

USER GUIDE

Essential Studio for EJ2 React

Version - v25.1.35 | Release Date - March 15, 2024

PivotTable	31
Getting started	31
Dependencies.....	31
Setup for Local Development.....	31
Adding Syncfusion packages	32
Adding CSS reference.....	33
Browser compatibility	33
Adding pivot table component	33
Adding fields to row, column, value and filter axes.....	36
Applying formatting to a value field	37
Module Injection.....	38
Enable Field List.....	39
Enable Grouping Bar	40
Exploring Filter Axis.....	41
Calculated Field.....	42
Run the application	44
Creating a Next.js Application Using Syncfusion React Components	45
What is Next.js?	45
Prerequisites	45
Create a Next.js application	45
Install Syncfusion React packages.....	46
Import Syncfusion CSS styles	46
Add Syncfusion React component	47
Run the application	48
Data binding in React Pivotview component.....	49
JSON	49
CSV	53
Remote Data Binding	57
Mapping	62
Values in row axis.....	65
Values at different positions	66
Show 'no data' items.....	67
Show value headers always	68
Customize empty value cells.....	69
Event	70

See Also	74
Connecting to data source	74
MySQL in EJ2 React Pivotview Component	74
Microsoft SQL Server in EJ2 React Pivotview Component	80
PostgreSQL in EJ2 React Pivotview Component	84
Oracle in EJ2 React Pivotview Component	89
MongoDB in EJ2 React Pivotview Component	95
Elasticsearch in EJ2 React Pivotview Component	100
Snowflake in EJ2 React Pivotview Component	105
Olap in React Pivot Table component	111
Getting started	111
Data Binding	145
OLAP Cube: Elements	155
Server side pivot engine in React Pivotview component	162
Quick steps to render the Pivot Table by using the server-side Pivot Engine	162
Available configurations in Server-side application	164
Pivot chart in React Pivotview component	183
Data Binding	185
Chart Types	185
Accumulation Charts	187
Field List	199
Grouping Bar	201
Single Axis	204
Multiple axis	205
Series customization	211
Axis customization	214
Legend customization	217
User Interaction	219
Export	225
Print	227
Drill down in React Pivotview component	228
Drill down and drill up	228
Drill position	229
Expand all	229
Expand all headers for specific fields	230

Expand all except specific member(s).....	231
Expand specific member(s)	232
Event	234
Data Shaping	240
Aggregation in React Pivotview component.....	240
Calculated field in React Pivotview component	253
Grouping in React Pivotview component	264
Filtering in React Pivotview component	264
Sorting in React Pivotview component.....	264
Drill through in React Pivotview component.....	264
Editing in React Pivotview component	264
Data Formatting	264
Number formatting in React Pivotview component.....	264
Conditional formatting in React Pivotview component.....	265
Report Manipulation.....	265
Grouping bar in React Pivotview component.....	265
Field list in React Pivotview component	265
Defer update in React Pivotview component.....	265
Performance	269
Virtual scrolling in React Pivot Table component.....	269
Paging in React Pivotview component.....	279
Data Compression in React Pivot Table component.....	295
State persistence in React Pivotview component	297
Save and Load Pivot Layout	299
Row and column in React Pivotview component	300
Width And Height.....	300
Row Height.....	302
Column Width	303
Reorder	306
Column Resizing	307
Text Wrap.....	308
Text Align	309
AutoFit.....	312
Grid Lines	316
Selection.....	318

Clip Mode	327
Cell Template	328
Events.....	333
See Also	339
Show hide totals in React Pivotview component	339
Show or hide grand totals	339
Show grand totals at top or bottom	340
Show or hide sub-totals	341
Show or hide sub-totals for specific fields	343
Show or hide totals using toolbar	344
Hyper link in React Pivotview component	345
Hyperlink for all cells.....	346
Hyperlink for row headers	347
Hyperlink for column headers.....	348
Hyperlink for value cells.....	349
Hyperlink for summary cells	350
Condition based hyperlink	352
Header based hyperlink	353
Event	354
See Also	356
Tool bar in React Pivotview component	356
Built-in toolbar options	356
Show desired chart types in the dropdown menu	362
Switch the chart to multiple axes	363
Show or hide legend	364
Adding custom option to the toolbar	365
Save and load report as a JSON file.....	370
Save and load reports to a SQL database	372
Events.....	395
See Also	412
Tool tip in React Pivotview component	413
Tooltip Template.....	414
Css customization in React Pivotview component	416
Hiding Axis.....	416
Text Alignment.....	419

Customize header, value and summary cell style.....	420
Printing and Exporting	422
Print in React Pivotview component.....	422
Excel export in React Pivot Table component	426
Pdf export in React Pivotview component	448
Globalization and localization in React Pivotview component.....	487
Load CLDR-Data to the application	487
Internationalization.....	489
Localization	495
Right-to-left (RTL).....	502
See Also	505
Accessibility in React Pivotview component.....	505
WAI-ARIA attributes.....	506
Keyboard interaction	508
Ensuring accessibility	514
See also	525
Ej1 api migration in React Pivotview component.....	525
Data Binding.....	525
Aggregation.....	526
Number Format.....	526
Summary Customization	526
Drill operation	527
Field List	528
Grouping Bar	528
Filtering	529
Maximum node limit in member editor	529
No Data Items	529
Excel-like filtering.....	529
Drill Through	530
Cell Editing	530
Hyperlink.....	530
Defer Layout Update.....	532
Sorting.....	532
Value Sorting.....	533
Calculated Field.....	533

Paging.....	533
Conditional Formatting	534
Exporting	534
Grid Customization	534
Accessibility	535
Common.....	536
How To	537
Switching older themes style in React Pivotview component.....	537
Customize number date and time values in React Pivotview component	540
Customize the icons for pivot table in React Pivotview component	542
PivotView_PivotFieldList .e-icons.e-toggle-field-list::before {	542
PivotView_PivotFieldList.e - icons.e - toggle - field - list;	543
Configure data grid options on editing mode in React Pivotview component.....	544
Refresh the field list in React Pivotview component	546
Hide empty headers in React Pivotview component.....	548
Customizing loading indicator in React Pivotview component	549
Changing the pivotview component minimum height in React Pivotview component	550
Chart based on pivot table selection in React Pivotview component	551
Drill through grid cell edit type in React Pivotview component	556
Show field list when pivot table empty in React Pivotview component	558
Apply custom style to pivot cells in React Pivotview component	559
Show tooltip for row and column headers in React Pivotview component	562
Hide specific columns in React Pivotview component	565
Export table and chart into the same document using toolbar in React Pivotview component	567
Add custom aggregation type to the menu in React Pivotview component.....	568
Convert complex JSON to flat JSON and assign it to the pivot table in React Pivotview component	571
Load desired report from the report list as default in React Pivotview component.....	578
Display string value to pivot table values in React Pivotview component	584
Summary of Predefined Dialogs component.....	586
Predefined dialogs	586
Getting Started.....	586
Dependencies.....	586
Setup your development environment	586
Adding Syncfusion packages	587

Adding CSS reference.....	587
Render a dialog using utility functions.....	587
Adding predefined dialogs to the application.....	588
Run the application	591
Alert dialog.....	593
Confirm dialog.....	596
Prompt dialog.....	599
Draggable in React Predefined dialogs component.....	603
Alert dragging.....	603
Confirm drag	605
Prompt drag	606
Animation in React Predefined dialogs component	608
Alert animation	609
Prompt animation	612
Position in React Predefined dialogs component.....	614
Alert position.....	615
Confirm position	617
Prompt position	618
Dimension in React Predefined dialogs component.....	620
Alert dimension.....	620
Confirm dimension.....	622
Prompt dimension	624
Max-width and max-height.....	626
Min-width and min-height	629
Customization in React Predefined dialogs component.....	631
Alert action button.....	631
Confirm action buttons	633
Prompt action buttons.....	635
Show or hide dialog close button	637
Alert dialog close button.....	637
Confirm dialog close button.....	639
Prompt dialog close button.....	641
Customize dialog content	643
Progress bar	645
Getting Started.....	645

Dependencies.....	645
Installation and configuration.....	645
Add Progressbar to the Project.....	646
Run the application	646
Types in React Progress bar component	647
Linear.....	647
Circular	648
Tooltip in React Progress bar component	649
Tooltip	649
Format.....	650
Customization	651
States in React Progress bar component.....	652
Determinate	652
Indeterminate	653
Buffer	654
Customization in React Progress bar component.....	655
Segments.....	655
Thickness.....	656
Radius.....	657
InnerRadius	658
Progress color and track color	659
Annotation in React Progress bar component.....	660
Annotation	660
Label.....	661
Animation in React Progress bar component	662
Range in React Progress bar component.....	663
Events in React Progress bar component	664
valueChanged.....	664
progressCompleted.....	665
Accessibility in React Progress bar component	666
WAI-ARIA attributes.....	667
Keyboard interaction	667
Ensuring accessibility	667
See also	668
ProgressButton	668

Getting Started.....	668
Dependencies.....	668
Installation and configuration.....	668
Adding syncfusion packages	669
Adding CSS reference.....	669
Adding ProgressButton component.....	669
Run the application	670
See Also	670
Spinner and progress in React Progress button component	671
Progress.....	671
See Also	676
Accessibility in React ProgressButton component	676
WAI-ARIA attributes.....	677
Keyboard interaction	677
Ensuring accessibility	677
See also	677
Style and appearance in React Progress button component	678
See also	678
How To	678
Change the text content and styles of the progressbutton during progress in React Progress button component.....	678
Customize progress using cssclass in React Progress button component.....	679
Hide spinner in React Progress button component.....	680
Enable progress in button in React Progress button component.....	681
Trace events of progress button in React Progress button component.....	681
Query Builder	683
Getting Started.....	683
Dependencies.....	683
Installation and Configuration	684
Adding Syncfusion packages	684
Adding CSS Reference	685
Adding Query Builder component to the Application	685
Run the application	686
Columns in React Query builder component.....	687
Auto generation	687

Labels	688
Operators	688
Step	688
Format.....	688
Validations	690
Data binding in React Query builder component	692
Local data	692
Remote data.....	694
Data Manager	702
Complex Data Binding.....	705
Filtering in React Query builder component	709
Templates in React Query builder component.....	712
Header Template	712
Column Template.....	717
Rule Template	724
Model binding in React Query builder component	731
Importing and Exporting in React Query builder component	733
Importing	733
Exporting.....	746
Lock Group/Rule in React Query builder component.....	759
Clone Group/Rule in React Query builder component.....	762
Global local in React Query builder component.....	765
Style and appearance in React Query builder component	768
Accessibility in React Query Builder component	768
WAI-ARIA attributes.....	769
Keyboard interaction	770
Ensuring accessibility	770
See also	770
How To	770
Render with rule in React Query builder component.....	770
Display mode in React Query builder component.....	772
Sort columns in React Query builder component.....	773
Restrict groups in React Query builder component	775
State persistence in React Query builder component.....	777
Rtl in React Query builder component	778

Summary view in React Query builder component	780
RadioButton	783
Getting Started.....	783
Dependencies.....	783
Installation and Configuration	783
Adding Syncfusion packages	783
Adding CSS Reference	784
Adding RadioButton component to the Application	784
Run the application	784
Label and size in React Radio button component	785
Label.....	785
Size	786
See Also	787
Accessibility in React RadioButton component	787
WAI-ARIA attributes.....	788
Keyboard interaction	788
Ensuring accessibility	788
See also	788
Style and appearance in React Radio button component	789
How To	789
Change radiobutton state in React Radio button component	789
Customize radiobutton appearance in React Radio button component.....	790
Name and value in form submit in React Radio button component	791
Right to left in React Radio button component.....	792
Set the disabled state in React Radio button component	793
Ej1 api migration in React Radio button component.....	795
Properties.....	795
Methods	796
Events.....	796
Range Navigator.....	797
Getting Started.....	797
Dependencies.....	797
Installation and configuration.....	797
Add Range Navigator to the Project	798
Module Injection.....	799

Populate Range Navigator with Data.....	800
Enable Tooltip	801
Selecting range in React Range navigator component	802
Lightweight in React Range navigator component.....	803
See Also	804
Series types in React Range navigator component	804
Line	804
Area	805
StepLine.....	806
Data in React Range navigator component	807
Numeric.....	807
Logarithmic Axis	812
Date-time	817
Period selector in React Range navigator component	820
Periods	821
Positioning period selector	822
Height.....	824
Visibility of range navigator	826
See Also	827
Labels in React Range navigator component.....	827
Multilevel labels	827
Grouping	828
Smart labels.....	830
Label positioning.....	831
Labels customization.....	832
Grid tick in React Range navigator component	833
Grid line customization	833
Tick line customization.....	834
Customization in React Range navigator component.....	836
Navigator appearance.....	836
Thumb	837
Border customization.....	838
Deferred update.....	839
Allow snapping.....	841
Animation.....	842

See Also	843
Tool tip in React Range navigator component.....	843
Customization	843
Label Format	844
R t l in React Range navigator component.....	846
Export print in React Range navigator component	847
Export.....	847
Print.....	848
Accessibility in React Range navigator component	850
WAI-ARIA attributes.....	851
Keyboard interaction	851
Ensuring accessibility	851
See also	851
Ej1 api migration in React Range navigator component	851
RangeNavigator.....	851
Series.....	854
StyleSettings.....	855
Tooltip	857
Period Selector.....	858
Methods.....	858
Events.....	858
Range Slider	859
Getting Started.....	859
Dependencies.....	860
Installation and Configuration	860
Adding Syncfusion packages	860
Adding CSS Reference	861
Adding Slider component	861
Run the Application.....	862
Types	862
Customization	864
See Also	866
Ticks in React Range slider component	866
Step	867
Min and Max	868

Format in React Range slider component.....	870
Using format API	871
Using Events	872
Limits in React Range slider component.....	874
Default and MinRange Slider limits	874
Range Slider limits.....	875
Handle lock.....	877
Style in React Range slider component	878
Customizing the slider track.....	878
Customizing the slider handle.....	878
Customizing the slider limits	878
Customizing the slider ticks	878
Customizing the slider buttons	879
Accessibility in React Range Slider component	879
WAI-ARIA attributes.....	880
Keyboard interaction	880
Ensuring accessibility	881
See also	881
Ej1 api migration in React Range slider component.....	881
How To	883
Time range slider in React Range slider component	883
Date range slider in React Range slider component.....	884
Numeric range slider in React Range slider component.....	886
Customize slider bar in React Range slider component	888
Customize slider limits in React Range slider component	892
Customize slider ticks label in React Range slider component.....	894
ticks_slider .e-scale :nth-child(1)::before {	894
Customize slider thumb in React Range slider component	896
square_slider.e-control.e-slider .e-handle {	896
circle_slider.e-control.e-slider .e-handle {	897
oval_slider.e-control.e-slider .e-handle {	897
Form slider with formvalidator in React Range slider component.....	898
Show slider from hidden state in React Range slider component.....	907
Reversible Range Slider in React.....	909
Rating	911

Getting Started with React Rating Control	911
Dependencies.....	912
Installation and Configuration	912
Adding Syncfusion packages	912
Adding Rating component to the Application	912
Adding CSS Reference	913
Running the application	913
Value	914
Precision Modes in React Rating Component.....	915
Labels in React Rating Component	916
Label position	917
Label template	918
Tooltip in React Rating Component.....	919
Tooltip template	919
Tooltip customization	921
Selection in React Rating Component	922
Min value	923
Single selection	923
Show or hide reset button	924
Templates in React Rating Component	925
Empty (unrated) symbol template.....	925
Full (rated) symbol template	928
Using Emoji icon as rating symbol	930
Using SVG icon as rating symbol.....	932
Using PNG image as rating symbol	934
Events in React Rating Component.....	935
beforeItemRender	935
created	936
onItemHover	937
valueChanged.....	937
Appearance in React Rating Component.....	939
Items Count.....	939
Disabled.....	939
Visible.....	940
CssClass	942

Changing icon using CssClass	945
Accessibility in React Rating component	947
WAI-ARIA attributes	948
Keyboard interaction	949
Ensuring accessibility	949
See also	949
Ribbon	949
Getting Started.....	949
Dependencies.....	949
Setup your development environment	950
Adding Syncfusion packages	951
Adding Style sheet to the Application.....	951
Add Ribbon to the project.....	951
Adding Ribbon Tab	952
Adding Ribbon Group.....	953
Adding Ribbon Item	954
Run the application	955
Modules in Ribbon component	964
Tabs and Groups	964
Adding Tabs.....	965
Adding Groups	966
Adding Items	967
Ribbon Items	969
Built-in items.....	969
Custom items	999
Items display Mode.....	1001
Enable or disable items	1005
Ribbon Layouts.....	1007
Classic layout.....	1007
Simplified layout	1033
Minimized State	1041
File Menu	1044
Visibility.....	1044
Adding menu items	1046
Open submenu on click.....	1048

Custom header text	1050
Ribbon Backstage	1052
Adding backstage items	1052
Adding footer items	1057
Adding separator.....	1062
Back button.....	1067
Backstage target.....	1070
Template	1075
Setting width and height.....	1081
Ribbon contextual tabs	1085
Visible tabs	1085
Adding contextual tabs	1085
Selected tabs.....	1089
Methods.....	1092
Ribbon Keytips in React Ribbon component	1096
Ribbon items keytip	1096
File menu keytip.....	1103
Backstage menu keytip	1106
Ribbon layout switcher keytip	1110
Ribbon launcher icon keytip	1113
Methods.....	1116
Guidelines for adding keytips.....	1116
Gallery Items in React Ribbon component	1116
Groups.....	1116
Setting item count.....	1147
Setting selected item	1150
Setting popup height.....	1154
Setting popup width.....	1154
Help Pane	1157
Tooltip	1159
Adding Title	1159
Adding Content	1162
Adding Icon	1164
Customization	1167
Ribbon Resizing	1171

Defining items allowed size	1171
Defining items active size.....	1172
Events.....	1172
tabSelected	1173
tabSelecting.....	1174
ribbonCollapsing	1175
ribbonExpanding	1176
launcherIconClick	1177
Button item events	1178
Checkbox item events	1180
Colorpicker item events	1183
ComboBox item events	1191
DropDown item events	1199
SplitButton item events	1208
GroupButton item events	1217
FileMenu events.....	1220
Backstage view events	1229
Gallery events	1231
Accessibility in React Ribbon component.....	1241

RichTextEditor	1245
Getting Started with React Rich Text Editor Component	1245
Prerequisites	1245
Dependencies.....	1245
Create the React application.....	1246
Add Syncfusion React packages	1247
Import the Syncfusion CSS styles	1247
Add Rich Text Editor component to the application.....	1248
Module Injection.....	1251
Run the application	1252
Configure the Toolbar	1255
Retrieve the formatted content.....	1257

Insert images and links.....	1257
Editor modes in React Rich text editor component.....	1260
HTML editor	1260
Markdown editor	1265
Toolbar in React Rich text editor component.....	1273
Expand Toolbar	1273
MultiRow toolbar	1278
Floating toolbar.....	1284
Toolbar items	1289
Custom tool.....	1294
Quick inline toolbar	1306
Styling in React Rich text editor component	1314
Font name and size	1314
Custom font and size	1320
Font and Background color	1326
Editor content styles	1331
Image in React Rich text editor component	1337
Upload options.....	1337
Image delete	1342
Insert from web	1348
Dimension	1349
Caption and Alt Text.....	1350
Display position.....	1350
Image with link.....	1350
Resize	1351
Drag and Drop.....	1351
Audio in React Rich text editor component.....	1357
Configure audio tool in the toolbar	1357
Insert audio from the web	1362
Insert audio from local machine	1363
Replacing audio.....	1369
Delete audio.....	1369
Display position.....	1370
Rename audio before inserting	1371
Upload audio with authentication	1375

See Also	1377
Video in React Rich text editor component.....	1377
Configure the video tool in the toolbar	1378
Insert a video from the web.....	1382
Insert video from local machine	1383
Replacing video	1390
Delete video	1390
Dimension	1391
Display position.....	1392
Resize video.....	1393
Rename video before inserting.....	1393
Upload video with authentication	1397
See Also	1399
Link in React Rich text editor component.....	1399
Insert link	1399
Remove link.....	1405
Auto-link.....	1405
Manipulation.....	1405
Table in React Rich text editor component	1410
Insert table	1410
Quick Toolbar	1414
Table Header.....	1415
Insert Rows.....	1415
Insert Columns	1415
Set Color.....	1415
Delete Table	1415
Horizontal Align.....	1416
Table Styles	1416
Table Properties	1416
Table cell merge and split	1417
Emoji Picker in React RichTextEditor Component	1422
Enabling the toolbar option and custom emojis.....	1422
Using the shortcut key to open the emoji picker.....	1426
Navigating and selecting emojis using the keyboard.....	1427
Markdown in React Rich text editor component.....	1427

Supported Commands	1427
Markdown to HTML	1429
Table.....	1442
Custom format	1468
File browser in React Rich text editor component	1476
Required additional dependency.....	1476
Additional CSS Reference.....	1477
Format Painter in React Rich Text Editor Component Syncfusion.....	1483
Enabling the toolbar option for Format Painter	1483
Customization of copy and paste format.....	1488
Using the shortcut key to copy and paste the format	1494
Form support in React Rich text editor component	1495
Validation in React Rich text editor component.....	1499
Validation rules	1499
Validation message	1500
Custom placement of validation message	1504
Globalization in React Rich text editor component.....	1510
Localization	1510
RTL.....	1530
Miscellaneous in React Rich text editor component	1535
Placeholder	1535
Character count	1536
Code view.....	1542
Undo/Redo manager.....	1554
Prevention of cross-site scripting (XSS)	1559
Resizable support.....	1564
Number and Bullet Format Lists	1568
Xhtml validation in React Rich text editor component.....	1572
Attributes	1572
HTML Elements	1573
Inline mode in React Rich text editor component.....	1577
Show on select/click.....	1577
Paste cleanup in React Rich text editor component.....	1582
MS Word to HTML	1582
Paste cleanup	1582

Prompt dialog.....	1583
Paste as plain text	1583
Keep format	1583
Denied tags	1584
Denied attributes	1584
Allowed style properties	1584
Mention integration in React Rich text editor component	1589
See Also	1597
Enter key in React Rich text editor component	1597
Enter key customization.....	1597
Shift-Enter key customization.....	1604
Iframe in React Rich text editor component.....	1610
IFrame attributes	1615
Adding external CSS/Script file	1619
Third party integration in React Rich text editor component	1624
CodeMirror Integration.....	1624
Embed.ly Integration.....	1637
Exec command in React Rich text editor component.....	1637
Style in React Rich text editor component	1639
Customizing the Rich Text Editor's content	1639
Customizing the Rich Text Editor's toolbar	1639

PivotTable

Getting started

This section explain steps to create a simple [Link to the Video](#) with OLAP data source in React environment.

To get start quickly with React Pivot Table, you can check on this video:

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

```
`javascript
|-- @syncfusion/ej2-react-pivotview
|-- @syncfusion/ej2-pivotview
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
|-- @syncfusion/ej2-react-base
`,`
```

Setup for Local Development

You can use [create-react-app](#) to setup the application. To install **create-react-app** run the following command.

```
`
```

```
npm install -g create-react-app
```

,

To create basic **React** application use following commands.

```
<div class='tsx'>
```

,

```
create-react-app quickstart --scripts-version=react-scripts-ts
```

,

Now, the application is created in the **quickstart** demo folder. Run the following command one-by-one to navigate to the **quickstart** demo folder, and install the required **npm** dependent packages.

,

```
cd quickstart
```

```
npm install
```

,

```
</div>
```

```
<div class='jsx'>
```

,

```
create-react-app quickstart
```

,

Now, the application is cloned in the **quickstart** demo folder. Run the following command one-by-one to navigate to the **quickstart** demo folder, and install the required **npm** dependent packages.

,

```
cd quickstart
```

```
npm install
```

,

```
</div>
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. To install pivot table component, use the following command.

,

```
npm install @syncfusion/ej2-react-pivotview --save
```

,

The **--save** will instruct NPM to include the pivot table package inside the **dependencies** section of the **package.json**.

Adding CSS reference

Add pivot table and its [dependent](#) components styles as given below in **src/App.css** file. In this illustration, we have referred **material** theme.

```
`css
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-pivotview/styles/material.css';
`
```

You can also refer other themes like bootstrap, fabric, high-contrast etc. To know about individual component CSS, please refer [here](#).

Next we need to refer **App.css** in the application by importing it in the **src/App.tsx** file as follows.

```
`ts
import './App.css';
`
```

Browser compatibility

Polyfills are required to use the Pivot Table in Internet Explorer 11 browser. Refer the [documentation](#) for more details.

Adding pivot table component

You can initialize pivot table component in the application using following steps.

- Import the **PivotViewComponent** (aka, PivotTable) component from the **@syncfusion/ej2-react-pivotview** package in **app.ts** file.
- Then you can initialize pivot table component () using following code.

```
`ts
import { IDataOptions, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
```

```

return (<PivotViewComponent/>)
};
export default App;
`

```

After initialization, add the the following code in **src/App.tsx** file to populate pivot table with a sample relational data source. Refer [here](#) to know the more details about relational data binding.

```

`ts
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from "react-dom";
let pivotData = [
  { 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'Sold': 51, 'Amount': 86904, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q2' },
  { 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q3' },
  { 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q4' },
  { 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2016', 'Quarter': 'Q1' }];
function App() {
  const dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'CO' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent id='PivotView' height={350}
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};

```

```
export default App;

ReactDOM.render(<App />, document.getElementById("sample"));
`ts

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from "react-dom";

let pivotData = [
  { 'Sold': 31, 'Amount': 52824, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'Sold': 51, 'Amount': 86904, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q2' },
  { 'Sold': 90, 'Amount': 153360, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q3' },
  { 'Sold': 25, 'Amount': 42600, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2015', 'Quarter': 'Q4' },
  { 'Sold': 27, 'Amount': 46008, 'Country': 'France', 'Products': 'Mountain Bikes', 'Year': 'FY 2016', 'Quarter': 'Q1' }
];

function App() {
  const dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
  };

  let pivotObj;

  return (<PivotViewComponent id='PivotView' height={350}
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}

export default App;
```

```
ReactDOM.render(<App />, document.getElementById("sample"));
```

Adding fields to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample data, will further move to showcase the component by organizing appropriate fields in row, column, value and filter axes.

In [dataSourceSettings](#), four major axes - [rows](#), [columns](#), [values](#) and [filters](#) plays a vital role in defining and organizing fields from the bound data source, to render the entire pivot table component in a desired format.

[rows](#) – Collection of fields that needs to be displayed in row axis of the pivot table.

[columns](#) – Collection of fields that needs to be displayed in column axis of the pivot table.

[values](#) – Collection of fields that needs to be displayed as aggregated numeric values in the pivot table.

[filters](#) - Collection of fields that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each field in the respective axis, the following basic properties should be set.

- [name](#): It allows to set the field name from the bound data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will not be rendered.
- [caption](#): It allows to set the field caption, which is the alias name of the field that needs to be displayed in the pivot table.
- [type](#): It allows to set the summary type of the field. By default, **Sum** is applied.

In this illustration, "Year" and "Quarter" are added in column, "Country" and "Products" in row, and "Sold" and "Amount" in value section respectively.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  const dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }],
  };
  let pivotObj;
  return (
    <PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} dataSourceSettings={dataSourceSettings}>
      </PivotViewComponent>
    );
}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}>
        </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

Applying formatting to a value field

Formatting defines a way in which values should be displayed. For example, format “C” denotes the values should be displayed in currency pattern. To do so, define the [formatSettings](#) with its [name](#) and [format](#) properties and add it to [formatSettings](#). In this illustration, the [name](#) property is set as **Amount**, a field from value section and its format is set as currency. Likewise, we can set format for other value fields as well and add it to [formatSettings](#).

Only fields from value section, which is in the form of numeric data values are applicable for formatting.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
    };
    return (<PivotViewComponent id='PivotView' height={350}
dataSourceSettings={dataSourceSettings}>
        </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

```

        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}>
    </PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}>
    </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

Module Injection

To create pivot table with additional features, inject the required modules. The modules that are available with basic functionality are as follows.

- **GroupingBar** - Inject this module to access grouping bar.
- **FieldList** - Inject this module to access pivot field list.
- **CalculatedField** - Inject this module to access calculated field.

These modules should be injected into the PivotView using the **Inject** method within the **app.tsx** file as shown below. On doing so, only the injected views will be loaded and displayed along with pivot table.

`ts

```
<Inject services={[GroupingBar]} />
```

Enable Field List

The field list allows to add or remove fields and also rearrange the fields between different axes, including column, row, value, and filter along with filter and sort options dynamically at runtime. It can be enabled by setting the [showFieldList](#) property to **true** and by injecting the **FieldList** module as follows. To know more about field list, [refer](#) here.

If the **FieldList** module is not injected, the Field List will not be rendered with the pivot table component.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]} />
</PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent }
from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]} />
</PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

```

    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]} />
  </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

Enable Grouping Bar

The grouping bar feature automatically populates fields from the bound data source and allows end users to drag fields between different axes such as columns, rows, values, and filters, and alter pivot table at runtime. It also provides option to sort, filter and remove fields. It can be enabled by setting the [showGroupingBar](#) property to **true** and by injecting the **GroupingBar** module as follows. To know more about grouping bar, [refer](#) here.

If the **GroupingBar** module is not injected, the grouping bar will not be rendered with the pivot table component.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { Inject, PivotViewComponent, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  const dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent id='PivotView' height={350}
dataSourceSettings={dataSourceSettings} showGroupingBar={true}><Inject
services={[GroupingBar]} />
    </PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { IDataOptions, IDataset, Inject, PivotViewComponent, GroupingBar }
from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent id='PivotView' height={350}
dataSourceSettings={dataSourceSettings} showGroupingBar={true}><Inject
services={[GroupingBar]} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

Exploring Filter Axis

The filter axis contains collection of fields that would act as master filter over the data bound in [rows](#), [columns](#) and [values](#) axes of the pivot table. The fields along with filter members could be set to filter axis either through report via code behind or by dragging and dropping fields from other axes to filter axis via grouping bar or field list at runtime.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { CalculatedField, FieldList, Inject, PivotViewComponent } from
'@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [{ name: 'Quarter' }],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

```

    </PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  const dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [{ name: 'Quarter' }],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}/>
    </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));

```

Calculated Field

The calculated field feature allows user to insert or add a new calculated field based on the available fields from the bound data source using basic arithmetic operators. The calculated field can be included in pivot table using the [CalculatedFieldSettings](#) from code behind. Or else, calculated fields can be added at run time through the built-in dialog by just setting the [allowCalculatedField](#) property to **true** and by injecting the **CalculatedField** module as follows in pivot table. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation. To know more about calculated field, [refer](#) here.

If the **CalculatedField** module is not injected, the calculated field dialog will not be rendered with the pivot table component. Moreover calculated measure can be added only in value axis.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { CalculatedField, FieldList, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';

```

```
function App() {
  const dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Units', type:
'CalculatedField' }],
    calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}/>
</PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  const dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Units', type:
'CalculatedField' }],
    calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}/>
</PivotViewComponent>);
```

```
};
export default App;
ReactDOM.render(<App />, document.getElementById("sample"));
```

Run the application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

```
npm start
```

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { CalculatedField, FieldList, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
 'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
 caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
 height={350} dataSourceSettings={dataSourceSettings}
 allowCalculatedField={true} showFieldList={true}><Inject
 services={[CalculatedField, FieldList]}/>
 </PivotViewComponent>);
}
;
export default App;
const root = ReactDOM.createRoot(document.getElementById('sample'));
root.render(<App />);
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
 PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    const dataSourceSettings: IDataOptions = {
```

```
columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
dataSource: pivotData as IDataset[],
expandAll: false,
filters: [],
drilledMembers: [{ name: 'Country', items: ['France'] }],
formatSettings: [{ name: 'Amount', format: 'C0' }],
rows: [{ name: 'Country' }, { name: 'Products' }],
values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
};
let pivotObj: PivotViewComponent;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}/>
</PivotViewComponent>);
};
export default App;
const root = ReactDOM.createRoot(document.getElementById('sample'));
root.render(<App />);
```

You can also explore our [React Pivot Table example](#) that shows how to rendering of the pivot table with drill-up and drill-down functionality bound to a relational report.

Creating a Next.js Application Using Syncfusion React Components

This section provides a step-by-step guide for setting up a Next.js application and integrating the Syncfusion React Pivot Table component.

What is Next.js?

[Next.js](#) is a React framework that makes it easy to build fast, SEO-friendly, and user-friendly web applications. It provides features such as server-side rendering, automatic code splitting, routing, and API routes, making it an excellent choice for building modern web applications.

Prerequisites

Before getting started with the Next.js application, ensure the following prerequisites are met:

- [Node.js 16.8](#) or later.
- The application is compatible with macOS, Windows, and Linux operating systems.

Create a Next.js application

To create a new **Next.js** application, use one of the commands that are specific to either NPM or Yarn.

NPM

```
npx create-next-app@latest
```

YARN

```
yarn create next-app
```

Using one of the above commands will lead you to set up additional configurations for the project as below:

1. Define the project name: Users can specify the name of the project directly. Let's specify the name of the project as `ej2-nextjs-pivotview`.

CMD

```
✓ What is your project named? » ej2-nextjs-pivotview
```

2. Select the required packages.

CMD

```
✓ What is your project named? ... ej2-nextjs-pivotview
✓ Would you like to use TypeScript? ... No / `Yes`
✓ Would you like to use ESLint? ... No / `Yes`
✓ Would you like to use Tailwind CSS? ... `No` / Yes
✓ Would you like to use `src/` directory? ... No / `Yes`
✓ Would you like to use App Router? (recommended) ... No / `Yes`
✓ Would you like to customize the default import alias? ... `No` / Yes
Creating a new Next.js app in D:\ej2-nextjs-pivotview.
```

3. Once complete the above mentioned steps to create `ej2-nextjs-pivotview`, navigate to the directory using the below command:

CMD

```
cd ej2-nextjs-pivotview
```

The application is ready to run with default settings. Now, let's add Syncfusion components to the project.

Install Syncfusion React packages

Syncfusion React component packages are available at [npmjs.com](https://www.npmjs.com). To use Syncfusion React components in the project, install the corresponding npm package.

Here, the [React Pivot Table component](#) is used in the project. To install the React Pivot Table component, use the following command:

NPM

```
npm install @syncfusion/ej2-react-pivotview --save
```

YARN

```
yarn add @syncfusion/ej2-react-pivotview
```

Import Syncfusion CSS styles

Syncfusion React components come with [built-in themes](#), which are available in the installed packages. It's easy to adapt the Syncfusion React components to match the style of your application by referring to one of the built-in themes.

Import the **Material** theme into the **src/app/globals.css** file and removed the existing styles in that file, as shown below:

GLOBALS.CSS

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-pivotview/styles/material.css';
```

To know more about built-in themes and CSS reference for individual components, refer to the [themes](#) section.

Add Syncfusion React component

Follow the below steps to add the React Pivot Table component to the Next.js project:

1. Before adding the Pivot Table component to your markup, create a **datasource.tsx** file within the **src/app/** folder and add the Pivot Table component data.

DATASOURCE.TSX

```
export let pivotData: object[] = [
  { 'In_Stock': 42, 'Sold': 80, 'Amount': 2460, 'Country': 'Germany',
    'Product_Categories': 'Accessories', 'Products': 'Hydration Packs',
    'Order_Source': 'Retail Outlets', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'In_Stock': 19, 'Sold': 16, 'Amount': 184, 'Country': 'Germany',
    'Product_Categories': 'Accessories', 'Products': 'Fenders', 'Order_Source':
    'Retail Outlets', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'In_Stock': 36, 'Sold': 25, 'Amount': 188, 'Country': 'Germany',
    'Product_Categories': 'Accessories', 'Products': 'Bottles and Cages',
    'Order_Source': 'Retail Outlets', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'In_Stock': 6, 'Sold': 51, 'Amount': 229.5, 'Country': 'Germany',
    'Product_Categories': 'Accessories', 'Products': 'Cleaners', 'Order_Source':
    'Retail Outlets', 'Year': 'FY 2015', 'Quarter': 'Q1' },
  { 'In_Stock': 47, 'Sold': 337, 'Amount': 1110, 'Country': 'Germany',
    'Product_Categories': 'Clothing', 'Products': 'Vests', 'Order_Source': 'App
    Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
  { 'In_Stock': 14, 'Sold': 535, 'Amount': 10165, 'Country': 'United States',
    'Product_Categories': 'Accessories', 'Products': 'Tires and Tubes',
    'Order_Source': 'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
  { 'In_Stock': 47, 'Sold': 405, 'Amount': 3037.5, 'Country': 'United States',
    'Product_Categories': 'Accessories', 'Products': 'Bottles and Cages',
    'Order_Source': 'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
  { 'In_Stock': 14, 'Sold': 385, 'Amount': 11646.25, 'Country': 'United
    States', 'Product_Categories': 'Accessories', 'Products': 'Hydration Packs',
    'Order_Source': 'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
```

```
{ 'In_Stock': 11, 'Sold': 426, 'Amount': 1704, 'Country': 'United States',
'Product_Categories': 'Accessories', 'Products': 'Cleaners', 'Order_Source':
'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
{ 'In_Stock': 13, 'Sold': 392, 'Amount': 5989.76, 'Country': 'United
States', 'Product_Categories': 'Accessories', 'Products': 'Helmets',
'Order_Source': 'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' },
{ 'In_Stock': 9, 'Sold': 426, 'Amount': 4686, 'Country': 'United States',
'Product_Categories': 'Accessories', 'Products': 'Fenders', 'Order_Source':
'App Store', 'Year': 'FY 2017', 'Quarter': 'Q4' }
];
```

2. Then, import and define the Pivot Table component in the **src/app/page.tsx** file, as shown below:

PAGE.TSX

```
'use client'
import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
export default function Home() {
  const dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter'
}],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['Germany'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption:
'Sold Amount' }]
  };
  return (
    <>
    <h2>Syncfusion React Pivot Table Component</h2>
    <PivotViewComponent id='PivotView' height={350}
dataSourceSettings={dataSourceSettings} allowCalculatedField={true}
showFieldList={true}><Inject services={[CalculatedField, FieldList]} />
    </PivotViewComponent>
    </>
  )
}
```

Run the application

To run the application, use the following command:

NPM

```
npm run dev
```

YARN

```
yarn run dev
```

To learn more about the functionality of the Pivot Table component, refer to the [documentation](#).

[View the NEXT.js Pivot Table sample in the GitHub repository](#)[Link to the Video](#).

Data binding in React Pivotview component

To get start quickly with Data Binding, you can check on this video:

JSON

For JSON data binding, the `type` property under [dataSourceSettings](#) needs to be set as `JSON`. By default, the default value is assumed as `JSON`.

Binding JSON data via local

In-order to bind local JSON data to the pivot table user can assign the local variable holding the JSON data to the [dataSource](#) property under [dataSourceSettings](#).

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
```

```

    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Using local variable, the JSON data can also be bound to the pivot table using [DataManager](#) option with the help of [JsonAdaptor](#). Here the instance of [DataManager](#) holding JSON data is assigned to [dataSource](#) property under [dataSourceSettings](#). The use of [DataManager](#) is optional here.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, JsonAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let pivotObj;
  let dataSource = new DataManager({
    json: pivotData,
    adaptor: new JsonAdaptor
  });
  let dataSourceSettings = {
    dataSource: dataSource,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import { DataManager, JsonAdaptor, Query, ReturnOption } from
 '@syncfusion/ej2-data';

```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let pivotObj: PivotViewComponent;
  let dataSource: DataManager = new DataManager({
    json: pivotData,
    adaptor: new JsonAdaptor
  });
  let dataSourceSettings: IDataOptions = {
    dataSource: dataSource,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

In the meantime, the JSON data from the local *.json file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to JSON data that can be assigned to the [dataSource](#) property under [dataSourceSettings](#). The following code example illustrates the same.

`javascript

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Uploader } from '@syncfusion/ej2-inputs';
function App() {
  // Step 1: Initiate the file uploader
  let uploadObj: Uploader = new Uploader({
  });
  uploadObj.appendTo('#fileupload');
  let input = document.querySelector('input[type="file"]');
  // Step 2: Add the event listener which fires when the *.JSON file is uploaded.
  input.addEventListener('change', function (e: Event) {
  // Step 3: Initiate the file reader

```

```

let reader: FileReader = new FileReader();
reader.onload = function () {
// Step 4: Getting the string output which is to be parsed as JSON.
let result: string[][] = JSON.parse(reader.result as string);
let dataSourceSettings: IDataOptions = {
// Step 5: The JSON result to be bound as data source.
dataSource: result
// Step 6: The appropriate report needs to be provided here.
}
reader.readAsText((input as any).files[0]);
}
});
let pivotObj: PivotViewComponent;
return <PivotViewComponent ref={d => pivotObj = d} id = 'PivotView' height = { 350} dataSourceSettings
= { dataSourceSettings } ></PivotViewComponent>
}
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Binding JSON data via remote

In-order to bind remote JSON data, mention the endpoint [URL](#) under [dataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (*.json) and web service URL.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings = {
    url: 'https://cdn.syncfusion.com/data/sales-analysis.json',
    expandAll: false,
    rows: [
      { name: 'EnerType', caption: 'Energy Type' },
    ],
    columns: [
      { name: 'EneSource', caption: 'Energy Source' }
    ],
    values: [
      { name: 'PowUnits', caption: 'Units (GWh)' },
      { name: 'ProCost', caption: 'Cost (MM)' }
    ],
    filters: []
  };
};

```

```

    let pivotObj;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let dataSourceSettings: IDataOptions = {
        url: 'https://cdn.syncfusion.com/data/sales-analysis.json',
        expandAll: false,
        rows: [
            { name: 'EnerType', caption: 'Energy Type' },
        ],
        columns: [
            { name: 'EneSource', caption: 'Energy Source' }
        ],
        values: [
            { name: 'PowUnits', caption: 'Units (GWh)' },
            { name: 'ProCost', caption: 'Cost (MM)' }
        ],
        filters: []
    };
    let pivotObj: PivotViewComponent;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

CSV

For CSV data binding, the `type` property under [dataSourceSettings](#) needs to be set as `CSV` mandatorily.

The CSV format is considered to be the most compact format compared to JSON since it is half the size of JSON. This helps to reduce the bandwidth while transferring to the browser.

Binding CSV data via local

In-order to bind local CSV data to the pivot table, user needs to convert it as string array and then directly assign it to the [dataSource](#) property under [dataSourceSettings](#).

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { csvdata } from './datasource';
function App() {

```

```

    let dataSourceSettings = {
      dataSource: getCSVData(),
      type: 'CSV',
      expandAll: false,
      columns: [{ name: 'Item Type' }, { name: 'Sales Channel' }],
      filters: [],
      drilledMembers: [{ name: 'Item Type', items: ['Baby Food' ]}],
      formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name:
'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
      rows: [{ name: 'Region' }, { name: 'Country' }],
      values: [{ name: 'Total Cost' }, { name: 'Total Revenue' }, { name:
'Total Profit' }],
    };
    function getCSVData() {
      const dataSource = [];
      const jsonObject = csvdata.split(/\r?\n|\r/);
      for (let i = 0; i < jsonObject.length; i++) {
        if (!isNullOrUndefined(jsonObject[i]) && jsonObject[i] !== '') {
          dataSource.push(jsonObject[i].split(','));
        }
      }
      return dataSource;
    }
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { isNullOrUndefined } from '@syncfusion/ej2-base';
import { csvdata } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: getCSVData(),
    type: 'CSV',
    expandAll: false,
    columns: [{ name: 'Item Type' }, { name: 'Sales Channel' } ],
    filters: [],
    drilledMembers: [{ name: 'Item Type', items: ['Baby Food' ]}],
    formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name: 'Total
Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
    rows: [{ name: 'Region' }, { name: 'Country' }],
    values: [{ name: 'Total Cost' }, { name: 'Total Revenue' }, { name:
'Total Profit' }],
  };
  function getCSVData() {
    const dataSource = [];
    const jsonObject = csvdata.split(/\r?\n|\r/);

```

```

    for (let i = 0; i < jsonObject.length; i++) {
        if (!isNullOrUndefined(jsonObject[i]) && jsonObject[i] !== '') {
            dataSource.push(jsonObject[i].split(','));
        }
    }
    return dataSource;
}
let pivotObj: PivotViewComponent;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

In the meantime, the CSV data from the local *.csv file type can also be connected to the pivot table via the file uploader option. Here, the resulting string after uploading the file needs to be converted to string array that can be assigned to the [dataSource](#) property under [dataSourceSettings](#). The following code example illustrates the same.

`javascript

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { Uploader } from '@syncfusion/ej2-inputs';

function App() {
    // Step 1: Initiate the file uploader
    let uploadObj: Uploader = new Uploader({
    });
    uploadObj.appendTo('#fileupload');
    let input = document.querySelector('input[type="file"]');
    // Step 2: Add the event listener which fires when the *.CSV file is uploaded.
    input.addEventListener('change', function (e: Event) {
        // Step 3: Initiate the file reader
        let reader: FileReader = new FileReader();
        reader.onload = function () {
            // Step 4: Getting the string output which is to be converted as string[[]].
            let result: string[][] = (reader.result as string).split('\n').map(function (line) {
                return line.split(',');
            });
            let dataSourceSettings: IDataOptions = {

```

```
// Step 5: The string[][] result to be bound as data source
dataSource: result,
type: 'CSV',
// Step 6: The appropriate report needs to be provided here.
}
reader.readAsText((input as any).files[0]);
}
});

let pivotObj: PivotViewComponent;

return (<PivotViewComponent ref={d => pivotObj = d} id = 'PivotView' height = { 350}
dataSourceSettings = { dataSourceSettings } > </PivotViewComponent>);
}

export default App;

ReactDOM.render(<App />, document.getElementById('sample'));
`
```

Binding CSV data via remote

In-order to bind remote CSV data, mention the endpoint [URL](#) under [dataSourceSettings](#) property. The [URL](#) property supports both direct downloadable file (*.csv) and web service URL.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings = {
    url: 'https://bi.syncfusion.com/productservice/api/sales',
    type: 'CSV',
    expandAll: false,
    enableSorting: true,
    formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name:
'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
    drilledMembers: [{ name: 'Item Type', items: ['Baby Food' ]}],
    rows: [
      { name: 'Region' },
      { name: 'Country' }
    ],
    columns: [
      { name: 'Item Type' },
      { name: 'Sales Channel' }
    ],
    values: [
      { name: 'Total Cost' },
      { name: 'Total Revenue' },
      { name: 'Total Profit' }
    ],
    filters: []
  }
```

```

    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings: IDataOptions = {
    url: 'https://bi.syncfusion.com/productservice/api/sales',
    type: 'CSV',
    expandAll: false,
    enableSorting: true,
    formatSettings: [{ name: 'Total Cost', format: 'C0' }, { name: 'Total Revenue', format: 'C0' }, { name: 'Total Profit', format: 'C0' }],
    drilledMembers: [{ name: 'Item Type', items: ['Baby Food'] }],
    rows: [
      { name: 'Region' },
      { name: 'Country' }

  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Remote Data Binding

To interact with remote data source, provide the endpoint url within [DataManager](#) along with appropriate [adaptor](#). By default, [DataManager](#) uses [ODataAdaptor](#) for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. User can retrieve data from OData service using the [DataManager](#) class. Refer to the following code example for remote data binding using OData service.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let dataSource = new DataManager({
        url:
        'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders/',
        adaptor: new ODataAdaptor,
        crossDomain: true
    });
    let dataSourceSettings = {
        dataSource: dataSource,
        expandAll: true,
        filters: [],
        columns: [{ name: 'OrderDate' }, { name: 'ShipCity' }],
        rows: [{ name: 'OrderID' }, { name: 'CustomerID' }],
        values: [{ name: 'Freight' }]
    };
    let pivotObj;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import { DataManager, ODataAdaptor, Query, ReturnOption } from
 '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let dataSource: DataManager = new DataManager({
        url:
        'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders/',
        adaptor: new ODataAdaptor,
        crossDomain: true
    });
    let dataSourceSettings: IDataOptions = {
        dataSource: dataSource,
        expandAll: true,
        filters: [],
        columns: [{ name: 'OrderDate' }, { name: 'ShipCity' }],
        rows: [{ name: 'OrderID' }, { name: 'CustomerID' }],
        values: [{ name: 'Freight' }]
    };
    let pivotObj: PivotViewComponent;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
```

```
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Binding with OData V4 services

The OData V4 is an improved version of OData protocols, and the [DataManager](#) class can be used to retrieve and consume OData V4 services. For more details on OData V4 services, refer to the [OData documentation](#). To bind OData V4 service, use the [ODataV4Adaptor](#).

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let pivotObj;
    let dataSource = new DataManager({
        adaptor: new ODataV4Adaptor,
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7',
        crossDomain: true
    });
    let dataSourceSettings = {
        dataSource: dataSource,
        expandAll: true,
        filters: [],
        columns: [{ name: 'OrderDate' }, { name: 'ShipCity' }],
        rows: [{ name: 'OrderID' }, { name: 'CustomerID' }],
        values: [{ name: 'Freight' }]
    };
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import { DataManager, ODataV4Adaptor, Query, ReturnOption } from
 '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let pivotObj: PivotViewComponent;
    let dataSource: DataManager = new DataManager({
        adaptor: new ODataV4Adaptor,
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/?$top=7',
        crossDomain: true
    });
    let dataSourceSettings: IDataOptions = {
        dataSource: dataSource,
```

```

    expandAll: true,
    filters: [],
    columns: [{ name: 'OrderDate' }, { name: 'ShipCity' }],
    rows: [{ name: 'OrderID' }, { name: 'CustomerID' }],
    values: [{ name: 'Freight' }]
  };
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Web API

User can use [WebApiAdaptor](#) to bind pivot table with Web API created using OData endpoint.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSource = new DataManager({
    url: 'https://bi.syncfusion.com/northwindservice/api/orders',
    adaptor: new WebApiAdaptor,
    crossDomain: true
  });
  let dataSourceSettings = {
    dataSource: dataSource,
    expandAll: true,
    filters: [],
    columns: [{ name: 'ProductName', caption: 'Product Name' }],
    rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
    formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
    values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import { DataManager, WebApiAdaptor, Query, ReturnOption } from
 '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSource: DataManager = new DataManager({

```

```

url: 'https://bi.syncfusion.com/northwindservice/api/orders',
adaptor: new WebApiAdaptor,
crossDomain: true
});
let dataSourceSettings: IDataOptions = {
  dataSource: dataSource,
  expandAll: true,
  filters: [],
  columns: [{ name: 'ProductName', caption: 'Product Name' }],
  rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
  formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
  values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }]
};
let pivotObj: PivotViewComponent;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Querying in Data Manager

By default, the data manager retrieves all the data from the provider which is mapped in it. The data from the provider can be filtered, sorted, paged, etc. by setting the own query in `defaultQuery` property in the data manager instance.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, ODataAdaptor, Query } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let pivotObj;
  let dataSource = new DataManager({
    url:
'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders',
    adaptor: new ODataAdaptor(),
    crossDomain: true
  }, new Query().take(2));
  let dataSourceSettings = {
    dataSource: dataSource,
    expandAll: false,
    columns: [{ name: 'CustomerID', caption: 'Customer ID' }],
    rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
    values: [{ name: 'Freight' }]
  };
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { DataManager, ODataAdaptor, Query, ReturnOption } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let pivotObj: PivotViewComponent;
    let dataSource: DataManager = new DataManager(
        {
            url:
                'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/Orders',
            adaptor: new ODataAdaptor(),
            crossDomain: true
        },
        new Query().take(2)
    );
    let dataSourceSettings: IDataOptions = {
        dataSource: dataSource,
        expandAll: false,
        columns: [{ name: 'CustomerID', caption: 'Customer ID' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name: 'ShipCity', caption: 'Ship City' }],
        values: [{ name: 'Freight' }]
    };
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Mapping

One can define field information like alias name (caption), data type, aggregation type, show and hide subtotals etc. using the [fieldMapping](#) property under [dataSourceSettings](#). The available options are,

- [name](#) - It is to specify the appropriate field name.
- [caption](#) - It is to set the alias name (caption) to the specific field. Instead of actual field name, the alias name (caption) will be set in the UI of the pivot table.
- [type](#) - It is to display values in the pivot table with appropriate aggregation such as sum, product, count, average, minimum, maximum, etc. Its default value is **sum**. This option is applicable only for relational data source.
- [axis](#) - It will help to display the field in specified axis such as row/column/value/filter axis of the pivot table.
- [showNoDataItems](#) - It is to show all the members of a specific field to the pivot table, even if there are no data in the intersection of the row and column. The default value is **false**. This option is applicable only for relational data source.
- [baseField](#) - For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective field is assigned for comparison via this property.

- [baseItem](#) For the aggregate types like "DifferenceFrom" or "PercentageOfDifferenceFrom" or "PercentageOfParentTotal", selective member in a field is assigned for comparison via this property.
- [expandAll](#) - It is to expand or collapse all headers of a specific field in row and column axes of the pivot table. The default value is **false**.
- [showSubTotals](#) - It is to show or hide sub-totals of a specific field in row and column axis of the pivot table. The default value is **true**.
- [isNamedSet](#) - It is to set whether the specified field is named set or not. In general, the named set is a set of dimension members or a set expression (MDX query) to be created as a dimension in the SSAS OLAP cube itself. The default value is **false** and this option is applicable only for OLAP data source.
- [isCalculatedField](#) - It is to set whether the specified field is a calculated field or not. In general, a calculated field is created from the bound data source or using simple formula with basic arithmetic operators in the pivot table. The default value is **false** and this option is applicable only for OLAP data source.
- [showFilterIcon](#) - It is to show or hide the filter icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This filter icon is used to filter the members of a specified field at runtime in the pivot table. The default value is **true**.
- [showSortIcon](#) - It is to show or hide the sort icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This sort icon is used to order members of a specified field either in ascending or descending at runtime. The default value is **true**.
- [showRemoveIcon](#) - It is to show or hide the remove icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This remove icon is used to remove the specified field during runtime. The default value is **true**.
- [showValueTypeIcon](#) - It is to show or hide the value type icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This value type icon helps to select the appropriate aggregation type to specified value field at runtime. The default value is **true**.
- [showEditIcon](#) - It is to show or hide the edit icon of a specific field which will be displayed on the button of the grouping bar and field list UI. This edit icon is used to modify caption, formula, and format of a specified calculated field at runtime. The default value is **true**.
- [allowDragAndDrop](#) - It is to restrict specific field's button from being dragged on runtime in the grouping bar and field list UI. This will prevent from altering the current report. The default value is **true**.
- [dataType](#) - It is to specify the type of the field like 'string', 'number', 'datetime', 'date', and 'boolean'.
- [groupName](#) - It is to display fields in the field list UI by grouping them under the desired folder name.

The main purpose of these mapping options is to configure each field that is not part of the initial pivot report. Even if any field that is part of this mapping is defined here, the value set in the initial report will have the highest preceding.

This option is applicable only for relational data source.

In the below code sample, visibility of the field button icons are configured.

INDEX.JSX

```
import { GroupingBar, FieldList, Inject, PivotViewComponent } from
'@syncfusion/ej2-react-pivotview';
```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }],
    dataSource: pivotData,
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }],
    fieldMapping: [
      { name: 'Quarter', showSortIcon: false },
      { name: 'Products', showFilterIcon: false, showRemoveIcon: false
    },
      { name: 'Amount', showValueTypeIcon: false, caption: 'Sold
Amount' } ],
  ];
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} showGroupingBar={true}
showFieldList={true}><Inject services={[GroupingBar,
FieldList]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { GroupingBar, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }],
    fieldMapping: [
      { name: 'Quarter', showSortIcon: false },
      { name: 'Products', showFilterIcon: false, showRemoveIcon: false
    },
      { name: 'Amount', showValueTypeIcon: false, caption: 'Sold
Amount' } ],
  };

```

```

    ]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} showGroupingBar={true}
showFieldList={true} ><Inject services={[GroupingBar,
FieldList]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Values in row axis

By default, the value fields are plotted in column axis. To plot those fields in row axis, use the [valueAxis](#) property by setting its value as **row**. By default, it holds the value **column**.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    valueAxis: 'row'
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,

```

```

    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    valueAxis: 'row'
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Values at different positions

By default, the value fields are placed at the end of the row or column axis. To place those value fields in different positions, use the [valueIndex](#) property and set the value to an appropriate index position. Its default value is -1, which denotes the last position. The [valueIndex](#) property is dependent on the [valueAxis](#) property.

This support is only available for relational data sources. Also, enable the [showValuesButton](#) property in the grouping bar and field list UI to **true** to re-arrange the values fields at different positions via user interaction.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: true,
    filters: [],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    valueIndex: 1
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';

```

```
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: true,
    filters: [],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    valueIndex: 1
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Show 'no data' items

By default, the pivot table only shows the field item if it has data in its row or column combination. To show all items that do not have data in row and column combination in the pivot table, use the [showNoDataItems](#) property by settings its value to **true** for the desired fields. In the following code sample, rows of the "County" and "State" fields do not have data in all combination with "Date" column field.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { noData } from './datasource';
function App() {
  let dataSourceSettings = {
    dataSource: noData,
    expandAll: true,
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    columns: [{ name: 'Date', showNoDataItems: true }],
    values: [{ name: 'Quantity', caption: 'Units Sold' }, { name:
'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
    filters: []
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { noData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: noData,
    expandAll: true,
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    columns: [{ name: 'Date', showNoDataItems: true }],
    values: [{ name: 'Quantity', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country', showNoDataItems: true }, { name: 'State',
showNoDataItems: true }],
    filters: []
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Show value headers always

To show value header always in pivot table, even if it holds a single value, use the [alwaysShowValueHeader](#) property by settings its value as **true**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }],
    alwaysShowValueHeader: true
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }],
    alwaysShowValueHeader: true
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Customize empty value cells

User can show custom string in empty value cells using the [emptyCellsTextContent](#) property in [dataSourceSettings](#). Since the property is of string data type, user can fill empty value cells with any value like "0", "-", "*", "(blank)", etc. Its common for all value fields and can be configured through code behind.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    emptyCellsTextContent: '*',
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C2' }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
```

```

    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    emptyCellsTextContent: '*',
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C2' }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Event

Load

The event [load](#) fires before initiate rendering of pivot table. It holds following parameters like [dataSourceSettings](#), [fieldsType](#) and [PivotView](#). In this event user can customize data source settings before initiating pivot table render module.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    };
    let pivotObj;
    function onLoad(args) {
        args.dataSourceSettings.emptyCellsTextContent = "###";
        args.dataSourceSettings.columns[0].caption = "Full Year";
        args.dataSourceSettings.expandAll = true;
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} load={onLoad.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, LoadEventArgs } from
'@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    }
    let pivotObj: PivotViewComponent;
    function onLoad(args: LoadEventArgs): void {
        args.dataSourceSettings.emptyCellsTextContent = "###";
        args.dataSourceSettings.columns[0].caption = "Full Year";
        args.dataSourceSettings.expandAll = true;
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} load={onLoad.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}

```

```
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

EnginePopulated

The event [enginePopulated](#) is triggered after engine is populated. It has following parameters - `dataSourceSettings`, `pivotFieldList` and `pivotValues`.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C2' }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  };
  let pivotObj;
  function enginePopulated(args) {
    // triggers after engine gets populated
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enginePopulated={enginePopulated.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent,
EnginePopulatedEventArgs } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
  };
  let pivotObj;
  function enginePopulated(args: EnginePopulatedEventArgs) {
    // triggers after engine gets populated
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enginePopulated={enginePopulated.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

```

        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    }
    let pivotObj: PivotViewComponent;
    function enginePopulated(args: EnginePopulatedEventArgs): void {
        // triggers after engine gets populated
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enginePopulated={enginePopulated.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

EnginePopulating

The event [enginePopulating](#) triggers before the pivot engine starts to populate and allows to customize the pivot datasource settings. It has following parameter `dataSourceSettings`.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C2' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    };
    let pivotObj;
    function enginePopulating(args) {
        args.dataSourceSettings.columns[0].caption = "Full Year";
        args.dataSourceSettings.expandAll = true;
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enginePopulating={enginePopulating.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent,
EnginePopulatingEventArgs } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C2' }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  }
  let pivotObj: PivotViewComponent;
  function enginePopulating(args: EnginePopulatingEventArgs): void {
    args.dataSourceSettings.columns[0].caption = "Full Year";
    args.dataSourceSettings.expandAll = true;
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enginePopulating={enginePopulating.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Connecting to data source

MySQL in EJ2 React Pivotview Component

This section describes how to retrieve data from a MySQL database using [MySqlClient](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch MySQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a MySQL Server using the **MySqlClient** in our application, we need to install the [MySql.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MySql.Data** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MySQLConnection** helps to connect the MySQL database. Next, using **MySQLCommand** and **MySQLDataAdapter** you can process the desired query string and retrieve data from the MySQL database. The **Fill** method of the **MySQLDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using MySQL.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        public dynamic GetMySQLResult()
        {
```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySQLCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetMySQLResult** method is used to retrieve the MySQL data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using MySql.Data.MySqlClient;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetMySQLResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(GetMySQLResult());
        }
        public dynamic GetMySQLResult()
        {

```

```
// Replace with your own connection string.
MySQLConnection connection = new MySqlConnection("<Enter your valid connection string here>");
connection.Open();
MySQLCommand command = new MySqlCommand("SELECT * FROM orders", connection);
MySQLDataAdapter dataAdapter = new MySQLDataAdapter(command);
DataTable dataTable = new DataTable();
dataAdapter.Fill(dataTable);
connection.Close();
return dataTable;
}
}
}
```

6. Run the application and it will be hosted within the URL <https://localhost:7146>.

7. Finally, the retrieved data from MySQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:7146/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a MySQL database using the Web API service

1. Create a simple React Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link <https://localhost:7146/Pivot> to the Pivot Table in **app.ts** by using the **url** property under [dataSourceSettings](#).

```
`typescript
```

```
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
```

```

let dataSourceSettings = {
url: 'https://localhost:7146/pivot',
//Other codes here...
};

return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
};

export default App;
`

```

3. Frame and set the report based on the data retrieved from the MySQL database.

```

`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
let dataSourceSettings = {
url: 'https://localhost:7146/pivot',
enableSorting: true,
expandAll: false,
columns: [{ name: 'ShipName' }],
values: [{ name: 'Freight', caption: 'Sum of Freight' }],
rows: [{ name: 'ShipCity' }],
filters: []
};

return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
};

export default App;
`

```

When you run the sample, the resulting pivot table will look like this:

	Alfred's Futterkist	Alfreds Futterkist	Ana Trujillo Empa	Antonio Moreno	Around the Horn	B's	
Aachen							
Albuquerque							
Anchorage							
Barcelona							
Barquisimeto							
Bergamo							
Berlin	196.12000000...	29.46					
Bern							

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a MySQL database and bind to the Pivot Table in [this](#) GitHub repository.

Microsoft SQL Server in EJ2 React Pivotview Component

This section describes how to retrieve data from SQL Server database using [Microsoft SqlClient](#) and bind it to the Pivot Table via a Web API controller.

Steps to connect the SQL Server database via Web API application

1. Download the ASP.NET Core Web Application from [this](#) GitHub repository.
2. The application named as **PivotController** (server-side) that is downloaded from the above GitHub repository includes the following files.

- **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
- **Database1.mdf** file under **App_Data** folder – This MDF (Master Database File) file contains example data.

3. In the Web API controller (aka, PivotController), **SqlConnection** helps to connect the SQL database (that is, Database1.mdf). Next, using **SqlCommand** and **SqlDataAdapter** you can process the desired SQL query string and retrieve data from the database. The **Fill** method of the DataAdapter is used to populate the SQL data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using System.Data;
using System.Data.SqlClient;
namespace PivotController.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
```

```

{
private static DataTable FetchSQLResult()
{
string conSTR = @"<Enter your valid connection string here>";
string xquery = "SELECT * FROM table1";
SqlConnection sqlConnection = new(conSTR);
sqlConnection.Open();
SqlCommand cmd = new(xquery, sqlConnection);
SqlDataAdapter dataAdapter = new(cmd);
DataTable dataTable = new();
dataAdapter.Fill(dataTable);
return dataTable;
}
}
}
`

```

4. In the **Get()** method of the **PivotController.cs** file, the **FetchSQLResult** method is used to retrieve the SQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using System.Data.SqlClient;
namespace PivotController.Controllers
{
[ApiController]
[Route("[controller]")]
public class PivotController : ControllerBase
{
[HttpGet(Name = "GetSQLResult")]
public object Get()
{
return JsonConvert.SerializeObject(FetchSQLResult());
}
}
}

```

```

}

private static DataTable FetchSQLResult()
{
    string conSTR = @"<Enter your valid connection string here>";
    string xquery = "SELECT * FROM table1";
    SqlConnection sqlConnection = new(conSTR);
    sqlConnection.Open();
    SqlCommand cmd = new(xquery, sqlConnection);
    SqlDataAdapter dataAdapter = new(cmd);
    DataTable dataTable = new();
    dataAdapter.Fill(dataTable);
    return dataTable;
}
}
,

```

5. Run the web application (aka, PivotController) and it will be hosted within the URL <https://localhost:7139>.

6. Finally, the retrieved data from SQL Server which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:7139/pivot>, as shown in the browser page below.

```

[{"Product": "Bike", "State": "New South Wales", "Redueby": 10.00, "Date": "FY 2005", "Quantity": 3, "Amount": 500.000, "Category": "Small Vehicle", "Country": "Australia"},
{"Product": "Bus", "State": "Sydney", "Redueby": 40.00, "Date": "FY 2006", "Quantity": 4, "Amount": 6000.000, "Category": "Large Vehicle", "Country": "Australia"},

```

Connecting the Pivot Table to the hosted Web API URL

1. Download the react Pivot Table sample from [this](#) GitHub repository.

2. Next, map the hosted Web API's URL link <https://localhost:7139/pivot> to the Pivot Table component in **app.ts** by using the [url](#) property under [dataSourceSettings](#).

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:7139/pivot',
    //Other codes here...
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}/></PivotViewComponent>);
};
export default App;
`
```

3. Frame and set the report based on the data retrieved from the SQL database.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:7139/pivot',
    enableSorting: true,
    expandAll: false,
    columns: [{ name: 'Product' }],
    values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'State' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}/></PivotViewComponent>);
`
```

```
};
export default App;
`
```

4. Run the sample to get the following result.

	Large Vehicle		Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Am
▶ Australia	16	24000	12	2000	28	
▶ Canada			420	1649000	420	
▶ Jamaica	400	300120			400	
▶ Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176	

The sample for connecting the Pivot Table to a SQL Server database via an ASP.NET Web application can be found in [this](#) GitHub repository.

PostgreSQL in EJ2 React Pivotview Component

This section describes how to consume data from PostgreSQL database using [Microsoft Npgsql](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch PostgreSQL data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

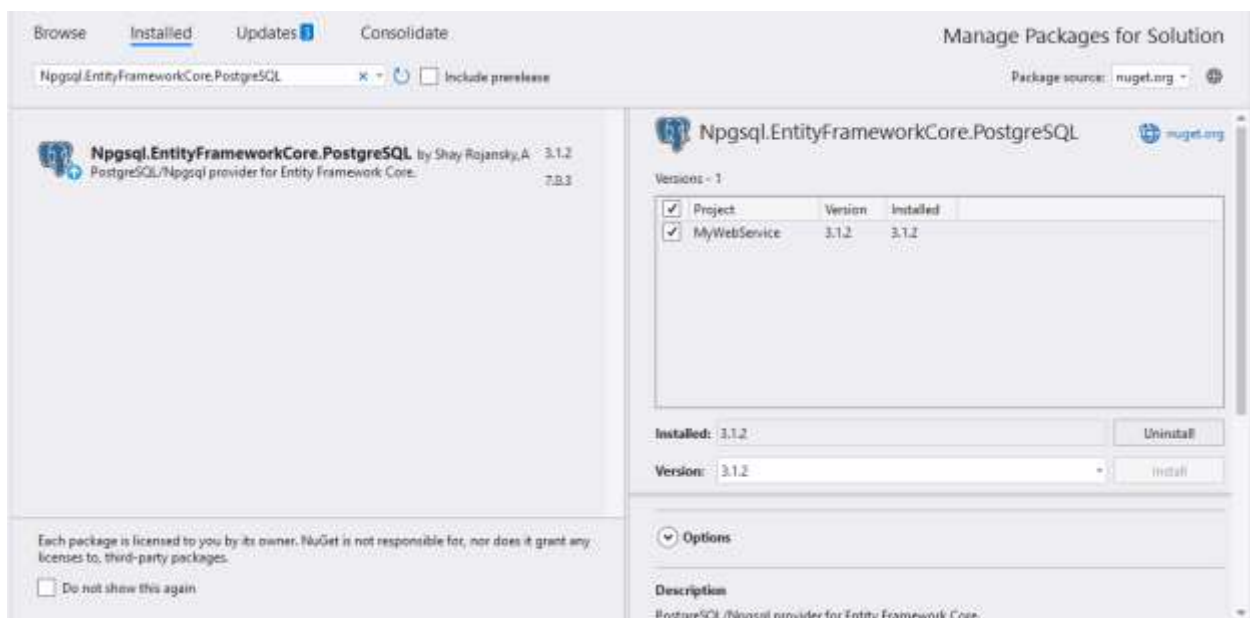

Location
C:\Users\username\source\repos

Solution name
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a PostgreSQL Server using the **Npgsql** in our application, we need to install the [Npgsql.EntityFrameworkCore.PostgreSQL](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Npgsql.EntityFrameworkCore.PostgreSQL** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **NpgsqlConnection** helps to connect the PostgreSQL database. Next, using **NpgsqlCommand** and **NpgsqlDataAdapter** you can process the desired PostgreSQL query string and retrieve data from the database. The **Fill** method of the **NpgsqlDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        public dynamic GetPostgreSQLResult()
        {
            // Replace with your own connection string.
            NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
            connection.Open();
            NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
            NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
            DataTable dt = new DataTable();
            da.Fill(dt);
            connection.Close();
            return dt;
        }
    }
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **GetPostgreSQLResult** method is used to retrieve the PostgreSQL data as a **DataTable**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
```

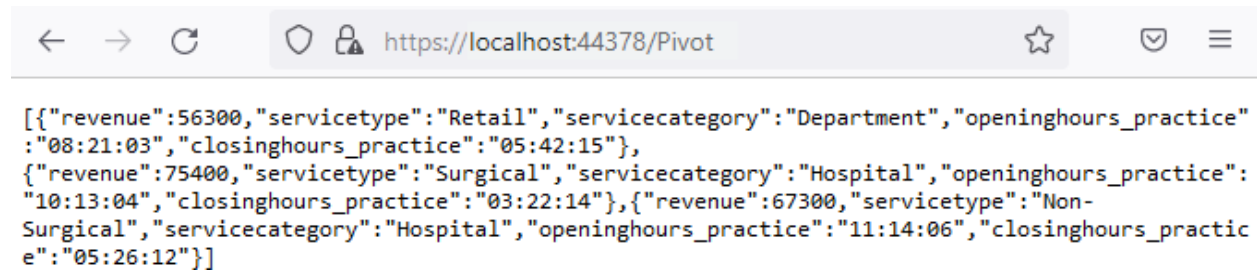

```

using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using System.Data;
using Npgsql;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetPostgreSQLResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(GetPostgreSQLResult());
        }
        public dynamic GetPostgreSQLResult()
        {
            // Replace with your own connection string.
            NpgsqlConnection connection = new NpgsqlConnection("<Enter your valid connection string here>");
            connection.Open();
            NpgsqlCommand cmd = new NpgsqlCommand("SELECT * FROM tablename", connection);
            NpgsqlDataAdapter da = new NpgsqlDataAdapter(cmd);
            DataTable dt = new DataTable();
            da.Fill(dt);
            connection.Close();
            return dt;
        }
    }
}

```

6. Run the application and it will be hosted within the URL <https://localhost:44378/>.

7. Finally, the retrieved data from PostgreSQL database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a PostgreSQL database using the Web API service

1. Create a simple React Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44378/Pivot` to the Pivot Table component in **app.ts** by using the `url` property under `dataSourceSettings`.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44378/pivot',
    //Other codes here...
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}></PivotViewComponent>);
};
export default App;
```

3. Frame and set the report based on the data retrieved from the PostgreSQL database.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44378/Pivot',
    enableSorting: true,
    columns: [{ name: 'openinghourspractice' }, { name: 'closinghourspractice' }],
```

```

values: [{ name: 'revenue' }],
rows: [{ name: 'servicetype' }, { name: 'servicecategory' }]
};
return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
};
export default App;
`

```

When you run the sample, the resulting pivot table will look like this:

	▶ 08:21:03	▶ 10:13:04	▶ 11:14:06	Grand Total
▶ Non-Surgical			67300	67300
▶ Retail	56300			56300
▶ Surgical		75400		75400
Grand Total	56300	75400	67300	199000

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a PostgreSQL database and bind to the Pivot Table in [this](#) GitHub repository.

