### Limitations of Protect sheet

- Password encryption is not supported

### Unprotect Sheet

Unprotect sheet is used to enable all the functionalities that are already disabled in a protected spreadsheet.

#### User Interface:

In the active Spreadsheet, the sheet Unprotection can be done by any of the following ways:

- Select the **Unprotect Sheet** item in the Ribbon toolbar under the Data Tab.
- Right-click the sheet tab, select the **Unprotect Sheet** item in the context menu.
- Use the [unprotectSheet\(\)](#) method programmatically.

### Unlock the particular cells in the protected sheet

In protected spreadsheet, to make some particular cell or range of cells are editable, you can use [lockCells\(\)](#) method, with the parameter **range** and **isLocked** property as false.

    }
  ]

```

### Protect Workbook

Protect workbook feature helps you to protect the workbook so that users cannot insert, delete, rename, hide the sheets in the spreadsheet. You can use the [password](#) property to protect workbook with password. You can use the [isProtected](#) property to protect or unprotect the workbook without the password.

The default value for `isProtected` property is `false`.

### User Interface:

In the active Spreadsheet, you can protect the worksheet by selecting the Data tab in the Ribbon toolbar and choosing the **Protect Workbook** item. Then, enter the password and confirm it and click on OK.

The following example shows **Protect Workbook** by using the [isProtected](#) property in the Spreadsheet control.

```

**Unprotect Workbook**

Unprotect Workbook is used to enable the insert, delete, rename, move, copy, hide or unhide sheets feature in the spreadsheet.

**User Interface:**

In the active Spreadsheet, the workbook Unprotection can be done in any of the following ways:

- Select the **Unprotect Workbook** item in the Ribbon toolbar under the Data Tab and provide the valid password in the dialog box.

#### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

#### See Also

- [Hyperlink](#)

### Searching in React Spreadsheet component

Find and Replace helps you to search for target text and replace the founded text with alternative text within the sheet or workbook. You can use the [allowFindAndReplace](#) property to enable or disable Find and Replace functionality.

\* The default value for **allowFindAndReplace** property is **true**.

#### Find

Find is used to select the matched contents of a cell within sheet or workbook. It is extremely useful when working with large sets of data source.

##### User Interface:

Find can be done by any of the following ways:

- Select the Search icon in the Ribbon toolbar or using **Ctrl + F** key to open the Find dialog.
- Using find Next and find Previous buttons to search the given value in workbook.
- Select the option button in Find dialog to open the Find and Replace dialog then select the below properties for enhanced searching.

\* **Search within**: To search the target in a sheet (default) or in an entire workbook.

\* **Search by**: It enhance the search, either By Rows (default), or By Columns.

\* **Match case**: To find the matched value with case sensitive.

\* **Match exact cell contents**: To find the exact matched cell value with entire match cases.

- Using [find\(\)](#) method to perform find operation.

#### Replace

Replace is used to change the find contents of a cell within sheet or workbook. Replace All is used to change all the matched contents of a cell within sheet or workbook.

##### User Interface:

Replace can be done by any of the following ways:

- Using **Ctrl + H** key to open the Find and Replace dialog.
- Using Replace button to change the found value in sheet or workbook.

- Using ReplaceAll button to change all the found value's in sheet or workbook.
- Using [replace\(\)](#) method to perform replace operation by passing the argument `args.replaceby` as `replace`.
- Using [replace\(\)](#) method to perform replace all operation by passing the argument `args.replaceby` as `replaceall`.

### Go to

Go to is used to navigate to a specific cell address in the sheet or workbook.

### User Interface:

- Using `Ctrl + G` key to open the Go To dialog.
- Using [goTo\(\)](#) method to perform Go To operation.

In the following sample, searching can be done by following ways:

- Select the Home tab in the Ribbon toolbar, and then select the Search icon.
- Enter any value in the search textbox.
- Select the next (or) previous button to find the entered value in the spreadsheet.
- You can have more options to find values by selecting the more options in the search toolbar.

## Limitations

- Undo/redo for Replace All is not supported in this feature.

## Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## Undo redo in React Spreadsheet component

**Undo** option helps you to undo the last action performed and **Redo** option helps you to do the same action which is reverted in the Spreadsheet. You can use the [allowUndoRedo](#) property to enable or disable undo redo functionality in spreadsheet.

\* The default value for `allowUndoRedo` property is `true`.

By default, the **UndoRedo** module is injected internally into Spreadsheet to perform undo redo.

## Undo

It reverses the last action you performed with Spreadsheet. Undo can be done by any of the following ways:

- Select the undo item from HOME tab in Ribbon toolbar.
- Use `Ctrl + Z` keyboard shortcut to perform the undo.

- Use the [undo](#) method programmatically.

### Redo

It reverses the last undo action you performed with Spreadsheet. Redo can be done by any of the following ways:

- Select the redo item from HOME tab in Ribbon toolbar.
- Use **Ctrl + Y** keyboard shortcut to perform the redo.
- Use the [redo](#) method programmatically.

### Update custom actions in UndoRedo collection

You can update your own custom actions in UndoRedo collection, by using the [updateUndoRedoCollection](#) method. And also customize the undo redo operations of your custom action by using **actionComplete** event.

