The speed of the scrolling action while resizing an appointment to the Scheduler edges, can be controlled within the `resizeStart` event by setting the desired value to the `scrollBy` option.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const onResizeStart = (args) => {
        args.scroll = { enable: true, scrollBy: 15 };
    }
    const eventSettings = { dataSource: scheduleData }
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={onResizeStart}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
    </ScheduleComponent>;
}

```

```

}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
  ResizeEventArgs, Inject, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onResizeStart = (args: ResizeEventArgs): void => {
    args.scroll = { enable: true, scrollBy: 15 };
  }
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={onResizeStart}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

  </div>
</body>
</html>

```

Setting resize time interval

By default, while resizing an appointment, it extends or shrinks at an interval of 30 minutes. To change this default resize interval, set appropriate values to `interval` option within the `resizeStart` event.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onResizeStart = (args) => {
    args.interval = 10;
  }
  const eventSettings = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={{onResizeStart}}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));

```

```
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Resize,
  ResizeEventArgs, Inject, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const onResizeStart = (args: ResizeEventArgs): void => {
    args.interval = 10;
  }
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings} resizeStart={onResizeStart}>>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, Resize]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

</html>

```

Appointment customization

The look and feel of the Scheduler events can be customized using any one of the following ways.

- [Using event templates](#)
- [Using eventRendered event](#)
- [Using customCSS class](#)

Using template

Any kind of text, images and links can be added to customize the look of the events. The user can format and change the default appearance of the events by making use of the `template` option available within the [Link to the Video](#) property. The following code example customizes the appointment's default color and time format.

Learn how easily you can customize the basic look and feel of React Scheduler appointments using template from this video:

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject
} from '@syncfusion/ej2-react-schedule';
import { webinarData } from './datasource';

```

```
import { Internationalization } from '@syncfusion/ej2-base';
const App = () => {
  const instance = new Internationalization();
  const getTimeString = (value) => {
    return instance.formatDate(value, { skeleton: 'hm' });
  }
  const eventTemplate = (props) => {
    const secondaryColor = { background: props.SecondaryColor };
    const primaryColor_1 = { background: props.PrimaryColor };
    const primaryColor_2 = { background: props.PrimaryColor };
    return (<div className="template-wrap" style={secondaryColor}>
      <div className="subject" style={primaryColor_1}>{props.Subject}</div>
      <div className="time" style={primaryColor_2}>
        Time: {getTimeString(props.StartTime)} -
      {getTimeString(props.EndTime)}</div>
    </div>);
  }
  const eventSettings = { dataSource: webinarData, template: eventTemplate };
  return <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} readonly={true}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
  EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { webinarData } from '../datasource';
import { Internationalization } from '@syncfusion/ej2-base';
const App = () => {
  const instance: Internationalization = new Internationalization();
  const getTimeString = (value: Date) => {
    return instance.formatDate(value, { skeleton: 'hm' });
  }
  const eventTemplate = (props) => {
    const secondaryColor = { background: props.SecondaryColor };
    const primaryColor_1 = { background: props.PrimaryColor };
    const primaryColor_2 = { background: props.PrimaryColor };
    return (<div className="template-wrap" style={secondaryColor}>
      <div className="subject" style={primaryColor_1}>{props.Subject}</div>
      <div className="time" style={primaryColor_2}>
        Time: {getTimeString(props.StartTime)} -
      {getTimeString(props.EndTime)}</div>
    </div>);
  }
  const eventSettings: EventSettingsModel = { dataSource: webinarData,
template: eventTemplate };
  return <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} readonly={true}>
```

```

    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

  </div>
</body>

```

```
</html>
```

All the built-in fields that are mapped to the appropriate field properties within the `eventSettings`, as well as custom mapped fields from the Scheduler dataSource can be accessed within the template code.

Using `eventRendered` event

The `eventRendered` event triggers before the appointment renders on the Scheduler. Therefore, this client-side event can be utilized to customize the look of events based on any specific criteria, before rendering them on the scheduler.

INDEX.JSX

```
import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const scheduleObj = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onEventRendered = (args) => {
        applyCategoryColor(args, scheduleObj.current.currentView);
    }
    const applyCategoryColor = (args, currentView) => {
        let categoryColor = args.data.CategoryColor;
        if (!args.element || !categoryColor) {
            return;
        }
        if (currentView === 'Agenda') {
            args.element.firstChild.style.borderColor = categoryColor;
        }
        else {
            args.element.style.backgroundColor = categoryColor;
        }
    }
    return (
        <ScheduleComponent width='100%' height='550px' ref={scheduleObj}
        selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
        eventRendered={onEventRendered}>
            <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
    );
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
    EventRenderedArgs, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
```

```
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef<ScheduleComponent>(null);
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  const onEventRendered = (args: EventRenderedArgs): void => {
    applyCategoryColor(args, scheduleObj.current.currentView);
  }

    </div>
</body>
</html>

```

Using cssClass

The customization of events can also be achieved using `cssClass` property of the Scheduler. In the following example, the background of appointments has been changed using the `cssClass`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
'@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData }
    return (<ScheduleComponent width='100%' height='550px' cssClass='custom-
class' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}

```

```
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
  EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings: EventSettingsModel = { dataSource: scheduleData }
  return (
    <ScheduleComponent width='100%' height='550px' cssClass='custom-class'
    selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  )
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.HTML

```
<!DOCTYPE html>

  <link
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
rel="stylesheet" />
```

```

<script
src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></scr
ipt>
<link href="index.css" rel="stylesheet" />
<script src="systemjs.config.js"></script>
<style>
    #loader {
        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
    .e-past-app {
        background-color: chocolate !important;
    }
    .custom-class.e-schedule .e-vertical-view .e-all-day-appointment-
wrapper .e-appointment,
    .custom-class.e-schedule .e-vertical-view .e-day-wrapper .e-
appointment,
    .custom-class.e-schedule .e-month-view .e-appointment {
        background: green;
    }
</style>
</head>
<body>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Setting minimum height

It is possible to set minimal height for appointments on Scheduler using `eventRendered` event, when its start and end time duration is less than the default duration of a single slot.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject
} from '@syncfusion/ej2-react-schedule';
const App = () => {
    const scheduleObj = useRef(null);
    const data = [{
        Id: 13,
        Subject: 'Myths of Andromeda Galaxy',
        StartTime: new Date(2018, 1, 16, 10, 30),
        EndTime: new Date(2018, 1, 16, 10, 40)
    }, {
        Id: 14,
        Subject: 'Aliens vs Humans',
        StartTime: new Date(2018, 1, 15, 10, 0),

```

```

        EndTime: new Date(2018, 1, 15, 10, 20)
    }];
    const eventSettings = { dataSource: data }
    const onEventRendered = (args) => {
        let cellHeight = scheduleObj.current.element.querySelector('.e-work-
cells').offsetHeight;
        let appHeight = (args.data.EndTime.getTime() -
args.data.StartTime.getTime()) / (60 * 1000) * (cellHeight *
scheduleObj.current.timeScale.slotCount) /
scheduleObj.current.timeScale.interval;
        args.element.style.height = appHeight + 'px';
    }
    return (
        <ScheduleComponent width='100%' height='550px' ref={scheduleObj}
selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
eventRendered={onEventRendered}>
            <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
    )
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

    </div>
</body>
</html>

```

Block Dates and Times

It is possible to block a set of dates or a particular time ranges on the Scheduler. To do so, define an appointment object within `eventSettings` along with the required time range to block and set the `isBlock` field to true. Usually, the event objects defined with `isBlock` field set to true will block the entire time cells lying within the appropriate time ranges specified through `startTime` and `endTime` fields.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
'@syncfusion/ej2-react-schedule';
import { blockData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: blockData }
    return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
    EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { blockData } from './datasource';
const App = () => {
    const eventSettings: EventSettingsModel = { dataSource: blockData }
    return (
        <ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)}
eventSettings={eventSettings}>
            <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
    );
}

```

```

    </ScheduleComponent>
  )
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

Readonly

An interaction with the appointments of Scheduler can be enabled/disabled using the **readonly** property. With this property enabled, you can simply navigate between the Scheduler dates, views and can be able to view the appointment details in the quick info window. Most importantly, the users are not allowed to perform any CRUD actions on Scheduler, when this property is set to true. By default, it is set as **false**.

INDEX.JSX

```

Make specific events readonly

There are scenarios where you need to restrict the CRUD action on specific appointments alone based on certain conditions. In the following example, the events that has occurred on the past hours from the current date of the Scheduler are made as read-only and the CRUD actions has been prevented only on those appointments. This can be achieved by setting `isReadOnly` field of read-only events to `true`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
 '@syncfusion/ej2-react-schedule';
import { readOnlyData } from '../datasource';
const App = () => {
    const eventSettings = { dataSource: readOnlyData }

```

```

    return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} eventSettings={eventSettings}>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
  }
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
  EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { readOnlyData } from '../datasource';
const App = () => {
  const eventSettings: EventSettingsModel = { dataSource: readOnlyData }
  return (
    <ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)}
    eventSettings={eventSettings}>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  )
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

    </style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

By default, the event editor is prevented to open on the read-only events when `isReadOnly` field is set to `true`.

Restricting event creation on specific time slots

You can restrict the users to create and update more than one appointment on specific time slots. Also, you can disable the CRUD action on those time slots if it is already occupied, which can be achieved using Scheduler's public method `isSlotAvailable`.

Note: The `isSlotAvailable` is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Inject } from
'@syncfusion/ej2-react-schedule';

```

```
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData }
  const onActionBegin = (args) => {
    if (args.requestType === 'eventCreate' && args.data.length > 0) {
      let eventData = args.data[0];
      let eventField = scheduleObj.current.eventFields;
      let startDate = eventData[eventField.startTime];
      let endDate = eventData[eventField.endTime];
      args.cancel = !scheduleObj.current.isSlotAvailable(startDate, endDate);
    }
  }
  return (<ScheduleComponent ref={scheduleObj} width='100%' height='550px'
selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
actionBegin={onActionBegin}>
    <Inject services={[Day, Week, WorkWeek]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

Differentiate the past time events

To differentiate the appearance of the appointments based on specific criteria such as displaying the past hour appointments with different colors on Scheduler, `eventRendered` event can be used which triggers before the appointment renders on the Scheduler.

INDEX.JSX

Appointments occupying entire cell

The Scheduler allows the event to occupies the full height of the cell without its header part by setting **true** for **enableMaxHeight** Property.

We can show more indicator if more than one appointment is available in a same cell by setting **true** to **enableIndicator** property whereas its default value is false.

INDEX.JSX

```

How to limit maximum number of events to display

In the Scheduler, the default behavior is to display concurrent events based on cell height, with each new event represented as

+n more characters. However, you may want to improve the quality of the presentation by limiting the number of concurrent events. This can be accomplished by using the [maxEventsPerRow](#) property, which is defaulted to the [views](#) property.

The [maxEventsPerRow](#) property is specific to the month, timeline month, and timeline year views, allowing you to view events visually in these rows. Below is a code example that demonstrates how to use this constraint and the events displayed in a cell have been created:

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Month, Inject, ViewsDirective, ViewDirective }
from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='380px' selectedDate={new
Date(2023, 11, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Month' maxEventsPerRow={3}/>
    </ViewsDirective>
    <Inject services={[Month]} />
  </ScheduleComponent>);
}

```

```
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Inject, Month,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='380px' selectedDate={new
Date(2023, 11, 15)}
    eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Month' maxEventsPerRow={3} />
    </ViewsDirective>
    <Inject services={[Month]} />
  </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

</body>
</html>

```

The property [maxEventsPerRow](#) will be applicable only when [rowAutoHeight](#) feature is disabled in the Scheduler.

Display tooltip for appointments

The tooltip shows the Scheduler appointment's information in a formatted style by making use of the tooltip related options.

Show or hide built-in tooltip

The tooltip can be displayed for appointments by setting **true** to the **enableTooltip** option within the **eventSettings** property.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, TimelineViews, Month, Agenda, Inject }

Customizing event tooltip using template

After enabling the default tooltip, it is possible to customize the display of needed event information on tooltip by making use of the `tooltipTemplate` option within the `eventSettings`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { eventsData } from './datasource';
const App = () => {
    const eventSettings = {
        dataSource: eventsData, enableTooltip: true,
        tooltipTemplate: template
    };
    const template = (props) => {
        return (<div className="tooltip-wrap">
            <div className="content-area"><div
className="name">{props.Subject}</div>
                {(props.City !== null && props.City !== undefined) ? <div
className="city">{props.City}</div> : ''}
                <div className="time">From : {props.StartTime.toLocaleString()}</div>
                <div className="time">To
: {props.EndTime.toLocaleString()}</div></div></div></div>);
    }
    return (<ScheduleComponent width='100%' height='500px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}

```

```
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
  EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { eventsData } from './datasource';
const App = () => {
  const eventSettings: EventSettingsModel = {
    dataSource: eventsData, enableTooltip: true,
    tooltipTemplate: template
  };
  const template = (props) => {
    return (<div className="tooltip-wrap">
      <div className="content-area"><div
className="name">{props.Subject}</div>
      {(props.City !== null && props.City !== undefined) ? <div
className="city">{props.City}</div> : ''}
      <div className="time">From : {props.StartTime.toLocaleString()}</div>
      <div className="time">To

    </div>
</body>
</html>

```

All the field names that are mapped from the Scheduler dataSource to the appropriate field properties such as subject, description, location, startTime and endTime within the `eventSettings` can be accessed within the template.

Appointment selection

Appointment selection can be done either through mouse or keyboard actions. The selected events in UI will have a box shadow effect around to differentiate it from other appointments.

| Action | Description |

|-----|-----|

| Mouse click or Single tap on appointments | Selects single appointment. |

| Ctrl + [Mouse click] or [Single tap] on appointments | Selects multiple appointments. |

Deleting multiple appointments

With the options available to select multiple appointments, it is also possible to delete the multiple selected appointments simply by pressing the `delete` key. In case of deleting multiple selected occurrences of an event series, only those occurrences will be deleted and not the entire series.

Retrieve event details from the UI of an event

It is possible to access the information about the event fields of an appointment element displayed on the Scheduler UI. This can be achieved by passing an appointment element as argument to the public method `getEventDetails`.

In the following example, the subject of the appointment clicked has been displayed.

INDEX.JSX

```
import * as React from 'react';
import { useRef } from 'react';
import * as ReactDOM from 'react-dom';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventLog = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onEventClick = (args) => {
    let event = scheduleObj.current.getEventDetails(args.element);
    appendElement(event.Subject + '<hr>');
  }
  const appendElement = (html) => {
    let span = document.createElement('span');
    span.innerHTML = html;
    let log = eventLog.current;
    log.insertBefore(span, log.firstChild);
  }
  const onClick = () => {
    eventLog.current.innerHTML = '';
  }
  return (
    <div className='content-wrapper'>
      <div className='col-lg-9 control-section'>
        <ScheduleComponent ref={scheduleObj} width='100%' height='550px'
selectedDate=
          {new Date(2018, 1, 15)} eventSettings={eventSettings}
eventClick={onEventClick}>
          <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
      </div>
      <div className='col-lg-3 property-section'>
        <div title='Event Trace'>
          <table id='property' title='Properties' className='property-panel-
table' style={{ width: '100%' }}>
            <tbody>

Get the current view appointments

To retrieve the appointments present in the current view of the Scheduler, you can make use of the `getCurrentViewEvents` public method. In the following example, the count of current view appointment collection rendered has been traced in `dataBound` event.

INDEX.JSX

```

import * as React from 'react';
import { useRef } from 'react';
import * as ReactDOM from 'react-dom';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
EventSettingsModel } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const scheduleObj = useRef(null);
    const eventLog = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onDataBound = () => {
        let event = scheduleObj.current.getCurrentViewEvents();
        if (event.length > 0) {

```

```

    appendElement('Events present on current view <b>' + event.length +
    '<b><hr>');
    } else {
        appendElement('No Events available in this view.<hr>');
    }
}
const appendElement = (html) => {
    let span = document.createElement('span');
    span.innerHTML = html;

Refresh appointments

If your requirement is to simply refresh the appointments instead of refreshing the entire Scheduler elements from your application end, make use of the `refreshEvents` public method.

```
`ts
```

```
this.scheduleObj.refreshEvents();
```

```
,
```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Data binding in React Schedule component

The Scheduler uses **DataManager**, which supports both RESTful data service binding and JavaScript object array binding. The [dataSource](#) property of Scheduler can be assigned either with the instance of **DataManager** or JavaScript object array collection, as it supports the following two kind of data binding methods:

- Local data
- Remote data

Binding local data

To bind local JSON data to the Scheduler, you can simply assign a JavaScript object array to the [dataSource](#) option of the scheduler within the **eventSettings** property. The JSON object **dataSource** can also be provided as an instance of **DataManager** and assigned to the Scheduler **dataSource** property.

```

By default, **DataManager** uses **JsonAdaptor** for binding local data.

You can also bind different field names to the default event fields as well as include additional custom fields to the event object collection which can be referred [here](#).

Binding remote data

Any kind of remote data services can be bound to the Scheduler. To do so, create an instance of **DataManager** and provide the service URL to the **url** option of **DataManager** and then assign it to the **dataSource** property within **eventSettings**.

Using ODataV4Adaptor

ODataV4 is a standardized protocol for creating and consuming data. Refer to the following code example to retrieve the data from ODataV4 service using the **DataManager**. To connect with ODataV4 service end points, it is necessary to make use of **ODataV4Adaptor** within **DataManager**.

INDEX.JSX

```

import { useState, useEffect } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from

Filter events using the in-built query

To enable server-side filtering operations based on predetermined conditions, the [includeFiltersInQuery](#) API can be set to true, this allows the filter query to be constructed using the start date, end date, and recurrence rule which in turn enables the request to be filtered accordingly.

This method greatly improves the component's performance by reducing the data that needs to be transferred to the client side. As a result, the component's efficiency and responsiveness are significantly enhanced, resulting in a better user experience. However, it is important to consider the possibility of longer query strings, which may cause issues with the maximum URL length or server limitations on query string length.

The following image represents how the parameters are passed using ODataV4 filter.

×	Headers	Payload	Preview	Response	Initiator	Timing
▼ General						
Request URL: https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?\$filter=(((((OrderDate%20ge%201996-06-29T18:30:00.000Z)%20and%20(RequiredDate%20ge%201996-06-29T18:30:00.000Z))%20and%20(OrderDate%20lt%201996-08-03T18:30:00.000Z))%20or%20((OrderDate%20le%201996-06-29T18:30:00.000Z)%20and%20(RequiredDate%20gt%201996-06-29T18:30:00.000Z)))%20or%20((ShipRegion%20ne%20null)%20and%20(ShipRegion%20ne%20%27%27))						
Request Method: GET						
Status Code:  200 OK						
Remote Address: 137.117.17.70:443						
Referrer Policy: strict-origin-when-cross-origin						

Using custom adaptor

It is possible to create your own custom adaptor by extending the built-in available adaptors. The following example demonstrates the custom adaptor usage and how to add a custom field `EventID` for the appointments by overriding the built-in response processing using the `processResponse` method of the `ODataV4Adaptor`.

INDEX.JSX

```
import { useState, useEffect } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
const CustomAdaptor = () => {
    ODataV4Adaptor.call(this);
}
CustomAdaptor.prototype = Object.create(ODataV4Adaptor.prototype);
CustomAdaptor.prototype.constructor = CustomAdaptor;
CustomAdaptor.prototype.processResponse = function () {
    let i = 0;
    let original = ODataV4Adaptor.prototype.processResponse.apply(this, arguments);
    original.forEach((item) => (item['EventID'] = ++i));
    return original;
};
const App = () => {
    const [dataManager, setDataManager] = useState(null);
    useEffect(() => {
        const fetchData = async () => {
            const manager = new DataManager({
```

```

        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
        adaptor: new CustomAdaptor(),
    });
    const query = new Query().take(10); // Example query to limit the
number of records
    const data = await manager.executeQuery(query);
    setDataManager(new DataManager(data));
    };
    fetchData();
}, []);
const fieldsData = {
    id: 'Id',
    subject: { name: 'ShipName' },
    location: { name: 'ShipCountry' },
    description: { name: 'ShipAddress' },
    startTime: { name: 'OrderDate' },
    endTime: { name: 'RequiredDate' },
    recurrenceRule: { name: 'ShipRegion' }
}
const eventSettings = { dataSource: dataManager, fields: fieldsData };
return (
    <ScheduleComponent
        height='550px'
        selectedDate={new Date(1996, 6, 9)}
        readonly={true}
        eventSettings={eventSettings}
    >
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
);
}
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import { useState, useEffect } from 'react';

Loading data via AJAX post

You can bind the event data through external ajax request and assign it to the `dataSource` property of Scheduler. In the following code example, we have retrieved the data from server with the help of ajax request and assigned the resultant data to the `dataSource` property of Scheduler within the `onSuccess` event of Ajax.

[src/app/app.tsx]

```
`ts
```

```
import * as React from 'react';
```

```
import { useState, useEffect } from 'react';
```

```
import ReactDOM from 'react-dom';
```

```
import { Ajax } from '@syncfusion/ej2-base';
```

```
import {
```

```
ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject, EventSettingsModel
```

```

} from '@syncfusion/ej2-react-schedule';
import { DataManager } from '@syncfusion/ej2-data';
const App = () => {
  const [dataManager, setDataManager] = useState<DataManager | null>(null);
  useEffect(() => {
    const ajax = new Ajax('Home/GetData', 'GET', false);
    ajax.send();
    ajax.onSuccess = function (value: DataManager) {
      setDataManager(value);
    };
  }, []);
  const eventSettings: EventSettingsModel = { dataSource: dataManager };
  return (
    <ScheduleComponent height='550px' selectedDate={new Date(2017, 5, 11)}
      eventSettings={eventSettings}>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  );
}

const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

[src/app/app.ts]

Definition for the controller method `GetData` can be referred [here](#).

Passing additional parameters to the server

To send an additional custom parameter to the server-side post, you need to make use of the `addParams` method of `Query`. Now, assign this `Query` object with additional parameters to the `query` property of Scheduler.

INDEX.JSX

```

import { useState, useEffect } from 'react';

The parameters added using the [query](#) property will be sent along with the data request sent to the server on every scheduler actions.

Handling failure actions

During the time of Scheduler interacting with server, there are chances that some server-side exceptions may occur. You can acquire those error messages or exception details in client-side using the [actionFailure](#) event of Scheduler.

The argument passed to the [actionFailure](#) event contains the error details returned from the server.

The [actionFailure](#) event will be triggered not only on server returning errors, but also when there is an exception while processing any of the Scheduler CRUD actions.

Scheduler CRUD actions

The CRUD (Create, Read, Update and Delete) actions can be performed easily on Scheduler appointments using the various adaptors available within the **DataManager**. Most preferably, we will be using **UrlAdaptor** for performing CRUD actions on scheduler appointments.

```
`ts
```

```
import { Schedule, Day, Week, WorkWeek, Month, Agenda } from '@syncfusion/ej2-schedule';
```

```
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';
```

```

Schedule.Inject(Day, Week, WorkWeek, Month, Agenda);
let dataManager: DataManager = new DataManager({
url: 'Home/GetData', // 'controller/actions'
crudUrl: 'Home/UpdateData',
adaptor: new UrlAdaptor
});
let scheduleObj: Schedule = new Schedule({
height: '550px',
selectedDate: new Date(2017, 5, 5),
eventSettings: { dataSource: dataManager }
});
scheduleObj.appendTo('#Schedule');
`

```

The server-side controller code to handle the CRUD operations are as follows.

```

`c#
using System;
using System.Collections.Generic;
using System.Linq;
using System.Web;
using System.Web.Mvc;
using ScheduleSample.Models;
namespace ScheduleSample.Controllers
{
public class HomeController : Controller
{
ScheduleDataDataContext db = new ScheduleDataDataContext();
public ActionResult Index()
{
return View();
}

public JsonResult LoadData() // Here we get the Start and End Date and based on that can filter the data
and return to Scheduler
{

```

```
var data = db.ScheduleEventDatas.ToList();
return Json(data, JsonRequestBehavior.AllowGet);
}
[HttpPost]
public JsonResult UpdateData(EditParams param)
{
    if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
        will execute while inserting the appointments
    {
        var value = (param.action == "insert") ? param.value : param.added[0];
        int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
        1;
        DateTime startTime = Convert.ToDateTime(value.StartTime);
        DateTime endTime = Convert.ToDateTime(value.EndTime);
        ScheduleEventData appointment = new ScheduleEventData()
        {
            Id = intMax + 1,
            StartTime = startTime.ToLocalTime(),
            EndTime = endTime.ToLocalTime(),
            Subject = value.Subject,
            IsAllDay = value.IsAllDay,
            StartTimezone = value.StartTimezone,
            EndTimezone = value.EndTimezone,
            RecurrenceRule = value.RecurrenceRule,
            RecurrenceID = value.RecurrenceID,
            RecurrenceException = value.RecurrenceException
        };
        db.ScheduleEventDatas.InsertOnSubmit(appointment);
        db.SubmitChanges();
    }
    if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
        code will execute while updating the appointment
    {
        var value = (param.action == "update") ? param.value : param.changed[0];
```

```
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
    DateTime startTime = Convert.ToDateTime(value.StartTime);

    public ScheduleEventData value { get; set; }
}
}
}
,

```

Configuring Scheduler with Google API service

We have assigned our custom created Google Calendar url to the DataManager and assigned the same to the Scheduler `dataSource`. Since the events data retrieved from the Google Calendar will be in its own object format, therefore it needs to be resolved manually within the Scheduler's `dataBinding` event. Within this event, the event fields needs to be mapped properly and then assigned to the result.

```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Crud actions in React Schedule component

Events, a.k.a. Appointments, play an important role in Scheduler with which the users mostly interact. You can easily manipulate (add/edit/delete) the desired appointments as and when required either using the editor window or through the drag and resize action.

Add

Any kind of appointments such as normal, all-day, spanned or recurring events can be easily added on Scheduler using any one of the following ways.

- [Creation using editor window](#)
- [Creation Using addEvent method](#)

Creation using editor window

The default editor window opens when you double click on the Scheduler cells. It provides you with event related options such as Subject, Location, Start and End time, All-day, Timezone, Description and other recurrence options. With these available fields, you can choose to provide detailed information to the events. Once the fields are filled with proper values, enter the **Save** button to add an event.

In case, if you want to simply provide the Subject alone for appointments, just single click on the required cells which will open the quick popup expecting you to enter subject alone and save it. You can also select multiple cells and press **Enter** key to open the quick popup for selected time range and save the appointment for that time range.

In case, if you need to add some other additional fields to the editor window, then you can opt for [custom editor window](#) which allows you to include fields as per your application needs. If you need to add just one or two [additional fields to the existing default editor window](#), you can do so by defining it manually and then appending it to the editor window.

Creation using addEvent method

The appointments can be created dynamically by using **addEvent** method. Either you can add a single or a collection of appointment objects using **addEvent** method. The following code example let you know how to use the **addEvent** method to create multiple appointments simultaneously.

INDEX.JSX

```
import * as React from 'react';
import { useRef } from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Inject,

    </div>
</body>

</html>

```

Inserting events into database at server-side

While adding the normal or recurring events to the Scheduler, **insert** action takes place and the following code example describes how to add a new event into database at server side.