Oracle in EJ2 React Pivotview Component

This section describes how to retrieve data from Oracle database using [Oracle Managed Data Access](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch Oracle data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

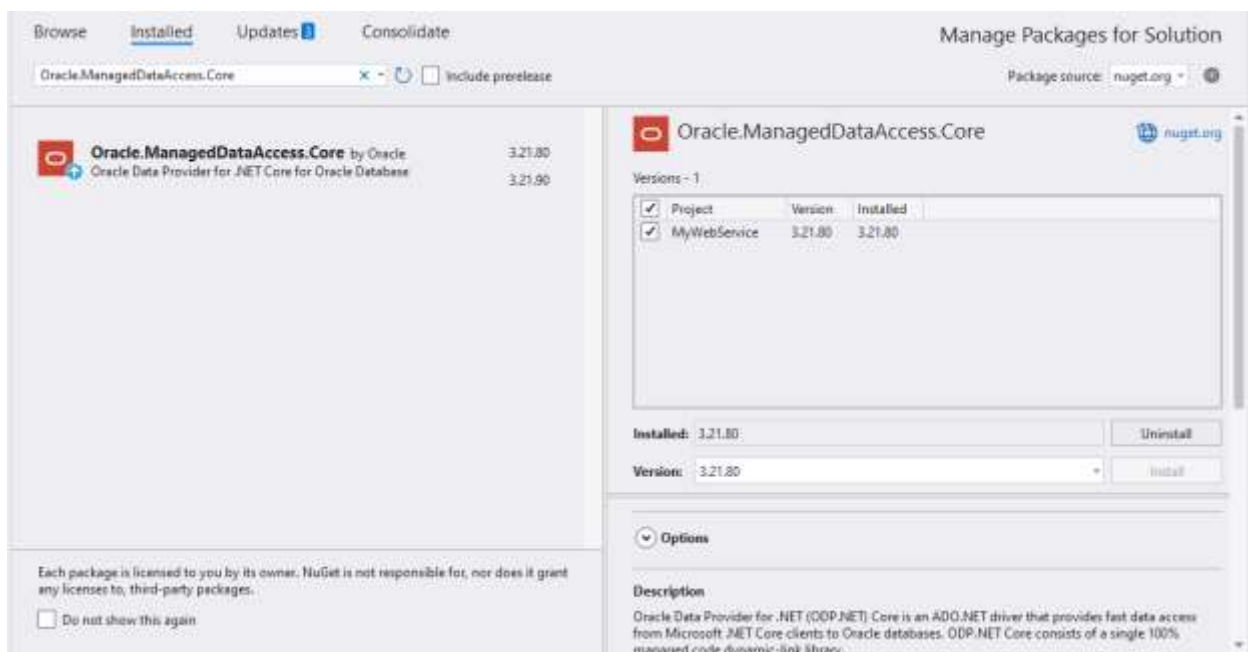

Location
C:\Users\username\source\repos

Solution name
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a Oracle Server using the **Oracle.ManagedDataAccess.Client** in our application, we need to install the [Oracle.ManagedDataAccess.Core](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Oracle.ManagedDataAccess.Core** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **OracleConnection** helps to connect the Oracle database. Next, using **OracleCommand** and **OracleDataAdapter** you can process the desired Oracle query string and retrieve data from the database. The **Fill** method of the **OracleDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        private static DataTable FetchOracleResult()
        {
            // Replace with your own connection string.
            string connectionString = "<Enter your valid connection string here>";
            OracleConnection oracleConnection = new OracleConnection(connectionString);
            oracleConnection.Open();
            OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
            OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
            DataTable dataTable = new DataTable();
            dataAdapter.Fill(dataTable);
            oracleConnection.Close();
            return dataTable;
        }
    }
}
```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchOracleResult()** method is used to retrieve the Oracle data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using Oracle.ManagedDataAccess.Client;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetOracleResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchOracleResult());
        }
        private static DataTable FetchOracleResult()
        {
            // Replace with your own connection string.
            string connectionString = "<Enter your valid connection string here>";
            OracleConnection oracleConnection = new OracleConnection(connectionString);
            oracleConnection.Open();
            OracleCommand command = new OracleCommand("SELECT * FROM EMPLOYEES", oracleConnection);
            OracleDataAdapter dataAdapter = new OracleDataAdapter(command);
            DataTable dataTable = new DataTable();
            dataAdapter.Fill(dataTable);
            oracleConnection.Close();
            return dataTable;
        }
    }
}
```

6. Run the application and it will be hosted within the URL <https://localhost:44346/>.

7. Finally, the retrieved data from Oracle database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a Oracle database using the Web API service

1. Create a simple React Pivot Table by following the “**Getting Started**” documentation [link](#).
2. Map the hosted Web API's URL link <https://localhost:44346/Pivot> to the Pivot Table component in **app.ts** by using the [url](#) property under [dataSourceSettings](#).

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44346/pivot',
    //Other codes here...
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
  showFieldList={true}>
    <Inject services={[FieldList]}></PivotViewComponent>);
};
export default App;
```

3. Frame and set the report based on the data retrieved from the Oracle database.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
```

```
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44346/pivot',
    enableSorting: true,
    expandAll: false,
    columns: [
      { name: 'DEPARTMENT_ID', caption: 'Department ID' },
      { name: 'EMPLOYEE_NAME', caption: 'Employee Name' },
    ],
    rows: [
      { name: 'JOB', caption: 'Job' },
      { name: 'SALARY', caption: 'Salary' }
    ],
    values: [
      { name: 'EMPLOYEE_ID', caption: 'Employee ID' },
      { name: 'CC_EMPLOYEES', caption: 'Employees' },
      { name: 'CCTAXPERCENTAGE', caption: 'Percentage' },
    ],
    filters: []
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}/></PivotViewComponent>);
};
export default App;
```

When you run the sample, the resulting pivot table will look like this:

	▶ 10	▶ 20	▶ 30	Grand Total
▶ ANALYST		15690		15690
▶ CLERK	7934	15245	7900	31079
▶ MANAGER	7782	7566	7698	23046
▶ PRESIDENT	7839			7839
▶ SALESMAN			30518	30518
Grand Total	23555	38501	46116	108172

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a Oracle database and bind to the Pivot Table in [this](#) GitHub repository.

MongoDB in EJ2 React Pivotview Component

This section describes how to consume data from MongoDB database using [MongoDB Driver](#) and [MongoDB Bson](#) libraries and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch MongoDB data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

Location
C:\Users\username\source\repos

Solution name ⓘ
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a MongoDB Server using the **MongoDB.Driver** and **MongoDB.Bson** in our application, we need to install the [MongoDB.Driver](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **MongoDB.Driver** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **MongoClient** helps to connect the MongoDB database. Next, using the **GetDatabase** and **GetCollection** methods, you can retrieve data from the database. The **Find** method of the **IMongoDatabase** is used to populate the retrieved data into a **List**, as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Driver;
using MongoDB.Bson;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        private static List<ProductDetails> FetchMongoDbResult()
        {
            // Replace with your own connection string.
            string connectionString = "<Enter your valid connection string here>";
```

```

MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}

public class ProductDetails
{
    public ObjectId Id { get; set; }
    public int Sold { get; set; }
    public double Amount { get; set; }
    public string? Country { get; set; }
    public string? Products { get; set; }
    public string? Year { get; set; }
    public string? Quarter { get; set; }
}
}
}
`

```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchMongoDbResult()** method is used to retrieve the MongoDB data as a **List**, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Newtonsoft.Json;
using MongoDB.Bson;
using MongoDB.Driver;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetMongoDbResult")]
        public object Get()
    }
}

```

```

{
return JsonConvert.SerializeObject(FetchMongoDbResult());
}
private static List<ProductDetails> FetchMongoDbResult()
{
// Replace with your own connection string.
string connectionString = "<Enter your valid connection string here>";
MongoClient client = new MongoClient(connectionString);
IMongoDatabase database = client.GetDatabase("sample_training");
var collection = database.GetCollection<ProductDetails>("ProductDetails");
return collection.Find(new BsonDocument()).ToList();
}
public class ProductDetails
{
public ObjectId Id { get; set; }
public int Sold { get; set; }
public double Amount { get; set; }
public string? Country { get; set; }
public string? Products { get; set; }
public string? Year { get; set; }
public string? Quarter { get; set; }
}
}
}
`

```

6. Run the web application and it will be hosted within the URL <https://localhost:44346/>.

7. Finally, the retrieved data from MongoDB database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44346/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a MongoDB database using the Web API service

1. Create a simple React Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link `https://localhost:44346/Pivot` to the Pivot Table component in `app.ts` by using the `url` property under `dataSourceSettings`.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44346/pivot',
    //Other codes here...
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}></PivotViewComponent>);
};
export default App;
```

3. Frame and set the report based on the data retrieved from the MongoDB database.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44346/Pivot',
```

```

enableSorting: true,
columns: [
  { name: 'Year' }
],
values: [
  { name: 'Sold', caption: "Units Sold"},
  { name: 'Amount', caption: "Sold Amount"}
],
rows: [
  { name: 'Country' },
  { name: 'Products' }
]
];

return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={{FieldList}}/></PivotViewComponent>);
};

export default App;
`

```

When you run the sample, the resulting pivot table will look like this:

	FY 2015		FY 2016		F
	Units Sold	Sold Amount	Units Sold	Sold Amount	U
> France	729	1160099.5	609	983317	
> Germany	528	845472	667	1067220	
> United Kingdom	782	1263109.5	640	1031630.5	
> United States	682	1085398.5	480	770362	
Grand Total	2721	4354079.5	2396	3852529.5	

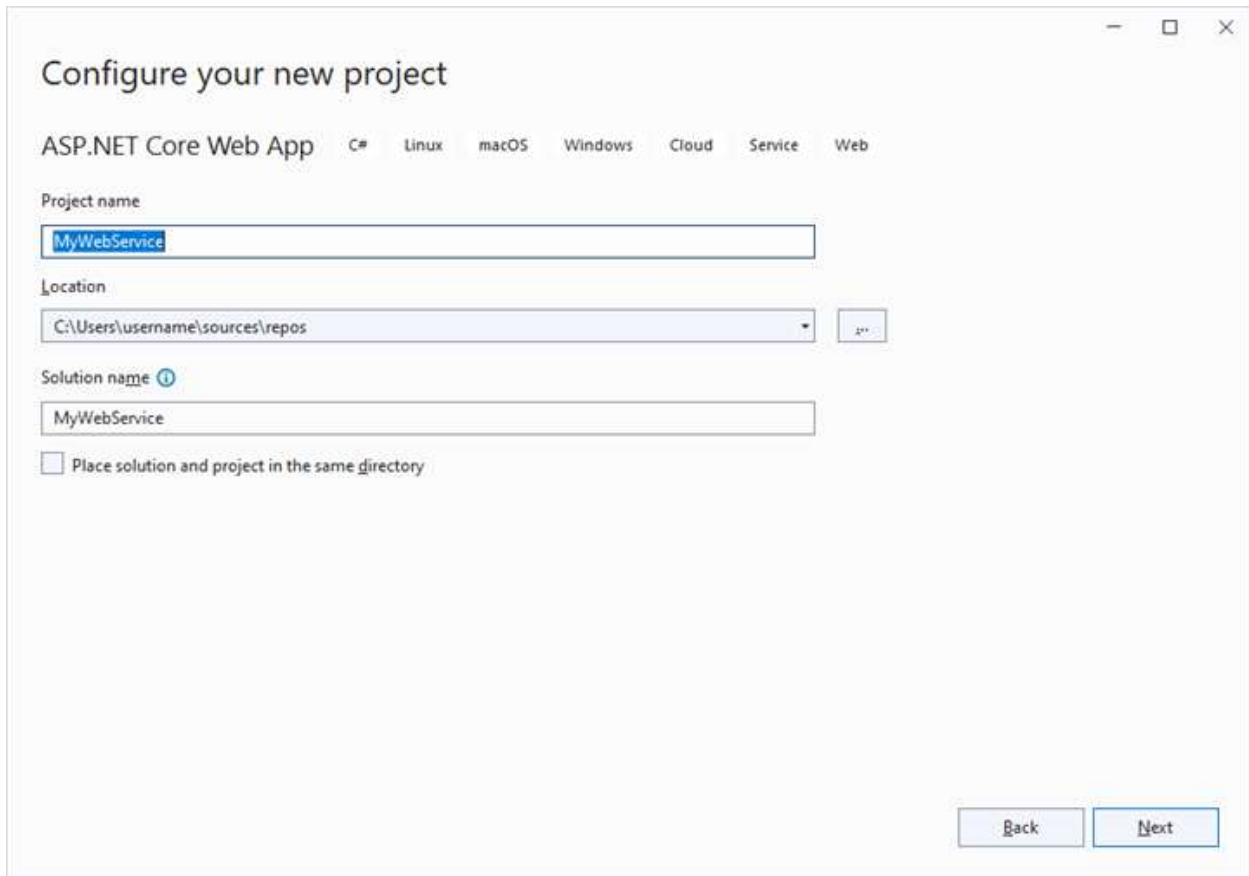

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a MongoDB database and bind to the Pivot Table in [this](#) GitHub repository.

Elasticsearch in EJ2 React Pivotview Component

This section describes how to retrieve data from Elasticsearch database using [Nest](#) library and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch Elasticsearch data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

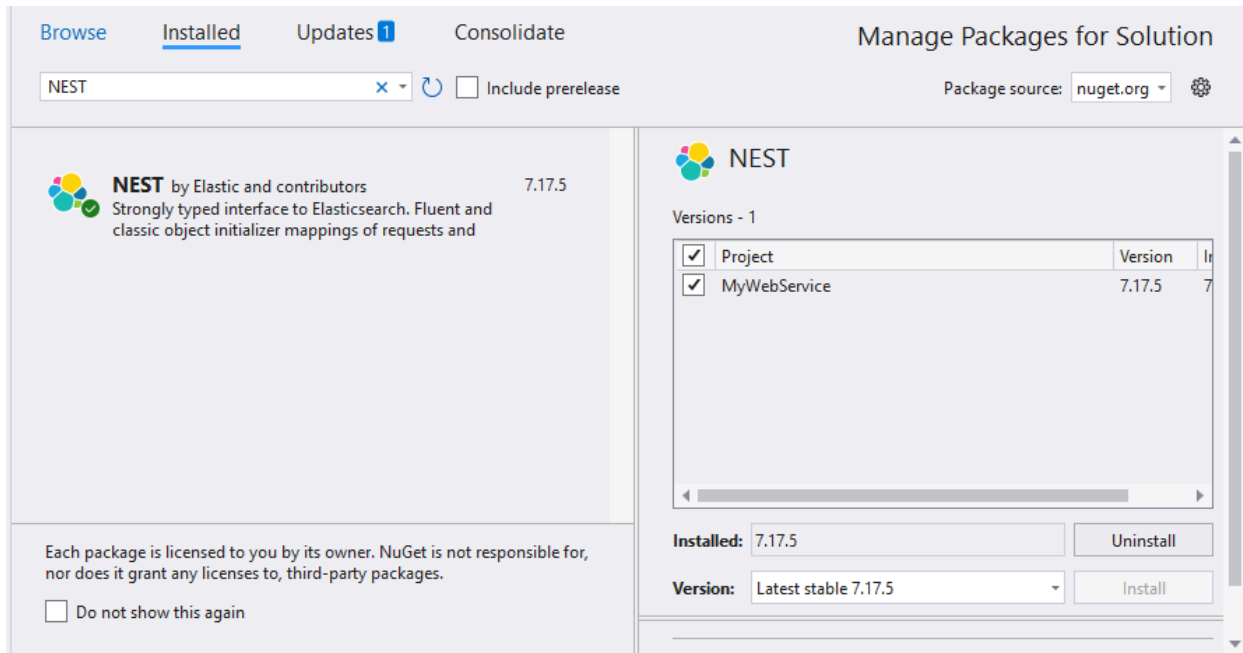

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a Elasticsearch Server using the **NEST** in our application, we need to install the [NEST](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **NEST** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **ElasticClient** helps to connect the Elasticsearch database. Next, using **Search** method you can query your Elasticsearch index and retrieve results from the database.

5. In the **Get()** method of the **PivotController.cs** file, the **FetchElasticsearchData** method is used to retrieve the Elasticsearch data, which is then serialized into JSON using **JsonConvert.SerializeObject()**.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Nest;
using Newtonsoft.Json;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetElasticSearchData")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchElasticsearchData());
        }
    }
}
```

```

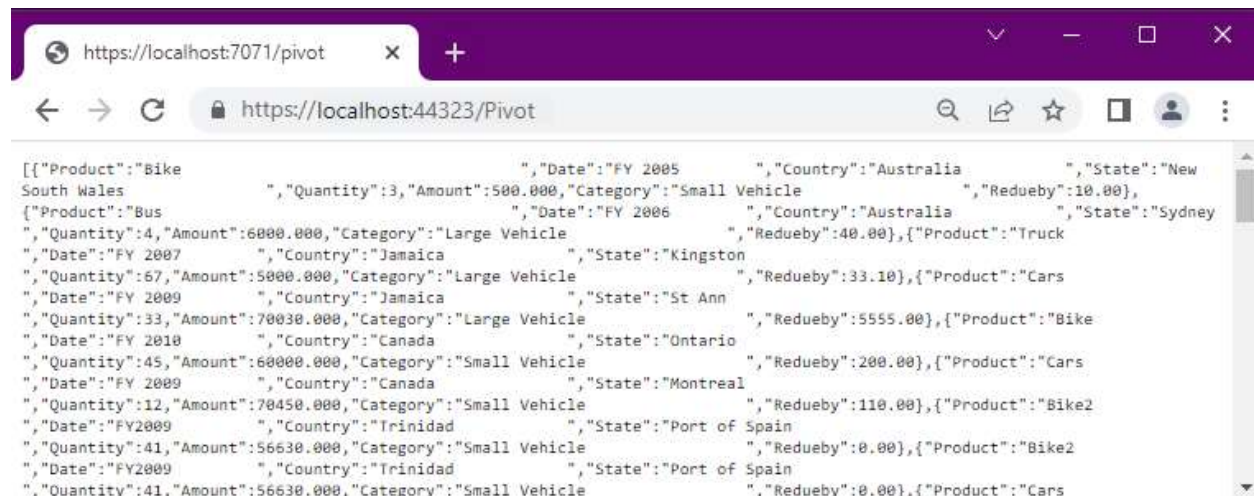

}

private static object FetchElasticsearchData()
{
    // Replace with your own connection string.
    var connectionString = "<Enter your valid connection string here>";
    var uri = new Uri(connectionString);
    var connectionSettings = new ConnectionSettings(uri);
    var client = new ElasticClient(connectionSettings);
    var searchResponse = client.Search<object>{s => s
        .Index("product")
        .Size(1000)
    };
    return searchResponse.Documents;
}
}
}
`

```

6. Run the web application and it will be hosted within the URL <https://localhost:44323>.

7. Finally, the retrieved data from Elasticsearch database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44323/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a Elasticsearch database using the Web API service

1. Create a simple React Pivot Table by following the “**Getting Started**” documentation [link](#).

2. Map the hosted Web API's URL link `https://localhost:44323/Pivot` to the Pivot Table component in `app.ts` by using the `url` property under `dataSourceSettings`.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44323/pivot',
    //Other codes here...
  };
  return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
    showFieldList={true}>
    <Inject services={[FieldList]}></PivotViewComponent>);
};
export default App;
`
```

3. Frame and set the report based on the data retrieved from the Elasticsearch database.

```
`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    url: 'https://localhost:44323/Pivot',
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Product' }],
    values: [{ name: 'Quantity' }, { name: 'Amount', caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'State' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  };
};
```

```

return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
};
export default App;
`

```

When you run the sample, the resulting pivot table will look like this:

	▶ Large Vehicle		▶ Small Vehicle		Grand Total	
	Quantity	Amount	Quantity	Amount	Quantity	Am
▶ Australia	16	24000	12	2000	28	
▶ Canada			420	1649000	420	
▶ Jamaica	400	300120			400	
▶ Trinidad			328	453040	328	
Grand Total	416	324120	760	2104040	1176	

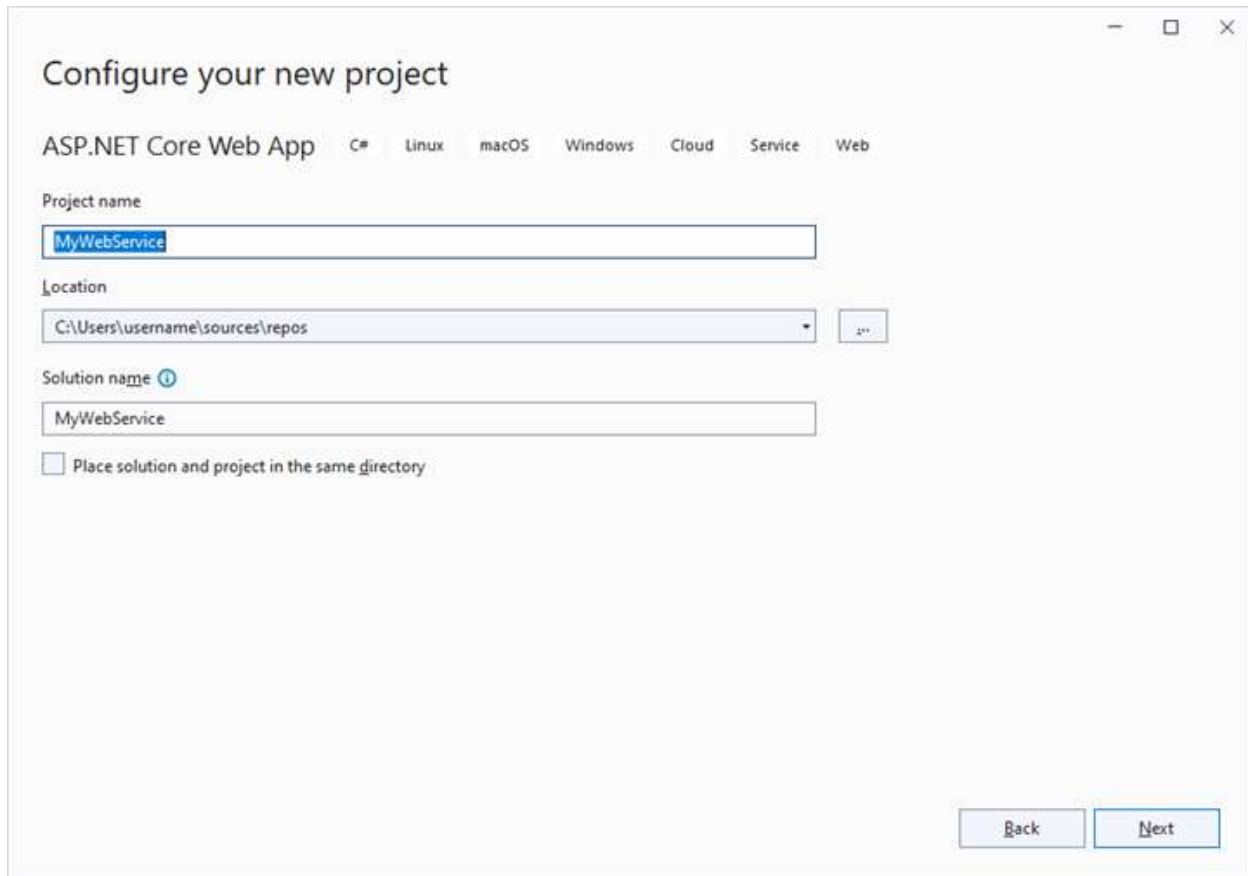

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a Elasticsearch database and bind to the Pivot Table in [this](#) GitHub repository.

Snowflake in EJ2 React Pivotview Component

This section describes how to retrieve data from a Snowflake database using [Snowflake Data](#) and bind it to the Pivot Table via a Web API controller.

Create a Web API service to fetch Snowflake data

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name
MyWebService

Location
C:\Users\username\source\repos

Solution name
MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a Snowflake Server using the **Snowflake.Data.Client** in our application, we need to install the [Snowflake.Data](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Snowflake.Data** and install it.

3. Create a Web API controller (aka, PivotController.cs) file under **Controllers** folder that helps to establish data communication with the Pivot Table.

4. In the Web API controller (aka, PivotController), **SnowflakeDbConnection** helps to connect the Snowflake database. Next, using **SnowflakeDbDataAdapter** you can process the desired Snowflake query string and retrieve data from the database. The **Fill** method of the **SnowflakeDbDataAdapter** is used to populate the retrieved data into a **DataTable** as shown in the following code snippet.

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetSnowflakeResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchSnowflakeResult());
        }
        public static DataTable FetchSnowflakeResult()
        {
            using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
            {
                // Replace with your own connection string.
                snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
                snowflakeConnection.Open();
                SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",
                    snowflakeConnection);
                DataTable dataTable = new DataTable();
                adapter.Fill(dataTable);
                snowflakeConnection.Close();
                return dataTable;
            }
        }
    }
}
```

```

}
}
}
}
`

```

5. In the **Get()** method of the **PivotController.cs** file, the **FetchSnowflakeResult** method is used to retrieve the Snowflake data as a **DataTable**, which is then serialized into JSON string using **JsonConvert.SerializeObject()**.

```

`csharp
using Microsoft.AspNetCore.Mvc;
using Snowflake.Data.Client;
using Newtonsoft.Json;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpGet(Name = "GetSnowflakeResult")]
        public object Get()
        {
            return JsonConvert.SerializeObject(FetchSnowflakeResult());
        }
        public static DataTable FetchSnowflakeResult()
        {
            using (SnowflakeDbConnection snowflakeConnection = new SnowflakeDbConnection())
            {
                // Replace with your own connection string.
                snowflakeConnection.ConnectionString = "<Enter your valid connection string here>";
                snowflakeConnection.Open();
                SnowflakeDbDataAdapter adapter = new SnowflakeDbDataAdapter("select * from CALL_CENTER",
                    snowflakeConnection);
                DataTable dataTable = new DataTable();
            }
        }
    }
}

```

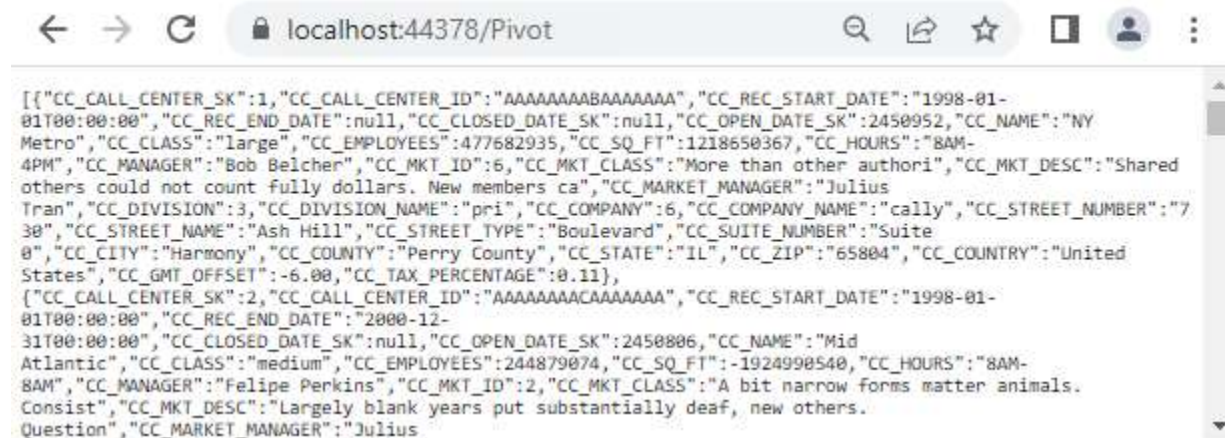

```

adapter.Fill(dataTable);
snowflakeConnection.Close();
return dataTable;
}
}
}
}
,

```

6. Run the application and it will be hosted within the URL <https://localhost:44378/>.

7. Finally, the retrieved data from Snowflake database which is in the form of JSON can be found in the Web API controller available in the URL link <https://localhost:44378/Pivot>, as shown in the browser page below.

Connecting the Pivot Table to a Snowflake database using the Web API service

1. Create a simple React Pivot Table by following the **"Getting Started"** documentation [link](#).
2. Map the hosted Web API's URL link <https://localhost:44378/Pivot> to the Pivot Table component in **app.ts** by using the [url](#) property under [dataSourceSettings](#).

```

`typescript
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
let dataSourceSettings = {
url: 'https://localhost:44378/pivot',
//Other codes here...
};

```

```
return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
};
export default App;
`
```

3. Frame and set the report based on the data retrieved from the Snowflake database.

`typescript

```
import { PivotViewComponent, FieldList, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
let dataSourceSettings = {
url: 'https://localhost:44378/Pivot',
enableSorting: true,
expandAll: false,
dataSource: [],
columns: [
{ name: 'CC_COUNTRY', caption: 'Country' }
],
rows: [
{ name: 'CC_STATE', caption: 'State' },
{ name: 'CC_CITY', caption: 'City' }
],
values: [
{ name: 'CC_COMPANY', caption: 'Company' },
{ name: 'CC_EMPLOYEES', caption: 'Employees' },
{ name: 'CCTAXPERCENTAGE', caption: 'Percentage' },
],
filters: []
};
return (<PivotViewComponent id='PivotView' height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}>
<Inject services={[FieldList]}/></PivotViewComponent>);
`
```

```
};
export default App;
`
```

When you run the sample, the resulting pivot table will look like this:

	United States			Grand Total		
	Company	Employees	Percentage	Company	Employees	Percentage
▶ CA	16	413279139	0.4800000000...	16	413279139	0.480000...
▶ CO	5	1160903623	0.18	5	1160903623	
▶ FL	15	1162362540	0.33	15	1162362540	
▶ GA	20	2358562323	0.12	20	2358562323	
▶ IL	8	707852970	0.1699999999...	8	707852970	0.169999...
▶ KS	9	1842349179	0.19	9	1842349179	
▶ LA	6	528468075	0.16	6	528468075	

Explore our React Pivot Table sample and ASP.NET Core Web Application to extract data from a Snowflake database and bind to the Pivot Table in [this](#) GitHub repository.

Olap in React Pivot Table component

Getting started

This section explain steps to create a simple **Pivot Table** with OLAP data source in React environment.

Dependencies

The following list of dependencies are required to use the pivot table component in your application.

```
`javascript
|-- @syncfusion/ej2-react-pivotview
|-- @syncfusion/ej2-pivotview
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-excel-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-svg-base
```

```
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-grids
|-- @syncfusion/ej2-react-base
\
```

Setup for Local Development

You can use [create-react-app](#) to setup the application. To install **create-react-app** run the following command.

```
\
npm install -g create-react-app
\
```

To create basic **React** application use following commands.

```
<div class='tsx'>
\
```

```
create-react-app quickstart --scripts-version=react-scripts-ts
\
```

Now, the application is created in the **quickstart** demo folder. Run the following command one-by-one to navigate to the **quickstart** demo folder, and install the required **npm** dependent packages.

```
\
cd quickstart
```

```
npm install
\
```

```
</div>
```

```
<div class='jsx'>
\
```

```
create-react-app quickstart
\
```

Now, the application is cloned in the **quickstart** demo folder. Run the following command one-by-one to navigate to the **quickstart** demo folder, and install the required **npm** dependent packages.

```
cd quickstart
```

```
npm install
```

```
,
```

```
</div>
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. To install pivot table component, use the following command.

```
,
```

```
npm install @syncfusion/ej2-react-pivotview --save
```

```
,
```

The **--save** will instruct NPM to include the pivot table package inside the **dependencies** section of the **package.json**.

Adding CSS reference

Add pivot table and its [dependent](#) components styles as given below in **src/App.css** file. In this illustration, we have referred **material** theme.

```
`css
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-dropdowns/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-grids/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-inputs/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-lists/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-navigations/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
```

```
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
```

```
@import '../node_modules/@syncfusion/ej2-calendars/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-react-pivotview/styles/material.css';
```

```
,
```

You can also refer other themes like bootstrap, fabric, high-contrast etc. To know about individual component CSS, please refer [here](#).

Next we need to refer **App.css** in the application by importing it in the **src/App.tsx** file as follows.

```
`ts
```

```
import './App.css';
```

```
,
```

Adding pivot table component

You can initialize pivot table component in the application using following steps.

- Import the **PivotViewComponent** (aka, PivotTable) component from the **@syncfusion/ej2-react-pivotview** package in **app.ts** file.
- Then you can initialize pivot table component () using following code.

```
`ts
import { IDataOptions, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  return <PivotViewComponent/>
};
export default App;
`
```

After initialization, add the the following code in **src/App.tsx** file to populate pivot table with a sample OLAP data source. Refer [here](#) to know the more details about OLAP data binding.

```
`ts
import { IDataOptions, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings: IDataOptions = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    enableSorting: true,
    localeIdentifier: 1033,
    providerType: 'SSAS',
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350}
    dataSourceSettings={dataSourceSettings} />)
};
export default App;
```

```

ReactDOM.render(<App />, document.getElementById('sample'));
,
`ts
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import './App.css';
function App() {
  let dataSourceSettings = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    enableSorting: true,
    localeIdentifier: 1033,
    providerType: 'SSAS',
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350}
    dataSourceSettings={dataSourceSettings}/>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
,

```

Adding OLAP cube elements to row, column, value and filter axes

Now that pivot table is initialized and assigned with sample OLAP data source, will further move to showcase the component by organizing appropriate [OLAP cube elements](#) in [rows](#), [columns](#), [values](#) and [filters](#) axes.

In [dataSourceSettings](#) property, four major axes [rows](#), [columns](#), [values](#) and [filters](#) plays a vital role in defining and organizing [OLAP cube elements](#) from the bound data source, to render the entire pivot table component in a desired format.

[rows](#) – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in row axis of the pivot table.

[columns](#) – Collection of [OLAP cube elements](#) (such as Hierarchies, NamedSet, Calculated Members etc.,) that needs to be displayed in column axis of the pivot table.

[values](#) – Collection of [OLAP cube elements](#) (such as Measures, Calculated Measures) that needs to be displayed as aggregated numeric values in the pivot table.

[filters](#) - Collection of [OLAP cube elements](#) (such as Hierarchies and Calculated Members) that would act as master filter over the data bound in row, column and value axes of the pivot table.

In-order to define each [OLAP cube element](#) in the respective axis, the following basic properties should be set.

- [name](#): It allows to set the unique name of the hierarchies, named set, measures, calculated members etc., from the bound OLAP data source. It's casing should match exactly like in the data source and if not set properly, the pivot table will be rendered as empty.
- [caption](#): It allows to set the caption, which is the alias name of the unique name that needs to be displayed in the pivot table. If not provided, unique name will be displayed.

In this sample, "Product Categories" is added in column, "Customer Geography" in row, and "Customer Count" and "Internet Sales Amount" in value axes respectively.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
function App() {
  let dataSourceSettings = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption: 'Customer
Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product
Categories' },

ReactDOM.render(<App />, document.getElementById('sample'));

```

Applying formatting to measures

Formatting defines a way in which values should be displayed in pivot table. For example, format **"C0"** denotes the values should be displayed in currency pattern without decimal points. To do so, define the [formatSettings](#) with its [name](#) and [format](#) properties. In this sample, the [name](#) property is set as "[Measures].[Internet Sales Amount]", a measure from value axis and its format is set as "C0". Likewise, we can set format for other measures as well.

Only measures from value axis, which is in the form of numeric data values are applicable for formatting.

INDEX.JSX

```

height={350} dataSourceSettings={dataSourceSettings}>
    </PivotViewComponent>
    };
    export default App;
    ReactDOM.render(<App />, document.getElementById('sample'));

```

Enable grouping bar

The Grouping Bar feature automatically populates [OLAP cube elements](#) from the bound data source and allows end users to drag [OLAP cube elements](#) between different axes such as [rows](#), [columns](#), [values](#) and [filters](#), and change pivot view at runtime. Sorting, filtering and removing of elements is also possible. It can be enabled by setting the [showGroupingBar](#) property to **true** and by injecting the **GroupingBar** module as follows.

If the **GroupingBar** module is not injected, the grouping bar will not be rendered with the pivot table component.

INDEX.JSX

</PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Enable pivot field list

The component provides a built-in Field List similar to Microsoft Excel. It allows you to add or remove [OLAP cube elements](#) and also rearrange the [OLAP cube elements](#) between different axes, including [rows](#), [columns](#), [values](#) and [filters](#) along with filter and sort options dynamically at runtime. It can be enabled by setting the [showFieldList](#) property to **true** and by injecting the **FieldList** module as follows.

If the **FieldList** module is not injected, the Field List will not be rendered with the pivot table component.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
function App() {
    let dataSourceSettings = {
        catalog: 'Adventure Works DW 2008 SE',

```

        levelCount: 3
      }
    ]
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Exploring filter axis

The filter axis contains collection of [OLAP cube elements](#) such as hierarchies and calculated members that would act as master filter over the data bound in [rows](#), [columns](#) and [values](#) axes of the pivot table. The [OLAP cube elements](#) along with filter members could be set to filter axis either through report via code behind or by dragging and dropping [OLAP cube elements](#) from other axes to filter axis via grouping bar or field list at runtime.

INDEX.JSX

```

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available [OLAP cube elements](#) from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

It can be customized using the [calculatedFieldsSettings](#) property through code behind. The setting required for calculate field feature at code behind are:

- [name](#): It allows to set the unique name for new calculated field.
- [formula](#): It allows to set the user-defined expression.
- [hierarchyUniqueName](#): It allows to specify dimension unique name whose hierarchies alone should be used in the expression. This will be applicable only for calculated dimension.
- [formatString](#): It allows to set the format string for the resultant calculated field.

You need to set [isCalculatedField](#) property to true, while adding calculated fields to respective axis through code behind.

Also calculated fields can be added at run time through the built-in dialog. The dialog can be enabled by setting the [allowCalculatedField](#) property to **true** and by injecting the **CalculatedField** module as follows. You will see a button enabled in the Field List UI automatically to invoke the calculated field dialog and perform necessary operation.

If the **CalculatedField** module is not injected, the calculated field dialog will not be rendered with the pivot table component. Moreover calculated measure can be added only in value axis.

                levelCount: 3
            }
        ]
    };

```

```

    ];
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}/>
    </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Users can add a calculated field at runtime through the built-in dialog by using the following steps.

Step 1: Click the "CALCULATED FIELD" button in the field list dialog positioned at the top right corner. The calculated field dialog will be opened now. Enter the name of the calculated field to be created.

Field List

CLOSE

Create Calculated Field

All Fields

- > Calculated Members
- > Measures
- > Account
- > Customer
- > Date
- > Delivery Date
- > Department
- > Destination Currency
- > Employee
- > Geography
- > Internet Sales Order Details
- > Organization
- > Product

Field Name
BikeAndComponents

Expression
Example: [Measures].[Order Quantity] + ([Measures].[Order Quantity] * 0.10)

Field Type
Measure

Parent Hierarchy
Account Number

Format String
Standard

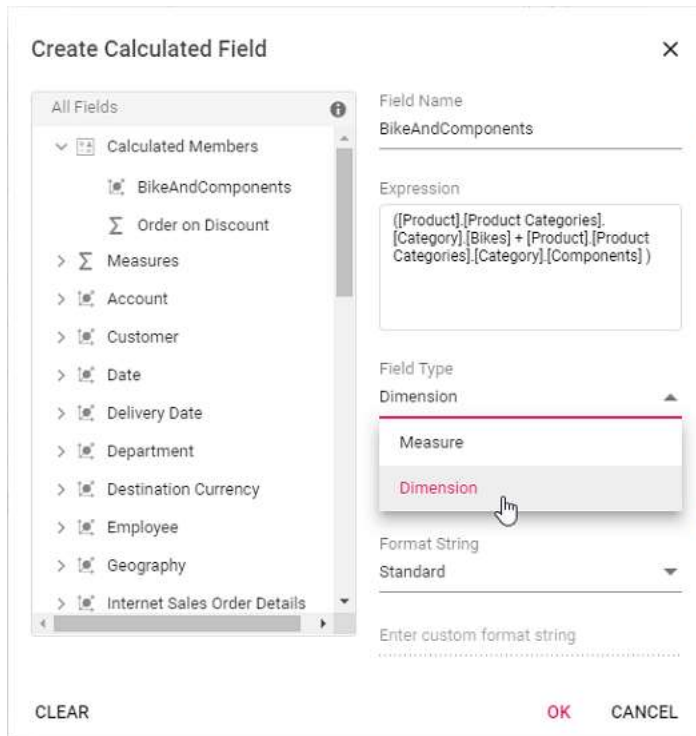

Enter custom format string

CLEAR OK CANCEL

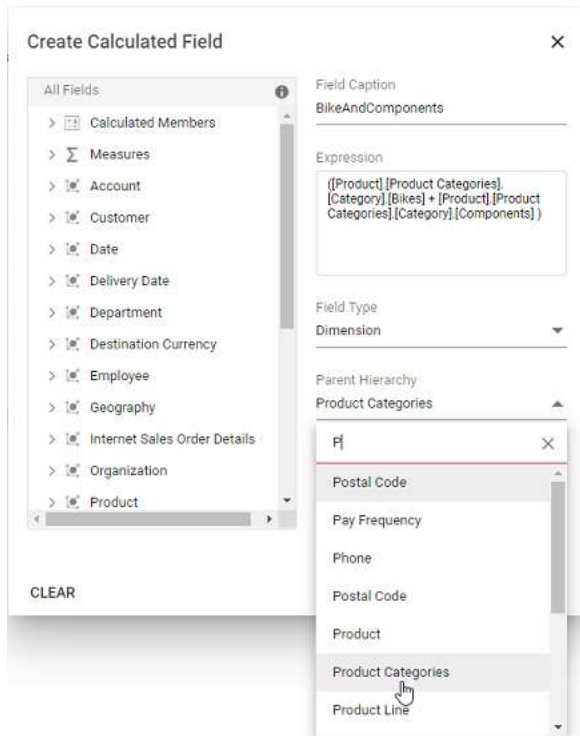

Step 2: Frame the expression by dragging and dropping the fields from the tree view on the left side of the dialog using simple arithmetic operators. **Example:** "IIF([Measures].[Internet Sales Amount]^0.5 > 100, [Measures].[Internet Sales Amount]*100, [Measures].[Internet Sales Amount]/100)". Please refer here to learn more about the supported [operators](#) and [functions](#) to frame the expression.

Step 3: Confirm the type of the field to be created - calculated measure or calculated dimension.

Step 4: Choose the parent hierarchy of the calculated field. NOTE: It is only applicable to the calculated dimension.

Step 5: Then select the format string from the drop-down list and finally click "OK".

	Accessories		
	Customer Count	Internet Sales Amount	Order on Discount
► Australia	2,905	\$138,690.63	\$68,124.10
► Canada	1,230	\$103,377.85	\$68,124.10
► France	1,505	\$63,406.78	\$68,124.10
► Germany	1,535	\$62,232.59	\$68,124.10

Format String

Allows you to specify the required format string while creating new calculated field. Supported format strings are:

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "###0.##0#". This shows the value "9584.3" as "9584.300."

By default, **Standard** will be selected from the drop down list.

Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, click the target field. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

CLEAR

Clearing the changes while editing the calculated field

Previous changes can be cleared by using the "Clear" option while performing operations such as creating and editing the calculated field. To do so, click the "Clear" button in the bottom left corner of the dialog.

Virtual Scrolling

Allows large amounts of data to be loaded without any performance degradation by rendering rows and columns in relation to the current viewport. Rest of the data will be brought into the viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the [enableVirtualization](#) property to **true**.

To use the virtual scrolling feature, inject the **VirtualScroll** module into the pivot table.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent, Inject, VirtualScroll } from '@syncfusion/ej2-react-pivotview';
function App() {
  let dataSourceSettings = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer]', caption: 'Customer' },
    ],
    columns: [
```

```

        { name: '[Product].[Product Categories]', caption: 'Product
Categories' },
        { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
        { name: '[Measures].[Customer Count]', caption: 'Customer Count'
    },
        { name: '[Measures].[Internet Sales Amount]', caption: 'Internet
Sales Amount' }
    ],
    formatSettings: [{ name: '[Measures].[Internet Sales Amount]',
format: 'C0' }]
    };
    let pivotObj;
    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} enableVirtualization={true}
dataSourceSettings={dataSourceSettings}><Inject
services={[VirtualScroll]}/></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { IDataOptions, IDataset, PivotViewComponent, Inject, VirtualScroll }
from '@syncfusion/ej2-react-pivotview';
function App() {
    let dataSourceSettings: IDataOptions = {
        catalog: 'Adventure Works DW 2008 SE',
        cube: 'Adventure Works',
        providerType: 'SSAS',
        enableSorting: true,
        url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
        localeIdentifier: 1033,

        ],
        formatSettings: [{ name: '[Measures].[Internet Sales Amount]',
format: 'C0' }]
    };
    let pivotObj: PivotViewComponent;

```

```

    return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
    height={350} enableVirtualization={true}
    dataSourceSettings={dataSourceSettings}><Inject
    services={[VirtualScroll]}></PivotViewComponent>
    </>;
    export default App;
    ReactDOM.render(<App />, document.getElementById('sample'));

```

Limitations for virtual scrolling

- In virtual scrolling, the [columnWidth](#) property in [gridSettings](#) should be in pixels, and percentage values are not accepted.
- Resizing columns or setting width to individual columns affects the calculation used to pick the correct page on scrolling.
- When using OLAP data, subtotals and grand totals are only displayed when measures are bound at the last position in the [rows](#) or [columns](#) axis. Otherwise, the data from the pivot table will be shown without summary totals.
- When the pivot table's width and height are large, the loading data count in the current, previous, and next viewports (pages) will also increase, affecting performance.

Run the application

The quickstart project is configured to compile and run the application in the browser. Use the following command to run the application.

`

npm start

`

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { CalculatedField, FieldList, Inject, PivotViewComponent } from
'@syncfusion/ej2-react-pivotview';

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Data Binding

To bind OLAP datasource to the pivot table, you need to specify following properties under [dataSourceSettings](#) option.

Properties	Description
cube	Points the respective cube name from OLAP database.
providerType	Points the provider type for pivot table to identify the type of data source.
url	Contains the cube URL for establishing the connection (online).
catalog	Contains the database name (catalog name) to fetch the data.

INDEX.JSX

```

Fields

Measures in row axis

By default, the measures are plotted in column axis. To plot those measures in row axis, place the **Measures** button in the row axis as follows.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
function App() {
    let dataSourceSettings = {
        catalog: 'Adventure Works DW 2008 SE',
        cube: 'Adventure Works',
        providerType: 'SSAS',
        enableSorting: true,
        url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
        localeIdentifier: 1033,
        rows: [
            { name: '[Customer].[Customer Geography]', caption: 'Customer Geography' },
            { name: '[Measures]', caption: 'Measures' }
        ],
        columns: [
            { name: '[Product].[Product Categories]', caption: 'Product Categories' }
        ],
        values: [
            { name: '[Measures].[Customer Count]', caption: 'Customer Count' },
            { name: '[Measures].[Internet Sales Amount]', caption: 'Internet Sales Amount' }
        ],
        filters: [
            { name: '[Date].[Fiscal]', caption: 'Date Fiscal' }
        ],
        filterSettings: [
            {
                name: '[Date].[Fiscal]', items: ['[Date].[Fiscal].[Fiscal Quarter].&[2002]&[4]',
                    '[Date].[Fiscal].[Fiscal Year].&[2005]'],
                levelCount: 3
            }
        ]

Measures in different position

You can place measures in different position in row or column axis either thorough code behind or UI. In this sample, **measures** placed before the dimension in the column axis.

ReactDOM.render(<App />, document.getElementById('sample'));

```

Named set

Named set is a multidimensional expression (MDX) that returns a set of dimension members, which can be created by combining the cube data, arithmetic operators, numbers, and functions.

You can bind the named sets in the pivot table by setting its unique name in the [name](#) property either in row or column axis and [isNamedSet](#) boolean property to **true**. In this sample, we have added "Core Product Group" named set in the column axis.

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Configuring authentication

Users can configure basic authentication information to access the OLAP cube using the [authentication](#) property. The settings required to configure are as follows:

- [userName](#): It allows the user to set a username that recognizes the basic authentication of the IIS.

- [password](#): It allows to set the appropriate password.

If the user does not configure the authentication, a default popup will appear in the browser to get the authentication information.

```
`ts
```

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';

import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';

function App() {
  let dataSourceSettings: IDataOptions = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    enableSorting: true,
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,
    rows: [
      { name: '[Customer].[Customer Geography]', caption: 'Customer Geography' },
    ],
    columns: [
      { name: '[Product].[Product Categories]', caption: 'Product Categories' },
      { name: '[Measures]', caption: 'Measures' },
    ],
    values: [
      { name: '[Measures].[Customer Count]', caption: 'Customer Count' },
      { name: '[Measures].[Internet Sales Amount]', caption: 'Internet Sales Amount' }
    ],
    filters: [
      { name: '[Date].[Fiscal]', caption: 'Date Fiscal' },
    ],
    filterSettings: [
      {
        name: '[Date].[Fiscal]', items: ['[Date].[Fiscal].[Fiscal Quarter].[2002]&[4]',
```

```

'[/Date].[/Fiscal].[/Fiscal Year].&[2005]'],
levelCount: 3
}
],
authentication: {
  userName: 'username',
  password: 'password'
}
};
let pivotObj: PivotViewComponent;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings} showFieldList={true}><Inject services={{FieldList}} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
`

```

Roles

SQL Server Analysis Services uses [roles](#) to limit data access within a cube. Each role defines a set of permissions that can be granted to a single user or groups of users. It is used to manage security by limiting access to sensitive data and determining who has access to and can change the cube. It can be configured using the [roles](#) property in [dataSourceSettings](#).

The [roles](#) property can be used to specify one or more roles to the OLAP cube, separated by commas.

```

`ts
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { IDataOptions, IDataset, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
function App() {
  let dataSourceSettings: IDataOptions = {
    catalog: 'Adventure Works DW 2008 SE',
    cube: 'Adventure Works',
    providerType: 'SSAS',
    roles: 'Role1',
    url: 'https://bi.syncfusion.com/olap/msmdpump.dll',
    localeIdentifier: 1033,

```

```

rows: [
{ name: '[Customer].[Customer Geography]', caption: 'Customer Geography' },
],

{ name: '[Product].[Product Categories]', caption: 'Product Categories' },
{ name: '[Measures]', caption: 'Measures' },
],
values: [
{ name: '[Measures].[Customer Count]', caption: 'Customer Count' },
{ name: '[Measures].[Internet Sales Amount]', caption: 'Internet Sales Amount' }
]
};

let pivotObj: PivotViewComponent;

return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings}><Inject services={[]} />
</PivotViewComponent>);

};

export default App;

ReactDOM.render(<App />, document.getElementById('sample'));
`

```

OLAP Cube: Elements

Field list

The field list, aka cube dimension browser, is a tree view like structure that organizes the cube elements such as dimensions, hierarchies, measures, etc., from the selected cube into independent logical groups.

Types of node in field list

- **Display folder:** A folder that contains a set of similar elements.
- **Measure:** Quantity available for analysis.
- **Dimension:** A name given to the parts of the cube that categorizes data.
- **Attribute Hierarchy:** Level of attributes down the hierarchy.
- **User-defined Hierarchy:** Members of a dimension in a hierarchical structure.
- **Level:** Denotes a specific level in the category.
- **Named Set:** A collection of tuples and members, that can be defined and saved as a part of cube definition for later use.

Measure

In a cube, a measure is a set of values that are based on a column in the cube's fact table and are usually numeric. The measures are the central values of a cube that are analyzed. That is, measures are the

numeric data of primary interest to users browsing a cube. You can select measures depend on the types of users request. Some common measures are sales, costs, expenditures, and production count.

Dimension

A simple dimension object is composed of basic information such as name, hierarchy, level, and members. You can create a dimension element by specifying its name and providing the hierarchy and level name. The dimension element contains the hierarchical details and information about each included level elements in that hierarchy. A hierarchy can have any number of level elements and the level elements can have any number of members and the member elements can have any number of child members.

Hierarchy

Each element of a dimension can be summarized using a hierarchy. The hierarchy is a series of parent-child relationship, where a parent member represents the consolidation of members which are its children. Parent members can be further aggregated as the children of another parent. For example, May 2005 can be summarized into Second Quarter 2005 which in turn would be summarized in the year 2005.

Level

Level element is the child of hierarchy element which contains a set of members, each of which has the same rank within a hierarchy.

Attribute hierarchy

Attribute hierarchy contains the following levels:

- A leaf level contains distinct attribute member, and each member of the leaf level is known as a leaf member.
- Intermediate levels if the attribute hierarchy is a parent-child hierarchy.
- An optional (all) level contains the aggregated value of the attribute hierarchy's leaf members, with the member of the (all) level also known as the (all) member.

User-defined hierarchy

User-defined hierarchy organizes the members of a dimension into hierarchical structure and provides navigation paths in a cube. For example, take a dimension table that supports three attributes such as year, quarter, and month. The year, quarter, and month attributes are used to construct a user-defined hierarchy, named Calendar, in the time dimension that relates to all levels.

Differentiating user-defined hierarchy and attribute hierarchy

- User-defined hierarchy contains more than one level whereas attribute hierarchy contains only one level.
- User-defined hierarchy provides the navigation path between the levels taken from attribute hierarchies of the same dimension.
- The attribute hierarchy and the user-defined hierarchy are represented in different ways as shown in the following table.

Named set

A named set is a collection of tuples and members, which can be defined and saved as a part of the cube definition. Named set records reside inside the sets folder, which is under a dimension element. These elements can be dragged to [rows](#) or [columns](#) axis via grouping bar or field list at runtime. To work with a

lengthy, complex, or commonly used expression easier, Multidimensional Expressions (MDX) allows you to define a named set.

Calculated field

The calculated field allows user to insert or add a new calculated field based on the available OLAP cube elements from the bound data source. Calculated fields are nothing but customized dimensions or measures that are newly created based on the user-defined expression.

The two types of calculated fields are as follows:

- **Calculated Measure** – Creates a new measure through user-defined expression.
- **Calculated Dimension** – Creates a new dimension through user-defined expression.

Symbolic representation of the nodes inside field list

| Icon | Name | Node type | Is Draggable |

|-----|-----|-----|-----|

|
False|

| Display Folder | Display Folder |

|

| Measure | Measure | False |

|

| Dimension | Dimension | False |

|

| User Defined Hierarchy| Hierarchy| True|

|

| Attribute Hierarchy| Hierarchy| True|

|

Element| True|

| Levels (in order)| Level

| | Named Set| Named Set| True|

In general, the Pivot Table is created using the built-in engine for given data source. This is an optional feature that allows you to create the Pivot Table with a server-side pivot engine and external data binding. And this option is applicable only for relational data source.

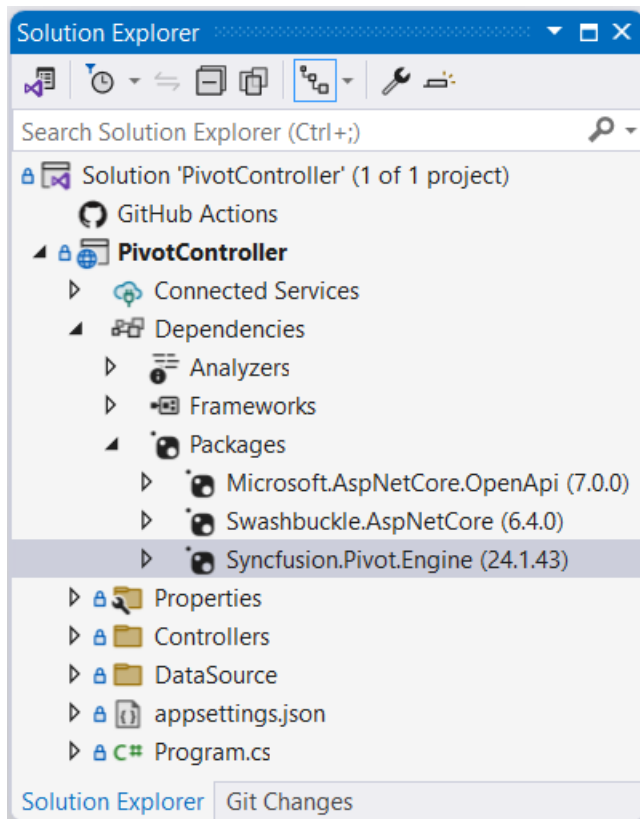

Server side pivot engine in React Pivotview component

This section briefs the Syncfusion assembly [Syncfusion.Pivot.Engine](#), which is used in a server-side application to perform all Pivot calculations such as aggregation, filtering, sorting, grouping, and so on, and only the information to be displayed in the Pivot Table's viewport is passed to the client-side (browser) via web service (Web API) rather than the entire data source. It reduces network traffic and improves the rendering performance of the Pivot Table, especially when dealing with large amounts of data. It also works best with virtual scrolling enabled and supports all the Pivot Table's existing features.

Quick steps to render the Pivot Table by using the server-side Pivot Engine

Download and installing Server-side Pivot Engine

1. Download the ASP.NET Core-based stand-alone Pivot Table [application](#) from the GitHub repository.
2. The **PivotController** (Server-side) application that is downloaded includes the following files.
 - **PivotController.cs** file under **Controllers** folder – This helps to do data communication with Pivot Table.
 - **DataSource.cs** file under **DataSource** folder – This file has model classes to define the structure of the data sources.
 - The sample data source files **sales.csv** and **sales-analysis.json** under **DataSource** folder.
3. Open the **PivotController** application in Visual Studio where the Syncfusion library [Syncfusion.Pivot.Engine](#) will be downloaded automatically from the nuget.org site.

Connecting Pivot Table to Server-side Pivot Engine

1. Run the **PivotController** (Server-side) application which will be hosted in IIS shortly.

2. Then in the Pivot Table sample, set the [mode](#) property under [dataSourceSettings](#) as **Server** and map the URL of the hosted Server-side application in [URL](#) property of [dataSourceSettings](#).

```
`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings: IDataOptions = {
    url: 'https://localhost:44350/api/pivot/post',
    mode: 'Server',
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

3. Frame and set the report based on the data source available in the **PivotController** application.

```
`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings: IDataOptions = {
    url: 'https://localhost:44350/api/pivot/post',
    mode: 'Server',
    rows: [{
      name: 'ProductID', caption: 'Product ID'
    }],
    formatSettings: [{
      name: 'Price', format: 'C'
    }],
    columns: [{
```

```

name: 'Year', caption: 'Production Year'
}},
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
}
let pivotObj: PivotViewComponent;
return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
`

```

4. Run the sample to get the following result.

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	\$1,841,712.00	7561880	\$1,762,804.00	7591220
PRO-11	7174625	\$1,673,533.00	7338175	\$1,711,599.80	7164625
PRO-12	9168140	\$2,135,848.80	7689400	\$1,792,704.00	7375140
PRO-13	6674280	\$1,560,619.20	8585260	\$2,001,738.40	6574280
PRO-14	7489240	\$1,745,841.20	7167840	\$1,675,479.20	7396240
PRO-15	8149185	\$1,902,397.00	7450585	\$1,734,093.00	7249185
PRO-16	7070150	\$1,652,838.40	8037500	\$1,873,597.60	7880150

Available configurations in Server-side application

[Supportive Data Sources](#)

The server-side Pivot Engine supports the following data sources,

- Collection
- JSON
- CSV
- DataTable
- Dynamic

[Collection](#)

The collection data sources such as List, IEnumerable, and so on are supported. This can be bound using the **GetData** controller method. Also, in the Pivot Table sample, set the [type](#) property under [dataSourceSettings](#) to **JSON**, which is also the default enumeration value.

In the server-side application (**PivotController**), a collection type data source is framed in the **DataSource.cs** file as shown in the following.

```
`csharp
public class PivotViewData
{
    public string ProductID { get; set; }
    public string Country { get; set; }
    public string Product { get; set; }
    public double Sold { get; set; }
    public double Price { get; set; }
    public string Year { get; set; }
    public List<PivotViewData> GetVirtualData()
    {
        List<PivotViewData> VirtualData = new List<PivotViewData>();
        for (int i = 1; i <= 10000; i++)
        {
            PivotViewData p = new PivotViewData
            {
                ProductID = "PRO-" + ((100 + i)%20),
                Year = (new string[] { "FY 2015", "FY 2016", "FY 2017", "FY 2018", "FY 2019" })[new Random().Next(5)],
                Country = (new string[] { "Canada", "France", "Australia", "Germany", "France" })[new
                Random().Next(5)],
                Product = (new string[] { "Car", "Van", "Bike", "Flight", "Bus" })[new Random().Next(5)],
                Price = (3.4 * i) + 500,
                Sold = (i * 15) + 10
            };
            VirtualData.Add(p);
        }
        return VirtualData;
    }
}
```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```
`csharp
```

```
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
`
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
`csharp
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind the collection type data source.
        return new DataSource.PivotViewData().GetVirtualData();
    });
}
`
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let dataSourceSettings: IDataOptions = {
        url: 'https://localhost:44350/api/pivot/post',
        mode: 'Server',
        rows: [{
            name: 'ProductID', caption: 'Product ID'
        }],
        formatSettings: [{
            name: 'Price', format: 'C'
        }],
        columns: [{
```

```

name: 'Year', caption: 'Production Year'
}},
values: [
{ name: 'Sold', caption: 'Units Sold' },
{ name: 'Price', caption: 'Sold Amount' }
],
}
let pivotObj: PivotViewComponent;
return <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
`

```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold

JSON

The JSON data from a local *.json file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the Server-side pivot engine.

In the Server-side application, **sales-analysis.json** file is available under **DataSource** folder and its model type is defined in **DataSource.cs** file.

```

`csharp
public class PivotJSONData
{
    public string Date { get; set; }
    public string Sector { get; set; }
    public string EnerType { get; set; }
    public string EneSource { get; set; }
}

```

```

public int PowUnits { get; set; }
public int ProCost { get; set; }
public List<PivotJSONData> ReadJSONData(string url)
{
    WebClient myWebClient = new WebClient();
    Stream myStream = myWebClient.OpenRead(url);
    StreamReader stream = new StreamReader(myStream);
    string result = stream.ReadToEnd();
    stream.Close();
    return Newtonsoft.Json.JsonConvert.DeserializeObject<List<PivotJSONData>>(result);
}
}
`

```

To bind the data source, set its model type **PivotJSONData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotJSONData> PivotEngine = new PivotEngine<DataSource.
PivotJSONData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind JSON type data source from the sales-analysis.json file.
        return new DataSource.PivotJSONData().ReadJSONData(_hostingEnvironment.ContentRootPath +
        "//DataSource//sales-analysis.json");
    });
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings: IDataOptions = {
    url: 'https://localhost:44350/api/pivot/post',
    mode: 'Server',
    type: 'JSON',
    rows: [{
      name: 'EneSource', caption: 'Energy Source'
    }],
    formatSettings: [{
      name: 'ProCost', format: 'C'
    }],
    columns: [{
      name: 'EnerType', caption: 'Energy Type'
    }],
    values: [
      { name: 'PowUnits', caption: 'Units Sold' },
      { name: 'ProCost', caption: 'Sold Amount' }
    ],
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

	Biomass		Free Energy		Grand Total
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
Bio-diesel	1042	\$1,439.00			1042
Ethanol Fuel	595	\$1,031.00			595
Geo-thermal			1528	\$2,115.00	1528
Hydro-electric			3378	\$3,244.00	3378
Solar			7929	\$6,210.00	7929
Wastage	712	\$1,043.00			712
Wind			15571	\$7,666.00	15571

JSON data from any remote server, like a local JSON file, can also be supported. It accepts both directly downloadable files (*.json*) and *web service URLs*. To bind this, the URL of the .json file of a remote server has to be mapped under the **GetData** method. The rest of the configurations are the same as described above.

In the server-side application, the CDN link is used to connect the same **sales-analysis.json** file which is already hosted in the Syncfusion server.

```
`csharp
```

```
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind JSON type data source from remote server.
        return new DataSource.PivotJSONData().ReadJSONData("http://cdn.syncfusion.com/data/sales-
        analysis.json");
    });
}
```

CSV

The CSV data from a local *.csv file type can be connected to the Pivot Table. Here, the file can be read by the **StreamReader** option, which will give the result in the string format. The resultant string needs to be converted to collect data that can be bound to the server-side pivot engine. Also, in the Pivot Table sample, set the **type** property under [dataSourceSettings](#) as **CSV**.

In the server application, the **sales.csv** file is available under the **DataSource** folder, and its model type is defined in the **DataSource.cs** file.

```
`csharp
```

```
public class PivotCSVData
{
    public string Region { get; set; }
    public string Country { get; set; }
    public string ItemType { get; set; }
    public string SalesChannel { get; set; }
    public string OrderPriority { get; set; }
    public string OrderDate { get; set; }
    public int OrderID { get; set; }
    public string ShipDate { get; set; }
    public int UnitsSold { get; set; }
    public double UnitPrice { get; set; }
    public double UnitCost { get; set; }
    public double TotalRevenue { get; set; }
    public double TotalCost { get; set; }
    public double TotalProfit { get; set; }
    public List<string[]> ReadCSVData(string url)
    {
        List<string[]> data = new List<string[]>();
        using (StreamReader reader = new StreamReader(new WebClient().OpenRead(url)))
        {
            string line;
            while ((line = reader.ReadLine()) != null)
            {
                line = line.Trim();
                if (!string.IsNullOrEmpty(line))
                {
                    data.Add(line.Split(','));
                }
            }
            return data;
        }
    }
}
```

```
}
,
```

To bind the data source, set its model type **PivotCSVData** to **TValue** of the **PivotEngine** class.

```
`csharp
```

```
private PivotEngine<DataSource.PivotCSVData> PivotEngine = new PivotEngine<DataSource.
PivotCSVData>();
```

```
,
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
`csharp
```

```
public async Task<object> GetData(FetchData param)
```

```
{
```

```
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
```

```
{
```

```
cacheEntry.SetSize(1);
```

```
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
```

```
// Here bind CSV type data source from sales.csv file.
```

```
return new DataSource.PivotCSVData().ReadCSVData(_hostingEnvironment.ContentRootPath +
"//DataSource//sales.csv");
```

```
});
```

```
}
```

```
,
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
```

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
```

```
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
```

```
function App() {
```

```
let dataSourceSettings: IDataOptions = {
```

```
url: 'https://localhost:44350/api/pivot/post',
```

```
mode: 'Server',
```

```
type: 'CSV',
```

```
rows: [{
```

```
name: 'ItemType', caption: 'Item Type'
```

```

    }},
    formatSettings: [{
      name: 'UnitPrice', format: 'C'
    }],
    columns: [{
      name: 'Region'
    }],
    values: [
      { name: 'UnitsSold', caption: 'Units Sold' },
      { name: 'UnitPrice', caption: 'Sold Amount' }
    ],
  },
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
`

```

	Asia		Australia and Oceania		Central Ar
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold

CSV data from any remote server, like a local CSV file, can also be supported. It accepts both directly downloadable files (.csv) and web service URLs. To bind this, the URL of the .csv file of a remote server has to be mapped under **GetData** method. The rest of the configurations are the same as described above.

In the server application, the CDN link is used to connect the same **sales.csv** file which is already hosted in the Syncfusion server.

```
`csharp
```

```

public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here bind CSV type data source from remote server.
        return new DataSource.PivotCSVData().ReadCSVData("http://cdn.syncfusion.com/data/sales-
analysis.csv");
    });
}
`

```

DataTable

In the server-side application, there is a manually created DataTable **BusinessObjectsDataView** by mapping the model type **PivotViewData** in **DataSource.cs** file.

```

`csharp
public class BusinessObjectsDataView
{
    public DataTable GetDataTable()
    {
        DataTable dt = new DataTable("BusinessObjectsDataTable");
        PropertyDescriptorCollection pdc = TypeDescriptor.GetProperties(typeof(PivotViewData));
        foreach (PropertyDescriptor pd in pdc)
        {
            dt.Columns.Add(new DataColumn(pd.Name, pd.PropertyType));
        }
        List<PivotViewData> list = new PivotViewData().GetVirtualData();
        foreach (PivotViewData bo in list)
        {
            DataRow dr = dt.NewRow();
            foreach (PropertyDescriptor pd in pdc)
            {
                dr[pd.Name] = pd.GetValue(bo);
            }
        }
    }
}

```

```

}
dt.Rows.Add(dr);
}
return dt;
}
}
`

```

To bind the data source, set its model type **PivotViewData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotViewData> PivotEngine = new
PivotEngine<DataSource.PivotViewData>();
`

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
async (cacheEntry) =>
{
cacheEntry.SetSize(1);
cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
// Here bind the DataTable.
return new DataSource.BusinessObjectsDataView().GetDataTable();
});
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
let dataSourceSettings: IDataOptions = {

```

```

url: 'https://localhost:44350/api/pivot/post',
mode: 'Server',
rows: [{
  name: 'ProductID', caption: 'Product ID'
}],
formatSettings: [{
  name: 'Price', format: 'C'
}],
columns: [{
  name: 'Year', caption: 'Production Year'
}],
values: [
  { name: 'Sold', caption: 'Units Sold' },
  { name: 'Price', caption: 'Sold Amount' }
],
let pivotObj: PivotViewComponent;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
  dataSourceSettings={dataSourceSettings}></PivotViewComponent>
);
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
PRO-10	7901220	\$1,841,712.00	7561880	\$1,762,804.00	7591220

PRO-16	7070150	\$1,652,838.40	8037500	\$1,873,597.60	7881500

Dynamic

The model type has to be defined in the aforementioned data sources. However, there is no need to define a model type for the following data sources, which are also supported by the server-side pivot engine.

ExpandoObject

In the server-side application, an **ExpandoObject** type data source is available under the class **PivotExpandoData** in **DataSource.cs** file.

```
`csharp
public class PivotExpandoData
{
    public List<ExpandoObject> Orders { get; set; } = new List<ExpandoObject>();
    public List<ExpandoObject> GetExpandoData()
    {
        Orders = Enumerable.Range(1, 75).Select((x) =>
        {
            dynamic d = new ExpandoObject();
            d.OrderID = 1000 + (x % 100);
            d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new
            Random().Next(5)];
            d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
            d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new
            DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
            d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
            d.Verified = (new bool[] { true, false })[new Random().Next(2)];
            return d;
        }).Cast<ExpandoObject>().ToList<ExpandoObject>();
        return Orders;
    }
}
```

To bind the data source, set its model type as **ExpandoObject** to **TValue** of the **PivotEngine** class.

```
`csharp
private PivotEngine<ExpandoObject> PivotEngine = new PivotEngine<ExpandoObject>();
`
```

Then call the data source in **GetData** method of **PivotController.cs** file.

```
`csharp
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,
    async (cacheEntry) =>
    {
        cacheEntry.SetSize(1);
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        // Here returns ExpandoObject type data source.
        return new DataSource.PivotExpandoData().GetExpandoData();
    });
}
```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```
`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

function App() {
    let dataSourceSettings: IDataOptions = {
        url: 'https://localhost:44350/api/pivot/post',
        mode: 'Server',
        rows: [{
            name: 'CustomerID', caption: 'Customer ID'
        }],
        columns: [{
            name: 'ShipCountry', caption: 'Ship Country'
        }],
        values: [
            { name: 'Freight', caption: 'Units Sold' }
        ],
    }

    let pivotObj: PivotViewComponent;
```

```

return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
`

```

	UK	USA	Grand Total
	Units Sold	Units Sold	Units Sold
ALFKI	1187	738	1925
ANANTR	1011	814	1825
ANTON	1046	632	1678
BLONP	1080	749	1829
BOLID	492	929	1421
Grand Total	4816	3862	8678

Dynamic Objects

In the server-side application, a data source is framed by dynamic objects which is available under the class **PivotDynamicData** in the **DataSource.cs** file.