The following code example shows **How to update and customize your own actions for undo redo functionality in the Spreadsheet control.**

### APP.JSX

### Accessibility in React Spreadsheet component

The Spreadsheet component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Spreadsheet component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The Spreadsheet component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Spreadsheet component:

| Attributes | Purpose |

|-----|-----|

| **grid** (role) | This role is added to the spreadsheet content table and describes the collection of rows and columns. |

| **gridcell** (role) | This role is added to the cell element and describes the rows **<td>** element. |

| **rowheader** (role) | This role is added to the row header and describes the header of the rows. |

- | **colheader** (role) | This role is added to the column header and describes the header of the columns. |
- | **aria-rowindex** (attribute) | This attribute describes the table's row index in the spreadsheet. |
- | **aria-colindex** (attribute) | This attribute describes the table's column index in the spreadsheet. |
- | **aria-selected** (attribute) | This attribute describes an item's (cell, menu, checkbox, etc.) current selected state in the spreadsheet. |
- | **aria-rowcount** (attribute) | This attribute describes the total number of rows in the table. |
- | **aria-colcount** (attribute) | This attribute describes the total number of columns in the table. |
- | **aria-busy** (attribute) | This attribute describes a currently updated or modified element. |
- | **aria-label** (attribute) | This attribute describes the accessible name for the interactive elements. |
- | **textbox** (role) | This role is assigned to the textbox that accepts text input. |
- | **menu** (role) | This role has been added to the menu and describes the menu items. |
- | **aria-expanded** (attribute) | This attribute describes the control (for example, dropdown) is expanded or collapsed. |
- | **aria-multiline** (attribute) | This attribute defines what the Alt + Enter key does in the spreadsheet editor. |

### Keyboard interaction

The Spreadsheet component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Spreadsheet component.

- | Press | To do this |
- |-----|-----|
- | Up arrow | Navigate from the active cell to the previous cell in the same column. |
- | Down arrow | Navigate from the active cell to the next cell in the same column. |
- | Left arrow | Navigate from the active cell to the previous cell in the same row. |
- | Right arrow | Navigate from the active cell to the next cell in the same row. |
- | Tab | Navigate the active cell to the next cell in the same row. |
- | Shift + Tab | Navigate the active cell to the previous cell in the same row. |
- | Home | Moves the selection to starting column in worksheet. |
- | Ctrl + Home | Move the selection to the first visible cell on a worksheet. |
- | Shift + Home | Extend the cell selection to the first column of a worksheet. |
- | Ctrl + Shift + Home | Extend the selection of cells to the beginning of the worksheet. |
- | Ctrl + End | Move to the last cell on a worksheet, right most last column and last row cell. |
- | Page Up | Move page up. |
- | Page Down | Move page down. |

- | Shift + Page Up | Perform page up by selecting all cells between. |
- | Shift + Page Down | Perform page down by selecting all cells between. |
- | Ctrl + Up | Navigate to the non-blank cell before the active cell in the same column. |
- | Ctrl + Down | Navigate to the last non-blank cell in the same column as the active cell. |
- | Ctrl + Left | Navigate to the non-blank cell before the active cell in the same row. |
- | Ctrl + Right | Navigate to the last non-blank cell in the same row as the active cell. |
- | Shift + Up | Extend the selection of cells to the previous row. |
- | Shift + Down | Extend the selection of cells to the next row. |
- | Shift + Left | Extend the selection of cells to the previous column. |
- | Shift + Right | Extend the selection of cells to the next column. |
- | Ctrl + Shift + Up | Extend the cell selection to the previous non-blank cell in the same column as the active cell. |
- | Ctrl + Shift + Down | Extend the cell selection to the last non-blank cell in the same column as the active cell. |
- | Ctrl + Shift + Left | Extend the cell selection to the previous non-blank cell in the same row as the active cell. |
- | Ctrl + Shift + Right | Extend the cell selection to the last non-blank cell in the same row as the active cell. |
- | Enter | Navigate the active cell to the next cell in the same column. |
- | Shift + Enter | Navigate to the previous cell in the same column from the active cell. |
- | Alt + Enter | While editing, add a new line. |
- | Enter | Complete the cell editing and select the cell below in the same column. |
- | Shift + Enter | Complete the cell editing and select the cell above in the same column. |
- | Tab | Complete the cell editing and select the next cell in the same row. |
- | Shift + Tab | Complete the cell editing and select the previous cell in the same row. |
- | Alt | Focus on the active ribbon tab. |
- | Left | Move the focus to the previous items in the ribbon content. |
- | Right | Move the focus to the next items in the ribbon content. |
- | Alt + Down | Open the ribbon dropdown menu. |
- | Esc / Alt + Up | Close the ribbon dropdown menu. |

### Ensuring accessibility

The Spreadsheet component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Spreadsheet component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Spreadsheet component with accessibility tools.

### Keyboard shortcuts in React Spreadsheet component

The keyboard shortcuts supported in the spreadsheet are,

Shortcut	Description
----- -----	
Ctrl + O	Displays dialog to open a file.
Ctrl + S / Alt + F2	Saves the workbook.
F2	Enables edit mode.
ESC	Cancel edit mode and discard the changes.
Backspace and SPACE	Clears content of the active cell and enables edit mode.
Ctrl + C	Copies the selected cells.
Ctrl + X	Cuts the selected cells.
Ctrl + V	Paste the clipboard(cut or copied) content in the new selected range.
Ctrl + B	Applies or removes <b>bold</b> formatting.
Ctrl + I	Applies or removes <i>italic</i> formatting.
Ctrl + U	Applies or removes <u>underline</u> .
Ctrl + 5	Applies or removes <del>strikethrough</del> .
Ctrl + Z	Reverses (Undo) the last action.
Ctrl + Y	Repeats (Redo) the last reversed action.
Ctrl + K	It opens the <b>Insert Hyperlink</b> dialog for adding new hyperlink to a cell. If the selected cell already contains hyperlink, it opens the <b>Edit Hyperlink</b> dialog.
Ctrl + F / Shift + F5	Opens <b>Find</b> dialog.
Ctrl + H	Opens <b>Find and Replace</b> dialog.
Ctrl + G	Opens <b>GoTo</b> dialog, which helps to navigate to cell.
Ctrl + Shift + L	Applies filter to the first row of the selected range or used range.
Alt + F	Opens the <b>File</b> menu.
Alt + H	Go to <b>Home</b> tab.
Alt + N	Go to <b>Insert</b> tab.
Alt + M	Go to <b>Formulas</b> tab.
Alt + A	Go to <b>Data</b> tab.
Alt + W	Go to <b>View</b> tab.