```
`ts
```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
```

```
{
```

```
var value = (param.action == "insert") ? param.value : param.added[0];
```

```
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
```

```
DateTime startTime = Convert.ToDateTime(value.StartTime);
```

```
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```
ScheduleEventData appointment = new ScheduleEventData()
```

```
{
```

```
Id = intMax + 1,
```

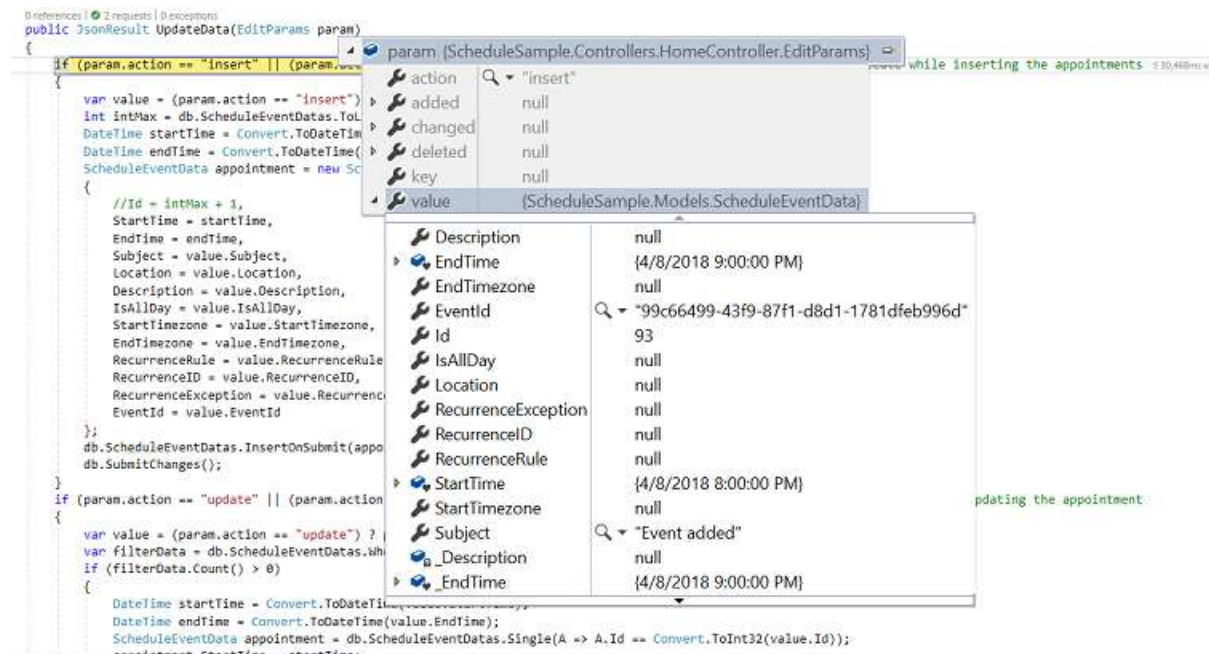

```
StartTime = startTime.ToLocalTime(),
```

```
EndTime = endTime.ToLocalTime(),
```

```

Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

```

Restricting add action based on specific criteria

In the following example, the specific fields of Scheduler editor window such as Subject and Location are made to undergo validation such that if it is left as blank, then the default **Required** validation message will be displayed, while clicking on a save button.

Additionally, the regex condition has been added to the Location field, so that if any special characters are typed into it, then the custom validation message will be displayed.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
'@syncfusion/ej2-react-schedule';

```

```
import { scheduleData } from './datasource';
const App = () => {
  const fields = {
    subject: { name: 'Subject', validation: { required: true } },
    location: {
      name: 'Location', validation: {
        required: true,
        regex: ["^[a-zA-Z0-9- ]*$", 'Special character(s) not allowed
in this field']
      }
    }
  };
  const eventSettings = { dataSource: scheduleData, fields: fields }
  return (<ScheduleComponent height='550px' width='100%' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

  </div>
</body>
</html>

```

You can also dynamically prevent the creation of appointments on Scheduler. For example, say if you want to decline the creation of appointments on weekend days, you can check for its appropriate condition within the `actionBegin` event.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData }
    const onActionBegin = (args) => {
        let weekEnds = [0, 6];
        if (args.requestType === 'eventCreate' &&
            weekEnds.indexOf((args.data[0].StartTime).getDay()) >= 0) {
            args.cancel = true;
        }
    }
    return (<ScheduleComponent height='550px' width='100%' selectedDate={new
    Date(2018, 1, 15)} eventSettings={eventSettings}
    actionBegin={onActionBegin.bind(this)}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}

Edit

The same way the appointments such as normal, all-day, spanned or recurring events are created, it can be easily edited using any of the following ways.

- [Update using editor window](#)
- [Update using saveEvent method](#)

Update using editor window

You can open the default editor window filled with appointment details by double clicking on the required events. It gets pre-filled with event options such as Subject, Location, Start and End time, All-day, timezone, description and other recurrence options, from which you can edit the desired field values and, then enter the **Save** button to update it.

You can also single click on appointments, which opens the quick info popup with edit and delete options. Clicking on the **edit** option will open the default editor filled with event details and **delete** option will prompt for delete confirmation.

Updating using saveEvent method

The appointments can be edited and updated manually using the **saveEvent** method. The following code examples shows how to edit the normal and recurring events.

Normal event - Here, an event with ID **3** is edited and its subject is changed with a new text. When the modified data object is passed onto the **saveEvent** method, the changes gets reflected onto the original event. The **Id** field is mandatory in this edit process, where the modified event object should hold the valid **Id** value that exists in the Scheduler data source.

Recurring event - The following code example shows how to edit a single occurrence of a recurring event. In this case, the modified data should hold an additional field namely `RecurrenceID` mapping to its parent recurring event's Id value. Also, this modified occurrence will be considered as a new event in the Scheduler dataSource, where it is linked with its parent event through the `RecurrenceID` field value. The `saveEvent` method takes 2 arguments, first one accepting the modified event data object and second argument accepting either of the 2 text values - `EditOccurrence` or `EditSeries`.

When the second argument is passed as `EditOccurrence`, which means that the passed event data is a single modified occurrence - whereas if the second argument is passed as `EditSeries`, it means that the modified data needs to be edited as a whole series and therefore no new event object will be maintained in the Scheduler dataSource.

In case of modifying the single occurrence, it is also necessary to update the `RecurrenceException` field of parent event altogether with the occurrence editing. To know more about how to set `RecurrenceException` values, refer the [recurring events](#) topic.

Updating events in database at server-side

While editing the normal events in the Scheduler, **update** action takes place and the following code example describes how to update event into database at server side.

```

`ts
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`

```

How to edit a single occurrence or entire series and update it in database at server-side

The recurring appointments can be edited in either of the following two ways.

- Single occurrence
- Entire series

Editing single occurrence - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or entire series. From this, if you choose to select **EDIT EVENT** option, a single occurrence of the recurring appointment alone will be edited. The following process takes place while editing a single occurrence,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the **recurrenceID** field will be added to it, that holds the **id** value of the parent recurring event. Also, a new **Id** will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate **recurrenceException** field to hold the edited occurrence appointment's date collection.

Therefore, when a single occurrence is edited from a recurring event, the batch action takes place by allowing both the **Add** and **Edit** action requests to take place together.

In case, if you edit an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get updated. In this case, **update** action alone takes place on the edited occurrence object on the database.

`ts

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
RecurrenceException = value.RecurrenceException
};
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
```

```

ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
,

```

Editing entire series - When you select an option **EDIT SERIES** from the popup that opens on double clicking the recurring event, the whole recurring series will be updated with the newly provided value. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences will be removed from the dataSource and simply the single parent data will be updated.

This action of editing entire series also leads to the batch process, as both the **Delete** and **Edit** action takes place together.

```
`ts
```

```

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();

```

```

appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}

```

How to edit from the current and following events of a series

The recurring appointments can be edited from current and following events when enable the property editFollowingEvents.

Editing Following Events - When you double click on a recurring event, a popup prompts you to choose either to edit the single event or Edit Following Events or entire series. From this, if you choose to select **EDIT FOLLOWING EVENTS** option, a current and following events of the recurring appointment will be edited. The following process takes place while editing a following events,

- A new event will be created from the parent event data and added to the Scheduler dataSource, with all its default field values overwritten with the newly modified data and additionally, the **followingID** field will be added to it, that holds the **id** value of the immediate parent recurring event. Also, a new **Id** will be generated for this event in the dataSource.
- The parent recurring event needs to be updated with appropriate **recurrenceRule** field to hold the modified occurrence appointment's end date.

Therefore, when a following events are edited from a recurring event, the batch action takes place by allowing the **Add**, **Edit** and **Delete** action requests to take place together.

```
`ts
```

```
if (param.action == "insert" || (param.action == "batch" && param.added != null)) // this block of code
will execute while inserting the appointments
{
var value = (param.action == "insert") ? param.value : param.added[0];
int intMax = db.ScheduleEventDatas.ToList().Count > 0 ? db.ScheduleEventDatas.ToList().Max(p => p.Id) :
1;
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = new ScheduleEventData()
{
Id = intMax + 1,
StartTime = startTime.ToLocalTime(),
EndTime = endTime.ToLocalTime(),
Subject = value.Subject,
IsAllDay = value.IsAllDay,
StartTimezone = value.StartTimezone,
EndTimezone = value.EndTimezone,
RecurrenceRule = value.RecurrenceRule,
RecurrenceID = value.RecurrenceID,
FollowingID = value.FollowingID,
RecurrenceException = value.RecurrenceException
};
```

```
db.ScheduleEventDatas.InsertOnSubmit(appointment);
db.SubmitChanges();
}

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
    var value = (param.action == "update") ? param.value : param.changed[0];
    var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
    if (filterData.Count() > 0)
    {
        DateTime startTime = Convert.ToDateTime(value.StartTime);
        DateTime endTime = Convert.ToDateTime(value.EndTime);
        ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
        Convert.ToInt32(value.Id));
        appointment.StartTime = startTime.ToLocalTime();
        appointment.EndTime = endTime.ToLocalTime();
        appointment.StartTimezone = value.StartTimezone;
        appointment.EndTimezone = value.EndTimezone;
        appointment.Subject = value.Subject;
        appointment.IsAllDay = value.IsAllDay;
        appointment.RecurrenceRule = value.RecurrenceRule;
        appointment.RecurrenceID = value.RecurrenceID;
        appointment.FollowingID = value.FollowingID;
        appointment.RecurrenceException = value.RecurrenceException;
    }
    db.SubmitChanges();
}

if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
    if (param.action == "remove")
    {
        int key = Convert.ToInt32(param.key);
        ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
```

```

if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)
{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
`

```

To know more about handling recurrence exceptions, refer the [Adding exceptions](#) topic.

Restricting edit action based on specific criteria

You can also dynamically prevent the editing of appointments on Scheduler. For example, say if you want to decline the updating of appointments on non-working hours, you can check for its appropriate condition within the `actionBegin` event.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onActionBegin = (args) => {
    if (args.requestType === 'eventChange') {
      let weekEnds = [0, 6];
      let weekDay = weekEnds.indexOf((args.data.StartTime).getDay()) >= 0;
      let workHours = (args.data.StartTime.getHours <
      parseInt(scheduleObj.current.workHours.start)) ||
      (args.data.StartTime.getHours > parseInt(scheduleObj.current.workHours.end));

```

Delete

The appointments can be deleted in either of the following ways,

- Selecting an appointment and clicking the delete icon from the quick popup that opens.
- Selecting an appointment and pressing **Delete** key.

- Selecting multiple appointments by tap holding an event and then continuously single clicking on other consecutive events and then clicking the **Delete** key.
- Double clicking on an event which opens the default event editor pre-filled with event details, and then choosing **Delete** button in it.

While performing all these above mentioned actions, a pop-up with a delete confirmation message will be displayed prompting either to proceed with deleting an appointment.

Deletion using editor window

When you double click an event, the default editor window will be opened which includes a **Delete** button at the bottom left position to allow you to delete that particular appointment. When deleting an appointment through this editor window, the delete alert confirmation will not be asked and the event will be deleted immediately.

Deletion using deleteEvent method

The appointments can be removed manually using the **deleteEvent** method. The following code examples shows how to edit the normal and recurring events.

Normal event - You can delete the normal appointments of Scheduler by simply passing its **Id** value or the entire event object collection to the **deleteEvent** method.

Removing events from database at server-side

While deleting the event from the Scheduler, **remove** action takes place and the following code example describes how to delete event from database at server side.

```
`ts
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
{
    if (param.action == "remove")
    {
        int key = Convert.ToInt32(param.key);
        ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
        if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
    }
    else
    {
        foreach (var apps in param.deleted)
        {
            ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
            if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
        }
    }
    db.SubmitChanges();
}
```

How to delete a single occurrence or entire series from Scheduler and update it in database at server-side

The recurring events can be deleted in either of the following two ways.

- Single occurrence
- Entire series

Single occurrence - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or entire series. From this, if you choose to select **DELETE EVENT** option, a single occurrence of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceException` field, to hold the deleted occurrence appointment's date collection.

Therefore, when a single occurrence is deleted from a recurring event, the **update** action takes place on the parent recurring event as shown in the following code example.

In case, if you delete an existing edited occurrence of a recurring event, only those edited occurrence which present in the database as an individual event object will get removed. In this case, **delete** action takes place instead of **update** action and the parent recurring event object remains same with no changes.

`ts

if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of code will execute while updating the appointment

{

```
var value = (param.action == "update") ? param.value : param.changed[0];
```

```
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
```

```
if (filterData.Count() > 0)
```

{

```

DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;
appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.RecurrenceException = value.RecurrenceException;
}
db.SubmitChanges();
}
`

```

Entire series - When you select an option **DELETE SERIES** from the popup, the whole recurring series will be deleted. When this option is chosen explicitly, if a parent event holds any edited occurrences - then all its child occurrences which are maintained as separate event objects will also be removed from the dataSource. This action of deleting entire series leads to **remove** action and removes one or more event objects at the same time.

```
`ts
```

```
if (param.action == "remove" || (param.action == "batch" && param.deleted != null)) // this block of
code will execute while removing the appointment
```

```

{
if (param.action == "remove")
{
int key = Convert.ToInt32(param.key);
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == key).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
else
{
foreach (var apps in param.deleted)

```

```

{
ScheduleEventData appointment = db.ScheduleEventDatas.Where(c => c.Id == apps.Id).FirstOrDefault();
if (appointment != null) db.ScheduleEventDatas.DeleteOnSubmit(appointment);
}
}
db.SubmitChanges();
}
,

```

How to delete only the current and following events of a series

The recurring events can be deleted from current and following events only when enable `editFollowingEvents` property.

Delete Following Events - When you attempt to delete the recurring events, a popup prompts you to choose either to delete the single event or Following Events or entire series. From this, if you choose to select **FOLLOWING EVENT** option, a current and following events of the recurring appointment alone will be removed. The following process takes place while removing a single occurrence,

- The selected occurrence and the following events in same series will be deleted from the Scheduler user interface.
- In code, the parent recurring event object will be updated with appropriate `recurrenceRule` field, to update the end date of the recurring events.

Therefore, when following events are deleted from a recurring event, the `remove` and `update` action takes place on the immediate parent recurring event as shown in the following code example.

```

`ts
if (param.action == "update" || (param.action == "batch" && param.changed != null)) // this block of
code will execute while updating the appointment
{
var value = (param.action == "update") ? param.value : param.changed[0];
var filterData = db.ScheduleEventDatas.Where(c => c.Id == Convert.ToInt32(value.Id));
if (filterData.Count() > 0)
{
DateTime startTime = Convert.ToDateTime(value.StartTime);
DateTime endTime = Convert.ToDateTime(value.EndTime);
ScheduleEventData appointment = db.ScheduleEventDatas.Single(A => A.Id ==
Convert.ToInt32(value.Id));
appointment.StartTime = startTime.ToLocalTime();
appointment.EndTime = endTime.ToLocalTime();
appointment.StartTimezone = value.StartTimezone;

```

```

appointment.EndTimezone = value.EndTimezone;
appointment.Subject = value.Subject;
appointment.IsAllDay = value.IsAllDay;
appointment.RecurrenceRule = value.RecurrenceRule;
appointment.RecurrenceID = value.RecurrenceID;
appointment.FollowingID = value.FollowingID;

```

Drag and drop

When you drag and drop a normal event on the Scheduler, the event editing action takes place. When a recurring event is drag and dropped on a desired time range, the batch action explained in [Editing a single occurrence](#) process will take place - thus allowing both the [Add](#) and [Edit](#) action to take place together.

By default, when you drag a recurring instance, only the occurrence of the event gets edited and not a whole series.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Virtual scrolling in React Schedule component

To achieve better performance in the Scheduler when loading a large number of resources and events, we have added virtual scrolling support to load a large set of resources and events instantly as you scroll. You can dynamically load large number of resources and events in the Scheduler by setting `true` to the `allowVirtualScrolling` property within the view specific settings. The virtual loading of events is possible in Agenda view, by setting `allowVirtualScrolling` property to `true` within the agenda view specific settings.

</body>
</html>

```

For now, the virtual loading of resources and events is not supported in **MonthAgenda**, **Year** and **TimelineYear** (Horizontal Orientation) views.

Enabling lazy loading for appointments

The lazy loading feature provides a convenient way to efficiently load resource appointments into the Scheduler using an on-demand approach. With this feature, you can seamlessly load a large volume of appointment data into the Scheduler without experiencing any performance degradation.

By default, the Scheduler fetches all the relevant appointments from the server with in the current date range. However, enabling this feature will trigger query requests to the server for appointment retrieval whenever new resources are rendered due to scroll actions. These queries contain the resource IDs of currently displayed resources along with current date range, which can be passed as a comma-separated string. In the server controller, these resource IDs are parsed to filter the necessary appointments to render in the scheduler.

When you enable this feature, the Scheduler becomes capable of fetching events from remote services only for the current view port alone to optimize the data retrieval. The remaining appointment data is fetched form the server on-demand based on currently rendered view port resources as you scroll's through the scheduler content.

To enable this feature, you have to set the [enableLazyLoading](#) property to **true** within the view specific settings.

Here's the server-side controller code that retrieves appointment data based on the resource IDs provided as query parameters:

```

`c#
using Microsoft.AspNetCore.Mvc;
using System.Collections.Generic;
using System;
using Microsoft.EntityFrameworkCore;
using System.Linq;
using System.ComponentModel.DataAnnotations;
using Microsoft.AspNetCore.OData.Query;
namespace LazyLoadingServices.Controllers
{
    public class VirtualEventDataController : Controller
    {
        private readonly EventsContext dbContext;

        [HttpGet]
        [EnableQuery]
        [Route("api/VirtualEventData")]
        public IActionResult GetData([FromQuery] Params param)
        {
            IQueryable<EventData> query = dbContext.Events;

```

```
// Filter the appointment data based on the ResourceId query params.
if (!string.IsNullOrEmpty(param.ResourceId))
{
    string[] resourceId = param.ResourceId.Split(',');
    query = query.Where(data => resourceId.Contains(data.ResourceId.ToString()));
}
return Ok(query.ToList());
}
}

public class Params
{
    public DateTime? StartDate { get; set; }
    public DateTime? EndDate { get; set; }
    public string ResourceId { get; set; }
}
,
```

* The property will be effective, when large number of resources and appointments bound to the Scheduler.

* This property is applicable only when [resource grouping](#) is enabled in Scheduler.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Editor template in React Schedule component

Scheduler makes use of popups and dialog to display the required notifications, as well as includes an editor window with event fields for making the appointment creation and editing process easier. You can also easily customize the editor window and the fields present in it, and can also apply validations on those fields.

Event editor

The editor window usually opens on the Scheduler, when a cell or event is double clicked. When a cell is double clicked, the detailed editor window opens in "Add new" mode, whereas when an event is double clicked, the same is opened in an "Edit" mode.

In mobile devices, you can open the detailed editor window in edit mode by clicking the edit icon on the popup, that opens on single tapping an event. You can also open it in add mode by single tapping a cell, which will display a **+** indication, clicking on it again will open the editor window.

You can also prevent the editor window from opening, by rendering Scheduler in a **readonly** mode or by doing code customization within the **popupOpen** event.

How to change the editor window header title and text of footer buttons

You can change the header title and the text of buttons displayed at the footer of the editor window by changing the appropriate localized word collection used in the Scheduler.

```

Field validation

It is possible to validate the required fields of the editor window from client-side before submitting it, by adding appropriate validation rules to each field. The appointment fields have been extended to accept both **string** and **object** type values. To perform validations, it is necessary to specify object values for the event fields.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from
'@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const minValidation = (args) => {
        return args['value'].length >= 5;
    };
    const fieldsData = {
        id: 'Id',
        subject: { name: 'Subject', validation: { required: true } },
        location: { name: 'Location', validation: { required: true } },
        description: {
            name: 'Description', validation: {
                required: true, minLength: [minValidation, 'Need atleast 5
letters to be entered']
            }
        }
    };

```

</body>
</html>

```

Applicable validation rules can be referred from [form validation](#) documentation.

Add additional fields to the default editor

The additional fields can be added to the default event editor by making use of the `popupOpen` event which gets triggered before the event editor opens on the Scheduler. The `popupOpen` is a client-side event that triggers before any of the generic popups opens on the Scheduler. The additional field (any of the form elements) should be added with a common class name `e-field`, so as to handle and process

those additional data along with the default event object. In the following example, an additional field **Event Type** has been added to the default event editor and its value is processed accordingly.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { ScheduleComponent, ViewsDirective, ViewDirective, Day, Week,
WorkWeek, Month, Inject } from '@syncfusion/ej2-react-schedule';

Customizing the default time duration in editor window

In default event editor window, start and end time duration are processed based on the **interval** value set within the **timeScale** property. By default, **interval** value is set to 30, and therefore the start/end time duration within the event editor will be in a 30 minutes time difference. You can change this duration value by changing the **duration** option within the **popupOpen** event as shown in the following code example.

How to prevent the display of editor and quick popups

It is possible to prevent the display of editor and quick popup windows by passing the value `true` to `cancel` option within the `popupOpen` event.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { ScheduleComponent, ViewsDirective, ViewDirective, Day, Week,
WorkWeek, Month, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    const onPopupOpen = (args) => {
        args.cancel = true;
    }
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} popupOpen={onPopupOpen}>
        <ViewsDirective>
            <ViewDirective option='Day' />
            <ViewDirective option='Week' />
            <ViewDirective option='WorkWeek' />
            <ViewDirective option='Month' />
        </ViewsDirective>
        <Inject services={[Day, Week, WorkWeek, Month]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the `popupOpen` event are as follows.

Type	Description
Editor	For Detailed editor window.
QuickInfo	For Quick popup which opens on cell click.
EditEventInfo	For Quick popup which opens on event click.
ViewEventInfo	For Quick popup which opens on responsive mode.
EventContainer	For more event indicator popup.
RecurrenceAlert	For edit recurrence event alert popup.
DeleteAlert	For delete confirmation popup.
ValidationAlert	For validation alert popup.
RecurrenceValidationAlert	For recurrence validation alert popup.

Customizing timezone collection in the editor window

By default, the timezone collections in the editor window have been loaded with built-in timezone collections. Now we can be able to customize the timezone collections using the `timezoneDataSource` property with the collection of `TimezoneFields` data.

INDEX.JSX

```

import * as React from 'react';

Customizing event editor using template

The event editor window can be customized by making use of the `editorTemplate` option. Here, the custom window design is built with the required fields using the script template and its type should be of `text/x-template`.

Each field defined within template should contain the `e-field` class, so as to allow the processing of those field values internally. The ID of this customized script template section is assigned to the `editorTemplate` option, so that these customized fields will be replaced onto the default editor window.

Note: `e-field` class only applicable for **DropDownList**, **DateTimePicker**, **MultiSelect**, **DatePicker**, **CheckBox** and **TextBox** components. Since we have processed the field values internally for the above mentioned components.

As we are using our Syncfusion sub-components within our editor using template in the following example, the custom defined form elements needs to be configured as required Syncfusion components such as **DropDownList** and [Link to the Video](#) within the `popupOpen` event. This particular step can be skipped, if the user needs to simply use the usual form elements.

Learn how to customize the event editor window using templates from this video:

How to customize header and footer using template

The editor window's header and footer can be enhanced with custom designs using the [editorHeaderTemplate](#) and [editorFooterTemplate](#) options. To achieve this, create a script template that includes the necessary fields. Ensure that the template type is set to **text/x-template**.

In this demo, we tailor the editor's header according to the appointment's subject field using the [editorHeaderTemplate](#). Furthermore, we make use of the [editorFooterTemplate](#) to handle the functionality of validating specific fields before proceeding with the save action or canceling it if validation requirements are not met.