```

`csharp
public class PivotDynamicData
{
    public List<DynamicDictionary> Orders = new List<DynamicDictionary>() { };
    public List<DynamicDictionary> GetDynamicData()
    {
        Orders = Enumerable.Range(1, 100).Select((x) =>
        {
            dynamic d = new DynamicDictionary();
            d.OrderID = 100 + x;
            d.CustomerID = (new string[] { "ALFKI", "ANANTR", "ANTON", "BLONP", "BOLID" })[new
            Random().Next(5)];
            d.Freight = (new double[] { 2, 1, 4, 5, 3 })[new Random().Next(5)] * x;
            d.OrderDate = (new DateTime[] { new DateTime(2010, 11, 5), new DateTime(2018, 10, 3), new
            DateTime(1995, 9, 9), new DateTime(2012, 8, 2), new DateTime(2015, 4, 11) })[new Random().Next(5)];
            d.ShipCountry = (new string[] { "USA", "UK" })[new Random().Next(2)];
            d.Verified = (new bool[] { true, false })[new Random().Next(2)];
            return d;
        }).Cast<DynamicDictionary>().ToList<DynamicDictionary>();
    }
}

```

```

return Orders;
}
public class DynamicDictionary : System.Dynamic.DynamicObject
{
    Dictionary<string, object> dictionary = new Dictionary<string, object>();
    public override bool TryGetMember(GetMemberBinder binder, out object result)
    {
        string name = binder.Name;
        return dictionary.TryGetValue(name, out result);
    }
    public override bool TrySetMember(SetMemberBinder binder, object value)
    {
        dictionary[binder.Name] = value;
        return true;
    }
    //The "GetDynamicMemberNames" method of the "DynamicDictionary" class must be overridden and
    return the property names to perform data operation and editing while using dynamic objects.
    public override System.Collections.Generic.IEnumerable<string> GetDynamicMemberNames()
    {
        return this.dictionary?.Keys;
    }
}

```

To bind the data source, set its class **PivotDynamicData** to **TValue** of the **PivotEngine** class.

```

`csharp
private PivotEngine<DataSource.PivotDynamicData> PivotEngine = new
PivotEngine<DataSource.PivotDynamicData>();

```

Then call the data source in **GetData** method of **PivotController.cs** file.

```

`csharp
public async Task<object> GetData(FetchData param)
{
    return await _cache.GetOrCreateAsync("dataSource" + param.Hash,

```

```

async (cacheEntry) =>
{
  cacheEntry.SetSize(1);
  cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
  // Here bind data source with dynamic objects.
  return new DataSource.PivotDynamicData().GetDynamicData();
});
}
`

```

Finally set the appropriate report to the Pivot Table sample based on the above data source.

```

`javascript
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let dataSourceSettings: IDataOptions = {
    url: 'https://localhost:44350/api/pivot/post',
    mode: 'Server',
    rows: [{
      name: 'CustomerID', caption: 'Customer ID'
    }],
    columns: [{
      name: 'ShipCountry', caption: 'Ship Country'
    }],
    values: [
      { name: 'Freight', caption: 'Units Sold' }
    ],
  };
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
    dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('sample'));
```

```
,
```

	UK	USA	Grand Total

Controller Configuration

Memory Cache

In the server-side application, the [Memory Cache](#) option is used to store the data source and engine properties in RAM, which will be used for UI operations. To improve performance, this limits the execution of all initial rendering code to regenerate the aggregated values during each UI operation. The codes below show how we use the memory cache option in the **GetEngine** method to store engine properties.

```
`csharp
public async Task<EngineProperties> GetEngine(FetchData param)
{
    isRendered = false;
    // Engine properties are stored in memory cache with GUID "param.Hash".
    return await _cache.GetOrCreateAsync("engine" + param.Hash,
    async (cacheEntry) =>
    {
        isRendered = true;
        cacheEntry.SetSize(1);
        // Memory cache expiration time can be set here.
        cacheEntry.AbsoluteExpiration = DateTimeOffset.UtcNow.AddMinutes(60);
        PivotEngine.Data = await GetData(param);
        return await PivotEngine.GetEngine(param);
    });
}
```

The engine properties are stored in RAM as a cache with a unique ID (GUID) that is transferred from the client-side source code. The GUID is generated at random and will be changed if the page containing the

Pivot Table is refreshed or opened in a new tab/window. As a result, each GUID's memory cache contains unique information, and the component operates independently.

Meanwhile, the memory cache is set to expire after 60 minutes from RAM to free its memory. If the component is still running, the data will be generated and stored for another 60 minutes.

Methods and its needs

- **Post:** Allows to get the information from the client-side source and calls appropriate controller methods.
- **GetEngine:** Allows to store the engine properties in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetData:** Allows to store data source in RAM as a cache which fires on initial rendering or when the memory cache is expired.
- **GetMembers:** Allows to get the members of a field. This fires when the member editor is opened to do a filtering operation.
- **GetRawData:** Allows to get raw data of an aggregated value cell. This fires when the drill-through or editing dialog is opened.
- **GetPivotValues:** Allows to update the stored engine properties in-memory cache and returns the aggregated values to browser to render the Pivot Table. Here, the return value can be modified. The Pivot Table will be rendered browser-based on this.

Pivot chart in React Pivotview component

In pivot table component, pivot chart would act as an additional visualization component with its basic and important characteristic like drill down and drill up, 15+ chart types, series customization, axis customization, legend customization, export, print and tooltip. Its main purpose is to show the pivot data in graphical format.

If user prefers, the pivot chart component can also be displayed individually with pivot values and can change the report dynamically with the help of field list and grouping bar. Using the [displayOption](#) property, user can set the visibility of grid and chart in pivot table component. It holds below properties,

- [view](#): Specifies the pivot table component to display grid alone or chart alone or both.
- [primary](#): Specifies the pivot table to display either grid or chart as primary component during initial loading. It is applicable only when setting the property [view](#) to **Both**.

You should inject the PivotChart module to make the its features available in the pivot table.

The below sample displays the pivot chart component based on the pivot report bound on it.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
```

```

        chartSeries: { type: 'Column' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        chartSeries: { type: 'Column' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);
};

```

```
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Data Binding

End user can bind both local and remote data binding options available in the component to feed the data. The [dataSource](#) property can be assigned either with an instance of [DataManager](#) or JavaScript object array collection.

For more information [refer](#) here.

Chart Types

Supports 21 different types of charts as follows,

- Line
- Column
- Area
- Bar
- StepArea
- StackingLine
- StackingColumn
- StackingArea
- StackingBar
- StepLine
- Pareto
- Bubble
- Scatter
- Spline
- SplineArea
- StackingLine100
- StackingColumn100
- StackingBar100
- StackingArea100
- Polar
- Radar

Line is the default pivot chart type. User can change the pivot chart type by using the property [type](#) in [chartSeries](#) class.

In the below code sample, the pivot chart type is set as **Bar**.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
};
```

```

    let chartSettings = {
      chartSeries: { type: 'Bar' }
    };
    let dataSourceSettings = {
      columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
      dataSource: pivotData,
      expandAll: false,
      filters: [],
      formatSettings: [{ name: 'Amount', format: 'C0' }],
      rows: [{ name: 'Country' }, { name: 'Products' }],
      values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    chartSeries: { type: 'Bar' }
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);

```

```
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Accumulation Charts

Supports 4 different types of accumulation charts as follows,

- Pie
- Doughnut
- Funnel
- Pyramid

As like other chart types it can be changed using the property [type](#) in [chartSeries](#).

In the below code sample, the **Pie** chart is rendered, and the other accumulation charts can be switched using the drop-down list.

INDEX.JSX

```
{% raw %}
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Pie' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let fields = { text: 'text', value: 'value' };
  let chartTypes = [
    { 'value': 'Pie', 'text': 'Pie' },
    { 'value': 'Doughnut', 'text': 'Doughnut' },
    { 'value': 'Funnel', 'text': 'Funnel' },
    { 'value': 'Pyramid', 'text': 'Pyramid' },
  ];
  let pivotObj;
  function ddlOnChange(args) {
    pivotObj.chartSettings.chartSeries.type = args.value;
  }
}
```

```

    return (<div><div className="container" style={{ height: '500px' }}><div
    id="dropdown-control" style={{ marginBottom: '5px' }}><table style={{ width:
    '350px', marginLeft: '50px' }}><tbody><tr style={{ height: '50px'
    }}><td><div><b>Accumulation
    Chart:</b></div></td><td><div><DropDownListComponent floatLabelType={'Auto'}
    fields={fields} change={ddlOnChange.bind(this)} id="charttypes" index={0}
    enabled={true}
    dataSource={chartTypes}></div></td></tr></tbody></table></div><div><PivotVi
    ewComponent height={350} ref={d => pivotObj = d} id='PivotView'
    chartSettings={chartSettings} displayOption={displayOption}
    dataSourceSettings={dataSourceSettings}><Inject
    services={[PivotChart]}></PivotViewComponent></div></div></div>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

INDEX.TSX

```

    );
    export default App;
    ReactDOM.render(<App />, document.getElementById('sample'));
    {% endraw %}

```

Drill Down/Up

In the accumulation charts, drill down and drill up operations can be performed using the built-in context menu option. It will be shown while clicking on the chart series. The context menu has the following options:

Expand - It is to drill down the corresponding series until the last level.

Collapse - It is to drill up the corresponding series until the first level.

Exit - It is to close the context menu.

The drill operation in accumulation charts can be performed only for row headers.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        chartSeries: { type: 'Pie' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Products' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Year', caption: 'Production
Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
    };
}

```

```

    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        chartSeries: { type: 'Pie' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Products' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Year', caption: 'Production
Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Column Headers and Delimiters

Unlike other chart types, the accumulation charts consider the values of a single column from the pivot table to be drawn. Preferably the first column of the pivot table is considered by default. But it can be changed by defining the column headers using the `columnHeader` property in [chartSettings](#).

If the column has more than one header, then need to mention all the headers separated by the delimiter -, for example, **Germany-Road Bikes**. Using the property `columnDelimiter` in [chartSettings](#), one can set the desired delimiter to separate the column headers.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        columnHeader: "Germany-Road Bikes", columnDelimiter: "-",
        chartSeries: { type: 'Doughnut' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Country' }, { name: 'Products' }],
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['Germany'] }],
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
```

```
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    columnHeader: "Germany-Road Bikes", columnHeader: "-",
    chartSeries: { type: 'Doughnut' }
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Country' }, { name: 'Products' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    drilledMembers: [{ name: 'Country', items: ['Germany'] }],
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Year' }, { name: 'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject services={[PivotChart]}
/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Label Customization

The data labels are visible by default showing header name. Its visibility can be modified using the `visible` boolean property in `dataLabel`. With regard to the label arrangement, the **Smart Labels** options help to arrange labels efficiently without overlapping. It can be disabled by setting the `enableSmartLabels` property in `chartSettings` as `false`.

The `position` property in `dataLabel` allows to specify the position of the data label. The available options are,

- **Outside**: Positions the label outside the point. It is the default option.
- **Inside**: Positions the label inside the point.

In the following code sample, the data labels are placed inside.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        enableSmartLabels: false,
        chartSeries: { dataLabel: { visible: true, position: "Inside" },
type: 'Pyramid' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        enableSmartLabels: false,
        chartSeries: { dataLabel: {visible:true, position: "Inside" }, type:
'Pyramid' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {

```

```

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject services={[PivotChart]}
/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

The **Connector Line** will be visible when the data label is placed outside the chart. It can be customized using the **connectorStyle** property in **dataLabel** for its color, length, width etc. In the following code sample, the connector line is customized.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';

export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Pie and Doughnut Customization

User can draw pie and doughnut charts within the specified range using the `startAngle` and `endAngle` properties in [chartSeries](#). The default value of the `startAngle` property is `0`, and the `endAngle` property is `360`. By customizing these properties, user can draw semi pie and semi doughnut charts.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {

dataSourceSettings={dataSourceSettings} ><Inject services={[PivotChart]}
/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Users can get doughnut chart from pie chart and vice-versa using the `innerRadius` property in [chartSeries](#). If the property is greater than 0 percent, the doughnut chart will appear from the pie chart.

It takes the value only in percentage.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

dataSourceSettings={dataSourceSettings} ><Inject services={[PivotChart]
}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Field List

User can enable the field list by setting the property [showFieldList](#) as **true**.

By using this, user can customize the report dynamically and view the result in pivot chart. For more information regarding the field list, refer the [field list](#) topic.

In the following sample, the Popup mode of field list is enabled in the pivot chart.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart, FieldList } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Bar' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} showFieldList={true}
displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject services={[PivotChart,
FieldList]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart, FieldList } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    chartSeries: { type: 'Bar' }
  } as ChartSettings;
```

```

let dataSourceSettings: IDataOptions = {
  columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
  dataSource: pivotData as IDataset[],
  expandAll: false,
  filters: [],
  formatSettings: [{ name: 'Amount', format: 'C0' }],
  rows: [{ name: 'Country' }, { name: 'Products' }],
  values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
}
let pivotObj: PivotViewComponent;
return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} showFieldList={true}
displayOption={displayOption} dataSourceSettings={dataSourceSettings}
><Inject services={[PivotChart, FieldList]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Grouping Bar

User can enable the grouping bar by setting the property [showGroupingBar](#) as **true**. The grouping bar in pivot chart shows a dropdown list in value axis instead of buttons. The dropdown list holds list of value fields bounded in the [dataSourceSettings](#) and it can be switched to draw the pivot chart with the selected value field. This has been defined as the default behavior in the pivot chart component. For more information regarding the grouping bar, refer the [grouping bar](#) topic.

For multiple axis support, buttons will be placed in value axis instead of dropdown list.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart, GroupingBar } from
'@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Bar' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;

```

```

    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} showGroupingBar={true}
displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject services={[PivotChart,
GroupingBar]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataSet, PivotViewComponent, Inject, DisplayOption,
PivotChart, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        chartSeries: { type: 'Bar' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataSet[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} showGroupingBar={true}
displayOption={displayOption} dataSourceSettings={dataSourceSettings}
><Inject services={[PivotChart, GroupingBar]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

For accumulation charts alone, a drop-down list will be placed in the column axis instead of the buttons. The drop-down list shows the column headers available in the pivot table. Users can dynamically switch column headers with the help of the drop-down list, and the accumulation chart will be updated accordingly.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart, GroupingBar } from
'@syncfusion/ej2-react-pivotview';

```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

```

Multiple axis

User can draw the pivot chart with multiple value fields by setting the property [enableMultipleAxis](#) in [chartSettings](#) as **true**. In the below code sample, the pivot chart will be drawn with both value fields "Sold" and "Amount" available in the [dataSourceSettings](#).

The multiple axis support is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    enableMultipleAxis: true, chartSeries: { type: 'Column' }
  };
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

```

    };
    let dataSourceSettings = {
      columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
      dataSource: pivotData,
      expandAll: false,
      filters: [],
      formatSettings: [{ name: 'Amount', format: 'C0' }],
      rows: [{ name: 'Country' }, { name: 'Products' }],
      values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    enableMultipleAxis: true, chartSeries: { type: 'Column' }
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}></PivotViewComponent>);
};
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('sample'));
```

If the user binds more value fields, the result will be multiple pivot charts, and each chart will shrink within the parent container height. To avoid this, set the [enableScrollOnMultiAxis](#) property in [chartSettings](#) to **true**. By doing so, each pivot chart will only shrink to a minimal "160px" – "180px" height showing a vertical scrollbar for a clear view.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        enableScrollOnMultiAxis: true, enableMultipleAxis: true,
        chartSeries: { type: 'Column' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Products', type: 'Count' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,

}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

```

    } as DisplayOption;
    let chartSettings: ChartSettings = {
        enableScrollOnMultiAxis: true, enableMultipleAxis: true, chartSeries: {
type: 'Column' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Products', type: 'Count' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Meanwhile, there is another way to display multiple values in a chart. In this approach, the series drawn from multiple values are grouped and displayed in a single chart. And, based on the values, multiple Y axis scales will be framed with different ranges. This can be achieved by setting the properties [enableMultipleAxis](#) as **true** and [multipleAxisMode](#) as **Single** in [chartSettings](#).

In the following code sample, the pivot chart can be seen as a single chart with multiple value fields such as **Sold** and **Amount** that are drawn as multiple Y axis.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        enableMultipleAxis: true, multipleAxisMode: 'Single', chartSeries: {
type: 'Column' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],

```

```

        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        enableMultipleAxis: true, multipleAxisMode : 'Single', chartSeries: {
type: 'Column' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Show member based chart series

When multiple axes are enabled, the user can create each chart series with a unique color palette based on members by setting the [showMemberSeries](#) property in [chartSettings](#) to **true**. As a result, user can

easily identify each member enclosed chart series consistently across different measures in the entire chart area.

Furthermore, with a single click over the legend item, you can show or hide specific chart series visibility based on members across different measures in the entire chart area.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        enableMultipleAxis: true, value: 'Amount', chartSeries: { type:
'Column', animation: { enable: false } }, showMemberSeries: true
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    };
    let pivotObj;
    return <PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
```

```

    enableMultipleAxis: true, value: 'Amount', chartSeries: { type:
'Column', animation: { enable: false } }, showMemberSeries: true
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
  let pivotObj: PivotViewComponent;
  return <PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>
</>;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Series customization

User can customize series of the pivot chart using [chartSeries](#) in [chartSettings](#) class. The changes handled in the property will be reflected commonly in all chart series.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Column', enableTooltip: false, border: {
color: '#000', width: 2 } }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
  };
  let pivotObj;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}

```

```

dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    chartSeries: { type: 'Column', enableTooltip: false, border: { color:
'#000', width: 2 } }
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings} ><Inject
services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

User can also customize the pivot chart series individually using the [chartSeriesCreated](#) event, which occurs after the pivot chart series has been created. You can customize each series individually by iterating them.

In the following sample, the even series are hidden in the pivot chart.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Column' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  function chartSeriesCreated(args) {
    for (let pos = 0; pos < args.series.length; pos++) {
      if (pos % 2 == 0) {
        args.series[pos].visible = false;
      }
    }
  }
  let pivotObj;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}
chartSeriesCreated={chartSeriesCreated}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, Inject, DisplayOption,
PivotChart, ChartSeriesCreatedEventArgs } from '@syncfusion/ej2-react-
pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
  let displayOption: DisplayOption = {
    view: 'Chart'
  } as DisplayOption;
  let chartSettings: ChartSettings = {
    chartSeries: { type: 'Column' }
  } as ChartSettings;
  let dataSourceSettings: IDataOptions = {

```

```

    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  function chartSeriesCreated(args: ChartSeriesCreatedEventArgs): void {
    for (let pos:number = 0; pos < args.series.length; pos++) {
      if (pos % 2 == 0) {
        args.series[pos].visible = false;
      }
    }
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}
chartSeriesCreated={chartSeriesCreated}><Inject
services={[PivotChart]}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Axis customization

User can customize axis of the pivot chart using [primaryXAxis](#) and [primaryYAxis](#) properties in [chartSettings](#).

Axis customization is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

In the following sample, title of y-axis and x-axis are customized.

INDEX.JSX

```

import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Column' },
    primaryXAxis: { title: 'X axis title' },
    primaryYAxis: { title: 'Y axis title' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,

```

```

        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent, DisplayOption, Inject,
PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ChartSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/chartSettings';
function App() {
    let displayOption: DisplayOption = {
        view: 'Chart'
    } as DisplayOption;
    let chartSettings: ChartSettings = {
        chartSeries: { type: 'Column' },
        primaryXAxis: { title: 'X axis title' },
        primaryYAxis: { title: 'Y axis title' }
    } as ChartSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView' chartSettings={chartSettings} displayOption={displayOption}
dataSourceSettings={dataSourceSettings}><Inject
services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

One can also customize multi-level labels of primary x-axis by using the [multiLevelLabelRender](#) event in the [chartSettings](#), which fires on rendering each multi-level label in the pivot chart. It has the following parameters:

axis - It holds the information of the current axis.

text - It allows to change the text of the multi-level label.

textStyle - It allows to customize the text font.

alignment - It allows to set the text alignment.

INDEX.JSX

```
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let displayOption = {
        view: 'Chart'
    };
    let chartSettings = {
        chartSeries: { type: 'Column' },
        multiLevelLabelRender(e) {
            e.alignment = 'Near';
            e.textStyle = { fontFamily: 'Bold', fontWeight: '400', size: '16px', color: 'red' };
            if (e.text === ' + United Kingdom') {
                e.text = 'Text Changed';
                e.textStyle = { fontFamily: 'Bold', fontWeight: '800', size: '16px', color: 'Blue' };
            }
        }
    };

```

Legend customization

User can customize legend using [legendSettings](#) in [chartSettings](#). By default, legend will be visible and it can be hidden by setting the property `Visible` in [legendSettings](#) as `false`.

The pivot chart support different types of legend shapes as follows,

- Circle
- Rectangle
- VerticalLine

- Pentagon
- InvertedTriangle
- SeriesType
- Triangle
- Diamond
- Cross
- HorizontalLine

Here **seriesType** would act as the default shape and it can be changed using the property [legendShape](#) in [chartSeries](#).

Also user can set the position of the legend in pivot chart using the property [position](#) in [legendSettings](#). The available options to set the legend position are as follows,

- Auto: Places the legend based on area type. This is the default.
- Top: Displays the legend at the top of the pivot chart.
- Left: Displays the legend at the left of the pivot chart.
- Bottom: Displays the legend at the bottom of the pivot chart.
- Right: Displays the legend at the right of the pivot chart.
- Custom: Displays the legend based on the given x and y values.

By default, the legend is not visible for the accumulation chart types like pie, doughnut, pyramid, and funnel.

User Interaction

Marker and CrossHair

User can enable and customize the marker and crosshair using [markerSettings](#) and [crosshairSettings](#) properties in [chartSettings](#) class respectively.

Also user can enable and customize the crosshair tooltip for axes using [crosshairTooltip](#).

Marker and crosshair is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Zooming and Panning

User can customize zooming and panning option using the property [zoomSettings](#) in [chartSettings](#).

The pivot chart support four types of zooming which can be set as follows,

- [enablePinchZooming](#)
- [enableSelectionZooming](#)
- [enableDeferredZooming](#)
- [enableMouseWheelZooming](#)

and three modes of zooming direction that specifies whether to zoom vertically or horizontally or in both ways which are,

- x: Pivot chart can be zoomed horizontally.
- y: Pivot chart can be zoomed vertically.
- x,y: Pivot chart can be zoomed both vertically and horizontally.

This can be set using the property [mode](#) in [zoomSettings](#). By default, if the pivot chart is zoomed, a toolbar would display with the options - Zoom, ZoomIn, ZoomOut, Pan, Reset. User can also customize its option using the property [toolbarItems](#) in [zoomSettings](#).

Zooming and panning is not applicable for the accumulation chart types like pie, doughnut, pyramid, and funnel.

services={[PivotChart]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Export

The pivot chart can be exported using the [chartExport](#) method which holds parameters like export type, file name, PDF orientation, width, and height in the same order. The mandatory parameters for this method are export type and file name whereas other parameters are optional.

The following are the four export types:

- PNG
- JPEG
- SVG
- PDF

In the following code sample, exporting can be done using an external button named as "Chart Export".

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent, Inject, PivotChart } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let displayOption = {
    view: 'Chart'
  };
  let chartSettings = {
    chartSeries: { type: 'Column' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:

```

Drill down in React Pivotview component

Drill down and drill up

The drill down and drill up action helps to view the bound data in detailed and abstract view respectively. By default, if member(s) has children, then expand and collapse icon will be displayed in the respective row/column header. On clicking the icon, expand or collapse action will be performed automatically through built-in source code. Meanwhile, leaf member(s) does not contain expand and collapse icon.

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
▼ France	450	\$714,955	526	\$1,542,104	
Mountain Bikes	197	\$335,688	238	\$405,552	
Road Bikes	253	\$379,267	288	\$1,136,552	
► Germany	440	\$563,515	496	\$1,772,104	
► United States	546	\$754,515	636	\$2,263,104	
Grand Total	1436	\$2,032,985	1658	\$5,577,312	1

Drill position

Allows to drill only the current position of the selected member and exclude the drilled data of selected member in other positions. For example, if "FY 2015" and "FY 2016" have "Quarter 1" member as child in next level, and when end user attempts to drill "Quarter 1" under "FY 2016", only it will be expanded and not "Quarter 1" under "FY 2015".

This feature is built-in and occurs every time when expand or collapse action is done for better performance.

	FY 2015		FY 2016

Expand all

This property is applicable only for the relational data source.

Allows to either expand or collapse all headers that are displayed in row and column axes. To display all headers in expanded state, set the property [expandAll](#) to **true** and to collapse all headers, set the property [expandAll](#) to **false**. By default, [expandAll](#) property is set to **false**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: true,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        columns: [{ name: 'Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: true,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    columns: [{name: 'Year' }, {name: 'Quarter'}],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Expand all headers for specific fields

This property is applicable only for the relational data source.

Allows to expand or collapse all headers for specific fields (only) in row and column axes. To expand headers for a specific field in row or column axis, set the property [expandAll](#) in [rows](#) or [columns](#) to **true**. By default, [expandAll](#) property in [rows](#) or [columns](#) is set to **false**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country', expandAll: true }, { name: 'Products' }],
    columns: [{ name: 'Year', expandAll: true }, { name: 'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
```

```

    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country', expandAll: true }, { name: 'Products' }],
        columns: [{name: 'Year', expandAll: true }, {name: 'Quarter'}],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent height={350} ref={d => pivotObj = d}
id='PivotView'
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Expand all except specific member(s)

This option is applicable only for the relational data source.

In addition to the previous topic, there is an enhancement to expand all headers except specific header(s) and similarly to collapse all headers except specific header(s). To achieve this, [drilledMembers](#) is used. The required properties of the [drilledMembers](#) are explained below:

- [name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [items](#): It allows to set the exact member(s) which needs to be drilled.

The [drilledMembers](#) option always works in vice-versa with respect to the property [expandAll](#) in pivot table. For example, if [expandAll](#) is set to **true**, then the member(s) added in [items](#) collection alone will be in collapsed state.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';

```

```
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: true,
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataSet, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataSet[],
    expandAll: true,
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Expand specific member(s)

End user can also manually expand or collapse specific member(s) in each fields under row and column axes using the [drilledMembers](#) from code behind. The required properties of the [drilledMembers](#) are explained below:

- [name](#): It allows to set the field name whose member(s) needs to be specifically drilled.
- [items](#): It allows to set the exact member(s) which needs to be drilled.
- [delimiter](#): It allows to separate next level of member from its parent member.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('sample'));
```

Event

Drill

The event [drill](#) triggers every time when a field is expanded or collapsed. For instance using this event user can alter delimiter and drill action for the respective item. It has the following parameters:

- **drillInfo** - It holds the current drilled item information.
- **pivotview** - It holds pivot table instance.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C2' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    };
    let pivotObj;
    function drill(args) {
        args.dataSourceSettings.columns[0].caption = "Full Year";
        args.dataSourceSettings.expandAll = true;
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} drill={drill.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, DrillArgs } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
```

```

    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C2'}],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  }
  let pivotObj: PivotViewComponent;
  function drill(args: DrillArgs): void {
    args.dataSourceSettings.columns[0].caption = "Full Year";
    args.dataSourceSettings.expandAll = true;
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} drill={drill.bind(this)}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

ActionBegin

The event [actionBegin](#) triggers when the UI actions such as drill down and drill up begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| [Expand](#) | Drill down |

| [Collapse](#) | Drill up |

- **cancel**: It allows user to restrict the current action.

In the below sample, drill down and drill up action can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

```

```
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    filters: [],
  };
  let pivotObj;
  function actionBegin(args) {
    if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
      args.cancel = true;
    }
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
actionBegin={actionBegin.bind(this)} showFieldList={true}><Inject
services={[FieldList]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent,
PivotActionBeginEventArgs } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    filters: [],
  }
  let pivotObj: PivotViewComponent;
  function actionBegin(args: PivotActionBeginEventArgs): void {
    if (args.actionName == 'Drill down' || args.actionName == 'Drill
up') {
      args.cancel = true;
    }
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
actionBegin={actionBegin.bind(this)} showFieldList={true} ><Inject
services={[FieldList]} /></PivotViewComponent>);
```

```
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

ActionComplete

The event [actionComplete](#) triggers when a UI action such as drill down or drill up, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. The following are the UI actions and their names:

Action	Action Name
-----	-----
Expand	Drill down
Collapse	Drill up

- **actionInfo**: It holds the unique information about the current UI action. For example, if drill down action is completed, the event argument contains information such as field name and the drill information.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';

services={[FieldList]} /></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- actionName:** It holds the name of the current action failed. The following are the UI actions and their names:

Action	Action Name
-----	-----
Expand	Drill down
Collapse	Drill up

- **errorInfo**: It holds the error information of the current UI action.

INDEX.JSX

export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Data Shaping

Aggregation in React Pivotview component

This feature is applicable only for the relational data source.

End user can perform calculations over a group of values (exclusively for value fields bound in value axis) using the aggregation option. By default, values are added (summed) together. The other aggregation types are explained below.

The fields with data type such as number support all aggregation types mentioned below except for **“CalculatedField”**. The fields with data type such as string, date, datetime, boolean, etc., support **“Count”** and **“DistinctCount”** aggregation types alone.

Operator	Description
----- -----	
Sum	Displays the pivot table values with sum.
Product	Displays the pivot table values with product.
Count	Displays the pivot table values with count.
DistinctCount	Displays the pivot table values with distinct count.
Min	Displays the pivot table with minimum value.
Max	Displays the pivot table with maximum value.
Avg	Displays the pivot table values with average.
Median	Displays the pivot table values with median.
Index	Displays the pivot table values with index.
PopulationStDev	Displays the pivot table values with standard deviation of population.
SampleStDev	Displays the pivot table values with sample standard deviation.
PopulationVar	Displays the pivot table values with variance of population.
SampleVar	Displays the pivot table values with sample variance.
RunningTotals	Displays the pivot table values with running totals.

| **DifferenceFrom** | Displays the pivot table values with difference from the value of the base item in the base field. |

| **PercentageOfDifferenceFrom** | Displays the pivot table values with percentage difference from the value of the base item in the base field. |

| **PercentageOfGrandTotal** | Displays the pivot table values with percentage of grand total of all values. |

| **PercentageOfColumnTotal** | Displays the pivot table values in each column with percentage of total values for the column. |

| **PercentageOfRowTotal** | Displays the pivot table values in each row with percentage of total values for the row. |

| **PercentageOfParentTotal** | Displays the pivot table values with percentage of total of all values based on selected field. |

| **PercentageOfParentColumnTotal** | Displays the pivot table values with percentage of its parent total in each column. |

| **PercentageOfParentRowTotal** | Displays the pivot table values with percentage of its parent total in each row. |

| **CalculatedField** | Displays the pivot table with calculated field values. It allows user to create a new calculated field alone. |

Assigning aggregation type for value fields through API

For each value field, the aggregation type can be set using the property [type](#) in [values](#) class. Meanwhile, aggregation types like **DifferenceFrom** and **PercentageOfDifferenceFrom** can check for specific field of specific item using [baseField](#) and [baseItem](#) properties. Likewise, **PercentageOfParentTotal** type can for specific field using [baseField](#) property. For instance, the aggregation type **DifferenceFrom** would intake the specified field and its corresponding member as input and its value is compared across other members in the same field and also across different fields to formulate an appropriate output value.

- [type](#): It allows to set the aggregate type of the field.
- [baseField](#): It allows to set the specific field to aggregate the values.
- [baseItem](#): It allows to set the specific member to aggregate the values.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],

    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }]
```

```

    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
  }
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' } ]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

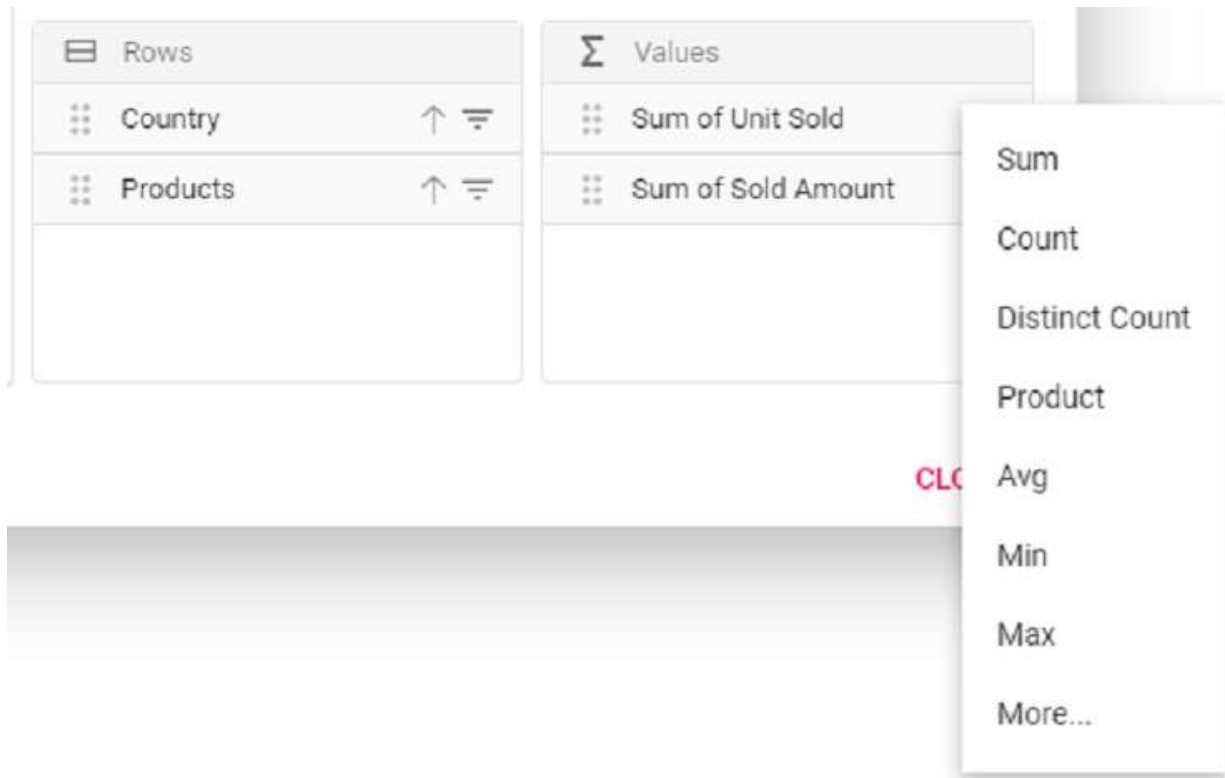

```

By default, the aggregation will be considered as **Sum** to the value fields which had number type and for the value fields which had non-number type values such as string, date, datetime, boolean, etc., the aggregation type will be considered as **Count**.

Modifying aggregation type for value fields at runtime

Aggregation types can be changed easily through UI at runtime. The value fields bound to grouping bar and field list appears with a dropdown icon which helps to select an appropriate aggregation type for the respective value field. On selection, the values in the pivot table will be changed dynamically.

<!-- markdownlint-disable MD012 -->

Sum of Units Sold	Sum	Drop filter here		
Sum of Sold Amount	Count	Year	Quarter	
Country	Distinct Count	FY 2015		FY 2016
Products	Product	Units Sold	Sold Amount	Units Sold
▶ France	Min	450	\$714,955	526
▶ Germany	Max	440	\$563,515	496
▶ United States	Avg	546	\$754,515	636
Grand Total	More...	1436	\$2,032,985	1658

Show desired aggregation types in its dropdown menu

By default, all the aggregation types are displayed in the dropdown menu available in buttons. However, based on the request for an application, we may need to show selective aggregation types on our own. This can be achieved using the [aggregateTypes](#) property.

INDEX.JSX

```

import { GroupingBar, FieldList, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        dataSource: pivotData,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    };
    let pivotObj;
    let pivotAggregateTypes = ['DistinctCount', 'Avg', 'Product'];
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} showFieldList={true}
showGroupingBar={true} aggregateTypes={pivotAggregateTypes}><Inject
services={[GroupingBar, FieldList]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { GroupingBar, FieldList, Inject, IDataOptions, IDataset,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        dataSource: pivotData as IDataset,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount', type: 'Sum' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: [],
    }
    let pivotObj: PivotViewComponent;
    let pivotAggregateTypes: any = ['DistinctCount', 'Avg', 'Product'];

showGroupingBar={true} aggregateTypes={pivotAggregateTypes}><Inject
services={[GroupingBar, FieldList]}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Hiding aggregation type from button text

By default, in value axis each field would be displayed by its name and aggregation type together. To hide aggregation type and display field name alone, set the property [showAggregationOnValueField](#) in [dataSourceSettings](#) to **false**.

INDEX.JSX

```
import { PivotViewComponent, Inject, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount', type: 'Sum' }],
        showAggregationOnValueField: false
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} dataSourceSettings={dataSourceSettings} showGroupingBar={true}><Inject services={[GroupingBar]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent, Inject, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount', type: 'Sum' }],
        showAggregationOnValueField: false
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} dataSourceSettings={dataSourceSettings} showGroupingBar={true}><Inject services={[GroupingBar]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

```

    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showGroupingBar={true}><Inject
services={[GroupingBar]}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Hiding aggregation type icon from UI

By default, the icon to set aggregation type is enabled in the grouping bar. To disable this icon, set the property [showValueTypeIcon](#) in [groupingBarSettings](#) to **false**.

Icon to change the aggregation type can be hidden only in Grouping Bar but not in Field List at the moment.

INDEX.JSX

```

import { GroupingBar, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

dataSourceSettings={dataSourceSettings} showGroupingBar={true} ><Inject
services={[GroupingBar]}/> </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Event

AggregateCellInfo

The event [aggregateCellInfo](#) triggers every time while rendering each value cell. This allows user to change the cell value and skip formatting if applied. It has following parameters:

- **fieldName** - It holds current cell's field name.
- **row** - It holds current cell's row value.
- **column** - It holds current cell's row value.
- **value** - It holds value of current cell.
- **cellSets** - It holds raw data for the aggregated value cell.
- **rowCellType** - It holds row cell type value.
- **columnCellType** - It holds column cell type value.
- **aggregateType** - It holds aggregate type of the cell.
- **skipFormatting** - boolean property, it allows to skip formatting if applied.

INDEX.JSX

```

dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

ActionBegin

The event [actionBegin](#) triggers when clicking and selecting the aggregate type via the dropdown icon in the value field button, which is present in both grouping bar and field list UI. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. For example, while performing aggregation, the action name will be shown as **Aggregate field**.
- **fieldInfo**: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

- **cancel**: It allows user to restrict the current action.

In the following example, action taken during aggregation type selection via dropdown icon can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

INDEX.JSX

```
import { FieldList, GroupingBar, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
 'Quarter' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
 caption: 'Sold Amount' }],
    filters: [],
  };
  let pivotObj;
  function actionBegin(args) {
    if (args.actionName == 'Aggregate field') {
      args.cancel = true;
    }
  }
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
 height={350} dataSourceSettings={dataSourceSettings}
 actionBegin={actionBegin.bind(this)} showFieldList={true}
 showGroupingBar={true}><Inject services={[FieldList,
 GroupingBar]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { FieldList, GroupingBar, IDataOptions, IDataset, Inject,
PivotViewComponent, PivotActionBeginEventArgs } from '@syncfusion/ej2-react-
pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    filters: [],
  }
  let pivotObj: PivotViewComponent;
  function actionBegin(args: PivotActionBeginEventArgs): void {
    if (args.actionName == 'Aggregate field') {

/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

ActionComplete

The event [actionComplete](#) triggers when a UI action, such as applying aggregation using the dropdown icon via the value field button, which is present in both the grouping bar and the field list UI, is completed. This allows user to identify the current UI action being completed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action completed. For example, after completing the aggregation, the action name will be shown as **Field aggregated**.
- **fieldInfo**: It holds the selected value field information.

Note: This option is applicable only when the field based UI actions are performed such as filtering, sorting, removing field from grouping bar, editing and aggregation type change.

INDEX.JSX

```
import { FieldList, GroupingBar, Inject, PivotViewComponent } from
'@syncfusion/ej2-react-pivotview';
import * as React from 'react';
```

```

import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        dataSource: pivotData,
        expandAll: false,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        filters: [],
    };
    let pivotObj;
    function actionComplete(args) {
        if (args.actionName == 'Field aggregated') {
            // Triggers when the aggregation type is applied.
        }
    }
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
actionComplete={actionComplete.bind(this)} showFieldList={true}
showGroupingBar={true}><Inject services={[FieldList,
GroupingBar]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { FieldList, GroupingBar, IDataOptions, IDataset, Inject,
PivotViewComponent, PivotActionCompleteEventArgs } from '@syncfusion/ej2-
react-pivotview';

ReactDOM.render(<App />, document.getElementById('sample'));
```

Calculated field in React Pivotview component

Allows end user to create a new calculated field in the pivot table, based on available fields from the bound data source or using simple formula with basic arithmetic operators. It can be added at runtime through the built-in dialog, invoked from Field List UI. To do so, set the [allowCalculatedField](#) property to **true** in the pivot table. End user can now see a "CALCULATED FIELD" button enabled in Field List UI automatically, which on clicking will invoke the calculated field dialog and perform necessary operation.

Calculated field can also be included in the pivot table through code behind using the [calculatedFieldsSettings](#). The required properties to create a new calculate field are:

- [name](#): It allows to indicate the calculated field with a unique name.
- [formula](#): It allows to set the formula.
- [formatSettings](#): It helps to set the number format for the resultant value.

To use calculated field option, you need to inject the `CalculatedField` module in pivot table.

The calculated field is applicable only for value fields. Also, calculated field created through code behind will be automatically listed in the UI dialog as well.

INDEX.JSX

```

import { CalculatedField, FieldList, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {

caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Units', type:
 'CalculatedField' }],
        calculatedFieldSettings: [{ name: 'Total', formula:
 '"Sum(Amount)"+"Sum(Sold)"' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services={[CalculatedField, FieldList]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
 'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Units', type:
 'CalculatedField' }],
        calculatedFieldSettings: [{ name: 'Total', formula:
 '"Sum(Amount)"+"Sum(Sold)"' }]
    }
}

```

```

    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}><Inject
services=[CalculatedField, FieldList]/> </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Meanwhile, user can also view calculated field dialog in UI by invoking [createCalculatedFieldDialog](#) method on an external button click which is shown in the below code sample.

To use calculated field option, you need to inject the **CalculatedField** module in pivot table.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { CalculatedField, Inject, PivotViewComponent } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }, { name: 'Total',
format: 'C2' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }, { name: 'Total', caption: 'Total Units', type:
'CalculatedField' }],
        calculatedFieldSettings: [{ name: 'Total', formula:
'"Sum(Amount)"+"Sum(Sold)"' }]
    };
    let pivotObj;
    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings} allowCalculatedField={true}><Inject
services=[CalculatedField]/> </PivotViewComponent></div>
    <div className="col-lg-3 property-section"><ButtonComponent cssClass='e-
primary' onClick={btnClick.bind(this)}>Calculated
Field</ButtonComponent></div></div>);
    function btnClick() {
        pivotObj.calculatedFieldModule.createCalculatedFieldDialog();
    }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

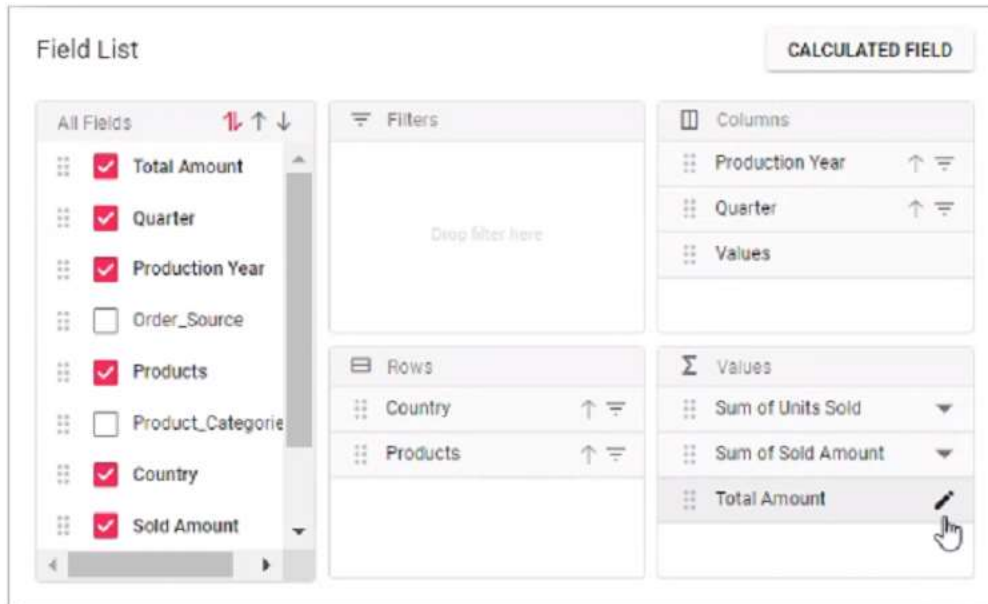

```

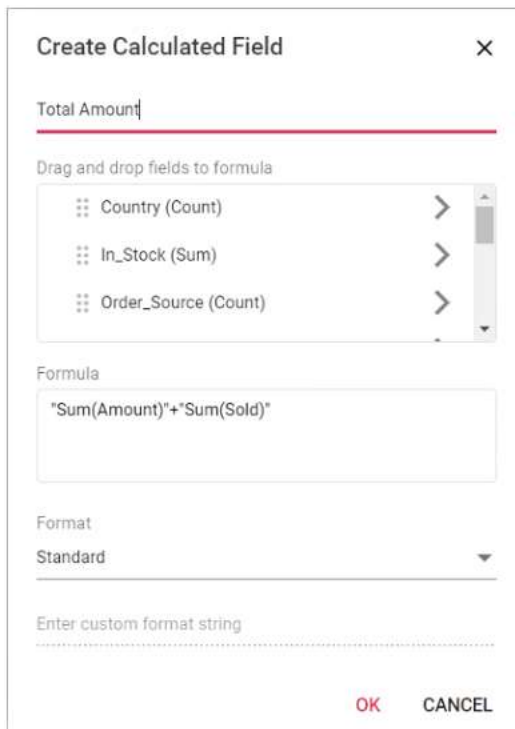

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { CalculatedField, IDataOptions, IDataset, Inject, PivotViewComponent
} from '@syncfusion/ej2-react-pivotview';

```

Editing through the field list and the grouping bar

User can also modify the existing calculated field using the built-in edit option available directly in the field list (or) grouping bar. To do so, click the "Edit" icon available in the calculated field button. Now the calculated field dialog is opened and the current calculated field name, formula and format can be changed at runtime.

Renaming the existing calculated field

Existing calculated field can be renamed only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing name getting displayed in the text box at the top of the dialog. Now, change the name based on user requirement and click "OK".

<!-- markdownlint-disable MD012 -->

Create Calculated Field ×

Enter the field name

Drag and drop fields to formula

- Sold Amount (Sum)
- Total Amount (Calculated Field)** Edit
- Units Sold (Sum)

Formula

Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250

Format

None

Enter custom format string

OK **CANCEL**

Create Calculated Field ×

Total Sales Amount

Drag and drop fields to formula

- Sold Amount (Sum)
- Total Amount (Calculated Field)** Edit
- Units Sold (Sum)

Formula

"Sum(Amount)"+"Sum(Sold)"

Format

Standard

Enter custom format string

OK **CANCEL**

Editing the existing calculated field formula

Existing calculated field formula can be edited only through the UI at runtime. To do so, open the calculated field dialog, select the target field and click "Edit" icon. User can now see the existing formula

getting displayed in a multiline text box at the bottom of the dialog. Now, change the formula based on user requirement and click "OK".

Create Calculated Field [X]

Enter the field name

Drag and drop fields to formula

- Sold Amount (Sum) >
- Total Amount (Calculated Field) [trash] [edit]
- Units Sold (Sum) >

Formula

Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250

Format

None

Enter custom format string

OK CANCEL

Create Calculated Field [X]

Total Amount

Drag and drop fields to formula

- Sold Amount (Sum) >
- Total Amount (Calculated Field) [trash] [edit]
- Units Sold (Sum) >

Formula

"Sum(Amount)"+"Sum(Sold)"

Format

Standard

Enter custom format string

OK CANCEL

Reusing the existing formula in a new calculate field

While creating a new calculated field, if user wants to add the formula of an existing calculated field, it can be done easily. To do so, simply drag-and-drop the existing calculated field to the "Formula" section.

The screenshot shows the 'Create Calculated Field' dialog box. At the top, there's a title bar with 'Create Calculated Field' and a close button. Below it, the 'Sales Amount' field is visible. The 'Drag and drop fields to formula' section contains a list of fields: 'Sold Amount (Sum)', 'Total Amount (Calculated Field)', and 'Total Amount (Calculated Field)'. The 'Total Amount (Calculated Field)' is highlighted. Below this list is the 'Formula' section, which contains a text box with the example formula: 'Example: ("Sum(Order_Count)" + "Sum(In_Stock)") * 250'. Below the formula section is the 'Format' section, which has a dropdown menu set to 'None'. At the bottom, there is a field for 'Enter custom format string' and two buttons: 'OK' and 'CANCEL'.

Apply the format to the calculated field values

Values in a new or existing calculated field can be formatted via the calculated field UI or code behind. The [formatSettings](#) property in code-behind can be used to specify the desired format. For more information about the supported formats refer [here](#).

To apply format to calculated field values at runtime via UI, a built-in dropdown under the "Format" label is available, from which the user can select the pre-defined format options listed below.

- **Standard** - Denotes the numeric type.
- **Currency** - Denotes the currency type.
- **Percent** - Denotes the percentage type.
- **Custom** - Denotes the custom format. For example: "C2". This shows the value "9584.3" as "\$9584.30."
- **None** - Denotes that no format will be applied.

By default, **None** will be selected from the dropdown.

In addition, you can specify the desired custom formats by selecting the **Custom** option from the "Format" dropdown.

Create Calculated Field [X]

Sales Amount

Drag and drop fields to formula

- Sold Amount (Sum) >
- Total Amount (Calculated Field) [trash] [edit]
- Units Sold (Sum) >

Supported operators and functions for the calculated field formula

Below is a list of operators and functions that can be used in the formula to create the calculated fields.

- **+** – addition operator.

`ts

Syntax: X + Y

,

- **-** – subtraction operator.

`ts

Syntax: X - Y

,

- ***** – multiplication operator.

`ts

Syntax: X * Y

,

- **/** – division operator.

`ts

Syntax: X / Y

,

- `^` – power operator.

Grouping in React Pivotview component

This feature is applicable only for relational data source.

Grouping is the most-useful feature in pivot table and the component automatically groups date, time, number and string. For example, the date type can be formatted and displayed based on year, quarter, month, and more. Likewise, the number type can be grouped range-wise, such as 1-5, 6-10, etc. These group fields will act as individual fields and allows users to drag them between different axes such as columns, rows, values, and filters and create pivot table at runtime.

<!-- markdownlint-disable MD012 -->

Filtering in React Pivotview component

Filtering allows to view the pivot table with selective records based on members that can be either included or excluded through UI and code-behind.

The following are the three different types of filtering:

- Member filtering
- Label filtering
- Value filtering

When all the above filtering options are disabled via code-behind, then the filter icon would be disabled in the field list or grouping bar UI.

Member filtering

Sorting in React Pivotview component

To have a quick glance on how to sort data in the React Pivot Table, watch this video:

Drill through in React Pivotview component

Editing in React Pivotview component

This feature is applicable only for the relational data source.

Data Formatting

Number formatting in React Pivotview component

Allows you to specify the required display format that should be used in values of the pivot table.

Supported display formats are:

- Number
- Currency
- Percentage
- Custom

Conditional formatting in React Pivotview component

Allows end user to change the appearance of the pivot table value cells with its background color, font color, font family, and font size based on specific conditions.

Report Manipulation

Grouping bar in React Pivotview component

To have a quick glance on how to enable grouping bar in the React Pivot Table, watch this video:

Field list in React Pivotview component

To have a quick glance on how to enable field list in the React Pivot Table, watch this video:

Defer update in React Pivotview component

Defer layout update support allows to update the pivot table component only on demand. On enabling this feature, end user can drag-and-drop fields between row, column, value and filter axes, apply sorting and filtering inside the Field List, resulting in change of pivot report alone but not the pivot table values. Once all operations are performed and on clicking the "Apply" button in the Field List, pivot table will start to update with the last modified report. This also helps in bringing better performance in pivot table component rendering.

The field list can be displayed in two different formats to interact with pivot table. They are:

- **In-built Field List (Popup):** To display the field list icon in pivot table UI to invoke the built-in dialog.
- **Stand-alone Field List (Fixed):** To display the field list in a static position within a web page.

In-built Field List (Popup)

To enable deferred updates in the pivot table, set the property [allowDeferLayoutUpdate](#) as **true** in [PivotView](#). To make a note, the defer update option can be controlled only via Field List during runtime.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} dataSourceSettings={dataSourceSettings} showFieldList={true}
```

```
allowDeferLayoutUpdate={true}><Inject
services={[FieldList]}/></PivotViewComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent }
from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    allowLabelFilter: true,
    allowValueFilter: true,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} showFieldList={true}
allowDeferLayoutUpdate={true}><Inject services={[FieldList]}
/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Stand-alone Field List (Fixed)

The field list can be rendered in a static position, anywhere in web page layout, like a separate component. To do so, you need to set [renderMode](#) property to **Fixed** in PivotFieldList.

To enable deferred updates in the static fieldlist, set the property [allowDeferLayoutUpdate](#) in [PivotFieldList](#) as **true**. To make a note, the defer update option can be controlled only via Field List during runtime.

To make field list interact with pivot table, you need to use the **UpdateView** and **Update** methods for data source update in both field list and pivot table simultaneously.

Performance

<!-- markdownlint-disable MD036 -->

Virtual scrolling in React Pivot Table component

Virtual Scrolling

Allows to load the large amounts of data without any performance degradation by rendering rows and columns only in the current content viewport. Rest of the aggregated data will be brought into viewport dynamically based on vertical or horizontal scroll position. This feature can be enabled by setting the [enableVirtualization](#) property to **true**.

To use the virtual scrolling feature, inject the **VirtualScroll** module in to the pivot table.

INDEX.JSX

```

import { PivotViewComponent, VirtualScroll, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
let datel1;
let date2;
function data(count) {
    let result = [];
    let dt = 0;
    for (let i = 1; i < (count + 1); i++) {
        dt++;
        let round;
        let toString = i.toString();
        if (toString.length === 1) {

```

```

        round = '0000' + (i);
    }
    else if (toString.length === 2) {
        round = '000' + i;
    }
    else if (toString.length === 3) {
        round = '00' + i;
    }
    else if (toString.length === 4) {
        round = '0' + i;
    }
    else {
        round = toString;
    }
    result.push({
        ProductID: 'PRO-' + round,
        Year: "FY " + (dt + 2013),

height={350} enableVirtualization={true}
dataSourceSettings={dataSourceSettings}><Inject
services={ [VirtualScroll] }/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

The **height** and **width** properties should be set for virtual scrolling. If it is not defined then the pivot table will consider its value as **300px** and **800px** respectively.

Virtual scrolling with single page mode

When virtual scrolling is enabled, the pivot table renders not only the current view page, but also the previous and next pages by default. This default behavior, however, can cause performance delays when dealing with a large number of rows and columns. This is because the same number of rows and columns from adjacent pages are also processed, resulting in additional computational load. This performance constraint can be avoided by setting the [allowSinglePage](#) property to **true** within the [virtualScrollSettings](#).

Enabling this property causes the pivot table to render only the rows and columns that are relevant to the current view page during virtual scrolling. This optimization significantly improves the performance of the pivot table during initial rendering and when performing UI actions such as drill up/down, sorting, filtering, and more.

Limitations for virtual scrolling

- In virtual scrolling, the [columnWidth](#) property in [gridSettings](#) should be in pixels, and percentage values are not accepted.
- Resizing columns or setting width to individual columns affects the calculation used to pick the correct page on scrolling.
- Grouping, which takes additional time to splitting the raw items into the provided format.
- Date Formatting, which takes additional time to convert date format.
- Date Formatting with sorting, here additionally full date time format should be framed to perform sorting along with the provided date format which lags the performance.
- When using OLAP data, subtotals and grand totals are only displayed when measures are bound at the last position in the [rows](#) or [columns](#) axis. Otherwise, the data from the pivot table will be shown without summary totals.
- Even if virtual scrolling is enabled, not only is the current view port data retrieved, but also the data for the immediate previous page and the immediate next page. As a result, when the end user scrolls slightly ahead or behind, the next or previous page data is displayed immediately without requiring a refresh. **Note:** If the pivot table's width and height are large, the loading data count in the current, previous, and next viewports (pages) will also increase, affecting performance.

Virtual scrolling for static field list

Virtual scrolling automatically works with "Popup" field list on setting the [enableVirtualization](#) property in the Pivot Table to **true**. In case of static field list, which act as a separate component, user need to enable [enableVirtualization](#) property in the Pivot Table and also pass the report information to pivot table instance via the [load](#) event of the field list.

Paging in React Pivotview component

Paging allows you to load large amounts of data that can be divided and displayed page by page in the pivot table. It can be enabled by setting the [enablePaging](#) property to **true**. It can be configured at code-behind by using the [pageSettings](#) property, during initial rendering of the component. The properties required are:

- [currentRowPage](#): Allows user to set the current row page number to be displayed in the pivot table.
- [currentColumnPage](#): Allows user to set the current column page number to be displayed in the pivot table.
- [rowPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's row axis.
- [columnPageSize](#): Allows user to set the total number of records to be displayed on each page of the pivot table's column axis.

Pager UI

When paging is enabled, a built-in pager UI appears at the bottom of the pivot table, allowing you to change the current page in the row and column axes by navigating to a desired page using the navigation buttons or an input text box, as well as change the page size via dropdown at runtime.

You can also change the position, visibility, compact view, and template of the row and column pagers by using the [pagerSettings](#).

In order to see and use the pager UI, insert the **Pager** module into the pivot table using the **services** tag.

    <Inject services={[Pager]} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

Inverse pager

Toggles and displays row and column pager. To show the column pager on the left side of the pager UI, set the [isInversed](#) property in [pagerSettings](#) to true.

By default, the row pager is displayed on the left side of the pager UI, while the column pager is displayed on the right side.

INDEX.JSX

```

{% raw %}
import { PivotViewComponent, Pager, Inject } from '@syncfusion/ej2-react-pivotview';

{% endraw %}

```

Show or hide paging option

By using the [showRowPager](#) and [showColumnPager](#) properties in [pagerSettings](#), you can show or hide row and column pager separately in the pager UI.

In the following example, row pager has been disabled by setting the [showRowPager](#) property in [pagerSettings](#) to **false**.

INDEX.JSX

```

{% raw %}
import { PivotViewComponent, Pager, Inject } from '@syncfusion/ej2-react-
pivotview';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```
function App() {
  let pivotObj;
  let remoteData = new DataManager({
    url: 'https://bi.syncfusion.com/northwindservice/api/orders',
    adaptor: new WebApiAdaptor,
    crossDomain: true
  });
  let dataSourceSettings = {
    type: 'JSON',
    dataSource: remoteData,
    expandAll: true,
    columns: [{ name: 'ProductName', caption: 'Product Name' }],
    rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:
'ShipCity', caption: 'Ship City' }],
    formatSettings: [{ name: 'UnitPrice', format: 'C0' }],
    values: [{ name: 'Quantity' }, { name: 'UnitPrice', caption: 'Unit
Price' }],
    filters: []
  };
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} gridSettings={{
columnWidth: 120 }} pageSettings={{
  rowPageSize: 10,
  columnPageSize: 5,
  currentColumnPage: 1,
  currentRowPage: 1
}} pagerSettings={{
  showRowPager: false
}} enablePaging={true}>
    <Inject services={[Pager]}/>
  </PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import { IDataOptions, PivotViewComponent, Pager, Inject } from
'@syncfusion/ej2-react-pivotview';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let pivotObj: PivotViewComponent;
  let remoteData: DataManager = new DataManager({
    url: 'https://bi.syncfusion.com/northwindservice/api/orders',
    adaptor: new WebApiAdaptor,
    crossDomain: true
  });
  let dataSourceSettings: IDataOptions = {
    type: 'JSON',
    dataSource: remoteData,
    expandAll: true,

```

```

        columns: [{ name: 'ProductName', caption: 'Product Name' }],
        rows: [{ name: 'ShipCountry', caption: 'Ship Country' }, { name:

    currentColumnPage: 1,
    currentRowPage: 1
}} pagerSettings={{
    showRowPager: false
}} enablePaging={true}>
        <Inject services={[Pager]} />
    </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

Show or hide page size

By using the [showRowPageSize](#) and [showColumnPageSize](#) properties in [pagerSettings](#), you can show or hide "Rows per page" and "Columns per page" dropdown menu. The dropdown menu contains a list of pre-defined or user-defined page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

INDEX.JSX

```

{% raw %}
import { PivotViewComponent, Pager, Inject } from '@syncfusion/ej2-react-
pivotview';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
import * as React from 'react';

    </PivotViewComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

Customize page size

By using the [rowPageSizes](#) and [columnPageSizes](#) properties in [pagerSettings](#), you can specify a set of desired page sizes, which will be displayed in the "Rows per page" and "Columns per page" dropdowns, allowing you to change the page size for the row and column axes at runtime.

By default, the "Rows per page" dropdown have pre-defined page sizes of **10, 50, 100, and 200**, while the "Columns per page" dropdown have pre-defined page sizes of **5, 10, 20, 50, and 100**.

In the following example, the "Rows per page" dropdown is set with user-defined page sizes of **10, 20, 30, 40, and 50** and the "Columns per page" dropdown is set with user-defined page sizes of **5, 10, 15, 20, and 30**.

Data Compression in React Pivot Table component

This property is applicable only for relational data source.

When binding one million raw data, the pivot table processes all raw data to generate aggregated data during initial rendering and report manipulation. However, with data compression, the input raw data is compressed based on the uniqueness of the raw data, and the final compressed raw data are utilized by the pivot table. The compressed raw data is then used for further operations at all times, reducing the looping complexity and improving the performance of the pivot table. For example, if the pivot table is connected to one million raw data compressed to 1,000 unique raw data, it will render within 3 seconds rather than 10 seconds. You can enable this option by using the [allowDataCompression](#) property along with the [enableVirtualization](#) property.

This options will only function when the virtual scrolling is enabled.

INDEX.JSX

```

import { PivotViewComponent, VirtualScroll, Inject } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
let date1;

height={350} enableVirtualization={true} allowDataCompression={true}
dataSourceSettings={dataSourceSettings}><Inject
services={[VirtualScroll]}/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Limitations during data compression:

- The following aggregation types will not be supported:
- Average
- Populationstdev
- Samplestdev
- Populationvar
- Samplevar
- If you use any of the above aggregations, they will result in the aggregation type **“Sum”**.
- **“DistinctCount”** will act as **“Count”** aggregation type.
- In the calculated field, an existing field can be inserted without altering its default aggregation type. Even if changed, it would revert to the default aggregation type for calculation.

State persistence in React Pivotview component

State persistence allows user to maintain the current state of the component along with its report bounded in the browser local storage (cookie). Even if the browser is refreshed or if you move to the

next page within the browser, components state will be persisted. State persistence stores the Pivot Table object in the local storage when [enablePersistence](#) property is set to **true**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

```

Row and column in React Pivotview component

To learn about how to use the row and column options effectively in the React Pivot Table, watch this video:

Width And Height

Allows end user to set the pivot table's height and width by using [height](#) and [width](#) properties respectively. The supported formats to set [height](#) and [width](#) properties are,

- Pixel: For example - 100, 200, "100px", "200px".
- Percentage: For example - "100%", "200%".
- Auto: It is applicable for [height](#) property alone in-order to render the pivot table beyond its parent container height without vertical scrollbar. The parent container here would show its vertical scrollbar as soon as the component reaches beyond its dimension.

The pivot table will not be displayed less than **400px**, since it's the minimum width of the component.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} width={'100%'}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataSet, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataSet[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} width={'100%'}dataSourceSettings={dataSourceSettings}
></PivotViewComponent>);
};
```

```
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Row Height

Allows end user to set the height of each pivot table rows commonly using the [rowHeight](#) property in [gridSettings](#).

By default, the [rowHeight](#) property is set as **36** pixels for desktop layout and **48** pixels for mobile layout.

The height of the column headers alone may vary when grouping bar feature is enabled.

In the below code sample, the [rowHeight](#) property is set as **60** pixels.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {
        rowHeight: 60
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        rowHeight: 60
    } as GridSettings;
```

```

let dataSourceSettings: IDataOptions = {
  columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
  dataSource: pivotData as IDataset[],
  expandAll: false,
  filters: [],
  formatSettings: [{ name: 'Amount', format: 'C0' }],
  rows: [{ name: 'Country' }, { name: 'Products' }],
  values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
}
let pivotObj: PivotViewComponent;

return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Column Width

Allows end user to set the width of each pivot table columns commonly using the [columnWidth](#) property in [gridSettings](#).

By default, the [columnWidth](#) property is set as **110** pixels to each columns except the first column. For first column, **250** pixels and **200** pixels are set respectively with and without grouping bar.

In the below example, the [columnWidth](#) property is set as **200** pixels.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let gridSettings = {
    columnWidth: 120
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}

```

```
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        columnWidth: 120
    } as GridSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={350} gridSettings={gridSettings} dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Adjust width based on columns

By default, if the component width set in code-behind is more than the width of the total columns, then the columns will be stretched to make it fit. To avoid the stretching, set the [allowAutoResizing](#) property in the [gridSettings](#) to **false**. By doing so, the component will be adjusted (shrunk) based on the width of total columns.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {
        allowAutoResizing: false
    };
    let dataSourceSettings = {
```

```

        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filterSettings: [{ name: 'Year', type: 'Exclude', items: ['FY 2015',

dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Reorder

Allows end user to reorder a particular column header from one index to another index within the pivot table through drag-and-drop option. It can be enabled by setting the [allowReordering](#) property in [gridSettings](#) to **true**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {

    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        allowReordering: true
    } as GridSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
```

```

    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Column Resizing

Allows end user to resize the columns by clicking and dragging the right edge of the column header. While dragging, the width of the respective column will be resized immediately. To enable column resizing option, set the [allowResizing](#) property in [gridSettings](#) to **true**.

By default, the column resizing option is enabled.

In RTL mode, user can click and drag the left edge of the header cell to resize the column.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let gridSettings = {
    allowResizing: true
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-pivotview/src/pivotview/model/gridsettings';
function App() {
  let gridSettings: GridSettings = {
    allowResizing: true
  } as GridSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

In RTL mode, you can click and drag the left edge of the header cell to resize the column.

Text Wrap

Allows end user to wrap the cell content to the next line when it exceeds the boundary of the cell width. To enable text wrap, set the [allowTextWrap](#) property in [gridSettings](#) to **true**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let gridSettings = {
    allowTextWrap: true
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
```

```

        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        allowTextWrap: true
    } as GridSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Text Align

Allows end user to align the content of the pivot table's row and column headers and value cells by using the [textAlign](#) and [headerTextAlign](#) properties in the [columnRender](#) event under [gridSettings](#). The following alignments are:

- **Left** - It allows the content to be positioned on the left.
- **Right** - It allows the content to be positioned on the right.

- **Center** - It allows the content to be positioned in the middle.
- **Justify** - It allows the content to be as flexible as possible, when the cell does not occupy the entire available area.

INDEX.JSX

```

  } as GridSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: true,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  function columnRender(args) {
    for (let i: number = 0; i < args.columns.length; i++) {
      args.columns[i].autoFit = true;
    }
  }

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
gridSettings={gridSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Grid Lines

Allows end user to display cell border for each cells using [gridLines](#) property in [gridSettings](#).

Available mode of grid lines are:

- | Modes | Actions |
- |-----|-----|
- | Both | Displays both the horizontal and vertical grid lines.|
- | None | No grid lines are displayed.|
- | Horizontal | Displays the horizontal grid lines only.|
- | Vertical | Displays the vertical grid lines only.|
- | Default | Displays grid lines based on the theme.|

By default, pivot table renders grid lines in **Both** mode.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let gridSettings = {
    gridLines: 'Vertical'
```

```

    };
    let dataSourceSettings = {
      columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Selection

Selection provides an option to highlight a row or a column or a cell. It can be done through simple mouse down or arrow keys. To enable selection in the pivot table, set the [allowSelection](#) property in [gridSettings](#) to **true**.

The pivot table supports two types of selection that can be set using [type](#) property in [selectionSettings](#). The selection types are:

- **Single:** It is set by default, and it only allows selection of a single row or a column or a cell.
- **Multiple:** Allows you to select multiple rows or columns or cells. To perform multi-selection, press and hold "CTRL" key and click the desired rows or cells. To select range of rows or cells, press and hold the "SHIFT" key and click the rows or columns or cells.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Selection Mode

The pivot table supports four types of selection mode that can be set using [mode](#) in [selectionSettings](#). The selection modes are:

- **Row:** It is set by default, and allows user to select only rows.
- **Column:** Allows user to select only columns.
- **Cell:** Allows user to select only cells.
- **Both:** Allows user to select rows and columns at the same time.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let gridSettings = {
    allowSelection: true,
    selectionSettings: { mode: 'Both' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
```

```

        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        allowSelection: true,
        selectionSettings: { mode: 'Both' }
    } as GridSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Cell Selection Mode

The pivot table supports two types of cell selection mode that can be set using [cellSelectionMode](#) in [selectionSettings](#). The cell selection modes are:

- **Flow:** It is set by default. The range of cells are selected between the start index and end index that includes in-between cells of rows.

- **Box:** Range of cells are selected from the start and end column indexes that includes in-between cells of rows within the range.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {
        allowSelection: true,
        selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple',
mode: 'Cell' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataSet, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
    let gridSettings: GridSettings = {
        allowSelection: true,
        selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple', mode:
'Cell' }
    } as GridSettings;
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataSet[],
        expandAll: false,
```

```

    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Cell selection requires [mode](#) property in [selectionSettings](#) to be **Cell** or **Both**, and [type](#) property should be **Multiple**.