- | Spacebar or Enter | Activate a selected button. |
- | Ctrl + F8 | Expand or collapse the ribbon content. |
- | Ctrl + Shift + U | Expand or collapse the formula bar. |
- | Ctrl + 9 | Hide the selected row. |
- | Ctrl + 0 | Hide the selected column. |
- | Ctrl + & | Apply an outline border to the selected cells. |
- | Ctrl + Shift + & | Apply an outline border to the cells that you've chosen. |
- | Ctrl + Shift + ~ | Apply the **General** number format. |
- | Ctrl + Shift + \$ | Apply the **Currency** format with two decimal places (negative numbers in parentheses). |
- | Shift + F10 | Open the context menu. |
- | Ctrl + % | Apply the **Percentage** format with no decimal places. |
- | Ctrl + ^ | Apply the **Scientific** number format with two decimal places. |
- | Ctrl + Shift + # | Apply the **Date** format with the day, month, and year. |
- | Ctrl + Shift + @ | Apply the **Time** format with the hour and minute, and AM or PM. |
- | Ctrl + Shift + ! | Apply the **Number** format with two decimal places, thousands separator, and minus sign (-) for negative values. |
- | Ctrl + Spacebar | Select an entire column in a worksheet. |
- | Shift + Spacebar | Select an entire row in a worksheet. |
- | Shift + F3 | Opens **Insert Function** dialog. |
- | Ctrl + Alt + N | Opens new workbook. |
- | Shift + Alt + K | Open the **List All Sheets** dropdown option. |
- | Alt + Down | Open the list data validation menu and filter menu. |
- | Alt + Up | Close the list data validation menu and filter menu. |
- | Delete | Remove the contents of the cell. |
- | Shift + F11 | Add a new sheet. |
- | Ctrl + Shift + 9 | Unhide the selected rows. |
- | Ctrl + Shift + 0 | Unhide the selected columns. |
- | Ctrl + D | Fill the cell down. |
- | Ctrl + R | Fill the cell right. |

#### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

## Ribbon in React Spreadsheet component

It helps to organize a spreadsheet's features into a series of tabs. By clicking the expand or collapse icon, you can expand or collapse the ribbon toolbar dynamically.

### Ribbon Customization

You can customize the ribbon using the following methods,

Method	Action
<a href="#">hideRibbonTabs</a>	Used to show or hide the existing ribbon tabs.
<a href="#">enableRibbonTabs</a>	Used to enable or disable the existing ribbon tabs.
<a href="#">addRibbonTabs</a>	Used to add custom ribbon tabs.
<a href="#">hideToolbarItems</a>	Used to show or hide the existing ribbon toolbar items.
<a href="#">enableToolbarItems</a>	Used to enable or disable the specified toolbar items.
<a href="#">addToolbarItems</a>	Used to add the custom items in ribbon toolbar.
<a href="#">hideFileMenuitems</a>	Used to show or hide the ribbon file menu items.
<a href="#">enableFileMenuitems</a>	Used to enable or disable file menu items.
<a href="#">addFileMenuitems</a>	Used to add custom file menu items.

The following code example shows the usage of ribbon customization.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { DropDownButton } from '@syncfusion/ej2-splitbuttons';
import { select, createElement } from '@syncfusion/ej2-base';
import { data } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center'
}, 'A1:F1');
      // Hiding the `Insert` from ribbon.
      spreadsheet.hideRibbonTabs(['Insert']);
      // Set disabled state to `View` ribbon tab.
      spreadsheet.enableRibbonTabs(['View'], false);
      // Adding the `Help` ribbon tab at the last index.
    }
  });
}
```

```

    // Specify the ribbon tab header text in last optional
    argument(`insertBefore`) for inserting new tab before any existing tab.
    spreadsheet.addRibbonTabs([
      header: { text: 'Help' }, content: [{
        text: 'Feedback', tooltipText: 'Feedback',
        click: () => { /* Any click action for this toolbar item
will come here. */ }
      }]
    ]]);
    // Hiding the unwanted toolbar items from `Home` by specifying
    its index.
    spreadsheet.hideToolbarItems('Home', [0, 1, 2, 4, 14, 15, 21,
24]);
    // Set disable state to `Underline`, `Wrap text` toolbar items
    from `Home` by specifying the item id.
    spreadsheet.enableToolbarItems('Home',
[`${spreadsheet.element.id}_underline`, `${spreadsheet.element.id}_wrap`],
false);
    // Set disable state to `Protect Sheet` toolbar item from `Data`
    by mentioning its index.
    spreadsheet.enableToolbarItems('Data', [0], false);
    // Adding the new `Custom Formulas` toolbar item under
    `Formulas` tab for adding custom formulas.
    spreadsheet.addToolbarItems('Formulas', [{ type: 'Separator' },
{
  text: 'Custom Formulas', tooltipText: 'Custom Formulas',
  // You can set click handler for each new custom toolbar
  item
  click: () => {
    // You can add custom formulas here.
  }
}]);
    // Adding new custom item `Import` after the existing `Open`
    item. By default, new item will add after the specified item.
    spreadsheet.addFileMenuItems([
      { text: 'Import', iconCss: 'e-open e-icons' }
    ], 'Open');
    // Adding new custom item `Export As` after the existing `Save
    As` item.
    // Set `insertAfter` optional argument as `false` for adding new
    item before the specified item.
    spreadsheet.addFileMenuItems([
      {
        text: 'Export As', iconCss: 'e-save e-icons', items: [
          { text: 'XLSX', iconCss: 'e-xlsx e-icons' },
          { text: 'XLS', iconCss: 'e-xls e-icons' },
          { text: 'CSV', iconCss: 'e-csv e-icons' }
        ]
      },
      { text: 'Save As', false }
    ], 'Save As', false);
    // Adding the new `custom dropdown button` in the ribbon toolbar
    item under the `Data` tab for adding a custom dropdown button using the
    addToolbarItems method in the spreadsheet ribbon.
    spreadsheet.addToolbarItems('Data', [
      { type: 'Separator' },
      {
        id: 'custombtn', tooltipText: 'Custom Btn', template:
        appendDropDownBtn('custombtn')
      }
    ], 7);
    const fileMenuBeforeOpen = () => {
      // Because the file menu items are created dynamically, you need to
      perform the hide or show and enable/disable operations

```