Apply validations on editor template fields

In the following code example, validation has been added to the status field.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { ScheduleComponent, ViewsDirective, ViewDirective, Day, Week,
WorkWeek, Month, Inject } from '@syncfusion/ej2-react-schedule';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { DateTimePickerComponent } from '@syncfusion/ej2-react-calendars';
import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    const onPopupOpen = (args) => {
        if (args.type === 'Editor') {
            let statusElement = args.element.querySelector('#EventType');
            if (statusElement) {
                statusElement.setAttribute('name', 'EventType');
            }
            if (!isNullOrUndefined(document.getElementById("EventType_Error"))) {
                document.getElementById("EventType_Error").style.display = "none";
                document.getElementById("EventType_Error").style.left = "351px";
            }
            let formElement = args.element.querySelector('.e-schedule-form');
            let validator = formElement.ej2_instances[0];
            validator.addRules('EventType', { required: true });
        }
    }
    const onSelect = (args) => {
        if (!isNullOrUndefined(document.getElementById("EventType_Error"))) {
            document.getElementById("EventType_Error").style.display = "none";
        }
    }
    const editorTemplate = (props) => {
        return ((props !== undefined) ? <table className="custom-event-editor"

How to save the customized event editor using template

The **e-field** class is not added to each field defined within the template, so you should allow to set those field values externally by using the **popupClose** event.

Note: You can allow to retrieve the data only on the **save** and **delete** option. Data cannot be retrieved on the **close** and **cancel** options in the editor window.

The following code example shows how to save the customized event editor using a template by the **popupClose** event.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';

In case, if you need to prevent only specific popups on Scheduler, then you can check the condition based on the popup type. The types of the popup that can be checked within the `popupClose` event are as follows.

Type	Description
Editor	For Detailed editor window.
QuickInfo	For Quick popup which opens on cell click.
EditEventInfo	For Quick popup which opens on event click.
ViewEventInfo	For Quick popup which opens on responsive mode.
EventContainer	For more event indicator popup.
RecurrenceAlert	For edit recurrence event alert popup.
DeleteAlert	For delete confirmation popup.
ValidationAlert	For validation alert popup.
RecurrenceValidationAlert	For recurrence validation alert popup.

Quick popups

The quick info popups are the ones that gets opened, when a cell or appointment is single clicked on the desktop mode. On single clicking a cell, you can simply provide a subject and save it. Also, while single clicking on an event, a popup will be displayed where you can get the overview of the event information. You can also edit or delete those events through the options available in it.

By default, these popups are displayed over cells and appointments of Scheduler and to disable this action, set `false` to `showQuickInfo` property.

The quick popup that opens while single clicking on the cells are not applicable on mobile devices.

How to open QuickInfo popup on multiple cell selection

By default the **QuickInfo** popup will open on single click of the cell. To open the quick info popup on multiple cell selection, you need to select the cells and press enter key. You can open this popup immediately after multiple cell selection by setting up **true** to **quickInfoOnSelectionEnd** property where as its default value is **false**.

How to change the watermark text of quick popup subject

By default, **Add Title** text is displayed on the subject field of quick popup. To change the default watermark text, change the value of the appropriate localized word collection used in the Scheduler.

```

`ts
L10n.load({
'en-US': {
'schedule': {
'addTitle': 'New Title'
}
}
});
`

```

Customizing quick popups

The look and feel of the built-in quick popup window, which opens when single clicked on the cells or appointments can be customized by making use of the **quickInfoTemplates** property of the Scheduler. There are 3 sub-options available to customize them easily,

- header - Accepts the template design that customizes the header part of the quick popup.
- content - Accepts the template design that customizes the content part of the quick popup.
- footer - Accepts the template design that customizes the footer part of the quick popup.

    </div>
</body>
</html>

```

The quick popup in adaptive mode can also be customized using `quickInfoTemplates` using `e-device` class.

More events indicator and popup

When the number of appointments count that lies on a particular time range * default appointment height exceeds the default height of a cell in month view and all other timeline views, a `+ more` text indicator will be displayed at the bottom of those cells. This indicator denotes that the cell contains few more appointments in it and clicking on that will display a popup displaying all the appointments present on that day.

To disable this option of showing popup with all hidden appointments, while clicking on the text indicator, you can do code customization within the `popupOpen` event.

The same indicator is displayed on all-day row in calendar views such as day, week and work week views alone, when the number of appointment count present in a cell exceeds three. Clicking on the text indicator here will not open a popup, but will allow the expand/collapse option for viewing the remaining appointments present in the all-day row.

The following code example shows how to disable the display of such popups while clicking on the more text indicator.

How to open the quick info popup manually

You can open the quick info popup in scheduler by using the [openQuickInfoPopup](#) public method. To open the cell quick info popup, you can pass the cell data as an argument to the method. To open the event quick info popup, you should pass the event data object as an argument to the method.

How to close the quick info popup manually

You can close the quick info popup in scheduler by using the [closeQuickInfoPopup](#) public method. The following code example demonstrates the how to close quick info popup manually.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { Day, Week, WorkWeek, Month, ScheduleComponent, ViewsDirective,
ViewDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
const App = () => {
  const scheduleObj = useRef(null);
  const ClickButton = () => {
    scheduleObj.current.closeQuickInfoPopup();
  }
  const data = [{
    Id: 1,
    Subject: 'Review Meeting',
    StartTime: new Date(2023, 2, 5, 9, 0, 0),
    EndTime: new Date(2023, 2, 5, 10, 0, 0)
  }];
  const eventSettings = { dataSource: data };
  return (<div>
    <ButtonComponent onClick={ClickButton.bind(this)}>Close QuickInfo
    Popup</ButtonComponent>
    <ScheduleComponent width='100%' height='550px' selectedDate={new
    Date(2023, 2, 5)} ref={scheduleObj} currentView='Month'
    eventSettings={eventSettings}>
      <ViewsDirective>
        <ViewDirective option='Day' />
        <ViewDirective option='Week' />
        <ViewDirective option='WorkWeek' />

```

```

        <ViewDirective option='Month' />
      </ViewsDirective>
      <Inject services={[Day, Week, WorkWeek, Month]} />
    </ScheduleComponent>

```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Timezone in React Schedule component

The Scheduler makes use of the current system time zone by default. If it needs to follow some other user-specific time zone, then the `timezone` property needs to be used. Apart from the default action of applying specific timezone to the Scheduler, it is also possible to set different time zone values for each

appointments through the properties `startTimezone` and `endTimezone` which can be defined as separate fields within the event fields collection.

Note: **timezone** property only applicable for the appointment processing and current time indication.

Understanding date manipulation in JavaScript

The `new Date()` in JavaScript returns the exact current date object with complete time and timezone information. For example, it may return value such as `Wed Dec 12 2018 05:23:27 GMT+0530 (India Standard Time)` which indicates that the current date is December 12, 2018 and the current time is 5.23 AM on browsers following the IST timezone.

Scheduler with no timezone

When no specific time zone is set to Scheduler, appointments will be displayed based on the client system's timezone which is the default behavior. Here, the same appointment when viewed from different timezone will have different start and end times.

The following code example displays an appointment from 9.00 AM to 10.00 AM when you open the Scheduler from any of the timezone. This is because, we are providing the start and end time enclosing with `new Date()` which works based on the client browser's timezone.

      width: 30%;
    }
  </style>

```

```

    </style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Scheduler set to specific timezone

When a time zone is set to Scheduler through `timezone` property, the appointments will be displayed exactly based on the Scheduler timezone regardless of its client timezone. In the following code example, appointments will be displayed based on Eastern Time (UTC -05:00).

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject, }
from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 17)} eventSettings={eventSettings} timezone='America/New_York'>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
    EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings: EventSettingsModel = { dataSource: scheduleData };
    return (
        <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 17)} eventSettings={eventSettings} timezone='America/New_York'
        >
            <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
    )
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

[Add or remove timezone names to/from the timezone collection](#)

Instead of displaying all the timezone names within the timezone collection (more than 200 are displayed on the editor window timezone fields by default), you can customize the timezone collection at application end as shown in the following example.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { useEffect } from 'react';
import { ScheduleComponent, Day, Week, Month, timezoneData, Inject } from
 '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    const timeZones = [
        { Value: 'America/New_York', Text: '(UTC-05:00) Eastern Time' },
        { Value: 'UTC', Text: 'UTC' },
        { Value: 'Asia/Kolkata', Text: '(UTC+05:30) India Standard Time' }
    ];
    useEffect(() => {
        timezoneData.splice(0, timezoneData.length, timeZones);
    }, []);
    return (
        <ScheduleComponent width='100%' height='550px' selectedDate={new
        Date(2018, 1, 1)} eventSettings={eventSettings}>
            <Inject services={[Day, Week, Month]} />
        </ScheduleComponent>
    );
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';

Timezone methods

offset

This method is used to calculate the difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **number**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let timeZoneOffset: number = timezone.offset(date,"Europe/Paris");
console.log(timeZoneOffset); //-60
`
```

convert

This method is used to convert the passed date from one timezone to another timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
fromOffset	number/string	Timezone from which date need to be converted.
toOffset	number/string	Timezone to which date need to be converted.

Returns **Date**

```
`ts
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.convert(date, "Europe/Paris", "Asia/Tokya");
let convertedDate1: Date = timezone.convert(date, 60, -360);
console.log(convertedDate); //2018-12-05T08:55:11.000Z
console.log(convertedDate1); //2018-12-05T16:55:11.000Z
`
```

`

add

This method is used to add the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC time as date object.
Timezone	String	Timezone.

Returns **Date**

`ts

```
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.add(date, "Europe/Paris");
console.log(convertedDate); //2018-12-05T05:25:11.000Z
```

`

remove

This method is used to remove the time difference between passed UTC date and timezone.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC as date object.
Timezone	String	Timezone.

Returns **Date**

`ts

```
// Assume your local timezone as IST/UTC+05:30
let timezone: Timezone = new Timezone();
let date: Date = new Date(2018,11,5,15,25,11);
let convertedDate: Date = timezone.remove(date, "Europe/Paris");
console.log(convertedDate); //2018-12-05T14:25:11.000Z
```

`

removeLocalOffset

This method is used to remove the local offset time from the date passed.

Parameters	Type	Description
----- ----- -----		
Date	Date	UTC as date object.

Returns `Date`

```
`ts
```

```
// Assume your local timezone as IST/UTC+05:30
```

```
let timezone: Timezone = new Timezone();
```

```
let date: Date = new Date(2018,11,5,15,25,11);
```

```
let convertedDate: Date = timezone.removeLocalOffset(date);
```

```
console.log(convertedDate); //2018-12-05T15:25:11.000Z
```

```
`
```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Views in React Schedule component

The Scheduler includes wide variety of view modes with unique configuration options for each view. The available view modes are listed below, out of which the [Link to the Video](#) view is set as active.

- Day
- Week
- Work week
- Month
- Year
- Agenda
- Month-Agenda
- Timeline Day
- Timeline Week
- Timeline Work Week
- Timeline Month
- Timeline Year

To navigate between different views and dates, the navigation options are available at the Scheduler header bar. The active view option is usually highlighted by default. The date range of the active view will also be displayed at the left corner of the header bar, clicking on which will open a calendar popup for the ease of desired date selection.

Learn how to customize each individual view of React Scheduler with different settings by watching this video:

By default, Scheduler displays the calendar views such as day, week, work week, month and agenda.

Setting specific view on scheduler

As the Scheduler displays `week` view by default, therefore to change the active view, set `currentView` property with the desired view name. The applicable view names that the Scheduler accepts are as follows,

- Day
- Week
- WorkWeek

- Month
- Year
- Agenda
- MonthAgenda
- TimelineDay
- TimelineWeek
- TimelineWorkWeek
- TimelineMonth
- TimelineYear

It is necessary to import and inject the appropriate view modules into the application to make use of these view modes on the Scheduler. Also, it is possible to display only the desired views on the Scheduler. To define and configure specific views, use the [views](#) property.

In the following example, the Scheduler displays 4 views namely, Week, Month, TimelineWeek and Timeline Month. The appropriate view modules are imported and injected properly to display those views on the Scheduler.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Week, Month, TimelineViews, TimelineMonth,
Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-
schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Week' />
      <ViewDirective option='TimelineWeek' />
      <ViewDirective option='Month' />
      <ViewDirective option='TimelineMonth' />
    </ViewsDirective>
    <Inject services={[Week, Month, TimelineViews, TimelineMonth]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```

  </div>
</body>
</html>

```

ViewDirective and ViewsDirective needs to be imported to define views.

To configure Scheduler with simply 2 views, but with different configurations on each view, refer the following code example. Here, the Week view displays the dates in dd-MM-yyyy format whereas the Month view hides the weekend days and also displays it in readonly mode.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Week, Month, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Week' dateFormat='dd-MMM-yyyy' />
      <ViewDirective option='Month' showWeekend={false} readonly={true} />
    </ViewsDirective>
    <Inject services={[Week, Month]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, Month, Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} >
    <ViewsDirective>
      <ViewDirective option='Week' dateFormat='dd-MMM-yyyy' />
      <ViewDirective option='Month' showWeekend={false} readonly={true} />
    </ViewsDirective>

```

```

    <Inject services={[Week, Month]} />
  </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

</html>

View specific configuration

There are scenarios where each view may need to have different configurations. For such cases, you can define the applicable scheduler properties within the `views` Property for each view option as depicted in the following examples. The fields available to be used within each view options are as follows.

Property	Type	Description	Applicable views
----------	------	-------------	------------------

option	View	It accepts the Scheduler view name, based on which we can define its related properties. The view names can be <code>Day</code> , <code>Week</code> and so on.	All views.
--------	------	--	------------

isSelected	Boolean	It acts similar to the <code>currentView</code> property and defines the active view of the Scheduler.	All views.
------------	---------	--	------------

dateFormat	Date	By default, Scheduler follows the date format as per the default culture assigned to it. When it is defined under specific view, only those assigned views follows this date format.	All views.
------------	------	--	------------

readonly	Boolean	When set to <code>true</code> , prevents the CRUD actions on the respective view under where it is defined.	All views.
----------	---------	---	------------

resourceHeaderTemplate	String	The template option which is used to customize the resource header cells on the Scheduler. It gets applied only on the views, wherever it is defined.	All views.
------------------------	--------	---	------------

dateHeaderTemplate	String	The template option which is used to customize the date header cells and is applied only on the views, wherever it is defined.	All views.
--------------------	--------	--	------------

eventTemplate	String	The template option to customize the events background. It will get applied to the events of the view to which it is currently being defined.	All views.
---------------	--------	---	------------

showWeekend	Boolean	When set to <code>false</code> , it hides the weekend days of a week from the views on which it is defined.	All views.
-------------	---------	---	------------

group	GroupModel	Allows to set different resource grouping options on all available Scheduler view modes.	All views.
-------	------------	--	------------

cellTemplate	String	The template option to customize the work cells of the Scheduler and is applied only on the views, on which it is defined.	Applicable on all views except Agenda view.
--------------	--------	--	---

workDays	Number[]	It is used to set the working days on the Scheduler views.	Applicable on all views except Agenda view.
----------	----------	--	---

displayName	String	When a particular view is customized to display with different intervals, this property allows the user to set different display name for each of the views.	Applicable on all views except Agenda and Month Agenda.
-------------	--------	--	---

interval	Number	It allows to customize the default Scheduler views with different set of days, weeks, work weeks or months on the applicable view type.	Applicable on all views except Agenda and Month Agenda.
----------	--------	---	---

startHour	String	It is used to specify the start hour, from which the Scheduler should be displayed. It accepts the time string in a short skeleton format and also, hides the time beyond the specified start	
-----------	--------	---	--

time. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. |

| **endHour** | String | It is used to specify the end hour, at which the Scheduler ends. It accepts the time string in a short skeleton format. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| **timeScale** | TimeScaleModel | Allows to set different timescale configuration on each applicable view modes. | Applicable on Day, Week, Work Week, Timeline Day, Timeline Week, and Timeline Work Week views. |

| **showWeekNumber** | Boolean | When set to **true**, shows the week number on the respective weeks. | Applicable on Day, Week, Work Week, and Month views. |

| **allowVirtualScrolling** | Boolean | It is used to enable or disable the virtual scrolling functionality. | Applicable on Agenda and Timeline views. |

| **headerRows** | HeaderRowsModel | Allows defining the custom header rows on timeline views of the Scheduler to display the year, month, week, date and hour label as an individual row. | Applicable only on all timeline views. |

Day view

Usually a day view displays a single day with all its related appointments. It is possible to customize the day view to display more number of days by extending the **ViewDirective** with **interval** option. You can also define any of the above defined properties within the **ViewDirective** definition as depicted in the following code example.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  const timeScale = { enable: true, slotCount: 5 };
  return <ScheduleComponent width='100%' height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' startHour='09:30' endHour='18:00'
timeScale={timeScale} />
    </ViewsDirective>
    <Inject services={[Day]} />
  </ScheduleComponent>;
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
```

```

ScheduleComponent, Day, Inject,
ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  const timeScale = { enable: true, slotCount: 5 };
  return <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)}
    eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' startHour='09:30' endHour='18:00'
timeScale={timeScale} />
    </ViewsDirective>
    <Inject services={[Day]} />
  </ScheduleComponent>
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

inputs/styles/material.css" rel="stylesheet" />
  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-
navigations/styles/material.css" rel="stylesheet" />
  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-
popups/styles/material.css" rel="stylesheet" />
  <link href="https://cdn.syncfusion.com/ej2/20.3.56/ej2-react-
schedule/styles/material.css" rel="stylesheet" />
  <link
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
rel="stylesheet" />
  <link href="index.css" rel="stylesheet" />
  <script
src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></scr
ipt>
  <script src="systemjs.config.js"></script>
  <style>
    #loader {

```

```

        color: #008cff;
        height: 40px;
        left: 45%;
        position: absolute;
        top: 45%;
        width: 30%;
    }
</style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

All the above defined properties can be accessed within Day view except `allowVirtualScrolling` and `headerRows`.

Week view

The Week view displays a count of 7 days (from Sunday to Saturday) with all its related appointments. The first day of the week can be changed using the `firstDayOfWeek` which accepts the integer (Sunday=0, Monday=1, Tuesday=2 and so on) value. You can navigate to a particular date in day view from the week view by clicking on the appropriate dates on the date header bar.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    const timeScale = { enable: true, slotCount: 5 };
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Day' interval={2} displayName='2 Days' startHour='09:30' endHour='18:00' timeScale={timeScale} />
            <ViewDirective option='Week' interval={2} displayName='2 Weeks' showWeekend={false} isSelected={true} />
        </ViewsDirective>
        <Inject services={[Day, Week]} />
    </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

    width: 30%;
  }
</style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

Work Week view

The Work week view displays only the working days of a week (count of 5 days) and its associated appointments. It is possible to customize the working days on the work week view by using the **workDays** property which accepts an array of integer values (such as Sunday=0, Monday=1, Tuesday=2 and so on). By default, it displays from Monday to Friday (5 days). You can also navigate to a particular date in the day view from the work week view by clicking on the appropriate dates in the date header bar.

The following code example depicts how to customize the resource header cells only on the **Work Week** view of the Scheduler.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, WorkWeek, Inject, ViewsDirective, ViewDirective }
from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  const workDays = [2, 3, 5];
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='WorkWeek' workDays={workDays} />
    </ViewsDirective>
    <Inject services={[WorkWeek]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

The Week, Work week and Day views can display the all-day row appointments in a separate all-day row with an expand/collapse option to view it.

Month view

A Month view displays the entire days of a particular month and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the month cells.

By default, when you try to create an appointment through Month view, it is considered as created for an entire day. You can explicitly change this behavior by unchecking the **All-day** option from editor window, so that it defaults to the start time duration as 9.00 AM and end time as 9.30 AM.

You can also have the **+ more** text indicator on each day cell of a Month view, clicking on which will allows you to view the hidden appointments of a day.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Month, Inject, ViewsDirective, ViewDirective }
from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Month' showWeekNumber={true} readonly={true} />

Year view

A Year view displays all the days of a particular year with months and all its related appointments. You can navigate to a particular date in the day view by clicking on the appropriate date text on the year cells.

Year view is available in both the **Horizontal** and **Vertical** orientations. You can manage the orientation of year view through **views** property.

  </div>
</body>
</html>

```

The year view also has module support. In that, you can get all the months of a particular year in a calendar view format. In that calendar view, appointment contained dates are highlighted with dots placed under the individual date. When you click on the date, the event popup will be displayed and the events will be listed.

Agenda view

The Agenda view lists out the appointments in a grid-like view for the next 7 days by default from the current date. The count of the days can be changed using the API `agendaDaysCount`. It allows virtual scrolling of dates by enabling the `allowVirtualScrolling` property. Also, you can enable or disable the display of days on Scheduler that has no appointments by setting true or false to the `hideEmptyAgendaDays` property.

The following code example depicts how to customize the display of events within Agenda view alone.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Agenda, Inject, ViewsDirective, ViewDirective }
from '@syncfusion/ej2-react-schedule';

    </div>
</body>
</html>

```

Schedule Height is mandatory to set in pixels for Agenda view alone.

Month Agenda view

A Month-Agenda view shows a month calendar, where clicking on a particular day will display the appointments present on that date below the calendar. The day with appointments are differentiated with a circular dot below the date of the calendar.

The following code example shows how to hide the weekend days on **MonthAgenda** view as well as the working days list is modified on Month Agenda view alone.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, MonthAgenda, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    const workDays = [1, 2, 3];

```

```

    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 14)} eventSettings={eventSettings}>
    <ViewsDirective>
    <ViewDirective option='MonthAgenda' showWeekend={false}
workDays={workDays} />
    </ViewsDirective>
    <Inject services={[MonthAgenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

Timeline views – Day, Week, Work Week

Similar to the day view, it shows a single day with all its appointments where the time slots are displayed horizontally. By default, the cell height adjusts as per the height set to Scheduler. When the number of appointments exceeds the visible area of the cells, the **+ more** text indicator will be displayed at the bottom to denote the presence of few more appointments in that time range.

To make use of the timeline views (Timeline Day, Timeline Week and Timeline Work Week) on Scheduler, import and inject the module **TimelineViews** from the **ej2-schedule** package.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineViews, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
        <ViewsDirective>

```

```

    <ViewDirective option='TimelineDay' startHour='10:00' endHour='15:30'
  />
  </ViewsDirective>
  <Inject services={[TimelineViews]} />
</ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

</html>

```

The following code example depicts how to display the timeline work week view on Scheduler,

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineViews, Agenda, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    const workDays = [2, 3, 5];
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='TimelineWorkWeek' interval={3}
workDays={workDays} dateFormat='dd-MMM-yyyy' />
            <ViewDirective option='Agenda' />
        </ViewsDirective>
        <Inject services={[TimelineViews, Agenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, TimelineViews, Agenda, Inject,
    ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    const workDays: number[] = [2, 3, 5];

```

```

return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)}
    eventSettings={eventSettings}>
    <ViewsDirective>
        <ViewDirective option='TimelineWorkWeek' interval={3}
workDays={workDays} dateFormat='dd-MMM-yyyy' />
        <ViewDirective option='Agenda' />
    </ViewsDirective>
    <Inject services={[TimelineViews, Agenda]} />
    </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.HTML

```

<!DOCTYPE html>

            height: 40px;
            left: 45%;
            position: absolute;
            top: 45%;
            width: 30%;

```

```

    }
  </style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

Clicking on the dates in the date header bar of Timeline day, Timeline week and Timeline work week will allow you to navigate to the Agenda view.

Timeline Month view

A Timeline Month view displays the current month days along with its appointments. To make use of the timeline Month view on Scheduler, import and inject `TimelineMonth` module from the `ej2-schedule` package.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineMonth, TimelineViews, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='TimelineMonth' showWeekend={false} />
      <ViewDirective option='TimelineDay' />
    </ViewsDirective>
    <Inject services={[TimelineMonth, TimelineViews]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, TimelineMonth, TimelineViews, Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)}
    eventSettings={eventSettings}>
    <ViewsDirective>

```

```

    <ViewDirective option='TimelineMonth' showWeekend={false} />
    <ViewDirective option='TimelineDay' />
  </ViewsDirective>
  <Inject services={[TimelineMonth, TimelineViews]} />
</ScheduleComponent>
);
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.HTML

```

<!DOCTYPE html>

ipt>
  <script src="systemjs.config.js"></script>
  <style>
    #loader {
      color: #008cff;
      height: 40px;
      left: 45%;
      position: absolute;
      top: 45%;
      width: 30%;
    }
  </style>
</head>
<body>
  <div id='schedule'>

```

```

        <div id='loader'>Loading....</div>
      </div>
</body>
</html>

```

Clicking on the dates in the date header bar of Timeline month will allow you to navigate to the Timeline day view.

Timeline Year view

In Timeline Year view, each row depicts a single resource. Whereas in the vertical view, each resource is grouped parallelly as columns. Here, the resource grouping follows the tree-view like hierarchical grouping structure and can contain any level of child resources.

To make use of the timeline Year view on Scheduler, import and inject `TimelineYear` module from the `ej2-schedule` package.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineYear, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='TimelineYear' displayName='Horizontal Timeline
Year' isSelected={true} />
    </ViewsDirective>
    <Inject services={[TimelineYear]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, TimelineYear, Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: appData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)}
    eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='TimelineYear' displayName='Horizontal Timeline
Year' isSelected={true} />

```

```

    </ViewsDirective>
    <Inject services={[TimelineYear]} />
  </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.HTML

```

Resource grouping

The following code example depicts how to group the multiple resources on Timeline Year view and its relevant events are displayed accordingly under those resources.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineYear, ViewsDirective, ViewDirective,
ResourcesDirective, ResourceDirective, Inject } from '@syncfusion/ej2-react-
schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData };
  const group = { resources: ['Projects', 'Categories'] };
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
  ];
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 3, 1)} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='TimelineYear' displayName='Horizontal Timeline
Year' isSelected={true} />
      <ViewDirective option='TimelineYear' displayName='Vertical Timeline
Year' orientation='Vertical' group={group} />
    </ViewsDirective>
    <ResourcesDirective>
      <ResourceDirective field='OwnerId' title='Owner' name='Owners'
allowMultiple={true} dataSource={ownerData} textField='OwnerText'
idField='Id' colorField='OwnerColor'>
      </ResourceDirective>
    </ResourcesDirective>
    <Inject services={[TimelineYear]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
ScheduleComponent, TimelineYear, ViewsDirective, ViewDirective,
ResourcesDirective, ResourceDirective, Inject, EventSettingsModel,
GroupModel
} from '@syncfusion/ej2-react-schedule';

    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Auto row height

Timeline Year view supports Auto row height. When the feature `rowAutoHeight` is enabled, the row height gets auto-adjusted based on the number of overlapping events occupied in the same time range. If you disable the Auto row height, you have the + more text indicator on each day cell of a Timeline Year view, clicking on which will allow you to view the hidden appointments of a day.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineYear, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';

```

Extending view intervals

It is possible to customize the display of default number of days on different Scheduler view modes. For example, a day view can be extended to display 3 days by setting the `interval` option as 3 for the `Day` option within the `ViewDirective` as depicted in the following code example. In the same way, you can also display 2 weeks by setting interval 2 for the `Week` option.