Changing background color of the selected cell

The background-color of the selected cell can be changed using built-in CSS names. To do so, please refer to the code sample below, which shows that the selected cells are changed to a **green yellow** color.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `
.e-pivotview .e-cellselectionbackground,
.e-pivotview .e-selectionbackground,
.e-pivotview .e-grid .e-rowsheader .e-selectionbackground,
.e-pivotview .e-grid .e-columnsheader.e-selectionbackground {
  background-color: greenYellow !important;
}
`;
function App() {
  let gridSettings = {
    allowSelection: true,
    selectionSettings: { cellSelectionMode: 'Box', type: 'Multiple',
mode: 'Cell' }
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<div>

```

```

        <style>{SAMPLE_CSS}</style>
        <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>
    </div>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

    return (
        <div>
            <style>{SAMPLE_CSS}</style>
            <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>
        </div>
    );
};
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('sample'));
```

Event

CellSelected

The event [cellSelected](#) is triggered when cell selection gets completed. It provides selected cells information with its corresponding column and row headers. It has following parameters - `selectedCellsInfo`, `currentCell` and `target`. This event allows user to view selected cells information and user can pass those selected cells information to any external component for data binding.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let gridSettings = {
        allowSelection: true,
        selectionSettings: { mode: 'Both', type: 'Multiple' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],

height={350} dataSourceSettings={dataSourceSettings}
gridSettings={gridSettings}
cellSelecting={onCellSelecting}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Clip Mode

The clip mode provides options to display its overflow cell content in the pivot table. It can be configured using the [clipMode](#) property in [gridSettings](#). The pivot table supports three types of clip modes which are:

- **Clip:** Truncates the cell content when it overflows its area.
- **Ellipsis:** Displays ellipsis when the cell content overflows its area.
- **EllipsisWithTooltip:** Displays ellipsis when the cell content overflows its area, also it will display the tooltip while hover on ellipsis is applied.

By default, [clipMode](#) value is set to **Ellipsis**.

INDEX.JSX

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Cell Template

User can customize the pivot table cell element by using the [cellTemplate](#) property. The [cellTemplate](#) property accepts either an HTML string or the element's ID, which can be used to append additional HTML elements to showcase each cell with custom format.

In this demo, the revenue cost for each year is represented with trend icons.

Events

QueryCellInfo

The event `queryCellInfo` triggers while rendering each row and value cells in the pivot table. It allows the user to customize the current cell like adding or removing styles, editing value, etc. It has the following parameters:

- `cell` - It holds the current cell information.
- `data` - It holds the entire row data besides the current cell.
- `column` - It holds the entire column data besides the current cell.
- `pivotview` - It holds pivot table instance.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('sample'));
```

ColumnRender

The event [columnRender](#) triggers while framing each columns for rendering in the pivot table. It allows the user to customize the text alignment, column visibility, autofit, re-ordering, minimum and maximum width for a specific column. It has the following parameters:

- **columns** - It holds the leaf level columns (i.e., value headers) information.
- **dataSourceSettings** - It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **name** - It holds the name of the event.
- **stackedColumns** - It holds the drilled columns (i.e., including column and value headers) information.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

CellClick

The event [cellClick](#) triggers while clicking a cell in the pivot table. For instance, using this event end-user can either add or remove styles, edit value and also perform any other DOM manipulations. It has the following parameters:

- **currentCell** - It holds the current cell information.
- **data** - It holds the clicked cell's data like axis, formatted text, actual text, row header, column header and value informations.

INDEX.JSX

Show hide totals in React Pivotview component

Show or hide grand totals

Allows to show or hide grand totals in rows and columns using the [showGrandTotals](#) property. To hide the grand totals in rows and columns, set the property [showGrandTotals](#) in [dataSourceSettings](#) to **false**. End user can also hide grand totals for row or columns separately by setting the property [showRowGrandTotals](#) or [showColumnGrandTotals](#) in [dataSourceSettings](#) to **false** respectively.

By default, [showGrandTotals](#), [showRowGrandTotals](#) and [showColumnGrandTotals](#) properties in [dataSourceSettings](#) are set as **true**.

        drilledMembers: [{ name: 'Country', items: ['France' ]}],
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]}/>
</PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

```

    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country', showSubTotals: false }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings} showFieldList={true}
><Inject services={[FieldList]}/> </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Show or hide totals using toolbar

It can also be achieved using built-in toolbar options by setting the [showToolbar](#) property to **true**. Also, include the items **GrandTotal** and **SubTotal** within the [toolbar](#) property. End user can now see "Show/Hide Grand totals" and "Show/Hide Sub totals" icons in toolbar UI automatically.

Hyper link in React Pivotview component

The pivot table supports to show hyperlink option to link data for individual cells that are displayed in the component. Also, the hyperlink can be enabled separately for row headers, column headers, value cells, and summary cells using the [hyperlinkSettings](#). It can be configured through code behind, during initial rendering and the settings available to show hyperlink are:

- [showHyperlink](#): It allows to set the visibility of hyperlink in all cells.
- [showRowHeaderHyperlink](#): It allows to set the visibility of hyperlink in row headers.
- [showColumnHeaderHyperlink](#): It allows to set the visibility of hyperlink in column headers.
- [showValueCellHyperlink](#): It allows to set the visibility of hyperlink in value cells.
- [showSummaryCellHyperlink](#): It allows to set the visibility of hyperlink in summary cells.
- [headerText](#): It allows to set the visibility of hyperlink based on header text.
- [conditionalSettings](#): It allows to set the visibility of hyperlink based on specific condition.

By default, the hyperlink options are disabled for all cells in the pivot table.

User defined style can be applied to hyperlink using [cssClass](#) property in [hyperlinkSettings](#).

Hyperlink for all cells

The pivot table has an option to show hyperlink option for all cells that are currently in display. To do so, user need to set [showHyperlink](#) to **true**.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

```

Condition based hyperlink

The pivot table has an option to show hyperlink option to the cells based on specific conditions. It can be configured using the [conditionalSettings](#) option through code behind, during initial rendering. The settings required to sort are:

- [measure](#): Specifies the value field name to get visibility of hyperlink option for specific measure.
- [conditions](#): Specifies the operator type such as equals, greater than, less than, etc.
- [value1](#): Specifies the start value.
- [value2](#): Specifies the end value.

```

Event

The event [hyperlinkCellClick](#) fires on every hyperlink cell click.

It has following parameters - **Cancel** and **CurrentCell**. The parameter **CurrentCell** is used to customize the host cell element by any means. Meanwhile, when the parameter **Cancel** is set to **true**, applied customization will not be updated to the host cell element.

INDEX.JSX

Tool bar in React Pivotview component

A toolbar option has been provided to the pivot controls. It allows users access the frequently used features easily. Users also can save the state of the pivot table and load it back whenever required using this option. This option can be enabled by setting the `showToolbar` property to true. The [toolbar](#) property accepts the collection of built-in toolbar options.

To use the toolbar, inject the `Toolbar` module into the pivot table.

Built-in toolbar options

Built-in toolbar options can be added by defining the [toolbar](#) as a collection of built-in options.

The following table shows built-in toolbar options and its actions.

Built-in Toolbar Options	Actions
----- -----	
New	Creates a new report

- | Save | Saves the current report |
- | Save As | Save as current report |
- | Rename | Renames the current report |
- | Delete | Deletes the current report |
- | Load | Loads any report from the report list |
- | Grid | Shows pivot table |
- | Chart | Shows a chart in any type from the built-in list and option to enable/disable multiple axes|
- | Exporting | Exports the pivot table as PDF/Excel/CSV |
- | Sub total | Shows or hides sub totals |
- | Grand total | Shows or hides grand totals |
- | Conditional Formatting | Shows the conditional formatting pop-up to apply formatting |
- | Number Formatting | Shows the number formatting pop-up to apply number formatting |
- | Fieldlist | Shows the fieldlist pop-up |
- | MDX | Shows the MDX query that was run to retrieve data from the OLAP data source. **NOTE: This applies only to the OLAP data source.** |

Report manipulation like save, load, rename, etc., operations can be performed through events. In the following example, the localStorage (session storage) is used to manipulate the report operation.

saveReport={saveReport.bind(this)}><Inject services={[FieldList,
CalculatedField, Toolbar, PDFExport, ExcelExport, ConditionalFormatting,
NumberFormatting]} /></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

```
{% endraw %}
```

Show desired chart types in the dropdown menu

By default, all chart types are displayed in the dropdown menu included in the toolbar. However, based on the request for an application, we may need to show selective chart types on our own. This can be achieved using the [chartTypes](#) property. To know more about supporting chart types, [click here](#).

INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent, Inject, Toolbar } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData,
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' } ]
  };
  let pivotObj;
  let toolbarOptions = ['Grid', 'Chart'];
  let chartTypes = ['Column', 'Bar', 'Line', 'Area'];
  return (<PivotViewComponent id='PivotView'
    dataSourceSettings={dataSourceSettings} width={100%} height={350}
    showToolbar={true} toolbar={toolbarOptions} displayOption={{ view: 'Both' }}
    chartTypes={chartTypes}><Inject
    services={[Toolbar]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
  PivotViewComponent, IDataOptions, Inject, Toolbar
} from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: pivotData as IDataset[],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  };
  let pivotObj;
  let toolbarOptions = ['Grid', 'Chart'];
  let chartTypes = ['Column', 'Bar', 'Line', 'Area'];
  return (<PivotViewComponent id='PivotView'
    dataSourceSettings={dataSourceSettings} width={100%} height={350}
    showToolbar={true} toolbar={toolbarOptions} displayOption={{ view: 'Both' }}
    chartTypes={chartTypes}><Inject
    services={[Toolbar]}/></PivotViewComponent>);
}

};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

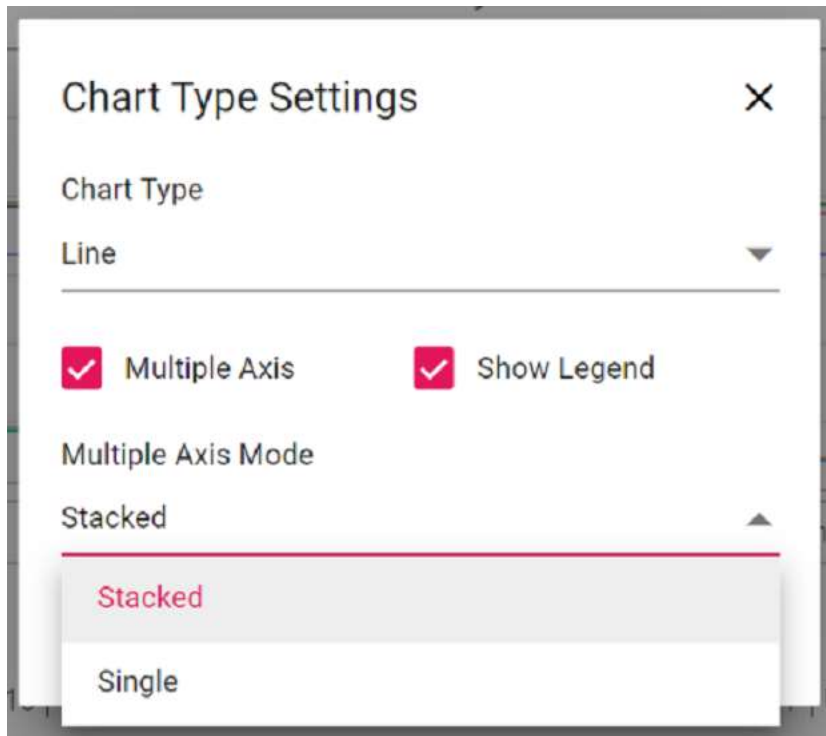

Switch the chart to multiple axes

In the chart, the user can switch from single axis to multiple axes with the help of the built-in checkbox available inside the chart type dropdown menu in the toolbar. For more information [refer here](#).

<!-- markdownlint-disable MD009 -->

There are two modes available in **Multiple Axis** option: **Stacked** and **Single**. The modes can be changed using “Multiple Axis Mode” drop-down list which appears while clicking the **More...** option.

Show or hide legend

In the chart, legend can be shown or hidden dynamically with the help of the built-in option available in the chart type drop-down menu.

By default, the legend is not be visible for the accumulation chart types like pie, doughnut, pyramid, and funnel. Users can enable or disable using the built-in checkbox option.

Adding custom option to the toolbar

In addition to the existing built-in toolbar items, new toolbar item(s) may also be included. This can be achieved by using the [toolbarRender](#) event. The action of the new toolbar item(s) can also be defined within this event.

The new toolbar item(s) can be added to the desired position in the toolbar using the `splice` option.

INDEX.JSX

```
{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent, Inject, Toolbar } from '@syncfusion/ej2-react-pivotview';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' } ]
    };
    let pivotObj;
    let toolbarOptions = ['Expand/Collapse'];
    function beforeToolbarRender(args) {
        args.customToolbar.splice(12, 0, {
            prefixIcon: 'e-tool-expand e-icons', tooltipText: 'Expand/Collapse',
            click: toolbarClicked.bind(this),
        });
    }
    function toolbarClicked(args) {
        pivotObj.dataSourceSettings.expandAll = !pivotObj.dataSourceSettings.expandAll;
    }
    return (<PivotViewComponent id='PivotView' ref={d => pivotObj = d}
        dataSourceSettings={dataSourceSettings} width={'100%'} height={350}
        gridSettings={{ columnWidth: 140 }} showToolbar={true} displayOption={{
            view: 'Both' }} toolbar={toolbarOptions}
        toolbarRender={beforeToolbarRender.bind(this)}><Inject
            services={[Toolbar]}></PivotViewComponent>);
}
;

      click: toolbarClicked.bind(this),
    });
  }
  function toolbarClicked(args: any): void {
    pivotObj.dataSourceSettings.expandAll =
!pivotObj.dataSourceSettings.expandAll;
  }

  return (<PivotViewComponent id='PivotView' ref={d => pivotObj = d}
dataSourceSettings={dataSourceSettings} width={'100%'} height={350}
gridSettings={{ columnWidth: 140 }} showToolbar={true} displayOption={{
view: 'Both' }} toolbar={toolbarOptions}
toolbarRender={beforeToolbarRender.bind(this)}><Inject services={[Toolbar]}
/></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
{% endraw %}

```

In the above topic, we have seen how to add an icon as one of the toolbar item in toolbar panel. In the next topic, we are going to see how to frame the entire toolbar panel and how to add a custom control in it.

Toolbar Template

It allows to customize the toolbar panel by using template option. It allows any custom control to be used as one of the toolbar item inside the toolbar panel. It can be achieved by two ways,

Here, the entire toolbar panel can be framed in HTML elements that are appended at the top of the pivot table. The **id** of the HTML element needs to be set in the [toolbarTemplate](#) property in-order to map it to the pivot table.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

import { PivotViewComponent, Inject, Toolbar } from '@syncfusion/ej2-react-pivotview';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };
    let pivotObj;
    let toolbarOptions = '#template';
    return (<div><div><PivotViewComponent id='PivotView' ref={d => pivotObj = d} dataSourceSettings={dataSourceSettings} width={'100%'} height={350} showToolbar={true} toolbarTemplate={toolbarOptions}><Inject services={[Toolbar]}></PivotViewComponent></div><div id='template'><div><ButtonComponent id='expandall' cssClass="e-flat e-primary" onClick={expandAll.bind(this)}>EXPAND ALL</ButtonComponent><ButtonComponent id='collapseall' cssClass="e-flat e-primary" onClick={collapseAll.bind(this)}>COLLAPSE ALL</ButtonComponent></div></div></div>);
    function expandAll() {
        pivotObj.dataSourceSettings.expandAll = true;
    }
    function collapseAll() {
        pivotObj.dataSourceSettings.expandAll = false;
    }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    PivotViewComponent, IDataOptions, Inject, Toolbar
} from '@syncfusion/ej2-react-pivotview';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData as IDataset[],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;

```

```

let toolbarOptions: any = '#template';

return (<div><div><PivotViewComponent id='PivotView' ref={d => pivotObj
= d} dataSourceSettings={dataSourceSettings} width={'100%'} height={350}
showToolbar={true} toolbarTemplate={toolbarOptions} ><Inject services={[
Toolbar]} /></PivotViewComponent></div><div
id='template'><div><ButtonComponent id='expandall' cssClass="e-flat e-
primary" onClick={expandAll.bind(this)}>EXPAND
ALL</ButtonComponent><ButtonComponent id='collapseall' cssClass="e-flat e-
primary" onClick={collapseAll.bind(this)}>COLLAPSE
ALL</ButtonComponent></div></div></div>);

function expandAll() {
    pivotObj.dataSourceSettings.expandAll=true;
}
function collapseAll() {
    pivotObj.dataSourceSettings.expandAll=false;
}
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Another option allows to frame a custom toolbar item using HTML elements and include in the toolbar panel at the desired position. The custom toolbar items can be declared as control **instance** or element **id** in the [toolbar](#) property in pivot table.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PivotViewComponent, Inject, Toolbar } from '@syncfusion/ej2-react-pivotview';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    };
    let pivotObj;
    let toolbarOptions = [{ template: '#enablertl' }, { template:
'#disablertl' }];
    return (<div><div><PivotViewComponent id='PivotView' ref={d => pivotObj
= d} dataSourceSettings={dataSourceSettings} width={'100%'} height={350}
showToolbar={true} toolbar={toolbarOptions}><Inject
services={[Toolbar]} /></PivotViewComponent></div><div><ButtonComponent
id='enablertl' cssClass="e-flat e-primary"
onClick={enableRtl.bind(this)}>ENABLE
RTL</ButtonComponent></div><div><ButtonComponent id='disablertl'
cssClass="e-flat e-primary" onClick={disableRtl.bind(this)}>DISABLE
RTL</ButtonComponent></div></div>);
    function enableRtl() {

```

```

        pivotObj.enableRtl = true;
    }
    function disableRtl() {
        pivotObj.enableRtl = false;
    }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import {
    PivotViewComponent, IDataOptions, Inject, Toolbar
} from '@syncfusion/ej2-react-pivotview';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    };
    let pivotObj: PivotViewComponent;
    let toolbarOptions: any = [{template: '#enablertl'},
{template: '#disablertl'}];

    return (<div><div><PivotViewComponent id='PivotView' ref={d => pivotObj
= d} dataSourceSettings={dataSourceSettings} width={'100%'} height={350}
showToolbar={true} toolbar={toolbarOptions} ><Inject services={[ Toolbar]}
/></PivotViewComponent></div><div><ButtonComponent id='enablertl'
cssClass="e-flat e-primary" onClick={enableRtl.bind(this)}>ENABLE
RTL</ButtonComponent></div><div><ButtonComponent id='disablertl'
cssClass="e-flat e-primary" onClick={disableRtl.bind(this)}>DISABLE
RTL</ButtonComponent></div></div>);
    function enableRtl() {
        pivotObj.enableRtl=true;
    }
    function disableRtl() {
        pivotObj.enableRtl=false;
    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Note: For both options, the actions for the toolbar template items can be defined in the event [toolbarClick](#). Also, if the toolbar item is a custom control then its built-in events can also be accessed.

<!-- markdownlint-disable MD009 -->

Save and load report as a JSON file

The current pivot report can be saved as a JSON file in the desired path and loaded back to the pivot table at any time.

Save and load reports to a SQL database

SQL Server is a relational database management system (RDBMS) that can be used to store and manage large amounts of data. In this topic, we will see how to save, save as, rename, load, delete, and add reports between a SQL Server database and a React Pivot Table at runtime.

Create a Web API service to connect to a SQL Server database

1. Open Visual Studio and create an ASP.NET Core Web App project type, naming it **MyWebService**. To create an ASP.NET Core Web application, follow the document [link](#).

Configure your new project

ASP.NET Core Web App C# Linux macOS Windows Cloud Service Web

Project name

MyWebService

Location

C:\Users\username\source\repos

Solution name ⓘ

MyWebService

☐ Place solution and project in the same directory

Back Next

2. To connect a SQL Server database using the Microsoft SqlClient in our application, we need to install the [Microsoft.Data.SqlClient](#) NuGet package. To do so, open the NuGet package manager of the project solution, search for the package **Microsoft.Data.SqlClient** and install it.

3. Under the **Controllers** folder, create a Web API controller (aka, PivotController.cs) file that aids in data communication with the Pivot Table.

4. In the Web API Controller (aka, PivotController), the **OpenConnection** method is used to connect to the SQL database. The **GetDataTable** method then processes the specified SQL query string, retrieves data from the database, and converts it into a **DataTable** using **SqlCommand** and **SqlDataAdapter**. This **DataTable** can be used to retrieve saved reports and modify them further as shown in the code block below.

[PivotController.cs]

```
`csharp
using Microsoft.AspNetCore.Mvc;
using Microsoft.Data.SqlClient;
using System.Data;
namespace MyWebService.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpPost]
```

```
[Route("Pivot/SaveReport")]
public void SaveReport([FromBody] Dictionary<string, string> reportArgs)
{
    SaveReportToDB(reportArgs["reportName"], reportArgs["report"]);
}
[HttpPost]
[Route("Pivot/FetchReport")]
public IActionResult FetchReport()
{
    return Ok((FetchReportListFromDB()));
}
[HttpPost]
[Route("Pivot/LoadReport")]
public IActionResult LoadReport([FromBody] Dictionary<string, string> reportArgs)
{
    return Ok((LoadReportFromDB(reportArgs["reportName"])));
}
[HttpPost]
[Route("Pivot/RemoveReport")]
public void RemoveReport([FromBody] Dictionary<string, string> reportArgs)
{
    RemoveReportFromDB(reportArgs["reportName"]);
}
[HttpPost]
[Route("Pivot/RenameReport")]
public void RenameReport([FromBody] RenameReportDB reportArgs)
{
    RenameReportInDB(reportArgs.ReportName, reportArgs.RenameReport, reportArgs.isReportExists);
}
public class RenameReportDB
{
    public string ReportName { get; set; }
    public string RenameReport { get; set; }
```

```
public bool isReportExists { get; set; }
}

private void SaveReportToDB(string reportName, string report)
{
    SqlConnection sqlConn = OpenConnection();
    bool isDuplicate = true;
    SqlCommand cmd1 = null;
    foreach (DataRow row in GetDataTable(sqlConn).Rows)
    {
        if ((row["ReportName"] as string).Equals(reportName))
        {
            isDuplicate = false;
            cmd1 = new SqlCommand("update ReportTable set Report=@Report where ReportName like
@ReportName", sqlConn);
        }
    }
    if (isDuplicate)
    {
        cmd1 = new SqlCommand("insert into ReportTable (ReportName,Report)
Values(@ReportName,@Report)", sqlConn);
    }
    cmd1.Parameters.AddWithValue("@ReportName", reportName);
    cmd1.Parameters.AddWithValue("@Report", report.ToString());
    cmd1.ExecuteNonQuery();
    sqlConn.Close();
}

private string LoadReportFromDB(string reportName)
{
    SqlConnection sqlConn = OpenConnection();
    string report = string.Empty;
    foreach (DataRow row in GetDataTable(sqlConn).Rows)
    {
        if ((row["ReportName"] as string).Equals(reportName))
        {

```

```
report = (string)row["Report"];
break;
}
}
sqlConn.Close();

```

5. When you run the app, it will be hosted at <https://localhost:44313>. You can use the hosted URL to save and load reports in the SQL database from the Pivot Table.

Further, let us explore more on how to save, load, rename, delete, and add reports using the built-in toolbar options via Web API controller (aka, PivotController) one-by-one.

[Saving a report](#)

When you select the **“Save a report”** option from the toolbar, the [saveReport](#) event is triggered. In this event, an AJAX request is made to the Web API controller's **SaveReport** method, passing the name of the current report and the current report, which you can use to check and save in the SQL database.

For example, the report shown in the following code snippet will be passed to the **SaveReport** method along with the report name **“Sample Report”** and saved in the SQL database.

```

[App.js]
`js
import React, { Component } from 'react';
import './index.css';
import './App.css';

```

```
import { PivotViewComponent, Inject, FieldList, CalculatedField, Toolbar, PDFExport, ExcelExport,
ConditionalFormatting, NumberFormatting } from '@syncfusion/ej2-react-pivotview';

export default class App extends Component {
  static displayName = App.name;

  dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
    dataSource: this.getPivotData(),
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
  };

  toolbarOptions = ['New', 'Save', 'SaveAs', 'Rename', 'Remove', 'Load',
'Grid', 'Chart', 'Export', 'SubTotal', 'GrandTotal', 'Formatting', 'FieldList'];

  chartSettings = { title: 'Sales Analysis' };

  gridSettings = { columnWidth: 140 };

  displayOption = { view: 'Both' };

  saveReport(args) {
    var report = JSON.parse(args.report);
    report.dataSourceSettings.dataSource = [];
    fetch('https://localhost:44313/Pivot/SaveReport', {
      method: 'POST',
      headers: {
        'Accept': 'application/json',
        'Content-Type': 'application/json',
      },
      body: JSON.stringify({ reportName: args.reportName, report: JSON.stringify(report) })
    }).then(response => {
      this.fetchReport();
    });
  }

  render() {
```

```

return (<PivotViewComponent id='PivotView' ref={(scope) => { this.pivotObj = scope; }}
dataSourceSettings={this.dataSourceSettings} width={'100%'} height={'450'} showFieldList={true}
gridSettings={this.gridSettings} allowExcelExport={true} allowNumberFormatting={true}
allowConditionalFormatting={true} allowPdfExport={true} showToolbar={true}
allowCalculatedField={true} displayOption={this.displayOption} toolbar={this.toolbarOptions}
newReport={this.newReport.bind(this)} renameReport={this.renameReport.bind(this)}
removeReport={this.removeReport.bind(this)} loadReport={this.loadReport.bind(this)}
fetchReport={this.fetchReport.bind(this)} saveReport={this.saveReport.bind(this)}
toolbarRender={this.beforeToolbarRender.bind(this)} chartSettings={this.chartSettings}>

<Inject services={[FieldList, CalculatedField, Toolbar, PDFExport, ExcelExport, ConditionalFormatting,
NumberFormatting]} />

</PivotViewComponent>;
}
}
,

```

[PivotController.cs]

```

`csharp
namespace MyWebApp.Controllers
{
    [ApiController]
    [Route("[controller]")]
    public class PivotController : ControllerBase
    {
        [HttpPost]
        [Route("Pivot/SaveReport")]
        public void SaveReport([FromBody] Dictionary<string, string> reportArgs)
        {
            SaveReportToDB(reportArgs["reportName"], reportArgs["report"]);
        }
        private void SaveReportToDB(string reportName, string report)
        {
            SqlConnection sqlConn = OpenConnection();
            bool isDuplicate = true;
            SqlCommand cmd1 = null;
            foreach (DataRow row in GetDataTable(sqlConn).Rows)
            {

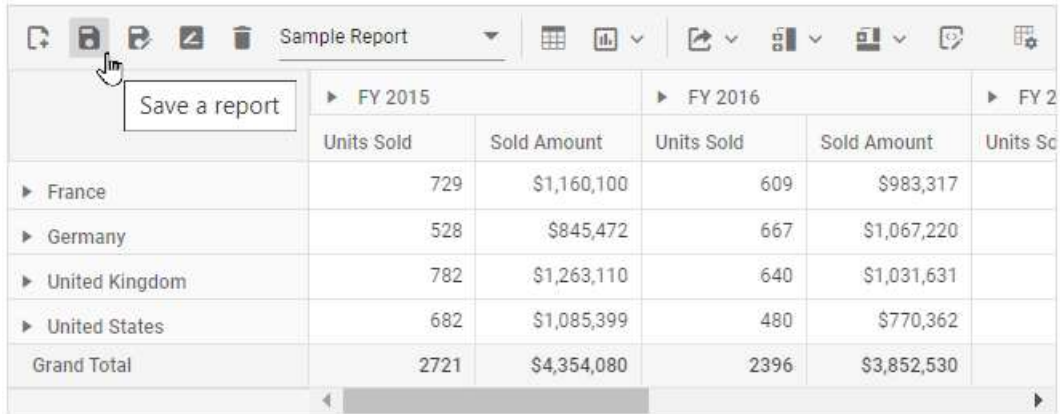

```

```
if ((row["ReportName"] as string).Equals(reportName))
{
    isDuplicate = false;
    cmd1 = new SqlCommand("update ReportTable set Report=@Report where ReportName like
    @ReportName", sqlConn);
}
}
if (isDuplicate)
{
    cmd1 = new SqlCommand("insert into ReportTable (ReportName,Report)
    Values(@ReportName,@Report)", sqlConn);
}
cmd1.Parameters.AddWithValue("@ReportName", reportName);
cmd1.Parameters.AddWithValue("@Report", report.ToString());
cmd1.ExecuteNonQuery();
sqlConn.Close();
}
private SqlConnection OpenConnection()
{
    // Replace with your own connection string.
    string connectionString = @"<Enter your valid connection string here>";
    SqlConnection sqlConn = new SqlConnection(connectionString);
    sqlConn.Open();
    return sqlConn;
}
private DataTable GetDataTable(SqlConnection sqlConn)
{
    string xquery = "select * from ReportTable";
    SqlCommand cmd = new SqlCommand(xquery, sqlConn);
    SqlDataAdapter da = new SqlDataAdapter(cmd);
    DataTable dt = new DataTable();
    da.Fill(dt);
    return dt;
}
```

```

}
}
,

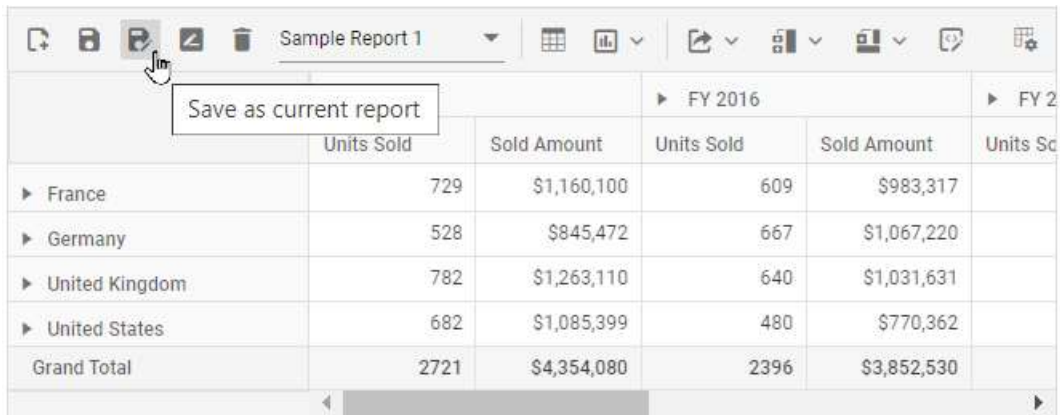

```

The screenshot shows the React Pivotview toolbar with the 'Save a report' button highlighted. A tooltip labeled 'Save a report' is visible. Below the toolbar, a pivot table is displayed with the following data:

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
France	729	\$1,160,100	609	\$983,317	
Germany	528	\$845,472	667	\$1,067,220	
United Kingdom	782	\$1,263,110	640	\$1,031,631	
United States	682	\$1,085,399	480	\$770,362	
Grand Total	2721	\$4,354,080	2396	\$3,852,530	

In the meantime, you can save a duplicate of the current report to the SQL Server database with a different name by selecting **“Save as current report”** from the toolbar. The [saveReport](#) event will then be triggered with the new report name **“Sample Report 1”** and the current report. You can save them to the SQL Server database after passing them to the Web API service, as mentioned above.

The screenshot shows the React Pivotview toolbar with the 'Save as current report' button highlighted. A tooltip labeled 'Save as current report' is visible. Below the toolbar, a pivot table is displayed with the following data:

	FY 2015		FY 2016		FY 2017
	Units Sold	Sold Amount	Units Sold	Sold Amount	Units Sold
France	729	\$1,160,100	609	\$983,317	
Germany	528	\$845,472	667	\$1,067,220	
United Kingdom	782	\$1,263,110	640	\$1,031,631	
United States	682	\$1,085,399	480	\$770,362	
Grand Total	2721	\$4,354,080	2396	\$3,852,530	

Loading a report

When you select the dropdown menu item from the toolbar, the [loadReport](#) event is triggered. In this event, an AJAX request is made to the **LoadReport** method of the Web API controller, passing the name of the selected report. The method uses this information to search for the report in the SQL database, fetch it, and load it into the pivot table.

For example, if the report name **“Sample Report 1”** is selected from a dropdown menu and passed, the **LoadReport** method will use that name to search for the report in the SQL database, retrieve it, and then load it into the pivot table.

[App.js]

```
`js
```

```
import React, { Component } from 'react';

Renaming a report

When you select the **“Rename a current report”** option from the toolbar, the [renameReport](#) event is triggered. In this event, an AJAX request is made to the **RenameReport** method of the Web API controller, passing the current and new report names, where you can use the current report name to identify the report and resave it with the new report name in the SQL database.

For example, if we rename the current report from **“Sample Report 1”** to **“Sample Report 2”**, both **“Sample Report 1”** and **“Sample Report 2”** will be passed to the **RenameReport** method, which will rename the current report with the new report name **“Sample Report 2”** in the SQL database.

Grand Total	2721	\$4,354,080	2396	\$3,852,530	

Deleting a report

When you select the **“Delete a current report”** option from the toolbar, the [removeReport](#) event is triggered. In this event, an AJAX request is made to the **RemoveReport** method of the Web API controller, passing the current report name to identify and delete the appropriate report from the SQL database.

Note: * If the current report **n** from the pivot table is deleted, the pivot table will automatically load the last report from the report list.

* When a report is removed from a pivot table with only one report, the SQL database refreshes; however, the pivot table will continue to show the removed report until a new report is added to the pivot table.

For example, if we delete the current report **“Sample Report 2”** from the pivot table, the current report name **“Sample Report 2”** is passed to the **RemoveReport** method, which allows you to identify and delete the report from the SQL database.

[App.js]

```

`js

Adding a report

When you select the “**Create a new report**” option from the toolbar, the [newReport](#) event is triggered, followed by the [saveReport](#) event. To save this new report to the SQL database, use the [saveReport](#) event triggered later, and then follow the save report briefing in the preceding [topic](#).

Limitations with respect to report manipulation

Below points need to be considered when saving the report to SQL Server database.

- **Data source:** Both raw data and aggregated data won't be saved and loaded from the database.
- **Hyperlinks:** Option to link external facts via pivot table cells won't be saved and loaded from the database.
- The pivot table should always load reports from the SQL database based on the data source that is currently bound to it.

In [this](#) GitHub repository, you can find our React Pivot Table sample and ASP.NET Core Web Application to save and load reports from SQL Server database.

Events

FetchReport

The event [fetchReport](#) is triggered when dropdown list is clicked in the toolbar in-order to retrieve and populate saved reports. It has following parameter - `reportName`. This event allows user to fetch the report names from local storage and populate the dropdown list.

LoadReport

The event [loadReport](#) is triggered when a report is selected from the dropdown list in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to load the selected report to the pivot table.

NewReport

The event [newReport](#) is triggered when the new report icon is clicked in the toolbar. It has following parameter - `report`. This event allows user to create new report and add to the report list.

RenameReport

The event [renameReport](#) is triggered when rename report icon is clicked in the toolbar. It has following parameters - `rename`, `report` and `reportName`. This event allows user to rename the selected report from the report list.

RemoveReport

The event [removeReport](#) is triggered when remove report icon is clicked in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to remove the selected report from the report list.

SaveReport

The event [saveReport](#) is triggered when save report icon is clicked in the toolbar. It has following parameters - `report` and `reportName`. This event allows user to save the altered report to the report list.

ToolbarRender

The [toolbarRender](#) event is triggered when the toolbar is rendered. It has the `customToolbar` parameter. This event helps to customize the built-in toolbar items and to [include new toolbar item\(s\)](#).

{% endraw %}

```

BeforeExport

The pivot table (or) pivot chart can be exported as a pdf, excel, csv etc., document using the toolbar options. And, you can customize the export settings for exporting document by using the [beforeExport](#) event in the toolbar.

For example, you can add the header and footer for the pdf document by setting the **header** and **footer** properties for the **pdfExportProperties** in the [beforeExport](#) event.

{% endraw %}
```

ActionBegin

The event [actionBegin](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI begin. This allows user to identify the current action being performed at runtime. It has the following parameters:

- **dataSourceSettings**: It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName**: It holds the name of the current action began. The following are the UI actions and their names:

Action	Action Name
-----	-----
New report	Add new report
Save report	Save current report
Save as report	Save as current report
Rename report	Rename current report
Remove report	Remove current report
Report change	Report change
Conditional Formatting	Open conditional formatting dialog
Number Formatting	Open number formatting dialog
Export menu	PDF export, Excel export, CSV export
Show Fieldlist	Open field list
Show Table	Show table view
Chart menu	Show chart view
Sub-totals menu	Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals
Grand totals menu	Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals

- **cancel**: It allows user to restrict the current action.

In the below sample, toolbar UI actions such as add new report and save current report can be restricted by setting the **args.cancel** option to **true** in the **actionBegin** event.

ActionComplete

The event [actionComplete](#) triggers when the UI actions such as switching between pivot table and pivot chart, changing chart types, conditional formatting, exporting, etc. that are present in toolbar UI, is completed. This allows user to identify the current UI actions being completed at runtime. It has the following parameters:

- **dataSourceSettings:** It holds the current data source settings such as input data source, rows, columns, values, filters, format settings and so on.
- **actionName:** It holds the name of the current action completed. The following are the UI actions and their names:

| Action | Action Name |

|-----|-----|

| New report | New report added |

| Save report | Report saved |

| Save as report | Report re-saved |

| Rename report | Report renamed |

| Remove report | Report removed |

| Report change | Report changed |

| Conditional Formatting | Conditionally formatted |

| Number Formatting | Number formatted |

| Export menu | PDF exported, Excel exported, CSV exported |

| Show Fieldlist | Field list closed |

| Show Table | Table view shown |

| Sub-totals menu | Sub-totals hidden, Row sub-totals shown, Column sub-totals shown, Sub-totals shown |

| Grand totals menu | Grand totals hidden, Row grand totals shown, Column grand totals shown, Grand totals shown |

- **actionInfo**: It holds the unique information about the current UI action. For example, while adding new report, the event argument contains information such as report name and the action name.

```

ActionFailure

The event [actionFailure](#) triggers when the current UI action fails to achieve the desired result. It has the following parameters:

- **actionName**: It holds the name of the current action failed. The following are the UI actions and their names:

Action	Action Name
-----	-----
New report	Add new report
Save report	Save current report
Save as report	Save as current report
Rename report	Rename current report
Remove report	Remove current report
Report change	Report change
Conditional Formatting	Open conditional formatting dialog
Number Formatting	Open number formatting dialog
Export menu	PDF export, Excel export, CSV export
Show Fieldlist	Open field list
Show Table	Show table view
Chart menu	Show chart view
Sub-totals menu	Hide sub-totals, Show row sub-totals, Show column sub-totals, Show sub-totals

| Grand totals menu | Hide grand totals, Show row grand totals, Show column grand totals, Show grand totals |

- **errorInfo**: It holds the error information of the current UI action.

export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Tooltip Template

User can design their own tooltip by setting the property [tooltipTemplate](#) with own HTML elements. The property accepts both HTML string and ID attribute. The following place holders are available to display its dynamic values inside the HTML elements.

`${rowHeaders}` – Row headers of the selected value cell.

`${columnHeaders}` – Column headers of the selected value cell.

`${rowFields}` – Row fields of the selected value cell.

`${columnFields}` – Column fields of the selected value cell.

`${valueField}` – Field name of the selected value cell.

`${aggregateType}` – Aggregate type of the selected value cell.

`${value}` - Formatted value of the selected value cell.

The tooltip customization is common for both pivot table and pivot chart or it can be done individually as well. To customize the pivot table tooltip, the above procedure needs to be followed. To customize the pivot chart tooltip alone use `template` property of tooltip under [chartSettings](#).

In the below sample, the pivot table and pivot chart shows customized tooltip layouts.

INDEX.JSX

```

{% raw %}
import { Inject, PivotViewComponent, Toolbar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let toolbarOptions = ['Grid', 'Chart'];
    let chartSettings = {
        chartSeries: { type: 'Column', animation: { enable: false } },
        tooltip: { template: '<span class="wrap">${aggregateType} of
${valueField}: ${value}</span>' }
    };
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
    };
    let pivotObj;

```

```

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} showTooltip={true} dataSourceSettings={dataSourceSettings}
chartSettings={chartSettings} displayOption={{ view: 'Both' }}

Css customization in React Pivotview component

Hiding Axis

The visibility of row, column, value and filter axis in Field List and Grouping Bar can be changed using custom CSS setting. To do so, please refer the code sample below:

INDEX.JSX

```
import { CalculatedField, FieldList, Inject, PivotViewComponent, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `
/* Hiding column axis in grouping bar */
#PivotView .e-group-columns {
    display: none;
}
/* Increasing filter axis height to fill column axis portion */
#PivotView .e-group-filters {
    min-height: 74.67px !important;
}
/* Hiding column axis in field list */
.e-pivotfieldlist-wrapper .e-field-list-columns {
    display: none;
}
/* Increasing value axis height to fill column axis portion */
.e-pivotfieldlist-wrapper .e-field-list-values {
    margin-top: 0px !important;
    min-height: 338px !important;
}
.e-pivotfieldlist-wrapper .e-values {
    height: 310px !important;
}
/* Hiding row axis in grouping bar */
// #PivotView .e-group-rows {
//     display: none;
// }
/* Hiding row axis in field list */
// .e-pivotfieldlist-wrapper .e-field-list-rows {
//     display: none;
// }
/* Hiding value axis in grouping bar */
// #PivotView .e-group-values {
//     display: none;
// }
/* Hiding value axis in field list */

        </div>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Text Alignment

The alignment of text inside row headers, column headers, value cells and summary cells can be changed using custom CSS setting. To do so, please refer the code sample below:

INDEX.JSX

```
import { CalculatedField, FieldList, Inject, PivotViewComponent, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `
//Value Cells
.e-pivotview .e-valuescontent {
    text-align: center !important;
}
//Columns Headers
/* .e-pivotview .e-columnsheader {
    text-align: center !important;
}
//Rows Headers
.e-pivotview .e-rowsheader {
    text-align: center !important;
}*/
//Summary Cells
/* .e-pivotview .e-summary {
    text-align: center !important;
}*/`;
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (
        <div>
            <style>{SAMPLE_CSS}</style>
            <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
            height={350} dataSourceSettings={dataSourceSettings}
            allowCalculatedField={true} showFieldList={true}
            showGroupingBar={true}><Inject services={[CalculatedField, FieldList, GroupingBar]}> </PivotViewComponent>
        </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```

import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `
//Value Cells
.e-pivotview .e-valuescontent {
    text-align: center !important;
}
//Columns Headers
/* .e-pivotview .e-columnsheader {
    text-align: center !important;
}
//Rows Headers
.e-pivotview .e-rowsheader {
    text-align: center !important;
}*/
//Summary Cells
/* .e-pivotview .e-summary {
    text-align: center !important;
}*/`;
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;
    return (
        <div>
            <style>{SAMPLE_CSS}</style>
            <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}
showGroupingBar={true}><Inject services={[CalculatedField, FieldList,
GroupingBar]}></PivotViewComponent>
        </div>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Customize header, value and summary cell style

The elements in pivot table like header cell, value cell and summary cell style can be customized using built-in CSS names. To do so, please refer the code sample below:

INDEX.JSX

```

import { CalculatedField, FieldList, Inject, PivotViewComponent, GroupingBar
} from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `
  //Value Cells
  .e-pivotview .e-summary:not(.e-gtot) {
    background-color: pink !important;
  }
  //Columns Headers
  /*.e-pivotview .e-headercell {
    background-color: thistle !important;
  }
  //Rows Headers
  .e-pivotview .e-rowsheader {
    background-color: skyblue !important;
  }*/
  //Summary Cells
  /*.e-pivotview .e-gtot {
    background-color: greenYellow !important;
  }*/`;
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<div>
    <style>{SAMPLE_CSS}</style>
    <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}
showGroupingBar={true}><Inject services={[CalculatedField, FieldList,
GroupingBar]}></PivotViewComponent>
    </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { CalculatedField, FieldList, IDataOptions, IDataset, Inject,
PivotViewComponent, GroupingBar } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
const SAMPLE_CSS = `

```

```

//Value Cells
.e-pivotview .e-summary:not(.e-gtot) {
    background-color: pink !important;
}
//Columns Headers
/* .e-pivotview .e-headercell {
    background-color: thistle !important;
}
//Rows Headers
.e-pivotview .e-rowsheader {
    background-color: skyblue !important;
}*/
//Summary Cells
/* .e-pivotview .e-gtot {
    background-color: greenYellow !important;
}*/;
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;

    return (
        <div>
            <style>{SAMPLE_CSS}</style>
            <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
allowCalculatedField={true} showFieldList={true}
showGroupingBar={true}><Inject services={[CalculatedField, FieldList,
GroupingBar]}> </PivotViewComponent>
        </div>
    )
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Printing and Exporting

Print in React Pivotview component

The rendered pivot table can be printed directly from the browser by invoking the [print](#) method from the grid's instance. The below sample code illustrates the print option being invoked by an external button click.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

import { pivotData } from './datasource';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [
      { name: 'Year', caption: 'Production Year' },
      { name: 'Quarter' },
    ],
    values: [
      { name: 'Sold', caption: 'Units Sold' },
      { name: 'Amount', caption: 'Sold Amount' },
    ],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
  let pivotObj;
  function btnClick() {
    pivotObj.grid.print();
  }
  return (<div>
    <div className='col-lg-3 property-section'>
      <ButtonComponent cssClass='e-primary' isPrimary={true}
onClick={btnClick.bind(this)}>Print</ButtonComponent>
    </div>
    <div className="col-md-9">
      <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
    </div>
  </div>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    columns: [
      { name: 'Year', caption: 'Production Year' },
      { name: 'Quarter' },
    ],
  },

```

```

    values: [
      { name: 'Sold', caption: 'Units Sold' },
      { name: 'Amount', caption: 'Sold Amount' },
    ],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
  let pivotObj: PivotViewComponent;
  function btnClick(): void {
    pivotObj.grid.print();
  }
  return (<div>
    <div className='col-lg-3 property-section'>
      <ButtonComponent cssClass='e-primary' isPrimary={true}
onClick={btnClick.bind(this)}>Print</ButtonComponent>
    </div>
    <div className="col-md-9">
      <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>
    </div>
  </div>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Similarly, to print the pivot chart, use the [print](#) method from the chart's instance. The below sample code illustrates the print option being invoked by an external button click.

To use pivot chart, you need to inject the `PivotChart` module in the pivot table.

To display the pivot chart, set the [displayOption](#) property to either **Chart** or **Both**.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    columns: [
      { name: 'Year', caption: 'Production Year' },
      { name: 'Quarter' },
    ],
    values: [
      { name: 'Sold', caption: 'Units Sold' },
      { name: 'Amount', caption: 'Sold Amount' },
    ],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }

```

```

    }
    let pivotObj;
    function btnClick() {
        pivotObj.chart.print();
    }
    return (<div>
        <div className='col-lg-3 property-section'>
            <ButtonComponent cssClass='e-primary' isPrimary={true}
onClick={btnClick.bind(this)}>Print</ButtonComponent>
        </div>
        <div className="col-md-9">
            <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350}
            displayOption={{ view: 'Chart' }}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>
        </div>
    </div>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
function App() {
    let dataSourceSettings: IDataOptions = {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        enableSorting: true,
        drilledMembers: [{ name: 'Country', items: ['France'] }],
        columns: [
            { name: 'Year', caption: 'Production Year' },
            { name: 'Quarter' },
        ],
        values: [
            { name: 'Sold', caption: 'Units Sold' },
            { name: 'Amount', caption: 'Sold Amount' },
        ],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    };
    let pivotObj: PivotViewComponent;
    function btnClick(): void {
        pivotObj.chart.print();
    }
    return (<div>
        <div className='col-lg-3 property-section'>
            <ButtonComponent cssClass='e-primary' isPrimary={true}
onClick={btnClick.bind(this)}>Print</ButtonComponent>
        </div>
    </div>);
}

```

```

    <div className="col-md-9">
      <PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350}
      displayOption={{ view: 'Chart' }}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>
    </div>
  </div>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Excel export in React Pivot Table component

The Excel export allows Pivot Table data to be exported as Excel document. To enable Excel export in the pivot table, set the [allowExcelExport](#) property in [PivotView](#) to **true**. Once the API is set, user needs to call the [excelExport](#) method for exporting on external button click.

The pivot table component can be exported to Excel format using options available in the toolbar. For more details [refer](#) here.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings}
allowExcelExport={true}></PivotViewComponent></div>
    <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
  function btnClick() {
    pivotObj.excelExport();
  }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;

    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings}
allowExcelExport={true}></PivotViewComponent></div>
        <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
    function btnClick(): void {
        pivotObj.excelExport();
    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Multiple pivot table exporting

The Excel export provides an option to export multiple pivot table data in the same Excel file.

Same WorkSheet

The Excel export provides support to export multiple pivot tables in same sheet. To export in same sheet, define `multipleExport.type` as `AppendToSheet` in `excelExportProperties`. It has an option to provide blank rows between pivot tables and these blank row(s) count can be defined using the `multipleExport.blankRows` property.

By default, `multipleExport.blankRows` value is 5 between pivot tables within the same sheet.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],

```

```

        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]}
    };
    let pivotObj;
    let dataSourceSettings1 = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: true,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]}
    };
    let pivotObj1;
    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350}
dataSourceSettings={dataSourceSettings}
allowExcelExport={true}></PivotViewComponent></div>
        <div className="col-md-9"> <PivotViewComponent ref={d => pivotObj1 = d}
id='PivotView1' height={350} dataSourceSettings={dataSourceSettings1}
allowExcelExport={true}></PivotViewComponent></div>
        <div className="col-lg-3 property-section"><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
    function btnClick() {
        let excelExportProperties = {
            multipleExport: { type: 'AppendToSheet', blankRows: 2 }

```

Changing the pivot table style while exporting

The Excel export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **excelExportProperties** object and pass it as a parameter to the [excelExport](#) method.

By default, material theme will be applied to the pivot table during Excel exporting.

Limitation when exporting millions of records to Excel format

By default, Microsoft Excel supports only 1,048,576 records in an Excel sheet. Hence, it is not possible to export millions of records to Excel. You can refer to the [documentation link](#) for more details on Microsoft Excel specifications and limits. Therefore, it is suggested to export the data in CSV (Comma-Separated Values) or other formats that can handle large datasets more efficiently than Excel.

CSV Export

The Excel export allows pivot table data to be exported in **CSV** file format as well. To enable CSV export in the pivot table, set the [allowExcelExport](#) property in [PivotView](#) as **true**. Once the API is set, user needs to call the [csvExport](#) method for exporting on external button click.

The pivot table component can be exported to CSV format using options available in the toolbar. For more details [refer](#) here.

```

Virtual Scroll Data

You can export the pivot table virtual scroll data as Excel/CSV document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the [allowExcelExport](#) as true. You need to use the `exportToExcel` method for PivotEngine export.

To use PivotEngine export, You need to inject the `ExcelExport` module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default.

Virtual Scroll Data Excel Export

[Export all pages](#)

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as an Excel/CSV document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the [ExcelExport](#) module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

Events

ExcelQueryCellInfo

The event `excelQueryCellInfo` triggers while framing each row and value cell during Excel export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- `value` - It holds the cell value.
- `column` - It holds column information for the current cell.
- `data` - It holds the entire row data across the current cell.
- `style` - It holds the style properties for the cell.

ExportComplete

The event [exportComplete](#) is triggered after the pivot table data has been exported to a Excel/CSV document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the `isBlob` parameter as **true** when using the [excelExport](#) method. It has the following parameters:

- **type** - It holds the current export type such as PDF, Excel, and CSV.
- **promise** - It holds the promise object for blob data.

```
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Export table and chart into the same document

When the [displayOption](#) is set to **Both**, you can export both the table and the chart into the same PDF document. To achieve this, use the [pdfExport](#) method and set the [exportBothTableAndChart](#) parameter to **true**.

INDEX.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent, VirtualScroll, Inject, PDFExport, PivotChart }
from '@syncfusion/ej2-react-pivotview';

    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Customization during PDF export

PDF export provides option to customize mapping of pivot table to the exported PDF document.

To add header and footer while exporting

You can customize text, page number, line, page size and changing orientation in header and footer of the exported document.

To add a text in header/footer

You can add text either in header or footer of the exported PDF document like in the below code example.

```
`ts
```

```
let pdfExportProperties: PdfExportProperties = {  
  header: {  
    fromTop: 0,  
    height: 130,  
    contents: [  
      {  
        type: 'Text',  
        value: "Northwind Traders",  
        position: { x: 0, y: 50 },  
        style: { textBrushColor: '#000000', fontSize: 13 }  
      },  
    ]  
  }  
},  
,
```

```
`ts
```

```
let pdfExportProperties = {  
  header: {  
    fromTop: 0,  
    height: 130,  
    contents: [  
      {  
        type: 'Text',  
        value: "Northwind Traders",  
        position: { x: 0, y: 50 },  
        style: { textBrushColor: '#000000', fontSize: 13 }  
      },  
    ]  
  }  
};
```

`

To draw a line in header/footer

You can add line either in header or footer of the exported PDF document like in the below code example.

Supported line styles:

- dash
- dot
- dashdot
- dashdotdot
- solid

`ts

```
let pdfExportProperties: PdfExportProperties = {  
  header: {  
    fromTop: 0,  
    height: 130,  
    contents: [  
      {  
        type: 'Line',  
        style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },  
        points: { x1: 0, y1: 4, x2: 685, y2: 4 }  
      }  
    ]  
  }  
}
```

`

`ts

```
let pdfExportProperties = {  
  header: {  
    fromTop: 0,  
    height: 130,  
    contents: [  
      {  
        type: 'Line',  
        style: { penColor: '#000080', penSize: 2, dashStyle: 'Solid' },
```

```
points: { x1: 0, y1: 4, x2: 685, y2: 4 }
}
]
}
};
`ts
```

[Add page number in header/footer](#)

You can add page number either in header or footer of exported PDF document like in the below code example.

Supported page number types:

- LowerLatin - a, b, c,
- UpperLatin - A, B, C,
- LowerRoman - i, ii, iii,
- UpperRoman - I, II, III,
- Number - 1,2,3.

```
`ts
let pdfExportProperties: PdfExportProperties = {
  header: {
    fromTop: 0,
    height: 130,
    contents: [
      {
        type: 'PageNumber',
        pageNumberType: 'Arabic',
        format: 'Page {$current} of {$total}', //optional
        position: { x: 0, y: 25 },
        style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
      }
    ]
  }
}
`ts

let pdfExportProperties = {
```

```

header: {
  fromTop: 0,
  height: 130,
  contents: [
    {
      type: 'PageNumber',
      pageNumberType: 'Arabic',
      format: 'Page {$current} of {$total}',
      position: { x: 0, y: 25 },
      style: { textBrushColor: '#ffff80', fontSize: 15, hAlign: 'Center' }
    }
  ]
};

```

The below code illustrates the PDF export customization options.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={280}
dataSourceSettings={dataSourceSettings}
allowPdfExport={true}></PivotViewComponent></div>

  function btnClick() {
    let pdfExportProperties = {

```

```

        header: {
            fromTop: 0,
            height: 130,
            contents: [
                {
                    type: 'Text',
                    value: "Pivot Table",
                    position: { x: 0, y: 50 },
                    style: { textBrushColor: '#000000', fontSize: 13,
dashStyle: 'Solid', hAlign: 'Center' }
                }
            ]
        },
        footer: {
            fromBottom: 160,
            height: 150,
            contents: [
                {
                    type: 'PageNumber',
                    pageNumberType: 'Arabic',
                    format: 'Page {$current} of {$total}',
                    position: { x: 0, y: 25 },
                    style: { textBrushColor: '#02007a', fontSize: 15 }
                }
            ]
        }
    };
    pivotObj.pdfExport(pdfExportProperties);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { PdfExportProperties } from '@syncfusion/ej2-grids';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;

```

```

    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={280}
dataSourceSettings={dataSourceSettings}
allowPdfExport={true}></PivotViewComponent></div>
    <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
    function btnClick(): void {
        let pdfExportProperties: PdfExportProperties = {
            header: {
                fromTop: 0,
                height: 130,
                contents: [
                    {
                        type: 'Text',
                        value: "Pivot Table",
                        position: { x: 0, y: 50 },
                        style: { textBrushColor: '#000000', fontSize: 13,
dashStyle:'Solid',hAlign:'Center' }
                    }
                ]
            },
            footer: {
                fromBottom: 160,
                height: 150,
                contents: [
                    {
                        type: 'PageNumber',
                        pageNumberType: 'Arabic',
                        format: 'Page { $current } of { $total }',
                        position: { x: 0, y: 25 },
                        style: { textBrushColor: '#02007a', fontSize: 15 }
                    }
                ]
            }
        };
        pivotObj.pdfExport(pdfExportProperties);
    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Add an image in header/footer

You can add image (Base64 string) either in header or footer of the exported PDF document like in the below code example.

`ts

```

let pdfExportProperties = {
    header: {
        fromTop: 0,
        height: 130,

```

```

contents: [
{
type: 'Image',
src: image,
position: { x: 20, y: 10 },
size: { height: 100, width: 100 },
}
]
}
};
`

```

The below code illustrates the PDF export customization options.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    };
    let pivotObj;
    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={280}
dataSourceSettings={dataSourceSettings}
allowPdfExport={true}></PivotViewComponent></div>
    <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
    function btnClick() {
        let pdfExportProperties = {
            header: {
                fromTop: 0,
                height: 130,
                contents: [
                    {
                        type: 'Image',
                        src: image,

```

```

                position: { x: 20, y: 10 },
                size: { height: 100, width: 100 },
            }
        ]
    }
};
pivotObj.pdfExport(pdfExportProperties);
}
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import { image } from './image';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
        filters: [],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };
    let pivotObj: PivotViewComponent;

    return (
        <div><div className="col-md-9"> <PivotViewComponent ref={d => pivotObj = d} id='PivotView' height={280} dataSourceSettings={dataSourceSettings} allowPdfExport={true}></PivotViewComponent></div>
        <div className="col-lg-3 property-section"><ButtonComponent cssClass='e-primary' onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>
    );
    function btnClick(): void {
        let pdfExportProperties: PdfExportProperties = {
            header: {
                fromTop: 0,
                height: 130,
                contents: [
                    {
                        type: 'Image',
                        src: image,
                        position: { x: 20, y: 10 },
                        size: { height: 100, width: 100 },
                    }
                ]
            }
        };
    }
}

```

```

    ]
  }
};
pivotObj.pdfExport(pdfExportProperties);
}
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Changing the file name while exporting

The PDF export provides an option to change file name of the document before exporting. In-order to change the file name, define **fileName** property in **pdfExportProperties** object and pass it as a parameter to the [pdfExport](#) method.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';

Changing page orientation while exporting

The PDF export provides an option to change page orientation of the document before exporting. In order to change the page orientation, define **pageOrientation** property in **pdfExportProperties** object and pass it as a parameter to the [pdfExport](#) method. By default, the page orientation will be in **Portrait** and it can be changed to **Landscape** based on user requirement.

```

        fileName: 'pdfexport'
    };
    pivotObj.pdfExport(pdfExportProperties, false, null, false, true);
}
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Changing the table's column width and row height while exporting

You can change the column width and row height in the PDF document during the pivot table export by using the [onPdfCellRender](#) event. Within this event, the `args.column.width` property allows you to change the width of specific columns.

As shown in the code example below, the “Unit Sold” column under “FY 2015” is changed to a width of 60 pixels.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent, VirtualScroll, Inject, PDFExport } from
 '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' } ]
    };
    let pivotObj;
    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350} allowPdfExport={true}
enableVirtualization={true}
        dataSourceSettings={dataSourceSettings}
onPdfCellRender={onPdfCellRender.bind(this)}><Inject
services={[VirtualScroll, PDFExport]}></PivotViewComponent></div>
        <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
    function onPdfCellRender(args) {
        if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'FY 2015.Units Sold') {
            args.column.width = 60
        }
    }
    function btnClick() {
        let pdfExportProperties = {
            fileName: 'pdfexport'
        };
    };

```

```

        pivotObj.pdfExport(pdfExportProperties, false, null, false, true);
    }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { IDataOptions, IDataset, PivotViewComponent, VirtualScroll, Inject,
PdfCellRenderArgs, PDFExport } from '@syncfusion/ej2-react-pivotview';
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData as IDataset[],
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
    }
    let pivotObj: PivotViewComponent;

    return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350} allowPdfExport={true}
enableVirtualization={true}
        dataSourceSettings={dataSourceSettings}
onPdfCellRender={onPdfCellRender.bind(this)}><Inject

```

```

import { IDataOptions, IDataset, PivotViewComponent, VirtualScroll, Inject,
PdfCellRenderArgs, PDFExport } from '@syncfusion/ej2-react-pivotview';
import { PdfExportProperties } from '@syncfusion/ej2-grids';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;
  return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={350} allowPdfExport={true}
enableVirtualization={true}
  dataSourceSettings={dataSourceSettings}
onPdfCellRender={onPdfCellRender.bind(this)}><Inject
services={[VirtualScroll, PDFExport]} /></PivotViewComponent></div>
  <div className='col-lg-3 property-section'><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
  function onPdfCellRender(args: PdfCellRenderArgs): void {
    if (args.pivotCell && args.pivotCell.valueSort &&
args.pivotCell.valueSort.levelName === 'France.Mountain Bikes') {
      args.cell.height = 30
    }
  }
  function btnClick(): void {
    let pdfExportProperties: PdfExportProperties = {
      fileName: 'pdfexport'
    };
    pivotObj.pdfExport(pdfExportProperties, false, null, false, true);
  }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

This option is only available if [enableVirtualization](#) is set to **true**. In addition, the [VirtualScroll](#) and [PDFExport](#) modules must be injected into the pivot table.

Changing the pivot table style while exporting

The PDF export provides an option to change colors for headers, caption and records in pivot table before exporting. In-order to apply colors, define **theme** settings in **pdfExportProperties** object and pass it as a parameter to the [pdfExport](#) method.

By default, material theme will be applied to the pivot table during PDF exporting.

```

<!-- markdownlint-disable MD009 -->

Changing default font while exporting

By default, the pivot table uses "Helvetica" font in the exported document. But it can be changed using the [theme](#) property in [pdfExportProperties](#).

The available built-in fonts are,

- Helvetica

- TimesRoman
- Courier
- Symbol
- ZapfDingbats

    };
    pivotObj.pdfExport(pdfExportProperties);
  }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Virtual Scroll Data

You can export the pivot table virtual scroll data as PDF document by using PivotEngine export without any performance degradation. To enable PivotEngine export in the pivot table, set the `allowPdfExport` as true. You need to use the `exportToPDF` method for PivotEngine export.

To use PivotEngine export, You need to inject the `PDFExport` module in pivot table.

PivotEngine export will be performed while enabling virtual scrolling by default

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent, Inject, PDFExport } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={280}
dataSourceSettings={dataSourceSettings} allowPdfExport={true}><Inject
services={[PDFExport]} /></PivotViewComponent></div>
  <div className="col-lg-3 property-section"><ButtonComponent cssClass='e-
primary'
onClick={btnClick.bind(this)}>Export</ButtonComponent></div></div>);
  function btnClick() {
    pivotObj.pdfExportModule.exportToPDF();
  }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { IDataOptions, IDataset, PivotViewComponent, Inject, PDFExport }
from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<div><div className="col-md-9"> <PivotViewComponent ref={d =>
pivotObj = d} id='PivotView' height={280}
dataSourceSettings={dataSourceSettings} allowPdfExport={true}><Inject
services={[PDFExport]} /></PivotViewComponent></div>

    function btnClick(): void {
        pivotObj.pdfExportModule.exportToPDF();
    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Repeat row headers

Repeat row headers on each page can be achieved using PivotEngine export option. To disable repeat row headers, you need to set `allowRepeatHeader` to `false` in `beforeExport` event. You need to use the `exportToPDF` method for PivotEngine export.

To use PivotEngine export, You need to inject the `PDFExport` module in pivot table.

By default, repeat row headers is enabled in the PivotEngine export.

INDEX.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { PivotViewComponent, Inject, PDFExport } from '@syncfusion/ej2-
react-pivotview';

export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Export all pages

The pivot engine exports the entire virtual data of the pivot table (i.e. the data that contains all of the records used to render the complete pivot table) as a PDF document. To export just the current viewport of the pivot table, set the [exportAllPages](#) property to **false**. To use the pivot engine export, add the **PDFExport** module into the pivot table.

By default, the pivot engine export will be performed while virtual scrolling is enabled.

Events

PdfQueryCellInfo

The event **pdfQueryCellInfo** triggers on framing each row and value cell during PDF export. It allows the user to customize the cell value, style etc. of the current cell. It has the following parameters:

- **value** - It holds the cell value.
- **column** - It holds column information for the current cell.
- **data** - It holds the entire row data across the current cell.
- **style** - It holds the style properties for the cell.

```

ExportComplete

The event [exportComplete](#) is triggered after the pivot table data has been exported to a PDF document. You can use this event to acquire blob stream data for further customization and processing at your end by passing the `isBlob` parameter as `true` when using the [pdfExport](#) method. It has the following parameters:

- `type` - It holds the current export type such as PDF, Excel, and CSV.
- `promise` - It holds the promise object for blob data.

Globalization and localization in React Pivotview component

Globalization is the combination of Internationalization and localization. You can adapt the component to various languages by parsing and formatting the date or number ([Internationalization](#)) & adding culture specific customization and translation to the text ([Localization](#)).

Load CLDR-Data to the application

- Open command prompt in your machine.
- Run the following command in command prompt.

,

cd /d 'Folder path of your react application'

For example: cd /d E:\react\WebApplication

,

- Make sure that you have installed **Node and NPM** in your machine before installing the **CLDR-Data**.
- To check if you have **Node**, run this command in command prompt.

node -v

- If **Node** is not installed, then you can download and install the **Node** from this [location](#).
- To confirm if you have **NPM**, run this command in command prompt.

npm -v

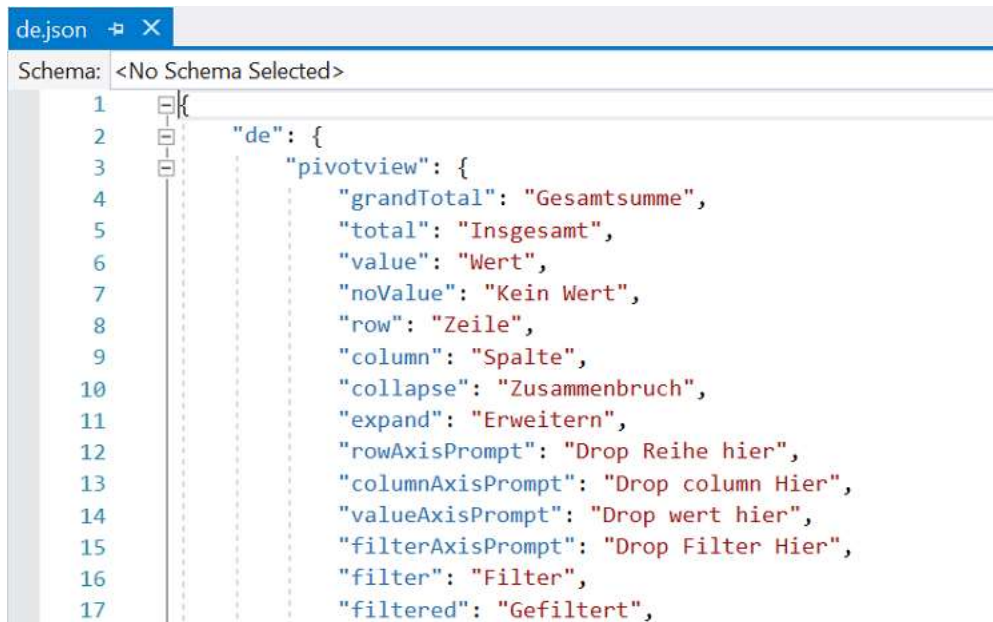

- Now, install the **CLDR-Data** package by using the following command (it installs the CLDR JSON data). To

learn more about CLDR-Data, refer to [CLDR-Data](#).

npm install cldr-data --save

- After installing the package, you can find the culture specific JSON data under the location **/node_modules/cldr-data**. Then, copy the **cldr-data** folder into your react application.
- Download the required locale packages to render the react Pivot Table component with specified locale. To download the locale definition of react components, use this [link](#).
- After downloading the ej2-locale package, copy the ej2-locale folder with required local definition file into your react application. By default, the ej2-locale package contains the localized text for static text present in components like grid, chart, pivot table, tools, and more.

The locale JSON file will look like:

Internationalization

The Internationalization library is used to globalize number, date, and time values in pivot table component using the `dataSourceSettings.formatSettings` option. In the below code sample, we set the culture and currency using the `load`, `setCulture` and `setCurrencyCode` methods. By default, pivot table component is displayed in english culture.

- Set the culture by using the `locale` property.

      'dropColPrompt': 'Drop column Hier',
      'dropValPrompt': 'Drop wert hier',
      'dropFilterPrompt': 'Drop Filter Hier',
      'addPrompt': 'Feld hinzufügen',
      'centerHeader': 'Ziehen Sie die Felder zwischen den Bereichen
unten:',
      'add': 'Hinzufügen',
      'drag': 'Ziehen',
      'filters': 'Filter',
      'rows': 'Zeilen',
      'columns': 'Spalten',
      'values': 'Werte',
      'error': 'Fehler',
      'dropAction': 'Berechnetes Feld nicht in jeder anderen Region
außer Wert Achse sein.',
      'search': 'Suche',
      'close': 'Schließen',
      'cancel': 'Abbrechen',
      'delete': 'Löschen',
      'alert': 'Warnung',
      'warning': 'Warnung',
      'ok': 'OK',
      'allFields': 'Alle Felder',
      'noMatches': 'Keine Treffer'
    }
  }
});
function App() {
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
      minimumSignificantDigits: 1, maximumSignificantDigits: 3,
currency: 'EUR' }],

```

```

    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} locale='de-DE' dataSourceSettings={dataSourceSettings}
showFieldList={true} showGroupingBar={true}
allowCalculatedField={true}><Inject services={[FieldList, GroupingBar,
CalculatedField]} /></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

* In the above sample, **Amount** field is formatted by [NumberFormatOptions](#). For date formats, the value strings are formatted by [DateFormatOptions](#).

* By default, **locale** value is **en-US**. If you want to change the **en-US** culture to a different culture, you have to change the **locale** accordingly.

* Also, you will find more details about support format string for number formats and data formats [here](#).

<!-- markdownlint-disable MD009 -->

Decimal separators

The decimal separators of pivot table values varies based on the culture applied to the component. The culture can be set by calling the method [setCulture](#) with appropriate culture string as its parameter.

The following example demonstrates the decimal separators in **Deutsch** culture.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent, GroupingBar, CalculatedField
} from '@syncfusion/ej2-react-pivotview';

Localization

The [Localization](#) library allows you to localize default text content of the pivot table. The pivot table component has static text on some features (like drop area text, pivot field list title, etc...) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the `locale` value and translation object.

The following list of properties and its values are used in the pivot table.

Locale keywords | Text

staticFieldList | Pivot Field List

fieldList | Field List

dropFilterPrompt | Drop filter here

dropColPrompt | Drop column here

dropRowPrompt | Drop row here

dropValPrompt | Drop value here

addPrompt | Add field here

adaptiveFieldHeader | Choose field

centerHeader | Drag fields between axes below:

add | add

drag | Drag

filter | Filter

filtered | Filtered

sort | Sort

remove | Remove

filters | Filters

rows | Rows

columns | Columns

values | Values

CalculatedField | Calculated Field

createCalculatedField | Create Calculated Field

fieldName | Enter the field name

error | Error

invalidFormula | Invalid formula.

dropText | Example: ('Sum(*OrderCount*)' + 'Sum(*InStock*)') * 250

dropTextMobile | Add fields and edit formula here.

dropAction | Calculated field cannot be place in any other region except value axis.

search | Search

close | Close

cancel | Cancel

delete | Delete

alert | Alert

warning | Warning

ok | OK

Sum | Sum

Avg | Avg

Count | Count

Min | Min

Max | Max

allFields | All Fields

formula | Formula

fieldExist | A field already exists in this name. Please enter a different name.

confirmText | A calculation field already exists in this name. Do you want to replace it?

noMatches | No matches

format | Summaries values by

edit | Edit

clear | Clear

formulaField | Drag and drop fields to formula

dragField | Drag field to formula

clearFilter | Clear

by | by

enterValue | Enter value

chooseDate | Enter date

all | All

multipleItems | Multiple items

Equals | Equals

DoesNotEquals | Does Not Equal

BeginWith | Begins With

DoesNotBeginWith | Does Not Begin With

EndsWith | Ends With

DoesNotEndsWith | Does Not End With

Contains | Contains

DoesNotContains | Does Not Contain

GreaterThan | Greater Than

GreaterThanOrEqualTo | Greater Than Or Equal To

LessThan | Less Than

LessThanOrEqualTo | Less Than Or Equal To

Between | Between

NotBetween | Not Between

Before | Before

BeforeOrEqualTo | Before Or Equal To

After | After

AfterOrEqualTo | After Or Equal To

member | Member

label | Label

date | Date

value | Value

labelTextContent | Show the items for which the label

dateTextContent | Show the items for which the date

valueTextContent | Show the items for which
And | and
DistinctCount | Distinct Count

undefined | undefined

groupOutOfRange | Out of Range

fieldDropErrorAction | The field you are moving cannot be placed in that area of the report

MoreOption | More...

memberType | Field Type

selectedHierarchy | Parent Hierarchy

formatString | Format String

expressionField | Expression

olapDropText | Example: [Measures].[Order Quantity] + ([Measures].[Order Quantity] * 0.10)

customFormat | Enter custom format string

Measure | Measure

Dimension | Dimension

Standard | Standard

Currency | Currency

Percent | Percent

Custom | Custom

blank | (Blank)

fieldTooltip | Drag and drop fields to create an expression. And, if you want to edit the existing the calculated fields! You can achieve it by simply selecting the field under 'Calculated Members'.

fieldTitle | Field Name

QuarterYear | Quarter Year

caption | Field Caption

copy | Copy

group | Group

numberFormatString | Example: C, P, 0000 %, ###0.##0#, etc.

sortAscending | Sort ascending order

sortDescending | Sort descending order

sortNone | Sort data order

clearCalculatedField | Clear edited field info

editCalculatedField | Edit calculated field

selectGroup | Select groups

of | of

removeCalculatedField | Are you sure you want to delete this calculated field?

yes | Yes

no | No

None | None

Note: To find the latest localization keywords of pivotview and pivotfieldlist for different languages, visit this [GitHub](#) repository.