```

        // under filemenu before open event.
        // Hiding the `Save As` and `Open` item.
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            spreadsheet.hideFileMenuItems(['Save As', 'Open']);
            // Set disable state to `New` item. You can perform any file
            menu items customization by specifying the item id,
            // if it has more than one same item text. Set the last argument
            `isUniqueId` as true for using the item id.

        spreadsheet.enableFileMenuItems([`${spreadsheet.element.id}_New`], false,
        true);
        }
    };
    const fileMenuItemSelect = (args) => {

## Global local in React Spreadsheet component

### Localization

The [Localization](#) library allows you to localize the default text content of the Spreadsheet. The Spreadsheet has static text on some features (cell formatting, Merge, Data validation, etc.) that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the

[locale](#) value and translation object.

The following list of properties and their values are used in the Spreadsheet.

Locale keywords | Text

Cut | Cut

Copy | Copy

Paste | Paste

PasteSpecial | Paste Special

All | All

Values | Values

Formats | Formats

DestroyAlert | Are you sure you want to destroy the current workbook without saving and create a new workbook?

SheetRenameInvalidAlert | Sheet name contains invalid character.

SheetRenameEmptyAlert | Sheet name cannot be empty.

SheetRenameAlreadyExistsAlert | Sheet name already exists. Please enter another name.

DeleteSheetAlert | Are you sure you want to delete this sheet?

DeleteSingleLastSheetAlert | A Workbook must contain at least one visible worksheet.

PickACategory | Pick a category

Description | Description

UnsupportedFile | Unsupported File

InvalidUrl | Invalid Url

SUM | Adds a series of numbers and/or cells.

SUMIF | Adds the cells based on the specified condition.

SUMIFS | Adds the cells based on the specified conditions.

ABS | Returns the value of a number without its sign.

RAND | Returns a random number between 0 and 1.

RANDBETWEEN | Returns a random integer based on the specified values.

FLOOR | Rounds a number down to the nearest multiple of a given factor.

CEILING | Rounds a number up to the nearest multiple of a given factor.

PRODUCT | Multiplies a series of numbers and/or cells.

AVERAGE | Calculates average for the series of numbers and/or cells excluding text.

AVERAGEIF | Calculates average for the cells based on the specified criterion.

AVERAGEIFS | Calculates average for the cells based on the specified conditions.

AVERAGEA | Calculates the average for the cells evaluating TRUE as 1 text and FALSE as 0.

COUNT | Counts the cells that contain numeric values in a range.

COUNTIF | Counts the cells based on the specified condition.

COUNTIFS | Counts the cells based on specified conditions.

COUNTA | Counts the cells that contain values in a range.

MIN | Returns the smallest number of the given arguments.

MAX | Returns the largest number of the given arguments.

DATE | Returns the date based on the given year, month, and day.

DAY | Returns the day from the given date.

DAYS | Returns the number of days between two dates.

IF | Returns value based on the given expression.

IFS | Returns value based on the given multiple expressions.

AND | Returns TRUE if all the arguments are TRUE otherwise returns FALSE.

OR | Returns TRUE if any of the arguments are TRUE otherwise returns FALSE.

IFERROR | Returns value if no error found else it will return specified value.

CHOOSE | Returns a value from the list of values based on the index number.

INDEX | Returns the value of the cell in a given range based on row and column number.

FIND | Returns the position of a string within another string which is case sensitive.

CONCATENATE | Combines two or more strings together.

CONCAT | Concatenates a list or a range of text strings.

SUBTOTAL | Returns subtotal for a range using the given function number.

RADIANS | Converts degrees into radians.

MATCH | Returns the relative position of a specified value in the given range.

DefineNameExists | This name already exists try a different name.

CircularReference | When a formula refers to one or more circular references this may result in an incorrect calculation.

### *Loading translations*

To load translation object in an application, use [load](#) function of the [L10n](#) class.

The following example demonstrates the Spreadsheet in **French** culture. In the below sample we have translated the ribbon tab names and Home tab content (clipboard, cell style).

### **APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { L10n } from '@syncfusion/ej2-base';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
L10n.load({
  'fr-CH': {
    'spreadsheet': {
      'File': 'Fichier',
      'Home': 'Accueil',
      'Insert': 'Insérer',
      'Formulas': 'Formules',
      'Data': 'Les données',
      'View': 'Vue',
      'Cut': 'Coupe',
      'Copy': 'Copie',

```

### Internationalization

The Internationalization library is used to globalize number, date, and time values in the spreadsheet component.

The following example demonstrates the Spreadsheet in French [ fr-CH] culture. In the below sample we have globalized the Date(Date column), Time(Time column), and Currency(Amount column) formats.