You can provide the alternative display name for such customized views on the Scheduler header bar, by setting the appropriate `displayName` property.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { appData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: appData };
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Day' interval={3} displayName='3 Days' />

```

```

    <ViewDirective option='Week' interval={2} displayName='2 Weeks' />
  </ViewsDirective>
  <Inject services={[Day, Week]} />
</ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Calendar mode in React Schedule component

The Scheduler supports the following two types of calendar mode.

- Gregorian Calendar
- Islamic Calendar

Gregorian Calendar

The Scheduler by default displays the gregorian calendar dates which is the most widely used calendar in the world. The Gregorian calendar is a solar calendar which has 12 months with 28 to 31 days each. A year which is divisible by four is said to be a leap year in this calendar mode. A leap year usually has 366 days whereas the regular year has 365 days.

Islamic Calendar

The Islamic Calendar, also known as the Hijri or Muslim calendar, is a lunar calendar which has 12 months in a year with 354 or 355 days. Each month of this calendar denotes the birth of the new lunar cycle and therefore, each month can have 29 or 30 days depending on the visibility of the moon. Here, the odd-numbered months have 30 days and the even months have 29 days.

The current Islamic year is 1440 AH. Usually the Gregorian calendar runs from approximately 11 September 2018 to 30 August 2019 for this 1440 AH year.

The Scheduler has a property `calendarMode` which is used to switch between the gregorian and islamic calendar modes. By default, it is set to `Gregorian` and to use it with Islamic calendar dates, define the `calendarMode` of Scheduler to `Islamic`. The following example depicts, how to display the Islamic calendar dates on Scheduler.

To make use of Islamic calendar in Scheduler, import the `Calendar` and `Islamic` module from `ej2-calendars` package and also inject it using the `Calendar.Inject` method. Apart from this, it requires the following CLDR data to be loaded using `loadCldr` function.

- `numberingSystems.json`
- `ca-gregorian.json`
- `numbers.json`
- `timeZoneNames.json`
- `ca-islamic.json`

To know more information on, how to install the CLDR data, refer the [Internationalization](#) topic.

    </div>
</body>
</html>

```

Note: However, this feature does not yet support recurrence options, which we are planning to add them in the next release.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) [Link to the Video](#) to know how to present and manipulate data.

Resources in React Schedule component

Resources and grouping support allows the Scheduler to be shared by multiple resources. Also, the appointments of each resource are displayed under relevant resources. Each resource in the Scheduler is arranged in a column/row wise order, with individual spacing to display all its respective appointments on a single page. It also supports the multiple levels of grouping of resources, thus enabling the categorization of resources in a hierarchical structure and shows it either in expandable groups (Timeline views) or else vertical hierarchy one after the other (Calendar views).

It is also possible to assign one or more resources to the same appointment, by allowing multiple selection of resource options available in the event editor window.

The HTML5 JavaScript Scheduler groups the resources based on different criteria. It includes grouping appointments based on resources, grouping resources based on dates, and timeline scheduling. Also, the data for resources bind with Scheduler either as a local JSON collection or URL, retrieving data from remote data services.

Learn how to add appointments of multiple resources to the React Scheduler from this video:

Resource fields

The default options available within the `resources` collection are as follows,

Field name	Type	Description
-----	-----	-----
<code>field</code>	String	A value that binds to the resource field of event object.
<code>title</code>	String	It holds the title of the resource field to be displayed on the event editor window.
<code>name</code>	String	A unique resource name used for differentiating various resource objects while grouping.
<code>allowMultiple</code>	Boolean	When set to <code>true</code> , allows multiple selection of resource names, thus creating multiple instances of same appointment for the selected resources.
<code>dataSource</code>	Object	Assigns the resource <code>dataSource</code> , where data can be passed either as an array of JavaScript objects, or else can create an instance of DataManager in case of processing remote data and can be assigned to the <code>dataSource</code> property. With the remote data assigned to <code>dataSource</code> , check the available adaptors to customize the data processing.
<code>query</code>	Query	Defines the external query that will be executed along with the data processing.
<code>idField</code>	String	Binds the resource ID field name from the resources <code>dataSource</code> .
<code>expandedField</code>	String	Binds the <code>expandedField</code> name from the resources <code>dataSource</code> . It usually holds boolean value which decide whether the resource of timeline views is in collapse or expand state on initial load.
<code>textField</code>	String	Binds the text field name from the resources <code>dataSource</code> . It usually holds the resource names.
<code>groupIDField</code>	String	Binds the group ID field name from the resource <code>dataSource</code> . It usually holds the value of resource IDs of parent level resources.
<code>colorField</code>	String	Binds the color field name from the resource <code>dataSource</code> . The color value mapped in this field will be applied to the events of resources.
<code>startHourField</code>	String	Binds the start hour field name from the resource <code>dataSource</code> . It allows to provide different work start hour for the resources.
<code>endHourField</code>	String	Binds the end hour field name from the resource <code>dataSource</code> . It allows to provide different work end hour for the resources.
<code>workDaysField</code>	String	Binds the work days field name from the resources <code>dataSource</code> . It allows to provide different working days collection for the resources.
<code>cssClassField</code>	String	Binds the custom CSS class field name from the resources <code>dataSource</code> . It maps the CSS class written for the specific resources and applies it to the events of those resources.

Resource data binding

The data for resources can bind with Scheduler either as a local JSON collection or a service URL, retrieving resource data from remote data services.

Using local JSON data

The following code example depicts how to bind the local JSON data to the `dataSource` of `resources` collection.

```
`ts
import * as React from 'react';
import { useState } from 'react';
import * as ReactDOM from 'react-dom';

import { Day, Week, WorkWeek, Month, Agenda, ScheduleComponent, ResourcesDirective,
ResourceDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';

const App = () => {
  const [ownerData] = useState([
    { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
  ]);

  const eventSettings: EventSettingsModel = { dataSource: resourceData };

  return (
    <ScheduleComponent width='100%' height='550px' selectedDate={new Date(2018, 3, 1)}
    eventSettings={eventSettings}>
      <ResourcesDirective>
        <ResourceDirective field='OwnerId' title='Owner' name='Owners' allowMultiple={true}
        dataSource={ownerData} textField='OwnerText' idField='Id' colorField='OwnerColor'>
        </ResourceDirective>
      </ResourcesDirective>
      <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
    </ScheduleComponent>
  );
}

;

const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

,

[Using remote service URL](#)

The following code example depicts how to bind the remote data for resources `dataSource`.

```
`ts
import * as React from 'react';
import { useState } from 'react';
import * as ReactDOM from 'react-dom';

import { Week, Month, Agenda, ScheduleComponent, ResourcesDirective, ResourceDirective, Inject }
from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
import { DataManager, UrlAdaptor } from '@syncfusion/ej2-data';

const App = () => {
  const [ownerData] = useState(new DataManager({
    url: 'Home/GetResourceData',
    adaptor: new UrlAdaptor(),
    crossDomain: true
  }));

  const eventSettings: EventSettingsModel = { dataSource: resourceData };

  return <ScheduleComponent width='100%' height='550px' selectedDate={new Date(2018, 3, 1)}
    eventSettings={eventSettings}>
    <ResourcesDirective>
      <ResourceDirective field='OwnerId' title='Owner' name='Owners' allowMultiple={true}
        dataSource={ownerData} textField='OwnerText' idField='Id' colorField='OwnerColor'>
      </ResourceDirective>
    </ResourcesDirective>
    <Inject services={[Week, Month, Agenda]} />
  </ScheduleComponent>;
}

const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

,

[Scheduler with multiple resources](#)

It is possible to display the Scheduler in default mode without visually showcasing all the resources in it, but allowing to assign the required resources to the appointments through the event editor resource options.

The appointments belonging to the different resources will be displayed altogether on the default Scheduler, which will be differentiated based on the resource color assigned in the **resources** (depicting to which resource that particular appointment belongs) collection.

Example: To display default Scheduler with multiple resource options in the event editor, ignore the group option and simply define the **resources** property with all its internal options.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, Agenda, ScheduleComponent, ViewsDirective,
ViewDirective, ResourcesDirective, ResourceDirective, Inject } from

ipt>
  <script src="systemjs.config.js"></script>

```

```

<style>
  #loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }
</style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

Setting `allowMultiple` to [Link to the Video](#) in the above code example allows you to select multiple resources from the event editor and also creates multiple copies of the same appointment in the Scheduler for each resources while rendering.

Resource grouping

Resource grouping support allows the Scheduler to group the resources in a hierarchical structure both as an expandable groups (Timeline views) and as vertical hierarchy displaying resources one after the other (Resources view).

Scheduler supports both single and multiple levels of resource grouping that can be customized both in timeline and vertical Scheduler views.

Explore the advanced options available with the multiple resources and grouping concepts of React Scheduler by watching this video:

Vertical resource view

The following code example displays how the multiple resources are grouped and its events are portrayed in the default calendar views.

INDEX.JSX

Grouping single-level resources

This kind of grouping allows the Scheduler to display all the resources at a single level simultaneously. The appointments mapped under resources will be displayed with the colors as per the `colorField` defined on the resources collection.

Example: To display the Scheduler with single level resource grouping,

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, Agenda,
ScheduleComponent, ViewsDirective, ViewDirective, ResourcesDirective,
ResourceDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData }
  const group = { resources: ['Owners'] }
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
  ];
  return (<ScheduleComponent width='100%' height='550px' currentView='Week'
selectedDate={new Date(2018, 3, 1)} eventSettings={eventSettings}
group={group}>
    <ViewsDirective>
      <ViewDirective option='Week' />
      <ViewDirective option='Month' />
      <ViewDirective option='TimelineWeek' />
      <ViewDirective option='TimelineMonth' />
      <ViewDirective option='Agenda' />
    </ViewsDirective>
    <ResourcesDirective>
      <ResourceDirective field='OwnerId' title='Owner' name='Owners'
allowMultiple={true} dataSource={ownerData} textField='OwnerText'
idField='Id' colorField='OwnerColor'>
      </ResourceDirective>
    </ResourcesDirective>
    <Inject services={[Week, Month, TimelineViews, TimelineMonth, Agenda]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';

schedule/styles/material.css" rel="stylesheet" />
  <link
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
rel="stylesheet" />

```

```

<script
src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></scr
ipt>
  <script src="systemjs.config.js"></script>
  <style>
    #loader {
      color: #008cff;
      height: 40px;
      left: 45%;
      position: absolute;
      top: 45%;
      width: 30%;
    }
  </style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

The **name** field defined in the **resources** collection namely **Owners** will be mapped within the **group** property, in order to enable the grouping option with those resource levels on the Scheduler.

Grouping multi-level resources

It is possible to group the resources of Scheduler in multiple levels, by mapping the child resources to each parent resource. In the following example, there are 2 levels of resources, on which the second level resources are defined with **groupId** mapping to the first level resource's ID so as to establish the parent-child relationship between them.

Example: To display the Scheduler with multiple level resource grouping options,

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, ScheduleComponent,
ViewsDirective, ViewDirective, ResourcesDirective, ResourceDirective, Inject
} from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData }
  const group = { resources: ['Rooms', 'Owners'] }
  const roomData = [
    { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
    { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
  ];
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, GroupId: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, GroupId: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, GroupId: 1, OwnerColor: '#7499e1' }
  ];
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 3, 1)} eventSettings={eventSettings} group={group}>
    <ResourcesDirective>

```

```

    <ResourceDirective field='RoomId' title='Room' name='Rooms'
dataSource={roomData} textField='RoomText' idField='Id'
colorField='RoomColor'>
    </ResourceDirective>
    <ResourceDirective field='OwnerId' title='Owner' name='Owners'
allowMultiple={true} dataSource={ownerData} textField='OwnerText'
idField='Id' groupIDField='GroupId' colorField='OwnerColor'>
    </ResourceDirective>
</ResourcesDirective>
<ViewsDirective>
    <ViewDirective option='Week' />
    <ViewDirective option='Month' />
    <ViewDirective option='TimelineWeek' />
    <ViewDirective option='TimelineMonth' />
</ViewsDirective>
<Inject services={[Week, Month, TimelineViews, TimelineMonth]} />
</ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';

</html>

```

One-to-One grouping

In multi-level grouping, Scheduler usually groups the resources on the child level based on the **GroupID** that maps with the **Id** field of parent level resources (as **byGroupID** set to true by default). There are also option which allows you to group all the child resource(s) against each of its parent resource(s). To enable this kind of grouping, set **false** to the **byGroupID** option within the **group** property. In the following code example, there are two levels of resources, on which all the 3 resources at the child level is mapped one to one with each resource on the first level.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, Agenda,
ScheduleComponent, ViewsDirective, ViewDirective, ResourcesDirective,
ResourceDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData }
  const group = { byGroupID: false, resources: ['Rooms', 'Owners'] }
  const roomData = [
    { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
    { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
  ];
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' }
  ];
  return (<ScheduleComponent width='100%' height='550px' currentView='Week'

Grouping resources by date

It groups the number of resources under each date and is applicable only on the calendar views such as Day, Week, Work Week, Month, Agenda and Month-Agenda. To enable such grouping, set `byDate` option to `true` within the `group` property.

Example: To display the Scheduler with resources grouped by date,

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, Agenda, ScheduleComponent, ViewsDirective,
ViewDirective, ResourcesDirective, ResourceDirective, Inject } from
'@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData }
  const group = { byDate: true, resources: ['Owners'] }
  const resourceDatas = [
    { text: 'Alice', id: 1, color: '#1aaa55' },
    { text: 'Smith', id: 2, color: '#7fa900' }
  ];
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 3, 1)} eventSettings={eventSettings} group={group}>
    <ResourcesDirective>
      <ResourceDirective field='OwnerId' title='Owner' name='Owners'
allowMultiple={true} dataSource={resourceDatas} textField='text' idField='id'
colorField='color'>
        </ResourceDirective>
      </ResourcesDirective>
      <ViewsDirective>
        <ViewDirective option='Week' />
        <ViewDirective option='Month' />
        <ViewDirective option='Agenda' />
      </ViewsDirective>
      <Inject services={[Week, Month, Agenda]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';

  }
</style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

This kind of grouping by date is not applicable on any of the timeline views.

Working with shared events

Multiple resources can share the same events, thus allowing the CRUD action made on it to reflect on all other shared instances simultaneously. To enable such option, set `allowGroupEdit` option to `true` within the `group` property. With this property enabled, a single appointment

object will be maintained within the appointment collection, even if it is shared by more than one resource – whereas the resource fields of such appointment object will hold the IDs of the multiple resources.

Any actions such as create, edit or delete held on any one of the shared event instances, will be reflected on all other related instances visible on the UI.

Example: To edit all the resource events simultaneously,

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, Agenda,
ScheduleComponent, ResourcesDirective, ResourceDirective, ViewsDirective,
ViewDirective, Inject } from '@syncfusion/ej2-react-schedule';
const App = () => {
  const conferenceData = [
    { Text: 'Margaret', Id: 1, Color: '#1aaa55' },
    { Text: 'Robert', Id: 2, Color: '#357cd2' },
    { Text: 'Laura', Id: 3, Color: '#7fa900' }
  ];
  const data = [
    {
      Id: 1,
      Subject: 'Burning Man',
      StartTime: new Date(2018, 5, 1, 15, 0),

Simple resource header customization

It is possible to customize the resource header cells using built-in template option and change the look and appearance of it in both the vertical and timeline view modes. All the resource related fields and other information can be accessed within the resource header template option.

Example: To customize the resource header and display it along with designation field, refer the below code example.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, Agenda,
ScheduleComponent, ViewsDirective, ViewDirective, ResourcesDirective,
ResourceDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { doctorData } from './datasource';
const App = () => {
    const getDoctorName = (value) => {
        return ((value.resourceData) ?
            value.resourceData[value.resource.textField] :
            value.resourceName);
    }
    const getDoctorLevel = (value) => {
        let resourceName = getDoctorName(value);
        return (resourceName === 'Will Smith') ? 'Cardiologist' : (resourceName
=== 'Alice') ? 'Neurologist' : 'Orthopedic Surgeon';
    }
    const eventSettings = { dataSource: doctorData };
    const group = { resources: ['Doctors'] };
    const resourceData = [
        { text: 'Will Smith', id: 1, color: '#ea7a57', designation: 'Cardioligst' },
        { text: 'Alice', id: 2, color: '#7fa900', designation: 'Neurologist' },
        { text: 'Robson', id: 3, color: '#7fa900', designation: 'Orthopedic
Surgeon' }
    ];
    const resourceHeaderTemplate = (props) => {
        return (<div className="template-wrap">
            <div className="resource-detail"><div className="resource-
name">{getDoctorName(props)}</div>
            <div className="resource-
designation">{getDoctorLevel(props)}</div></div></div>);
    }
    return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 3, 1)} currentView='WorkWeek'
resourceHeaderTemplate={resourceHeaderTemplate} eventSettings={eventSettings}
group={group}>

```

```

    <ResourcesDirective>
      <ResourceDirective field='DoctorId' title='Doctor' name='Doctors'
dataSource={resourceData} textField='text' idField='id'
DesignationField='designation' colorField='color'>
    </ResourceDirective>
  </ResourcesDirective>
  <ViewsDirective>
    <ViewDirective option='Week' />
    <ViewDirective option='Month' />
    <ViewDirective option='TimelineWeek' />
    <ViewDirective option='TimelineMonth' />
    <ViewDirective option='Agenda' />
  </ViewsDirective>
  <Inject services={[Week, Month, TimelineViews, TimelineMonth, Agenda]} />
</ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";

To customize the resource header in compact mode properly make use of the class

device as in the code example.

![Resource header template in compact mode](./images/header-template.png)

Customizing resource header with multiple columns

It is possible to customize the resource headers to display with multiple columns such as Room, Type and Capacity. The following code example depicts the way to achieve it and is applicable only on timeline views.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { TimelineViews, TimelineMonth, ScheduleComponent, ViewsDirective,
ViewDirective, ResourcesDirective, ResourceDirective, Inject } from
 '@syncfusion/ej2-react-schedule';
import { roomData } from './datasource';
const App = () => {
  const getRoomName = (value) => {
    return value.resourceData[value.resource.textField];
  }
  const getRoomType = (value) => {
    return value.resourceData.type;
  }
  const getRoomCapacity = (value) => {
    return value.resourceData.capacity;
  }
  const eventSettings = { dataSource: roomData };
  const group = { resources: ['MeetingRoom'] };
  const ownerData = [
    { text: 'Jammy', id: 1, color: '#ea7a57', capacity: 20, type:
'Conference' },
    { text: 'Tweety', id: 2, color: '#7fa900', capacity: 7, type: 'Cabin' },
    { text: 'Nestle', id: 3, color: '#5978ee', capacity: 5, type: 'Cabin' },
    { text: 'Phoenix', id: 4, color: '#fec200', capacity: 15, type:
'Conference' },
    { text: 'Mission', id: 5, color: '#df5286', capacity: 25, type:
'Conference' },
    { text: 'Hangout', id: 6, color: '#00bdae', capacity: 10, type: 'Cabin'
},
    { text: 'Rick Roll', id: 7, color: '#865fcf', capacity: 20, type:
'Conference' },
    { text: 'Rainbow', id: 8, color: '#1aaa55', capacity: 8, type: 'Cabin' },
    { text: 'Swarm', id: 9, color: '#df5286', capacity: 30, type:
'Conference' },
    { text: 'Photogenic', id: 10, color: '#710193', capacity: 25, type:
'Conference' }
  ];
  const resourceHeaderTemplate = (props) => {
    return (<div className="template-wrap">
      <div className="room-name">{getRoomName(props)}</div>
      <div className="room-type">{getRoomType(props)}</div>
      <div className="room-capacity">{getRoomCapacity(props)}</div>
    </div>);
  }
  const onRenderCell = (args) => {
    if (args.elementType === 'emptyCells' &&
args.element.classList.contains('e-resource-left-td')) {
      let target = args.element.querySelector('.e-resource-text');
```

```

        target.innerHTML = '<div class="name">Rooms</div><div
class="type">Type</div><div class="capacity">Capacity</div>';
    }
}
return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 7, 1)} currentView='TimelineWeek'
resourceHeaderTemplate={resourceHeaderTemplate} eventSettings={eventSettings}
renderCell={onRenderCell} group={group}>
    <ResourcesDirective>
        <ResourceDirective field='RoomId' title='Room Type' name='MeetingRoom'

Collapse/Expand child resources in timeline views

It is possible to expand and collapse the resources which have child resource in timeline views dynamically. By default, resources are in expanded state with their child resource. We can collapse and expand the child resources in UI by setting `expandedField` option as `false` whereas its default value is `true`.

INDEX.JSX

Displaying tooltip for resource headers

It is possible to display tooltips over the resource headers showing the resource information. By default, there won't be any tooltips displayed on the resource headers, and to enable it, you need to assign the customized template design to the `headerTooltipTemplate` option within the `group` property.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, TimelineViews, TimelineMonth, ScheduleComponent,
ViewsDirective, ViewDirective, ResourcesDirective, ResourceDirective, Inject
} from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: resourceData }
    const getRoomName = (value) => {
        return value.resourceData[value.resource.textField];
    }
    const headerTooltipTemplate = (props) => {
        return (<div className="template-wrap">
            <div className="room-name">{getRoomName(props)}</div>
        </div>);
    }

Choosing between resource colors for appointments

By default, the colors defined on the top level resources collection will be applied for the events. In case, if you want to apply specific resource color to events irrespective of its top-level parent resource color, it can be achieved by defining `resourceColorField` option within the `eventSettings` property.

In the following example, the colors mentioned in the second level will get applied over the events.

INDEX.JSX

The value of the `resourceColorField` field should be mapped with the `name` value given within the `resources` property.

Dynamically add and remove resources

It is possible to add or remove the resources dynamically to and from the Scheduler respectively. In the following example, when the checkboxes are checked and unchecked, the respective resources gets added up or removed from the Scheduler layout. To add new resource dynamically, `addResource` method is used which accepts the arguments such as resource object, resource name (within which level, the resource object to be added) and index (position where the resource needs to be added).

To remove the resources dynamically, `removeResource` method is used which accepts the index (position from where the resource to be removed) and resource name (within which level, the resource object presents) as parameters.

Setting different working days and hours for resources

Each resource in the Scheduler can have different working hours as well as different working days set to it. There are default options available within the `resources` collection, to customize the default working hours and days of the Scheduler.

Set different work days

Different working days can be set for the resources of Scheduler using the `workDaysField` property which maps the working days field from the resource dataSource. This field accepts the collection of day indexes (from 0 to 6) of a week. By default, it is set to [1, 2, 3, 4, 5] and in the following example, each resource has been set with different values and therefore each of them will render only those working days. This option is applicable only on the calendar views and is not applicable on timeline views.

INDEX.JSX

Set different work hours

Working hours indicates the work hour duration of a day, which is highlighted visually with active color over the work cells. Each resource on the Scheduler can be defined with its own set of working hours as depicted in the following example.

- **startHourField** - Denotes the start time of the working/business hour in a day.
- **endHourField** - Denotes the end time limit of the working/business hour in a day.

    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

In this example, a resource named **Will Smith** is depicted with working hours ranging from 7.00 AM to 3.00 PM and is visually illustrated with active colors, whereas the other two resources have different working hours set.

Hide non-working days when grouped by date

In Scheduler, you can set custom work days for each resource and group the Scheduler by date to display these work days. By default, the Scheduler will show all days when it is grouped by date, even if they are not included in the custom work days for the resources. However, you can use the [hideNonWorkingDays](#) property to only display the custom work days in the Scheduler.

To use the [hideNonWorkingDays](#) property, you need to include it in the configuration options for your Scheduler component. Set the value of [hideNonWorkingDays](#) to **true** to enable this feature.