Loading Translations

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the pivot table in **Deutsch** culture.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent, GroupingBar, CalculatedField } from '@syncfusion/ej2-react-pivotview';
import { L10n } from '@syncfusion/ej2-base';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
L10n.load({
  'de-DE': {
    'pivotview': {
      'grandTotal': 'Gesamtsumme',
      'total': 'Insgesamt',
      'value': 'Wert',
      'noValue': 'Kein Wert',
      'row': 'Zeile',
      'column': 'Spalte',
      'collapse': 'Zusammenbruch',
      'expand': 'Erweitern'
    },
    'pivotfieldlist': {
      'fieldList': 'Feld Liste',

allowCalculatedField={true}><Inject services={[FieldList, GroupingBar,
CalculatedField]} /></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Right-to-left (RTL)

Right-to-left (RTL) provides an option to switch the text direction and layout of the pivot table component from right to left. It improves the user experiences and accessibility for users who use right-

to-left languages (Arabic, Farsi, Urdu, etc...). To enable RTL pivot table, set the `enableRtl` property to `true`.

Accessibility in React Pivotview component

The pivot table component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the pivot table component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

```

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

[WAI-ARIA](#) (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components. The following ARIA attributes are used in the pivot table component:

Attributes	Purpose
---	---
<code>role=grid</code>	Attribute added to identify the grid component element within the pivot table element.
<code>role=region</code>	Attribute added to identify the chart component element within the pivot table element.
<code>role=button</code>	This attribute is added to the pager navigation buttons as well as the buttons in the dialog popup such as field list, calculated field, member editor, conditional formatting of pivot table component to indicate that it is a clickable element.

| **role=table** | This attribute is added to each conditional formatting style container element to denote it as a table. |

| **role=tableItems** | This attribute is added to the container element that appears inside the number formatting popup to indicate it as a table. |

| **aria-disabled** | The buttons within the dialog popups, such as field list, calculated field and member editor, will be disabled based on their usability. To indicate its disabled state, we will add this attribute with the values **true**. By default, the attribute value is set to **false**. |

| **aria-label** | This attribute is added to label elements that are placed inside the pager, member editor popup, and calculated field popup to identify them as label elements. |

| **aria-selected** | This attribute is added to the selected treeview item in the calculated field popup with the value as **true** to denote that it is a selected element. |

| **aria-colspan** | This attribute is added to the **th** elements in the **e-table**, which represent the column span value. |

| **aria-rowspan** | This attribute is added to the **th** elements in the **e-table**, which represent the row span value. |

| **data-type** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the aggregate type for the specified field. |

| **data-caption** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It represents the caption for the specified field. |

| **data-basefield** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base field for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-baseitem** | This attribute is added to the treeview item in the calculated field popup, as well as the buttons in the grouping bar and field list. It denotes the base item for the specified field, which is used to display the values for aggregation types such as **DifferenceFrom**, **PercentageOfDifferenceFrom**, and **PercentageOfParentTotal**. |

| **data-field** | This attribute is added to the treeview item in the calculated field popup. It denotes the name of the specified field. |

| **data-membertype** | This attribute is added to the treeview item in the calculated field popup. It denotes the member type of the selected OLAP calculated field. |

| **data-hierarchy** | This attribute is added to the treeview item in the calculated field popup. It denotes the parent hierarchy unique name of the selected OLAP calculated field. |

| **data-formula** | This attribute is added to the treeview item in the calculated field popup. It denotes the formula used for the specified calculated field. |

| **data-formatString** | This attribute is added to the treeview item in the calculated field popup. It denotes the format string used for the specified calculated field. |

| **data-customformatstring** | This attribute is added to the treeview item in the calculated field popup. It denotes the custom format string used for the specified calculated field. |

Keyboard interaction

The pivot table component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Message component.

| **Press** | **To do this** |

| --- | --- |

| Tab / Shift + Tab | To focus the close icon in the message. |

| Enter / Space | Closes the focused close icon's message. |

Pivot Table

| **Press** | **To do this** |

| --- | --- |

| Tab | Moves the cell focus right side. If no cells are focused, it moves to the next active element in the browser page. |

| Shift + Tab | Moves the cell focus left side. If no cells are focused, it moves to the previous active element in the browser page. |

| DownArrow | Moves the cell focus downwards. If the selection is enabled in the pivot table, then it will move downwards to select next row or column or individual cell. |

| UpArrow | Moves the cell focus upwards. If the selection is enabled in the pivot table, then it will move upwards to select previous row or column or individual cell. |

| LeftArrow | Moves the cell focus left side. If the selection is enabled in the pivot table, then it will move left side to select previous row or column or individual cell. |

| RightArrow | Moves the cell focus right side. If the selection is enabled in the pivot table, then it will move right side to select next row or column or individual cell. |

| Shift + DownArrow | Extends the cell selection downwards. |

| Shift + UpArrow | Extends the cell selection selection upwards. |

| Shift + LeftArrow | Extends the cell selection to the left side. |

| Shift + RightArrow | Extends the cell selection to the right side. |

| Ctrl + A | Selects all cells. |

| Esc | Deselects all cells. If the current active element is a context menu, then the context menu popup will be closed. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | If the current cell is an expand/collapse cell, it performs expand/collapse operation (drill operation). If the current row/column header is in value sort state, it performs value sorting. If the current cell is in selection state, it moves to the next row, column or individual cell. If drill-through or editing is enabled in the pivot table, the drill-through dialog will be opened based on the selected value cell. If the current active element is a context menu popup, menu selection will be performed. |

| Shift + Enter | If value sorting is enabled in the pivot table and the current cell is a header with respect to its value axis, it performs value sorting to either ascending or descending order. If the current cell is in selection state, it moves to the previous row, column or individual cell. |

| Ctrl + Enter | If hyperlink is enabled in the current cell, it performs hyperlink selection. |

| Shift + F10 or Menu | If context menu is enabled in the pivot table, the context menu popup will be opened in the current cell. |

Field List

| Press | To do this |

| --- | --- |

| Shift + Ctrl + F | If the popup field list is enabled in either the pivot table or the pivot chart, the field list dialog will be opened. |

| Tab | Moves to the next active element in the field list. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the field list. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will open to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and it has a dropdown icon, the aggregation menu will open to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Esc or Escape | Closes the popup field list dialog. |

Grouping Bar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element (field's button) in the grouping bar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element (field's button) in the grouping bar. If no active elements present, it moves to the previous active element in the browser page. |

| Shift + F | If the current active element is a field's button and if it has a filter icon, the filter dialog will be opened to perform filtering. |

| Shift + S | If the current active element is a field's button and if it has a sort icon, the sorting will be performed to the selected field. |

| Shift + E | If the current active element is a calculated field's button and if it has an edit icon, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Enter | Performs the selection operation of the current active element. If the current active element is a field's button and if it has a dropdown icon, the aggregation menu will be opened to perform calculations using aggregation options to the selected value field. |

| Delete | If the current active element is a field's button, the selected field will be removed from the current report. |

| DownArrow | If the current active element is a dropdown list, the next item will be selected. |

| UpArrow | If the current active element is a dropdown list, the previous item will be selected. |

| Home | If the current active element is a dropdown list, the first item will be selected. |

| End | If the current active element is a dropdown list, the last item will be selected. |

| Alt + Down | If the current active element is a dropdown list, the popup will be opened. |

| Alt + Down | If the current active element is a dropdown list, the popup will be closed. |

| Esc or Escape | Closes the dropdown list.

Filter Dialog

| Press | To do this |

| --- | --- |

| Shift + F | If the current active element is a field's button and if it has a filter icon in either the field list or grouping bar UI, the filter dialog will be opened to perform filtering. |

| Tab | Moves to the next active element in the filter dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the filter dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. If the current active element is a tab, it moves focus to the previous tab element. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tab, it moves focus to the next tab element. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Alt + Down | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be opened. |

| Alt + Up | If the current active element is a DropDownList or DatePicker or DateTimePicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tab, the current tab element will be selected. If the current active element is a tree node, the current node will be either checked or unchecked. If the current active element is DropDownList, the focus item will be selected, and the popup list will close when it is open. Otherwise, toggles the popup list. |

| Esc or Escape | Closes the filter dialog. |

Calculated Field Dialog

| Press | To do this |

| --- | --- |

| Shift + E | If the current active element is a field's button and if it has an edit icon in either the field list or grouping bar UI, the calculated field dialog will be opened to perform editing the selected calculated field. |

| Tab | Moves to the next active element in the calculated field dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the calculated field dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a tree node, it moves to the next node. |

| UpArrow | If the current active element is a tree node, it moves to the previous node. |

| LeftArrow | If the current active element is a tree node, it collapses the current node. |

| RightArrow | If the current active element is a tree node, it expands the current node. If the current active element is a tree node and has a menu icon, the aggregation menu will be opened to select appropriate aggregation type to the selected field. |

| Home | If the current active element is a tree node, it goes to the first node. |

| End | If the current active element is a tree node, it goes to the last node. |

| Enter | Performs the selection operation of the current active element. If the current active element is a tree node, it copies the selected field name/formula to the formula text area to perform calculations. |

| Esc or Escape | Closes the calculated field dialog. |

Formatting Dialog

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the formatting dialog. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the formatting dialog. If no active elements present, it moves to the previous active element in the browser page. |

| DownArrow | If the current active element is a DropDownList, the next item will be selected. |

| UpArrow | If the current active element is a DropDownList, the previous item will be selected. |

| Home | If the current active element is a DropDownList, the first item will be selected. |

| End | If the current active element is a DropDownList, the last item will be selected. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be opened. |

| Alt + Down | If the current active element is a DropDownList or ColorPicker, the popup will be closed. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | Closes the formatting dialog. |

Toolbar

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active option in the toolbar. If no active elements present, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active option in the toolbar. If no active elements present, it moves to the previous active element in the browser page. |

| Enter | Performs the selection operation of the current active element. |

Drill-Through Dialog

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to right side. If no active elements present, then it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the drill-through dialog. If the current active element is a Grid cell, it moves the cell focus to left side, If no active elements present, then it moves to the previous active element in the browser page. |

| DownArrow | Moves the row/cell focus downwards. |

| UpArrow | Moves the row/cell focus upwards. |

| LeftArrow | Moves the cell focus left side. |

| RightArrow | Moves the cell focus right side. |

| Home | Goes to the first cell in the current row. |

| End | Goes to the last cell in the current row. |

| Ctrl + Home | Goes to the first cell in the table. |

| Ctrl + End | Goes to the last cell in the table. |

| Enter | Performs the selection operation of the current active element. |

| Esc or Escape | If the cell is in selected state, then it deselects all rows/cells. If the row/cell is in edit state, it cancels the current entries in the row/cell. If the current active element is not a row/cell, it closes the drill-through dialog. |

| F2 | Initiate editing a row/cell in the data grid. |

| Insert | Adds a new row/cell in the data grid. |

| Delete | Removes the selected row in the data grid. |

Some commonly used applicable key combinations and their relative functionalities in all dialogs are listed below.

| Press | To do this |

| --- | --- |

| Tab | Moves to the next active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the next active element in the browser page. |

| Shift + Tab | Moves to the previous active element in the dialog. If either no active elements present in the dialog or an overlay is not present in the dialog, it moves to the previous active element in the browser page. |

| Space | If the current active element is a tree node or a checkbox element, it will be either checked or unchecked. |

| Enter | When the Dialog button or any input (except text area) is in focus state, when pressing the Enter key, the click event associated with the primary button or button will be triggered. The Enter key will not be worked, when the dialog content contains any text area with initial focus. |

| Esc or Escape | Closes the dialog. |

Ensuring accessibility

The pivot table component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the pivot table component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the pivot table component with accessibility tools.

Ej1 api migration in React Pivotview component

This article describes the API migration process of pivot table component from Essential JS 1 to Essential JS 2.

Data Binding

{% raw %}

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Data source | **property:** dataSource

<EJ.PivotGrid id="PivotGrid" dataSource={pivotdataSource}></EJ.PivotGrid>

var pivotdataSource = {
data: []
}; | **property:** dataSourceSettings

<PivotViewComponent id='PivotView' dataSourceSettings={dataSourceSettings}></PivotViewComponent>

let dataSourceSettings: IDataOptions = {
dataSource: [] as IDataset[]
}; |

| Rows | **property:** rows

<EJ.PivotGrid id="PivotGrid" dataSource={pivotdataSource}></EJ.PivotGrid>

var pivotdataSource = {
rows: [{
fieldName: "Country", fieldCaption: "Country"}]
}; | **property:** rows

<PivotViewComponent id='PivotView' dataSourceSettings={dataSourceSettings}></PivotViewComponent>

let dataSourceSettings: IDataOptions = {
row: [{
 name: 'company', caption: 'Industry' }]
}; |

| Columns | **property:** columns

<EJ.PivotGrid id="PivotGrid" dataSource={pivotdataSource}></EJ.PivotGrid>

var pivotdataSource = {
columns: [{
fieldName: "Country", fieldCaption: "Country"}]
}; | **property:** columns

<PivotViewComponent id='PivotView' dataSourceSettings={dataSourceSettings}></PivotViewComponent>

let dataSourceSettings: IDataOptions = {
columns: [{
 name: 'company', caption: 'Industry' }]
}; |

| Values | **property:** values

<EJ.PivotGrid id="PivotGrid" dataSource={pivotdataSource}></EJ.PivotGrid>

var pivotdataSource = {
values: [{
fieldName: "balance", fieldCaption: "Balance(\$)" }]
 }; | **property:** values

<PivotViewComponent id='PivotView' dataSourceSettings={dataSourceSettings}></PivotViewComponent>

let

```

dataSourceSettings: IDataOptions = {<br/>values: [{<br/> name: 'balance', caption: 'Balance($)'
}]<br/>};|
| Filters | property: filters<br/><br/><EJ.PivotGrid id="PivotGrid" dataSource=
{pivotdataSource}></EJ.PivotGrid><br/><br/>var pivotdataSource = {<br/>filters:
[{{<br/>fieldName: "Country", fieldCaption: "Country" }}<br/>];| property:
filters<br/><br/><PivotViewComponent id='PivotView'

```

How To

```
<!-- markdownlint-disable MD009 -->
```

Switching older themes style in React Pivotview component

From Volume 1, 2020 onwards Syncfusion has revised the theming and layout of the Pivot Table. So, to inherit the older theme style and layout please do the necessary changes in CSS and pivot table height.

CSS Selectors

In current theme, the cells can be differentiated by their background colors. To avoid it, you need to override its background colors via simple CSS coding within your application. The below CSS selectors allow to achieve the same for material, fabric, bootstrap and bootstrap v4 themes.

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#fff !important;
}
</style>
</head>
```

```
<body>
</body>
</html>
`
```

Meanwhile for high contrast theme, we need to set the following CSS.

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<!-- Codes here... -->
<style>
.e-pivotview .e-rowsheader,
.e-pivotview .e-columnsheader,
.e-pivotview .e-gtot,
.e-pivotview .e-content,
.e-pivotview .e-gridheader,
.e-pivotview .e-headercell {
background-color:#000 !important;
}
</style>
</head>
<body>
</body>
</html>
`
```

Adjusting Row Height

In current theme, to make the component compact we have reduced the height of each pivot table rows. But user can reset the height of the pivot table using the [rowHeight](#) property in [gridSettings](#). In older theme, the property was set to 36 pixels for desktop layout and 48 pixels for mobile layout. So reset the [rowHeight](#) accordingly to visualize the older theme style.

In the below code sample, we replicate the older theme style.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
```

```
function App() {
  let gridSettings = {
    rowHeight: 36
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  };
  let pivotObj;
  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-
pivotview/src/pivotview/model/gridsettings';
function App() {
  let gridSettings: GridSettings = {
    rowHeight: 36
  } as GridSettings;
  let dataSourceSettings: IDataOptions = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }]
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} gridSettings={gridSettings}
dataSourceSettings={dataSourceSettings} ></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

Customize number date and time values in React Pivotview component

You can format the number, date, and time values for each field using `formatSettings` option under `dataSourceSettings`. It can be configured through code behind, during initial rendering.

Number formatting

For numbers, the formatting settings required to apply through code behind are:

- `name`: It allows to set the field name.
- `format`: It allows to set the format of the respective field.

Also, you can customize the applied number format by setting the `NumberFormatOptions` options in `formatSettings` itself.

INDEX.JSX

```
import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
```

```

    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData as IDataset[],
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France' ]}],
    formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Date and Time formatting

For date and time, the formatting settings required to apply through code behind are:

- **name**: It allows to set the field name.
- **format**: It allows to set the format of the respective field.
- **type**: It allows to set the type of format to be used for the respective field.

Also, you can customize the applied date format by setting [DateFormatOptions](#) options in **formatSettings** itself.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    allowLabelFilter: true,
    formatSettings: [{ name: 'Year', format: 'dd/MM/yyyy-hh:mm', type:
'date' }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    filters: []
  };
  let pivotObj;

```

```

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        dataSource: pivotData as IDataset[],
        expandAll: false,
        allowLabelFilter: true,
        formatSettings: [{ name: 'Year', format: 'dd/MM/yyyy-hh:mm', type:
'date' }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        filters: []
    }
    let pivotObj: PivotViewComponent;

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Limitations of date formatting

As per Firefox and Edge browsers standards, most of the date and time formats used in data source aren't supported. For example: Apr-2000, Apr-01-2000, 01-03-2000, 2000-Apr-01 etc... are not supported. Meanwhile [ISO formats](#) will be supported across all browsers.

Customize the icons for pivot table in React Pivotview component

You can customize the pivot button icons in the pivot table by overriding the class **.pivot-button** with a custom property content as mentioned below.

```

`ts
PivotView_PivotFieldList.e-icons.e-toggle-field-list::before {
content: '\e337';
}
`
`ts

```

PivotView_PivotFieldList.e - icons.e - toggle - field - list;
before;

```
{
content: '\e337';
}
,
```

In the below sample, pivot table is rendered with a customized pivot button icons.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]}/></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent }
from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData as IDataset[],
        expandAll: false,
```

```

    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C2', useGrouping: false,
minimumSignificantDigits: 1, maximumSignificantDigits: 3 }],
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
  }
  let pivotObj: PivotViewComponent;

  return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={ [FieldList]} /></PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Configure data grid options on editing mode in React Pivotview component

You can access the data grid options such as sort, group, filter, etc on editing mode using **beginDrillThrough** event in the pivot table. The event fires on every value cell click and provides the data grid information before it displays.

To access the data grid options, you need to inject module for the provided options in data grid itself.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import { Grid, Sort, Filter, Group } from '@syncfusion/ej2-grids';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let editSettings = {
    allowAdding: true, allowDeleting: true, allowEditing: true, mode:
'Normal'
  };
  let dataSourceSettings = {
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    dataSource: pivotData,
    expandAll: false,
    filters: [],
    drilledMembers: [{ name: 'Country', items: ['France'] }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
  };
  function beginDrillThrough(args) {
    if (args.gridObj) {
      Grid.Inject(Sort, Filter, Group);
      let gridObj = args.gridObj;
      gridObj.allowGrouping = true;
      gridObj.allowSorting = true;
    }
  }
}

```

```

        gridObj.allowFiltering = true;
        gridObj.filterSettings = { type: 'CheckBox' };
    }
}
let pivotObj;
return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
editSettings={editSettings}
beginDrillThrough={beginDrillThrough.bind(this)}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, CellEditSettings, IDataset, Inject,

Hide empty headers in React Pivotview component

If the raw data for a particular field is not defined, it will be shown as 'Undefined' in the pivot table headers. You can hide those headers by setting the [showHeaderWhenEmpty](#) property to **false** in the pivot table.

For example, if the raw data for the field 'Country' is defined as “United Kingdom” and “State” is not defined means, it will be shown as “United Kingdom >> Undefined” in the header section. Here, you can hide those 'Undefined' header using the [showHeaderWhenEmpty](#) property.

By default, this property is set as **true**.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotNullData } from './datasource';
function App() {
    let dataSourceSettings = {
        dataSource: pivotNullData,
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'State' }],
        columns: [{ name: 'Product', showNoDataItems: true }, { name: 'Date'
    }],
        values: [{ name: 'Amount' }, { name: 'Quantity' }],
        showHeaderWhenEmpty: false
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
showFieldList={true}><Inject services={[FieldList]}></PivotViewComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));
```

INDEX.TSX

```
import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent }
from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotNullData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        dataSource: pivotNullData as IDataset[],
        expandAll: false,
        rows: [{ name: 'Country' }, { name: 'State' }],
        columns: [{ name: 'Product', showNoDataItems: true }, { name: 'Date'
    }],
        values: [{ name: 'Amount' }, { name: 'Quantity' }],
        showHeaderWhenEmpty: false
    }
}
```

Chart based on pivot table selection in React Pivotview component

The cell selection support is enabled using the [allowSelection](#) property and its type and mode are configured using the [selectionSettings](#) property. The [cellSelected](#) event gets fired on every selection operation performed in the pivot table. This event returns the selected cell informations, like row header name, column header name, measure name, and value. Based on this information, the [chart](#) control will be plotted.

INDEX.JSX

Drill through grid cell edit type in React Pivotview component

Using the [drillThrough](#) event in the pivot table, you can define the edit type of a particular column in the grid present inside the drill-through dialog. To do so, check the column name in the [drillThrough](#) event and then specify the edit type of that column using the [gridColumns.editType](#) event argument.

The [gridColumns.editType](#) property must be set based on the column's data type. For example, the string data type will not be applicable for the numeric text box edit type.

- [NumericTextBox](#) control for integer, double, and decimal data types.
- [TextBox](#) control for string data type.

- [DropDownList](#) control to show all unique values related to that field.
- [CheckBox](#) control for boolean data type.
- [DatePicker](#) control for date data type.
- [DateTimePicker](#) control for date time data type.

In the below example, the data type of the **Country** column is set to **DropDownList**.

INDEX.JSX

```
{% raw %}
import { DrillThrough, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        dataSource: pivotData,
        expandAll: false,
        filters: [],
        drilledMembers: [{ name: 'Country', items: ['France' ]}],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }]
    };

Show field list when pivot table empty in React Pivotview component

When there are no fields in a pivot table's row, column, value, and filter axes, a field list can still be displayed. To do so, use the [dataBound](#) event and call the `onShowFieldList` method as shown below.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {

```

```

        dataSource: pivotData,
    };
    let pivotObj;
    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
dataBound={dataBound.bind(this)} showFieldList={true}><Inject
services={[FieldList]} /></PivotViewComponent>);
    function dataBound() {
        if (pivotObj && pivotObj.dataSourceSettings.values.length === 0) {
            pivotObj.pivotFieldListModule.dialogRenderer.onShowFieldList();
        }
    }
}
;
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { FieldList, IDataOptions, IDataset, Inject, PivotViewComponent }
from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings: IDataOptions = {
        dataSource: pivotData as IDataset[],
    }
    let pivotObj: PivotViewComponent;

    return (<PivotViewComponent ref={d => pivotObj = d} id='PivotView'
height={350} dataSourceSettings={dataSourceSettings}
dataBound={dataBound.bind(this)} showFieldList={true}><Inject
services={[FieldList]} /></PivotViewComponent>);
    function dataBound(): void {
        if (pivotObj && pivotObj.dataSourceSettings.values.length === 0) {
            (pivotObj.pivotFieldListModule.dialogRenderer as
any).onShowFieldList();
        }
    }
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Apply custom style to pivot cells in React Pivotview component

The [queryCellInfo](#) event in [gridSettings](#) can be used to apply custom style to row and value cells, and the [headerCellInfo](#) event in [gridSettings](#) can be used to apply custom styles to column cells.

In the following example, a custom style has been applied to the column header **“Sold Amount”** under **“FY 2016”** via the [headerCellInfo](#) event and to the row header **“Germany”** and its aggregated value via the [queryCellInfo](#) event by adding the **“e-custom”** class to the cell element.

INDEX.JSX

```

import { PivotViewComponent } from '@syncfusion/ej2-react-pivotview';

```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
  let dataSourceSettings = {
    dataSource: pivotData,
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
  let gridSettings = {
    queryCellInfo: function (args) {
      var colIndex = Number(args.cell.getAttribute('data-colindex'));
      var cells = args.data[colIndex] ? args.data[colIndex] : {};
      // Here by using 'actualText' option, a custom class can be added to
the specific row header and its value to apply custom style.
      if (cells.actualText === 'Germany') {
        args.cell.classList.add('e-custom');
      } else if (cells.actualText === 'Amount' &&
        cells.columnHeaders === 'FY 2016' && cells.rowHeaders === 'Germany')
{
        args.cell.classList.add('e-custom');
      }
    },
    headerCellInfo: function (args) {
      var customAttributes = args.cell.column.customAttributes;
      // Here custom class can be added to the specific column header by
using unique level name, to apply custom style.
      if (args.node.classList.contains('e-columnsheader') &&
customAttributes &&
        customAttributes.cell.valueSort.levelName === 'FY 2016.Sold Amount')
{
        args.node.classList.add('e-custom');
      }
    }
  };
  let pivotObj;
  return (<PivotViewComponent id='PivotView' ref={d => pivotObj = d}
dataSourceSettings={dataSourceSettings}
gridSettings={gridSettings} width={'100%'} height={350}>
    </PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

INDEX.TSX

```

import { IDataOptions, IDataset, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';

```

```

import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
import { GridSettings } from '@syncfusion/ej2-pivotview/src/pivotview/model/gridsettings';
function App() {
  let dataSourceSettings: IDataOptions = {
    dataSource: pivotData as IDataset[],
    expandAll: false,
    enableSorting: true,
    columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
    values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
    rows: [{ name: 'Country' }, { name: 'Products' }],
    formatSettings: [{ name: 'Amount', format: 'C0' }],
    filters: []
  }
  let gridSettings: GridSettings = {
    queryCellInfo: function (args: any) {
      let colIndex: number = Number(args.cell.getAttribute('data-
colindex'));
      let cells: any = args.data[colIndex] ? args.data[colIndex] : {};
      // Here by using 'actualText' option, a custom class can be added to
the specific row header and its value to apply custom style.
      if (cells.actualText === 'Germany') {
        args.cell.classList.add('e-custom');
      } else if (cells.actualText === 'Amount' &&
cells.columnHeaders === 'FY 2016' && cells.rowHeaders === 'Germany')
{
        args.cell.classList.add('e-custom');
      }
    },
    headerCellInfo: function (args: any) {
      let customAttributes: any = args.cell.column.customAttributes;
      // Here custom class can be added to the specific column header by
using unique level name, to apply custom style.
      if (args.node.classList.contains('e-columnsheader') &&
customAttributes &&
customAttributes.cell.valueSort.levelName === 'FY 2016.Sold Amount')
{
        args.node.classList.add('e-custom');
      }
    }
  } as GridSettings;
  let pivotObj: PivotViewComponent;
  return (<PivotViewComponent id='PivotView' ref={d => pivotObj = d}
dataSourceSettings={dataSourceSettings}
gridSettings={gridSettings} width={'100%'} height={350}>
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Note: The **dot(.)** character in **FY 2016.Sold Amount** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the [headerDelimiter](#) in the [valueSortSettings](#) property to any other delimiter instead of the default separator.

Show tooltip for row and column headers in React Pivotview component

You can create and display the tooltip for each row and column header(s) in the pivot table by using an external tooltip component via the [dataBound](#) event.

INDEX.JSX

```
import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from '../datasource';
import { Tooltip } from '@syncfusion/ej2-popups';
function App() {
    let headerTooltip;
    let dataSourceSettings = {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name: 'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount', caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    };
    let pivotObj;
    function dataBound() {
        if (!headerTooltip) {
            headerTooltip = new Tooltip({
                target: 'td.e-rowsheader,th.e-columnsheader', beforeRender: beforeRender
            });
            headerTooltip.appendTo(pivotObj.element);
        }
    }
    function beforeRender(args) {
        if (args.target.parentElement.querySelector('.e-rowsheader')) {
            // Here you can set custom content for row header(s) tooltip from its cell information.

```

Hide specific columns in React Pivotview component

By using the [columnRender](#) event in the [gridSettings](#), you can hide specific column(s) in the pivot table. In the example below, the “Units Sold” column under “FY 2016” is hidden by setting its **visible** property to **false** via the [columnRender](#) event.

Note: The **dot(.)** character in **FY 2016.Units Sold** is used by default to identify the header levels in the pivot table's row and column. It can be changed by setting the [headerDelimiter](#) in the [valueSortSettings](#) property to any other delimiter instead of the default separator.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { pivotData } from './datasource';
function App() {
    let dataSourceSettings = {
        dataSource: pivotData,
        expandAll: false,
        enableSorting: true,
        columns: [{ name: 'Year', caption: 'Production Year' }, { name:
'Quarter' }],
        values: [{ name: 'Sold', caption: 'Units Sold' }, { name: 'Amount',
caption: 'Sold Amount' }],
        rows: [{ name: 'Country' }, { name: 'Products' }],
        formatSettings: [{ name: 'Amount', format: 'C0' }],
        filters: []
    };
    let gridSettings = {
        columnRender: function (args) {
            // Specific column(s) can be hidden by checking their level name and
            setting its visible property accordingly.
            for (let i = 1; i < args.columns.length; i++) {
                if (args.stackedColumns[i].customAttributes &&
                    args.stackedColumns[i].customAttributes.cell.valueSort.levelName
                    === 'FY 2016.Units Sold') {
                    args.stackedColumns[i].visible = false;
                }
            }
        }
    };
    let pivotObj;
    return (<PivotViewComponent id='PivotView' ref={d => pivotObj = d}
dataSourceSettings={dataSourceSettings}
    gridSettings={gridSettings} width={'100%'} height={350}>

Export table and chart into the same document using toolbar in React Pivotview component. Even if the [displayOption.view](#) property is set to **Both** in the pivot table, you can only export either the table or the chart to the PDF document based on the current value set in the [displayOption.primary](#) property. But, to export both the table and the chart to the same PDF document, use the [pdfExport](#) method during the [actionBegin](#) event invoke.

In the following example, the built-in export action can be restricted by setting the [args.cancel](#) option to **true** in the [actionBegin](#) event, and both the table and the chart can be exported by calling the [pdfExport](#) method and setting the [exportBothTableAndChart](#) argument to **true**.

Add custom aggregation type to the menu in React Pivotview component

By using the [dataBound](#) event, you can add your own custom aggregate type(s) to the pivot table's aggregate menu.

In the following example, we have added the aggregation types **CustomAggregateType 1** and **CustomAggregateType 2** to the aggregate menu. The calculation for those aggregated types can be done using the [aggregateCellInfo](#) event.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-
react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { L10n } from '@syncfusion/ej2-base';

Convert complex JSON to flat JSON and assign it to the pivot table in React Pivotview component. By default, flat JSON can only bind to the pivot table. However, you can connect complex JSON to the pivot table by converting it to flat JSON via code-behind and binding it to the pivot table using the [dataSource](#) property in the [load](#) event.

In the following example, the **complexToFlatJson()** method is used to convert complex JSON to flat JSON and bind it to the pivot table using the [dataSource](#) property, then modifying the field names in the [rows](#) and [columns](#) based on the converted flat JSON under [dataSourceSettings](#) in the [load](#) event.

INDEX.JSX

```

import { FieldList, Inject, PivotViewComponent } from '@syncfusion/ej2-react-pivotview';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

Load desired report from the report list as default in React Pivotview component

By default, the pivot table is displayed with the report bound at the code-behind. To load a desired report from the previously saved report collection during initial rendering, set the desired report name in the [dataBound](#) event, along with the additional report-based customization code shown below.

INDEX.JSX

Display string value to pivot table values in React Pivotview component

End user can display string value to the pivot table's value cell by using the [aggregateCellInfo](#) event.

In the following example, each cell value of the **Sold** field's actual value has been assigned from its combination data sets obtained from the [args.cellSets](#) in the [aggregateCellInfo](#) event.

INDEX.JSX

```

height={350} dataSourceSettings={dataSourceSettings} showFieldList={true}
aggregateCellInfo={aggregateCell.bind(this)}>
  <Inject services={[FieldList]} />
</PivotViewComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById('sample'));

```

Summary of Predefined Dialogs component

Predefined dialogs

Getting Started

This section explain how to create the predefined dialogs in React application with its basic features in step-by-step procedure.

Dependencies

The following list of dependencies are required to use the React Dialog component in your application.

```
`javascript
```

```
|-- @syncfusion/ej2-react-popups
```

```
|-- @syncfusion/ej2-react-base
```

```
|-- @syncfusion/ej2-react-buttons
```

```
|-- @syncfusion/ej2-popups
```

```
|-- @syncfusion/ej2-base
```

```
|-- @syncfusion/ej2-buttons
```

```
,
```

Setup your development environment

You can use [Create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
```

```
npm install -g create-react-app
```

```
,
```

Start a new project using create-react-app command as follows

```
<div class='tsx'>
`

create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
`

</div>

<div class='jsx'>
`

create-react-app quickstart
cd quickstart
`

</div>
```

'react-scripts-ts' is used for creating React app with typescript.

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

You can choose the component that you want to install. For this application, we are going to use Dialog component.

To install Dialog component, use the following command

```
`bash
npm install @syncfusion/ej2-react-popups --save
`
```

Adding CSS reference

Import the Dialog component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-popups/styles/material.css";
`
```

The [Custom Resource Generator \(CRG\)](#) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

Render a dialog using utility functions

The dialog component provides built-in utility functions to render the alert and confirm dialogs with the minimal code.

The following options are used as an argument on calling the utility functions:

Options	Description
title	Specifies the title of dialog like the header property.
content	Specifies the value that can be displayed in dialog's content area like the content property.
isModal	Specifies the Boolean value whether the dialog can be displayed as modal or non-modal. For more details, refer to the isModal property.
position	Specifies the value where the alert or confirm dialog is positioned within the document. For more details, refer to the position property { X: 'center', Y: 'center' }
okButton	Configures the OK button that contains button properties with the click events. okButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for OK button click', text: 'Yes' // <-- Default value is 'OK' }
cancelButton	Configures the Cancel button that contains button properties with the click events. cancelButton:{ icon:'prefix icon to the button', cssClass:'custom class to the button', click: 'action for 'Cancel' button click', text: 'No' // <-- Default value is 'Cancel' }
isDraggable	Specifies the value whether the alert or confirm dialog can be dragged by the user.
showCloseIcon	When set to true, the close icon is shown in the dialog component.
closeOnEscape	When set to true, you can close the dialog by pressing ESC key.
animationSettings	Specifies the animation settings of the dialog component.
cssClass	Specifies the CSS class name that can be appended to the dialog.
zIndex	Specifies the order of the dialog, that is displayed in front or behind of another component.
open	Event which is triggered after the dialog is opened.
Close	Event which is triggered after the dialog is closed.

Adding predefined dialogs to the application

Now, you can start adding React predefined dialog to the application. We have added predefined dialog component in `src/App.tsx` file using following code.

```
[Class-component]
```

```
`ts
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}, {hideDialog: boolean;}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
}
```

```
public buttonClick() {
  dialogObj = DialogUtility.alert({
    title: 'Low Battery',
    width: '250px',
    content: '10% of battery remaining'
  });
}

public render() {
  return (
    <div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
        onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
}

export default App;
`ts

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";

class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }

  buttonClick() {
    dialogObj = DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining'
    });
  }
}
```

```

render() {
return (<div className="App" id='dialog-target'>
<ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
</div>);
}
}
export default App;
`

```

[Functional-component]

```

`ts
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App(){
function buttonClick() {
dialogObj = DialogUtility.alert({
title: 'Low Battery',
width: '250px',
content: '10% of battery remaining'
});
}
return (
<div className="App" id='dialog-target'>
<ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
</div>
);
}
export default App;
`
`ts
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';

```

```
import * as React from "react";

function App() {
  function buttonClick() {
    dialogObj = DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining'
    });
  }

  return (<div className="App" id='dialog-target'>
    <ButtonComponent id="alertBtn" cssClass="e-danger"
      onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
  </div>);
}

export default App;
```

Run the application

Now use the `npm run start` command to run the application in the browser.

```
npm run start
```

The below example shows the alert dialog.

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    dialogObj = DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining'
    });
  }
  render() {
```

```

        return (<div className="App" id='dialog-target'>
            <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
        </div>);
    }
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}, {}> {
    constructor(props: {}) {
        super(props);
        this.state = { };
    }
    public buttonClick() {
        dialogObj = DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining'
        });
    }
    public render() {
        return (
            <div className="App" id='dialog-target'>
                <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
            </div>);
    }
}
export default App;

```

[Functional-component]

APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
    function buttonClick() {
        dialogObj = DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining'
        });
    }
    return (<div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
}
export default App;

```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
    function buttonClick() {
        dialogObj = DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining'
        });
    }
    return (
        <div className="App" id='dialog-target'>
            <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
        </div>
    );
}
export default App;
```

Alert dialog

An alert dialog box used to display an errors, warnings, and information alerts that needs user awareness. The alert dialog is displayed along with the OK button. When user clicks on 'OK' button, alert dialog will get closed. Use the following code to render a simple alert dialog in an application.

[Class-component]**APP.JSX**

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
class App extends React.Component {
    constructor(props) {
        super(props);
        this.state = {};
    }
    buttonClick() {
        document.getElementById("statusText").style.display = "none";
        dialogObj = DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining',
            okButton: { click: this.alertOkAction.bind(this) },
        });
    }
    alertOkAction() {
        dialogObj.hide();
        document.getElementById('statusText').innerHTML =
            'The user closed the Alert dialog.';
        document.getElementById('statusText').style.display = 'block';
    }
}
```

```

    }
    render() {
        return (<div className="App" id='dialog-target'>
            <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
            <span id="statusText"></span>
        </div>);
    }
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
class App extends React.Component<{}, {}> {
    constructor(props: {}) {
        super(props);
        this.state = { };
    }
    public buttonClick() {
        document.getElementById("statusText").style.display = "none";
        dialogObj = DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining',
            okButton: { click: this.alertOkAction.bind(this) },
        });
    }
    public alertOkAction() {
        dialogObj.hide();
        document.getElementById('statusText').innerHTML =
            'The user closed the Alert dialog.';
        document.getElementById('statusText').style.display = 'block';
    }
    public render() {
        return (
            <div className="App" id='dialog-target'>
                <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
                <span id="statusText"></span>
            </div>);
    }
}
export default App;

```

[Functional-component]**APP.JSX**

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;

```

```
function App() {
  function buttonClick() {
    document.getElementById("statusText").style.display = "none";
    dialogObj = DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining',
      okButton: { click: alertOkAction.bind(this) },
    });
  }
  function alertOkAction() {
    dialogObj.hide();
    document.getElementById('statusText').innerHTML =
      'The user closed the Alert dialog.';
    document.getElementById('statusText').style.display = 'block';
  }
  return (<div className="App" id='dialog-target'>
    <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
    <span id="statusText"></span>
  </div>);
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
function App() {
  function buttonClick() {
    document.getElementById("statusText").style.display = "none";
    dialogObj = DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining',
      okButton: { click: alertOkAction.bind(this) },
    });
  }
  function alertOkAction() {
    dialogObj.hide();
    document.getElementById('statusText').innerHTML =
      'The user closed the Alert dialog.';
    document.getElementById('statusText').style.display = 'block';
  }
  return (
    <div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
      <span id="statusText"></span>
    </div>
  );
}
export default App;
```

Confirm dialog

A confirm dialog box used to displays a specified message along with the 'OK' and 'Cancel' button. It is used to get approval from the user, and it appears before any critical action. After get approval from the user the dialog will disappear automatically. Use the following code to render a simple confirm dialog in an application.

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    document.getElementById("statusText").style.display = "none";
    dialogObj = DialogUtility.confirm({
      title: 'Delete Multiple Items',
      content: 'Are you sure you want to permanently delete these
items?',
      width: '300px',
      okButton: { click: this.confirmOkAction.bind(this) },
      cancelButton: { click: this.confirmCancelAction.bind(this) }
    });
  }
  confirmOkAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = " The user
confirmed the dialog box";
    document.getElementById("statusText").style.display = "block";
  }
  confirmCancelAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = "The user canceled
the dialog box.";
    document.getElementById("statusText").style.display = "block";
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="confirmBtn" cssClass="e-success"
onClick={this.buttonClick.bind(this)}>Confirm</ButtonComponent>
      <span id="statusText"></span>
    </div>);
  }
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
```

```

import * as React from "react";
let dialogObj;
class App extends React.Component<{}, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    document.getElementById("statusText").style.display = "none";
    dialogObj = DialogUtility.confirm({
      title: 'Delete Multiple Items',
      content: 'Are you sure you want to permanently delete these items?',
      width: '300px',
      okButton: { click: this.confirmOkAction.bind(this) },
      cancelButton: { click: this.confirmCancelAction.bind(this) }
    });
  }
  public confirmOkAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = " The user confirmed the dialog box";
    document.getElementById("statusText").style.display = "block";
  }
  public confirmCancelAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = "The user canceled the dialog box.";
    document.getElementById("statusText").style.display = "block";
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="confirmBtn" cssClass="e-success"
onClick={this.buttonClick.bind(this)}>Confirm</ButtonComponent>
        <span id="statusText"></span>
      </div>);
  }
}
export default App;

```

[Functional-component]

APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
function App() {
  function buttonClick() {
    document.getElementById("statusText").style.display = "none";
    dialogObj = DialogUtility.confirm({
      title: 'Delete Multiple Items',
      content: 'Are you sure you want to permanently delete these
items?',
      width: '300px',

```

```

        okButton: { click: confirmOkAction.bind(this) },
        cancelButton: { click: confirmCancelAction.bind(this) }
    });
}
function confirmOkAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = " The user
confirmed the dialog box";
    document.getElementById("statusText").style.display = "block";
}
function confirmCancelAction() {
    dialogObj.hide();
    document.getElementById("statusText").innerHTML = "The user canceled
the dialog box.";
    document.getElementById("statusText").style.display = "block";
}
return (<div className="App" id='dialog-target'>
    <ButtonComponent id="confirmBtn" cssClass="e-success"
onClick={buttonClick.bind(this)}>Confirm</ButtonComponent>
    <span id="statusText"></span>
</div>);
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
function App() {
    function buttonClick() {
        document.getElementById("statusText").style.display = "none";
        dialogObj = DialogUtility.confirm({
            title: 'Delete Multiple Items',
            content: 'Are you sure you want to permanently delete these
items?',
            width: '300px',
            okButton: { click: confirmOkAction.bind(this) },
            cancelButton: { click: confirmCancelAction.bind(this) }
        });
    }
    function confirmOkAction() {
        dialogObj.hide();
        document.getElementById("statusText").innerHTML = " The user
confirmed the dialog box";
        document.getElementById("statusText").style.display = "block";
    }
    function confirmCancelAction() {
        dialogObj.hide();
        document.getElementById("statusText").innerHTML = "The user
canceled the dialog box.";
        document.getElementById("statusText").style.display = "block";
    }
    return (
        <div className="App" id='dialog-target'>

```

```

        <ButtonComponent id="confirmBtn" cssClass="e-success"
onClick={buttonClick.bind(this)}>Confirm</ButtonComponent>
        <span id="statusText"></span>
    </div>
    );
}
export default App;

```

Prompt dialog

A prompt dialog is used to get the input from the user. When the user clicks the 'OK' button the input value from the dialog is returned. If the user clicks the 'Cancel' button the null value is returned. After getting the input from the user the dialog will disappear automatically.

[Class-component]

APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
let dialogObj;
class App extends React.Component {
    constructor(props) {
        super(props);
        this.state = {};
    }
    buttonClick() {
        document.getElementById("statusText").style.display = "none";
        dialogObj = DialogUtility.confirm({
            title: 'Join Chat Group',
            width: '300px',
            content: '<p>Enter your name:</p> <input id= "inputEle"
type="text" name="Required" class="e-input" placeholder="Type here.." />',
            okButton: { click: this.promptOkAction.bind(this) },
            cancelButton: { click: this.promptCancelAction.bind(this) },
        });
    }
    promptOkAction() {
        let value;
        value = document.getElementById("inputEle").value;
        if (value == "") {
            dialogObj.hide();
            document.getElementById("statusText").innerHTML = "The user's
input is returned as\" \" ";
            document.getElementById("statusText").style.display = "block";
        }
        else {
            dialogObj.hide();
            document.getElementById("statusText").innerHTML = "The user's
input is returned as" + " " + value;
            document.getElementById("statusText").style.display = "block";
        }
    }
    promptCancelAction() {
        dialogObj.hide();
    }
}

```

```

        document.getElementById("statusText").innerHTML = "The user canceled
the prompt dialog";
        document.getElementById("statusText").style.display = "block";
    }
    render() {
        return (<div className="App" id='dialog-target'>
            <ButtonComponent id="promptBtn" isPrimary
onClick={this.buttonClick.bind(this)}>Prompt</ButtonComponent>
            <span id="statusText"></span>
        </div>);
    }
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

Draggable in React Predefined dialogs component

The predefined dialogs supports dragging within its target container by grabbing the dialog header, which allows the user to reposition the dialog dynamically by using `isDraggable` property.

Alert dragging

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining',
      isDraggable: true
    });
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
  }
}
export default App;
```

APP.TSX

Animation in React Predefined dialogs component

The predefined dialogs can be animated during the open and close actions. Also, user can customize animation's **delay**, **duration** and **effect** of animation by using the **animationSettings** property.

In the below sample, **Zoom** effect is enabled. So, The Dialog will open with **ZoomIn** and close with **ZoomOut** effects.

Alert animation

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining',
      animationSettings: { effect: 'Zoom' }
    });
  }
  render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
          onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
      </div>);
  }
}
export default App;
```

Position in React Predefined dialogs component

Customize the dialog position by using the **position** property. The position can be represented with specific **X** and **Y** values.

- The **PositionDataModel.X** can be configured with a left, center, right, or offset value. By default, the value is set as **center**.

- The `PositionDataModel.Y` can be configured with a top, center, bottom, or offset value. By default, the value is set as `center`.

        width: '300px'
    });
}
return (<div className="App" id='dialog-target'>
    <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
</div>);
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
    function buttonClick() {
        DialogUtility.confirm({
            title: 'Join Chat Group',
            content: '<p>Enter your name:</p> <input type="text" name="Required"
class="e-input" placeholder="Type here.." />',
            height: '250px',
            width: '300px'
        });
    }
    return (
        <div className="App" id='dialog-target'>
            <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
        </div>
    );
}
export default App;

```

Max-width and max-height

To have a restricted max-width and max-height dialog dimension, you need to specify the max-width, max-height CSS properties for the component's container element by using the `cssClass` property. The max-height value is calculated in source level and set to the dialog. so, need to override the max-height property.

Use the following code to customize the max-width and max-height for alert dialog:

[Class-component]**APP.JSX**

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
    constructor(props) {

```

```

    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Serires',
      content: 'In the Succinctly series, Syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.Each title in the Succinctly series is written by a carefully
chosen expert and provides essential content in about 100 pages. The
Succinctly series was born in 2012 out of a desire to provide concise
technical e-books for software developers.',
      cssClass: 'customClass'
    });
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
  }
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Serires',
      content: 'In the Succinctly series, Syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.Each title in the Succinctly series is written by a carefully
chosen expert and provides essential content in about 100 pages. The
Succinctly series was born in 2012 out of a desire to provide concise
technical e-books for software developers.',
      cssClass : 'customClass'
    });
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
      </div>);
  }
}
export default App;

```

[Functional-component]**APP.JSX**

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
    function buttonClick() {
        DialogUtility.alert({
            title: 'About SYNCFUSION Succinctly Serires',
            content: 'In the Succinctly series, Syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.Each title in the Succinctly series is written by a carefully
chosen expert and provides essential content in about 100 pages. The
Succinctly series was born in 2012 out of a desire to provide concise
technical e-books for software developers.',
            cssClass: 'customClass'
        });
    }
    return (<div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
        </div>);
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
    function buttonClick() {
        DialogUtility.alert({
            title: 'About SYNCFUSION Succinctly Serires',
            content: 'In the Succinctly series, Syncfusion created a robust,
free library of more than 130 technical e-books formatted for PDF, Kindle,
and EPUB.Each title in the Succinctly series is written by a carefully
chosen expert and provides essential content in about 100 pages. The
Succinctly series was born in 2012 out of a desire to provide concise
technical e-books for software developers.',
            cssClass : 'customClass'
        });
    }
    return (
        <div className="App" id='dialog-target'>
            <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
        </div>
    );
}
export default App;
```

Min-width and min-height

To have a restricted min-width and min-height dialog dimension, you need to specify the min-width, min-height CSS properties for the component's container element by using the `cssClass` property.

Use the following code to customize the min-width and min-height for alert dialog:

[Class-Component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Series',
      content: ' The Succinctly series was born in 2012 out of a
desire to provide concise technical e-books for software developers.',
      cssClass: 'customClass'
    });
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
  }
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Series',
      content: ' The Succinctly series was born in 2012 out of a desire to
provide concise technical e-books for software developers.',
      cssClass : 'customClass'
    });
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
```

```

    <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>;
  }
}
export default App;

```

[Functional-Component]

APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Serires',
      content: ' The Succinctly series was born in 2012 out of a
desire to provide concise technical e-books for software developers.',
      cssClass: 'customClass'
    });
  }
  return (<div className="App" id='dialog-target'>
    <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>);
}
export default App;

```

APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.alert({
      title: 'About SYNCFUSION Succinctly Serires',
      content: ' The Succinctly series was born in 2012 out of a
desire to provide concise technical e-books for software developers.',
      cssClass : 'customClass'
    });
  }
  return (
    <div className="App" id='dialog-target'>
      <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={buttonClick.bind(this)}>Alert</ButtonComponent>
    </div>
  );
}
export default App;

```

Customization in React Predefined dialogs component

You can customize the predefined dialogs buttons by using below properties.

- **okButton** - Use this property to customize **OK** button text.
- **cancelButton** - Use this property to customize **Cancel** button text.

Use the following code snippet for **alert**, **confirm** and **prompt** to customize the predefined dialogs action buttons.

For alert dialog , customized the default dialog button content as **Dismiss** by using the **text** property.

For confirm dialog, customized the default dialog buttons content as **Yes** and **No** by using the **text** property and also customized the dialog button icons by using **icon** property.

For prompt dialog , customized the default dialog buttons content as **Connect** and **Close** by using **text** property.

Alert action button

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.alert({
      title: 'Low Battery',
      content: '10% of battery remaining',
      width: '250px',
      okButton: { text: 'Dismiss' }
    });
  }
  render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
          onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
      </div>);
  }
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";

import * as React from "react";
function App() {
    function buttonClick() {
        DialogUtility.confirm({
            title: 'Join Chat Group',
            content:
                '<p>Enter your name:</p><input type="text" name="Required"
class="e-input" placeholder="Type here.." />',
            height: '200px',

```

```

        okButton: { text: 'Connect' },
        cancelButton: { text: 'Close' }
    });
}
return (
    <div className="App" id='dialog-target'>
        <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
    </div>
);
}
export default App;

```

Show or hide dialog close button

When rendering the predefined dialogs through utility methods, You can close the dialog using the following ways. The default values of `closeOnEscape` and `showCloseIcon` is `false`.

- By pressing the escape key if the `closeOnEscape` property is enabled.
- By clicking the close button if the `showCloseIcon` property is enabled.

You can also manually close the Dialogs by creating an instance to the dialog and call the `hide` method.

Use the following code for **alert**, **confirm** and **prompt** to demonstrates the different ways of hiding the utility dialog.

Alert dialog close button

[Class-component]

APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
    constructor(props) {
        super(props);
        this.state = {};
    }
    buttonClick() {
        DialogUtility.alert({
            title: 'Low Battery',
            width: '250px',
            content: '10% of battery remaining',
            showCloseIcon: true,
            closeOnEscape: true
        });
    }
    render() {
        return (<div className="App" id='dialog-target'>
            <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
        </div>);
    }
}
export default App;

```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    DialogUtility.alert({
      title: 'Low Battery',
      width: '250px',
      content: '10% of battery remaining',
      showCloseIcon : true,
      closeOnEscape : true
    });
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="alertBtn" cssClass="e-danger"
onClick={this.buttonClick.bind(this)}>Alert</ButtonComponent>
      </div>);
  }
}
export default App;
```

[Functional-component]**APP.JSX**

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.alert({
      title: 'Low Battery',

  );
}
export default App;
```

Prompt dialog close button

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content: '<p>Enter your name:</p> <input type="text"
name="Required" class="e-input" placeholder="Type here.." />',
      width: '300px',
      showCloseIcon: true,
      closeOnEscape: true
    });
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="promptBtn" isPrimary
onClick={this.buttonClick.bind(this)}>Prompt</ButtonComponent>
    </div>);
  }
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component<{}>, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content:
        '<p>Enter your name:</p> <input type="text" name="Required"
class="e-input" placeholder="Type here.." />',
      width: '300px',
      showCloseIcon : true,
      closeOnEscape : true
    });
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="promptBtn" isPrimary
onClick={this.buttonClick.bind(this)}>Prompt</ButtonComponent>
      </div>);
  }
}
export default App;
```

[Functional-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content: '<p>Enter your name:</p> <input type="text"
name="Required" class="e-input" placeholder="Type here.." />',
      width: '300px',
      showCloseIcon: true,
      closeOnEscape: true
    });
  }
  return (<div className="App" id='dialog-target'>
    <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
  </div>);
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content:
        '<p>Enter your name:</p> <input type="text" name="Required"
class="e-input" placeholder="Type here.." />',
      width: '300px',
      showCloseIcon : true,
      closeOnEscape : true
    });
  }
  return (
    <div className="App" id='dialog-target'>
      <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
    </div>
  );
}
export default App;
```

Customize dialog content

You can load custom content in predefined dialogs using the `content` property.

Use the following code to customize the dialog content to render the custom TextBox component inside the prompt dialog to get the username from the user.

[Class-component]

APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
class App extends React.Component {
  constructor(props) {
    super(props);
    this.state = {};
  }
  buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content: '<p>Enter your name:</p><input class="e-input"
placeholder="Type here.." />',
      width: '300px',
    });
  }
  render() {
    return (<div className="App" id='dialog-target'>
      <ButtonComponent id="promptBtn" isPrimary
onClick={this.buttonClick.bind(this)}>Prompt</ButtonComponent>
    </div>);
  }
}
```

```
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
class App extends React.Component<{}, {}> {
  constructor(props: {}) {
    super(props);
    this.state = { };
  }
  public buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content:
        '<p>Enter your name:</p><input class="e-input" placeholder="Type here.." />',
      width: '300px',
    });
  }
  public render() {
    return (
      <div className="App" id='dialog-target'>
        <ButtonComponent id="promptBtn" isPrimary
          onClick={this.buttonClick.bind(this)}>Prompt</ButtonComponent>
      </div>);
  }
}
export default App;
```

[Functional-component]**APP.JSX**

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content: '<p>Enter your name:</p><input class="e-input"
placeholder="Type here.." />',
      width: '300px',
    });
  }
  return (<div className="App" id='dialog-target'>
    <ButtonComponent id="promptBtn" isPrimary
      onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
  </div>);
}
export default App;
```

APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogUtility } from '@syncfusion/ej2-react-popups';
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
function App() {
  function buttonClick() {
    DialogUtility.confirm({
      title: 'Join Chat Group',
      content:
        '<p>Enter your name:</p><input class="e-input" placeholder="Type here.." />',
      width: '300px',
    });
  }
  return (
    <div className="App" id='dialog-target'>
      <ButtonComponent id="promptBtn" isPrimary
onClick={buttonClick.bind(this)}>Prompt</ButtonComponent>
    </div>
  );
}
export default App;
```

Progress bar

Getting Started

This section explains the steps required to create the ProgressBar control using React and configure its properties.

Dependencies

Below is the list of minimum dependencies required to use the progress bar component.

```
`javascript
|-- @syncfusion/ej2-react-progressbar
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-svg-base
`,`
```

Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`
npm install -g create-react-app
`,`
```

- To setup basic `React` sample use following commands.

`

```
create-react-app quickstart --template typescript
```

```
cd quickstart
```

```
npm start
```

`

- Install Syncfusion packages using below command.

`

```
npm install @syncfusion/ej2-react-progressbar --save
```

`

Add Progressbar to the Project

Now, you can start adding Progress bar component in the application. For getting started, add the Progress bar component in `src/App.tsx` file using following code.

```
`ts
```

```
import {ProgressBarComponent} from '@syncfusion/ej2-react-progressbar';
```

```
import * as React from 'react';
```

```
function App() {
```

```
  return ( <ProgressBarComponent/>)
```

```
};
```

```
export default App;
```

```
`
```

Run the application

Now, we might create a simple progress bar sample as shown below.

INDEX.JSX

```
{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (
    <ProgressBarComponent id="linear" type='Linear' height='60'
    value={40} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
      </ProgressBarComponent>
    );
}
;
```

```
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="linear"
    type='Linear'
    height='60'
    value={40}
    animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

Now run the `npm start` command in the console, it will run your application and open the browser window.

,

npm start

,

Types in React Progress bar component

Visualize progress in different shapes (rectangle, circle, and semi-circle) to give a unique appearance to your app design.

Linear

Set **type** to Linear to get the linear progress bar. It also support secondary progress and different mode of progress.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
function App() {
  return (<ProgressBarComponent id="lineardeterminate" type="Linear"
    height="60" value={100} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

```

    }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent
        id="lineardeterminate"
        type="Linear"
        height="60"
        value={100}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
        </ProgressBarComponent>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Circular

Set **type** to Circular to get the circular progress bar. It also support secondary progress and different mode of progress.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent id="circular-container" type="Circular"
        height="160px" value={100} animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
        </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent
    id="circular-container"
    type="Circular"
    height="160px"
    value={100}
    animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

Tooltip in React Progress bar component

Tooltip

The tooltip for the progress bar is used to represent the progress value. During the initial load, it can be enabled by using the [enable](#) property. The [showTooltipOnHover](#) property can show the tooltip on mouseover.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent id="lineardeterminate" type="Linear"
    height="60" tooltip={{enable: true} value={100} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
```

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent
        id="lineardeterminate"
        type="Linear"
        height="60"
        value={100}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}
        tooltip={{enable: true}}>
    </ProgressBarComponent>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

Format

By default, the tooltip shows information about progress. In addition to that, show more information in the tooltip using the [format](#) property.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent id="lineardeterminate" type="Linear"
height="60" tooltip={{enable: true, format: "Progress: ${value}%"}}
value={100} animation={{
    enable: true,
    duration: 2000,
    delay: 0
}}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent
```

```

        id="lineardeterminate"
        type="Linear"
        height="60"
        value={100}
        animation={{
          enable: true,
          duration: 2000,
          delay: 0
        }}
        tooltip={{enable: true, format: "Progress: ${value}"}}>
      </ProgressBarComponent>
    )
  };
  export default App;
  ReactDOM.render(<App />, document.getElementById("container"));
  {% endraw %}

```

Customization

The [fill](#) and [border](#) properties are used to customize the background color and border of the tooltip respectively. The [textStyle](#) property in the tooltip is used to customize the font of the tooltip text.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent id="lineardeterminate" type="Linear"
    height="60" value={100} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }} tooltip={{
      enable: true,
      textStyle: {
        fontWeight: '600',
        size: '9px',
        color: 'red',
        fontFamily: 'Roboto',
        fontStyle: 'Italic'
      }
    }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";

```

```
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent
    id="lineardeterminate"
    type="Linear"
    height="60"
    value={100}
    animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}
    tooltip={{enable: true,
      textStyle: {
        fontWeight: '600',
        size: '9px',
        color: 'red',
        fontFamily: 'Roboto',
        fontStyle: 'Italic'
      }}}
  </ProgressBarComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

States in React Progress bar component

Visualize progress in different modes.

Determinate

<!-- markdownlint-disable MD033 -->

This is the default state. You can use it when the progress estimation is known.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent id="linear" type="Linear" height="60"
value={100} animation={{
  enable: true,
  duration: 2000,
  delay: 0
}}>
  </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent
        id="linear"
        type="Linear"
        height="60"
        value={100}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
    </ProgressBarComponent>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

Indeterminate

By enabling the **isIndeterminate** property, the state of the progress bar can be changed to indeterminate when the progress cannot be estimated or is not being calculated. It can be combined with determinate mode to know that the application is estimating progress before the actual progress starts.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
    return (<ProgressBarComponent id="linear" type="Linear" height="60"
    value={20} isIndeterminate={true} animation={{
        enable: true,
        duration: 2000,
        delay: 0
    }}>
    </ProgressBarComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
```

```
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent
    id="linear"
    type="Linear"
    height="60"
    value={20}
    isIndeterminate={true}
    animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

Buffer

<!-- markdownlint-disable MD033 -->

You can use a secondary progress indicator when the primary progress depends on the secondary progress. This will allow users to visualize both primary and secondary progress simultaneously.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent id="linear" type="Linear" height="60"
    value={40} secondaryProgress={60} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>);
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { ProgressBarComponent } from "@syncfusion/ej2-react-progressbar";
function App() {
  return (<ProgressBarComponent
    id="linear"
    type="Linear"

```

```

        height="60"
        value={40}
        secondaryProgress={60}
        animation={{
          enable: true,
          duration: 2000,
          delay: 0
        }}
      </ProgressBarComponent>
    )
  };
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Customization in React Progress bar component

Segments

We can divide a progress bar into multiple segments using a `segmentCount` to visualize the progress of multiple sequential tasks.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="circular" type='Circular'
    height='160px' segmentCount={8} value={100} animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}
  ></ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return(<ProgressBarComponent id="circular"
    type='Circular'
    height='160px'
    segmentCount={8}
    value={100}
    animation={{
      enable: true,
      duration: 2000,

```

```

                delay: 0
            }>
        </ProgressBarComponent>
    )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Thickness

Customize the thickness of the track using [trackThickness](#), progress using [progressThickness](#) and secondary progress using [secondaryProgressThickness](#) to render the progress bar with different appearances.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="circular" type='Circular'
height='160px' width='90%' trackThickness={24} progressThickness={24}
secondaryProgressThickness={20} value={100} animation={{
        enable: true,
        duration: 2000,
        delay: 0
    }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="circular"
        type='Circular'
        height='160px'
        width='90%'
        trackThickness={24}
        progressThickness={24}
        secondaryProgressThickness={20}
        value={100}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
    </ProgressBarComponent>);
}

```

```

    </ProgressBarComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Radius

The radius of the progress bar can be customized using **radius** property and corner can be customized by **cornerRadius** property.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="circular" type='Circular'
    height='160px' width='90%' trackThickness={80} progressThickness={10}
    value={100} enableRtl={false} trackColor="#FFD939" radius="100%"
    progressColor="white" cornerRadius="Round" animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="circular"
    type='Circular'
    height='160px'
    width='90%'
    trackThickness={80}
    progressThickness={10}
    value={100}
    enableRtl={false}
    trackColor="#FFD939"
    radius="100%"
    progressColor="white"
    cornerRadius="Round"
    animation={{
      enable: true,
      duration: 2000,

```

```

                delay: 0
            }>
        </ProgressBarComponent>
    )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

InnerRadius

The inner radius of the progress bar can be customized using `innerRadius` property.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="circular" type='Circular'
        height='160px' width='90%' trackThickness={80} progressThickness={10}
        value={100} enableRtl={false} trackColor="#FFD939" radius="100%"
        innerRadius='80%' progressColor="white" cornerRadius="Round" animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
        </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="circular"
        type='Circular'
        height='160px'
        width='90%'
        trackThickness={80}
        progressThickness={10}
        value={100}
        enableRtl={false}
        trackColor="#FFD939"
        radius="100%"
        innerRadius='80%'
        progressColor="white"
        cornerRadius="Round"
        animation={{

```

```

        enable: true,
        duration: 2000,
        delay: 0
      }}>
    </ProgressBarComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Progress color and track color

Customize the color of progress, secondary progress, and track by using the [progressColor](#), [secondaryProgressColor](#), and [trackColor](#) properties.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="circular" type='Circular'
    height='160px' width='90%' trackThickness={24} progressThickness={24}
    value={50} secondaryProgress={70} secondaryProgressColor='green'
    enableRtl={false} showProgressValue={true} trackColor="#F8C7D8"
    radius="100%" progressColor="#E3165B" cornerRadius="Round" animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (
    <ProgressBarComponent id="circular"
      type='Circular'
      height='160px'
      width='90%'
      trackThickness={24}
      progressThickness={24}
      secondaryProgressColor='green'
      value={50}
      enableRtl={false}

```

```

        showProgressValue={true}
        trackColor="#F8C7D8"
        radius="100%"
        progressColor="#E3165B"
        cornerRadius="Round"
        secondaryProgress={70}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}
    </ProgressBarComponent>
)
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Annotation in React Progress bar component

Annotation

In the circular progress bar, you can add any view to the center using the **Content** property in annotation.

For example, you can include add, start, or pause button to control the progress. You can also add an image that indicates the actual task in progress or add custom text that conveys how far the task is completed.

INDEX.JSX

```

import { ProgressBarComponent, ProgressBarAnnotationsDirective,
ProgressBarAnnotationDirective, Inject, ProgressAnnotation } from
'@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    let content = '<div id="point1" style="font-size:20px;font-
weight:bold;color:#ffffff;fill:#ffffff"><span>60%</span></div>';
    return (<ProgressBarComponent id="circular" type='Circular'
innerRadius="190%" height='160px' trackThickness={80} cornerRadius={"Round"}
trackColor={"#FFD939"}>
        <Inject services={[ProgressAnnotation]}>/>
        <ProgressBarAnnotationsDirective>
            <ProgressBarAnnotationDirective content={content}>
                </ProgressBarAnnotationDirective>
            </ProgressBarAnnotationsDirective>
        </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));

```

INDEX.TSX

```

import { ProgressBarComponent, ProgressBarAnnotationsDirective,
ProgressBarAnnotationDirective, Inject,

```

```

ProgressAnnotation } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  let content: string = '<div id="point1" style="font-size:20px;font-weight:bold;color:#ffffff;fill:#ffffff"><span>60%</span></div>';
  return (<ProgressBarComponent id="circular" type='Circular'
innerRadius="190%" height='160px' trackThickness={80} cornerRadius={"Round"}
trackColor={"#FFD939"}>
    <Inject services={[ProgressAnnotation]} />
    <ProgressBarAnnotationsDirective>
      <ProgressBarAnnotationDirective content={content}>
        </ProgressBarAnnotationDirective>
      </ProgressBarAnnotationsDirective>
    </ProgressBarComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));

```

Label

You can show the progress value in both linear and circular progress bar using **showProgressValue** property.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="linear" type='Linear'
showProgressValue={true} labelStyle={{ color: '#FFFFFF' }}
trackThickness={24} progressThickness={24} value={50} textRender={ (args) =>
{
  args.text = '50';
}} animation={{
  enable: true,
  duration: 2000,
  delay: 0,
}}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {

```

```

    return( <ProgressBarComponent id="linear"
        type='Linear'
        showProgressValue={true}
        labelStyle={{color: '#FFFFFF'}}
        trackThickness={24}
        progressThickness={24}
        value={50}
        textRender={(args: ITextRenderEventArgs) => {
            args.text = '50';
        }}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0,
        }}>
    </ProgressBarComponent>
    )
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Animation in React Progress bar component

Progress Bar support to animate the progress by using **animation** property. Enable the animation by setting **enable** property and also you can control the speed by using **duration** property.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="linear" type='Linear'
        trackThickness={24} progressThickness={24} value={60} animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}>
    </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (
        <ProgressBarComponent id="linear"

```

```

        type='Linear'
        trackThickness={24}
        progressThickness={24}
        value={60}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}
    </ProgressBarComponent>
)
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Range in React Progress bar component

Range represents the entire span of the progress bar and can be defined using the **minimum** and **maximum** properties. The default value of the range is 0 to 100.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="Circular" type='Circular'
        height='160px' trackThickness={24} progressThickness={24} minimum={0}
        maximum={1} value={0.5} animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}
    ></ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<ProgressBarComponent id="Circular"
        type='Circular'
        height='160px'
        trackThickness={24}
        progressThickness={24}
        minimum={0}
        maximum={1}
    ></ProgressBarComponent>);
}

```

```

        value={0.5}
        animation={{
          enable: true,
          duration: 2000,
          delay: 0
        }}
      </ProgressBarComponent>
    )
  };
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

Events in React Progress bar component

valueChanged

This event is triggered when the progress value is changed.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  let progressInstance;
  function changeValue() {
    progressInstance.value = 80;
  }
  return (<div> <button onClick={changeValue}>Change
value</button><br></div>
    <ProgressBarComponent id="linear" ref={linear1 =>
progressInstance = linear1 type='Linear' trackColor='gray'
progressColor='blue' value={100} animation={{
  enable: false,
  duration: 2000,
  delay: 0
}} valueChanged={ (args) => {
  args.progressValue = 90;
}}>
    </ProgressBarComponent>
    </div>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import { IProgressValueEventArgs } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {

```

```

let progressInstance: ProgressBarComponent;
function changeValue() {
  progressInstance.value = 80;
}
return(<div> <button onClick={changeValue}>Change value</button><br></br>
  <ProgressBarComponent id="linear"
    ref={linear1 => progressInstance = linear1}
    type='Linear'
    trackColor='gray'
    progressColor='blue'
    value={100}
    animation={{
      enable: false,
      duration: 2000,
      delay: 0
    }}
    valueChanged={({ args: IProgressValueEventArgs) => {
      args.progressValue = 90;
    }}>
  </ProgressBarComponent>
</div>
)
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% enddraw %}

```

progressCompleted

This event is triggered when the progress attains the maximum value.