```
`ts
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { L10n, loadCldr, setCulture, setCurrencyCode } from '@syncfusion/ej2-base';
import { SpreadsheetComponent, SheetsDirective, SheetDirective, RangesDirective, RangeDirective,
ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-spreadsheet';
import * as cagregorian from './ca-gregorian.json';
import * as currencies from './currencies.json';
import * as numberingSystems from './numberingSystems.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
import { data } from './datasource';
loadCldr(currencies, cagregorian, numbers, timeZoneNames, numberingSystems);
setCulture('fr-CH');
setCurrencyCode('EUR');
L10n.load({
'fr-CH': {
'spreadsheet': {
'File': 'Fichier',
'Home': 'Accueil',
'Insert': 'Insérer',
'Formulas': 'Formules',
'Data': 'Les données',
'View': 'Vue',
'Cut': 'Coupe',
'Copy': 'Copie',
'Paste': 'Pte',
'PasteSpecial': 'Pte spéciale',
'All': 'Tous les',
'Values': 'Valeurs',
'Formats': 'Les formats',
'Font': 'fonte',
'FontSize': 'Taille de police',
```

```
'Bold': 'Audacieux',
'Italic': 'Italique',
'Underline': 'Souligner',
'Strikethrough': 'Barré',
'TextColor': 'Couleur du texte',
'FillColor': 'La couleur de remplissage',
'HorizontalAlignment': 'Alignement horizontal',
'AlignLeft': 'Alignez à gauche',
'AlignCenter': 'centre',
'AlignRight': 'Aligner à droite',
'VerticalAlignment': 'Alignement vertical',
'AlignTop': 'Aligner en haut',
'AlignMiddle': 'Aligner le milieu',
'AlignBottom': 'Aligner le bas',
'InsertFunction': 'Insérer une fonction',
'Delete': 'Effacer',
'Rename': 'Rebaptiser',
'Hide': 'Cacher',
'Unhide': 'Démasquer',
'NumberFormat': 'Nombre Format',
}
}
});
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      //Applies cell and number formatting to specified range of the active sheet
      spreadsheet.cellFormat({ fontWeight: 'bold', textAlign: 'center', verticalAlign: 'middle' }, 'A1:F1');
      spreadsheet.numberFormat('$#,##0.00', 'F2:F11');
    }
  }, []);
```

```

return (
  <SpreadsheetComponent ref={spreadsheetRef} locale='fr-CH' >
    <SheetsDirective>
      <SheetDirective>
        <RangesDirective>
          <RangeDirective dataSource={data}></RangeDirective>
        </RangesDirective>
        <ColumnsDirective>
          <ColumnDirective width={100}></ColumnDirective>
          <ColumnDirective width={110}></ColumnDirective>
          <ColumnDirective width={100}></ColumnDirective>
          <ColumnDirective width={180}></ColumnDirective>
          <ColumnDirective width={130}></ColumnDirective>
          <ColumnDirective width={130}></ColumnDirective>
        </ColumnsDirective>
      </SheetDirective>
    </SheetsDirective>
  </SpreadsheetComponent>
);
};

export default App;

const root = createRoot(document.getElementById('root')!);

root.render(<App />);
`

```

Internationalization [sample link](#)

### Right to left (RTL)

RTL provides an option to switch the text direction and layout of the Spreadsheet component from right to left. It improves the user experiences and accessibility for users who use right-to-left languages (Arabic, Farsi, Urdu, etc.). To enable RTL Spreadsheet, set the [enableRtl](#) to true.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

### See Also

- [Localization](#)

### Freeze pane in React Spreadsheet component

Freeze Panes helps you to keep particular rows or columns visible when scrolling the sheet content in the spreadsheet. You can specify the number of frozen rows and columns using the [frozenRows](#) and [frozenColumns](#) properties inside the [Link to the Video](#) property.

To get started quickly with Freeze Panes in React Spreadsheet, you can check on this video:

### Apply freeze panes on UI

#### User Interface:

In the active spreadsheet, click the cell where you want to create freeze panes. Freeze panes can be done in any of the following ways:

- Select the View tab in the Ribbon toolbar and choose the **Freeze Panes** item.
- Use the [freezePanels](#) method programmatically.

### FrozenRows

It allows you to keep a certain number of rows visible while scrolling vertically through the rest of the worksheet.

#### User Interface:

In the active spreadsheet, select the cell where you want to create frozen rows. Frozen rows can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the **Freeze Rows** item.
- You can specify the number of frozen rows using the **frozenRows** property inside the **Sheet** property.

### FrozenColumns

It allows you to keep a certain number of columns visible while scrolling horizontally through the rest of the worksheet.

**User Interface:**

In the active spreadsheet, select the cell where you want to create frozen columns. Frozen columns can be done in any one of the following ways:

- Select the View tab in the Ribbon toolbar and choose the Freeze Columns item.
- You can specify the number of frozen columns using the frozenColumns property inside the Sheet property.

In this demo, the frozenColumns is set as '2', and the frozenRows is set as '2'. Hence, the two columns on the left and the top two rows are frozen.

### Limitations

Here, we have listed out the limitations with Freeze Panes feature.

- Merging the cells between freeze and unfreeze area.
- If images and charts are added inside the freeze area cells, their portion in the unfreeze area will not move when scrolling.

### Note

You can refer to our [React Spreadsheet](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Spreadsheet example](#) to know how to present and manipulate data.

### Template in React Spreadsheet component

Cell Template is used for adding HTML elements into Spreadsheet. You can add the cell template in spreadsheet by using the `template` property and specify the address using the `address` property inside the `ranges` property. You can customize the HTML elements similar to Syncfusion components (TextBox, DropDownList, RadioButton, MultiSelect, DatePicker etc) by using the `beforeCellRender` event. In this demo, Cell template is applied to C2:C9 and instantiated with HTML input components like TextBox, RadioButton, TextArea. You need to bind the events to perform any operations through HTML elements or Syncfusion components. Here, we have added `change` event in to the MultiSelect control, and we have updated the selected data into the spreadsheet cell through that change event.

The following sample describes the above behavior.

Sample link: [Cell template](#)

### Use Cases

#### Collaborative editing in React Spreadsheet component

The collaborative editing support allows you to work at a spreadsheet collaboratively with other users. Multiple users can access to the the same spreadsheet simultaneously.

#### Dependencies

The following list of dependencies are required to use the collaborative editing support in spreadsheet.