Example: To display the Scheduler with resources grouped by date for custom working days,

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Week, Month, Agenda, ScheduleComponent, ViewsDirective,
ViewDirective, ResourcesDirective, ResourceDirective, Inject } from
'@syncfusion/ej2-react-schedule';
const App = () => {
  const group = { byDate: true, resources: ['Owners'], hideNonWorkingDays:
true }
  const resourceData = [
    { text: 'Alice', id: 1, color: '#1aaa55', workDays: [1, 2, 3, 4] },
    { text: 'Smith', id: 2, color: '#7fa900', workDays: [2, 3, 5] }
  ];
  return (<ScheduleComponent width='100%' height='550px' group={group}>
    <ResourcesDirective>
      <ResourceDirective field='OwnerId' title='Owner' name='Owners'
allowMultiple={true} dataSource={resourceData} textField='text' idField='id'
colorField='color' workDaysField='workDays'>
    </ResourceDirective>
    </ResourcesDirective>
    <ViewsDirective>
      <ViewDirective option='Week' />
      <ViewDirective option='Month' />
      <ViewDirective option='Agenda' />
    </ViewsDirective>
    <Inject services={[Week, Month, Agenda]} />
  </ScheduleComponent>);
}

```

The [hideNonWorkingDays](#) property only applies when the Scheduler is grouped [byDate](#).

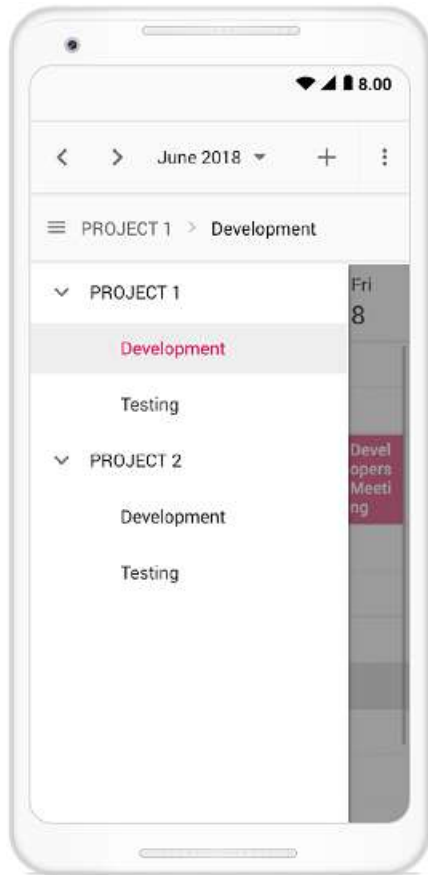

Compact view in mobile

Although the Scheduler views are designed keeping in mind the responsiveness of the control in mobile devices, however when using Scheduler with multiple resources - it is difficult to view all the resources and its relevant events at once on the mobile. Therefore, we have introduced a new compact mode specially for displaying multiple resources of Scheduler on mobile devices. By default, this mode is enabled while using Scheduler with multiple resources on mobile devices. If in case, you need to disable this compact mode, set `false` to the `enableCompactView` option within the `group` property. Disabling this option will display the exact desktop mode of Scheduler view on mobile devices.

With this compact view enabled on mobile, you can view only single resource at a time and to switch to other resources, there is a tree view at the left listing out all other available resources - clicking on which will display that particular resource and its related appointments.

Clicking on the menu icon before the resource text will show the resources available in the Scheduler as following.

Adaptive UI in desktop

By default, the Scheduler layout adapts automatically in the desktop and mobile devices with appropriate UI changes. In case, if the user wants to display the Adaptive scheduler in desktop mode with adaptive enhancements, then the property `enableAdaptiveUI` can be set to true. Enabling this option will display the exact mobile mode of Scheduler view on desktop devices.

Some of the default changes made for compact Scheduler to render in desktop devices are as follows,

- View options displayed in the Navigation drawer.
- Plus icon is added to the header for new event creation.
- Today icon is added to the header instead of the Today button.
- With Multiple resources – only one resource has been shown to enhance the view experience of resource events details clearly. To switch to other resources, there is a TreeView on the left that lists all other available resources, clicking on which will display that particular resource and its related events.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Header rows in React Schedule component

The Timeline views can have additional header rows other than its default date and time header rows. It is possible to show individual header rows for displaying year, month and week separately using the `HeaderRowDirective`. This is applicable only on the timeline views. The possible rows which can be added using `HeaderRowDirective` are as follows.

- Year
- Month
- Week
- Date
- Hour

The [Link to the Video](#) row is not applicable for Timeline month view.

Learn to add and customize additional header rows in the Timeline views of React Scheduler from this video:

The following example shows the Scheduler displaying all the available header rows on timeline views.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, HeaderRowDirective, HeaderRowsDirective,
TimelineViews, Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new

Importing `HeaderRowsDirective` and `HeaderRowDirective` is mandatory.

Display year and month rows in timeline views

To display the timeline Scheduler simply with year and month names alone, define the option `Year` and `Month` within the `HeaderRowDirective`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, HeaderRowDirective, HeaderRowsDirective,
TimelineMonth, Inject, ViewsDirective, ViewDirective } from '@syncfusion/ej2-
react-schedule';
import { scheduleData } from '../datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData }
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 11, 31)} eventSettings={eventSettings}>
    <HeaderRowsDirective>
      <HeaderRowDirective option='Year' />
      <HeaderRowDirective option='Month' />
    </HeaderRowsDirective>
    <ViewsDirective>
      <ViewDirective option='TimelineMonth' interval={24} />
    </ViewsDirective>
    <Inject services={[TimelineMonth]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, HeaderRowDirective, HeaderRowsDirective, TimelineMonth,
  Inject,
  ViewsDirective, ViewDirective
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Row auto height in React Schedule component

By default, the height of the Scheduler rows in Timeline views are static and therefore, when the same time range holds multiple overlapping appointments, a **+n more** text indicator will be displayed. With this feature enabled, you can now view all the overlapping appointments present in those specific time range by auto-adjusting the row height based on the presence of the appointments count, instead of displaying the **+n more** text indicators.

To enable auto row height adjustments on Scheduler Timeline views and Month view, set **true** to the **rowAutoHeight** property whose default value is **false**.

This auto row height adjustment is applicable only on all the Timeline views as well as on the calendar Month view.

Now, let's see how it works on those applicable views with examples.

Calendar month view

By default, the rows of the calendar Month view can hold only the limited appointments count based on its row height, and the rest of the overlapping appointments are indicated with a **+n more** text indicator. The following example shows how the month view row auto-adjusts based on the number of appointments count, when this **RowAutoHeight** feature is enabled.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Month, Inject, ViewsDirective, ViewDirective }
from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} rowAutoHeight={true}>
    <ViewsDirective>
      <ViewDirective option='Month' />
    </ViewsDirective>
    <Inject services={[Month]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Month, Inject,
  ViewsDirective, ViewDirective, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
```

```

const eventSettings: EventSettingsModel = { dataSource: scheduleData };
return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} rowAutoHeight={true}>
  <ViewsDirective>
    <ViewDirective option='Month' />
  </ViewsDirective>
  <Inject services={[Month]} />
</ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

</html>
```

Timeline views

When the feature **RowAutoHeight** is enabled in Timeline views, the row height gets auto-adjusted based on the number of overlapping events occupied on the same time range, which is demonstrated in the following example.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, TimelineViews, Inject, TimelineMonth, Agenda,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} rowAutoHeight={true}>
    <ViewsDirective>
      <ViewDirective option='TimelineDay' />
      <ViewDirective option='TimelineWeek' />
      <ViewDirective option='TimelineWorkWeek' />
      <ViewDirective option='TimelineMonth' />
      <ViewDirective option='Agenda' />
    </ViewsDirective>
    <Inject services={[TimelineViews, TimelineMonth, Agenda]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, TimelineViews, Inject, TimelineMonth, Agenda,
  ViewsDirective, ViewDirective, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings: EventSettingsModel = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} rowAutoHeight={true}>
    <ViewsDirective>
      <ViewDirective option='TimelineDay' />
      <ViewDirective option='TimelineWeek' />
      <ViewDirective option='TimelineWorkWeek' />
      <ViewDirective option='TimelineMonth' />
    </ViewsDirective>
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

```

    <ViewDirective option='Agenda' />
  </ViewsDirective>
  <Inject services={[TimelineViews, TimelineMonth, Agenda]} />
</ScheduleComponent>
);
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

Appointments occupying entire cell

By default, with the feature **rowAutoHeight**, there will be a space in the bottom of the cell when appointment is rendered. To avoid this space, we can set true to the property **ignoreWhitespace** with

in `eventSettings` whereas its default property value is false. In the following code example, the whitespace below the appointments has been ignored.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { TimelineViews, TimelineMonth, ScheduleComponent, ViewsDirective,
ViewDirective, ResourcesDirective, ResourceDirective, Inject } from
'@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData, ignoreWhitespace: true };
  const group = { resources: ['Rooms', 'Owners'] };
  const roomData = [
    { RoomText: 'ROOM 1', Id: 1, RoomColor: '#cb6bb2' },
    { RoomText: 'ROOM 2', Id: 2, RoomColor: '#56ca85' }
  ];
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, GroupId: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, GroupId: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, GroupId: 1, OwnerColor: '#7499e1' }
  ];
  return (<ScheduleComponent width='100%' height='550px'
currentView='TimelineWeek' rowAutoHeight={true} selectedDate={new Date(2021,
7, 4)} eventSettings={eventSettings} group={group}>

```

Note: The property `ignoreWhitespace` will be applicable only when `rowAutoHeight` feature is enabled in the Scheduler

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Header bar in React Schedule component

The header part of Scheduler can be customized easily with the built-in options available.

Show or Hide header bar

By default, the header bar holds the date and view navigation options, through which the user can switch between the dates and various views. This header bar can be hidden from the UI by setting `false` to the `showHeaderBar` property. Its default value is `true`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';

```

```
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} showHeaderBar={false} eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='WorkWeek' />
    </ViewsDirective>
    <Inject services={[Day, Week, WorkWeek]} />
  </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

Customizing header bar

Apart from the default date navigation and view options available on the header bar, you can add custom items into the Scheduler header bar by making use of the `actionBegin` event. Here, an employee image is added to the header bar, clicking on which will open the popup showing that person's short profile information.

How to display the view options within the header bar popup

By default, the header bar holds the view navigation options, through which the user can switch between various views. You can move this view options to the header bar popup by setting `true` to the `enableAdaptiveUI` property.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return (<ScheduleComponent width='100%' height='500px' selectedDate={new Date(2018, 1, 15)} enableAdaptiveUI={true} eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

Refer [here](#) to know more about adaptive UI in resources scheduler.

Date header customization

The Scheduler UI that displays the date text on all views are considered as the date header cells. You can customize the date header cells of Scheduler either using `dateHeaderTemplate` or `renderCell` event.

Using date header template

The `dateHeaderTemplate` option is used to customize the date header cells of day, week, work-week and timeline views.

INDEX.JSX

</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

INDEX.CSS

```

/* csslint ignore:start */
.schedule-date-header-template.e-schedule .e-vertical-view .e-header-cells {
    padding: 0;
    text-align: center !important;
}
.schedule-date-header-template.e-schedule .date-text {
    font-size: 14px;
}
.schedule-date-header-template.e-schedule.e-device .date-text {
    font-size: 12px;
}
.schedule-date-header-template.e-schedule .weather-text {
    font-size: 11px;
}
.schedule-date-header-template.e-schedule .e-month-view .weather-text {
    float: right;
    margin: -20px 2px 0 0;
    width: 20px;
}

```

```

    height: 20px;
  }
  /* csslint ignore:end */

```

Using renderCell event

In month view, the date header template is not applicable and therefore the same customization can be added beside the date text in month cells by making use of the `renderCell` event.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { ScheduleComponent, ViewsDirective, ViewDirective, Month, Inject }

```

Customizing the date range text

The [dateRangeTemplate](#) option allows you to customize the text content of the date range displayed in the scheduler. By default, the date range text is determined by the scheduler view being used. However, you can use the [dateRangeTemplate](#) option to override the default text and specify your own custom text to be displayed.

The [dateRangeTemplate](#) property includes `startDate`, `endDate` and `currentView` options, you can customize the date range text using these available options.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { ScheduleComponent, ViewsDirective, ViewDirective, Day, Week,

    width: 20px;
    height: 20px;
}
/* csslint ignore:end */

```

Customizing header indent cells

It is possible to customize the header indent cells using the `headerIndentTemplate` option and change the look and appearance in both the vertical and timeline views. In vertical views, You can customize the

header indent cells at the hierarchy level and you can customize the resource header left indent cell in timeline views using the template option.

Example: To customize the header left indent cell to display resources text, refer to the below code example.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { Week, TimelineViews, TimelineMonth, Day, ScheduleComponent,
ViewsDirective, ViewDirective, ResourcesDirective, ResourceDirective, Inject
} from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: resourceData };
  const group = { resources: ['Owners'] };
  const ownerData = [
    { OwnerText: 'Nancy', Id: 1, OwnerColor: '#ffaa00' },
    { OwnerText: 'Steven', Id: 2, OwnerColor: '#f8a398' },
    { OwnerText: 'Michael', Id: 3, OwnerColor: '#7499e1' }
  ];
  const headerIndentTemplate = () => {
    return (<div className='e-resource-text'>
      <div className="text">Resources</div></div>);

```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Timescale in React Schedule component

The time slots are usually the time cells that are displayed on the Day, Week and Work Week views of both the calendar (to the left most position) and timeline views (at the top position). The **timeScale** property allows you to control and set the required time slot duration for the work cells displayed on Scheduler. It includes the following sub-options such as,

- **enable** - When set to **true**, allows the Scheduler to display the appointments accurately against the exact time duration. If set to **false**, all the appointments of a day will be displayed one below the other with no gridlines displayed. Its default value is **true**.
- **interval** – Defines the time duration on which the time axis to be displayed either in 1 hour or 30 minutes interval and so on. It accepts the values in minutes and defaults to 60.
- **slotCount** – Decides the number of slot count to be split for the specified time interval duration. It defaults to 2, thus displaying two slots to represent an hour(each slot depicting 30 minutes duration).

Note: The upper limit for rendering slots within a single day, utilizing the **interval** and **slotCount** properties of the **timeScale**, stands at 1000. This constraint aligns with the maximum **colspan** value

permissible for the **table** element, also capped at 1000. This particular restriction is relevant exclusively to the **TimelineDay**, **TimelineWeek** and **TimelineWorkWeek** views.

Setting different time slot duration

The **interval** and **slotCount** properties can be used together on the Scheduler to set different time slot duration which is depicted in the following code example. Here, six time slots together represents an hour.

INDEX.JSX

```
import * as React from 'react';

Customizing time cells using template

The `timeScale` property also provides template option to allow customization of time slots which are as follows,

- **majorSlotTemplate** - The template option to be applied for major time slots. Here, the template accepts either the string or `HTMLElement` as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.
- **minorSlotTemplate** - The template option to be applied for minor time slots. Here, the template accepts either the string or `HTMLElement` as template design and then the parsed design is displayed onto the time cells. The time details can be accessed within this template.

Highlighting current date and time

By default, Scheduler indicates current date with a highlighted date header on all views, as well as marks accurately the system's current time on specific views such as Day, Week, Work Week, Timeline Day, Timeline Week and Timeline Work Week views. To stop highlighting the current time indicator on Scheduler views, set `false` to the `showTimeIndicator` property which defaults to `true`.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Working days in React Schedule component

The Scheduler can be customized on various aspects as well as it inherits almost all the calendar-specific features such as options,

- To set custom time range display on Scheduler
- To set different working hours
- To set different working days
- To set different first day of week
- To show/hide weekend days
- To show the week number
- To display the current time indicator

Set working days

By default, Scheduler considers the week days from Monday to Friday as **Working days** and therefore defaults to [1,2,3,4,5] - where 1 represents Monday, 2 represents Tuesday and so on. The days which are not defined in this working days collection are considered as non-working days. Therefore, when the weekend days are set to hide from Scheduler, all those non-working days too get hidden from the layout.

The Work week and Timeline Work week views display exactly the defined working days on Scheduler layout, whereas other views display all the days and simply differentiate the non-working days on UI with inactive cell color.

The working or business hours depiction on Scheduler are usually valid only on these specified working days.

The following example code depicts how to set the Scheduler to display Monday, Wednesday and Friday as working days of a week.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Week, WorkWeek, TimelineViews, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  const workingDays = [1, 3, 5];
  return (<ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} workDays={workingDays}>
    <ViewsDirective>
      <ViewDirective option='Week' />
      <ViewDirective option='WorkWeek' />
      <ViewDirective option='TimelineWorkWeek' />
    </ViewsDirective>
    <Inject services={[Week, WorkWeek, TimelineViews]} />
  </ScheduleComponent>);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

```

Hiding weekend days

The `showWeekend` property is used to either show or hide the weekend days of a week and it is not applicable on Work week view (as non-working days are usually not displayed on work week view). By default, it is set to `true`. The days which are not a part of the working days collection of a Scheduler are usually considered as non-working or weekend days.

Here, the working days are defined as [1, 3, 4, 5] on Scheduler and therefore the remaining days (0, 2, 6 – Sunday, Tuesday and Saturday) are considered as non-working or weekend days and will be hidden from all the views when `showWeekend` property is set to `false`.

INDEX.JSX

```

Show week numbers

It is possible to show the week number count of a week in the header bar of the Scheduler by setting true to `showWeekNumber` property. By default, its default value is `false`. In Month view, the week numbers are displayed as a first column.

The `showWeekNumber` property is not applicable on Timeline views, as it has the equivalent [headerRows](#) property to handle such requirement with additional customizations.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, Month, Inject, } from
 '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';

Different options in showing week numbers

By default, week numbers are shown in the Scheduler based on the first day of the year. However, the week numbers can be determined based on the following criteria.

FirstDay – The first week of the year is calculated based on the first day of the year.

FirstFourDayWeek – The first week of the year begins from the first week with four or more days.

FirstFullWeek – The first week of the year begins when meeting the first day of the week (firstDayOfWeek) and the first day of the year.

For more details refer to [this link](#)

<style>
  #loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
  }
</style>
</head>
<body>
  <div id='schedule'>
    <div id='loader'>Loading....</div>
  </div>
</body>
</html>

```

Note: Enable the `showWeekNumber` property to configure the `weekRule` property. Also, the `weekRule` property depends on the value of the `firstDayOfWeek` property

Set working hours

Working hours indicates the work hour limit within the Scheduler, which is visually highlighted with an active color on work cells. The working hours can be set on Scheduler using the `workHours` property which is of object type and includes the following sub-options,

- `highlight` – enables/disables the highlighting of work hours.
- `start` - sets the start time of the working/business hour of a day.
- `end` - sets the end time limit of the working/business hour of a day.

Scheduler displaying custom hours

It is possible to display the event Scheduler layout with specific time durations by hiding the unwanted hours. To do so, set the start and end hour for the Scheduler using the `startHour` and `endHour` properties respectively.

The following code example displays the Scheduler starting from the time range 7.00 AM to 6.00 PM and the remaining hours are hidden on the UI.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    return <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} startHour='07:00' endHour='18:00'
eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Day' />
            <ViewDirective option='Week' />

```

```

    <ViewDirective option='WorkWeek' />
  </ViewsDirective>
  <Inject services={[Day, Week, WorkWeek]} />
</ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Setting start day of the week

By default, Scheduler defaults to **Sunday** as its first day of a week. To change the Scheduler's start day of a week with different day, set the **firstDayOfWeek** property with the values ranging from 0 to 6.

Here, Sunday is always denoted as 0, Monday as 1 and so on.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Week, Month, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';

  </div>
</body>
</html>

```

Scroll to specific time and date

You can manually scroll to a specific time on Scheduler by making use of the `scrollTo` method as depicted in the following code example.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import { ScheduleComponent, Day, Week, TimelineViews, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onChange = (args) => {
    scheduleObj.current.scrollTo(args.text);
  }
  return (
    <div className='content-wrapper'>
      <div className='property-section'>
        <table id='property' title='Properties' className='property-panel-
table' style={{ width: '100%' }}>
          <tbody>
            <tr style={{ height: '50px' }}>
              <td style={{ width: '30%' }}>
                <div className='col-md-4' style={{ padding: '8px' }}>
                  Scroll To</div>
              </td>
              <td style={{ width: '70%' }}>
                <div>
                  <TimePickerComponent width={100} value={new Date(2000, 0,
1, 9)} format='HH:mm'
                    change={onChange}></TimePickerComponent>
                </div>
              </td>
            </tr>
          </tbody>
        </table>
      </div>
    </div>
  );
}

```

```

        </tr>
      </tbody>
    </table>
  </div>
  <div className='control-section'>
    <ScheduleComponent width='100%' height='550px' ref={scheduleObj}
      selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}>
      <ViewsDirective>
        <ViewDirective option='Day' />

How to scroll to current time on initial load

There are scenarios where you may need to load the Scheduler displaying the system's current time on the currently visible view port area. In such cases, the Scheduler needs to be scrolled to a specific time based on the system's current time which is depicted in the following code example.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, TimelineViews, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
import { Internationalization } from '@syncfusion/ej2-base';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const instance = new Internationalization();
  const onCreated = () => {
    scheduleObj.current.scrollTo(instance.formatDate(new Date(), { skeleton:
'hm' }));
  }
  return (<ScheduleComponent ref={scheduleObj} width='100%' height='550px'
selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
created={onCreated}>
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='TimelineWeek' />
    </ViewsDirective>
    <Inject services={[Day, Week, TimelineViews]} />
  </ScheduleComponent>);

```

```

}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

Cell customization in React Schedule component

The cells of the Scheduler can be easily customized either using the cell template or `RenderCell` event.

Setting cell dimensions in all views

The height and width of the Scheduler cells can be customized either to increase or reduce its size through the `cssClass` property, which overrides the default CSS applied on cells.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return <ScheduleComponent width='100%' height='550px' selectedDate={new
Date(2018, 1, 15)} cssClass='schedule-cell-dimension'
eventSettings={eventSettings}>

    height: 200px;
}
/* csslint ignore:end */

```

Check for cell availability

You can check whether the given time range slots are available for event creation or already occupied by other events using the `isSlotAvailable` method. In the following code example, if a specific time slot already contains an appointment, then no more appointments can be added to that cell.

Note: The `isSlotAvailable` is centered around verifying appointments within the present view's date range. Yet, it does not encompass an evaluation of availability for recurrence occurrences that fall beyond this particular date range.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Inject } from
'@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const scheduleObj = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onActionBegin = (args) => {
        if (args.requestType === 'eventCreate' && args.data.length > 0) {
            let eventData = args.data[0];
            let eventField = scheduleObj.current.eventFields;
            let startDate = eventData[eventField.startTime];
            let endDate = eventData[eventField.endTime];
            args.cancel = !scheduleObj.current.isSlotAvailable(startDate,
            endDate);
        }
    }
}

```

```

    return <ScheduleComponent ref={scheduleObj} width='100%' height='550px'
    selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}

Customizing cells in all the views

It is possible to customize the appearance of the cells using both template options and `renderCell` event on all the views.

Using template

The `cellTemplate` option accepts the template string and is used to customize the cell background with specific images or appropriate text on the given date values.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, TimelineViews, Month, Inject,

Using renderCell event

An alternative to `cellTemplate` is the `renderCell` event, which can also be used to customize the cells with appropriate images or formatted text values.

/* csslint ignore:end */

```

You can customize cells such as work cells, month cells, all-day cells, header cells, resource header cells using `renderCell` event by checking the `elementType` option within the event. You can check `elementType` with any of the following.

Element type	Description
dateHeader	triggers on header cell rendering.
monthDay	triggers on header cell in month view rendering.
resourceHeader	triggers on resource header cell rendering.
alldayCells	triggers on all day cell rendering.
emptyCells	triggers on empty cell rendering on header bar.
resourceGroupCells	triggers on rendering of work cells for parent resource.
workCells	triggers on work cell rendering.
monthCells	triggers on month cell rendering.
majorSlot	triggers on major time slot cell rendering.
minorSlot	triggers on minor time slot cell rendering.
weekNumberCell	triggers on cell displaying week number.

Customizing cell header in month view

The month header of each date cell in the month view can be customized using the `cellHeaderTemplate` option which accepts the string or `HTMLElement`. The corresponding date can be accessed with the template.

```

Customizing the minimum and maximum date values

Providing the `minDate` and `maxDate` property with some date values, allows the Scheduler to set the minimum and maximum date range. The Scheduler date that lies beyond this minimum and maximum date range will be in a disabled state so that the date navigation will be blocked beyond the specified date range.

INDEX.JSX

.schedule-cell-dimension.e-schedule .e-month-view .e-date-header-wrap table
col {
    width: 200px;
}

.schedule-cell-dimension.e-schedule .e-month-view .e-work-cells {
    height: 200px;
}
/* csslint ignore:end */

```

By default, the `minDate` property value is set to `new Date(1900, 0, 1)` and `maxDate` property value is set to `new Date(2099, 11, 31)`. The user can also set the customized `minDate` and `maxDate` property values.

Customizing the weekend cells background color

You can customize the background color of weekend cells by utilizing the [renderCell](#) event and checking the [elementType](#) option within the event.

```
`ts
const onRendercell = (args) => {
  if (args.elementType == "workCells") {
    // To change the color of weekend columns in week view
    if (args.date) {
      if (args.date.getDay() === 6) {
        (args.element).style.background = '#ffdea2';
      }
      if (args.date.getDay() === 0) {
        (args.element).style.background = '#ffdea2';
      }
    }
  }
}
```

And, the background color for weekend cells in the Month view through the [cssClass](#) property, which overrides the default CSS applied on cells.

```
`css
.schedule-cell-customization.e-schedule .e-month-view .e-work-cells:not(.e-work-days) {
  background-color: #f08080;
}
```

How to disable multiple cell and row selection in Schedule

By default, the `allowMultiCellSelection` and `allowMultiRowSelection` properties of the Schedule are set to `true`. So, the Schedule allows user to select multiple cells and rows. If the user want to disable this multiple cell and row selection. The user can disable this feature by setting up `false` to these properties.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

State persistence in React Schedule component

State persistence allowed Scheduler to retain the `currentView`, `selectedDate` and Scroll position values in the `localStorage` for state maintenance even if the browser is refreshed or if you move to the next page within the browser. This action is handled through the `enablePersistence` property which is set to `false` by default. When it is set to `true`, `currentView`, `selectedDate` and Scroll position values of the scheduler component will be retained even after refreshing the page.

Note: Scheduler `id` is essential to set state persistence.

The following sample demonstrates how to set state persistence of the Scheduler component.

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Exporting in React Schedule component

The Scheduler supports exporting all its appointments both to an Excel or ICS extension file at client-side. It offers different client-side methods to export its appointments in an Excel or iCal format file. Let's look onto the ways on how to implement the exporting functionality in Scheduler.

Excel Exporting

The Scheduler allows you to export all its events into an Excel format file by using the `exportToExcel` client-side method. By default, it exports all the default fields of Scheduler mapped through `eventSettings` property.

Before you start with excel exporting functionality, you need to import and inject the `ExcelExport` module from the '@syncfusion/ej2-schedule' package using the `Inject` method of Scheduler.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import { useRef } from 'react';
import * as React from 'react';
import { ScheduleComponent, ViewDirective, Week, Resize, ExcelExport,
DragAndDrop, Inject, ViewsDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
/**
 * Schedule header customization sample
 */
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onActionBegin = (args) => {
    if (args.requestType === 'toolbarItemRendering') {
      let exportItem = {
        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
        text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
      };
      args.items.push(exportItem);
    }
  }
  const onExportClick = () => {
    scheduleObj.current.exportToExcel();
  }
  return (
    <ScheduleComponent cssClass='excel-export' width='100%'
height='550px' id='schedule' ref={scheduleObj} selectedDate={new Date(2019,
0, 10)} eventSettings={eventSettings} actionBegin={onActionBegin}>
      <ViewsDirective>
        <ViewDirective option='Week' />
      </ViewsDirective>
      <Inject services={[Week, Resize, DragAndDrop, ExcelExport]} />
    </ScheduleComponent>
  );
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

INDEX.TSX

```

Exporting with custom fields

By default, Scheduler exports all the default event fields that are mapped to it through the `eventSettings` property. To limit the number of fields on the exported excel file, it provides an option to export only the custom fields of the event data. To export such custom fields alone, define the required fields through the `ExportOptions` interface and pass it as argument to the `exportToExcel` method as shown in the following example. For example: `['Id', 'Subject', 'StartTime', 'EndTime', 'Location']`.

INDEX.JSX

Exporting individual occurrences of a recurring series

By default, the Scheduler exports recurring events as a single data by exporting only its parent record into the excel file. If you want to export each individual occurrences of a recurring series appointment as separate records in an Excel file, define the `includeOccurrences` option as `true` through the `ExportOptions` interface and pass it as argument to the `exportToExcel` method. By default, the `includeOccurrences` option is set to `false`.

INDEX.JSX

```

Exporting custom event data

By default, the whole event collection bound to the Scheduler gets exported as an excel file. To export only specific events of Scheduler or some custom event collection, you need to pass those custom data collection as a parameter to the `exportToExcel` method as shown in this following example, through the `customData` option of `ExportOptions` interface.