INDEX.JSX

```

{% raw %}
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return (<ProgressBarComponent id="linear2" type='Linear' value={100}
    animation={{
      enable: true,
      duration: 2000,
      delay: 0
    }} progressCompleted={({ args) => {
      args.value = 50;
    }}>
  </ProgressBarComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% enddraw %}

```

INDEX.TSX

```
{% raw %}
```

```
import { ProgressBarComponent } from '@syncfusion/ej2-react-progressbar';
import { IProgressValueEventArgs } from '@syncfusion/ej2-progressbar';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return(<ProgressBarComponent id="linear2"
        type='Linear'
        value={100}
        animation={{
            enable: true,
            duration: 2000,
            delay: 0
        }}
        progressCompleted={(args: IProgressValueEventArgs)
=> {
            args.value = 50;
        }}>
        </ProgressBarComponent>
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById("container"));
{% endraw %}
```

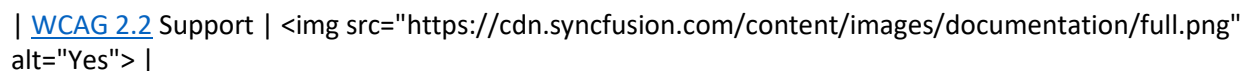

Accessibility in React Progress bar component

The Progress bar component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Progress bar component is outlined below.

| Accessibility Criteria | Compatibility |

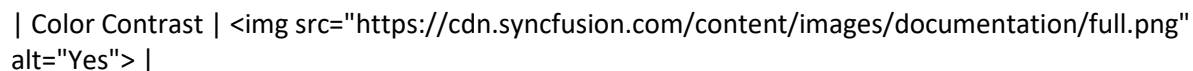

| -- | -- |

| [WCAG 2.2](#) Support |  alt="Yes" |

| [Section 508](#) Support |  alt="Yes" |

| Screen Reader Support |  alt="Yes" |

| Right-To-Left Support |  alt="Yes" |

| Color Contrast |  alt="Yes" |

| Mobile Device Support |  alt="Yes" |

| Keyboard Navigation Support |  alt="Yes" |

| [Accessibility Checker](#) Validation |  alt="Yes" |

```
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Progress bar component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Progress bar component:

- progressbar (role)
- aria-valuemin (attribute)
- aria-valuemax (attribute)
- aria-valuenow (attribute)
- aria-label (attribute)

Keyboard interaction

The Progress bar component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Progress bar component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Moves the focus to the Progress bar element.** |

| **Ctrl + P** | **Prints the Progress bar.** |

Ensuring accessibility

The Progress bar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Progress bar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Progress bar component with accessibility tools.

ProgressButton

Getting Started

This section explains how to create a simple ProgressButton and to configure it.

Dependencies

The list of dependencies required to use the ProgressButton component in your application is given as follows:

```
`js
|-- @syncfusion/ej2-react-splitbuttons
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
`,`
```

Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
`,`
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash
npx create-react-app my-app
cd my-app
```

npm start

,

Adding syncfusion packages

All the available Essential JS 2 packages are published in

[npmjs.com](https://www.npmjs.com) public registry.

You can choose the component that you want to install.

To install ProgressButton component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-splitbuttons --save
```

,

Adding CSS reference

Import the ProgressButton component required CSS references as follows in `src/App.css`.

```
`css
```

```
/ import the ProgressButton dependency styles /
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
```

,

Adding ProgressButton component

Now, you can start adding ProgressButton component in the application. For getting started, add the

ProgressButton component in `src/App.tsx` file using following code.

Add the below code in the `src/App.tsx` to initialize the ProgressButton.

```
`ts
```

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
```

```
import * as React from 'react';
```

```
import './App.css';
```

```
// To render ProgressButton.
```

```
function App() {
```

```
  return (<div style={{marginTop: '150px'}}>
```

```
    <ProgressButtonComponent content='Spin Left' />
```

```
  </div>
```

```
);
```

```
}
```

```
export default App;
```

```
,
```

Run the application

After completing the configuration required to render a basic ProgressButton, run the following command to

display the output in your default browser.

```
,
```

```
npm start
```

```
,
```

The following example shows a basic Progress button component.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render ProgressButton.
function App() {
  return (
    <div>
      <ProgressButtonComponent content='Spin Left' />
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render ProgressButton.
function App() {
  return (
    <div>
      <ProgressButtonComponent content='Spin Left' />
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

ProgressButton supports different styles, types and sizes like [Button](#). In addition, it also supports **top** and **bottom** icon positions.

```

Spinner and progress in React Progress button component

Change spinner position

Spinner position can be changed by modifying the [position](#) property of [spinSettingsModel](#). By default, the spinner is positioned at the left of the ProgressButton. You can position it at the [left](#), [right](#), [top](#), [bottom](#), or [center](#) of the text content.

Change spinner size

Spinner size can be changed by modifying the [width](#) property of [spinSettingsModel](#). In this demo, the [width](#) is set to [20](#) to change the spinner size.

Spinner template

You can use custom spinner by specifying the [template](#) property of [spinSettingsModel](#) with custom styles.

The following sample demonstrates the above functionalities of the spinner.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let spinSettings = { position: 'Right', width: 20, template: '<div class="template"></div>' };
    return (<ProgressButtonComponent content='Submit' spinSettings={spinSettings}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent, SpinSettingsModel } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let spinSettings : SpinSettingsModel = { position: 'Right', width: 20, template: '<div class="template"></div>' };
    return (
        <ProgressButtonComponent content='Submit' spinSettings={spinSettings}/>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Progress

Content animation

The [content](#) of the ProgressButton can be animated during progress using the [effect](#) property of [animationSettingsModel](#). You can also set custom duration and timing function using the [duration](#) and

[easing](#) properties. The possible [effect](#) values are [None](#), [SlideLeft](#), [SlideRight](#), [SlideUp](#), [SlideDown](#), [ZoomIn](#), and [ZoomOut](#).

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let animationSettings = { effect: 'SlideLeft', duration: 500, easing: 'linear' };
    let spinSettings = { position: 'Center' };
    return (<ProgressButtonComponent content='Slide Left'
enableProgress={true} animationSettings={animationSettings}
spinSettings={spinSettings}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { AnimationSettingsModel, ProgressButtonComponent, SpinSettingsModel } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let animationSettings: AnimationSettingsModel = { effect: 'SlideLeft', duration: 500, easing: 'linear' };
    let spinSettings : SpinSettingsModel = { position: 'Center' };
    return (
        <ProgressButtonComponent content='Slide Left' enableProgress = {true}
animationSettings={animationSettings} spinSettings={spinSettings}/>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Change step of the ProgressButton

The progress can be visualized at the specified interval by changing the [step](#) property in the [begin](#) event of the ProgressButton. In this demo, the [step](#) property is set to [20](#) to show progress at every 20% increment.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    function begin(args) {
        args.step = 20;
    }
    return (<ProgressButtonComponent content='Progress Step'
enableProgress={true} begin={begin} cssClass='e-hide-spinner'/>);
}
```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));

```

APP.TSX

```

import { ProgressButtonComponent, ProgressEventArgs } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  function begin(args: ProgressEventArgs): void {
    args.step = 20;
  }
  return (
    <ProgressButtonComponent content='Progress Step' enableProgress = {true}
    begin={begin} cssClass='e-hide-spinner'/>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));

```

The class `e-hide-spinner` hides the spinner in the ProgressButton, For more information, see [hide spinner](#) section.

Change progress dynamically

The progress can be changed dynamically by modifying the `percent` property in the ProgressButton events. In this demo, on 40% completion of progress, the `percent` property is set to `90` to show dynamic change of the progress.

APP.JSX

```

import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { useState } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  const [state, setState] = useState({
    content: 'Progress'
  });
  return (<ProgressButtonComponent content={state.content}
  enableProgress={true} duration={15000} begin={begin} progress={progress}
  end={end} cssClass='e-hide-spinner'/>);
  function begin(args) {
    setState({ content: 'Progress ' + args.percent + '%' });
  }
  function progress(args) {
    setState({ content: 'Progress ' + args.percent + '%' });
    if (args.percent === 40) {
      args.percent = 90;
    }
  }
  function end(args) {
    setState({ content: 'Progress ' + args.percent + '%' });
  }
}

```

```

    }
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('progress-button'));

```

APP.TSX

```

import { ProgressButtonComponent, ProgressEventArgs } from '@syncfusion/ej2-react-splitbuttons';
import { useState } from "react";
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  const [state, setState] = useState({
    content: 'Progress'
  });
  return (
    <ProgressButtonComponent content={state.content} enableProgress =
    {true} duration={15000} begin={begin} progress={progress} end={end}
    cssClass='e-hide-spinner' />
  );
  function begin(args: ProgressEventArgs): void {
    setState({ content: 'Progress ' + args.percent + '%' });
  }
  function progress(args: ProgressEventArgs): void {
    setState({ content: 'Progress ' + args.percent + '%' });
    if (args.percent === 40) {
      args.percent = 90;
    }
  }
  function end(args: ProgressEventArgs): void {
    setState({ content: 'Progress ' + args.percent + '%' });
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));

```

The method [dataBind](#) applies the property changes immediately to the component.

Start and stop methods

You can pause and resume the progress using the [stop](#) and [start](#) methods, respectively. In this demo, clicking the ProgressButton will pause and resume the progress.

APP.JSX

```

{% raw %}
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from "react";
function App() {
  let progressBtn;
  const [state, setState] = useState({
    content: 'Download',
    iconCss: 'e-btn-sb-icon e-download'
  });

```

```

    });
    return (<ProgressButtonComponent content={state.content}
enableProgress={true} duration={4000} iconCss={state.iconCss} end={end}
cssClass='e-hide-spinner' onClick={clickHandler} ref={(scope) => {
progressBtn = scope; }}/>);
    function end() {
        setState({ content: 'Download', iconCss: 'e-btn-sb-icon e-download'
    });
    }
    function clickHandler() {
        if (state.content === 'Download') {
            setState({ content: 'Pause', iconCss: 'e-btn-sb-icon e-pause'
        });
        }
        else if (state.content === 'Pause') {
            setState({ content: 'Resume', iconCss: 'e-btn-sb-icon e-play'
        });
        }
        progressBtn.stop();
    }
        else if (state.content === 'Resume') {
            setState({ content: 'Pause', iconCss: 'e-btn-sb-icon e-pause'
        });
        }
        progressBtn.start();
    }
    }
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
{% endraw %}

```

APP.TSX

```

{% raw %}
import { ProgressButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from "react";
function App() {
    let progressBtn: ProgressButtonComponent;
    const [state, setState] = useState({
        content: 'Download',
        iconCss: 'e-btn-sb-icon e-download'
    });
    return (
        <ProgressButtonComponent content={state.content} enableProgress = {true}
duration={4000}
        iconCss={state.iconCss} end={end} cssClass='e-hide-spinner'
onClick={clickHandler} ref={(scope)=>{progressBtn = scope as
ProgressButtonComponent;}}/>
    );
    function end(): void {
        setState({ content: 'Download', iconCss: 'e-btn-sb-icon e-download' });
    }

    function clickHandler(): void {

```

```

    if (state.content === 'Download') {
      setState({ content: 'Pause', iconCss: 'e-btn-sb-icon e-pause' });
    }
    else if (state.content === 'Pause') {
      setState({ content: 'Resume', iconCss: 'e-btn-sb-icon e-play' });
      progressBtn.stop();
    }
    else if (state.content === 'Resume') {
      setState({ content: 'Pause', iconCss: 'e-btn-sb-icon e-pause' });
      progressBtn.start();
    }
  }
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
{% endraw %}

```

Accessibility in React ProgressBar component

The ProgressBar component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the ProgressBar component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

```
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The ProgressBar component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the ProgressBar component:

Attributes	Purpose
---	---
aria-label	Provides an accessible name for the icon only ProgressBar.
aria-disabled	Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable.

Keyboard interaction

The ProgressBar component followed the [keyboard interaction] guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the ProgressBar component.

Press	To do this
---	---
Enter / Space	Starts the progress.

Ensuring accessibility

The ProgressBar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the ProgressBar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the ProgressBar component with accessibility tools.

- [Accessibility in Syncfusion React components](#)

Style and appearance in React Progress button component

To modify the ProgressButton appearance, you need to override the default CSS of ProgressButton component. Please find the list of CSS classes and its corresponding section in ProgressButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-progress-btn|To customize the progress button
- |.e-progress-btn: hover|To customize the progress button on hover
- |.e-progress-btn: focus|To customize the progress button on focus
- |.e-progress-btn .e-spinner-pane .e-spinner-inner svg .e-path-circle|To customize the progress button spinner

How To

Change the text content and styles of the progressbutton during progress in React Progress button component

You can change the text content and styles of the ProgressButton during progress by changing the text content and the [cssClass](#) property at the [begin](#) and [end](#) events.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from "react";
function App() {
    const [state, setState] = useState({
        content: 'Upload',
        cssClass: 'e-hide-spinner'
    });
    function begin() {
        setState({ content: 'Uploading...', cssClass: 'e-hide-spinner e-info' });
    }
    function end() {
        setState({ content: 'Success', cssClass: 'e-hide-spinner e-success' });
    }
    setTimeout(() => {
        setState({ content: 'Upload', cssClass: 'e-hide-spinner' });
    }, 500);
    return (<ProgressButtonComponent content={state.content} enableProgress
cssClass={state.cssClass} duration={4000} begin={begin} end={end}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from 'react';
function App() {
    const [state, setState] = useState({
        content: 'Upload',
        cssClass: 'e-hide-spinner'
    });
    function begin(): void {
        setState({ content: 'Uploading...', cssClass: 'e-hide-spinner e-info' });
    }
    function end(): void {
        setState({ content: 'Success', cssClass: 'e-hide-spinner e-success' });
    };
    setTimeout(() => {
        setState({ content: 'Upload', cssClass: 'e-hide-spinner' });
    }, 500)
}
return (
    <ProgressButtonComponent content={state.content} enableProgress
    cssClass={state.cssClass} duration={4000} begin={begin} end={end}/>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Customize progress using cssclass in React Progress button component

You can customize the background filler UI using the [cssClass](#) property.

- Adding `e-vertical` to `cssClass` shows vertical progress.
- Adding `e-progress-top` to `cssClass` shows progress at the top.

You can also show reverse progress by adding custom class to the [cssClass](#) property.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    return (<div>
        <ProgressButtonComponent content='Vertical Progress'
        enableProgress={true} cssClass='e-hide-spinner e-vertical' duration={4000}/>
        <ProgressButtonComponent content='Progress Top' enableProgress={true}
        cssClass='e-hide-spinner e-progress-top' duration={4000}/>
        <ProgressButtonComponent content='Reverse Progress'
        enableProgress={true} cssClass='e-hide-spinner e-reverse-progress'
        duration={4000}/></div>);
}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  return (<div>
    <ProgressButtonComponent content='Vertical Progress' enableProgress =
    {true} cssClass='e-hide-spinner e-vertical' duration={4000}/>
    <ProgressButtonComponent content='Progress Top' enableProgress = {true}
    cssClass='e-hide-spinner e-progress-top' duration={4000}/>
    <ProgressButtonComponent content='Reverse Progress' enableProgress =
    {true} cssClass='e-hide-spinner e-reverse-progress' duration={4000}/></div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Hide spinner in React Progress button component

You can hide spinner in the ProgressButton by setting the `e-hide-spinner` property to [cssClass](#).

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  return (<ProgressButtonComponent content='Progress'
  enableProgress={true} cssClass='e-hide-spinner'/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  return (
    <ProgressButtonComponent content='Progress' enableProgress = {true}
    cssClass='e-hide-spinner'/>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Enable progress in button in React Progress button component

You can enable the background filler UI by setting the [enableProgress](#) property to `true`.

APP.JSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render ProgressButton.
function App() {
    return (<div>
        <ProgressButtonComponent content='Spin Left' enableProgress={true}/>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

APP.TSX

```
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render ProgressButton.
function App() {
    return (
        <div>
            <ProgressButtonComponent content='Spin Left' enableProgress= {true}/>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
```

Trace events of progress button in React Progress button component

The ProgressButton component triggers events based on its actions. The events can be used as extension points to perform custom operations.

The events available in ProgressButton are [fail](#), [begin](#), [progress](#), and [end](#).

APP.JSX

```
{% raw %}
import { ProgressButtonComponent } from '@syncfusion/ej2-react-splitbuttons';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from 'react';
function App() {
    const [state, setState] = useState({
        eventTrace: ''
    });
    function begin(args) {
        updateEventLog(args);
    }
}
```

```

    }
    function end(args) {
        updateEventLog(args);
    }
    function progress(args) {
        updateEventLog(args);
    }
    function fail(args) {
        updateEventLog(args);
    }
    function updateEventLog(args) {
        setState({ eventTrace: state.eventTrace + args.name + ' Event
triggered. <br />' });
    }
    function btnClick() {
        setState({ eventTrace: '' });
    }
    return (<div className='control-section'>
        <div className='progress-btn-section'>
            <ProgressButtonComponent content='Progress'
enableProgress={true} begin={begin} end={end} progress={progress}
fail={fail}/>
        </div>
        <div className='property-section'>
            <table id='propertyTable' title='Event trace'>
                <tbody>
                    <th>Event trace:-</th>
                    <tr>
                        <td dangerouslySetInnerHTML={{ __html:
state.eventTrace }}/>
                    </tr>
                </tbody>
            </table>
        </div>
        <ButtonComponent id='clear' cssClass='e-small' content='Clear'
onClick={btnClick}/>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
{% endraw %}

```

APP.TSX

```

{% raw %}
import { ProgressButtonComponent, ProgressEventArgs } from '@syncfusion/ej2-
react-splitbuttons';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { useState } from "react";
function App() {
    const [state, setState] = useState({
        eventTrace: ''
    });
    function begin(args: ProgressEventArgs): void {

```

```

        updateEventLog(args);
    }
    function end(args: ProgressEventArgs): void {
        updateEventLog(args);
    }
    function progress(args: ProgressEventArgs): void {
        updateEventLog(args);
    }
    function fail(args: Event): void {
        updateEventLog(args);
    }
    function updateEventLog(args: any): void {
        setState({ eventTrace: state.eventTrace + args.name + ' Event
triggered. <br />' });
    }
    function btnClick(): void {
        setState({ eventTrace: '' });
    }
    return (
        <div className='control-section'>
            <div className='progress-btn-section'>
                <ProgressButtonComponent content='Progress' enableProgress =
{true} begin={begin} end={end} progress={progress} fail={fail}/>
            </div>
            <div className='property-section'>
                <table id='propertyTable' title='Event trace'>
                    <tbody>
                        <th>Event trace:-</th>
                        <tr>
                            <td dangerouslySetInnerHTML={{__html:
state.eventTrace}}/>
                        </tr>
                    </tbody>
                </table>
            </div>
            <ButtonComponent id='clear' cssClass='e-small' content='Clear'
onClick={btnClick}/>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('progress-button'));
{% enddraw %}

```

Query Builder

Getting Started

This section explains how to create and configure a simple [React Query Builder component](#).

Dependencies

The list of dependencies required to use the Query Builder component in your application is given below:

```
`javascript`
```

```
|-- @syncfusion/ej2-react-querybuilder
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-querybuilder
|-- @syncfusion/ej2-datamanager
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-calenders
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-popups
\
```

Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
\
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
\
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash
npx create-react-app my-app
cd my-app
npm start
\
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install Query Builder component, use the following command.

```
`bash
npm install @syncfusion/ej2-react-querybuilder --save
\
```

Adding CSS Reference

Import the Button component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-calendars/styles/material.css";
@import "../node_modules/@syncfusion/ej2-querybuilder/styles/material.css";
`
```

Adding Query Builder component to the Application

To include the Query Builder component in your application import the `QueryBuilderComponent` from `ej2-react-querybuilder` package in `App.tsx`.

Add the Query Builder component in application as shown in below code example.

```
`ts
import { ColumnsModel, QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
import './App.css';
function App() {
  let columnData: ColumnsModel[] = [
    { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  return (
    <QueryBuilderComponent width='100%' columns={columnData}/>
  );
}
```

```
);
}

export default App;
`
```

Run the application

Run the application in the browser using the following command:

```
`
npm start
`
```

The following example shows a basic Query Builder component.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let columnData = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    return (<QueryBuilderComponent width='100%'
columns={columnData}></QueryBuilderComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
```

APP.TSX

```
import { ColumnsModel, QueryBuilderComponent } from '@syncfusion/ej2-react-
querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number'},
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ]
```

```

    ];
    return (
      <QueryBuilderComponent width='100%' columns={columnData}>
    </QueryBuilderComponent>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

You can also explore our [React Query Builder example](#) that shows how to render the Query Builder in React.

Columns in React Query builder component

The column definitions are used as the [dataSource](#) schema in the Query Builder. This plays a vital role in rendering column values. The query builder operations such as create or delete conditions and create or delete group they are performed based on the column definitions. The [field](#) property of the columns is necessary to map the data source values in the query builder columns.

If the column field is not specified in the [dataSource](#), the column values will be empty.

Auto generation

The [columns](#) are automatically generated when the [columns](#) declaration is empty or undefined while initializing the query builder. All the columns in the [dataSource](#) are bound as the query builder columns.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  return (<QueryBuilderComponent width='100%'
dataSource={employeeData}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  return (
    <QueryBuilderComponent width='100%' dataSource={employeeData}/>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

When columns are auto-generated, the column type will be determined from the first record of the [dataSource](#).

Labels

By default, the column label is displayed from the column [field](#) value. To override the default label, you have to define the [label](#) value.

Operators

The operator for a column can be defined in the [operators](#) property.

The available operators and its supported data types are:

Operators	Description	Supported Types
-----	-----	-----
startswith	Checks whether the value begins with the specified value.	String
endswith	Checks whether the value ends with the specified value.	String
contains	Checks whether the value contains the specified value.	String
equal	Checks whether the value is equal to the specified value.	String Number Date Boolean
notequal	Checks whether the value is not equal to the specified value.	String Number Date Boolean
greaterthan	Checks whether the value is greater than the specified value.	Date Number
greaterthanorequal	Checks whether a value is greater than or equal to the specified value.	Date Number
lessthan	Checks whether the value is less than the specified value.	Date Number
lessthanorequal	Checks whether the value is less than or equal to the specified value.	Date Number
between	Checks whether the value is between the two-specific value.	Date Number
notbetween	Checks whether the value is not between the two-specific value.	Date Number
in	Checks whether the value is one of the specific values.	String Number
notin	Checks whether the value is not in the specific values.	String Number

Step

The Query Builder allows you to set the step values to the number fields. So that you can easily access the numeric textbox. Use the [step](#) property, to set the step value for number values.

Format

The Query Builder formats date and number values. Use the [format](#) property to format date and number values.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
```

```
function App() {
  let columnData = [
    { field: 'EmployeeID', label: 'Employee ID', operators: [{ key:
'Equal', value: 'equal' },
    { key: 'Greater than', value: 'greaterthan' }, { key: 'Less
than', value: 'lessthan' }], step: 10, type: 'number' },
    { field: 'FirstName', label: 'First Name', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'Hire Date', type: 'date', format:
'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules = {
    'condition': 'and',
    'rules': [{
      'field': 'EmployeeID',
      'label': 'Employee ID',
      'operator': 'equal',
      'type': 'number',
      'value': 1001
    },
    {
      'field': 'HireDate',
      'label': 'Hire Date',
      'operator': 'equal',
      'type': 'date',
      'value': '07/05/1991'
    },
    {
      'field': 'Title',
      'label': 'Title',
      'operator': 'equal',
      'type': 'string',
      'value': 'Sales Manager'
    }
  ]
};
  return (<QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
```

APP.TSX

```
import { ColumnsModel, QueryBuilderComponent, RuleModel } from
'@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  let columnData: ColumnsModel[] = [
```

```

    { field: 'EmployeeID', label: 'Employee ID', operators: [{ key:
'Equal', value: 'equal' },
    { key: 'Greater than', value: 'greaterthan' }, { key: 'Less
than', value: 'lessthan' }], step: 10, type: 'number'},
    { field: 'FirstName', label: 'First Name', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'Hire Date', type: 'date', format:
'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules: RuleModel = {
    'condition': 'and',
    'rules': [{
      'field': 'EmployeeID',
      'label': 'Employee ID',
      'operator': 'equal',
      'type': 'number',
      'value': 1001
    },
    {
      'field': 'HireDate',
      'label': 'Hire Date',
      'operator': 'equal',
      'type': 'date',
      'value': '07/05/1991'
    },
    {
      'field': 'Title',
      'label': 'Title',
      'operator': 'equal',
      'type': 'string',
      'value': 'Sales Manager'
    }
  ]
};
  return (
    <QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData}
rule={importRules} />
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Validations

Validation allows you to validate the conditions and it display errors for invalid fields while using the [validateFields](#) method. To enable validation in the query builder , set the allowValidation to true. Column fields are validated after setting [allowValidation](#) as to true. So, you should manually configure the validation for Operator and, Value fields through [validation](#).

APP.JSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

```

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let qryBldrObj;
    let columnData = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number',
validation: { isRequired: true } },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', format: 'dd/MM/yyyy', label: 'HireDate', type:
'date' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    function onClick() {
        qryBldrObj.validateFields();
    }
    return (<div>
        <QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData} allowValidation={true} ref={(scope) => { qryBldrObj =
scope; }}/>
        <div className="e-qb-button">
            <ButtonComponent id="validatebtn" cssClass='e-primary'
content='Validate Fields' onClick={onClick}/>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}

```

APP.TSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ColumnsModel, QueryBuilderComponent } from '@syncfusion/ej2-react-
querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let qryBldrObj: QueryBuilderComponent;
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number',
validation: { isRequired: true } },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },

```

```

    { field: 'HireDate', format: 'dd/MM/yyyy', label: 'HireDate', type:
'date' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  function onClick(): void {
    qryBldrObj.validateFields();
  }
  return (
    <div>
      <QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData} allowValidation={true} ref={(scope) => { qryBldrObj =
scope as QueryBuilderComponent; }}/>
      <div className="e-qb-button">
        <ButtonComponent id="validatebtn" cssClass='e-primary'
content='Validate Fields' onClick = {onClick} />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}

```

Set [isRequired](#) validation for Operator and Value fields.

Set [min](#), [max](#) values for number values.

Data binding in React Query builder component

The Query Builder uses **DataManager**, which supports both RESTful JSON data services binding and local JavaScript object array binding. The **dataSource** property can be assigned either with the instance of **DataManager** or JavaScript object array collection. It supports two kind of databinding method:

- Local data
- Remote data

Local data

To bind local data to the query builder, you can assign the [dataSource](#) property with a JavaScript object array. The local data source can also be provided as an instance of the **DataManager**.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  let columnData = [
    { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },

```

```

    { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules = {
    'condition': 'and',
    'rules': [{
      'field': 'EmployeeID',
      'label': 'EmployeeID',
      'operator': 'equal',
      'type': 'number',
      'value': 1
    },
    {
      'field': 'Title',
      'label': 'Title',
      'operator': 'equal',
      'type': 'string',
      'value': 'Sales Manager'
    }
  ]
};
  return (<QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, RuleModel } from
'@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  let columnData: ColumnsModel[] = [
    { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules: RuleModel = {
    'condition': 'and',
    'rules': [{
      'field': 'EmployeeID',
      'label': 'EmployeeID',
      'operator': 'equal',
      'type': 'number',
      'value': 1
    }
  ]
};

```

```

    },
    {
      'field': 'Title',
      'label': 'Title',
      'operator': 'equal',
      'type': 'string',
      'value': 'Sales Manager'
    }
  ]
};
return (
  <QueryBuilderComponent width='100%' dataSource={employeeData}
  columns={columnData} rule={importRules} />
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

By default, **DataManager** uses **JsonAdaptor** for local data-binding.

Remote data

To bind remote data to the query builder, assign service data as an instance of **DataManager** to the [dataSource](#) property. To interact with remote data source, provide the endpoint [url](#).

APP.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
function App() {
  let data = new DataManager({
    url:
    'https://services.odata.org/v4/Northwind/Northwind.svc/Employees/',
    adaptor: new ODataV4Adaptor(),
  });
  let columnData = [
    { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
    'boolean', values: ['Mr.', 'Mrs.'] },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format:
    'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules = {
    'condition': 'and',
    'rules': [{
      'label': 'EmployeeID',
      'field': 'EmployeeID',
      'type': 'number',
      'operator': 'equal',
      'value': 1
    }
  ],
  {

```

```

        'label': 'Title',
        'field': 'Title',
        'type': 'string',
        'operator': 'equal',
        'value': 'Sales Manager'
    }]
    };
    return (<QueryBuilderComponent width='100%' dataSource={data}
columns={columnData} rule={importRules}></QueryBuilderComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent, ColumnsModel, RuleModel } from
'@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
function App() {
    let data = new DataManager({
        url:
'https://services.odata.org/v4/Northwind/Northwind.svc/Employees/',
        adaptor: new ODataV4Adaptor()
    });
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'and',
        'rules': [{
            'label': 'EmployeeID',
            'field': 'EmployeeID',
            'type': 'number',
            'operator': 'equal',
            'value': 1
        },
        {
            'label': 'Title',
            'field': 'Title',
            'type': 'string',
            'operator': 'equal',
            'value': 'Sales Manager'
        }
    ]
    };
    return (

```

```

        <QueryBuilderComponent width='100%' dataSource={data}
        columns={columnData} rule={importRules} ></QueryBuilderComponent>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

By default, **DataManager** uses **ODataAdaptor** for remote data-binding.

Binding with OData services

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

APP.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
function App() {
    let data = new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/orders/',
        adaptor: new ODataAdaptor,
        crossDomain: true
    });
    let columnData = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
        'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
        'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules = {
        'condition': 'and',
        'rules': [{
            'field': 'EmployeeID',
            'label': 'EmployeeID',
            'operator': 'equal',
            'type': 'number',
            'value': 1
        },
        {
            'field': 'Title',
            'label': 'Title',
            'operator': 'equal',
            'type': 'string',
            'value': 'Sales Manager'
        }
    ]
    };
    return (<QueryBuilderComponent width='100%' dataSource={data}
    columns={columnData} rule={importRules}></QueryBuilderComponent>);
}

```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent, ColumnsModel, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
function App() {
    let data = new DataManager({
        url: 'https://services.syncfusion.com/js/production/api/orders/',
        adaptor: new ODataAdaptor,
        crossDomain: true
    });
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'and',
        'rules': [{
            'field': 'EmployeeID',
            'label': 'EmployeeID',
            'operator': 'equal',
            'type': 'number',
            'value': 1
        },
        {
            'field': 'Title',
            'label': 'Title',
            'operator': 'equal',
            'type': 'string',
            'value': 'Sales Manager'
        }
    ]
    };
    return (
        <QueryBuilderComponent width='100%' dataSource={data}
columns={columnData} rule={importRules} ></QueryBuilderComponent>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Binding with OData v4 services

The ODataV4 is an improved version of OData protocols, and the **DataManager** can also retrieve and consume OData v4 services. For more details on OData v4 services, refer to the [odata documentation](#). To bind OData v4 service, use the **ODataV4Adaptor**.

APP.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
function App() {
    let data = new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
        adaptor: new ODataV4Adaptor
    });
    let columnData = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
        'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
        'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules = {
        'condition': 'and',
        'rules': [{
            'label': 'EmployeeID',
            'field': 'EmployeeID',
            'type': 'number',
            'operator': 'equal',
            'value': 1
        },
        {
            'label': 'Title',
            'field': 'Title',
            'type': 'string',
            'operator': 'equal',
            'value': 'Sales Manager'
        }
    ]
    };
    return (<QueryBuilderComponent width='100%' dataSource={data}
    columns={columnData} rule={importRules}></QueryBuilderComponent>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
```

APP.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```

import { QueryBuilderComponent, ColumnsModel, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import { DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
function App() {
    let data = new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Orders/',
        adaptor: new ODataV4Adaptor
    });
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
        'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
        'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'and',
        'rules': [{
            'label': 'EmployeeID',
            'field': 'EmployeeID',
            'type': 'number',
            'operator': 'equal',
            'value': 1
        },
        {
            'label': 'Title',
            'field': 'Title',
            'type': 'string',
            'operator': 'equal',
            'value': 'Sales Manager'
        }
    ]
    };
    return (
        <QueryBuilderComponent width='100%' dataSource={data}
        columns={columnData} rule={importRules} ></QueryBuilderComponent>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Web API

You can use **WebApiAdaptor** to bind query builder with Web API created using OData endpoint.

`ts

```
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
```

```
import { QueryBuilderComponent, ColumnsModel, RuleModel } from '@syncfusion/ej2-react-
querybuilder';
```

```
function App() {
  let data = new DataManager({
    url: '/api/OrderAPI',
    adaptor: new WebApiAdaptor
  });
  let columnData: ColumnsModel[] = [
    { field: 'EmployeeID', label: 'EmployeeID', type: 'number'},
    { field: 'FirstName', label: 'FirstName', type: 'string' },
    { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'], },
    { field: 'Title', label: 'Title', type: 'string' },
    { field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
    { field: 'Country', label: 'Country', type: 'string' },
    { field: 'City', label: 'City', type: 'string' }
  ];
  let importRules: RuleModel = {
    'condition': 'and',
    'rules': [{
      'label': 'EmployeeID',
      'field': 'EmployeeID',
      'type': 'number',
      'operator': 'equal',
      'value': 1
    },
    {
      'label': 'Title',
      'field': 'Title',
      'type': 'string',
      'operator': 'equal',
      'value': 'Sales Manager'
    }
  ]
};
  return (
```

```
<QueryBuilderComponent width='100%' dataSource={data} columns={columnData} rule={importRules}
></QueryBuilderComponent>

);
}

export default App;

ReactDOM.render(<App />,document.getElementById('querybuilder'));
`ts

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
function App() {
let data = new DataManager({
url: '/api/OrderAPI',
adaptor: new WebApiAdaptor
});
let columnData = [
{ field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
{ field: 'FirstName', label: 'FirstName', type: 'string' },
{ field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
{ field: 'Title', label: 'Title', type: 'string' },
{ field: 'HireDate', label: 'HireDate', type: 'date', format: 'dd/MM/yyyy' },
{ field: 'Country', label: 'Country', type: 'string' },
{ field: 'City', label: 'City', type: 'string' }
];
let importRules = {
'condition': 'and',
'rules': [{
'label': 'EmployeeID',
'field': 'EmployeeID',
'type': 'number',
'operator': 'equal',
'value': 1
```

```

},
{
  'label': 'Title',
  'field': 'Title',
  'type': 'string',
  'operator': 'equal',
  'value': 'Sales Manager'
}]
};

return (<QueryBuilderComponent width='100%' dataSource={data} columns={columnData}
rule={importRules}></QueryBuilderComponent>);
}

export default App;

ReactDOM.render(<App />, document.getElementById('querybuilder'));
`

```

Data Manager

You can use the created conditions in DataManager through the `getPredicate` method. This method creates predicates which is used as conditions in DataManager. In this example given below, `getValidRules` method is used to get the valid queried data.

APP.JSX

```

{% raw %}
import { DataManager, Query } from '@syncfusion/ej2-data';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import { useState } from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let qryBldrObj;
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let importRules = {
    'condition': 'or',
    'rules': [{
      'field': 'TaskID',
      'label': 'Task ID',

```

```

        'operator': 'equal',
        'type': 'number',
        'value': 1
    ]
    });
    const [state, setState] = useState({
        result: [],
        style: { display: 'none' }
    });
    function onClick() {
        const validRule = qryBldrObj.getValidRules(qryBldrObj.rule);
        const dataManagerQuery = new Query().select(['TaskID', 'Category',
'Status']).where(qryBldrObj.getPredicate(validRule)).take(8);
        setState({ result: new
DataManager(hardwareData).executeLocal(dataManagerQuery), style: { display:
'block' } });
    }
    return (<div>
        <QueryBuilderComponent width='100%' dataSource={hardwareData}
columns={columnData} rule={importRules} ref={(scope) => { qryBldrObj =
scope; }}/>
        <div className="e-qb-button">
            <ButtonComponent id="getdata" cssClass='e-primary'
content='get data' onClick={onClick}/>
        </div>
        <table id="datatable" className="e-table" style={state.style}>
            <thead>
                <tr><th>TaskID</th><th>Category</th><th>Status</th></tr>
            </thead>
            <tbody>{state.result.map(function func(item, key) {
                return (<tr key={key}>
                    <td>{item.TaskID}</td>
                    <td>{item.Category}</td>
                    <td>{item.Status}</td>
                </tr>);
            })}</tbody>
        </table>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}

```

APP.TSX

```

{% raw %}
import { DataManager, Query } from '@syncfusion/ej2-data';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ColumnsModel, QueryBuilderComponent, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import { useState } from "react";
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {

```

```

let qryBldrObj: QueryBuilderComponent;
let columnData: ColumnsModel[] = [
  { field: 'TaskID', label: 'Task ID', type: 'number' },
  { field: 'Name', label: 'Name', type: 'string' },
  { field: 'Category', label: 'Category', type: 'string' },
  { field: 'SerialNo', label: 'Serial No', type: 'string' },
  { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
  { field: 'Status', label: 'Status', type: 'string' }
];
let importRules: RuleModel = {
  'condition': 'or',
  'rules': [{
    'field': 'TaskID',
    'label': 'Task ID',
    'operator': 'equal',
    'type': 'number',
    'value': 1
  }]
};
const [state, setState] = useState({
  result: [],
  style: {display: 'none'}
});
function onClick(): void {
  const validRule = qryBldrObj.getValidRules(qryBldrObj.rule);
  const dataManagerQuery = new Query().select(['TaskID', 'Category', 'Status']).where(qryBldrObj.getPredicate(validRule)).take(8);
  setState({result: new
DataManager(hardwareData).executeLocal(dataManagerQuery), style: {display: 'block'}});
}
return (
  <div>
    <QueryBuilderComponent width='100%' dataSource={hardwareData}
columns={columnData} rule={importRules}
      ref={(scope) => { qryBldrObj = scope as
QueryBuilderComponent; }}/>
    <div className="e-qb-button">
      <ButtonComponent id="getdata" cssClass='e-primary'
content='get data' onClick = {onClick} />
    </div>
    <table id="datatable" className="e-table" style={state.style}>
      <thead>
        <tr><th>TaskID</th><th>Category</th><th>Status</th></tr>
      </thead>
      <tbody>{state.result.map(function func(item, key) {
        return (
          <tr key = {key}>
            <td>{item.TaskID}</td>
            <td>{item.Category}</td>
            <td>{item.Status}</td>
          </tr>
        )
      })}</tbody>
    </table>
  </div>
);

```

```

}
export default App;
ReactDOM.render(<App />,document.getElementById('querybuilder'));
{% endraw %}

```

Complex Data Binding

Complex Data Binding allows you to create subfield for columns. To implement complex data binding, either bind the complex data in nested columns or specify complex data source and separator must be given in querybuilder.

In the following sample, complex data was bound in nested columns.

APP.JSX

```

{% raw %}
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let qryBldrObj;
  let importRules = {
    condition: 'and',
    rules: [{
      label: 'ID',
      field: 'Employee.ID',
      type: 'string',
      operator: 'equal',
      value: 0
    },
    {
      label: 'Last Name',
      field: 'Name.LastName',
      type: 'string',
      operator: 'contains',
      value: 'malan'
    },
    {
      condition: 'or',
      rules: [{
        label: 'City',
        field: 'Country.State.City',
        operator: 'startswith',
        type: 'string',
        value: 'U'
      },
      {
        label: 'Region',
        field: 'Country.Region',
        operator: 'endswith',
        type: 'string',
        value: 'C'
      },
      {
        label: 'Name',

```

```

        field: 'Country.Name',
        operator: 'isnotempty'
    }
  ]],
  });
  let columns1 = [
    { field: 'ID', label: 'ID', type: 'number' },
    { field: 'DOB', label: 'Date of birth', type: 'date' },
    { field: 'HireDate', label: 'Hire Date', type: 'date' },
    { field: 'Salary', label: 'Salary', type: 'number' },
    { field: 'Age', label: 'Age', type: 'number' },
    { field: 'Title', label: 'Title', type: 'string' }
  ];
  let columns2 = [
    { field: 'FirstName', label: 'First Name', type: 'string' },
    { field: 'LastName', label: 'Last Name', type: 'string' }
  ];
  let columns3 = [
    { field: 'State', label: 'State', columns: [
      { field: 'City', label: 'City', type: 'string' },
      { field: 'Zipcode', label: 'Zip Code', type: 'number' }
    ] },
    { field: 'Region', label: 'Region', type: 'string' },
    { field: 'Name', label: 'Name', type: 'string' }
  ];
  function onReset() {
    qryBldrObj.reset();
  }
  function onSetsqlRules() {
    qryBldrObj.setRulesFromSql("Employee.ID = 0 AND Name.LastName LIKE ('%malan%') AND (Country.State.City LIKE ('U%') AND Country.Region LIKE ('%c') AND Country.Name IS NOT EMPTY)");
  }
  function onSetrules() {
    qryBldrObj.setRules(importRules);
  }
  return (<div>
    <div>
      <table>
        <tr>
          <td> <ButtonComponent id="reset" className="e-control e-danger e-btn e-small" onClick={onReset}>Reset</ButtonComponent>
          <td> <ButtonComponent id="rule" className="e-control e-success e-btn e-small"
            onClick={onSetsqlRules}>SetSqlRules</ButtonComponent>
          <td> <ButtonComponent id="sql" className="e-control e-success e-btn e-small"
            onClick={onSetrules}>SetRules</ButtonComponent>
        </tr>
      </table>
    </div>
    <QueryBuilderComponent width="100%" rule={importRules}
      id='querybuilder' separator="." enableNotCondition="true" ref={(scope) => {
        qryBldrObj = scope; }}>
      <ColumnsDirective>

```

```

        <ColumnDirective field="Employee" label="Employee"
columns={columns1}/>
        <ColumnDirective field="Name" label="Name"
columns={columns2}/>
        <ColumnDirective field="Country" label="Country"
columns={columns3}/>
    </ColumnsDirective>
</QueryBuilderComponent>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder-component'));
{% endraw %}

```

APP.TSX

```

{% raw %}
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective,
RuleChangeEventArgs } from '@syncfusion/ej2-react-querybuilder';
import { RuleModel, ColumnsModel } from '@syncfusion/ej2-querybuilder';
import { RadioButtonComponent, ButtonComponent, ChangeEventArgs } from
 '@syncfusion/ej2-react-buttons';

Filtering in React Query builder component

Query Builder allows you to create or delete conditions and groups. You can use [showButtons](#) to enable/disable these buttons.

You can create or delete conditions by interacting through the user interface and methods.

- Use the [addRules](#), and [deleteRules](#) methods to create/delete conditions.
- Use [addGroups](#), and [deleteGroups](#) methods to create/delete groups.

Templates in React Query builder component

Templates allows users to define customized header and own user interface for columns.

Header Template

Header Template allows to define your own user interface for Header, which includes creating or deleting rules and groups and to customize the AND/OR condition and NOT condition options. To implement header template, you can create the user interface as React component and assign the values when requestType is header-template-create in `actionBegin` event.

In the following sample dropdown, splitbutton and button are used as the custom components in the header.

APP.JSX

```

import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { HeaderTemplate } from './template';
function App() {
    let qryBldrObj;
    let importRules = {
        'condition': 'and', 'not': true,
        'rules': [{
            'field': 'Age',
            'label': 'Age',
            'operator': 'equal',
            'type': 'number',
            'value': 30
        },
        {
            'label': 'LastName',
            'field': 'LastName',
            'type': 'string',
            'operator': 'equal',
            'value': 'vinit'
        },
        {
            'condition': 'or',
            'rules': [{
                'label': 'Age',
                'field': 'Age',
                'type': 'number',

```

```

                'operator': 'equal',

    }) () }
    <DropDownListComponent id = {args.ruleID + "_cndtn"} cssClass = 'e-
    custom-group-btn' dataSource={ds} fields={fields} value={args.condition}
    change={conditionChange}/>
    <DropDownButtonComponent id = {args.ruleID + "_addbtn"}
    items={ddbitems} cssClass= "e-round e-small e-caret-hide e-addrulegroup e-
    add-btn" iconCss="e-icons e-add-icon"
    select={onSelect}></DropDownButtonComponent>
    {(()=> {
        if (args.ruleID !== "querybuilder_group0") {
            return(<ButtonComponent id = {args.ruleID + "_dltbtn"}
            cssClass = 'e-btn e-delete-btn e-lib e-small e-round e-icon-btn' iconCss="e-
            btn-icon e-icons e-delete-icon" onClick={onClick} ></ButtonComponent>)
        }
    }) () }
    </div>
);
}

```

Column Template

Template allows you to define your own input widgets for columns. To implement [template](#), you can define the following functions

- **create**: Creates the custom component.
- **write**: Wire events for the custom component.
- **Destroy**: Destroy the custom component.

In the following sample, dropdown is used as the custom component in the PaymentMode column.

APP.JSX

```

{% raw %}
import { getComponent } from '@syncfusion/ej2-base';
import { DropDownList, MultiSelect } from '@syncfusion/ej2-react-dropdowns';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { expenseData } from '../datasource.ts';
function App() {
    let qryBldrObj;
    let elem;
    let dropDownObj;
    let multiSelectObj;
    let inOperators = ['in', 'notin'];
    let filter = [
        {
            field: 'PaymentMode', label: 'Payment Mode', operators: [
                { key: 'Equal', value: 'equal' },
                { key: 'Not Equal', value: 'notequal' },
            ]
        }
    ]
}

```

```

        { key: 'In', value: 'in' },
        { key: 'Not In', value: 'notin' }
    ], template: {
        create: () => {
            elem = document.createElement('input');
            elem.setAttribute('type', 'text');
            return elem;
        },
        destroy: (args) => {
            multiSelectObj =
getComponent(document.getElementById(args.elementId), 'multiselect');
            if (multiSelectObj) {
                multiSelectObj.destroy();
            }
            dropDownObj =
getComponent(document.getElementById(args.elementId), 'dropdownlist');
            if (dropDownObj) {
                dropDownObj.destroy();
            }
        },
        write: (args) => {
            const ds = ['Cash', 'Debit Card', 'Credit Card', 'Net

Using Template

Template allows you to define your own input widgets for columns. To implement template, you can create the user interface as `React` component.

APP.JSX

```
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { PaymentTemplate } from './payment-temp';
import { TransactionTemplate } from './transaction-temp';
function App() {
  let qryBldrObj;
  let importRules = {
    'condition': 'and',
    'rules': [{
      'label': 'Transaction Type',
      'field': 'TransactionType',
      'type': 'string',
      'operator': 'equal',
      'value': 'Expense'
    },
    {
      'label': 'Payment Mode',
      'field': 'PaymentMode',
      'type': 'string',
      'operator': 'equal',
      'value': 'Cash'
    }
  ]
};
  function paymentTemplate(props) {
    return (<PaymentTemplate {...props}/>);
  }
  function transactionTemplate(props) {
    return (<TransactionTemplate {...props}/>);
  }
  return (<div>
    <QueryBuilderComponent width='100%' rule={importRules}
    id='querybuilder'>
      <ColumnsDirective>
        <ColumnDirective field="Category" label="Category"
        type="string"/>
        <ColumnDirective field="PaymentMode" label="PaymentMode"
        type="string" template={paymentTemplate}/>
        <ColumnDirective field="TransactionType"
        label="TransactionType" type="string" template={transactionTemplate}/>
        <ColumnDirective field="Description" label="Description"
        type="string"/>
        <ColumnDirective field="Date" label="Date" type="string"/>
        <ColumnDirective field="Amount" label="Amount"
        type="string"/>
      </ColumnsDirective>
    </QueryBuilderComponent>
  </div>);
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('querybuilder-component'));
```

APP.TSX

```
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import { RuleModel } from '@syncfusion/ej2-querybuilder';

import { getComponent, closest } from '@syncfusion/ej2-base';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { QueryBuilder, ActionEventArgs, RuleModel } from '@syncfusion/ej2-
querybuilder';
export function PaymentTemplate(props) {
    let ds: string[] = ['Cash', 'Debit Card', 'Credit Card', 'Net Banking'];
    let qryBldrObj: QueryBuilderComponent;
    let state = Object.assign({}, props);
    qryBldrObj = getComponent(document.getElementById('querybuilder'),
    'query-builder') as QueryBuilder;
    const args: ActionEventArgs = state;
    function paymentChange(event: any): void{
        const args: ActionEventArgs = state;
        let elem: HTMLElement =
document.getElementById(args.ruleID).querySelector('.e-rule-value');
        qryBldrObj.notifyChange(event.value as string, elem, 'value');
    }
    return (<div >
        <DropDownListComponent dataSource={ds} value={args.rule.value}
change={paymentChange}/>
        </div>
    );
}
```

TRANSACTION-TEMP.JSX

```
import * as React from 'react';
import { getComponent } from '@syncfusion/ej2-base';
import { CheckBoxComponent } from '@syncfusion/ej2-react-buttons';
export function TransactionTemplate(props) {
    let qryBldrObj;
    let state = Object.assign({}, props);
    qryBldrObj = getComponent(document.getElementById('querybuilder'),
    'query-builder');
    const args = state;
    function transactionChange(event) {
        const args = state;
        let elem = document.getElementById(args.ruleID).querySelector('.e-
rule-value');
        qryBldrObj.notifyChange(event.checked === true ? 'Expense' :
'Income', elem, 'value');
    }
    return (<div>
        <CheckBoxComponent label="Is Expense" checked={args.rule.value}
change={transactionChange}/>
    </div>);
}
```

TRANSACTION-TEMP.TSX

```
import * as React from 'react';
import { getComponent, closest } from '@syncfusion/ej2-base';
import { CheckBoxComponent, ButtonComponent } from '@syncfusion/ej2-react-
buttons';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { QueryBuilder, ActionEventArgs, RuleModel } from '@syncfusion/ej2-
querybuilder';
export function TransactionTemplate(props) {
    let qryBldrObj: QueryBuilderComponent;
    let state = Object.assign({}, props);
    qryBldrObj = getComponent(document.getElementById('querybuilder'),
    'query-builder') as QueryBuilder;
    const args: ActionEventArgs = state;
    function transactionChange(event: any): void {
        const args: ActionEventArgs = state;
        let elem: HTMLElement =
document.getElementById(args.ruleID).querySelector('.e-rule-value');
        qryBldrObj.notifyChange(event.checked === true ? 'Expense' :
'Income', elem, 'value');
    }
    return (<div>
        <CheckBoxComponent label="Is Expense" checked={args.rule.value}
change={transactionChange}/>
    </div>
    );
}
```

Rule Template

Rule Template allows to define your own user interface for columns. To implement [ruleTemplate](#), you can create the user interface as **React** component and assign the values through **actionBegin** event.

In the following sample, dropdown and slider are used as the custom component and applied `greaterthanorequal` operator to `Age` column.

APP.JSX

```
{% raw %}
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
import { AgeTemplate } from './template';
function App() {
  let qryBldrObj;
  let elem;
  let importRules = {
    'condition': 'or',
    'rules': [{
      'field': 'Age',
      'label': 'Age',
      'operator': 'greaterthanorequal',
      'type': 'number',
      'value': 30
    }]
  };
  function ageTemplate(props) {
    return (<AgeTemplate {...props}/>);
  }
  function actionBegin(args) {
    let ruleID = args.ruleID;
    args.rule.operator = 'greaterthanorequal';
    if (args.requestType === 'template-initialize') {
      if (args.rule.value === '') {
        args.rule.value = 30;
      }
    }
  }
  return (<QueryBuilderComponent dataSource={employeeData} width='100%'
    rule={importRules} ref={(scope) => { qryBldrObj = scope; }}
    actionBegin={actionBegin} id='querybuilder'>
    <ColumnsDirective>
      <ColumnDirective field="EmployeeID" label="Employee ID"
type="number"/>
      <ColumnDirective field="LastName" label="Last Name"
type="string"/>
      <ColumnDirective field="FirstName" label="First Name"
type="string"/>
      <ColumnDirective field="Age" label="Age" type="number"
ruleTemplate={ageTemplate}/>
      <ColumnDirective field="City" label="City" type="string"/>
      <ColumnDirective field="Country" label="Country"
type="string"/>
    </ColumnsDirective>
  </QueryBuilderComponent>);
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('querybuilder-component'));
{% endraw %}
```

APP.TSX

```
{% raw %}
import { getComponent, setValue } from '@syncfusion/ej2-base';
import { ChangeEventArgs, DropDownList } from '@syncfusion/ej2-react-
dropdowns';
import { QueryBuilderComponent, ColumnsDirective, ColumnDirective,
RuleModel, ActionEventArgs } from '@syncfusion/ej2-react-querybuilder';

Model binding in React Query builder component

Model binding allows to bind properties for the components used in field, operator, and value columns. To implement model binding, assign fieldModel, operatorModel, and valueModel properties in QueryBuilder.

APP.JSX

```

import { QueryBuilderComponent, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let field = {
    allowFiltering: true,
    popupHeight: '400px'
  };
  let operator = {
    allowFiltering: true,
    popupHeight: '400px'
  };
  let value = {
    numericTextBoxModel: {
      cssClass: 'e-custom'
    },
    multiSelectModel: {
      cssClass: 'e-custom'
    },
    datePickerModel: {
      cssClass: 'e-custom'
    },
    textBoxModel: {
      cssClass: 'e-custom'
    },
    radioButtonModel: {
      cssClass: 'e-custom'
    }
  };
  let importRules = {
    'condition': 'and',
    'rules': [{
      'label': 'Employee ID',
      'field': 'EmployeeID',
      'type': 'number',
      'operator': 'equal',
      'value': 1001
    }]
  };
  return <div>

```

```

    <QueryBuilderComponent width='100%' rule={importRules}
    id='querybuilder' enableNotCondition="true" fieldModel={field}
    operatorModel={operator} valueModel={value}>
      <ColumnsDirective>
        <ColumnDirective field="EmployeeID" label="Employee ID"
type="number"/>

    </ColumnsDirective>
  </QueryBuilderComponent>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder-component'));

```

Importing and Exporting in React Query builder component

Importing facilitates the viewing or editing of predefined conditions available in JSON, SQL, and MongoDB query formats, while exporting enables obtaining the created rules in the query builder as JSON, SQL, and MongoDB queries.

Importing

Importing enables users to bring predefined conditions into the system for viewing or editing, available in formats such as JSON, SQL, and MongoDB query. It facilitates the quick incorporation of pre-defined rules or parameters into workflows, streamlining the setup process by importing directly from external sources or saved configurations.

Importing from JSON Object

Importing from JSON enables users to bring predefined conditions encoded in JSON format into the system. This feature streamlines the process by providing a standardized format for importing data, ensuring compatibility, and ease of use.

Initial rendering

To initially apply conditions, you can establish the [rule](#) by importing a structured JSON object and defining its properties.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let importRules = {
    'condition': 'or',
    'rules': [{
      'field': 'Category',
      'label': 'Category',
      'operator': 'equal',
      'type': 'string',
      'value': 'Laptop'
    },
    {
      'condition': 'and',
      'rules': [{
        'field': 'Status',
        'label': 'Status',
        'operator': 'notequal',
        'type': 'string',
        'value': 'Pending'
      },
      {
        'field': 'TaskID',
        'label': 'Task ID',
        'operator': 'equal',
        'type': 'number',
        'value': 5675
      }
    ]
  ]
  };
  return (<QueryBuilderComponent width='100%' dataSource={hardwareData}
  columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let columnData: ColumnsModel[] = [

```

```

        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'or',
        'rules': [{
            'field': 'Category',
            'label': 'Category',
            'operator': 'equal',
            'type': 'string',
            'value': 'Laptop'
        },
        {
            'condition': 'and',
            'rules': [{
                'field': 'Status',
                'label': 'Status',
                'operator': 'notequal',
                'type': 'string',
                'value': 'Pending'
            },
            {
                'field': 'TaskID',
                'label': 'Task ID',
                'operator': 'equal',
                'type': 'number',
                'value': 5675
            }
        ]
    }
    ];

    return (
        <QueryBuilderComponent width='100%' dataSource={hardwareData}
        columns={columnData} rule={importRules}/>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Post rendering

You can set the conditions from structured JSON object through the [setRules](#) method.

APP.JSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {

```

```

let gryBldrObj;
let columnData = [
  { field: 'TaskID', label: 'Task ID', type: 'number' },
  { field: 'Name', label: 'Name', type: 'string' },
  { field: 'Category', label: 'Category', type: 'string' },
  { field: 'SerialNo', label: 'Serial No', type: 'string' },
  { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
  { field: 'Status', label: 'Status', type: 'string' }
];
let importRules = {
  'condition': 'or',
  'rules': [{
    'field': 'Category',
    'label': 'Category',
    'operator': 'equal',
    'type': 'string',
    'value': 'Laptop'
  },
  {
    'condition': 'and',
    'rules': [{
      'field': 'Status',
      'label': 'Status',
      'operator': 'notequal',
      'type': 'string',
      'value': 'Pending'
    },
    {
      'field': 'TaskID',
      'label': 'Task ID',
      'operator': 'equal',
      'type': 'number',
      'value': 5675
    }
  ]
}
];

                content='Set Rules' onClick = {onClick}/>
            </div>
        </div>
    );
}

```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}

```

Importing from SQL Query

Importing from SQL involves integrating predefined conditions or data stored in a SQL database into the Query Builder. This enables the direct integration of SQL queries, thereby improving workflow efficiency and data accuracy within the application. SQL importing supports various types, including Inline SQL, Parameter SQL, and Named Parameter SQL.

Importing from Inline SQL Query

Importing from Inline SQL involves integrating SQL queries directly into the Query Builder. This method streamlines the process by enabling users to input SQL statements directly into the application for analysis, manipulation, or further processing within the Query Builder. Conditions can be set from Inline SQL queries using the [setRulesFromSql](#) method.

APP.JSX

```

{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let qryBldrObj;
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  function importRule() {
    qryBldrObj.setRulesFromSql("TaskID = 1 and Status LIKE ('Assigned%')");
  }
  return (<div>
    <QueryBuilderComponent width='100%' dataSource={hardwareData}
    ref={(scope) => { qryBldrObj = scope; }} columns={columnData}/>
    <div className="e-qb-button">
      <ButtonComponent id="importrules" cssClass='e-primary'
      content='set Rules' onClick={importRule}/>
    </div>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}

```

APP.TSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { QueryBuilderComponent, ColumnsModel } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
    let qryBldrObj: QueryBuilderComponent;
    let columnData: ColumnsModel[] = [
        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    function importRule(): void {
        qryBldrObj.setRulesFromSql("TaskID = 1 and Status LIKE ('Assigned%')");
    }
    return (
        <div>
            <QueryBuilderComponent width='100%' dataSource={hardwareData}
ref={(scope) => { qryBldrObj = scope as QueryBuilderComponent; }}
columns={columnData}/>
            <div className="e-qb-button">

content='set Rules' onClick = {importRule}/>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
{% endraw %}
```

Importing from Parameter SQL Query

Importing from Parameter SQL involves integrating SQL queries with parameters directly into the Query Builder. This method allows users to input SQL statements containing parameters, which can be dynamically filled in during execution. It streamlines the process by enabling flexible and customizable querying within the application. Conditions can be set from Parameter SQL queries using the [setParameterizedSql](#) method.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
QueryBuilderComponent.Inject(QueryLibrary);
// @ts-ignore
function App() {
    let qryBldrObj;
```

```

let columnData = [
  { field: 'TaskID', label: 'Task ID', type: 'number' },
  { field: 'Name', label: 'Name', type: 'string' },
  { field: 'Category', label: 'Category', type: 'string' },
  { field: 'SerialNo', label: 'Serial No', type: 'string' },
  { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
  { field: 'Status', label: 'Status', type: 'string' }
];
let hardwareData = [{
  'TaskID': 1,
  'Name': 'Lenovo Yoga',
  'Category': 'Laptop',
  'SerialNo': 'CB27932009',
  'InvoiceNo': 'INV-2878',
  'Status': 'Assigned'
},
{
  'TaskID': 2,
  'Name': 'Acer Aspire',
  'Category': 'Others',
  'SerialNo': 'CB35728290',
  'InvoiceNo': 'INV-3456',
  'Status': 'In-repair'
},
{
  'TaskID': 3,
  'Name': 'Apple MacBook',
  'Category': 'Laptop',
  'SerialNo': 'CB35628728',
  'InvoiceNo': 'INV-2763',
  'Status': 'In-repair'
}
];

function importSql() {
  qryBldrObj.setParameterizedSql({ sql: '(Category IN (?,?) OR TaskID IN (?,?))', params: ['Laptop', 'Others', 1, 2] });
}
return (<div>
  <QueryBuilderComponent width='100%' dataSource={hardwareData}
columns={columnData} ref={(scope) => { qryBldrObj = scope; }}/>
  <div className="e-qb-button">
    <ButtonComponent id="importSql" cssClass='e-primary'
content='Set Parameter SQL Rules' onClick = {importSql}/>
  </div>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, QueryLibrary } from
'@syncfusion/ej2-react-querybuilder';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```

QueryBuilderComponent.Inject(QueryLibrary);
// @ts-ignore
function App() {
  let qryBldrObj: QueryBuilderComponent;
  let hardwareData: Object[] = [{
    'TaskID': 1,
    'Name': 'Lenovo Yoga',
    'Category': 'Laptop',
    'SerialNo': 'CB27932009',
    'InvoiceNo': 'INV-2878',
    'Status': 'Assigned'
  },
  {
    'TaskID': 2,
    'Name': 'Acer Aspire',
    'Category': 'Others',

    'InvoiceNo': 'INV-3456',
    'Status': 'In-repair'
  },
  {
    'TaskID': 3,
    'Name': 'Apple MacBook',
    'Category': 'Laptop',
    'SerialNo': 'CB35628728',
    'InvoiceNo': 'INV-2763',
    'Status': 'In-repair'
  }
  ];
  let columnData: ColumnsModel[] = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  function importSql(): void {
    qryBldrObj.setParameterizedSql({ sql: '(Category IN (?,?) OR TaskID IN (?,?))', params: ['Laptop', 'Others', 1, 2] });
  }
  return (
    <div>
      <QueryBuilderComponent width='100%' dataSource={hardwareData}
        columns={columnData} ref={(scope) => { qryBldrObj = scope as
        QueryBuilderComponent; }}/>
      <div className="e-qb-button">
        <ButtonComponent id="importSql" cssClass='e-primary'
        content='Set Parameter SQL Rules' onClick = {importSql}/>
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Importing from Named Parameter SQL Query

Importing from Named Parameter SQL involves integrating SQL queries with named parameters directly into the Query Builder. This method enables users to input SQL statements containing named parameters, providing flexibility and customization during execution. It streamlines the process by allowing dynamic parameter assignment within the application's query environment. Conditions can be set from Named Parameter SQL queries using the [setParameterizedNamedSql](#) method.

APP.JSX

```
import { QueryBuilderComponent, QueryLibrary } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
QueryBuilderComponent.Inject(QueryLibrary);
// @ts-ignore
function App() {
  let qryBldrObj;
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let hardwareData = [{
    'TaskID': 1,
    'Name': 'Lenovo Yoga',
    'Category': 'Laptop',
    'SerialNo': 'CB27932009',
    'InvoiceNo': 'INV-2878',
    'Status': 'Assigned'
  },
  {
    'TaskID': 2,
    'Name': 'Acer Aspire',
    'Category': 'Others',
    'SerialNo': 'CB35728290',
    'InvoiceNo': 'INV-3456',
    'Status': 'In-repair'
  },
  {
    'TaskID': 3,
    'Name': 'Apple MacBook',
    'Category': 'Laptop',
    'SerialNo': 'CB35628728',
    'InvoiceNo': 'INV-2763',
    'Status': 'In-repair'
  }
  ];

  function importSql() {
    qryBldrObj.setParameterizedNamedSql({ sql: '(Category IN (:Category_1,:Category_2) OR TaskID IN (:TaskID_1,:TaskID_2))', params:
    {"Category_1": "Laptop", "Category_2": "Others", "TaskID_1": 1, "TaskID_2": 2} });
  }
}
```

```

    }
    return (<div>
      <QueryBuilderComponent width='100%' dataSource={hardwareData}
        columns={columnData} ref={(scope) => { qryBldrObj = scope; }}/>
      <div className="e-qb-button">
        <ButtonComponent id="importSql" cssClass='e-primary'
          content='Set Named Parameter SQL Rules' onClick = {importSql}/>
      </div>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, QueryLibrary } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

    </div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('querybuilder'));

```

Importing from MongoDB Query

Importing from MongoDB Query involves integrating MongoDB queries directly into the Query Builder. This enables users to input MongoDB query statements directly into the application, allowing for seamless integration and manipulation of MongoDB data within the Query Builder environment. It streamlines the process by facilitating direct access to MongoDB data for analysis, filtering, and further processing within the application. Conditions can be set from Named Parameter SQL queries using the [setMongoQuery](#) method.

APP.JSX

```

import { QueryBuilderComponent, QueryLibrary } from '@syncfusion/ej2-react-
querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
QueryBuilderComponent.Inject(QueryLibrary);
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let gryBldrObj;
    let columnData = [
        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    let hardwareData = [{
        'TaskID': 1,
        'Name': 'Lenovo Yoga',
        'Category': 'Laptop',
        'SerialNo': 'CB27932009',
        'InvoiceNo': 'INV-2878',
        'Status': 'Assigned'
    }];
}

```

```

    },
    {
      'TaskID': 2,
      'Name': 'Acer Aspire',
      'Category': 'Others',
      'SerialNo': 'CB35728290',
      'InvoiceNo': 'INV-3456',
      'Status': 'In-repair'
    },
    {
      'TaskID': 3,
      'Name': 'Apple MacBook',
      'Category': 'Laptop',
      'SerialNo': 'CB35628728',
      'InvoiceNo': 'INV-2763',
      'Status': 'In-repair'
    }
  ]];

  function importMongo() {
    gryBldrObj.setMongoQuery('{ "$and": [{"TaskID":1001},{
"$or":[{"Category":{"$regex":"Order"}}]}]}');
  }

  return (<div>
    <QueryBuilderComponent width='100%' dataSource={hardwareData}
columns={columnData} ref={ (scope) => { gryBldrObj = scope; } }/>
    <div className="e-qb-button">
      <ButtonComponent id="importSql" cssClass='e-primary'
content='Set MongoDB Rules' onClick = {importMongo}/>
    </div>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

        content='Set MongoDB Rules' onClick = {importMongo}/>
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('querybuilder'));
```

Exporting

Exporting from the Query Builder allows users to preserve or store the created conditions. The defined conditions can be exported using various methods, including:

Exporting to JSON Object

You can extract the established conditions in the Query Builder and convert them into a structured JSON object format using the [getRules](#) method. This process enables users to save or transfer the conditions for further use or analysis in other applications or systems that support JSON data.

Exporting to SQL Query

Exporting to SQL involves converting the defined conditions within the Query Builder into SQL queries. This functionality allows users to generate SQL code representing the conditions set in the Query Builder, which can then be executed directly on a SQL database or used for further analysis and

processing. SQL exporting supports various types, including Inline SQL, Parameter SQL, and Named Parameter SQL.

Exporting to Inline SQL Query

Exporting to Inline SQL Query entails embedding the defined conditions from the Query Builder directly into SQL statements within the exported code. This method ensures that the conditions are seamlessly integrated into the SQL query syntax, enabling straightforward execution or further processing within SQL database systems. This can be achieved using the [getSqlFromRules](#) method.

APP.JSX

```
{% raw %}
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DialogComponent } from '@syncfusion/ej2-react-popups';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';

Exporting to Named Parameter SQL Query

Exporting to Named Parameter SQL entails integrating the defined conditions from the Query Builder into SQL queries with named parameters. This method offers enhanced readability and flexibility during execution by using named placeholders for parameter values. Named Parameter SQL facilitates easier maintenance and modification of queries, making it convenient for dynamic parameter assignment within SQL database. This can be accomplished using the method [getParameterizedNamedSql](#) for exporting to Named Parameter SQL query.

APP.JSX

```

Exporting to MongoDB Query

Exporting to MongoDB Query involves converting the defined conditions within the Query Builder into MongoDB query syntax. This process allows users to generate MongoDB queries representing the conditions set in the Query Builder, which can then be executed directly on a MongoDB database or used for further analysis and processing. This can be accomplished using the [getMongoQuery](#) method for exporting to MongoDB query.

APP.JSX

```

import { QueryBuilderComponent, QueryLibrary } from '@syncfusion/ej2-react-querybuilder';
import { AnimationSettingsModel, DialogComponent } from '@syncfusion/ej2-react-popups';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
QueryBuilderComponent.Inject(QueryLibrary);
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
  let qryBldrObj;
  let dialog;
  let animationSettings;
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let importRules = {
    'condition': 'or',
    'rules': [{
      'label': 'Category',
      'field': 'Category',
      'type': 'string',
      'operator': 'equal',
      'value': 'Laptop'
    }]
  };
  let hardwareData = [{

Lock Group/Rule in React Query builder component

The Query Builder provides the functionality to lock individual rules or entire groups. When a rule is locked, it prevents users from modifying its field, operator, and value, effectively disabling these components. Similarly, locking a group disables all elements contained within it. This feature offers users greater control over their query configurations, ensuring that specific rules or groups remain unchanged. Additionally, users can manage the visibility of locking buttons through the [showButtons](#) function, allowing for seamless control over the locking mechanism.

You can lock groups and rules by interacting through the user interface and methods.

- Use the [lockGroup](#) method to lock group.
- Use [lockRule](#) method to lock rule.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';

Clone Group/Rule in React Query builder component

The Query Builder functionality extends to cloning both individual rules and entire groups. Utilizing the Clone options will generate an exact duplicate of a rule or group adjacent to the original one. This feature enables users to replicate complex query structures effortlessly. The [showButtons](#) function offers users the ability to toggle the visibility of these cloning buttons, providing convenient control over the cloning process within the Query Builder interface.

You can clone groups and rules by interacting through the user interface and methods.

- Use the [cloneGroup](#) method to clone group.
- Use [cloneRule](#) method to clone rule.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let qryBldrObj;
    let columnData = [
        { field: 'EmployeeID', label: 'Employee ID', type: 'number' },
        { field: 'FirstName', label: 'First Name', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type: 'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'Hire Date', type: 'date', format: 'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules = {
        'condition': 'and',
        'rules': [{
            'label': 'Employee ID',
            'field': 'EmployeeID',
            'type': 'number',
            'operator': 'equal',
            'value': 1001
        },
        {

      <ButtonComponent id="clonerule" cssClass='e-primary'
      content='Clone Rule' onClick = {cloneRule}/>
    </div>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Global local in React Query builder component

The **Localization** library allows you to localize default text content of the Query Builder. The Query Builder component has static text that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the locale value and translation object.

The following list of properties and its values are used in the Query Builder.

Locale key words	Text
-----	-----
AddGroup	Add Group
AddCondition	Add Condition
DeleteRule	Remove this condition
DeleteGroup	Delete group
Edit	EDIT
SelectField	Select a field
SelectOperator	Select operator
StartsWith	Starts With
EndsWith	Ends With
Contains	Contains
Equal	Equal
NotEqual	Not Equal
LessThan	Less Than
LessThanOrEqual	Less Than Or Equal
GreaterThan	Greater Than
GreaterThanOrEqual	Greater Than Or Equal
Between	Between
NotBetween	Not Between
In	In
NotIn	Not In
Remove	REMOVE
ValidationMessage	This field is required
SummaryViewTitle	Summary View
OtherFields	Other Fields
AND	AND
OR	OR
SelectValue	Enter Value

| IsEmpty | Is Empty |

| IsNotEmpty | Is Not Empty |

| IsNull | Is Null |

| IsNotNull | Is Not Null |

| True | True |

| False | False |

```

Style and appearance in React Query builder component

To modify the QueryBuilder appearance, you need to override the default CSS of QueryBuilder component. Please find the list of CSS classes and its corresponding section in QueryBuilder component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-group-header .e-btn|To customize the condition button in querybuilder
- |.e-group-body .e-rule-container|To customize the querybuilder rule container
- |.e-group-container .e-group-header .e-dropdown-btn|To customize the querybuilder Add group/condition button
- |.e-query-builder .e-group-header .e-deletegroup|To customize the querybuilder Delete group button
- |.e-query-builder .e-rule-field .e-rule-value-delete .e-rule-delete|To customize the querybuilder Delete condition button
- |.e-query-builder .e-rule-list > ::after,.e-query-builder .e-rule-list > ::before|To customize the querybuilder group joining line
- |.e-query-builder .e-rule-container.e-joined-rule|To customize the querybuilder condition joining line

Accessibility in React Query Builder component

The Query Builder component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Query Builder component is outlined below.

| Accessibility Criteria | Compatibility |

```

| -- | -- |
| WCAG 2.2 Support |  |
| Section 508 Support |  |
| Screen Reader Support |  |
| Right-To-Left Support |  |
| Color Contrast |  |
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with Ajax, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

The following list of ARIA attributes is used in Query Builder.

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the query builder component. |

Keyboard interaction

The Query Builder component followed the keyboard interaction guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Query Builder component.

| **Press** | **To do this** |

| --- | --- |

| **Tab / Shift + Tab** | **To focus the next item in the rule.** |

Ensuring accessibility

The Query Builder component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Query Builder component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Query Builder component with accessibility tools.

How To

Render with rule in React Query builder component

You can render the QueryBuilder with the defined rules. For this, you should use the [rule](#) property.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let columnData = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules = {
        'condition': 'and',
        'rules': [{
            'field': 'EmployeeID',
            'label': 'EmployeeID',
            'operator': 'equal',
```

```

        'type': 'number',
        'value': 1001
    },
    {
        'field': 'Title',
        'label': 'Title',
        'operator': 'equal',
        'type': 'string',
        'value': 'Sales Manager'
    }
  ]
};
return (<QueryBuilderComponent width='100%' dataSource={employeeData}
columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { employeeData } from '../datasource.ts';
function App() {
    let columnData: ColumnsModel[] = [
        { field: 'EmployeeID', label: 'EmployeeID', type: 'number' },
        { field: 'FirstName', label: 'FirstName', type: 'string' },
        { field: 'TitleOfCourtesy', label: 'Title Of Courtesy', type:
'boolean', values: ['Mr.', 'Mrs.'] },
        { field: 'Title', label: 'Title', type: 'string' },
        { field: 'HireDate', label: 'HireDate', type: 'date', format:
'dd/MM/yyyy' },
        { field: 'Country', label: 'Country', type: 'string' },
        { field: 'City', label: 'City', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'and',
        'rules': [{
            'field': 'EmployeeID',
            'label': 'EmployeeID',
            'operator': 'equal',
            'type': 'number',
            'value': 1001
        },
        {
            'field': 'Title',
            'label': 'Title',
            'operator': 'equal',
            'type': 'string',
            'value': 'Sales Manager'
        }
    ]
    };
    return (

```

```

        <QueryBuilderComponent width='100%' dataSource={employeeData}
        columns={columnData}
            rule={importRules} />
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

In this sample, `datasource(employeeData)` has been referred from `datasource` typescript file.

Display mode in React Query builder component

Display options allow you to view the Query Builder in Vertically or Horizontally. For this, you should use the [displayMode](#) property.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';

    );
}
export default App;
ReactDOM.render(<App />,document.getElementById('querybuilder'));

```

The default view the query builder component is Horizontal.