```

`ts
|-- @aspnet/signalr
|-- eventsource
|-- request
|-- ws
`

```

\* Run the command `npm i @aspnet/signalr` to install `@aspnet/signalr` packages in your application.

#### Client configuration

To broadcast the data for every action in the spreadsheet, you need to transfer the data to the server through `send` method in `actionComplete` event and receive the same data by using the `dataReceived` method. In the `dataReceived` method, you need to update the action to the connected clients through `updateAction` method.

The following code example shows `Collaborative Editing` support in the Spreadsheet control.

```

`ts
import * as React from 'react';
import { createRoot } from 'react-dom/client';

import { SpreadsheetComponent, SheetsDirective, SheetDirective, RangesDirective,
CollaborativeEditArgs } from '@syncfusion/ej2-react-spreadsheet';

```

```

import { RangeDirective, ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-spreadsheet';
import * as signalR from '@aspnet/signalr';
import { defaultData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  // For signalR Hub connection
  const connection: signalR.HubConnection = new
  signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
  from AspNetCore service
  skipNegotiation: true,
  transport: signalR.HttpTransportType.WebSockets
  }).build();
  const onActionComplete = (args: any) => {
    connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
  }
  React.useEffect(() => {
    let spreadsheet = spreadsheetRef.current;
    connection.on('dataReceived', (data: string) => {
      let model: CollaborativeEditArgs = JSON.parse(data) as CollaborativeEditArgs;
      if (spreadsheet) {
        spreadsheet.updateAction(model); // update the action to the connected clients
      }
    });
    connection.start().then(() => { // to start the server
      console.log('server connected!!!');
    }).catch(err => console.log(err));
  }, [connection]); // passing an empty array as second argument triggers the callback in useEffect only
  after the initial render thus replicating componentDidMount lifecycle behaviour
  return (
    <SpreadsheetComponent ref={spreadsheetRef} actionComplete={onActionComplete}>
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>

```

```

<RangeDirective dataSource={defaultData}></RangeDirective>
</RangesDirective>
<ColumnsDirective>
  <ColumnDirective width={180}></ColumnDirective>
  <ColumnDirective width={130}></ColumnDirective>
  <ColumnDirective width={130}></ColumnDirective>
</ColumnsDirective>
</SheetDirective>
</SheetsDirective>
</SpreadsheetComponent>
);
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
`

```

#### *Server configuration*

To make the communication between the server to the connected clients and from clients to the server, you need to configure the signalR Hubs using the following code.

```

`ts
import * as signalR from '@aspnet/signalr';
// For signalR Hub connection
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
`

```

#### *Hub configuration*

Initially create a ASP.NET Core project and add the hub file for sending and receiving the data between server and clients.

```

`ts
using Microsoft.AspNetCore.SignalR;
using System.Threading.Tasks;

```

```

namespace WebApplication.Hubs
{
    public class SpreadsheetHub : Hub
    {
        public async Task BroadcastData(string data)
        {
            await Clients.Others.SendAsync("dataReceived", data);
        }
    }
}

```

To configure the SignalR middleware by registering the following service in the `ConfigureServices` method of the `Startup` class.

```

`ts
services.AddSignalR(e =>
{
    e.MaximumReceiveMessageSize = int.MaxValue; // Option to increase message size for inserting image
    feature. By default, SignalR send messages up to 32 KB.
});

```

To set up the SignalR routes by calling `MapHub` in the `Configure` method of the `Startup` class.

```

`ts
app.UseEndpoints(endpoints =>
{
    endpoints.MapRazorPages();
    endpoints.MapHub<SpreadsheetHub>("/hubs/spreadsheethub");
});

```

For hosting the service, you may use the above code snippet or download and run the [local service](#).

*Prevent the particular action update for collaborative client*

Using the `action` argument from the `actionComplete` event, you can prevent the particular action update for collaborative client.

The following code example shows how to prevent collaborative client from updating the `format` action.

```

`ts

```

```

import * as React from 'react';
import { createRoot } from 'react-dom/client';

import { SpreadsheetComponent, SheetsDirective, SheetDirective, RangesDirective,
CollaborativeEditArgs } from '@syncfusion/ej2-react-spreadsheet';

import { RangeDirective, ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-spreadsheet';

import * as signalR from '@aspnet/signalr';
import { defaultData } from './datasource';

function App() {

const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);

// For signalR Hub connection

const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl('https://localhost:44385/hubs/spreadsheethub', { // localhost
from AspNetCore service

skipNegotiation: true,

transport: signalR.HttpTransportType.WebSockets

}).build();

const onActionComplete = (args: any) => {
if (args.action !== 'format') { // prevent the format action
connection.send('BroadcastData', JSON.stringify(args)); // send the action data to the server
}
}

React.useEffect(() => {
let spreadsheet = spreadsheetRef.current;
connection.on('dataReceived', (data: string) => {
if (spreadsheet) {
let model: CollaborativeEditArgs = JSON.parse(data) as CollaborativeEditArgs;
spreadsheet.updateAction(model); // update the action to the connected clients
}
});

connection.start().then(() => { // to start the server
console.log('server connected!!!');
}).catch(err => console.log(err));

}, [connection]); // passing an empty array as second argument triggers the callback in useEffect only
after the initial render thus replicating componentDidMount lifecycle behaviour

```

```

return (
  <SpreadsheetComponent ref={spreadsheetRef} actionComplete={onActionComplete}>
    <SheetsDirective>
      <SheetDirective>
        <RangesDirective>
          <RangeDirective dataSource={defaultData}></RangeDirective>
        </RangesDirective>
        <ColumnsDirective>
          <ColumnDirective width={180}></ColumnDirective>
          <ColumnDirective width={130}></ColumnDirective>
          <ColumnDirective width={130}></ColumnDirective>
        </ColumnsDirective>
      </SheetDirective>
    </SheetsDirective>
  </SpreadsheetComponent>
);
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
`

```

#### *Perform import action for collaborative clients*

Using the `action` argument from the `actionComplete` event, you can identify whether the import action is performed or not. If the action is `import`, then you need to send the `response data` to the server and also update the same to the collaborative clients.

The following code example shows how to perform the import functionality for collaborative clients.