By default, the event data are taken from Scheduler `dataSource`.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, ViewDirective, Week, Resize, ExcelExport,
DragAndDrop, Inject, ViewsDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
/**
 * Schedule header customization sample
 */
const App = () => {
    const scheduleObj = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onActionBegin = (args) => {
        if (args.requestType === 'toolbarItemRendering') {
            let exportItem = {
                align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-
schedule-excel-export',
                text: 'Excel Export', cssClass: 'e-excel-export', click:
onExportClick
            };
            args.items.push(exportItem);
        }
    }
    const onExportClick = () => {
        let exportValues = {
            customData: [{

Customizing column header with custom fields exporting

Using fields property, we can only export the defined fields into excel without customizing the header. Now we can provide the alternate support to customize the header of custom fields exporting using the fieldsInfo option through the ExportFieldInfo interface and pass it as an argument to the exportToExcel method as shown in the following example.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, ViewDirective, Week, Resize, ExcelExport,
DragAndDrop, Inject, ViewsDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
/**

Export with custom file name

By default, the Scheduler allows you to download the exported Excel file with a name `Schedule.xlsx`. It also provides an option to export the excel file with a custom file name, by defining the desired `fileName` through the `ExportOptions` interface and passing it as an argument to the `exportToExcel` method.

Excel file formats

By default, the Scheduler exports event data to an excel file in the .xlsx format. You can also export the Scheduler data in either of the file type such as .xlsx or csv formats, by defining the exportType option as either csv or xlsx through the ExportOptions interface. By default, the exportType is set to xlsx.

Exporting calendar events as ICS file

You can export the Scheduler events to a calendar (.ics) file format, and open it on any of the other default calendars such as Google or Outlook. To export the events of Scheduler to an ICS file, you need to first import the `ICalendarExport` module from `@syncfusion/ej2-schedule` package and then inject it using the `Schedule.Inject(ICalendarExport)` method.

The following code example shows how the Scheduler events are exported to a calendar (.ics) file by making use of the `exportToICalendar` public method.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
    ICalendarExport, ICalendarImport, Resize, Inject
} from '@syncfusion/ej2-react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { scheduleData } from './datasource';
/**
 * Schedule header customization sample
 */
const App = () => {
    const scheduleObj = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onClick = () => {
        scheduleObj.current.exportToICalendar();
    }
}

```

```

return (<div>
  <ButtonComponent id='ics-export' title='Export'
onClick={onClick}>Export</ButtonComponent>
  <ScheduleComponent ref={scheduleObj} width='100%' height='520px'
id='schedule' selectedDate={new Date(2018, 1, 15)}
eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
ICalendarExport, ICalendarImport, Resize, DragAndDrop]} />
  </ScheduleComponent></div>
);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

    box-shadow: inset 0 0 1px #e0e0e0, inset 0 0 14px rgba(0, 0, 0, 0.2);
    width: 60px;
    height: 60px;
  }

```

```
.e-profile-wrapper .content-wrap {
  padding-left: 10px;
}

.e-profile-wrapper .name {
  font-size: 14px;
  line-height: 20px;
  font-weight: 500;
  margin-top: 2px;
}

.e-profile-wrapper .destination {
  font-size: 12px;
}

.e-profile-wrapper .status-icon {
  height: 6px;
  width: 6px;
  background: green;
  border-radius: 100%;
  float: left;
  margin-right: 4px;
  margin-top: 4px;
}

.e-profile-wrapper .status {
  font-size: 11px;
}
```

Exporting calendar with custom file name

By default, the calendar is exported with a file name `Calendar.ics`. To change this file name on export, pass the custom string value as `fileName` to the method argument so as to get the file downloaded with this provided name.

The following example downloads the iCal file with a name `ScheduleEvents.ics`.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
ICalendarExport, ICalendarImport, Resize, Inject } from '@syncfusion/ej2-
react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { scheduleData } from './datasource';
/**
 * Schedule header customization sample
 */
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onClick = () => {
    scheduleObj.current.exportToICalendar('ScheduleEvents');
  }
}
```

```

    return (<div>
      <ButtonComponent id='ics-export' title='Export'
onClick={onClick}>Export</ButtonComponent>
      <ScheduleComponent ref={scheduleObj} width='100%' height='520px'
id='schedule' selectedDate={new Date(2018, 1, 15)}
eventSettings={eventSettings}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
ICalendarExport, ICalendarImport, Resize, DragAndDrop]} />
      </ScheduleComponent></div>);
  }
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

```

Import events from other calendars

The events from external calendars (ICS files) can be imported into Scheduler by using the `importICalendar` method. This method accepts the `blob object` of an .ics file to be imported, as a mandatory argument.

To import an ICS file containing events into Scheduler, you need to first import the `ICalendarImport` module from `@syncfusion/ej2-schedule` package and then inject it using the `Schedule.Inject(ICalendarImport)` method.

The following example shows how to import an ICS file into Scheduler, using the `importICalendar` method.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, DragAndDrop, Resize,
  Inject, ICalendarExport, ICalendarImport
} from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
const App = () => {
  const scheduleObj = useRef(null);

```

```

let multiple = false;
let showFileList = false;
const allowedExtensions = '.ics';
const eventSettings = { dataSource: scheduleData };
const onSelect = (args) => {
  scheduleObj.current.importICalendar(args.event.target.files[0]);
}
return (<div>
  <UploaderComponent id='fileUpload' type='file'
allowedExtensions={allowedExtensions} cssClass='calendar-import'
  buttons={{ browse: 'Choose file' }} multiple={multiple}
showFileList={showFileList}
  selected={onSelect}></UploaderComponent>
  <ScheduleComponent ref={scheduleObj} width='100%' height='520px'
selectedDate={new Date(2018, 1, 15)} allowDragAndDrop={false}
eventSettings={eventSettings}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda, DragAndDrop,
ICalendarExport, ICalendarImport, Resize, DragAndDrop]} />
  </ScheduleComponent></div>
);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

How to print the Scheduler element

The Scheduler allows you to print the Scheduler element by using the `print` client-side method. The `print` method works in two ways. You can find it below.

- Using `print` method without options.
- Using a `print` method with options.

To print the Schedule, you need to import the `Print` module from the `@syncfusion/ej2-react-schedule` package and then inject it using `<Inject services={[Print]} />`.

Using `print` method without options

You can print the Schedule element with the current view by using the `print` method without passing the options. The following example shows how to print the Scheduler using the `print` method without passing options.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Print, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onActionBegin = (args) => {
    if (args.requestType === 'toolbarItemRendering') {
      let exportItem = {

```

```

        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-schedule-
print',
        text: 'Print', cssClass: 'e-schedule-print', click: onPrintIconClick
    };
    args.items.push(exportItem);
}
}
const onPrintIconClick = () => {
    scheduleObj.current.print();
}
return (<div>
    <ScheduleComponent ref={scheduleObj} width='100%' height='520px'
selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings}
actionBegin={onActionBegin}>
        <Inject services={[Day, Week, WorkWeek, Month, Agenda, Print]} />
    </ScheduleComponent></div>
);
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda,
EventSettingsModel, Print, Inject, ActionEventArgs, ToolbarActionArgs } from
'@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
import { ItemModel } from '@syncfusion/ej2-react-navigations';
const App = () => {
    const scheduleObj = useRef<ScheduleComponent>(null);
    const eventSettings: EventSettingsModel = { dataSource: scheduleData };
    const onActionBegin = (args: ActionEventArgs & ToolbarActionArgs): void =>
    {
        if (args.requestType === 'toolbarItemRendering') {
            let exportItem: ItemModel = {
                align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-schedule-
print',

Using a print method with options

You can print the Schedule element based on your needs using the `print` method by passing the print options used in this example with its values. The following example shows how to print the Scheduler using the `print` method by passing the options.

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Print,
Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const scheduleObj = useRef(null);
  const eventSettings = { dataSource: scheduleData };
  const onActionBegin = (args) => {
    if (args.requestType === 'toolbarItemRendering') {
      let exportItem = {
        align: 'Right', showTextOn: 'Both', prefixIcon: 'e-icon-schedule-
print',
        text: 'Print', cssClass: 'e-schedule-print', click: onPrintIconClick
      };
      args.items.push(exportItem);
    }
  }
  const onPrintIconClick = () => {
    let printModel = {
      agendaDaysCount: 14,
      cssClass: 'e-print-schedule',
      currentView: scheduleObj.current.currentView,
      dateFormat: 'dd-MMM-yyyy',
      enableRtl: false,
      endHour: '18:00',
      firstDayOfWeek: 1,
      firstMonthOfYear: 0,
      group: {},
      height: 'auto',
      locale: scheduleObj.current.locale,
      maxDate: scheduleObj.current.selectedDate,
      minDate: scheduleObj.current.getCurrentViewDates()[0],
      readonly: true,
      resources: [],
      rowAutoHeight: false,
      selectedDate: new Date(),
      showHeaderBar: false,
      showTimeIndicator: false,
      showWeekNumber: false,
      showWeekend: false,
      startHour: '06:00',
      timeFormat: 'HH',
      timeScale: { enable: true },
      width: 'auto',
      workDays: [1, 2, 3, 4, 5],
      workHours: { highlight: true, start: '10:00', end: '20:00' }
    };
  };
};
```

```

    scheduleObj.current.print(printModel);
  }

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Context menu in React Schedule component

You can display context menu on work cells and appointments of Scheduler by making use of the **ContextMenu** control manually from the application end. In the following code example, context menu control is being added from sample end and set its target as **Scheduler**.

On Scheduler cells, you can display the menu items such as **New Event**, **New Recurring Event** and **Today** option. For appointments, you can display its related options such as **Edit Event** and **Delete Event**. The default event window can be opened for appointment creation and editing using the **openEditor** method of Scheduler.

The deletion of appointments can be done by using the **deleteEvent** public method. Also, the **selectedDate** property can be used to navigate between different dates.

You can also display custom menu options on Scheduler cells and appointments. Context menu will open on tap-hold in responsive mode.

}
.schedule-context-menu ul .e-menu-item .e-menu-icon {
  font-size: 12px;
}
}

```

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Dimensions in React Schedule component

The Scheduler dimensions refers to both height and width of the entire layout and it accepts 3 types of values.

- auto
- pixel
- percentage

Auto Height and Width

When height and width of the Scheduler are set to **auto**, it will try as hard as possible to keep an element the same width as its parent container. In other words, the parent container that holds Scheduler, its width/height will be the sum of its children. By default, Scheduler is assigned with **auto** values for both height and width properties.

INDEX.JSX

Recurrence editor in React Schedule component

The Recurrence editor is integrated into Scheduler editor window by default, to process the recurrence rule generation for events. Apart from this, it can also be used as an individual component referring from the Scheduler repository to work with the recurrence related processes.

All the valid recurrence rule string mentioned in the [iCalendar](#) specifications are applicable to use with the recurrence editor.

Customizing the repeat type option in editor

By default, there are 5 types of repeat options available in recurrence editor such as,

- Never
- Daily
- Weekly
- Monthly
- Yearly

It is possible to customize the recurrence editor to display only the specific repeat options such as **Daily** and **Weekly** options alone by setting the appropriate **frequencies** option.

INDEX.JSX

    </div>
</body>
</html>

```

The other properties available in recurrence editor are tabulated below,

Properties	Type	Description
firstDayOfWeek	number	Sets the first day of the week.
startDate	Date	Sets the start date

- | dateFormat | string | Sets the specific date format on recurrence editor.
- | locale | string | Sets the locale to be applied on recurrence editor.
- | cssClass | string | Allows styling with custom class names.
- | enableRtl | boolean | Allows recurrence editor to render in RTL mode.
- | minDate | Date | Sets the minimum date on recurrence editor.
- | maxDate | Date | Sets the maximum date on recurrence editor.
- | value | string | Sets the recurrence rule as its output values.
- | selectedType | number | Sets the current repeat type to be set on the recurrence editor.

Customizing the End Type Option in Editor

By default, there are 3 types of end options available in the recurrence editor such as:

- Never
- Until
- Count

It is possible to customize the recurrence editor to display only the specific end options, such as the **Until** and **Count** options alone, by setting the appropriate [endTypes](#) option.

Accessing the recurrence rule string

The recurrence rule is usually generated based on the options selected from the recurrence editor and also it follows the [iCalendar](#) specifications. The generated recurrence rule string is a valid one to be used with the Scheduler event's recurrence rule field.

There is a **change** event available in recurrence editor, that triggers on every time the fields of recurrence editor tends to change. Within this event argument, you can access the generated recurrence value through the **value** option as shown in the following code example.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef, useEffect } from 'react';
import { RecurrenceEditorComponent } from '@syncfusion/ej2-react-schedule';
const App = () => {
  const ruleOutput = useRef(null);
  useEffect(() => {
    let outputElement = ruleOutput.current;
    outputElement.innerText = 'Select Rule';
  }, []);
  const onChange = (args) => {
    let outputElement = ruleOutput.current;
    if (args.value == "") {
      outputElement.innerText = 'Select Rule';
    }
    else {
      outputElement.innerText = args.value;
    }
  }
  return (

Set specific value on recurrence editor

It is possible to display the recurrence editor with specific options loaded initially, based on the rule string that we provide. The fields of recurrence editor will change its values accordingly, when we provide a particular rule through the `setRecurrenceRule` method.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef, useEffect } from 'react';
import { RecurrenceEditorComponent, RecurrenceEditorChangeEventArgs }
    from '@syncfusion/ej2-react-schedule';
const App = () => {
    const recObject = useRef(null);
    const ruleOutput = useRef(null);
    useEffect(() => {
        let outputElement = ruleOutput.current;
        recObject.current.setRecurrenceRule('FREQ=DAILY; INTERVAL=2; COUNT=8');
        outputElement.innerText = recObject.current.value;
    }, []);
    const onChange = (args) => {
        let outputElement = ruleOutput.current;

```

```

    outputElement.innerText = args.value;
  }
  return (<div className='content-wrapper recurrence-editor-wrap'>
    <div style={{ paddingBottom: '15px' }}>

Recurrence date generation

You can parse the `recurrenceRule` of an event to generate the date instances on which that particular event is going to occur, using the `getRecurrenceDates` method. It generates the dates based on the `recurrenceRule` that we provide. The parameters to be provided for `getRecurrenceDates` method are as follows.

Field name	Type	Description
----- ----- -----		
startDate	Date	Appointment start date.
rule	String	Recurrence rule present in an event object.
excludeDate	String	Date collection (in ISO format) to be excluded. It is optional .
maximumCount	Number	Number of date count to be generated. It is optional .
viewDate	Date	Current view range's first date. It is optional .

INDEX.JSX

```
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef, useEffect } from 'react';
import { RecurrenceEditorComponent }
  from '@syncfusion/ej2-react-schedule';
const App = () => {
  const recObject = useRef(null);
  const ruleOutput = useRef(null);
  const today = new Date()
  useEffect(() => {
    let dates = recObject.current.getRecurrenceDates(new
Date(today.getFullYear(), today.getMonth(), today.getDate(), 10, 0),
    'FREQ=DAILY;INTERVAL=1', '20180108T114224Z,20180110T114224Z', 4, new
Date(today.getFullYear(), today.getMonth(), today.getDate()));
    let stringCollection = '';
    for (let index = 0; index < dates.length; index++) {
      stringCollection += new Date(dates[index]);
      if (index + 1 !== dates.length) {
        stringCollection += '\n';
      }

        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Above example will generate two dates January 7, 2018 & January 9 2018 by excluding the in between dates January 8 2018 & January 10 2018, since those dates were given in the exclusion list. Generated dates can then be utilised to create appointments.

Recurrence date generation in server-side

It is also possible to generate recurrence date instances from server-side by manually referring the `RecurrenceHelper` class, which is specifically written and referred from application end to handle this date generation process.

Refer [here](#) for the step by step procedure to achieve date generation in server-side.

Restrict date generation with specific count

In case, if the rule is given in "NEVER ENDS" category, then you can mention the maximum count when you actually want to stop the date generation starting from the provided start date. To do so, provide the appropriate `maximumCount` value within the `getRecurrenceDates` method as shown in the following code example.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef, useEffect } from 'react';
import { RecurrenceEditorComponent } from '@syncfusion/ej2-react-schedule';
const App = () => {
  const recObject = useRef(null);
  const ruleOutput = useRef(null);
  useEffect(() => {
    let dates = recObject.current.getRecurrenceDates(new Date(2018, 0, 7, 10, 0), 'FREQ=DAILY;INTERVAL=1', null, 10, null);
    let stringCollection = '';
    for (let index = 0; index < dates.length; index++) {
      stringCollection += new Date(dates[index]);
      if (index + 1 !== dates.length) {
        stringCollection += '\n';
      }
    }
    let outputElement = ruleOutput.current;
    outputElement.innerText = stringCollection;
  }, []);
  return (
    <div className='content-wrapper recurrence-editor-wrap'>

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Localization in React Schedule component

The Scheduler integrates different date-time formats and cultures, which allows it to function globally, thus meeting the diverse needs of different regions.

You can adapt the Scheduler to various languages by parsing and formatting the date or number ([Internationalization](#)), adding culture specific customization and translation to the text ([Localization](#)).

Globalization

The Internationalization library provides support for formatting and parsing the number, date, and time by using the official [Unicode CLDR](#) JSON data and also provides the `loadCldr` method to load the culture specific CLDR JSON data.

By default, Scheduler is set to follow the English culture ('en-US'). If you want to go with different culture other than English, follow the below steps.

- Install the `CLDR-Data` package by using the below command (it installs the CLDR JSON data). For more information about CLDR-Data, refer to this [link](#).

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `/node_modules/cldr-data`.

- Now import the installed CLDR JSON data into the `app.ts` file. To import JSON data, you need to install the JSON plugin loader. Here, we have used the SystemJS JSON plugin loader.

```
npm install systemjs-plugin-json --save-dev
```

- Once installed, configure the `system.config.js` configuration settings as shown in the following code to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'syncfusion': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",

  },
  meta: {
    '*.json': { loader: 'plugin-json' }
  },
  packages: {
    'app': { main: 'app', defaultExtension: 'js' },
    'cldr-data': { main: 'index.js', defaultExtension: 'js' }
  }
});
System.import('app');
```

- Now import the required cultures from the installed location to `app.ts` file as given in the following code example.

```
`ts
//import the loadCldr from ej2-base
import { loadCldr } from '@syncfusion/ej2-base';
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/fr-CH/ca-gregorian.json'),
  require('cldr-data/main/fr-CH/numbers.json'),
  require('cldr-data/main/fr-CH/timeZoneNames.json')
);`
```

- Set the culture to Scheduler by using the `locale` property.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
import { loadCldr } from '@syncfusion/ej2-base';
import * as numberingSystems from '../numberingSystems.json';
import * as gregorian from '../ca-gregorian.json';

Localizing the static Scheduler text

[Localization](#) library allows to display all the static text, date content, and time mode of the Scheduler following the localized language. To achieve this, set the `locale` property of Scheduler, as well as define the translation text of static words of Scheduler through the `load` method.

For example, the following code example lets you to define the French translation words for all the static words used in Scheduler.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from '../datasource';
import { Ajax, L10n, loadCldr } from '@syncfusion/ej2-base';
import * as numberingSystems from '../numberingSystems.json';
import * as gregorian from '../ca-gregorian.json';
import * as numbers from '../numbers.json';
import * as detimeZoneNames from '../timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, detimeZoneNames);
let localeTexts;
let ajax = new Ajax('../locale.json', 'GET', false);
ajax.onSuccess = (value) => {
  localeTexts = value;
};
ajax.send();
L10n.load(JSON.parse(localeTexts));
const App = () => {

```

```

    const eventSettings = { dataSource: scheduleData }
    return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} locale='fr-CH' eventSettings={eventSettings}>
      <ViewsDirective>
        <ViewDirective option='Day' />
        <ViewDirective option='Week' />
        <ViewDirective option='WorkWeek' />
        <ViewDirective option='Month' />
      </ViewsDirective>
      <Inject services={[Day, Week, WorkWeek, Month]} />
    </ScheduleComponent>;
  }
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';

}
}
});
`

```

Setting date format

Scheduler can be used with all valid date formats and by default it follows the universal date format "MM/dd/yyyy". If the `dateFormat` property is not specified particularly, then it will work based on the locale that is assigned to the Scheduler. As the default locale applied on Scheduler is "en-US", this makes it to follow the "MM/dd/yyyy" pattern.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings = { dataSource: scheduleData };
  return <ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} dateFormat="yyyy/MM/dd" eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='WorkWeek' />
      <ViewDirective option='Month' />
    </ViewsDirective>
    <Inject services={[Day, Week, WorkWeek, Month]} />
  </ScheduleComponent>;
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Inject,

    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Setting the time format

Time formats is a way of representing the time value in different string formats in the Scheduler. By default, the time mode of the Scheduler can be either 12 or 24 hours format which is completely based on the **locale** set to the Scheduler. Since the default **locale** value of the Scheduler is en-US, the time mode will be set to 12 hours format automatically. You can also customize the format by using the **timeFormat** property. To know more about the time format standards, refer to the [Date and Time Format](#) section.

The following example demonstrates the Scheduler component in 24 hours format.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,
15)} timeFormat="HH:mm" eventSettings={eventSettings}>
        <ViewsDirective>
            <ViewDirective option='Day' />
            <ViewDirective option='Week' />
            <ViewDirective option='WorkWeek' />
            <ViewDirective option='Month' />
        </ViewsDirective>
        <Inject services={[Day, Week, WorkWeek, Month]} />
    </ScheduleComponent>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
    ViewsDirective, ViewDirective, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';

```

```
import { scheduleData } from './datasource';
const App = () => {
  const eventSettings: EventSettingsModel = { dataSource: scheduleData };
  return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1, 15)} timeFormat="HH:mm" eventSettings={eventSettings}>
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='WorkWeek' />
      <ViewDirective option='Month' />
    </ViewsDirective>
    <Inject services={[Day, Week, WorkWeek, Month]} />
  </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);
```

  <script src="systemjs.config.js"></script>
  <style>
    #loader {
      color: #008cff;
      height: 40px;
      left: 45%;
      position: absolute;
```

```

        top: 45%;
        width: 30%;
    }
</style>
</head>
<body>
    <div id='schedule'>
        <div id='loader'>Loading....</div>
    </div>
</body>
</html>

```

Note: `timeFormat` property only accepts the valid time format's.

First day of the week

By default, the first day of the week can be set on Scheduler by making use of the `firstDayOfWeek` property, doing so will make the Scheduler to start with that day.

Here, Sunday is always denoted as 0, Monday as 1 and so on.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Month, Week, WorkWeek, Inject, ViewsDirective,
ViewDirective } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    return (<ScheduleComponent height='550px' selectedDate={new Date(2018, 1,

Displaying Scheduler in RTL mode

The Scheduler layout and its behavior can be changed as per the common RTL (Right to Left) conventions by setting `enableRtl` to `true`. By doing so, the Scheduler will display its usual layout from right to left. Its default value is `false`.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Inject, ViewsDirective,

Accessibility in React Schedule component

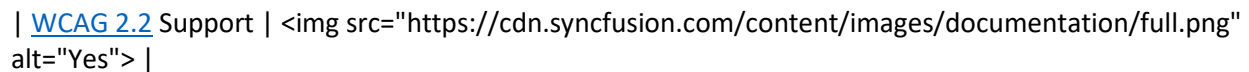

The Scheduler has been designed based on the WAI-ARIA specifications, thus applying the appropriate ARIA roles, states and properties for the Scheduler elements. It is also available with a built-in keyboard navigation support, making it easier for the people who use assistive technologies or who completely rely on the Keyboard support. As per the accessibility standard, the navigated dates, views and other interactive actions performed on the Scheduler will be read out to the target users who use assistive technologies such as screen readers.

The Scheduler makes use of the most required ARIA attributes such as `aria-label` and `role` to support the accessibility in it. To be more accurate, it must be used with an ARIA compliant browser along with the screen reader running from backend.

The accessibility compliance for the Schedule component is outlined below.

| Accessibility Criteria | Compatibility |

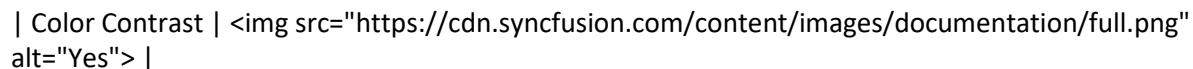

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