The default view the query builder component in Vertical.

Sort columns in React Query builder component

SortDirection allows you to sort the columns bounded to the Query Builder to view the columns by ascending or descending order. You should set the [sortDirection](#) property to sort the fields.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';

```

```

import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let importRules = {
    'condition': 'or',
    'rules': [{
      'field': 'Category',
      'label': 'Category',
      'operator': 'equal',
      'type': 'string',
      'value': 'Laptop'
    },
    {
      'condition': 'and',
      'rules': [{
        'field': 'Status',
        'label': 'Status',
        'operator': 'notequal',
        'type': 'string',
        'value': 'Pending'
      },
      {
        'field': 'TaskID',
        'label': 'Task ID',
        'operator': 'equal',
        'type': 'number',
        'value': 5675
      }
    ]
  }
  ];
  return (<QueryBuilderComponent width='100%' sortDirection="Ascending"
    dataSource={hardwareData} columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let columnData: ColumnsModel[] = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },

```

```

    { field: 'Name', label: 'Name', type: 'string' },
    { field: 'Category', label: 'Category', type: 'string' },
    { field: 'SerialNo', label: 'Serial No', type: 'string' },
    { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
    { field: 'Status', label: 'Status', type: 'string' }
  ];
  let importRules: RuleModel = {
    'condition': 'or',
    'rules': [{
      'field': 'Category',
      'label': 'Category',
      'operator': 'equal',
      'type': 'string',
      'value': 'Laptop'
    },
    {
      'condition': 'and',
      'rules': [{
        'field': 'Status',
        'label': 'Status',
        'operator': 'notequal',
        'type': 'string',
        'value': 'Pending'
      },
      {
        'field': 'TaskID',
        'label': 'Task ID',
        'operator': 'equal',
        'type': 'number',
        'value': 5675
      }
    ]
  }
  ];
  return (
    <QueryBuilderComponent width='100%' sortDirection="Ascending"
    dataSource={hardwareData} columns={columnData} rule={importRules} />
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Restrict groups in React Query builder component

You can restrict the condition set by defining the [maxGroupCount](#) property. By default, the value is 5. In the below demo, the [maxGroupCount](#) is set to 2.

APP.JSX

```

import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
  let columnData = [
    { field: 'TaskID', label: 'Task ID', type: 'number' },
    { field: 'Name', label: 'Name', type: 'string' },
  ];

```

```

        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    let importRules = {
        'condition': 'or',
        'rules': [{
            'field': 'Category',
            'label': 'Category',
            'operator': 'equal',
            'type': 'string',
            'value': 'Laptop'
        }]
    };
    return (<QueryBuilderComponent width='100%' maxGroupCount={2}
    dataSource={hardwareData} columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

APP.TSX

```

import { ColumnsModel, QueryBuilderComponent, RuleModel } from
'@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
    let columnData: ColumnsModel[] = [
        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    let importRules: RuleModel = {
        'condition': 'or',
        'rules': [{
            'field': 'Category',
            'label': 'Category',
            'operator': 'equal',
            'type': 'string',
            'value': 'Laptop'
        }]
    };
    return (
        <QueryBuilderComponent width='100%' maxGroupCount={2}
        dataSource={hardwareData} columns={columnData} rule={importRules} />
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

You can use this property in the mobile mode to restrict the nested group creation.

State persistence in React Query builder component

State persistence allows you to maintain the current state in the browser's `localStorage` even if the browser is refreshed or if you move to the next page within the browser. State persistence stores the Query Builder's [rule](#) object in the local storage when the [enablePersistence](#) is defined to true.

APP.JSX

```
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
    let columnData = [
        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
    let importRules = {
        'condition': 'or',
        'rules': [{
            'field': 'Category',
            'label': 'Category',
            'operator': 'equal',
            'type': 'string',
            'value': 'Laptop'
        }]
    };
    return (<QueryBuilderComponent width='100%' enablePersistence={true}
    dataSource={hardwareData} columns={columnData} rule={importRules}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));
```

APP.TSX

```
import { ColumnsModel, QueryBuilderComponent, RuleModel } from
 '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
function App() {
    let columnData: ColumnsModel[] = [
        { field: 'TaskID', label: 'Task ID', type: 'number' },
        { field: 'Name', label: 'Name', type: 'string' },
        { field: 'Category', label: 'Category', type: 'string' },
        { field: 'SerialNo', label: 'Serial No', type: 'string' },
        { field: 'InvoiceNo', label: 'Invoice No', type: 'string' },
        { field: 'Status', label: 'Status', type: 'string' }
    ];
};
```

```

let importRules: RuleModel = {
  'condition': 'or',
  'rules': [{
    'field': 'Category',
    'label': 'Category',
    'operator': 'equal',
    'type': 'string',
    'value': 'Laptop'
  }]
};
return (
  <QueryBuilderComponent width='100%' enablePersistence={true}
  dataSource={hardwareData} columns={columnData} rule={importRules} />
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

Rtl in React Query builder component

RTL provides an option to switch the text direction and layout of the Query Builder component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL, set the [enableRtl](#) to true.

APP.JSX

```

import { L10n } from '@syncfusion/ej2-base';
import { QueryBuilderComponent } from '@syncfusion/ej2-react-querybuilder';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// @ts-ignore
import { hardwareData } from '../datasource.ts';
L10n.load({

        {
            'condition': 'or',
            'rules': [{
                'label': 'Title Of Courtesy',
                'field': 'TitleOfCourtesy',
                'type': 'string',
                'operator': 'equal',
                'value': 'Mr.'
            },
            {
                'label': 'Country',
                'field': 'Country',
                'type': 'string',
                'operator': 'equal',
                'value': 'USA'
            },
            {
                'condition': 'and',
                'rules': [{
                    'label': 'City',
                    'field': 'City',
                    'type': 'string',
                    'operator': 'equal',
                    'value': 'London'
                }]
            }
        ]
    }
    return (
        <QueryBuilderComponent width='30%' dataSource={employeeData}
columns={columnData} rule={importRules} summaryView="true"
></QueryBuilderComponent>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('querybuilder'));

```

RadioButton

Getting Started

This section explains how to create a simple RadioButton, and configure its available functionalities in React using React quickstart application.

Dependencies

The following list of dependencies are required to use the RadioButton component in your application.

```
`javascript
|-- @syncfusion/ej2-react-buttons
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
`,`
```

Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
`,`
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash
npx create-react-app my-app
cd my-app
npm start
`,`
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install RadioButton component, use the following command

```
`bash
npm install @syncfusion/ej2-react-buttons --save
```

,

Adding CSS Reference

Import the RadioButton component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
,
```

Adding RadioButton component to the Application

To include the RadioButton component in your application import the `RadioButtonComponent` from `ej2-react-buttons` package in `App.tsx`.

Add the RadioButton component in application as shown in below code example.

```
`ts
// Import the RadioButton.
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import './App.css';
// To render RadioButton.
function App() {
  return (<div style={{marginTop: '150px'}}>
    <RadioButtonComponent label="default" />
  </div>);
}
export default App;
,
```

Run the application

Run the application in the browser using the following command:

,

```
npm start
```

,

The following example shows a basic RadioButton component.

APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
```

```
// To render RadioButton.
function App() {
  return (
    <ul>
      <li><RadioButtonComponent label="Option 1" name="default"/></li>
      <li><RadioButtonComponent label="Option 2" name="default"/></li>
    </ul>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render RadioButton.
function App() {
  return (
    <ul>
      <li><RadioButtonComponent label="Option 1" name="default" /></li>
      <li><RadioButtonComponent label="Option 2" name="default" /></li>
    </ul>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

You can refer to our [React Radio Button](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Radio Button Example](#) that shows you how to render the Radio Button in React.

Label and size in React Radio button component

This section explains the different sizes and labels.

Label

RadioButton caption can be defined by using the [label](#) property. This reduces the manual addition of label for RadioButton. You can customize the label position before or after the RadioButton through the [labelPosition](#) property.

APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
  return (
    <ul>
      { /* Label position - Left. */ }
      <li><RadioButtonComponent label="Left Side Label" name="position"
labelPosition="Before"/></li>
      { /* Label position - Right. */ }
    </ul>
  );
}
```

```

        <li><RadioButtonComponent label="Right Side Label" name="position"
checked={true}/></li>
      </ul>;
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('radio-button'));

```

APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
  return (
    <ul>
      { /* Label position - Left. */ }
      <li><RadioButtonComponent label="Left Side Label" name="position"
labelPosition="Before" /></li>
      { /* Label position - Right. */ }
      <li><RadioButtonComponent label="Right Side Label" name="position"
checked={true} /></li>
    </ul>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

Size

The different RadioButton sizes available are default and small. To reduce the size of the default RadioButton to small, set the [cssClass](#) property to `e-small`.

APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
  return <ul>
    { /* Small RadioButton. */ }
    <li><RadioButtonComponent label="Small" name="size" cssClass="e-
small"/></li>
    { /* Default RadioButton. */ }
    <li><RadioButtonComponent label="Default" name="size"/></li>
  </ul>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';

```

```
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
  return (
    <ul>
      { /* Small RadioButton. */ }
      <li><RadioButtonComponent label="Small" name="size" cssClass="e-small" /></li>
      { /* Default RadioButton. */ }
      <li><RadioButtonComponent label="Default" name="size" /></li>
    </ul>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

Accessibility in React RadioButton component

The RadioButton component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the RadioButton component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

```
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The RadioButton component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the RadioButton component:

Attributes	Purpose
------------	---------

---	---
-----	-----

aria-disabled	Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable.
---------------	--

Keyboard interaction

The RadioButton component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the RadioButton component.

Press	To do this
-------	------------

---	---
-----	-----

UP/Left arrow	Move and select the previous options.
---------------	---------------------------------------

Down/Right arrow	Move and select the next options.
------------------	-----------------------------------

Ensuring accessibility

The RadioButton component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the RadioButton component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the RadioButton component with accessibility tools.

Style and appearance in React Radio button component

To modify the RadioButton appearance, you need to override the default CSS of RadioButton component. Please find the list of CSS classes and its corresponding section in RadioButton. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Class | Purpose of Class

- |.e-radio-wrapper|To customize the radio button wrapper
- |.e-radio + label:hover::before|To customize the radiobutton on hover
- |.e-radio:checked + label::after, e-radio:checked + label::before |To customize the checked radiobutton
- |.e-radio:checked:focus + label::before, .e-radio:checked + label:hover::before |To customize the checked radiobutton on hover

How To

Change radiobutton state in React Radio button component

The Essential JS 2 RadioButton contains 2 different states visually, they are as follows:

- Checked
- Unchecked

The RadioButton [checked](#) property is used to handle the checked and unchecked state. In the checked state an inner circle will be added to the visualization of RadioButton.

APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
    return (
        <ul>
            { /* checked state. */ }
            <li><RadioButtonComponent label="Option 1" name="state"
checked={true}/></li>
            { /* unchecked state. */ }
            <li><RadioButtonComponent label="Option 2" name="state"/></li>
        </ul>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
function App() {
    return (
        <ul>
```

```

        {/* checked state. */}
        <li><RadioButtonComponent label="Option 1" name="state"
checked={true} /></li>
        {/* unchecked state. */}
        <li><RadioButtonComponent label="Option 2" name="state" /></li>
    </ul>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

Customize radiobutton appearance in React Radio button component

You can customize the appearance of the RadioButton component by using the CSS rules. Define own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

The background and border color of the RadioButton is customized through the custom classes to create the primary, success, warning, danger, and info type of radio button.

APP.JSX

```

import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To customize RadioButton appearance.
function App() {
    return <ul>
        {/* Refer the 'e-primary' class details in 'style.css'. */}
        <li><RadioButtonComponent label="Primary" cssClass="e-primary"
name="custom"/></li>
        {/* Refer the 'e-success' class details in 'style.css'. */}
        <li><RadioButtonComponent label="Success" cssClass="e-success"
name="custom"/></li>
        {/* Refer the 'e-info' class details in 'style.css'. */}
        <li><RadioButtonComponent label="Info" cssClass="e-info"
checked={true} name="custom"/></li>
        {/* Refer the 'e-warning' class details in 'style.css'. */}
        <li><RadioButtonComponent label="Warning" cssClass="e-warning"
name="custom"/></li>
        {/* Refer the 'e-danger' class details in 'style.css'. */}
        <li><RadioButtonComponent label="Danger" cssClass="e-danger"
name="custom"/></li>
    </ul>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

APP.TSX

```

import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To customize RadioButton appearance.
function App() {
    return (
        <ul>

```

```

        { /* Refer the 'e-primary' class details in 'style.css'. */ }
        <li><RadioButtonComponent label="Primary" cssClass="e-primary"
name="custom" /></li>
        { /* Refer the 'e-success' class details in 'style.css'. */ }
        <li><RadioButtonComponent label="Success" cssClass="e-success"
name="custom" /></li>
        { /* Refer the 'e-info' class details in 'style.css'. */ }
        <li><RadioButtonComponent label="Info" cssClass="e-info"
checked={true} name="custom" /></li>
        { /* Refer the 'e-warning' class details in 'style.css'. */ }
        <li><RadioButtonComponent label="Warning" cssClass="e-warning"
name="custom" /></li>
        { /* Refer the 'e-danger' class details in 'style.css'. */ }
        <li><RadioButtonComponent label="Danger" cssClass="e-danger"
name="custom" /></li>
    </ul>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

Name and value in form submit in React Radio button component

The [name](#) attribute of the RadioButton is used to group RadioButton. When the RadioButton are grouped in form, the checked items [value](#) attribute will be post to server on form submit that can be retrieved through the name. The disabled and unchecked RadioButton value will not be sent to the server on form submit.

In the following code snippet, Credit / Debit card is in checked state. Now, the value that is in checked state will be sent on form submit.

APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent, ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// Name and Value attribute in form submit.
function App() {
    return (<form>
        <ul>
            <li><RadioButtonComponent name="payment" value="credit/debit"
label="Credit /Debit card" checked={true}/></li>
            <li><RadioButtonComponent name="payment" value="netbanking"
label="Net Banking"/></li>
            <li><RadioButtonComponent name="payment" value="cashondelivery"
label="Cash On Delivery"/></li>
            <li><RadioButtonComponent name="payment" value="others"
label="Others"/></li>
            <li><ButtonComponent
isPrimary={true}>Submit</ButtonComponent></li>
        </ul>
    </form>);
}
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent, ButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// Name and Value attribute in form submit.
function App() {
  return (
    <form>
      <ul>
        <li><RadioButtonComponent name="payment" value="credit/debit"
label="Credit /Debit card" checked={true} /></li>
        <li><RadioButtonComponent name="payment" value="netbanking"
label="Net Banking" /></li>
        <li><RadioButtonComponent name="payment" value="cashondelivery"
label="Cash On Delivery" /></li>
        <li><RadioButtonComponent name="payment" value="others"
label="Others" /></li>
        <li><ButtonComponent
isPrimary={true}>Submit</ButtonComponent></li>
      </ul>
    </form>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

Right to left in React Radio button component

RadioButton component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in RadioButton component.

APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render RadioButton.
function App() {
  return <ul>
    <li><RadioButtonComponent label="Option 1" name="default"
enableRtl={true}/></li>
    <li><RadioButtonComponent label="Option 2" name="default"
enableRtl={true}/></li>
  </ul>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render RadioButton.
function App() {
    return (
        <ul>
            <li><RadioButtonComponent label="Option 1" name="default"
enableRtl={true} /></li>
            <li><RadioButtonComponent label="Option 2" name="default"
enableRtl={true} /></li>
        </ul>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

Set the disabled state in React Radio button component

RadioButton component can be enabled/disabled by giving [disabled](#) property. To disable RadioButton component,

the `disabled` property can be set as `true`.

The following example illustrates how to disable a radio button and the selected one is displayed using [change](#) event.

APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render RadioButton.
function App() {
    let radioInstance1;
    let radioInstance2;
    let radioInstance3;
    function changeOption1() {
        document.getElementById('text').innerText = 'Selected : ' +
radioInstance1.label;
    }
    function changeOption2() {
        document.getElementById('text').innerText = 'Selected : ' +
radioInstance2.label;
    }
    function changeOption3() {
        document.getElementById('text').innerText = 'Selected : ' +
radioInstance3.label;
    }
    return <ul>
        <li><div id="text">Selected : Option 1</div></li>
```

```

    <li><RadioButtonComponent label="Option 1" name="default"
checked={true} change={changeOption1} ref={radio1 => radioInstance1 =
radio1}/></li>
    <li><RadioButtonComponent label="Option 2" name="default"
disabled={true} change={changeOption2} ref={radio2 => radioInstance2 =
radio2}/></li>
    <li><RadioButtonComponent label="Option 3" name="default"
change={changeOption3} ref={radio3 => radioInstance3 = radio3}/></li>
  </ul>;
}
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));

```

APP.TSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { RadioButtonComponent, ChangeEventArgs } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render RadioButton.
function App() {
    let radioInstance1: RadioButtonComponent;
    let radioInstance2: RadioButtonComponent;
    let radioInstance3: RadioButtonComponent;
    function changeOption1(): void {
        (document.getElementById('text') as HTMLElement).innerText = 'Selected
: ' + radioInstance1.label;
    }

    function changeOption2(): void {
        (document.getElementById('text') as HTMLElement).innerText =
'Selected : ' + radioInstance2.label;
    }

    function changeOption3(): void {
        (document.getElementById('text') as HTMLElement).innerText =
'Selected : ' + radioInstance3.label;
    }

    return (
        <ul>
            <li><div id="text">Selected : Option 1</div></li>
            <li><RadioButtonComponent label="Option 1" name="default"
checked={true} change={changeOption1} ref={radio1 => radioInstance1 = radio1
as RadioButtonComponent}/></li>
            <li><RadioButtonComponent label="Option 2" name="default"
disabled={true} change={changeOption2} ref={radio2 => radioInstance2 =
radio2 as RadioButtonComponent}/></li>
            <li><RadioButtonComponent label="Option 3" name="default"
change={changeOption3} ref={radio3 => radioInstance3 = radio3 as
RadioButtonComponent}/></li>
        </ul>
    );
}

```

```
export default App;
ReactDOM.render(<App />, document.getElementById('radio-button'));
```

Ej1 api migration in React Radio button component

This article describes the API migration process of RadioButton component from Essential JS 1 to Essential JS 2.

Properties

{% raw %}

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Label | **Property:** *text*

 <EJ.RadioButton id="radio" text="RadioButton"></EJ.RadioButton> | **Property:** *label*

 <RadioButtonComponent id="radio" label="RadioButton"></RadioButtonComponent> |

| Checked state | **Property:** *checked*

 <EJ.RadioButton id="radio" text="RadioButton" checked={true}></EJ.RadioButton> | **Property:** *checked*

 <RadioButtonComponent id="radio" label="RadioButton" checked={true}></RadioButtonComponent> |

| Adding custom css class | **Property:** *cssClass*

 <EJ.RadioButton id="radio" text="RadioButton" cssClass="custom-class"></EJ.RadioButton> | **Property:** *cssClass*

 <RadioButtonComponent id="radio" label="RadioButton" cssClass="custom-class"></RadioButtonComponent> |

| Disabled state | **Property:** *enabled*

 <EJ.RadioButton id="radio" text="RadioButton" enabled={false}></EJ.RadioButton> | **Property:** *disabled*

 <RadioButtonComponent id="radio" label="RadioButton" disabled={true}></RadioButtonComponent> |

| State persistence | **Property:** *enablePersistence*

 <EJ.RadioButton id="radio" text="RadioButton" enablePersistence={true}></EJ.RadioButton> | **Property:** *enablePersistence*

 <RadioButtonComponent id="radio" label="RadioButton" enablePersistence={true}></RadioButtonComponent> |

| RTL | **Property:** *enableRTL*

 <EJ.RadioButton id="radio" text="RadioButton" enableRTL={true}></EJ.RadioButton> | **Property:** *enableRtl*

 <RadioButtonComponent id="radio" label="RadioButton" enableRtl={true}></RadioButtonComponent> |

| HTML Attributes | **Property:** *htmlAttributes*

 var attributes = { required:"required" };
 <EJ.RadioButton id="radio" text="RadioButton" htmlAttributes={attributes}></EJ.RadioButton> | Not applicable |

| Id property | **Property:** *id*

 <EJ.RadioButton id="sync"></EJ.RadioButton> | Not applicable |

| Prefix value of Id | **Property:** *idPrefix*

 <EJ.RadioButton id="radio" idPrefix="react"></EJ.RadioButton> | Not applicable |

| Name attribute | **Property:** *name*

 <EJ.RadioButton id="radio" name="gender" checked={true} text="Male"></EJ.RadioButton> | **Property:** *name*

`<RadioButtonComponent id="radio" name="gender" checked={true} label="Male"></RadioButtonComponent>` |

| Value attribute | **Property:** *value* `

` `<EJ.RadioButon id="radio" name="gender" checked={true} value="male" text="Male"></EJ.RadioButon>` | **Property:** *value* `

` `<RadioButtonComponent id="radio" name="gender" checked={true} value="male" label="Male"></RadioButtonComponent>` |

| Size | **Property:** *size* `

` `<EJ.RadioButon id="radio" size="small" text="RadioButton"></EJ.RadioButon>` | **Property:** *cssClass* `

` `<RadioButtonComponent id="radio" label="RadioButton" cssClass="e-small"></RadioButtonComponent>` |

| Validation rules | **Property:** *validationRules* `

` `var rules = { required: true };
` `<EJ.RadioButon id="radio" text="RadioButton" validationRules={rules}></EJ.RadioButon>` |

Not applicable |

| Validation message | **Property:** *validationMessage* `

` `var rules = { required: true };
` `var message = { required: "Required RadioButton value" };
` `<EJ.RadioButon id="radio" text="RadioButton" validationRules={rules} validationMessage={message}></EJ.RadioButon>` |

Not applicable |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroy | **Method:** *destroy* `

` `<EJ.RadioButon id="radio" text="RadioButton"></EJ.RadioButon>` `
` `var radioButton = $('#radio').ejRadioButon('instance');` `
` `radioButton.destroy();` | **Method:** *destroy* `

` `<RadioButtonComponent id="radio" label="RadioButton" ref={(scope) => {this.radioButton = scope}}></RadioButtonComponent>` `
` `constructor(props: {}) {
` ` ` `this.radioButton.destroy();
` `}` |

| Disable the RadioButton | **Method:** *disable* `

{% endraw %}

```

Range Navigator

Getting Started

This section explains you the steps required to create a simple range navigator and demonstrate the basic usage of the range navigator control.

Dependencies

The list of minimum dependencies required to use an range navigator are follows:

```

`javascript
|-- @syncfusion/ej2-react-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-svg-base
,

```

Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```

,
npm install -g create-react-app
,

```

- To set-up a React application in TypeScript environment, run the following command.

`

```
create-react-app quickstart --template typescript
```

```
cd quickstart
```

```
npm start
```

`

- To set-up a React application in JavaScript environment, run the following command.

`

```
create-react-app quickstart
```

```
cd quickstart
```

```
npm start
```

`

- Install Syncfusion packages using below command.

`

```
npm install @syncfusion/ej2-react-charts --save
```

`

Add Range Navigator to the Project

Now, you can start adding range navigator component in the application.

For getting started, add the Chart component in `src/App.tsx` file using following code.

```
`ts
```

```
import * as React from 'react';
```

```
import {RangeNavigatorComponent} from '@syncfusion/ej2-react-charts';
```

```
function App() {
```

```
  return (<RangeNavigatorComponent></RangeNavigatorComponent>);
```

```
};
```

```
export default App;
```

`

Now run the `npm start` command in the console, it will run your application and open the browser window.

`

```
npm start
```

`

The below example shows a basic Range Navigator.

INDEX.JSX

```
import { RangeNavigatorComponent } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  render() {
    return <RangeNavigatorComponent id="charts"/>;
  }
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
```

INDEX.TSX

```
import { RangeNavigatorComponent} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  render() {
    return <RangeNavigatorComponent id="charts" />
  }
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
```

Module Injection

Chart component are segregated into individual feature-wise modules. In order to use a particular feature, you need to inject its feature service in the AppModule. In the current application, we are going to modify the above basic chart to visualize sales data for a particular year. For this application we are going to use line series, tooltip, data label, category axis and legend feature of the chart. Please find the relevant feature service name and description as follows.

- **AreaSeries** - Inject this module in to **services** to use area series.
- **DateTime** - Inject this module in to **services** to use date time feature.
- **RangeTooltip** - Inject this module in to **services** to use tooltip feature.

These modules should be injected to the **services** section as follows,

```
`javascript
```

```
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent, RangeTooltip} from
 '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return <RangeNavigatorComponent id='charts'>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
```

```
</RangeNavigatorComponent>
```

```
};
```

```
export default App;
```

```
ReactDOM.render(<App />, document.getElementById("charts"));
```

```
`
```

Populate Range Navigator with Data

Now, we are going to provide data to the range navigator. Add a [series](#) object to the range navigator by using series property. Now map the field names x and y in the JSON data to the [xName](#) and [yName](#) properties of the series, then set the JSON data to dataSource property.

Since the JSON contains Datetime data, set the [valueType](#) range Navigator to **Category**. By default, the axis [valueType](#) is **Numeric**.

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-
01')]}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  return <RangeNavigatorComponent id='charts'
```

```

    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}]}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

Enable Tooltip

The tooltip is useful to show the selected data. You can enable the tooltip by setting the `enable` property as `true` in tooltip object and by injecting `RangeTooltip` module into the `services`.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true, displayMode: 'Always' };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {

```

```

const data: object[] = bitCoinData;
const tooltip: RangeTooltipSettingsModel = { enable: true, displayMode:
'Always' };
return <RangeNavigatorComponent id='charts'
  valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
  tooltip={tooltip}>
  <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
  <RangenavigatorSeriesCollectionDirective>
    <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
  </RangenavigatorSeriesCollectionDirective>
</RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

Selecting range in React Range navigator component

The Range Selector's left and right thumbs are used to indicate the selected range in the large collection of data. A range can be selected in the following ways:

- By dragging the thumbs.
- By tapping on the labels.
- By setting the start and the end through the [value](#) property.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
  tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```
{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
  </>
}
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Lightweight in React Range navigator component

By default, when the [dataSource](#) for [series](#) is empty, a lightweight Range Selector will be shown without Chart.

INDEX.JSX

```
{% raw %}
import { DateTime, Inject, RangeNavigatorComponent } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { GetDateTimeData } from 'default-data.ts';
function App() {
    const data = GetDateTimeData(new Date(2018, 0, 1), new Date(2019, 0, 1));
    return <RangeNavigatorComponent id='charts' valueType='DateTime'
intervalType='Months' labelFormat='MMM' value={[new Date('2018-04-1'), new
Date('2018-08-1')]} dataSource={data} xName='x' yName='y'>
        <Inject services={[DateTime]} />
    </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{ % raw %}
```

```
import { DateTime, Inject, RangeNavigatorComponent } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { GetDateTimeData } from 'default-data.ts';
function App() {
  const data: object[] = GetDateTimeData(new Date(2018, 0, 1), new Date(2019, 0, 1));
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' intervalType='Months' labelFormat='MMM'
    value={[new Date('2018-04-1'), new Date('2018-08-1')]}
    dataSource={data} xName='x' yName='y'>
    <Inject services={[DateTime]} />
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Series types in React Range navigator component

To render the data, the Range Selector supports three types of series.

<!-- markdownlint-disable MD036 -->

Line

<!-- markdownlint-disable MD036 -->

To render a line series, use series [type](#) as **Line** and inject the **LineSeries** module using **RangeNavigator.Inject(LineSeries)** method. By default, the line series is rendered in the Range Selector.

INDEX.JSX

```
{% raw %}
import { LineSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
tooltip={tooltip}>
  <Inject services={[LineSeries, DateTime, RangeTooltip]} />
  <RangenavigatorSeriesCollectionDirective>
    <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Line' width={2} />
  </RangenavigatorSeriesCollectionDirective>

```

```

    </RangeNavigatorComponent>;
  };
  export default App;
  ReactDOM.render(<App />, document.getElementById("charts"));
  {% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
  LineSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[LineSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Line' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
  </>
  export default App;
  ReactDOM.render(<App />, document.getElementById("charts"));
  {% endraw %}

```

Area

To render an area series, use series [type](#) as **Area** and inject **AreaSeries** module using **RangeNavigator.Inject(AreaSeries)** method.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
  tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
  </>
  export default App;
  ReactDOM.render(<App />, document.getElementById("charts"));
  {% endraw %}

```

```

    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

StepLine

To render a Step line series, use series [type](#) as **Step Line** and inject **StepLineSeries** module using **RangeNavigator.Inject(StepLineSeries)** method.

INDEX.JSX

```

{% raw %}
import { StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data = double;
  const tooltip = { enable: true };

```

```

    return <RangeNavigatorComponent id='charts' labelPosition='Outside'
    tooltip={tooltip} value={[12, 30]}>
      <Inject services={[RangeTooltip, StepLineSeries]} />
      <RangenavigatorSeriesCollectionDirective>
        <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
          </RangenavigatorSeriesDirective>
        </RangenavigatorSeriesCollectionDirective>
      </RangeNavigatorComponent>;
    };
    export default App;
    ReactDOM.render(<App />, document.getElementById("charts"));
    {% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
  StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data: object[] = double;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    labelPosition='Outside'
    tooltip={tooltip}
    value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
        </RangenavigatorSeriesDirective>
      </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>
  </>;
  export default App;
  ReactDOM.render(<App />, document.getElementById("charts"));
  {% endraw %}

```

<!-- markdownlint-disable MD036 -->

Data in React Range navigator component

Numeric

The numeric scale is used to represent the numeric values of data in a Range Selector. By default, the [valueType](#) of a Range Selector is **Double**.

INDEX.JSX

```

{% raw %}
import { StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';

```

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data = double;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' labelPosition='Outside'
  tooltip={tooltip} value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
      </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data: object[] = double;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
  labelPosition='Outside'
  tooltip={tooltip}
  value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
      </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Range

The minimum and the maximum of the scale will be calculated automatically based on the provided data. It can be customized by using the [minimum](#), [maximum](#), and [interval](#) properties.

INDEX.JSX

```
{% raw %}
```

```

import { StepLineSeries, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data = double;

{% raw %}
import {
  StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data: object[] = double;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    labelPosition='Outside'
    tooltip={tooltip}
    value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
    </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

Label Format

The numeric labels can be formatted using the [labelFormat](#) property and it supports all the globalized formats.

INDEX.JSX

```
{% raw %}
import { StepLineSeries, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data = double;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' labelPosition='Outside'
labelFormat='n1' tooltip={tooltip} value={[12, 30]}>
  <Inject services={[RangeTooltip, StepLineSeries]} />
  <RangenavigatorSeriesCollectionDirective>
    <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
    </RangenavigatorSeriesDirective>
  </RangenavigatorSeriesCollectionDirective>
</RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  StepLineSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data: object[] = double;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    labelPosition='Outside'
    labelFormat='n1'
    tooltip={tooltip}
    value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
      </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1,000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1,000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

Custom Label Format

The Range Selector also supports the Custom Label formats using the placeholders such as **{value}\$**, in which the value represents the axis label, e.g. 20\$.

INDEX.JSX

```
{% raw %}
import { StepLineSeries, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data = double;
  return <RangeNavigatorComponent id='charts' labelPosition='Outside'
labelFormat='{value}$' value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
    </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default-data.ts';
function App() {
  const data: object[] = double;
  return <RangeNavigatorComponent id='charts'
    labelPosition='Outside'
    labelFormat='{value}$'
    value={[12, 30]}>
    <Inject services={[RangeTooltip, StepLineSeries]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'>
        </RangenavigatorSeriesDirective>
      </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>
  </>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Logarithmic Axis

```
<!-- markdownlint-disable MD033 -->
```

The Logarithmic supports the logarithmic scale, and it is used to visualize the data when the Range Selector has numerical values in both the lower (e.g.: 10-6) and the higher (e.g.: 106) orders of the magnitude.

INDEX.JSX

```
import { StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  data = [];
  max = 100;
  chartLoad() {
    let i;
    for (i = 0; i < 100; i++) {
      this.data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
      });
    }
  }
  render() {
```

```

        this.chartLoad();
        return <RangeNavigatorComponent id='charts' labelPosition='Outside'
valueType='Logarithmic' interval={1} value={[4, 6]}>
    <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
        <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y' type='StepLine' width={2}>
            </RangenavigatorSeriesDirective>
        </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>;
    }
}
;
ReactDOM.render(<App />, document.getElementById("charts"));

```

INDEX.TSX

```

import {
    StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
    RangenavigatorSeriesCollectionDirective,
    RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default_data.ts';
class App extends React.Component<{}, {}> {
    public data: object[] = [];
    public max: number = 100;
    public chartLoad(): void {
        let i: number;
        for (i = 0; i < 100; i++) {
            this.data.push({
                x: Math.pow(10, i * 0.1),
                y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
            });
        }
    }
    render() {
        this.chartLoad();
        return <RangeNavigatorComponent id='charts'
            labelPosition='Outside'
            valueType='Logarithmic'
            interval={1}
            value={[4, 6]}>
            <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]} />
            <RangenavigatorSeriesCollectionDirective>
                <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y'
                    type='StepLine' width={2}>
                    </RangenavigatorSeriesDirective>
                </RangenavigatorSeriesCollectionDirective>
            </RangeNavigatorComponent>
        </>
    }
};
ReactDOM.render(<App />, document.getElementById("charts"));

```

To use logarithmic scale, inject the `Logarithmic` module using the `RangeNavigator.Inject(Logarithmic)`

method, and then set the `valueType` to `Logarithmic`.

Range

The minimum and the maximum of the Range Selector will be calculated automatically based on the provided data. It can be customized by using the [minimum](#), [maximum](#), and [interval](#) properties.

INDEX.JSX

```
import { StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  data = [];
  max = 100;
  chartLoad() {
    let i;
    for (i = 0; i < 100; i++) {
      this.data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
      });
    }
  }
  render() {
    this.chartLoad();
    return <RangeNavigatorComponent id='charts' labelPosition='Outside'
valueType='Logarithmic' interval={1} value={[4, 6]}>
      <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]}/>
      <RangenavigatorSeriesCollectionDirective>
        <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y' type='StepLine' width={2}>
          </RangenavigatorSeriesDirective>
        </RangenavigatorSeriesCollectionDirective>
      </RangeNavigatorComponent>;
  }
};
ReactDOM.render(<App />, document.getElementById("charts"));
```

INDEX.TSX

```
import {
  StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default_data.ts';
class App extends React.Component<{}, {}> {
  public data: object[] = [];
```

```

public max: number = 100;
public chartLoad(): void {
  let i: number;
  for (i = 0; i < 100; i++) {
    this.data.push({
      x: Math.pow(10, i * 0.1),
      y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
    });
  }
}
render() {
  this.chartLoad();
  return <RangeNavigatorComponent id='charts'
    labelPosition='Outside'
    valueType='Logarithmic'
    interval={1}
    value={[4, 6]}>
    <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y'
        type='StepLine' width={2}>
      </RangenavigatorSeriesDirective>
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
}
};
ReactDOM.render(<App />, document.getElementById("charts"));

```

Logarithmic Base

The Logarithmic Base can be customized using the [logBase](#) property. The default value of this property is 10.

INDEX.JSX

```

import { StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  data = [];
  max = 100;
  chartLoad() {
    let i;
    for (i = 0; i < 100; i++) {
      this.data.push({
        x: Math.pow(10, i * 0.1),
        y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
      });
    }
  }
  render() {
    this.chartLoad();
    return <RangeNavigatorComponent id='charts' labelPosition='Outside'
valueType='Logarithmic' logBase={2} value={[4, 6]}>

```

```

        <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]}/>
        <RangenavigatorSeriesCollectionDirective>
            <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y' type='StepLine' width={2}>
                </RangenavigatorSeriesDirective>
            </RangenavigatorSeriesCollectionDirective>
        </RangeNavigatorComponent>;
    }
}
;
ReactDOM.render(<App />, document.getElementById("charts"));

```

INDEX.TSX

```

import {
    StepLineSeries, Logarithmic, Inject, RangeNavigatorComponent,
    RangenavigatorSeriesCollectionDirective,
    RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { double } from 'default_data.ts';
class App extends React.Component<{}, {}> {
    public data: object[] = [];
    public max: number = 100;
    public chartLoad(): void {
        let i: number;
        for (i = 0; i < 100; i++) {
            this.data.push({
                x: Math.pow(10, i * 0.1),
                y: Math.floor(Math.random() * (80 - 30 + 1)) + 30
            });
        }
    }
    render() {
        this.chartLoad();
        return <RangeNavigatorComponent id='charts'
            labelPosition='Outside'
            valueType='Logarithmic'
            logBase={2}
            value={[4, 6]}>
            <Inject services={[StepLineSeries, Logarithmic, RangeTooltip]}/>
            <RangenavigatorSeriesCollectionDirective>
                <RangenavigatorSeriesDirective dataSource={this.data} xName='x'
yName='y'
                    type='StepLine' width={2}>
                    </RangenavigatorSeriesDirective>
                </RangenavigatorSeriesCollectionDirective>
            </RangeNavigatorComponent>
        </>
    }
};
ReactDOM.render(<App />, document.getElementById("charts"));

```

Date-time

The Range Selector supports the DateTime scale and displays the DateTime values as labels in the specified format.

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
```

```
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Date-time Range navigator supports date-time scale and displays date-time values as a labels in the specified format.

Interval Customization

The DateTime intervals can be customized using the [interval](#) and the [intervalType](#) properties of the Range Selector. For example, if the [interval](#) is set to 2 and the [intervalType](#) is set to years, the interval will be considered to be 2 years.

DateTime supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
```

```

    AreaSeries, DateTime, Inject, RangeNavigatorComponent,
    RangenavigatorSeriesCollectionDirective,
    RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
    const data: object[] = bitCoinData;
    const tooltip: RangeTooltipSettingsModel = { enable: true };
    return <RangeNavigatorComponent id='charts'
        valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
        tooltip={tooltip}>
        <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
        <RangenavigatorSeriesCollectionDirective>
            <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
        </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>
    </>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

Label Format

The [labelFormat](#) property is used to format and parse the date to all globalize format.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
    const data = bitCoinData;
    const tooltip = { enable: true };
    return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='y/M/d' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
        tooltip={tooltip}>
        <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
        <RangenavigatorSeriesCollectionDirective>
            <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
        </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```
{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='y/M/d' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
</>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

The following table shows the results of applying some common DateTime formats to the [labelFormat](#) property.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
new Date(2000, 03, 10)	EEEE	Monday	The Date is displayed in day format
new Date(2000, 03, 10)	yMd	04/10/2000	The Date is displayed in month/date/year format
new Date(2000, 03, 10)	MMM	Apr	The Shorthand month for the date is displayed
new Date(2000, 03, 10)	hm	12:00 AM	Time of the date value is displayed as label
new Date(2000, 03, 10)	hms	12:00:00 AM	The Label is displayed in hours:minutes:seconds format

Period selector in React Range navigator component

The period selector allows to select a range with specified periods.

Periods

An array of objects that allows the users to specify pre-defined time intervals. The [interval](#) property specifies the count value of the button, and the [text](#) property specifies the text to be displayed on the button. The [intervaltype](#) property allows the users to customize the interval type, and it supports the following types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip, PeriodSelector } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  const periodselector = {
    position: 'Top',
    periods: [
      { text: '1M', interval: 1, intervalType: 'Months' },
      { text: '3M', interval: 3, intervalType: 'Months' },
      { text: '6M', interval: 6, intervalType: 'Months' }, { text: 'YTD' },
      { text: '1Y', interval: 1, intervalType: 'Years' },
      { text: '2Y', interval: 2, intervalType: 'Years', selected: true }, {

```

To use the period selector feature, inject the **PeriodSelector** module using the **RangeNavigator.Inject(PeriodSelector)** method.

Positioning period selector

The **position** property allows the users to position the period selector at the **Top** or **Bottom**.

INDEX.JSX

```
{% raw %}
```

```

ReactDOM.render(<App />, document.getElementById("charts"));

```

Smart labels

The [labelIntersectAction](#) property is used to avoid overlapping of labels. The following code sample shows the setting of [labelIntersectAction](#) property to **Hide**.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='y/M/d' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
tooltip={tooltip} labelIntersectAction='Hide'>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';

```

```
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='y/M/d' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    tooltip={tooltip} labelIntersectAction='Hide'>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>
  </>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Label positioning

By default, the labels can be placed outside the Range Selector. It can also be placed inside the Range Selector using the [labelPosition](#) property.

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelPosition='Inside' value={[new Date('2017-09-01'), new Date('2018-02-
01')]} tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
```

```

} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelPosition='Inside' value={[new Date('2017-09-01'), new Date('2018-02-01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% enddraw %}

```

Labels customization

The font size, color, family, etc. can be customized using the [labelStyle](#) setting.

INDEX.JSX

```

import { DateTime, Inject, RangeNavigatorComponent } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  data = [];
  max = 100;
  chartLoad() {
    let value = 0;
    let point = {};
    for (let j = 1; j < 1090; j++) {
      value += (Math.random() * 10 - 5);
      value = value < 0 ? Math.abs(value) : value;
      point = { x: new Date(2000, 0, j), y: value, z: value + 10 };
      this.data.push(point);
    }
  }
  render() {
    this.chartLoad();
    return <RangeNavigatorComponent id='charts' valueType='DateTime'
intervalType='Months' labelFormat='MMM' value={[new Date('2001-01-01'), new
Date('2002-01-01')]} dataSource={this.data} xName='x' yName='y'>
      <Inject services={[DateTime]} />
    </RangeNavigatorComponent>;
  }
}
;
ReactDOM.render(<App />, document.getElementById("charts"));

```

INDEX.TSX

```
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip
} from '@syncfusion/ej2-react-charts';

```

Grid tick in React Range navigator component

Grid line customization

The gridlines indicate axis divisions by drawing the chart plot. Gridlines include helpful cues to the user, particularly for large or complicated charts. The **width**, **color**, and **dashArray** of the major gridlines can be customized by using the [majorGridLines](#) setting.

INDEX.JSX

```
import { StepLineSeries, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
class App extends React.Component {
  data = [
    { xData: 10, yData: 35 }, { xData: 20, yData: 28 },
    { xData: 30, yData: 34 }, { xData: 40, yData: 32 },
    { xData: 50, yData: 40 }
  ];
  tooltip = { enable: true };
  majorgridLines = { width: 4, color: 'blue', dashArray: '5,5' };
};
```

```

render() {
    return <RangeNavigatorComponent id='charts' labelPosition='Outside'

```

Customization in React Range navigator component

Navigator appearance

The Range Selector can be customized by using the [navigatorStyleSettings](#). The [selectedRegionColor](#) property is used to specify the color for the selected region, whereas the [unselectedRegionColor](#) property is used to specify the color for the unselected region.

INDEX.JSX

```

{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
    const data = bitCoinData;
    const tooltip = { enable: true };
    const navigatorstyleSettings = {
        unselectedRegionColor: 'skyblue',
        selectedRegionColor: 'pink'
    };
    return <RangeNavigatorComponent id='charts' valueType='DateTime'
labelFormat='MMM-yy' value={[new Date('2017-09-01'), new Date('2018-02-01')]}>
navigatorStyleSettings={navigatorstyleSettings} tooltip={tooltip}>
        <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
        <RangenavigatorSeriesCollectionDirective>
            <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
        </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>;
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import {
    AreaSeries, DateTime, Inject, RangeNavigatorComponent,
    RangenavigatorSeriesCollectionDirective,
    RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel,
    StyleSettingsModel
} from '@syncfusion/ej2-react-charts';

```

```

import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true };
  const navigatorstyleSettings: StyleSettingsModel = {
    unselectedRegionColor: 'skyblue',
    selectedRegionColor: 'pink'
  };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' labelFormat='MMM-yy' value={[new Date('2017-09-01'),
new Date('2018-02-01')]}
    navigatorStyleSettings={navigatorstyleSettings}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'

Tool tip in React Range navigator component

<!-- markdownlint-disable MD036 -->

The tooltip for sliders are supported by the Range Selector. Sliders are used in the Range Selector to select data from a specific range. The tooltip displays the selected start and end values.

<!-- markdownlint-disable MD013 -->

Customization

Tooltip can be customized using the following properties:

- enable - Customizes the visibility of the tooltip.
- fill - Customizes the background color of the tooltip.
- opacity - Customizes the opacity of the tooltip.
- textStyle - Customizes the font size, color, family, style, weight, alignment, and overflow of the tooltip.

  </>
  export default App;
  ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

Label Format

The **labelFormat** property in the tooltip is used to format and parse the date to all globalize formats.

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
  RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true, displayMode: 'Always', labelFormat: 'y/M/d'
  };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
  value={[new Date('2017-09-01'), new Date('2018-02-01')]} tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
```

```

    <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
  </RangenavigatorSeriesCollectionDirective>
</RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% enddraw %}

```

INDEX.TSX

```

{% raw %}
import {
  AreaSeries, DateTime, Inject, RangeNavigatorComponent,
  RangenavigatorSeriesCollectionDirective,
  RangenavigatorSeriesDirective, RangeTooltip, RangeTooltipSettingsModel
} from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data: object[] = bitCoinData;
  const tooltip: RangeTooltipSettingsModel = { enable: true, displayMode:
'Always', labelFormat: 'y/M/d' };
  return <RangeNavigatorComponent id='charts'
    valueType='DateTime' value={[new Date('2017-09-01'), new Date('2018-02-
01')]}
    tooltip={tooltip}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
    </RangeNavigatorComponent>
  </>;
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

The following table shows the results of applying some common date and time formats to the `labelFormat` property.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
<code>new Date(2000, 03, 10)</code>	<code>EEEE</code>	Monday	The Date is displayed in day format
<code>new Date(2000, 03, 10)</code>	<code>yMd</code>	04/10/2000	The Date is displayed in month/date/year format
<code>new Date(2000, 03, 10)</code>	<code>MMM</code>	Apr	The Shorthand month for the date is displayed

new Date(2000, 03, 10)	hm	12:00 AM	Time of the date value is displayed as label
new Date(2000, 03, 10)	hms	12:00:00 AM	The Label is displayed in hours:minutes:seconds format

Rtl in React Range navigator component

The Range Selector supports right-to-left (RTL), which can be enabled with the [enableRtl](#) property.

INDEX.JSX

```
{% raw %}
import { AreaSeries, DateTime, Inject, RangeNavigatorComponent,
RangenavigatorSeriesCollectionDirective, RangenavigatorSeriesDirective,
RangeTooltip } from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import { bitCoinData } from 'default-data.ts';
function App() {
  const data = bitCoinData;
  const tooltip = { enable: true };
  return <RangeNavigatorComponent id='charts' valueType='DateTime'
value={[new Date('2017-09-01'), new Date('2018-02-01')]} tooltip={tooltip}
enableRtl={true}>
    <Inject services={[AreaSeries, DateTime, RangeTooltip]} />
    <RangenavigatorSeriesCollectionDirective>
      <RangenavigatorSeriesDirective dataSource={data} xName='x' yName='y'
type='Area' width={2} />
    </RangenavigatorSeriesCollectionDirective>
  </RangeNavigatorComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}

{% endraw %}

```

Export print in React Range navigator component

Export

The rendered Range Selector can be exported to **JPEG, PNG, SVG, or PDF** format by using the [export](#) method in the Range Selector. This method contains the following parameters:

- **Type** - To specify the export type. The component can be exported to **JPEG, PNG, SVG, or PDF** format.
- **File name** - To specify the file name to export.
- **Orientation** - To specify the orientation type. This is applicable only for PDF export type.

INDEX.JSX

```

{% raw %}

Accessibility in React Range navigator component

The Range navigator component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range navigator component is outlined below.

| Accessibility Criteria | Compatibility |

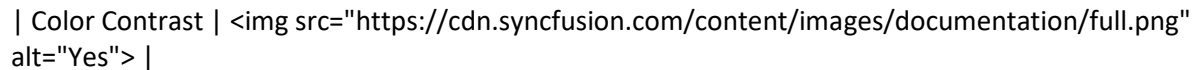

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Range navigator component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range navigator component:

- region (role)
- aria-label (attribute)

Keyboard interaction

The Range navigator component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range navigator component.

| **Press** | **To do this** |

| --- | --- |

| **Tab** | Moves the focus to the Range navigator element. |

| **Ctrl + P** | Prints the Range navigator. |

Ensuring accessibility

The Range navigator component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range navigator component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range navigator component with accessibility tools.

Range Slider

Getting Started

The following section explains the required steps to build the simple Slider component with its basic usage in step by step procedure.

To get start quickly with React Range Slider, you can check on this video:

Dependencies

Install the below required dependent packages to render the Slider component.

```
`javascript
|-- @syncfusion/ej2-react-inputs
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-react-popups
|-- @syncfusion/ej2-react-buttons
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
`,`
```

Installation and Configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

To set-up a React application in TypeScript environment, run the following command.

```
`
npx create-react-app my-app --template typescript
cd my-app
npm start
`,`
```

To set-up a React application in JavaScript environment, run the following command.

```
`
npx create-react-app my-app
cd my-app
npm start
`,`
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry. Now, we are going to render `Slider` component from these packages.

To install **Slider** component, use the following command.

```
`bash
npm install @syncfusion/ej2-react-inputs --save
`
```

The above command installs [Slider dependencies](#) which are required to render the component in the **React** environment.

Adding CSS Reference

Import **Slider** component required theme references at the top of **src/App.css**.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-inputs/styles/material.css";
`
```

We can also use [CRG](#) to generate combined component styles.

Adding Slider component

Now, you can add **Slider** component in the application. For getting started, add **Slider** component in **src/App.tsx** file using the following code snippet.

```
`ts
import * as React from 'react';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
import './App.css';
function App() {
  return (
    <div id='container'>
      <div className='wrap'>
        <SliderComponent id='slider' value={30} />
      </div>
    </div>
  );
}
export default App;
`
```

Run the Application

The Essential JS 2 quickstart application project is configured to compile and run the application in browser. Use the following command to run the application.

`

npm start

`

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <div className='sliderwrap'>
                    <SliderComponent id='default' value={30}/>
                </div>
            </div>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <div className='sliderwrap'>
                    <SliderComponent id='default' value={30} />
                </div>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Types

The types of Slider are as follows:

| **Types** | **Usage** |

| --- | --- |

| Default | Shows a default Slider to select a single value. |

| MinRange | Displays the shadow from the start value to the current selected value. |

| Range | Selects a range of values. It also displays the shadow in-between the selection range. |

Both the Default Slider and Min-Range Slider have same behavior that is used to select a single value.

In Min-Range Slider, a shadow is considered from the start value to current handle position. But the Range Slider

contains two handles that is used to select a range of values and a shadow is considered in between the two handles.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <div className="sliderwrap">
                    <div className="labeltext">Default</div>
                    <SliderComponent id='default' value={30}/>
                </div>
                <div className="sliderwrap">
                    <div className="labeltext">MinRange</div>
                    <SliderComponent id='minrange' type='MinRange'
value={30}/>
                </div>
                <div className="sliderwrap">
                    <div className="labeltext">Range</div>
                    <SliderComponent id='range' type='Range' value={[30,
70]}/>
                </div>
            </div>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <div className="sliderwrap">
                    <div className="labeltext">Default</div>
                    <SliderComponent id='default' value={30}/>
                </div>
                <div className="sliderwrap">
                    <div className="labeltext">MinRange</div>
                    <SliderComponent id='minrange' type='MinRange' value={30}
/>
                </div>
                <div className="sliderwrap">
                    <div className="labeltext">Range</div>
                    <SliderComponent id='range' type='Range' value={[30,
70]}/>
                </div>
            </div>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

```

        <div className="labeltext">Range</div>
        <SliderComponent id='range' type='Range' value={[30, 70]}
    />
    </div>
</div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Customization

Orientation

The Slider can be displayed, either in horizontal or vertical orientation. By default, the Slider renders in horizontal orientation.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (<div id='container'>
        <div className='wrap'>
            <SliderComponent id='slider' orientation='Vertical'
value={30}/>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <SliderComponent id='slider' orientation='Vertical'
value={30} />
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Tooltip

The Slider displays the tooltip to indicate the current value by clicking the Slider bar or drag the Slider handle. The Tooltip position can be customized by using the `placement` property.

Also decides the tooltip display mode on a page, i.e., on hovering, focusing, or clicking on the Slider handle and it always remains/displays on the page.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let tooltip = { placement: 'After', isVisible: true, showOn: 'Always' };
    return (<div id='container'>
        <div className='wrap'>
            <SliderComponent id='slider' type="MinRange"
tooltip={tooltip} value={30}/>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let tooltip: Object = { placement: 'After', isVisible: true, showOn:
'Always' };
    return (
        <div id='container'>
            <div className='wrap'>
                <SliderComponent id='slider' type="MinRange"
tooltip={tooltip} value={30} />
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Buttons

The Slider value can be changed by using the Increase and Decrease buttons. In Range Slider, by default the first handle value will be changed while clicking the button. Change the handle focus and press the button to change the last focused handle value.

After enabling the slider buttons if the 'Tab' key is pressed, the focus goes to the handle and not to the button.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (<div id='container'>
```

```

        <div className='wrap'>
            <SliderComponent id='slider' showButtons={true} type='Range'
value={ [30, 70]} />
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    return (
        <div id='container'>
            <div className='wrap'>
                <SliderComponent id='slider' showButtons={true} type='Range'
value={ [30, 70]} />
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

[Ticks in Slider](#)

[Limits in Slider](#)

Ticks in React Range slider component

The Ticks in Slider supports you to easily identify the current value/values of the Slider. It contains `smallStep` and `largeStep`. The value of the major ticks alone will be displayed in the slider. In order to enable/disable the small ticks, use the `showSmallTicks` property.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let tooltip = { placement: "Before", isVisible: true, showOn: "Always" };
    let value = 30;
    // Slider ticks customization
    let ticks = {
        placement: "After",
        largeStep: 20,
        smallStep: 10,
        showSmallTicks: true
    };
    return (<div id="container">

```

```

        <div className="wrap">
            <SliderComponent id="slider" value={value} tooltip={tooltip}
ticks={ticks}/>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let tooltip: TooltipDataModel = { placement: "Before", isVisible: true,
showOn: "Always" };
    let value = 30;
    // Slider ticks customization
    let ticks: TicksDataModel = {
        placement: "After",
        largeStep: 20,
        smallStep: 10,
        showSmallTicks: true
    };
    return (
        <div id="container">
            <div className="wrap">
                <SliderComponent id="slider" value={value} tooltip={tooltip}
ticks={ticks} />
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Step

When the Slider is moved, it increases/decreases the value based on the step value. By default, the value is increased/decreased by 1. Use the `step` property to change the increment step value.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let ticks = {
        placement: "After",
        largeStep: 20,
        smallStep: 10,
        showSmallTicks: true
    };
    let tooltip = { placement: "Before", isVisible: true, showOn: "Always" };
    let value = 30;

```

```
// Enables step
let step = 10;
return (<div id="container">
  <div className="wrap">
    <SliderComponent id="slider" value={value} step={step}
      tooltip={tooltip} ticks={ticks}/>
  </div>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let ticks: TicksDataModel = {
    placement: "After",
    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  let tooltip: TooltipDataModel = { placement: "Before", isVisible: true,
    showOn: "Always" };
  let value = 30;
  // Enables step
  let step = 10;
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent
          id="slider"
          value={value}
          step={step}
          tooltip={tooltip}
          ticks={ticks}
        />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Min and Max

Enables the minimum/starting and maximum/ending value of the Slider, by using the **min** and **max** property. By default, the minimum value is 1 and maximum value is 100. In the following sample the slider is rendered with the min value as 100 and max value as 1000.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let ticks = {
    placement: "After",
    largeStep: 200,
    smallStep: 100,
    showSmallTicks: true
  };
  let tooltip = { placement: "Before", isVisible: true, showOn: "Always" };
  // Minimum value
  let min = 100;
  // Maximum value
  let max = 1100;
  // Slider current value
  let value = 400;
  return (<div id="container">
    <div className="wrap">
      <SliderComponent id="slider" min={min} max={max} value={value}
tooltip={tooltip} ticks={ticks}/>
    </div>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let ticks: TicksDataModel = {
    placement: "After",
    largeStep: 200,
    smallStep: 100,
    showSmallTicks: true
  };
  let tooltip: TooltipDataModel = { placement: "Before", isVisible: true,
showOn: "Always" };
  // Minimum value
  let min = 100;
  // Maximum value
  let max = 1100;
  // Slider current value
  let value = 400;
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent
          id="slider"
          min={min}
          max={max}
          value={value}
          tooltip={tooltip}
          ticks={ticks}
        />
      </div>
    </div>
  );
}
```

```

    </div>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Format in React Range slider component

The **format** feature used to customize the units of Slider values to desired format. The formatted values will also be applied to the ARIA attributes of the slider. There are two ways of achieving formatting in slider.

- Use the **format** API of slider which utilizes our **Internationalization** to format values.
- Customize using the events namely **renderingTicks** and **tooltipChange**.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let tooltip = { isVisible: true, format: "C2" };
  let value = 30;
  // Slider ticks customization
  let ticks = {
    placement: "After",
    format: "C2",
    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent id="slider" min={0} max={100} value={value}
          tooltip={tooltip} ticks={ticks}/>
      </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let tooltip = { isVisible: true, format: "C2" };
  let value = 30;
  // Slider ticks customization
  let ticks: TicksDataModel = {
    placement: "After",
    format: "C2",

```

```

    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent
          id="slider"
          min={0}
          max={100}
          value={value}
          tooltip={tooltip}
          ticks={ticks}
        />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Using format API

In this method, we have different predefined formatting styles like Numeric (N), Percentage (P), Currency (C) and # specifiers. In this below example we have formatted the ticks and tooltip values into percentage.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let tooltip = {
    placement: "Before",
    isVisible: true,
    showOn: "Always",
    format: "P0"
  };
  let value = 0.3;
  // Slider ticks customization
  let ticks = {
    placement: "After",
    largeStep: 0.2,
    smallStep: 0.1,
    showSmallTicks: true,
    format: "P0"
  };
  return (<div id="container">
    <div className="wrap">
      <SliderComponent id="slider" min={0} max={1} step={0.01}
value={value} tooltip={tooltip} ticks={ticks}/>
    </div>
  </div>);
}
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let tooltip: TooltipDataModel = {
    placement: "Before",
    isVisible: true,
    showOn: "Always",
    format: "P0"
  };
  let value = 0.3;
  // Slider ticks customization
  let ticks: TicksDataModel = {
    placement: "After",
    largeStep: 0.2,
    smallStep: 0.1,
    showSmallTicks: true,
    format: "P0"
  };
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent
          id="slider"
          min={0}
          max={1}
          step={0.01}
          value={value}
          tooltip={tooltip}
          ticks={ticks}
        />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Using Events

In this method, we will be retrieving the values from the slider events then process them to desired formatted the values.

In this sample we have customized the **ticks** values into weekdays as one formatting and **tooltip** values into day of the week as another formatting.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
```

```

let tooltip = { placement: "Before", isVisible: true };
let value = 2;
// Slider ticks customization
let ticks = { placement: "After", largeStep: 1 };
function renderingTicksHandler(args) {
    // Weekdays Array
    let daysArr = [
        "Sunday",
        "Monday",
        "Tuesday",
        "Wednesday",
        "Thursday",
        "Friday",
        "Saturday"
    ];
    // Customizing each ticks text into weekdays
    args.text = daysArr[parseFloat(args.value.toString())];
}
function tooltipChangeHandler(args) {
    // Customizing tooltip to display the Day (in numeric) of the week
    args.text = "Day " + (Number(args.value) + 1).toString();
}
return (<div id="container">
    <div className="wrap">
        <SliderComponent id="slider" min={0} max={6} step={1} value={value}
        tooltip={tooltip} ticks={ticks}
        tooltipChange={tooltipChangeHandler.bind(this)}
        renderingTicks={renderingTicksHandler.bind(this)} />
    </div>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let tooltip: TooltipDataModel = { placement: "Before", isVisible: true };
    let value = 2;
    // Slider ticks customization
    let ticks: TicksDataModel = { placement: "After", largeStep: 1 };
    function renderingTicksHandler(args: SliderTickEventArgs) {
        // Weekdays Array
        let daysArr: string[] = [
            "Sunday",
            "Monday",
            "Tuesday",
            "Wednesday",
            "Thursday",
            "Friday",
            "Saturday"
        ];
    };
    // Customizing each ticks text into weekdays

```

```

    args.text = daysArr[parseFloat(args.value.toString())];
  }
  function tooltipChangeHandler(args: SliderTooltipEventArgs) {
    // Customizing tooltip to display the Day (in numeric) of the week
    args.text = "Day " + (Number(args.value) + 1).toString();
  }
  return (
    <div id="container">
      <div className="wrap">
        <SliderComponent
          id="slider"
          min={0}
          max={6}
          step={1}
          value={value}
          tooltip={tooltip}
          ticks={ticks}
          tooltipChange={tooltipChangeHandler.bind(this) as any}
          renderingTicks={renderingTicksHandler.bind(this) as any}
        />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Limits in React Range slider component

The slider limits restrict the slider thumb between a particular range. This is used if higher or lower value affects the process or product where the slider is being used.

The following are the six options in the slider's limits object. Each API in the limits object is optional.

- enabled: Enables the limits in the Slider.
- minStart: Sets the minimum limit for the first handle.
- minEnd: Sets the maximum limit for the first handle.
- maxStart: Sets the minimum limit for the second handle.
- maxEnd: Sets the maximum limit for the second handle.
- startHandleFixed: Locks the first handle.
- endHandleFixed: Locks the second handle.

Default and MinRange Slider limits

There is only one handle in the Default and MinRange Slider, so minStart, minEnd, and startHandleFixed options can be used.

When the limits are enabled in the Slider, the limited area becomes darken. So you can differentiate the allowed and restricted area.

Refer to the following snippet to enable the limits in the Slider.

```

`ts
.....

```

```
limits: { enabled: true, minStart: 10, minEnd: 40 }
```

```
.....
```

```
,
```

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let limits = { enabled: true, minStart: 10, minEnd: 40 };
  let tooltip = { isVisible: true };
  let value = 30;
  return (<div id='container'>
    <div className='wrap'>
      <div className="sliderwrap">
        <SliderComponent value={value} type='MinRange' min={0}
max={100} limits={limits} tooltip={tooltip}/>
      </div>
    </div>
  </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let limits: object = { enabled: true, minStart: 10, minEnd: 40 };
  let tooltip: object = { isVisible: true };
  let value: number = 30;
  return (
    <div id='container'>
      <div className='wrap'>
        <div className="sliderwrap">
          <SliderComponent value={value} type='MinRange' min={0}
max={100} limits={limits}
          tooltip={tooltip} />
        </div>
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Range Slider limits

In the range slider, both handles can be restricted and locked from the limit's object. In this sample, the first handle is limited between 10 and 40, and the second handle is limited between 60 and 90.

```
`ts
```

.....

limits: { enabled: true, minStart: 10, minEnd: 40, maxStart: 60, maxEnd: 90 }

.....

,

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let limits = { enabled: true, minStart: 10, minEnd: 40, maxStart: 60,
maxEnd: 90 };
    let tooltip = { isVisible: true };
    let value = [30, 70];
    return (<div id='container'>
        <div className='wrap'>
            <div className="sliderwrap">
                <SliderComponent value={value} type='Range' min={0}
max={100} limits={limits} tooltip={tooltip}/>
            </div>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let limits: object = { enabled: true, minStart: 10, minEnd: 40, maxStart:
60, maxEnd: 90 };
    let tooltip: object = { isVisible: true };
    let value: number[] = [30, 70];
    return (
        <div id='container'>
            <div className='wrap'>
                <div className="sliderwrap">
                    <SliderComponent value={value} type='Range' min={0}
max={100} limits={limits}
                    tooltip={tooltip} />
                </div>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Handle lock

The movement of slider handles can be locked by enabling the `startHandleFixed` and `endHandleFixed` properties in the limit's object.

In this sample, the movement of both slider handles has been locked.

```
`ts
```

```
.....
```

```
limits: { enabled: true, startHandleFixed: true, endHandleFixed: true }
```

```
.....
```

```
`
```

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let limits = { enabled: true, startHandleFixed: true, endHandleFixed:
true };
    let tooltip = { isVisible: true };
    let value = [30, 70];
    return (<div id='container'>
        <div className='wrap'>
            <div className="sliderwrap">
                <SliderComponent value={value} type='Range' min={0}
max={100} limits={limits} tooltip={tooltip}/>
            </div>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
import { Slider } from '@syncfusion/ej2-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let limits: object = { enabled: true, startHandleFixed: true,
endHandleFixed: true };
    let tooltip: object = { isVisible: true };
    let value: number[] = [30, 70];
    return (
        <div id='container'>
            <div className='wrap'>
                <div className="sliderwrap">
                    <SliderComponent value={value} type='Range' min={0}
max={100} limits={limits}
                    tooltip={tooltip} />
                </div>
            </div>
        </div>
    );
}
```

```

    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Style in React Range slider component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the slider track

Use the following CSS to customize the slider track.

```

`css

.e-control-wrapper.e-slider-container.e-horizontal .e-slider-track {
background: #007bff;
height: 3px;
}
`

```

Customizing the slider handle

Use the following CSS to customize the slider handle properties.

```

`css

.e-control-wrapper.e-slider-container .e-slider .e-handle {
background-color: #f9920b;
border-radius: 50%;
border: 0;
}
`

```

Customizing the slider limits

Use the following CSS to customize the slider limits.

```

`css

.e-control-wrapper.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}
`

```

Customizing the slider ticks

Use the following CSS to customize the slider ticks.

```

`css

.e-scale .e-tick.e-custom::before {

```

```
content: '\e967';
position: absolute;
}
`
```

Customizing the slider buttons

Use the following CSS to customize the slider buttons.