```

`ts
import * as React from 'react';
import { isNullOrUndefined } from "@syncfusion/ej2-base";
import { SpreadsheetComponent, CollaborativeEditArgs } from '@syncfusion/ej2-react-spreadsheet';
import * as signalR from "@microsoft/signalr";
import { useEffect, useRef } from "react";
import "./App.css";
function App() {

```

```
const height: string = "400px";
const connection: signalR.HubConnection = new
signalR.HubConnectionBuilder().withUrl(https://localhost:44385/hubs/spreadsheethub, {
skipNegotiation: true,
transport: signalR.HttpTransportType.WebSockets
}).build();
const onActionComplete = (args: {action: string, response: any}): void => {
if (args.action === 'import') {
// Send the action data to the server in args.response at the time of importing an excel file.
connection.send("BroadcastData", JSON.stringify(args.response.data));
}
else {
// Send the action data to the server for other than import actions.
connection.send("BroadcastData", JSON.stringify(args));
}
};
const editor = useRef<SpreadsheetComponent>(null);
useEffect(() => {
connection.on("dataReceived", (data: string) => {
const model: CollaborativeEditArgs = JSON.parse(
data
) as CollaborativeEditArgs;
// Condition to check whether action performed is import.
if (isNullOrUndefined(model['action'])) {
// Load the imported excel file data as JSON to the connected clients.
const jsonData: object = { Workbook: model };
editor.current!.openFromJson({ file: jsonData });
}
else {
// Update the action details to the connected clients.
editor.current!.updateAction(model);
}
});
});
```

```

connection
.start()
.then(() => {
console.log("server connected!!!");
})
.catch((err) => console.log(err));
}, [connection]);
return (
<SpreadsheetComponent
ref={editor}
height={height}
openUrl="https://services.syncfusion.com/react/production/api/spreadsheet/open"
actionComplete={onActionComplete}
/>
);
};
export default App;
`

```

## How To

Sort a range by custom list in React Spreadsheet component

You can also define the sorting of cell values based on your own customized personal list. In this article, custom list is achieved using **custom sort comparer**.

In the following demo, the **Trustworthiness** column is sorted based on the custom lists **Perfect**, **Sufficient**, and **Insufficient**.

### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { DataUtil } from '@syncfusion/ej2-data';

```

```

import { tradeData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const mySortComparer = (x, y) => {
    // custom sort comparer to sort based on the custom list.
    let customList = ['Perfect', 'Sufficient', 'Insufficient'];
    let comparer = DataUtil.fnSort('Ascending');
    return comparer(x ? customList.indexOf(x.value) : x, y ?
customList.indexOf(y.value) : y);
  };
  const onDataBound = () => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet && spreadsheet.activeSheetIndex === 0) {
      spreadsheet.sort({ sortDescriptors: { field: 'F', sortComparer:
mySortComparer }, containsHeader: true }, 'A1:H20');
    }
  };
  const onSortComplete = (args) => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.selectRange(args.range);
    }
  };
  return (
    <SpreadsheetComponent ref={spreadsheetRef} dataBound={onDataBound}
sortComplete={onSortComplete}>
      <SheetsDirective>
        <SheetDirective>
          <RangesDirective>
            <RangeDirective
dataSource={tradeData}></RangeDirective>
          </RangesDirective>
          <ColumnsDirective>
            <ColumnDirective width={90}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
          </ColumnsDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  );
};
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, CellModel, SortEventArgs } from '@syncfusion/ej2-react-
spreadsheet';

```

```

import { RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { DataUtil } from '@syncfusion/ej2-data';
import { tradeData } from './datasource';
function App() {
    const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
    const mySortComparer = (x: CellModel, y: CellModel): number => {
        // custom sort comparer to sort based on the custom list.
        let customList: string[] = ['Perfect', 'Sufficient',
'Insufficient'];
        let comparer: Function = DataUtil.fnSort('Ascending');
        return comparer(x ? customList.indexOf(x.value as string) : x, y ?
customList.indexOf(y.value as string) : y);
    };
    const onDataBound = (): void => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet && spreadsheet.activeSheetIndex === 0) {
            spreadsheet.sort({ sortDescriptors: { field: 'F', sortComparer:
mySortComparer }, containsHeader: true }, 'A1:H20');
        }
    };
    const onSortComplete = (args: SortEventArgs): void => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            spreadsheet.selectRange(args.range as string);
        }
    };
    return (
        <SpreadsheetComponent ref={spreadsheetRef} dataBound={onDataBound}
sortComplete={onSortComplete}>
            <SheetsDirective>
                <SheetDirective>
                    <RangesDirective>
                        <RangeDirective
dataSource={tradeData}></RangeDirective>
                    </RangesDirective>
                    <ColumnsDirective>
                        <ColumnDirective width={90}></ColumnDirective>
                        <ColumnDirective width={130}></ColumnDirective>
                        <ColumnDirective width={130}></ColumnDirective>
                    </ColumnsDirective>
                </SheetDirective>
            </SheetsDirective>
        </SpreadsheetComponent>
    );
};
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

### Print in React Spreadsheet component

You can use the `print` method by importing from `ej2-base` package. Here, the `Select` event in the dropdown and the `dataBound` event are used to print the single/multiple sheets of data. To print the single/multiple sheets, use the dropdown button and select the `Print` (or) `Print All` option. In the following sample, you can be able to print the single/multiple sheets.

#### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { DropDownButtonComponent } from '@syncfusion/ej2-react-
splitbuttons';
import { print } from '@syncfusion/ej2-base';
import { budgetData, salaryData, printElement } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const items = [
    { text: "Print" },
    { text: "Print All" }
  ];
  let isPrint = false;
  const dataBound = () => {
    let spreadsheet = spreadsheetRef.current;