```

```
margin: 0.5em 0;
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

ARIA attributes

The Scheduler parent element is assigned with a role of **main**, to denote it as the main content of a component as well as a unique element of the entire document.

The following ARIA attributes are used in the Scheduler.

Attributes	Description
------------	-------------

-----	-----
-------	-------

role="main"	Attribute added to the Scheduler element describes the actual role of the element and denote it as a main and unique content.
-------------	---

role="button"	Attribute is assigned to the appointments of Scheduler, to denote it as a clickable element.
---------------	--

aria-label	Attribute is set to the Scheduler parent element and its default value is Scheduler's current date. On every time, the date is navigated, this attribute is updated with appropriate current date values. It is also assigned to other scheduler UI elements such as previous and next date navigation buttons depicting its purpose, div element displaying date range in the header bar and appointment elements.
------------	---

aria-labelledby	It indicates editor dialog title to the user through assistive technologies.
-----------------	--

aria-describedby	It indicates editor dialog content description to the user through assistive technologies.
------------------	--

aria-disabled	Attribute is set to the appointment element to indicates the disabled state of the Scheduler.
---------------	---

Keyboard interaction

All the Scheduler actions can be controlled via keyboard keys by using the **allowKeyboardInteraction** property which is set to **true** by default. The following are the standard keys that work on Scheduler.

Keys	Description
------	-------------

-----	-----
-------	-------

Alt + j	Focuses the Scheduler element [provided from application end].
---------	--

Tab	Focuses the first or active item on the Scheduler header bar and then move the focus to the next available event elements. If no events present, then focus moves out of the component.
-----	---

| Shift + Tab | Reverse focusing of the Tab key functionality. Inverse focusing of event elements from the last one and then move onto the first or active item on Scheduler header bar and then moves out of the component.

| Enter | Opens the quick info popup on the selected cells or events. |

| Escape | Closes any of the popup that are in open state. |

| Arrow | To move onto the next available cells in either of the needed directions. (left, right, top and right) |

| Shift + Arrow | For multiple cell selection on either direction. |

| Delete | Deletes one or more selected events. |

| Ctrl + Click on events | To select multiple events. |

| Alt + Number (from 1 to 6) | To switch between the views of Scheduler. |

| Ctrl + Left Arrow | To navigate to the previous date period. |

| Ctrl + Right Arrow | To navigate to the next date period. |

| Left or Right Arrow | On pressing any of these keys, when focus is currently on the Schedule header bar, moves the focus to the previous or next items in the header bar. |

| Space or Enter | It activates any of the focused items. |

| Page Up & Page Down | To scroll through the work cells area. |

| Home | To move the selection to the first cell of Scheduler. |

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Ensuring accessibility

The Scheduler component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Scheduler component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Scheduler component with accessibility tools.

Scheduler styling in React Schedule component

To modify the Scheduler appearance, you need to override the default CSS of Scheduler. Also, you have an option to create your own custom theme using our [Theme Studio](#). Please find the list of CSS classes in Scheduler.

| Css class | Purpose |

|-----|-----|

| .e-schedule .e-vertical-view .e-work-cells | Work cells in vertical views of scheduler |

| .e-schedule .e-month-view .e-work-cells | Work cells in month view of scheduler |

| .e-schedule .e-month-view .e-other-month | Work cells of other month in month view of scheduler |

| .e-schedule .e-timeline-view .e-work-cells | Work cells in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-work-cells | Work cells in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells | Work cells in timeline year view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells.e-other-month | Work cells of other month in timeline year view of scheduler |

| .e-schedule .e-month-agenda-view .e-work-cells | Work cells in month agenda view of scheduler |

| .e-schedule .e-month-agenda-view .e-other-month | Work cells of other month in month agenda view of scheduler |

| .e-schedule .e-year-view .e-calendar-wrapper .e-month-calendar.e-calendar .e-other-month | Work cells of other month in year view of scheduler |

| .e-schedule .e-vertical-view .e-all-day-cells | All day cells in vertical views of scheduler |

| .e-schedule .e-vertical-view .e-work-hours | Work hour cells in vertical views of scheduler |

| .e-schedule .e-month-view .e-work-days | Work day cells in month view of scheduler |

| .e-schedule .e-month-agenda-view .e-work-days | Work day cells in month agenda view of scheduler |

| .e-schedule .e-timeline-view .e-work-hours | Work hour cells in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-work-days | Work day cells in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-work-cells.e-work-days | Work day cells in timeline year view of scheduler |

| .e-schedule .e-vertical-view .e-day-wrapper .e-appointment | Appointment in vertical views of scheduler |

| .e-schedule .e-vertical-view .e-all-day-appointment-wrapper .e-appointment | All day Appointment in vertical views of scheduler |

| .e-schedule .e-month-view .e-appointment | Appointment in month view of scheduler |

| .e-schedule .e-timeline-view .e-appointment | Appointment in timeline views of scheduler |

| .e-schedule .e-timeline-month-view .e-appointment | Appointment in timeline month view of scheduler |

| .e-schedule .e-timeline-year-view .e-event-table .e-appointment | Appointment in timeline year view of scheduler |

| .e-schedule .e-year-view .e-calendar-wrapper .e-month-calendar.e-calendar .e-appointment | Appointment in year view of scheduler |

| .e-schedule .e-agenda-view .e-appointment | Appointment in agenda view of scheduler |

| .e-schedule .e-month-agenda-view .e-appointment-indicator | Appointment in month agenda view of scheduler |

| .e-schedule .e-block-appointment | Block appointment in scheduler |

- | .e-schedule .e-read-only | Read only appointment in scheduler. |
- | e-appointment-border | Appointment which are currently selected, use the appointment class hierarchical based on your views. |
- | e-selected-cells | work cells which are currently selected, use the work cell class hierarchical based on your views. |
- | e-header-cells | Header cells of scheduler, use the work cells hierarchical based on your views. |
- | .e-schedule .e-vertical-view .e-resource-cells| Resource cells in vertical views of scheduler. |
- | .e-schedule .e-month-view .e-resource-cells| Resource cells in month view of scheduler. |
- | .e-schedule .e-timeline-view .e-resource-cells | Resource cells in timeline views of scheduler. |
- | .e-schedule .e-timeline-month-view .e-resource-cells| Resource cells in timeline month view of scheduler. |
- | e-parent-node | Parent resource cells in timeline views of scheduler. |
- | e-child-node | Child resource cells in timeline views of scheduler. |

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

Frequently asked questions in React Schedule component

In this article, you can find some frequently asked questions and corresponding solutions while getting hands-on experience with scheduler control.

Maximum call stack size exceeded

Error Image:

Solution:

The above error occurs when using scheduler views that were not imported into the project. You can resolve this issue by importing the required view modules.

In the below code, `Day` option is used without injecting, So, it throws the above error. You can resolve this problem by simply injecting the day module in below code.

```
`ts
import { render } from 'react-dom';
import * as React from 'react';
```

```

import { ScheduleComponent, ViewsDirective, ViewDirective, Agenda, TimelineViews, TimelineMonth,
Inject, Resize, DragAndDrop
} from '@syncfusion/ej2-react-schedule';
import { extend } from '@syncfusion/ej2-base';
import { SampleBase } from './sample-base';
import * as dataSource from './datasource.json';
export class TimelineView extends SampleBase {
  constructor() {
    super(...arguments);
    this.data = extend([], dataSource.scheduleData.concat(dataSource.timelineData), null, true);
  }
  private eventSettings: EventSettingsModel = { dataSource: this.data };
  render() {
    return (<ScheduleComponent height="650px" selectedDate={new Date(2021, 0, 10)}
    eventSettings={this.eventSettings}>
    <ViewsDirective>
    <ViewDirective option="Day" />
    <ViewDirective option="TimelineWeek" />
    <ViewDirective option="TimelineWorkWeek" />
    <ViewDirective option="TimelineDay" />
    <ViewDirective option="Agenda" />
    </ViewsDirective>
    <Inject
    services={[ TimelineViews, TimelineMonth, Agenda, Resize, DragAndDrop]}
    />
    </ScheduleComponent>
    );
  }
}
render(<TimelineView />, document.getElementById('sample'));

```

Grouping with empty resources

Grouping without providing any resource data will throw the following problems.

- Normal(vertical) views are rendered, but you are not able to perform CRUD operations

- Timeline views not at all render and shows empty scheduler table

So, we suggest to avoid grouping with empty resources in the scheduler.

Not providing e-field in editor template

Error: While using editor template, value of `e-field` is missing in editor window.

Solution: `e-field` value is mandatory, we need to add it. Please refer [here](#) for more info.

Missing CSS reference

Error Image:

Solution:

The above problem occurs when missing CSS references for the scheduler in a project. You can resolve this issue by providing proper CSS for the scheduler.

```
<html>
<head>
<title>Syncfusion React Sample</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0, user-scalable=no" />
<meta http-equiv="x-ua-compatible" content="ie=edge">
<meta name="description" content="Syncfusion React UI Components" />
<meta name="author" content="Syncfusion" />
<!-- scheduler CSS is referred from this link -->
<link href="https://cdn.syncfusion.com/ej2/material.css" rel="stylesheet">
</head>
<body class="material">
```

```
<div id='sample'>
</body>
</html>
`
```

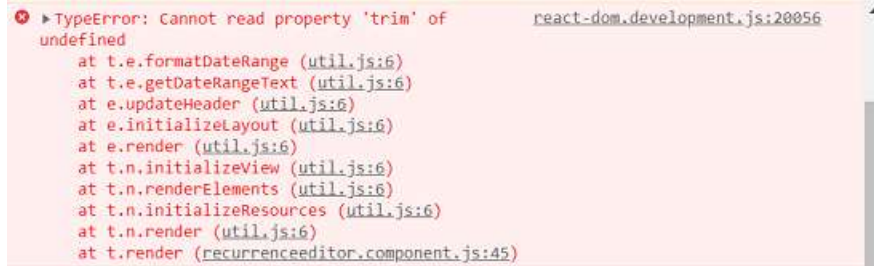

QuickInfoTemplate at bottom

When using the `quickInfoTemplate` in scheduler, sometimes quickinfo popup not shown fully at the bottom area of scheduler. You can resolve this by using `cellClick` and `eventClick` events and below code snippet.

```
`ts
constructor() {
super(...arguments);
this.eventAdded = false;
}
.
.
onClick(args) {
if (!this.eventAdded) {
let popupInstance = document.querySelector('.e-quick-popup-wrapper').ej2_instances[0];
popupInstance.open = () => {
popupInstance.refreshPosition();
};
this.eventAdded = true;
}
}
.
.
.
<ScheduleComponent id="schedule" cellClick={this.onClick.bind(this)}
eventClick={this.onClick.bind(this)}>
`
```

Not importing culture files while using localization

Error Image:

While using [locale](#) in scheduler, not importing the required culture files properly throws the problem.

Solution: Properly add and import the culture files (numberingSystems, timeZoneNames, loadCldr, L10n etc.,) in your project will resolve the problem.

`ts

```
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import * as numberingSystems from './culture-files/numberingSystems.json';
import * as gregorian from './culture-files/ca-gregorian.json';
import * as numbers from './culture-files/numbers.json';
import * as timeZoneNames from './culture-files/timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
  'en-GB': {
    schedule: {
      day: 'Day',
      week: 'Week',
      workWeek: 'Work Week',
      month: 'Month'
    }
  }
});
```

Ej1 api migration in React Schedule component

This topic shows the API equivalent of JS2 Scheduler component to be used, while migrating your project that uses JS1 Scheduler.

Scheduler

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| To change the display of days count in agenda view | **Property:** *daysInAgenda*

 <EJ.Schedule id="Schedule" currentView={ej.Schedule.CurrentView.Agenda}
 agendaViewSettings-daysInAgenda={5}>
</EJ.Schedule> | **Property:** *agendaDaysCount*

 <ScheduleComponent currentView='Agenda'
 agendaDaysCount={7}>
</ScheduleComponent> |

| Preventing deletion of appointment | **Property:** *allowDelete*

 <EJ.Schedule id="Schedule"
 allowDelete= {false}>
</EJ.Schedule> | Not applicable |

| Allows dragging and dropping of appointments | **Property:** *allowDragAndDrop*

 <EJ.Schedule id="Schedule" allowDragAndDrop={true}>
 </EJ.Schedule> | **Property:**
allowDragAndDrop

 <ScheduleComponent
 allowDragAndDrop={true}>
</ScheduleComponent> |

| Enabling inline editing of appointments | **Property:** *allowInline*

 <EJ.Schedule
 id="Schedule" allowInline={true}>
 </EJ.Schedule> | Not applicable |

| Allow keyboard interactions | **Property:** *allowKeyboardNavigation*

 <EJ.Schedule
 id="Schedule" allowKeyboardNavigation={true}>
 </EJ.Schedule> | **Property:**
allowKeyboardInteraction

 <ScheduleComponent
 allowKeyboardInteraction={true}>
</ScheduleComponent> |

| Enable resizing of appointments | **Property:** *enableAppointmentResize*

 <EJ.Schedule
 id="Schedule" enableAppointmentResize={true}>
 </EJ.Schedule> | **Property:** *allowResizing*

You can refer to our [React Scheduler](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Scheduler example](#) to know how to present and manipulate data.

How To

Add edit and remove events in React Schedule component

CRUD actions can be manually performed on appointments using `addEvent`, `saveEvent` and `deleteEvent` methods as shown below.

*Normal event***INDEX.JSX**

```

import * as React from 'react';
import { useRef } from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
const App = () => {
  const scheduleObj = useRef(null);
  const scheduleData = [{
    Id: 3,
    Subject: 'Testing',
    StartTime: new Date(2018, 1, 11, 9, 0),
    EndTime: new Date(2018, 1, 11, 10, 0),
    IsAllDay: false
  }, {
    Id: 4,
    Subject: 'Vacation',
    StartTime: new Date(2018, 1, 13, 9, 0),
    EndTime: new Date(2018, 1, 13, 10, 0),
    IsAllDay: false
  }];
  const eventSettings = { dataSource: scheduleData };
  const onClickAdd = () => {

```

When a single occurrence of the recurrence appointment is edited, `recurrenceID` field will be added which holds the `id` value of its parent recurrence appointment. It is applicable only for the edited occurrence appointments. Therefore the collection passing to the `saveEvent` with action as **EditOccurrence** should have `RecurrenceID` field as shown above.

Set default value for event fields in React Schedule component

Event window default fields name like Title, Location, etc.. can be customized and default value can be set to Subject field using `default` property which will be added if an appointment is created with empty subject.

Open editor window on single click

By default, Scheduler Editor window will open when double clicking the cells or appointments. You can also open the editor window with single click by using `openEditor` method in `eventClick` and `cellClick` events of scheduler and setting `false` to `showQuickInfo`. The following example shows how to open editor window on single click of cells and appointments.

INDEX.JSX

```

import * as ReactDOM from 'react-dom';
import * as React from 'react';
import { useRef } from 'react';
import { Day, Week, WorkWeek, Month, ScheduleComponent, ViewsDirective,
ViewDirective, Inject } from '@syncfusion/ej2-react-schedule';
import { scheduleData } from './datasource';
const App = () => {
    const scheduleObj = useRef(null);
    const eventSettings = { dataSource: scheduleData };
    const onCellClick = (args) => {
        scheduleObj.current.openEditor(args, 'Add');
    }
}

```

```

const onEventClick = (args) => {
  if (!args.event.RecurrenceRule) {
    scheduleObj.current.openEditor(args.event, 'Save');
  }
  else {
    scheduleObj.current.quickPopup.openRecurrenceAlert();
  }
}
return (<div>
  <ScheduleComponent ref={scheduleObj} height='550px' selectedDate={new
Date(2021, 7, 15)}
    eventSettings={eventSettings} showQuickInfo={false}
    eventClick={onEventClick}
    cellClick={onCellClick} >
    <ViewsDirective>
      <ViewDirective option='Day' />
      <ViewDirective option='Week' />
      <ViewDirective option='WorkWeek' />

Prevent date navigation in React Schedule component

We can prevent navigation while clicking on the date header by simply removing `e-navigate` class from header cells which can be achieved in the `renderCell` event as shown in the below demo.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject } from '@syncfusion/ej2-react-schedule';
import { removeClass } from '@syncfusion/ej2-base';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: scheduleData };
    const onRenderCell = (args) => {
        if (args.elementType === "dateHeader" || args.elementType === "monthCells") {
            removeClass(args.element.childNodes, "e-navigate");
        }
    }
    return (
        <ScheduleComponent width='100%' height='500px' selectedDate={new Date(2018, 1, 15)} eventSettings={eventSettings} currentView='WorkWeek' renderCell={onRenderCell}>
            <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
        </ScheduleComponent>
    );
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    ScheduleComponent, Day, Week, WorkWeek, Month, Agenda, Inject,
    RenderCellEventArgs, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { removeClass } from '@syncfusion/ej2-base';
import { scheduleData } from './datasource';
const App = () => {
    const eventSettings: EventSettingsModel = { dataSource: scheduleData };
    function onRenderCell(args: RenderCellEventArgs): void {
        if (args.elementType === "dateHeader" || args.elementType === "monthCells") {
            removeClass(args.element.childNodes, "e-navigate");
        }
    }

```

```

    }
  }
  return (<ScheduleComponent width='100%' height='500px' selectedDate={new
Date(2018, 1, 15)} eventSettings={eventSettings} currentView='WorkWeek'
  renderCell={onRenderCell}>
    <Inject services={[Day, Week, WorkWeek, Month, Agenda]} />
  </ScheduleComponent>)
};
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

```

Half yearly view in React Schedule component

The year view of our scheduler displays all the 365 days and their related appointments of a particular year. You can customize the year view by using the following properties.

- [firstMonthOfYear](#)
- [monthsCount](#)
- [monthHeaderTemplate](#)

In the following code example, you can see how to render only the last six months of a year in the scheduler. To start with the month of June, `firstMonthYear` is set to 6 and `monthsCount` is set to 6 to render only 6 months.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, ViewsDirective, ViewDirective, Resize,
DragAndDrop, ResourcesDirective, ResourceDirective, Inject, Year as YearView,
TimelineYear } from '@syncfusion/ej2-react-schedule';
import { resourceData } from './datasource';
const App = () => {
    const eventSettings = { dataSource: resourceData };
    const group = { resources: ['Categories'] };
    const categoriesData = [
        { text: 'Nancy', id: 1, color: '#ffaa00' },

Set different event time duration in React Schedule component

In event window, start/end time duration will be processed based on the **interval** value within the **timeScale** property. By default, **interval** value is 30, therefore in event window start/end time duration will be in 30 mins duration. You can set custom interval range to the start/end time in event window using **popupOpen** event as shown below.

INDEX.JSX

Enable scroll option on all day section in React Schedule component

When you have larger number of appointments in all-day row, it is difficult to view all the appointments properly. In that case you can enable scroller option for all-day row by setting true to **enableAllDayScroll** whereas its default value is false. When setting this property to true, individual scroller for all-day row is enabled when it reaches its maximum height on expanding.

Note: This property is not applicable for Scheduler with height **auto**.

Manual refresh in React Schedule component

Refresh Template

In Scheduler, we can able to refresh the elements of the template alone instead of the entire scheduler by using the [refreshTemplates](#) public method. We can provide an additional option to refresh specific templates alone or all templates together by using this method. The following template names are accepted as an argument to refresh it specifically.

- eventTemplate
- dateHeaderTemplate
- resourceHeaderTemplate
- quickInfoTemplates
- editorTemplate
- tooltipTemplate
- headerTooltipTemplate

In the following code example, you can see how to use the refreshTemplates method to refresh multiple templates. Here, we have added the following scheduler templates such as [cellTemplate](#), [dateHeaderTemplate](#), [eventTemplate](#) and [resourceHeaderTemplate](#)

Refresh Layout

In Scheduler, we can able to refresh the layout manually without re-render the DOM element by using the [refreshLayout](#) public method. The following example code explains to know how to use the refreshLayout method.

INDEX.JSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
ViewsDirective, ViewDirective } from '@syncfusion/ej2-react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
const App = () => {

```

```

const scheduleObj = useRef(null);
const scheduleData = [{
  Id: 1,
  Subject: 'Testing',
  StartTime: new Date(2021, 10, 16, 10, 0),
  EndTime: new Date(2021, 10, 16, 12, 0),
  IsAllDay: false
}, {
  Id: 2,
  Subject: 'Vacation',
  StartTime: new Date(2021, 10, 18, 10, 0),
  EndTime: new Date(2021, 10, 18, 12, 0),
  IsAllDay: false
}];
const eventSettings = { dataSource: scheduleData };
const onRefreshLayout = () => {
  scheduleObj.current.refreshLayout();
}
return (<div>
  <ButtonComponent onClick={onRefreshLayout}>Refresh
Layout</ButtonComponent> <ScheduleComponent ref={scheduleObj} width='100%'
height='550px' selectedDate={new Date(2021, 10, 15)}
eventSettings={eventSettings}>
  <ViewsDirective>
    <ViewDirective option='Day' />
    <ViewDirective option='Week' />
    <ViewDirective option='WorkWeek' />
    <ViewDirective option='Month' />
  </ViewsDirective>
  <Inject services={[Day, Week, WorkWeek, Month]} />
  </ScheduleComponent>
</div>);
}
;
const root = ReactDOM.createRoot(document.getElementById('schedule'));
root.render(<App />);

```

INDEX.TSX

```

import { useRef } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  ScheduleComponent, Day, Week, WorkWeek, Month, Inject,
  ViewsDirective, ViewDirective, EventSettingsModel
} from '@syncfusion/ej2-react-schedule';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
const App = () => {
  const scheduleObj = useRef<ScheduleComponent>(null);
  const scheduleData: Object[] = [{
    Id: 1,
    Subject: 'Testing',
    StartTime: new Date(2021, 10, 16, 10, 0),
    EndTime: new Date(2021, 10, 16, 12, 0),
    IsAllDay: false
  }, {

```

```

    Id: 2,
    Subject: 'Vacation',
    StartTime: new Date(2021, 10, 18, 10, 0),
    EndTime: new Date(2021, 10, 18, 12, 0),
    IsAllDay: false
  }];
  const eventSettings: EventSettingsModel = { dataSource: scheduleData };
  const onRefreshLayout = (): void => {
    scheduleObj.current.refreshLayout();
  }
  return (<div>
    <ButtonComponent onClick={onRefreshLayout}>Refresh
  Layout</ButtonComponent> <ScheduleComponent ref={scheduleObj} width='100%'
  height='550px' selectedDate=
    {new Date(2021, 10, 15)} eventSettings={eventSettings}>

Sidebar

Getting Started

The following section explains the required steps to build the simple **Sidebar** component with its basic usage in step by step procedure.

Dependencies

The following list of dependencies are required to use the Sidebar component in your application.

```
`javascript
|-- @syncfusion/ej2-react-navigations
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
```

,

Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

,

```
npm install -g create-react-app
```

,

- To setup basic `React` sample use following commands.

```
<div class='tsx'>
```

,

```
create-react-app quickstart --scripts-version=react-scripts-ts
```

```
cd quickstart
```

,

```
</div>
```

```
<div class='jsx'>
```

,

```
create-react-app quickstart
```

```
cd quickstart
```

,

```
</div>
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](#) public registry. You can choose the component that you want to install. For this application, we are going to use `Sidebar` component.

To install Sidebar component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-navigations --save
```

,

Adding Style sheet to the Application

To render the Sidebar component, need to import Sidebar and its dependent component's styles as given below in `App.css`.

```
`css
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-react-navigations/styles/material.css";
```

,

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

Adding Sidebar component to the Application

Sidebar can be initialized using the `<SidebarComponent>` tag, it's used to render Sidebar as it contains primary content aside from the main content. The immediate sibling element of the Sidebar will be considered as the main content.

- To include the Sidebar component in application import the `SidebarComponent` from `ej2-react-navigations` package in `App.tsx`.
- Then add the Sidebar component as shown in below code example.

[src/App.tsx]

`ts

```
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
```

```
import * as React from 'react';
```

```
function App() {
```

```
  return (
```

```
    <div className="control-section">
```

```
      <div id="wrapper">
```

```
        <SidebarComponent id="default-sidebar">
```

```
          <div className="title"> Sidebar content</div>
```

```
        </SidebarComponent>
```

```
        <div className="content">
```

```
          <div className="title">Main content</div>
```

```
          <div className="sub-title"> content goes here</div>
```

```
        </div>
```

```
      </div>
```

```
    </div>
```

```
  )
```

```
}
```

```
export default App;
```

,

`ts

```
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
```

```
import * as React from 'react';
```

```
function App() {
  return (<div className="control-section">
    <div id="wrapper">
      <SidebarComponent id="default-sidebar">
        <div className="title"> Sidebar content</div>
      </SidebarComponent>
      <div className="content">
        <div className="title">Main content</div>
        <div className="sub-title"> content goes here</div>
      </div>
    </div>
  </div>);
}
export default App;
```

Run the application

Now run the `npm start` command in the console, it will run your application and open the browser window.

```
npm start
```

The following sample, shows the basic Sidebar component.

APP.JSX

```
{% raw %}
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
  let sidebarObj;
  function onCreate() {
    sidebarObj.element.style.visibility = '';
  }
  return (<div className="control-section">
    <div id="wrapper">
      { /* Initializing the Sidebar component */ }
      <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarObj = Sidebar} created={onCreate} style={{ visibility: "hidden" }}>
        <div className="title"> Sidebar content</div>
      </SidebarComponent>
      <div className="content">
        <div className="title">Main content</div>
        <div className="sub-title"> content goes here</div>
      </div>
    </div>
  </div>);
}
```

```

        </div>
      </div>
    </div>);
  }
  export default App;
  {% endraw %}

```

APP.TSX

```

{% raw %}
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
  let sidebarObj: SidebarComponent;
  function onCreate():void {
    sidebarObj.element.style.visibility='';
  }
  return (
    <div className="control-section">
      <div id="wrapper">
        {/* Initializing the Sidebar component */}
        <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarObj = Sidebar as SidebarComponent} created={onCreate}
style={{visibility:"hidden"}}>
          <div className="title"> Sidebar content</div>
        </SidebarComponent>
        <div className="content">
          <div className="title">Main content</div>
          <div className="sub-title"> content goes here</div>
        </div>
      </div>
    </div>
  )
}
export default App;
{% endraw %}

```

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import App from './App';
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import App from './App';
ReactDOM.render(<App />, document.getElementById('sample'));

```

Enable backdrop

Enabling the [showBackdrop](#) in the Sidebar component will prevent the main content from user interactions.

Here, DOM elements will not get changed. It only closes the main content by covering with a black backdrop overlay and focuses the Sidebar in the screen. Sidebar can be rendered with specific width by setting `width` property

Note: To achieve a proper **backdrop**, we suggest that you create a wrapper parent container for the div block in which you intend to enable the backdrop. Set the class name of this parent container as the **target** for the Sidebar. Alternatively, you can place an empty div container after the target container.