```
`css
.e-control-wrapper.e-slider-container .e-slider-button {
background: #007bff;
height: 25px;
width: 25px;
}
`
```

Accessibility in React Range Slider component

The Range Slider component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Range Slider component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

The Range Slider component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Range Slider component:

Attributes	Purpose
---	---
<code>role=slider</code>	Used to convey a significant and contextual message to the user.
<code>aria-valuemin</code>	Indicates the Minimum value of the slider.
<code>aria-valuemax</code>	Indicates the Maximum value of the slider.
<code>aria-valuenow</code>	Indicates the current value of the slider.
<code>aria-valuetext</code>	Returns the current text of the slider.
<code>aria-orientation</code>	Indicates whether the Slider is oriented horizontally or vertically.
<code>aria-label</code>	Provides an accessible name for the Slider, serving as label text for the Slider's left and right buttons (for increment and decrement).

Keyboard interaction

The Range Slider component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Range Slider component.

Press	To do this
---	---
Right Arrow/Up Arrow	Increase the Slider value.
Left Arrow/Down Arrow	Decrease the Slider value.
Home	Moves to the start value (for Range Slider when the second thumb is focused and the Home key is pressed, it moves to the first thumb value).

| `<End>` | Moves to the end value (for Range Slider when the first thumb is focused and the End key is pressed, it moves to the second thumb value). |

| `Page Up` | Increases the Slider by `largeStep` value. |

| `Page Down` | Decreases the Slider by `largeStep` value. |

Ensuring accessibility

The Range Slider component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Range Slider component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Range Slider component with accessibility tools.

Ej1 api migration in React Range slider component

This article describes the API migration process of Slider component from Essential JS 1 to Essential JS 2

{% raw %}

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Max value | **Property:** `maxValue` `
` `<EJ.Slider maxValue={60} />` | **Property:** `max` `
` `<SliderComponent id='slider' max={100} />` |

| Min value | **Property:** `minValue` `
` `<EJ.Slider minValue={60} />` | **Property:** `min` `
` `<SliderComponent id='slider' min={100} />` |

| Step | **Property:** `incrementStep`, `largeStep`, `smallStep`, `showSmallTicks` `
` `<EJ.Slider incrementStep={20} smallStep={5} largeStep={40} showSmallTicks={true} />` | **Property:** `ticks` `
` `public ticks = { placement: 'After', largeStep: 20, smallStep: 10, showSmallTicks: true };
` `<SliderComponent id='slider' ticks={this.ticks} />` |

| Type | **Property:** `sliderType` `
` `<SliderComponent id='slider' value={30} sliderType="minrange" />` | **Property:** `type` `
` `<SliderComponent id='slider' type='Range' />` |

| Tooltip | **Property:** `showTooltip` `
` `<SliderComponent id='slider' value={30} showTooltip={true} />` | **Property:** `tooltip` `
` `public tooltip = { placement: 'Before', isVisible: true, showOn: 'Always' };
` `<SliderComponent id='slider' tooltip={this.tooltip} />` |

| RTL | **Property:** `enableRTL` `
` `<SliderComponent id='slider' value={30} enableRTL={true} />` | **Property:** `enableRtl` `
` `<SliderComponent id='slider' enableRtl={false} />` |

| Custom values | **Not Applicable** | **Property:** `customValues` `
` `public customValues = ['Mon', 'Tue', 'Wed'];
` `<SliderComponent id='slider' customValues={this.customValues} />` |

| Limit the slider movement | **Not Applicable** | **Property:** *limits*
 public limits = { enabled: true, minStart: 10, minEnd: 40 };
 <SliderComponent id='slider' type='MinRange' limits={this.limits} />|

| Disable | **Method:** *disable*
 <SliderComponent id='slider' value={30} />
 public sliderObj = \${"#slider"}.ejSlider("instance"); sliderObj.disable(); | **Property:** *enabled*
 <SliderComponent id='slider' enable={false} value={50} /> |

| Enable | **Method:** *enable*
 <SliderComponent id='slider' value={30} />
 public sliderObj = \${"#slider"}.ejSlider("instance"); sliderObj.enable(); | **Property:** *enabled*
 <SliderComponent id='slider' enable={true} value={50} /> |

| Set Value | **Method:** *setValue(value,[enableAnimation])*
 <SliderComponent id='slider' value={30} />
 public sliderObj = \${"#slider"}.ejSlider("instance"); sliderObj.setValue(50); | **Property:** *value*
 <SliderComponent id='slider' value={this.state.value} />
 this.setState({value: 100}); |

| Get Value | **Method:** *getValue()*
 <SliderComponent id='slider' value={30} />
 public sliderObj = \${"#slider"}.ejSlider("instance"); sliderObj.getValue(); | **Property:** *value*
 <SliderComponent id='slider' value={30} />
 public sliderValue = this.sliderObj.value; |

| Destroy | **Not Applicable** | **Method:** *destroy()*
 <SliderComponent id='slider' value={30} />
 public sliderValue = this.sliderObj.destroy(); |

| Change | **Event:** *change*
 public change(args) { }
 <SliderComponent id='slider' value={30} change={this.change} /> | **Event:** *changed*
 public changed(args): void { } ;
 <SliderComponent id='slider' value={30} changed={this.changed} /> |

| Create | **Event:** *create*
 public create(args) { }
 <SliderComponent id='slider' value={30} create={this.create} /> | **Event:** *created*
 public created(args): void { } ;
 <SliderComponent id='slider' value={30} created={this.created} /> |

| Slide | **Event:** *slide*
 public slide(args) { }
 <SliderComponent id='slider' value={30} slide={this.slide} /> | **Event:** *change*
 public change(args): void { } ;
 <SliderComponent id='slider' value={30} change={this.change} /> |

| Start | **Event:** *start*
 public start(args) { }
 <SliderComponent id='slider' value={30} start={this.start} /> | **Event:** *created*
 public created(args): void { } ;
 <SliderComponent id='slider' value={30} created={this.created} /> |

| Stop | **Event:** *stop*
 public stop(args) { }
 <SliderComponent id='slider' value={30} stop={this.stop} /> | **Event:** *changed*
 public changed(args): void { } ;
 <SliderComponent id='slider' value={30} changed={this.changed} /> |

| Rendered Ticks | **Not Applicable** | **Event:** *renderedTicks*
 public renderedTicks(args): void { } ;
 <SliderComponent id='slider' value={30} renderedTicks={this.renderedTicks} /> |

{% endraw %}

How To

Time range slider in React Range slider component

The time formatting can be achieved same as the date formatting using `renderingTicks` and `change` events. The process of time formatting is explained in the below sample.

INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let min = new Date(2013, 6, 13, 11).getTime();

```

Date range slider in React Range slider component

The Date formatting can be achieved in `ticks` and `tooltip` using `renderingTicks` and `tooltipChange` events respectively. The process of formatting is explained in the below sample.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let min = new Date("2013-06-13").getTime();
  let max = new Date("2013-06-21").getTime();
  let step = 86400000;
  let value = new Date("2013-06-15").getTime();
  // Slider ticks customization
  let ticks = { placement: "After", largeStep: 2 * 86400000 };
  let tooltip = { placement: "Before", isVisible: true };
  function renderingTicksHandler(args) {
    let totalMiliSeconds = Number(args.value);
    // Converting the current milliseconds to the respective date in
    desired format
    let custom = { year: "numeric", month: "short", day: "numeric" };

```

```

        args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
custom);
    }
    function tooltipChangeHandler(args) {
        let totalMiliSeconds = Number(args.text);
        // Converting the current milliseconds to the respective date in
desired format
        let custom = { year: "numeric", month: "short", day: "numeric" };
        args.text = new Date(totalMiliSeconds).toLocaleDateString("en-us",
custom);
    }
    return (<div id="container">
        <div className="wrap">
            <SliderComponent id="slider" min={min} max={max} value={value}
step={step} tooltip={tooltip} ticks={ticks} showButtons={true}
tooltipChange={tooltipChangeHandler.bind(this)}
renderingTicks={renderingTicksHandler.bind(this)} />
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let min = new Date("2013-06-13").getTime();
    let max = new Date("2013-06-21").getTime();
    let step = 86400000;
    let value = new Date("2013-06-15").getTime();
    // Slider ticks customization
    let ticks: TicksDataModel = { placement: "After", largeStep: 2 * 86400000

    />
  </div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Numeric range slider in React Range slider component

The numeric values can be formatted into different decimal digits or fixed number of whole numbers or to represent the units. The Numeric processing is demonstrated below.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  // Slider ticks customization
  let ticks01 = {
    placement: "After",
    format: "##.## Km",
    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  let tooltip01 = { isVisible: true, format: "##.## Km" };
  let ticks02 = {
    placement: "After",
    format: "##.##00",
    largeStep: 0.02,
    smallStep: 0.01,
    showSmallTicks: true
  };
  let tooltip02 = { isVisible: true, format: "##.##00" };
  let tooltip03 = { isVisible: true, format: "00##" };
  let ticks03 = {
    placement: "After",
    format: "00##",
    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  return (
    <div id="container">
      <div className="wrap">

```

```

    <div className="label">Slider formatted with unit
representation</div>
    <SliderComponent id="slider" min={0} max={100} value={30} step={1}
tooltip={tooltip01} ticks={ticks01}/>
  </div>
  <div className="wrap">
    <div className="label">Slider formatted with three decimal
specifiers</div>
    <SliderComponent id="slider1" min={0.1} max={0.2} value={0.13}
step={0.01} tooltip={tooltip02} ticks={ticks02}/>
  </div>
  <div className="wrap">
    <div className="label">Slider formatted with two leading zeros</div>
    <SliderComponent id="slider2" min={0} max={100} value={30} step={1}
tooltip={tooltip03} ticks={ticks03}/>
  </div>
</div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';

      step={1}
      tooltip={tooltip03}
      ticks={ticks03}
    />
  </div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Customize slider bar in React Range slider component

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the slider bar.

The slider bar can be customized with different themes. By default, slider have class name e-slider-track for bar. The

class can be overridden with our own color values like the following code snippet.

```

`css
.e-control.e-slider .e-slider-track .e-range {

```

```

background: linear-gradient(left, #e1451d 0, #fdff47 17%, #86f9fe 50%, #2900f8 65%, #6e00f8 74%,
#e33df9 83%, #e14423 100%);
}
,

`ts
function change(args: SliderChangeEventArgs) {
if (args.value > 0 && args.value <= 25) {
// Change handle and range bar color to green when
(sliderHandle as HTMLElement).style.backgroundColor = 'green';
(sliderTrack as HTMLElement).style.backgroundColor = 'green';
} else if (args.value > 25 && args.value <= 50) {
// Change handle and range bar color to royal blue
(sliderHandle as HTMLElement).style.backgroundColor = 'royalblue';
(sliderTrack as HTMLElement).style.backgroundColor = 'royalblue';
} else if (args.value > 50 && args.value <= 75) {
// Change handle and range bar color to dark orange
(sliderHandle as HTMLElement).style.backgroundColor = 'darkorange';
(sliderTrack as HTMLElement).style.backgroundColor = 'darkorange';
} else if (args.value > 75 && args.value <= 100) {
// Change handle and range bar color to red
(sliderHandle as HTMLElement).style.backgroundColor = 'red';
(sliderTrack as HTMLElement).style.backgroundColor = 'red';
}
}
,

```

You can also apply background color for a certain range depending upon slider values, using change event.

INDEX.JSX

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let defaultObj = null;
  let sliderTrack = null;
  let sliderHandle = null;
  function changeEvent(args) {
    if (args.value > 0 && args.value <= 25) {

```

```

        // Change handle and range bar color to green when
        sliderHandle.style.backgroundColor = "green";
        sliderTrack.style.backgroundColor = "green";
    }
    else if (args.value > 25 && args.value <= 50) {
        // Change handle and range bar color to royal blue
        sliderHandle.style.backgroundColor = "royalblue";
        sliderTrack.style.backgroundColor = "royalblue";
    }
    else if (args.value > 50 && args.value <= 75) {
        // Change handle and range bar color to dark orange
        sliderHandle.style.backgroundColor = "darkorange";
        sliderTrack.style.backgroundColor = "darkorange";
    }
    else if (args.value > 75 && args.value <= 100) {
        // Change handle and range bar color to red

[% endraw %]

```

Customize slider limits in React Range slider component

Slider appearance can be customized via CSS. By overriding the slider CSS classes, the slider limit bar can be customized.

```

`css
.e-slider-container.e-horizontal .e-limits {
background-color: rgba(69, 100, 233, 0.46);
}
`

```

Here, the limit bar is customized with different background color. By default, the slider has class `e-limits` for limits bar.

You can override the class with our own color values as given in the following code snippet.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let defaultObj;
  let value = [30, 70];
  let ticks = { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true };
  // Initialize tooltip with placement and showOn
  let tooltip = { isVisible: true, placement: 'Before', showOn: 'Focus' };
  // Set the limit values for the minrange slider
  let minLimits = { enabled: true, minStart: 10, minEnd: 40 };
  // Set the limit values for the range slider
  let rangeLimits = { enabled: true, minStart: 10, minEnd: 40, maxStart:
60, maxEnd: 90 };

```

```

    return (<div id='container'>
      <div className="content-wrapper">
        <div className='sliderwrap'>
          <label className="userselect">MinRange Slider With Limits</label>
          <SliderComponent id='minrange' type='MinRange' min={0} max={100}
value={30} ticks={ticks} tooltip={tooltip} limits={minLimits}/>
        </div>
        <div className='sliderwrap'>
          <label className="userselect">Range Slider With Limits</label>
          <SliderComponent id='range' type='Range' min={0} max={100}
value={value} ticks={ticks} tooltip={tooltip} limits={rangeLimits}/>
        </div>
      </div>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from "react-dom";
import { SliderComponent, SliderChangeEventArgs } from '@syncfusion/ej2-react-inputs';
function App() {
  let defaultObj: SliderComponent;
  let value: number[] = [30, 70];
  let ticks: object = { placement: 'Before', largeStep: 20, smallStep: 5,
showSmallTicks: true };
  // Initialize tooltip with placement and showOn
  let tooltip: object = { isVisible: true, placement: 'Before', showOn:
'Focus' };
  // Set the limit values for the minrange slider
  let minLimits: object = { enabled: true, minStart: 10, minEnd: 40 };
  // Set the limit values for the range slider
  let rangeLimits: object = { enabled: true, minStart: 10, minEnd: 40,
maxStart: 60, maxEnd: 90 };
  return (
    <div id='container'>
      <div className="content-wrapper">
        <div className='sliderwrap'>
          <label className="userselect">MinRange Slider With Limits</label>
          <SliderComponent id='minrange'

export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Customize slider ticks label in React Range slider component

Slider view can be customized via CSS. By overriding the slider CSS classes, you can customize the ticks. The ticks in slider allows you to easily identify the current value/values of the slider. It contains [smallStep](#) and [largeStep](#). By default, slider has class `e-tick` for slider ticks. You can override the class as per your requirement. Refer to the following code snippet to render ticks.

```

`css

.e-scale .e-tick.e-custom::before {
content: '\e967';
position: absolute;
}
`

`css
ticks_slider .e-scale :nth-child(1)::before {
color: red;
}
`

```

Here, the color for rendered ticks has been applied through `nth-child(childnumber)`. *The color is applied to the value of the childnumber* in the slider.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  let value = [30, 70];
  let icon = { placement: "Before", largeStep: 20 };
  let custom = { placement: "Both", largeStep: 20, smallStep: 5 };
  function iconTicks(args) {
    if (args.tickElement.classList.contains("e-large")) {
      args.tickElement.classList.add("e-custom");
    }
  }
  function customTicks(args) {
    let li = args.ticksWrapper.getElementsByClassName("e-large");
    let remarks = ["Very Poor", "Poor", "Average", "Good", "Very Good", "Excellent"];
    for (let i = 0; i < li.length; ++i) {
      li[i].querySelectorAll(".e-tick-both")[1].innerText = remarks[i];
    }
  }
  return (<div id="container">

export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Customize slider thumb in React Range slider component

Slider appearance can be customized through CSS. By overriding the slider CSS classes, you can customize the thumb. By default, slider has unique class `e-handle` for slider thumb. You can override the following class as per your requirement.

```

`css
.e-control.e-slider .e-handle {
background-image: url('https://ej2.syncfusion.com/demos/src/slider/images/thumb.png');
background-color: transparent;
height: 25px;
width: 25px;
}

square_slider.e-control.e-slider .e-handle {
border-radius: 0%;
background-color: #f9920b;
border: 0;
}

```

```

circle_slider.e-control.e-slider .e-handle {
border-radius: 50%;

background-color: #f9920b;

border: 0;
}

oval_slider.e-control.e-slider .e-handle {
height: 25px;

width: 8px;

top: 3px;

border-radius: 15px;

background-color: #f9920b;
}

```

Here, in the sample, the slider thumb has been customized to square, circle, oval shapes, and background image has also been customized.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';

                </div>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Form slider with formvalidator in React Range slider component

The Slider component can be validated using our [FormValidator](#). The following steps walk-through slider validation.

- Render slider component inside a form.
- Bind [changed](#) event in the slider component to validate the slider value when the value changes.
- Initialize and render FormValidator for the form using form ID.

```
`ts
```

```
// Initialize Form validation
```

```
let formObj: FormValidator;
formObj = new FormValidator("#formId", options);
`ts
```

- Set the required property in the FormValidator [rules](#) collection. Here, the [min](#) property of slider that sets the minimum value in the slider component is set, and it has hidden input as enable `validateHidden` property is set to true.

```
// Slider element
<div id="default" name="slider"></div>
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
rules: {
'default': {
validateHidden: true,
min: [6, "You must select value greater than 5"]
}
}
};
`ts
```

Form validation is done either by ID or name value of the slider component. Above ID of the slider is used to validate it.

Using slider name: Render slider with name attribute. In the following code snippet, name attribute value of slider is used for form validation.

```
`ts
// Slider element
<div id="default" name="slider"></div>
// sets required property in the FormValidator rules collection
let options: FormValidatorModel = {
rules: {
'slider': {
validateHidden: true,
min: [6, "You must select value greater than 5"]
}
}
};
`ts
```

```

}
};
`

```

- Validate the form using [validate](#) method, and it validates the slider value with the defined rules collection and returns the result. If user selects the value less than the minimum value, form will not submit.

```

`ts
formObj.validate();
`

```

- Slider validation can be done during value changes in slider. Refer to the following code snippet.

```

`ts
// change event handler for slider
function onChanged(args: any) {
formObj.validate();
}
`

```

The **FormValidator** has following default validation rules, which are used to validate the Slider component.

Rules	Description	Example
-----	-----	-----
max	Slider component must have value less than or equal to max number	if max: 3 , 3 is valid and 4 is invalid
min	Slider component must have value greater than or equal to min number	if min: 4 , 5 is valid and 2 is invalid
regex	Slider component must have valid value in regex format	if regex: '/4/' , 4 is valid and 1 is invalid
range	Slider component must have value between range number	if range: [4,5] , 4 is valid and 6 is invalid

</div>
</form>
</div>
</div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
{% endraw %}

```

Show slider from hidden state in React Range slider component

This section demonstrates how-to render the Slider component in hidden state and make it visible in button click. We can initialize Slider in hidden state by setting the display as none.

In the sample, by clicking on the button, we can make the Slider visible from hidden state, and we must also call the [refresh](#) method of the Slider to render it properly based on its original dimensions.

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    let sliderInstance;
    let min = new Date(2013, 6, 13, 11).getTime();
    let max = new Date(2013, 6, 13, 17).getTime();
    let value = new Date(2013, 6, 13, 13).getTime();
    let step = 3600000;
    let showButtons = true;
    // Slider ticks customization
    let ticks = { placement: "After", largeStep: 2 * 3600000 };
    let tooltip = { placement: "Before", isVisible: true };
    function renderingTicksHandler(args) {
        let totalMiliSeconds = Number(args.value);
        let custom = { hour: "2-digit", minute: "2-digit" };
        args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
    }
    function tooltipChangeHandler(args) {
        let totalMiliSeconds = Number(args.text);
        let custom = { hour: "2-digit", minute: "2-digit" };
        args.text = new Date(totalMiliSeconds).toLocaleTimeString("en-us",
custom);
    }
    function onClick() {

```

```

        const slider = document.getElementById("case");
        if (slider) {
            slider.style.display = "block";
            sliderInstance.refresh();
        }
    }
    return (<div id="container">
        <button onClick={onClick.bind(this)}>Button</button>
        <div id="case" className="wrap">
            <SliderComponent ref={t => (sliderInstance = t)} min={min} max={max}
value={value} step={step} tooltip={tooltip} ticks={ticks} showButtons={true}
tooltipChange={tooltipChangeHandler.bind(this)}

    }

    function onClick(){
        const slider = document.getElementById("case");
        if(slider){
            slider.style.display = "block";
            sliderInstance.refresh();
        }
    }
}

```

```

return (
  <div id="container">
    <button onClick={onClick.bind(this)}>Button</button>
    <div id="case" className="wrap">
      <SliderComponent
        ref={t=>(sliderInstance = t as SliderComponent)}
        min={min}
        max={max}
        value={value}
        step={step}
        tooltip={tooltip}
        ticks={ticks}
        showButtons={true}
        tooltipChange={tooltipChangeHandler.bind(this) as any}
        renderingTicks={renderingTicksHandler.bind(this) as any}
      />
    </div>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Reversible Range Slider in React

You can create a Range Slider rendered with values in reverse order by setting the [min](#) property to the maximum value and the [max](#) property to the minimum value. An example of how to achieve a reversible Range Slider is shown below

INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
  // Slider ticks customization
  let ticks01 = {
    placement: "After",
    format: "##.## Km",
    largeStep: 20,
    smallStep: 10,
    showSmallTicks: true
  };
  let tooltip01 = { isVisible: true, format: "##.## Km" };
  let ticks02 = {
    placement: "After",
    format: "##.##00",
    largeStep: 0.02,
    smallStep: 0.01,
    showSmallTicks: true
  };
  let tooltip02 = { isVisible: true, format: "##.##00" };
  let tooltip03 = { isVisible: true, format: "00##" };
  let ticks03 = {
    placement: "After",
    format: "00##",
    largeStep: 20,

```

```

        smallStep: 10,
        showSmallTicks: true
    };
    return (<div id="container">
        <div className="wrap">
            <div className="label">Slider formatted with unit
representation</div>
            <SliderComponent id="slider" min={0} max={100} value={30} step={1}
tooltip={tooltip01} ticks={ticks01}/>
        </div>
        <div className="wrap">
            <div className="label">Slider formatted with three decimal
specifiers</div>
            <SliderComponent id="slider1" min={0.1} max={0.2} value={0.13}
step={0.01} tooltip={tooltip02} ticks={ticks02}/>
        </div>
        <div className="wrap">
            <div className="label">Slider formatted with two leading zeros</div>
            <SliderComponent id="slider2" min={0} max={100} value={30} step={1}
tooltip={tooltip03} ticks={ticks03}/>
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SliderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    // Slider ticks customization
    let ticks01: TicksDataModel = {
        placement: "After",
        format: "##.## Km",
        largeStep: 20,
        smallStep: 10,
        showSmallTicks: true
    };
    let tooltip01: TooltipDataModel = { isVisible: true, format: "##.## Km" };
    let ticks02: TicksDataModel = {
        placement: "After",
        format: "##.##00",
        largeStep: 0.02,
        smallStep: 0.01,
        showSmallTicks: true
    };
    let tooltip02: TooltipDataModel = { isVisible: true, format: "##.##00" };
    let tooltip03: TooltipDataModel = { isVisible: true, format: "00##" };
    let ticks03: TicksDataModel = {
        placement: "After",
        format: "00##",
        largeStep: 20,
        smallStep: 10,
        showSmallTicks: true
    };
}

```

```

    };
    return (
      <div id="container">
        <div className="wrap">
          <div className="label">Slider formatted with unit
representation</div>
          <SliderComponent
            id="slider"
            min={0}
            max={100}
            value={30}
            step={1}
            tooltip={tooltip01}
            ticks={ticks01}
          />
        </div>
        <div className="wrap">
          <div className="label">Slider formatted with three decimal
specifiers</div>
          <SliderComponent
            id="slider1"
            min={0.1}
            max={0.2}
            value={0.13}
            step={0.01}
            tooltip={tooltip02}
            ticks={ticks02}
          />
        </div>
        <div className="wrap">
          <div className="label">Slider formatted with two leading zeros</div>
          <SliderComponent
            id="slider2"
            min={0}
            max={100}
            value={30}
            step={1}
            tooltip={tooltip03}
            ticks={ticks03}
          />
        </div>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('element'));

```

Reversible order can be achieved with [Horizontal](#) orientation Slider by setting [enableRtl](#) as true.

Rating

Getting Started with React Rating Control

This section explains how to create a simple Rating and demonstrate the basic usage of the Rating component in a React environment.

Dependencies

The list of dependencies required to use the Rating component in your application is given below:

```
`js
|-- @syncfusion/ej2-react-inputs
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-popups
`,`
```

Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

Start a new project using create-react-app command as follows

```
`
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
`,`
```

```
create-react-app quickstart
cd quickstart
`,`
```

'react-scripts-ts' is used for creating React app with typescript.

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install Rating component, use the following command

```
`bash
npm install @syncfusion/ej2-react-inputs --save
`,`
```

Adding Rating component to the Application

To include the Rating component in your application import the `RatingComponent` from `ej2-react-inputs` package in `App.tsx`.

Add the Rating component in application as shown in below code example.

```

`ts
{ / Import the Rating./ }
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import './App.css';
{ / To render Rating. / }
function App() {
  return (
    <RatingComponent id='rating'></RatingComponent>
  );
}
export default App;
`

```

Adding CSS Reference

Import the Rating component's required CSS references as follows in `src/App.css`.

```

`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
`

```

Running the application

Run the application in the browser using the following command:

```

npm start
`

```

The following example shows a basic Rating component.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  return (
    <div className='wrap'>
      <RatingComponent id='rating'></RatingComponent>
    </div>);
}
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating'></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Value

You can set the rating value by using the [value](#) property.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3.0}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3.0}></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Precision Modes in React Rating Component

You can use the [precision](#) property of the rating component to provide ratings with varying levels of precision.

The precision types of Rating are as follows:

- Full: The rating is increased in whole number increments. For example, if the current rating is 2, the next possible ratings are 3, 4, and so on.
- Half: The rating is increased in increments of 0.5 (half). For example, if the current rating is 2.5, the next possible ratings are 3, 3.5, 4, and so on.
- Quarter: The rating is increased in increments of 0.25 (quarter). For example, if the current rating is 3.75, the next possible ratings are 4, 4.25, 4.5, and so on.
- Exact: The rating is increased in increments of 0.1. For example, if the current rating is 3.9, the next possible ratings are 4, 4.1, 4.2, and so on.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent, PrecisionType } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <label>Full Precision</label><br />
        <RatingComponent id='rating1' value={3}
precision={PrecisionType.Full}></RatingComponent><br />
        <label>Half Precision</label><br />
        <RatingComponent id='rating2' value={2.5}
precision={PrecisionType.Half}></RatingComponent><br />
        <label>Quarter Precision</label><br />
        <RatingComponent id='rating3' value={3.75}
precision={PrecisionType.Quarter}></RatingComponent><br />
        <label>Exact Precision</label><br />
        <RatingComponent id='rating4' value={2.3}
precision={PrecisionType.Exact}></RatingComponent><br />
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent, PrecisionType } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
```

```

        <div className='wrap'>
            <label>Full Precision</label><br/>
            <RatingComponent id='rating1' value={3} precision=
{PrecisionType.Full} ></RatingComponent><br/>
            <label>Half Precision</label><br/>
            <RatingComponent id='rating2' value={2.5} precision=
{PrecisionType.Half} ></RatingComponent><br/>
            <label>Quarter Precision</label><br/>
            <RatingComponent id='rating3' value={3.75} precision=
{PrecisionType.Quarter} ></RatingComponent><br/>
            <label>Exact Precision</label><br/>
            <RatingComponent id='rating4' value={2.3} precision=
{PrecisionType.Exact} ></RatingComponent><br/>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Labels in React Rating Component

You can use the [showLabel](#) property to display a label that shows the current value of the rating. When the `showLabel` property is set to `true`, a label will be displayed.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3}
showLabel={true}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} showLabel= {true}
></RatingComponent>
        </div>
    );
}

```

```
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Label position

The rating component allows you to place the label on the top, bottom, left, or right side of the rating using the [labelPosition](#) property.

The following label positions are supported:

- Top: The label is placed on the top of the rating.
- Bottom: The label is placed on the bottom of the rating.
- Left: The label is placed on the left side of the rating.
- Right: The label is placed on the right side of the rating.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent, LabelPosition } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <label>Left Label Position</label><br />
            <RatingComponent id='rating1' value={3} showLabel={true}
labelPosition={LabelPosition.Left}></RatingComponent><br />
            <label>Right Label Position</label><br />
            <RatingComponent id='rating2' value={3} showLabel={true}
labelPosition={LabelPosition.Right}></RatingComponent><br />
            <label>Top Label Position</label><br />
            <RatingComponent id='rating3' value={3} showLabel={true}
labelPosition={LabelPosition.Top}></RatingComponent><br />
            <label>Bottom Label Position</label><br />
            <RatingComponent id='rating4' value={3} showLabel={true}
labelPosition={LabelPosition.Bottom}></RatingComponent><br />
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent, LabelPosition } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <label>Left Label Position</label><br/>
```

```

        <RatingComponent id='rating1' value={3} showLabel= {true}
labelPosition= {LabelPosition.Left} ></RatingComponent><br/>
        <label>Right Label Position</label><br/>
        <RatingComponent id='rating2' value={3} showLabel= {true}
labelPosition= {LabelPosition.Right}></RatingComponent><br/>
        <label>Top Label Position</label><br/>
        <RatingComponent id='rating3' value={3} showLabel= {true}
labelPosition= {LabelPosition.Top} ></RatingComponent><br/>
        <label>Bottom Label Position</label><br/>
        <RatingComponent id='rating4' value={3} showLabel= {true}
labelPosition= {LabelPosition.Bottom} ></RatingComponent><br/>
    </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Label template

You can use the [labelTemplate](#) tag directive to specify a custom template for the **Label** of the rating. The current value of the rating will be passed as the **value** property in the template context when building the content of the label. This allows you to include dynamic information about the rating in the template.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' showLabel={true} value={3}
labelTemplate='<span>${value} out of 5</span>'></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' showLabel={true} value={3}
labelTemplate='<span>${value} out of 5</span>' ></RatingComponent>
        </div>
    );
}

```

```
export default App;  
ReactDOM.render(<App />, document.getElementById('element'));
```

Tooltip in React Rating Component

The rating component supports tooltip to show additional information in rating items by setting the [showTooltip](#) property. If enabled, the tooltip appears when the user hovers over a rating item.

INDEX.JSX

```
// Import the Rating.  
import { RatingComponent } from '@syncfusion/ej2-react-inputs';  
import * as React from 'react';  
import * as ReactDOM from 'react-dom';  
// To render Rating.  
function App() {  
    return (<div className='wrap'>  
        <RatingComponent id='rating' showTooltip={true}  
value={3}></RatingComponent>  
        </div>);  
}  
export default App;  
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.  
import { RatingComponent } from '@syncfusion/ej2-react-inputs';  
import * as React from 'react';  
import * as ReactDOM from 'react-dom';  
// To render Rating.  
function App() {  
    return (  
        <div className='wrap'>  
            <RatingComponent id='rating' showTooltip={true} value={3}  
></RatingComponent>  
        </div>  
    );  
}  
export default App;  
ReactDOM.render(<App />, document.getElementById('element'));
```

Tooltip template

You can use the [tooltipTemplate](#) tag directive to specify a custom template for the **tooltip** of the rating. The current value of the rating will be passed as the **value** property in the template context when building the content of the tooltip. This allows you to include dynamic information about the rating in the template.

INDEX.JSX

```
// Import the Rating.  
import { RatingComponent } from '@syncfusion/ej2-react-inputs';  
import * as React from 'react';  
import * as ReactDOM from 'react-dom';
```

```
// To render Rating.
function App() {
  function tooltipTemplate(props) {
    if (props.value === 1) {
      return (<b>Angry</b>);
    }
    else if (props.value === 2) {
      return (<b>Sad</b>);
    }
    else if (props.value === 3) {
      return (<b>Neutral</b>);
    }
    else if (props.value === 4) {
      return (<b>Good</b>);
    }
    else {
      return (<b>Happy</b>);
    }
  }
  return (<div className='wrap'>
    <RatingComponent id='rating' showTooltip={true} value={3}
    tooltipTemplate={tooltipTemplate}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  function tooltipTemplate(props: any) {
    if(props.value === 1){
      return (<b>Angry</b>);}
    else if(props.value === 2){
      return (<b>Sad</b>);}
    else if(props.value === 3){
      return (<b>Neutral</b>);}
    else if(props.value === 4){
      return (<b>Good</b>);}
    else {
      return (<b>Happy</b>);}
  }

  return (
    <div className='wrap'>
      <RatingComponent id='rating' showTooltip={true} value={3}
      tooltipTemplate={tooltipTemplate} ></RatingComponent>
    </div>
  );
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('element'));
```

Tooltip customization

You can customize the appearance of the tooltips using the `cssClass` property of the rating component and by defining the custom styles for tooltip elements like the below example.

You can find more information about customizing the appearance of the tooltip in the [Tooltip Customization](#) documentation.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' showTooltip={true} value={3}
        cssClass='customtooltip'></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <RatingComponent id='rating' showTooltip={true} value={3}
            cssClass='customtooltip' ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

STYLES.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
}
```

```

        width: 30%;
    }
    .wrap {
        margin: 50px auto;
        text-align: center;
    }
    /* To change the radius of the tooltip corners. */
    .customtooltip.e-tooltip-wrap {
        border-radius: 3px;
    }
    /* To change the size of the tooltip content. */
    .customtooltip.e-tooltip-wrap .e-tip-content {
        font-size: 14px;
    }
    /* To change the border color and width for tooltip. */
    .customtooltip.e-tooltip-wrap.e-popup {
        border: 2px solid #000000;
    }
    /* To change the color for arrow of the tooltip. */
    .customtooltip.e-tooltip-wrap .e-arrow-tip-inner.e-tip-bottom {
        border: 12px #9693
    }
    /* To change the top border color for arrow of the tooltip. */
    .customtooltip.e-tooltip-wrap .e-arrow-tip-outer.e-tip-bottom {
        border-top: 9.5px solid #000000;
    }
}

```

Selection in React Rating Component

The rating component allows users to rate something using a visual scale, and the selection state can be changed by the user clicking or tapping on the stars in the rating scale or through code. The rating component has a minimum value and a reset button, and provides customization options for the selected rating value and selection behavior.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.

```

```
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Min value

You can use the [min](#) property of the rating component to set the minimum possible rating value the user can select. If you set the `min` property to 2, then you will not be able to select a rating lower than 2.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' min={2}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' min={2} ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Single selection

You can use the [enableSingleSelection](#) property of the rating component to select only one item at a time. When the `enableSingleSelection` property is set to `true`, only the selected item will be considered to be in the selected state, while all other items will be unselected.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3}
        enableSingleSelection={true}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3}
            enableSingleSelection={true} ></RatingComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Show or hide reset button

You can reset the rating value to its default by using the [allowReset](#) property of the rating component. When the `allowReset` property is set to `true`, a reset button will be shown that allows the user to reset the rating value to its default.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3}
        allowReset={true}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} allowReset={true}>
        </RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Templates in React Rating Component

The rating component allows you to customize the appearance of the rating items using templates. You can use templates to specify a custom layout for the rating items, which can include any content you want. This allows you to create a more customized and interactive rating experience for the user.

The rating component supports below templates for item customization.

- [emptyTemplate](#)
- [fullTemplate](#)

Empty (unrated) symbol template

To customize the appearance of **unrated** items, you can use the **emptyTemplate** tag directive. It allows you to specify the desired custom content for the unrated items.

The **value** and **index** are available in the template context for accessing information about the un-rated item.

If the **fullTemplate** is not defined, the **emptyTemplate** will be used as the default for both rated and unrated items. You can apply custom styles to differentiate between the rated and unrated states of the items.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    function emptyTemplate() {
        return (<React.Fragment><span className='custom-font sf-rating-heart'></span></React.Fragment>);
    }
    return (<div className='wrap'>
```

```

        <RatingComponent id='rating' value={3}
emptyTemplate={emptyTemplate}></RatingComponent>
        </div>);
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    function emptyTemplate() {
        return (
            <React.Fragment><span className='custom-font sf-rating-
heart'></span></React.Fragment>
        );
    }

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3}
emptyTemplate={emptyTemplate} ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

STYLES.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}
.e-rating-container .custom-font {
    /* To add the background color for the font icon. */
    background: linear-gradient(to right, rgb(254,87,133,255) var(--rating-
value), transparent var(--rating-value));
    /* To clip the background to the icon (text) alone. */
    background-clip: text;
    -webkit-background-clip: text;
}

```

```

/* To make the background color visible instead of font color. */
-webkit-text-fill-color: transparent;
/* To provide a border for font icon. */

}
.sf-rating-heart:before {
  content: "\e702";
}

```

The current value of the rating item available in the template context as `value` and in the rating item element as CSS Variable (`--rating-value`) can be used to support precision in templates.

Full (rated) symbol template

To customize the appearance of **rated** items in the rating component, you can use the `fullTemplate` tag directive. This directive allows you to specify a custom layout for the rated items, which can include any content you desire.

The `value` and `index` are available in the template context for accessing information about the rated item.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

Using Emoji icon as rating symbol

You can use emojis of your choice as rating symbol by specifying them as template content within the `emptyTemplate` tag directive.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
function emptyTemplate(props) {
if (props.index === 0) {
return (<span className='angry emoji'>😡</span>);
}
else if (props.index === 1) {
return (<span className='disagree emoji'>😞</span>);
}
else if (props.index === 2) {
return (<span className='neutral emoji'>😐</span>);
}
else if (props.index === 3) {
return (<span className='agree emoji'>😄</span>);
}
}

```

```

        else {
            return (<span className='happy emoji'>😊</span>);
        }
    }
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3}
        emptyTemplate={emptyTemplate} enableSingleSelection={true}
        enableAnimation={false}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    function emptyTemplate(props: any) {
        if(props.index===0) {
            return (<span className='angry emoji'>😡</span>); }
        else if(props.index===1) {
            return (<span className='disagree emoji'>😞</span>); }
        else if(props.index===2) {
            return (<span className='neutral emoji'>😐</span>); }
        else if(props.index===3) {
            return (<span className='agree emoji'>😊</span>); }
        else {
            return (<span className='happy emoji'>😊</span>); }
    }

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3}
            emptyTemplate={emptyTemplate} enableSingleSelection={true}
            enableAnimation={false} ></RatingComponent>
            </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

STYLES.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
}

```

```

    position: absolute;
    top: 45%;
    width: 30%;
  }
  .wrap {
    margin: 50px auto;
    text-align: center;
  }
  /* To change the color of an unselected rating item. */
  .e-rating-item-container:not(.e-rating-selected) .emoji {
    filter: grayscale(1);
  }
}

```

Using SVG icon as rating symbol

You can use SVG icons of your choice as rating symbol by specifying them as template content within the `emptyTemplate` and `fullTemplate` tag directive.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  function emptyTemplate() {
    return (
      <svg width="35" height="25" className="e-rating-svg-icon">
        <rect width="35" height="25" fill="transparent" strokeWidth="2"
stroke="rgb(173,181,189)"/>
      </svg>);
  }
  function fullTemplate(props) {
    return (
      <svg width="35" height="25" className="e-rating-svg-icon">
        <defs>
          <linearGradient id={`grad${props.index}`} x1="0%" y1="0%"
x2="100%" y2="0%">
            <stop className="start" offset="0%"/>
            <stop className="end" offset="100%"/>
          </linearGradient>
        </defs>
        <rect width="35" height="25" fill={`url(#grad${props.index})`}
strokeWidth="2" stroke="rgb(173,181,189)"/>
      </svg>);
  }
  return (
    <div className="wrap">
      <RatingComponent id="rating" value={4}
emptyTemplate={emptyTemplate} fullTemplate={fullTemplate}
enableAnimation={false}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  function emptyTemplate() {
    return (
      <svg width="35" height="25" className="e-rating-svg-icon">
        <rect width="35" height="25" fill="transparent"
strokeWidth="2" stroke="rgb(173,181,189)"/>
      </svg>
    );
  }
  function fullTemplate(props: any) {
    return (
      <svg width="35" height="25" className="e-rating-svg-icon">
        <defs>
          <linearGradient id={`grad${props.index}`} x1="0%" y1="0%"
x2="100%" y2="0%">
            <stop className="start" offset="0%" />
            <stop className="end" offset="100%" />
          </linearGradient>
        </defs>
        <rect width="35" height="25" fill={`url(#grad${props.index})`}
strokeWidth="2" stroke="rgb(173,181,189)"/>
      </svg>
    );
  }
  return (
    <div className='wrap'>
      <RatingComponent id='rating' value={4}
emptyTemplate={emptyTemplate} fullTemplate={fullTemplate}
enableAnimation={false} ></RatingComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

STYLES.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;

}

```

Using PNG image as rating symbol

You can use PNG images of your choice as rating symbol by specifying them as template content within the `emptyTemplate` and `fullTemplate` tag directives.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  function emptyTemplate() {
    return ();
  }
  function fullTemplate() {
    return ();
  }
  return (<div className='wrap'>
    <RatingComponent id='rating' value={4}
    emptyTemplate={emptyTemplate} fullTemplate={fullTemplate}>
    </RatingComponent>
    </div>);
}

```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  function emptyTemplate() {
    return (
      
    );
  }
  function fullTemplate() {
    return (
      
    );
  }

  return (
    <div className='wrap'>
      <RatingComponent id='rating' value={4}
        emptyTemplate={emptyTemplate} fullTemplate={fullTemplate} >
      </RatingComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Events in React Rating Component

This section describes the rating events that will be triggered when appropriate actions are performed. The following events are available in the rating component.

beforeItemRender

The rating component triggers the [beforeItemRender](#) event before rendering each rating item. The [RatingItemEventArgs](#) passed as an event argument provides the details of the item to be rendered.

`ts

```
{/ Import the Rating. /}
```

```
import { RatingComponent, RatingItemEventArgs } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
```

```

{/ To render Rating./}
function App() {
  function beforeItemRender(args: RatingItemEventArgs){
    //Your required action here
  }
  return (
    <div className='wrap'>
      <RatingComponent id='rating' beforeItemRender={ beforeItemRender } ></RatingComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('element'));
`

```

created

The rating component triggers the [created](#) event when the rendering of the rating component is completed.

```

`ts
{/ Import the Rating. /}
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render Rating./}
function App() {
  function created(){
    //Your required action here
  }
  return (
    <div className='wrap'>
      <RatingComponent id='rating' created={ created } ></RatingComponent>
    </div>
  );
}
export default App;

```

```
ReactDOM.render(<App />,document.getElementById('element'));  
,
```

onItemHover

The rating component triggers the [onItemHover](#) event when the rating item is hovered. The [RatingHoverEventArgs](#) passed as an event argument provides the details of the hovered item.

`ts

```
{/ Import the Rating. /}  
import { RatingComponent, RatingHoverEventArgs } from '@syncfusion/ej2-react-inputs';  
import * as React from 'react';  
import * as ReactDOM from 'react-dom';  
{/ To render Rating./}  
function App() {  
  function onItemHover(args: RatingHoverEventArgs){  
    //Your required action here  
  }  
  return (  
    <div className='wrap'>  
      <RatingComponent id='rating' onItemHover={ onItemHover } ></RatingComponent>  
    </div>  
  );  
}  
export default App;  
ReactDOM.render(<App />,document.getElementById('element'));  
,
```

valueChanged

The rating component triggers the [valueChanged](#) event when the value of the rating is changed. The [RatingChangedEventArgs](#) passed as an event argument provides the details when value is changed.

`ts

```
{/ Import the Rating. /}  
import { RatingComponent, RatingChangedEventArgs } from '@syncfusion/ej2-react-inputs';  
import * as React from 'react';  
import * as ReactDOM from 'react-dom';  
{/ To render Rating./}  
function App() {
```

```
function valueChanged(args: RatingChangedEventArgs){
//Your required action here
}
return (
<div className='wrap'>
<RatingComponent id='rating' valueChanged={ valueChanged } ></RatingComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('element'));
`
```

Below example demonstrates the valueChanged event of the Rating component.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    function valueChanged(args) {
        alert("Previous Value:" + args.previousValue + "\nValue:" +
args.value);
    }
    return (<div className='wrap'>
        <RatingComponent id='rating'
valueChanged={valueChanged}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent, RatingChangedEventArgs } from '@syncfusion/ej2-
react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    function valueChanged(args: RatingChangedEventArgs){
        alert("Previous Value:" +args.previousValue + "\nValue:" +args.value);
    }

    return (
```

```

        <div className='wrap'>
            <RatingComponent id='rating' valueChanged={ valueChanged }
        ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Appearance in React Rating Component

You can also customize the appearance of rating component.

Items Count

You can specify the number of rating items using the [itemsCount](#) property.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' itemsCount={8}
    value={3.0}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' itemsCount={8}
    value={3.0}></RatingComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Disabled

You can disable the rating component by using the [disabled](#) property. When the `disabled` property is set to `true`, the rating component will be disabled and the user will not be able to interact with it and a disabled rating component may have a different visual appearance than an enabled one.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3}
disabled={true}></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} disabled={true}
></RatingComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

Visible

You can use the [visible](#) property of the rating component to component the visibility of the component. When the [visible](#) property is set to `true`, the rating component will be visible on the page. When it is set to `false`, the component will be hidden.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    var rating;
    function visible() {
        rating.visible = !rating.visible;
    }
    return (<div className='wrap'>
        <button id="btn" onClick={visible}>Visible</button>
    );
}
```

```

    <RatingComponent id='rating' value={3} visible={true} ref={(scope)
=> { rating = scope; }}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent, Rating } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    var rating: Rating;
    function visible() {
        rating.visible = !rating.visible;
    }

    return (
        <div className='wrap'>
            <button id="btn" onClick={ visible }>Visible</button>
            <RatingComponent id='rating' value={3} visible={true}
ref={(scope) => { rating = scope; }} ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

Read only

You can use the [readOnly](#) property of the rating component to make the component non-interactive and prevent the user from changing the rating value.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3}
readOnly={true}></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.

```

```
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} readOnly={true}>
        </RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

CssClass

You can customize the appearance of the rating component, such as by changing its colors, fonts, sizes, or other visual aspects by using the [cssClass](#) property.

Changing rating symbol border color

You can change the rating icon border color in rating component, you can use the `cssClass` property and set the `text-stroke` CSS property of `.e-rating-icon` to your desired border color.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3} cssClass='custom-
border'></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} cssClass='custom-border'
        ></RatingComponent>
        </div>
    );
}
```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

STYLES.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container.custom-border .e-rating-item-list:hover .e-rating-item-
container .e-rating-icon,
.e-rating-container.custom-border .e-rating-item-container .e-rating-icon {
  /* To change rating symbol border color */
  -webkit-text-stroke: 2px #ae9e9d;
}

```

Changing rated/un-rated symbol fill color

You can customize the fill colors of rated and un-rated icons in the rating component using the `cssClass` property and the `linear-gradient` color-stops in the `background` CSS property of `.e-rating-icon`. The **first** color-stop defines the rated fill color and the **second** defines the un-rated fill color.

INDEX.JSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
  return (
    <div className='wrap'>
      <RatingComponent id='rating' value={3} cssClass='custom-
fill'></RatingComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} cssClass='custom-fill'
        ></RatingComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

STYLES.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}
.e-rating-container.custom-fill .e-rating-item-list:hover .e-rating-item-
container .e-rating-icon,
.e-rating-container.custom-fill .e-rating-item-container .e-rating-icon {
    /* To change rated symbol fill color and un-rated symbol fill color */
    background: linear-gradient(to right, #ffe814 var(--rating-value),
    #d8d7d4 var(--rating-value));
    background-clip: text;
    -webkit-background-clip: text;
}
```

This will customize the rated fill color to #ffe814 and un-rated fill color to #d8d7d4. --rating-value in the linear-gradient provides the current value of the rating item.

Changing the item spacing

You can change the space between the rating items in rating component, by using the cssClass property and setting the margin / padding CSS property of .e-rating-item-container to your desired size.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
```

```

    return (<div className='wrap'>
      <RatingComponent id='rating' value={3} cssClass='custom-
font'></RatingComponent>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('element'));

```

INDEX.TSX

```

// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

  return (
    <div className='wrap'>
      <RatingComponent id='rating' value={3} cssClass='custom-font'
></RatingComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));

```

STYLES.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  font-family: 'Helvetica Neue', 'calibiri';
  font-size: 14px;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.wrap {
  margin: 50px auto;
  text-align: center;
}
.e-rating-container.custom-font .e-rating-item-container {
  /* To change the size between items */
  margin: 0px 7px;
}

```

Changing icon using CssClass

You can change the rating item icon in rating component, you can use the `cssClass` property and set the `content` CSS property of `.e-icons.e-star-filled:before` to your desired font icon.

INDEX.JSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {
    return (<div className='wrap'>
        <RatingComponent id='rating' value={3} cssClass='custom-
icon'></RatingComponent>
        </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

INDEX.TSX

```
// Import the Rating.
import { RatingComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Rating.
function App() {

    return (
        <div className='wrap'>
            <RatingComponent id='rating' value={3} cssClass='custom-icon'
></RatingComponent>
            </div>
        );
}
export default App;
ReactDOM.render(<App />, document.getElementById('element'));
```

STYLES.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    font-family: 'Helvetica Neue', 'calibiri';
    font-size: 14px;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.wrap {
    margin: 50px auto;
    text-align: center;
}
/* Represents the styles for icon */
@font-face {
    font-family: 'custom-icon';
    src: url(data:application/x-font-ttf;charset=utf-
8;base64,AAEAAAIAIAAwAgTlMvMjlvSfQAAAEoAAAAVmNtYXDnEudXAAABiAAAADZnbHlmVIZr
owAAAcgAAAEYaGVhZCK6KOUAAADQAAAAANmhoZWEIUAQDAAAArAAAACRobXR4CAAAAAAAYAAAAAIb
```

Accessibility in React Rating component

The Rating component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Rating component is outlined below.

Accessibility Criteria	Compatibility	
--	--	
WCAG 2.2 Support		
Section 508 Support		

```

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

WAI-ARIA attributes

The Rating component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Rating component:

Attributes	Purpose
<code>role=slider</code>	It defines an input where the user selects a value from within a specified range.
<code>role=button</code>	Specifies that the reset is a clickable element that resets the rating to its minimum value.
<code>aria-label</code>	Provides an accessible name for Rating.
<code>aria-valuemin</code>	It defines the minimum value of rating.
<code>aria-valuemax</code>	It defines the maximum value of rating.

| `aria-valuenow` | It defines the current value of rating. |

| `aria-hidden` | It specifies whether the reset button is interactive or not. |

Keyboard interaction

The Rating component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Rating component.

| Keyboard shortcuts | Actions |

|-----|-----|

| Space | When **Reset Button** is focused, resets to min value. |

| Arrow Up | Increases the value. |

| Arrow Left | Decreases the value; in RTL mode, increases the value. |

| Arrow Down | Decreases the value. |

| Arrow Right | Increases the value; in RTL mode, decreases the value. |

Ensuring accessibility

The Rating component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Rating component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Rating component with accessibility tools.

Ribbon

Getting Started

This section explains how to create a simple Ribbon, and configure its available functionalities in React.

Dependencies

The following list of dependencies are required to use the Ribbon component in your application.

```
`javascript
```

```
|-- @syncfusion/ej2-react-ribbon
```

```
|-- @syncfusion/ej2-react-base
```

```
|-- @syncfusion/ej2-base
```

```
|-- @syncfusion/ej2-data
```

```
|-- @syncfusion/ej2-buttons
```

```
|-- @syncfusion/ej2-popups
```

```
|-- @syncfusion/ej2-splitbuttons
```

```
|-- @syncfusion/ej2-inputs
```

```
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-dropdowns
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-ribbon
\
```

Setup your development environment

To set-up a React application, choose any of the following ways. The best and easiest way is to use the [create-react-app](#). It sets up your development environment in JavaScript and improvise your application for production. Refer to the [installation instructions](#) of `create-react-app`.

```
`bash
npx create-react-app my-app
cd my-app
npm start
\
```

or

```
`bash
yarn create react-app my-app
cd my-app
yarn start
\
```

To set-up a React application in `TypeScript` environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
\
```

Besides using the [npm](#) package runner tool, also create an application from the `npm init`. To begin with the `npm init`, upgrade the `npm` version to `npm 6+`.

```
`bash
npm init react-app my-app
cd my-app
npm start
\
```

Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install **Ribbon** component, use the following command

```
`bash
npm install @syncfusion/ej2-react-ribbon --save
`
```

The above command installs [Ribbon dependencies](#) which are required to render the component in the **React** environment.

Adding Style sheet to the Application

Add Ribbon component's styles as given below in **App.css**.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css";
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
@import "../node_modules/@syncfusion/ej2-dropdowns/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
@import "../node_modules/@syncfusion/ej2-ribbon/styles/material.css";
`
```

Add Ribbon to the project

Now, you can create **Ribbon** component in the application. Add **Ribbon** component in **src/App.tsx** file using the following code snippet.

```
{% raw %}
`ts
import { RibbonComponent } from "@syncfusion/ej2-react-ribbon";
import * as React from "react";
import * as ReactDOM from "react-dom";
import "../App.css";
function App() {
  return (
    <RibbonComponent id="ribbon"></RibbonComponent>
  );
}
```

```

}

const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`

```

```
{% endraw %}
```

Injecting required modules

Inject the Ribbon required modules in your `src/App.tsx` file using the following code snippet.

```

{% raw %}
`ts

import { RibbonComponent, RibbonFileMenu, Inject, RibbonColorPicker } from "@syncfusion/ej2-react-ribbon";

import * as React from "react";
import * as ReactDOM from "react-dom";
import "./App.css";

function App() {
  return (
    <RibbonComponent id="ribbon">
      <Inject services={[RibbonFileMenu, RibbonColorPicker]} />
    </RibbonComponent>
  );
}

const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`

{% endraw %}

```

Adding Ribbon Tab

In Ribbon, the options are arranged in tabs for easy access. You can use the `RibbonTabDirective` to define the ribbon tab like below.

```

{% raw %}
`ts

import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective } from "@syncfusion/ej2-react-ribbon";

import * as React from "react";
import * as ReactDOM from "react-dom";
import "./App.css";

```

```
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home"></RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}

const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`
```

```
{% endraw %}
```

Adding Ribbon Group

To define a ribbon group under each tab, you can use the `RibbonGroupDirective` like below. The `orientation` property of ribbon group defines whether the collection of items will be rendered column-wise or row-wise.

```
{% raw %}
```

```
`ts
```

```
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonGroupsDirective,
RibbonGroupDirective } from "@syncfusion/ej2-react-ribbon";

import * as React from "react";
import * as ReactDOM from "react-dom";

import "./App.css";

function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
          <RibbonGroupsDirective>
            <RibbonGroupDirective header="Clipboard" orientation="Row"></RibbonGroupDirective>
          </RibbonGroupsDirective>
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}
```

```

</RibbonComponent>
);
}
const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`
{% endraw %}

```

Adding Ribbon Item

You can use the `RibbonCollectionDirective` to define each ribbon collection that contains one or more items. To define each ribbon item, you can use the `RibbonItemDirective` and the `type` property to specify the type of component to be rendered, like a button, a drop-down button, a combo box, and more.

```

{% raw %}
`ts
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonCollectionsDirective, RibbonCollectionDirective, RibbonItemsDirective,
RibbonItemDirective, RibbonItemSize } from "@syncfusion/ej2-react-ribbon";
import * as React from "react";
import * as ReactDOM from "react-dom";
import "./App.css";
function App() {
return (
<RibbonComponent id="ribbon">
<RibbonTabsDirective>
<RibbonTabDirective header="Home">
<RibbonGroupsDirective>
<RibbonGroupDirective header="Clipboard" orientation="Row">
<RibbonCollectionsDirective>
<RibbonCollectionDirective id="paste-collection">
<RibbonItemsDirective>
<RibbonItemDirective type="SplitButton" allowedSizes={RibbonItemSize.Large}
splitButtonSettings={{ iconCss: "e-icons e-paste", items: [{ text: "Keep Source Format" }, { text: "Merge
format" }, { text: "Keep text only" }], content: "Paste" }}>
</RibbonItemDirective>
</RibbonItemsDirective>

```

```

</RibbonCollectionDirective>
<RibbonCollectionDirective id="cutcopy-collection">
  <RibbonItemsDirective>
    <RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
  </RibbonItemDirective>
    <RibbonItemDirective type="Button" buttonSettings={{ iconCss: "e-icons e-copy", content: "Copy" }}>
  </RibbonItemDirective>
  </RibbonItemsDirective>
</RibbonCollectionDirective>
</RibbonCollectionsDirective>
</RibbonGroupDirective>
</RibbonGroupsDirective>
</RibbonTabDirective>
</RibbonTabsDirective>
</RibbonComponent>
);
}

const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`

{% endraw %}

```

Run the application

Run the application in the browser using the following command:

```
npm start
```

The following example illustrates how tabs, groups, collections, and items are used in a ribbon component to form the ribbon layout.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective,
RibbonColorPicker, DisplayMode } from "@syncfusion/ej2-react-ribbon";

```

```

import { RibbonFileMenu, RibbonItemSize, Inject } from "@syncfusion/ej2-react-ribbon";
function App() {
    const pasteOptions = [{ text: "Keep Source Format" }, { text: "Merge format" }, { text: "Keep text only" }];
    const tableOptions = [{ text: "Insert Table" }, { text: "This device" }, { text: "Convert Table" }, { text: "Excel SpreadSheet" }];
    const fontSize = ["8", "9", "10", "11", "12", "14", "16", "18", "20", "22", "24", "26", "28", "36", "48", "72", "96"];
    const fontStyle = ["Algerian", "Arial", "Calibri", "Cambria", "Cambria Math", "Courier New", "Candara", "Georgia", "Impact", "Segoe Print", "Segoe Script", "Segoe UI", "Symbol", "Times New Roman", "Verdana", "Windings"];
    function template(props) {
        const cssClass = "ribbonTemplate " + props.activeSize;
        return (<span className={cssClass}><span className="e-icons e-video"></span><span className="text">Video</span></span>)
    }
    const fileOptions = [{ text: "New", iconCss: "e-icons e-file-new", id: "new" },
        { text: "Open", iconCss: "e-icons e-folder-open", id: "Open" },
        { text: "Rename", iconCss: "e-icons e-rename", id: "rename" },
        { text: "Save as", iconCss: "e-icons e-save", id: "save" }]
    return (
        <RibbonComponent id="ribbon" fileMenu={{ visible: true, menuItems: fileOptions }}>
            <RibbonTabsDirective>
                <RibbonTabDirective header="Home">
                    <RibbonGroupsDirective>
                        <RibbonGroupDirective header="Clipboard"
groupIconCss="e-icons e-paste" showLauncherIcon={true}>
                            <RibbonCollectionsDirective>
                                <RibbonCollectionDirective>
                                    <RibbonItemsDirective>
                                        <RibbonItemDirective
type="SplitButton" allowedSizes={RibbonItemSize.Large}
splitButtonSettings={{ iconCss: "e-icons e-paste", items: pasteOptions, content: "Paste" }}>
                                            </RibbonItemDirective>
                                        </RibbonItemsDirective>
                                    </RibbonCollectionDirective>
                                </RibbonCollectionsDirective>
                            </RibbonGroupDirective>
                        <RibbonGroupDirective header="File"
buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut" }}>
                            <RibbonCollectionsDirective>
                                <RibbonCollectionDirective>
                                    <RibbonItemsDirective>
                                        <RibbonItemDirective type="Button"
buttonSettings={{ iconCss: "e-icons e-copy", content: "Copy" }}>
                                            </RibbonItemDirective>
                                        </RibbonItemsDirective>
                                    </RibbonCollectionDirective>
                                </RibbonCollectionsDirective>
                            </RibbonGroupDirective>
                        <RibbonGroupDirective header="Format"
buttonSettings={{ iconCss: "e-icons e-format-painter", content: "Format Painter" }}>
                            <RibbonCollectionsDirective>
                                <RibbonCollectionDirective>
                                    <RibbonItemsDirective>
                                        <RibbonItemDirective type="Button"
buttonSettings={{ iconCss: "e-icons e-format-painter", content: "Format Painter" }}>
                                            </RibbonItemDirective>
                                        </RibbonItemsDirective>
                                    </RibbonCollectionDirective>
                                </RibbonCollectionsDirective>
                            </RibbonGroupDirective>
                    </RibbonGroupsDirective>
                </RibbonTabDirective>
            </RibbonTabsDirective>
        </RibbonComponent>
    )
}

```

```

        <RibbonGroupDirective header="Font" groupIconCss="e-
icons e-bold" isCollapsible={false} enableGroupOverflow={true}
orientation="Row" cssClass="font-group">
            <RibbonCollectionsDirective>
                <RibbonCollectionDirective>
                    <RibbonItemsDirective>
                        <RibbonItemDirective type="ComboBox"
comboBoxSettings={{ dataSource: fontStyle, index: 3, width: "150px",
allowFiltering: true }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="ComboBox"
comboBoxSettings={{ dataSource: fontSize, index: 3, width: "65px",
allowFiltering: true }}>
                            </RibbonItemDirective>
                    </RibbonItemsDirective>
                </RibbonCollectionDirective>
                <RibbonCollectionDirective>
                    <RibbonItemsDirective>
                        <RibbonItemDirective
type="ColorPicker" allowedSizes={RibbonItemSize.Small}
displayOptions={DisplayMode.Simplified} colorPickerSettings={{ value:
"#123456" }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Small} buttonSettings={{ iconCss: "e-icons e-
bold", content: "Bold" }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Small} buttonSettings={{ iconCss: "e-icons e-
italic", content: "Italic" }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Small} buttonSettings={{ iconCss: "e-icons e-
underline", content: "Underline" }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Small} buttonSettings={{ iconCss: "e-icons e-
strikethrough", content: "Strikethrough" }}>
                            </RibbonItemDirective>
                        <RibbonItemDirective type="Button"
allowedSizes={RibbonItemSize.Small} buttonSettings={{ iconCss: "e-icons e-
change-case", content: "Change Case" }}>
                            </RibbonItemDirective>

}

```

Modules in Ribbon component

The following modules are available in Ribbon. If the module injection type is **selective**, manual injection is required to extend the Ribbon's functionality.

Module	Description	Module Injection Type
----- ----- -----		
RibbonButton	To use the built-in button as a ribbon item.	default
RibbonCheckBox	To use the built-in checkbox as a ribbon item.	default
RibbonDropDown	To use the built-in dropdown button as a ribbon item.	default
RibbonSplitButton	To use the built-in split button as a ribbon item.	default
RibbonComboBox	To use the built-in combobox as a ribbon item.	default
RibbonGroupButton	To use the built-in groupbutton as a ribbon item.	default
RibbonColorPicker	Inject this module to use the built-in colorpicker as a ribbon item.	selective
RibbonGallery	Inject this module to use the gallery as a ribbon item.	selective
RibbonFileMenu	Inject this module to use the file menu feature.	selective
RibbonBackstage	Inject this module to use the backstage view feature.	selective
RibbonContextualTab	Inject this module to use the contextual tab feature.	selective
RibbonKeyTip	Inject this module to use the keytip feature.	selective

These modules should be injected into the Ribbon using the **Inject** directive.

INDEX.JSX

```

{% raw %}
import { RibbonFileMenu, RibbonColorPicker, Inject } from "@syncfusion/ej2-react-ribbon";
<RibbonComponent id="ribbon" fileMenu={{ visible: true, menuItems:
fileOptions}}>
  // Render Tabs here
<Inject services={[RibbonFileMenu, RibbonColorPicker]} />
</RibbonComponent>
{% endraw %}

```

Tabs and Groups

The Ribbon component consists of a series of tabs that are organized into groups to enable quick access to specific commands or tools. Each tab contains a set of groups, and each group contains collections of items that are logically related to each other.

Adding Tabs

You can use the [tabs](#) property to add tabs to the Ribbon component and define the content of the tab header by using the [header](#) property.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective } from
"@syncfusion/ej2-react-ribbon";
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
        </RibbonTabDirective>
        <RibbonTabDirective header="Insert">
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective } from
"@syncfusion/ej2-react-ribbon";
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
        </RibbonTabDirective>
        <RibbonTabDirective header="Insert">
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
```

```

left: 45%;
position: absolute;
top: 45%;
width: 30%;
}

```

Adding Groups

You can use the [groups](#) property to add groups for each tab in the Ribbon and define the name of the group header by using the [header](#) property.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonGroupsDirective, RibbonGroupDirective } from "@syncfusion/ej2-react-
ribbon";
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
          <RibbonGroupsDirective>
            <RibbonGroupDirective header="Clipboard">
            </RibbonGroupDirective>
          </RibbonGroupsDirective>
        </RibbonTabDirective>
        <RibbonTabDirective header="Insert">
          <RibbonGroupsDirective>
            <RibbonGroupDirective header="Tables">
            </RibbonGroupDirective>
          </RibbonGroupsDirective>
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonGroupsDirective, RibbonGroupDirective } from "@syncfusion/ej2-react-
ribbon";
function App() {
  return (

```

For more information on the built-in and how to add custom Ribbon items, you can visit the [items](#) page.

Ribbon Items

Ribbon renders various built-in items by using the `RibbonItemDirective` tag, to specify the [type](#) property. By default, the type property is set as `Button` which renders the Button.

Built-in items

You can render the built-in Ribbon items by using the [items](#) property, to specify the [type](#) property.

The following table explains the built-in items and their actions.

| Built-in Ribbon Items | Actions |

|-----|-----|

| Button | Renders button as ribbon item.|

| CheckBox | Renders checkbox as ribbon item.|

| DropDown | Renders dropdownbutton as ribbon item.|

| SplitButton | Renders splitbutton as ribbon item.|

| ComboBox | Renders combobox as ribbon item.|

| ColorPicker | Renders color picker as ribbon item.|

| GroupButton | Renders groupbutton as ribbon item.|

Button items

You can render the built-in button Ribbon item by setting the [type](#) property as `Button`. You can also customize the button item using the [RibbonButtonSettings](#), which provides options such as `IconCss`, `Content`, `IsToggle` and more.

Toggle button

The [isToggle](#) property can be used to define whether the button act as a toggle button or not. By default, the value is `false`.

INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective } from
"@syncfusion/ej2-react-ribbon";
function App() {
  return (
    <RibbonComponent id="ribbon">
      <RibbonTabsDirective>
        <RibbonTabDirective header="Home">
          <RibbonGroupsDirective>
            <RibbonGroupDirective header="Clipboard">
              <RibbonCollectionsDirective>
                <RibbonCollectionDirective>
                  <RibbonItemsDirective>
                    <RibbonItemDirective type="Button"
buttonSettings={{ iconCss: "e-icons e-cut", content: "Cut", isToggle: true
}}}
                    </RibbonItemDirective>
                  </RibbonItemsDirective>
                </RibbonCollectionDirective>
              </RibbonCollectionsDirective>
            </RibbonGroupDirective>
          </RibbonGroupsDirective>
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </RibbonComponent>
  );
}
```

```

}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

Defining label

You can use the [label](#) property to add a caption for the CheckBox. The label position can be set **Before** or **After**, by using the [labelPosition](#) property. By default, the labelPosition is **After**.

INDEX.JSX

```

{% raw %}
import * as React from "react";

```

DropDown button items

You can render the built-in dropDown Ribbon item by setting the [type](#) property to `DropDown`. You can also customize the dropDown item through [RibbonDropDownSettingsModel](#), which provides options such as `iconCss`, `content`, `target` and more.

Target

The [target](#) property specifies the element selector to be displayed in the DropDownButton popup.

INDEX.JSX

```
{% raw %}

                        </RibbonTabDirective>
                    </RibbonTabsDirective>
                </RibbonComponent>
                <ListViewComponent id='pictureList' dataSource={['This device',
'Stock Images', 'Online Images']} showHeader={true} headerTitle="Insert
Picture From"></ListViewComponent>
            </div>
        );
    }
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

Customize Dropdown button item

You can customize the dropdown button item by specifying a custom cssClass using the [beforeItemRender](#) event.

The following sample showcases how to customize a specific dropdown item.

INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective,
RibbonCollectionsDirective, RibbonCollectionDirective, RibbonGroupsDirective,
RibbonGroupDirective, RibbonItemsDirective, RibbonItemDirective } from
"@syncfusion/ej2-react-ribbon";
function App() {
  const tableOptions = [{ text: "Insert Table" }, { text: "This device" },
{ text: "Convert Table" }, { text: "Excel Spreadsheet" }];
  return (
    <div>
      <RibbonComponent id="ribbon">
        <RibbonTabsDirective>
          <RibbonTabDirective header="Insert">
            <RibbonGroupsDirective>
              <RibbonGroupDirective header="Tables">
                <RibbonCollectionsDirective>
                  <RibbonCollectionDirective>
                    <RibbonItemsDirective>
                      <RibbonItemDirective
type="DropDown" dropDownSettings={{ iconCss: "e-icons e-table", items:
tableOptions, content: "Table", beforeItemRender: function (args) {
                                if (args.item.text ===
'Insert Table') {
args.element.classList.add("e-custom-class");
                                }
                                } }}>
                    </RibbonItemDirective>
                  </RibbonItemsDirective>
                </RibbonCollectionDirective>
              </RibbonCollectionsDirective>
            </RibbonGroupDirective>
          </RibbonGroupsDirective>
        </RibbonTabDirective>
      </RibbonTabsDirective>
    </div>
  );
}

```

```

        </RibbonComponent>
    </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.TSX

```

{% raw %}
import * as React from "react";

Combobox items

You can render the built-in comboBox Ribbon item by setting the `type` property to `ComboBox`. You can also customize the comboBox item through [RibbonComboBoxSettingsModel](#), which provides options such as `allowFiltering`, `autoFill`, `index`, `sortOrder` and more.

Filtering

You can use the `allowFiltering` property to filter the data items. The filtering operation is initiated automatically, as soon as you start typing characters. If no match is found the value of the `noRecordsTemplate` property will be displayed. By default, the value is `false`.

INDEX.JSX

```

Colorpicker items

You can render the built-in colorPicker Ribbon item by setting the [type](#) property to `ColorPicker`. You can also customize the colorPicker item through [RibbonColorPickerSettingsModel](#), which provides options such as `value`, `columns`, `showButtons` and more.

Value

You can use the [value](#) property to specify the color value. The value should be specified as Hex code.

```

Groupbutton items

You can render the built-in groupbutton Ribbon item by setting the [type](#) property to `GroupButton`. You can also customize the groupbutton item using the `RibbonGroupButtonSettingsModel`, which provides options such as `selection` and `items`.

Items

You can render the groupbutton items by using [items](#) property. You can also customize the groupbutton items through [RibbonGroupButtonItemModel](#), which provides options such as [content](#), [iconCss](#), [selected](#) and more.

Item content

You can use the [content](#) property to define the text content for the groupbutton.

Items display Mode

You can use the [displayOptions](#) property to display the items in the Ribbon.

Auto	The items are displayed in all layouts based on the ribbon's overflow state.
Classic	The items are displayed only in the classic layout group.
Simplified	The items are displayed only in the simplified layout group.
Overflow	The items are displayed only in the overflow popup.

Display items in Classic only

To display the items only in the classic layout group, set the mode as `DisplayMode.Classic` in the [displayOptions](#) property.

```
{% raw %}
`ts
import * as React from "react";
import * as ReactDOM from "react-dom";

import { RibbonComponent, RibbonTabsDirective, RibbonTabDirective, RibbonCollectionsDirective,
RibbonCollectionDirective, RibbonGroupsDirective, RibbonGroupDirective, RibbonItemsDirective,

Enable or disable items

You can use the [disabled](#) property to disable a Ribbon item. It prevents the user interaction when set to `true`. By default, the value is `false`.

  top: 45%;
  width: 30%;
}

```

Ribbon Layouts

The Ribbon allows to customize the layout by using the [activeLayout](#) property. The Ribbon component supports the following layouts:

Classic layout

In classic layout, the Ribbon component organizes the items and groups in a traditional form by setting the [activeLayout](#) property to [Classic](#). By default, the Ribbon component renders in the [Classic](#) layout.

```

```

        </RibbonComponent>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}

```

Defining items size

You can use the [allowedSizes](#) property to set the allowed size for an item. The Ribbon items can be appeared in three different sizes: Large(large icon with text), Medium(small icon with text) and Small(small icon only). On resizing, the items size can be changed based on the available width of the tab content from the order of Large-> Medium-> Small and viceversa.

                                </RibbonItemsDirective>
                                </RibbonCollectionDirective>
                                </RibbonCollectionsDirective>
                                </RibbonGroupDirective>
                                </RibbonGroupsDirective>
                                </RibbonTabDirective>
                                </RibbonTabsDirective>
                                </RibbonComponent>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

Defining items orientation

The Ribbon group [orientation](#) property allows to manage how the items are aligned either in a **Row** or **Column**. By default, the orientation is set to **Column**, in which the items are arranged vertically.

INDEX.JSX

```

{% raw %}

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

When the orientation is set to **Row** a group may have a maximum of three collections each of which may contain any number of items. When the orientation is set to **Column** a group may have any

number of collections, each of which may contain one large-sized item or three medium/small-sized items. If two large-sized items are specified, it automatically converts into two medium/small-sized items.

Defining group header

You can use the [header](#) property to set the name for each group header.

INDEX.JSX

```
{% raw %}

Defining priority order for group collapse or expand

You can use the [priority](#) property to set the priority order for each group which should be collapsed or expanded on resizing. When collapsing, higher priority values are fetched first. When expanding, lower priority values are fetched first.

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}

```

Simplified layout

In simplified layout, the Ribbon component organizes the items and groups into a single row by setting the [activeLayout](#) property to [Simplified](#).

    width: 30%;
}

```

Enabling group overflow popup

You can use the [enableGroupOverflow](#) property to add a separate popup for the overflow items in the group while resizing. The overflow items will appear in the standard common popup, located at the right end of the tab content if it is set to `false`.

INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}

```

Minimized State

You can hide the Ribbon contents and display only the tab headers by double-clicking on the tab header. In minimized state, the Ribbon component expands to its normal state when click on the tab header.

You can use the [isMinimized](#) property to change the Ribbon component to minimized state. By default, the value is `false`.

File Menu

The Ribbon component provides a built-in file menu that allows you to add menu items for performing specific actions. The file menu can be enabled by setting the [fileMenu](#) property.

Visibility

You can show the file menu by setting the [visible](#) property to `true`. By default, the file menu is hidden.

Open submenu on click

You can open the submenu on menu item click, by setting the [showItemOnClick](#) property to `true`. By default, the submenu will open on mouse hover.

Ribbon Backstage

The Ribbon supports backstage view which is an addition to the traditional file menu. It displays information like application settings, user details, etc. The backstage view can be enabled by setting the [backStageMenu](#) property.

The backstage view options are displayed on the left, while the content of each option is shown on the right.

Adding backstage items

The menu items can be added to the backstage view by using the [items](#) property. You can show the backstage view by setting the [visible](#) property to `true`. By default, the backstage view is hidden.

Adding footer items

You can use the [isFooter](#) property in the `items` collection to add the backstage view footer items. By default, the value is false.

Adding separator

The separators are horizontal lines used to separate the backstage view items. You can use the [separator](#) property to split the menu items.

Backstage target

The [target](#) property specifies the element selector in which backstage will be displayed. The target element should have the position as relative, else the backstage will be positioned nearest to the relative element. By default, the backstage is positioned to ribbon element.