APP.JSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
  let sidebarObj;
  let type = "Push";
  let showBackdrop = true;
  function onCreate() {
    sidebarObj.element.style.visibility = '';
  }
  // Toggle(Open/Close) the Sidebar
  function toggleClick() {
    sidebarObj.toggle();
  }
  // Close the Sidebar
  function closeClick() {
    sidebarObj.hide();
  }
  return (<div className="control-section">
    <div id="wrapper">
      /* Initializing the Sidebar component */
      <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarObj = Sidebar} style={{ visibility: "hidden" }} created={onCreate}
showBackdrop={showBackdrop} type={type} width="280px">
        <div className="title"> Sidebar content</div>
        <div className="sub-title">
          Click the button to close the Sidebar.
        </div>
        <div className="center-align">
          <ButtonComponent onClick={closeClick} id="close"
className="e-btn close-btn">Close Sidebar</ButtonComponent>
        </div>
      </SidebarComponent>
    <div>
      <div className="title">Main content</div>
      <div className="sub-title"> Click the button to
open/close the Sidebar.</div>
      <div className="center-align">
        <ButtonComponent onClick={toggleClick} id="toggle"
className="e-btn e-info">Toggle Sidebar</ButtonComponent>
      </div>
    </div>
  </div>);
}
export default App;
```

```
{% endraw %}
```

APP.TSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent, SidebarType } from '@syncfusion/ej2-react-
navigations';
import * as React from 'react';
function App() {
    let sidebarObj: SidebarComponent;
    let type: SidebarType = "Push";
    let showBackdrop: boolean = true;
    function onCreate(): void {
        sidebarObj.element.style.visibility='';
    }
    // Toggle(Open/Close) the Sidebar
    function toggleClick(): void {
        sidebarObj.toggle();
    }
    // Close the Sidebar
    function closeClick(): void {
        sidebarObj.hide();
    }
    return (
        <div className="control-section">
            <div id="wrapper">
                /* Initializing the Sidebar component */
                <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarObj = Sidebar as SidebarComponent} style={{visibility:"hidden"}}
created={onCreate} showBackdrop={showBackdrop} type={type} width="280px">
                    <div className="title"> Sidebar content</div>
                    <div className="sub-title">
                        Click the button to close the Sidebar.
                    </div>
                    <div className="center-align">
                        <ButtonComponent onClick={closeClick} id="close"
className="e-btn close-btn">Close Sidebar</ButtonComponent>
                    </div>
                </SidebarComponent>
                <div>
                    <div className="title">Main content</div>
                    <div className="sub-title"> Click the button to
open/close the Sidebar.</div>
                    <div className="center-align">
                        <ButtonComponent onClick={toggleClick} id="toggle"
className="e-btn e-info">Toggle Sidebar</ButtonComponent>
                    </div>
                </div>
            </div>
        </div>
    )
}
export default App;
{% endraw %}
```

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import App from './App';
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import App from './App';
ReactDOM.render(<App />, document.getElementById('sample'));
```

Position

Positioning the Sidebar to the right or left of the main content can be achieved by using the [position](#) property. If the position is not set, the Sidebar will expand from the left to the body element. [enablePersistence](#) will persist the component's state between page reloads. [change](#) event will be triggered when the state(expand/collapse) of the component is changed.

APP.JSX

```
{% raw %}
import { ButtonComponent, RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
    let sidebarObj;
    let btnObj;
    let type = "Push";
    function onCreate() {
        sidebarObj.element.style.visibility = '';
    }
    // Toggle button click event handler
    function btnClick() {
        if (btnObj.element.classList.contains('e-active')) {
            btnObj.content = 'Close';
            btnObj.iconCss = 'e-icons burg-icon';
            sidebarObj.show();
        }
        else {
            btnObj.content = 'Open';
            btnObj.iconCss = 'e-icons burg-icon';
            sidebarObj.hide();
        }
    }
    // Toggle(Open/Close) the Sidebar
    function toggleClick() {
        sidebarObj.toggle();
    }
    // Close the Sidebar
    function closeClick() {
        sidebarObj.hide();
        btnObj.content = 'Open';
    }
}
```

```

    }
    // function to handle the CheckBox change event
    function onChange(args) {
        sidebarObj.position = (args.event.target.id === "left") ? "Left" :
"Right";
    }
    return (<div className="control-section">
        <div id="wrapper">
            /* Initializing the Sidebar component */
            <SidebarComponent id="default-sidebar"
enablePersistence={true} ref={Sidebar => sidebarObj = Sidebar} style={{
visibility: "hidden" }} created={onCreate} type={type} width="280px">
                <div className="title"> Sidebar content</div>
                <div className="sub-title"> Click the button to close the
Sidebar. </div>
                <div className="center-align">
                    <ButtonComponent onClick={closeClick} id="close"

Custom context in React Sidebar component

By default, Sidebar initializes target to the body element. Using the [target](#) property, set target element to initialize the Sidebar inside any HTML element apart from the body element.

If required, `zIndex` can be set when sidebar act as overlay type.

APP.JSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
    let sidebarObj;
    let btnObj;
    let target = '.content';
    function onCreate() {
        sidebarObj.element.style.visibility = '';
    }
    // Toggle(Open/Close) the Sidebar
    function toggleClick() {
        sidebarObj.toggle();
    }
    // Close the Sidebar
    function closeClick() {
        sidebarObj.hide();
        btnObj.content = 'Open';
    }
    // Toggle button click event handler
    function btnClick() {
        if (btnObj.element.classList.contains('e-active')) {
            btnObj.content = 'Close';

Variations in React Sidebar component

The Sidebar component's expand behavior can be modified based on the purpose of use.

- Expanding types of the Sidebar

Expanding types of Sidebar

Sidebar can be set to initialize based on four different types that are consistent with the main component as explained below. When `dataBind` is invoked, this applies the pending property changes immediately to the component.

| Item | Description |

|-----|-----|

| [Over](#) | Sidebar floats over the main content area. |

| [Push](#) | Sidebar pushes the main content area to appear side-by-side, and shrinks the main content within the screen width. |

| [Slide](#) | Sidebar translates the x and y positions of main content area based on the Sidebar width. The main content area will not be adjusted within the screen width. |

| [Auto](#) | Sidebar with **Over** type in mobile resolution, and **Push** type in other higher resolutions. |

Auto is the default expand mode.

In the following sample, the types of Sidebar are demonstrated.

APP.JSX

```
{% raw %}
import { ButtonComponent, RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
    let sidebarObj;
    let btnObj;
    let type = "Push";
    let target = '.content';
    function onCreate() {
        sidebarObj.element.style.visibility = '';
    }
    // Toggle button click event handler
    function btnClick() {
        if (btnObj.content === 'Open') {
            btnObj.content = 'Close';
            sidebarObj.show();
        }
        else {
            btnObj.content = 'Open';
            sidebarObj.hide();
        }
    }
    //change the toggle button state
    function changestate() {
        if (sidebarObj.type === "Auto") {
            btnObj.content = 'Close';
            sidebarObj.show();
        }
        else {

Auto close in React Sidebar component

Sidebar often behaves differently on mobile display and differently on desktop display. It has an effective feature that offers to set it in opened or closed state depending on the specified resolution. This is achieved through [mediaQuery](#) property that allows you to set the Sidebar in an expanded state or collapsed state only in user-defined resolution.

APP.JSX

```

{% raw %}
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
  let sidebarobj;
  let mediaQueryState = { mediaQuery: window.matchMedia('(min-width: 600px)') };
  function onCreate() {
    sidebarobj.element.style.visibility = '';
  }
  return (
    <div className="control-section">
      <div id="wrapper">
        <div className="col-lg-12 col-sm-12 col-md-12">
          /* Initializing the Sidebar component */

```

```

        <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarobj = Sidebar} created={onCreate} style={{ visibility: "hidden" }}
mediaQuery={mediaQueryState.mediaQuery} width="248px">
            <div className="title"> Sidebar content</div>
        </SidebarComponent>
    </div>
    <div>
        <div className="title">Main content</div>
        <div className="sub-title"> * Sidebar will collapse
in mobile mode automatically</div>
    </div>
</div>
</div>
</div>);
}
export default App;
{% endraw %}

```

APP.TSX

```

{% raw %}
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
    let sidebarobj: SidebarComponent;
    let mediaQueryState={ mediaQuery: window.matchMedia('(min-width:
600px)')}
    function onCreate() {
        sidebarobj.element.style.visibility='';
    }
    return (
        <div className="control-section">
            <div id="wrapper">
                <div className="col-lg-12 col-sm-12 col-md-12">
                    /* Initializing the Sidebar component */
                    <SidebarComponent id="default-sidebar" ref={Sidebar =>

Docking sidebar in React Sidebar component

Dock state of the Sidebar reserves some space on the page that always remains in a visible state when the Sidebar is collapsed. It is used to show the short term of a content like icons alone instead of lengthy text. To achieve this, set [enableDock](#) as true along with required [dockSize](#).

In the following sample, the list item has icon with text representation. On dock state, only icons in list will be visible to represent the hint of the hidden text content.

APP.JSX

```

import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';

```

```
function App() {
  let dockBar;
  // Toggle(Open/Close) the Sidebar
  function toggleClick() {
    dockBar.toggle();
  }
  return (<div className="control-section">
    <div id="wrapper">
      {/* Initializing the Sidebar component */}
      <SidebarComponent id="dockSidebar" ref={Sidebar => dockBar =
Sidebar} enableDock={true} dockSize="72px" width="220px">
        <div className="dock">
          <ul>
            <li className="sidebar-item" id="toggle"
onClick={toggleClick}>
              <span className="e-icons expand"/>
              <span className="e-text"
title="menu">Menu</span>
            </li>
            <li className="sidebar-item">
              <span className="e-icons home"/>
              <span className="e-text"

Style in React Sidebar component

The following content provides the exact CSS structure that can be used to modify the component's appearance based on the user's preference.

Customizing the sidebar

Use the below CSS to customize the sidebar root element.

```
`css
.e-sidebar {
background: #898b2b
}
`
```

Customizing the sidebar based on the positions

Use the below CSS to customize the left positioned sidebar.

```
`css
.e-sidebar.e-left {
border-right: 2px solid red;
}
`
```

Use the below CSS to customize the right positioned sidebar.

```
`css
.e-sidebar.e-right {
border-left: 2px solid red;
}
`
```

Customizing the sidebar based on the active state

Use the below CSS to customize the open state of the left positioned sidebar.

```
`css
.e-sidebar.e-left.e-open {
transition: transform 2.5s ease;
}
`
```

Use the below CSS to customize the open state of the right positioned sidebar.

```
`css
.e-sidebar.e-right.e-open {
transition: transform 2.5s ease;
}
`
```

Use the below CSS to customize the closed state of the left positioned sidebar.

```
`css
.e-sidebar.e-left.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
`
```

Use the below CSS to customize the closed state of the right positioned sidebar.

```
`css
.e-sidebar.e-right.e-transition.e-close {
transition: transform 2.5s ease, visibility 1200ms;
}
`
```

Customizing the sidebar with dock state

When you enable the Dock support, the "e-dock" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element with a dock state.

```
`css
.e-sidebar.e-dock {
background: #2d323e;
}
`
```

Customizing the different types of sidebar

Use the below CSS to customize the auto type sidebar.

```
`css
.e-sidebar.e-left.e-auto {
background-color: pink;
}
`
```

Use the below CSS to customize the push type sidebar.

```
`css
.e-sidebar.e-left.e-push {
background-color: beige;
}
`
```

Use the below CSS to customize the over type sidebar.

```
`css
.e-sidebar.e-left.e-over {
background-color: aqua;
}
`
```

Use the below CSS to customize the slide type sidebar.

```
`css
.e-sidebar.e-left.e-slide {
background-color: green;
}
`
```

Customizing the backdrop of the sidebar

Use the below CSS to customize the backdrop of the sidebar.

```
`css
.e-sidebar-overlay {
background-color: aqua;
}
`
```

Customizing the sidebar in the RTL direction

When you enable the RTL (right to left direction) support, the "e-rtl" class will be added to the root element. Based on that class, you can also customize all the above stated customization. Use the following CSS to customize the sidebar element in the RTL (right to left direction) mode.

```
`css
.e-sidebar.e-left.e-rtl {
background-color: antiquewhite;
}
`
```

Prevent the animation transition for the Sidebar component

Use the below CSS to prevent the animation transition for the Sidebar component.

```
`css
.e-sidebar-context .e-content-animation {
transition: none !important;
transform: none !important;
}
`
```

Accessibility in React Sidebar component

The Sidebar component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Sidebar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

```
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Sidebar component followed the [WAI-ARIA](#) patterns to meet accessibility standards. By default, the Sidebar utilizes the [complementary](#) role, with the option to modify the ARIA role based on provided attributes to the root element, depending on the specific use case.

If there are multiple complementary landmark roles or aside elements in a document, it is important to provide a label for each landmark using the `aria-label` attribute. Alternatively, if the aside has a descriptive title, it can be referenced using the `aria-labelledby` attribute. This label will help assistive technology users quickly understand the purpose of each landmark.

For optimal accessibility, it is recommended to incorporate a trigger component that is navigable via a keyboard, such as a button. If this is not feasible, inclusion of the `tabIndex` attribute becomes necessary. Furthermore, explicit handling of the `aria-expanded` attribute is required for the trigger element.

Keyboard interaction

The Sidebar component does not have any inbuilt keyboard interaction support. However, you can utilize the keyboard interactions of focusable elements within the Sidebar component.

Ensuring accessibility

The Sidebar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Sidebar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Sidebar component with accessibility tools.

How To

Sidebar with listview in React Sidebar component

Any HTML element can be placed in the Sidebar content area. Sidebar supports all types of HTML structures like [TreeView](#), [ListView](#), etc.

In the following example, the Sidebar is rendered with ListView component in its content area.

APP.JSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ListViewComponent } from '@syncfusion/ej2-react-lists';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';

function App() {
  let sidebarObj;
  let listObj;
  let width = '100%';
  let type = 'Over';
  let data = [
    { text: 'Home', id: 'list-01' },
    { text: 'Offers', id: 'list-02' },
    { text: 'Support', id: 'list-03' },
    { text: 'Logout', id: 'list-04' }
  ];
  function onCreate() {
    sidebarObj.element.style.visibility = '';
  }
  // Toggle (Open/Close) the Sidebar
  function toggleClick() {
    sidebarObj.toggle();
  }
  // Close the Sidebar
  function closeClick() {
    sidebarObj.hide();
  }
  return (<div className="control-section">
    { /* Initializing the Sidebar component */ }
    <SidebarComponent id="default-sidebar" ref={Sidebar => sidebarObj
= Sidebar} width={width} style={{ visibility: "hidden" }} created={onCreate}
type={type}>
      <div id='closebtn'>
        <ButtonComponent cssClass='e-normal' iconCss='e-icons e-
add-icon' onClick={toggleClick}/>
      </div>
      <div className="title">Menu</div>
      <div className='listdiv'>
        { /* Initializing the Listview inside the sidebar
component */ }
        <ListViewComponent id="listview" dataSource={data}
onClick={closeClick}/>
      </div>
      <div className="center-align">
        * ListView component is placed inside the sidebar content
area.
      </div>
    </div>
```

```

        </SidebarComponent>
        <div>
            <div className="title">Main content</div>
            <div className="sub-title"> Click the button to open/close
the Sidebar.</div>
            <div className="center-align">
                <ButtonComponent onClick={toggleClick} id="toggle"
className="e-btn e-info">Toggle Sidebar</ButtonComponent>
            </div>
        </div>
    </div>);
}
export default App;
{% endraw %}

```

APP.TSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ListViewComponent } from '@syncfusion/ej2-react-lists';
import { SidebarComponent, SidebarType } from '@syncfusion/ej2-react-
navigations';
import * as React from 'react';
function App() {
    let sidebarObj: SidebarComponent;
    let listObj: SidebarComponent;
    let width: string = '100%';
    let type: SidebarType = 'Over';
    let data: Array<{ [key: string]: string }> = [
        { text: 'Home', id: 'list-01' },
        { text: 'Offers', id: 'list-02' },
        { text: 'Support', id: 'list-03' },
        { text: 'Logout', id: 'list-04' }
    ];
    function onCreate(): void {
        sidebarObj.element.style.visibility='';
    }
    // Toggle(Open/Close) the Sidebar
    function toggleClick(): void {
        sidebarObj.toggle();
    }
    // Close the Sidebar
    function closeClick(): void {
        sidebarObj.hide();
    }
    return (
        <div className="control-section">
            { /* Initializing the Sidebar component */ }
            <SidebarComponent id="default-sidebar" ref={Sidebar => sidebarObj
= Sidebar as SidebarComponent} width={width} style={{visibility:"hidden"}}
created={onCreate} type={type}>
                <div id='closebtn'>
                    <ButtonComponent cssClass='e-normal' iconCss='e-icons e-
add-icon' onClick={toggleClick}/>
                </div>
                <div className="title">Menu</div>

```

```

        <div className='listdiv'>
            /* Initializing the Listview inside the sidebar
component */
            <ListViewComponent id="listview" dataSource={data}
onClick={closeClick}/>
        </div>
        <div className="center-align">
            * ListView component is placed inside the sidebar content
area.
        </div>
    </SidebarComponent>
    <div>
        <div className="title">Main content</div>
        <div className="sub-title"> Click the button to open/close
the Sidebar.</div>
        <div className="center-align">
            <ButtonComponent onClick={toggleClick} id="toggle"
className="e-btn e-info">Toggle Sidebar</ButtonComponent>
        </div>
    </div>
)
}
export default App;
{% endraw %}

```

Open close sidebar in React Sidebar component

Opening and closing the Sidebar can be achieved with built-in public methods.

- [show\(\)](#): Method to open the Sidebar.
- [hide\(\)](#): Method to close the Sidebar.
- [toggle\(\)](#): Method to toggle the open/close state of the Sidebar.

In the following sample, toggle method has been used to show or hide the Sidebar on button click.

APP.JSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
    let sidebarObj;
    function onCreate() {
        sidebarObj.element.style.visibility = '';
    }
    function open() {
        console.log("Sidebar is opened");
    }
    function close() {
        console.log("Sidebar is closed");
    }
    // Open the Sidebar
    function openClick() {
        sidebarObj.show();
    }
}

```

```

    }
    // Toggle(Open/Close) the Sidebar
    function toggleClick() {
        sidebarObj.toggle();
    }
    // Close the Sidebar
    function closeClick() {
        sidebarObj.hide();
    }
    return (<div className="control-section">
        <div id="wrapper">
            /* Initializing the Sidebar component */
            <SidebarComponent id="default-sidebar" ref={Sidebar =>
sidebarObj = Sidebar} style={{ visibility: "hidden" }} close={close}
open={open} created={onCreate}>
                <div className="title"> Sidebar content</div>
                <div className="sub-title">
                    Click the button to close the Sidebar.
                </div>
                <div className="center-align">
                    <ButtonComponent onClick={closeClick} id="close"
className="e-btn close-btn">Close Sidebar</ButtonComponent>
                </div>
            </SidebarComponent>
            <div>
                <div className="title">Main content</div>
                <div className="sub-title"> Click the button to Open the
Sidebar.</div>
                <div className="center-align">
                    <ButtonComponent onClick={openClick} id="open"

className="e-btn e-info">Open Sidebar</ButtonComponent>
                </div>
                <div className="sub-title"> Click the button to
open/close the Sidebar.</div>
                <div className="center-align">
                    <ButtonComponent onClick={toggleClick} id="toggle"
className="e-btn e-info">Toggle Sidebar</ButtonComponent>
                </div>
            </div>
        </div>
    </div>
)
}
export default App;
{% endraw %}

```

Multiple sidebar in React Sidebar component

Two Sidebars can be initialized in a web page with same main content. Sidebars can be initialized on right side or left side of the main content using [position](#) property.

The HTML element with class name `e-main-content` will be considered as the main content and both the

Sidebars will behave as side content to this main content area.

APP.JSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
import * as React from 'react';
function App() {
  let leftSidebarObj;
  let rightSidebarObj;
  let type = 'Push';
  function onCreate() {
    leftSidebarObj.element.style.visibility = '';
    rightSidebarObj.element.style.visibility = '';
  }
  // Toggle(Open/Close) the Sidebar1
  function leftToggle() {
    leftSidebarObj.toggle();
  }
  // Toggle(Open/Close) the Sidebar2
  function rightToggle() {
    rightSidebarObj.toggle();
  }
  return (<div className="control-section">
    <div id="wrapper">
      /* Initializing the Sidebar component */
      <SidebarComponent id="default" ref={Sidebar => leftSidebarObj
= Sidebar} width="200px" type={type} created={onCreate} style={{ visibility:
"hidden" }}>
        <div className="title"> Left Sidebar content</div>
      </SidebarComponent>
      /* Initializing the another Sidebar component */
      <SidebarComponent id="default1" ref={Sidebar =>
rightSidebarObj = Sidebar} width="200px" type={type} position="Right"
created={onCreate} style={{ visibility: "hidden" }}>
        <div className="title"> Right Sidebar content</div>
      </SidebarComponent>
      <div className="e-main-content">
        <p>Place your main content here.....</p>
        <ButtonComponent onClick={leftToggle} id="toggle-btn"
className="e-btn e-info">Toggle Sidebar1</ButtonComponent>
        <br /><br />
        <ButtonComponent onClick={rightToggle} id="toggle-btn1"
className="e-btn e-info">Toggle Sidebar2</ButtonComponent>
      </div>
    </div>
  </div>);
}
export default App;
```

```
{% endraw %}
```

APP.TSX

                    width="200px" type={type} position="Right"
created={onCreate} style={{visibility:"hidden"}}>
                    <div className="title"> Right Sidebar content</div>
                </SidebarComponent>
                <div className="e-main-content">
                    <p>Place your main content here.....</p>
                    <ButtonComponent onClick={leftToggle} id="toggle-btn"
className="e-btn e-info">Toggle Sidebar1</ButtonComponent>
                    <br/><br/>
                    <ButtonComponent onClick={rightToggle} id="toggle-btn1"
className="e-btn e-info">Toggle Sidebar2</ButtonComponent>
                </div>
            </div>
        </div>
    )
}
export default App;
{% endraw %}
```

Sidebar with treeview in React Sidebar component

The following example demonstrates how to render TreeView component inside the Sidebar with dock state and how to achieve expand and collapse the functionalities simultaneously in the sidebar and Treeview.

On collapse, the LI elements of TreeView show icons only to represent the short sign of the hidden text content. On expand, hidden text content will be set to be visible.

APP.JSX

```
{% raw %}
import * as React from 'react';
import { SidebarComponent, TreeViewComponent } from '@syncfusion/ej2-react-navigations';
function App() {
    let sidebarobj;
    let treeviewobj;
    let data = [
        {
            nodeId: '01', nodeText: 'Installation', iconCss: 'icon-microchip icon',
            nodeChild: [
                { nodeId: '05-01', nodeText: 'Calendar', iconCss: 'icon-circle-thin icon' },
                { nodeId: '05-02', nodeText: 'DatePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '05-03', nodeText: 'DateTimePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '05-04', nodeText: 'DateRangePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '05-05', nodeText: 'TimePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '05-06', nodeText: 'SideBar', iconCss: 'icon-circle-thin icon' }
            ]
        },
        {
            nodeId: '02', nodeText: 'Deployment', iconCss: 'icon-thumbs-up-alt icon',
        },
        {
            nodeId: '03', nodeText: 'Quick Start', iconCss: 'icon-docs icon',
        },
        {
            nodeId: '04', nodeText: 'Components', iconCss: 'icon-th icon',
            nodeChild: [
                { nodeId: '04-01', nodeText: 'Calendar', iconCss: 'icon-circle-thin icon' },
                { nodeId: '04-02', nodeText: 'DatePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '04-03', nodeText: 'DateTimePicker', iconCss: 'icon-circle-thin icon' },
                { nodeId: '04-04', nodeText: 'DateRangePicker', iconCss: 'icon-circle-thin icon' },
            ]
        }
    ]
}
```

```

        { nodeId: '04-05', nodeText: 'TimePicker', iconCss: 'icon-
circle-thin icon' },
        { nodeId: '04-06', nodeText: 'SideBar', iconCss: 'icon-
circle-thin icon' }
    ]
},
{
    nodeId: '05', nodeText: 'API Reference', iconCss: 'icon-code
icon',

Fixed sidebar in React Sidebar component

The Sidebar does not require any specific style to make it as a fixed one. By default, the Sidebar position will be in fixed state. The following example demonstrates that the Sidebar is rendered with a fixed position. The position of the Sidebar will not change when scrolling the main content area.

APP.JSX

```
{% raw %}
import * as React from 'react';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
function App() {
  let sidebarobj;
  let width = '260px';
  function toggleClick() {
    sidebarobj.toggle();
  }
  function onCreate() {
    sidebarobj.element.style.visibility = '';
  }
  return (
    // Sidebar Element Declaration
    <div className="control-section">
      <SidebarComponent id="default-sidebar" ref={Sidebar => sidebarobj
= Sidebar} style={{ visibility: "hidden" }} width={width} created={onCreate}>
        <div className="sidebar-header header-cover" style={{
backgroundColor: '#0378d5' }}>
          <div className="image-container">
            <div className="sidebar-image">
              </div>
            </div>
            <div style={{ padding: '0 0 5px 0' }}>
              <a className="sidebar-brand" href="#settings-
dropdown">
                john.doe@gmail.com

Sidebar with variation animation in React Sidebar component

In the following example, the sidebar is rendered with custom animation effects. Click the buttons available in the main content area to check how the custom animations works with sidebar.

Sidebar will automatically adjust expanding animation to match any custom size specified in **CSS** styles.

APP.JSX

```

{% raw %}
import * as React from 'react';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { SidebarComponent } from '@syncfusion/ej2-react-navigations';
function App() {
    let sidebarObj;
    let btnObj;
    let showBackdrop = true;
    function onCreate() {
        sidebarObj.element.style.visibility = '';
    }
    // Zoom Sidebar
    function zoom() {
        sidebarObj.show();
        sidebarObj.element.classList.add("w3-animate-zoom");
    }
    // Open Door
    function open_door() {
        sidebarObj.show();
        const sidebar = document.getElementsByClassName("e-sidebar-
overlay")[0];
        sidebar.classList.add("move");
    }
    // Bottom to Top
    function bottom_top() {
        sidebarObj.show();
        sidebarObj.element.classList.add("w3-animate-bottom");
    }
    // Rotate
    function rotate() {
        sidebarObj.show();
        sidebarObj.element.classList.add("rotate");
    }