```

```

        if (spreadsheet && isPrint) {
            printElement.querySelector(".e-sheet-content").innerHTML +=
document.querySelector(".e-sheet-content").outerHTML;
            let usedRange = spreadsheet.getActiveSheet().usedRange;
            let tbody = printElement.querySelector('.e-sheet-
content').children[spreadsheet.activeSheetIndex].querySelector('tbody');
            for (let i = tbody.getElementsByClassName('e-row').length; i >=
0; i--) {
                if (tbody.getElementsByClassName('e-row')[i] &&
parseInt(tbody.getElementsByClassName('e-row')[i].getAttribute('aria-
rowindex')) > usedRange.rowIndex + 1) {
                    tbody.getElementsByClassName('e-row')[i].remove();
                }
            }
            let sheets = spreadsheet.sheets;
            if (sheets.length - 1 === spreadsheet.activeSheetIndex) {
                let count = printElement.querySelector(".e-sheet-

### Create a object structure in React Spreadsheet component

This topic guides you to construct a JSON structure that can be passed to the [openFromJson](#) method to render the spreadsheet. The JSON structure is an object with the key as **Workbook** and the [properties](#) of the spreadsheet as value.

```

`js
{ Workbook: {} }
`

```

The following properties are the root level properties of the **Workbook** object.

Property	Type	Description
activeSheetIndex	number	Specifies active sheet index in the workbook.
sheets	<b>Sheet[]</b>	Contains a list of sheet properties.
definedNames	<b>DefineName[]</b>	Specifies the name for a range and uses it in the formula for calculation.

The following table defines each property of the **Sheet**.

Property	Type	Description
name	string	Specifies the name of the sheet.
selectedRange	string	Specifies selected range in the sheet.
activeCell	string	Specifies active cell within <b>selectedRange</b> in the sheet.
topLeftCell	string	Specified cell will be positioned at the upper-left corner of the sheet.
showHeaders	boolean	Specifies to show or hide column and row headers in the sheet.
showGridLines	boolean	Specifies to show or hide gridlines in the sheet.
isProtected	boolean	Specifies to protect the cells in the sheet.
state	<a href="#">SheetState</a>	Specifies the sheet visibility state. There must be at least one visible sheet in Spreadsheet.
columns	<b>Column[]</b>	Contains a list of column properties
rows	<b>Row[]</b>	Contains a list of row properties
protectSettings	<a href="#">ProtectSettings</a>	Configures protect and its options.
conditionalFormats	<b>ConditionalFormat[]</b>	Specifies the conditional formatting for the sheet.

The following table defines each property of the **Column**.

Property	Type	Description
width	number	Specifies the width of the column.
customWidth	boolean	Specifies custom width of the column.
hidden	boolean	To hide or show the column in the sheet.

The following table defines each property of the **Row**.

Property	Type	Description
height	number	Specifies the height of the row.
customHeight	boolean	Specifies the custom height of the row.
hidden	boolean	To hide or show the row in the sheet.
cells	<b>Cell[]</b>	Contains a list of cell properties

The following table defines each property of the **Cell**.

Property	Type	Description
value	string	Defines the value of the cell which can be text or number.

| formula | string | Defines the formula or expression of the cell. |

| format | string | Specifies the number format code to display the value in specified number format. |

| hyperlink | string | Specifies the hyperlink of the cell. |

| wrap | boolean | Wraps the cell text to the next line, if the text width exceeds the column width. |

| isLocked | boolean | Specifies the cell whether it is locked or not, for allowing edit range in the spreadsheet protect option. |

| colSpan | number | Specifies the column-wise cell merge count. |

| rowSpan | number | Specifies the row-wise cell merge count. |

| style | **CellStyle** | Specifies the cell style options. |

| validation | **Validation** | Specifies the validation of the cell. |

| image | **Image[]** | Specifies the image of the cell. |

The following table defines each property of the **CellStyle**.

Property	Type	Description
-----	-----	-----
fontFamily	<b>FontFamily</b>	Specifies font family of the cell.
verticalAlign	<b>VerticalAlign</b>	Specifies vertical align of the cell.
textAlign	<b>TextAlign</b>	Specifies text align style of the cell.
textIndent	string	Specifies text indent style of the cell.
color	string	Specifies font color of the cell.
backgroundColor	string	Specifies the background color of the cell.
fontWeight	<b>FontWeight</b>	Specifies font weight of the cell.
fontStyle	<b>FontStyle</b>	Specifies font style of the cell.
fontSize	string	Specifies font size of the cell.
textDecoration	<b>TextDecoration</b>	Specifies text decoration of the cell.
border	string	Specifies border of the cell.
borderTop	string	Specifies top border of the cell.
borderBottom	string	Specifies bottom border of the cell.
borderLeft	string	Specifies left border of the cell.
borderRight	string	Specifies right border of the cell.

`js

```
type FontFamily = 'Arial' | 'Arial Black' | 'Axettac Demo' | 'Batang' | 'Book Antiqua' | 'Calibri' | 'Courier' |
'Courier New' | 'Din Condensed' | 'Georgia' | 'Helvetica' | 'Helvetica New' | 'Roboto' | 'Tahoma' | 'Times
New Roman' | 'Verdana';
```

```
type VerticalAlign = 'bottom' | 'middle' | 'top';
type TextAlign = 'left' | 'center' | 'right';
type FontWeight = 'bold' | 'normal';
type FontStyle = 'italic' | 'normal';
type TextDecoration = 'underline' | 'line-through' | 'underline line-through' | 'none';
`js
```

The following table defines each property of the Validation.

Property	Type	Description
type	ValidationType	Specifies Validation Type.
operator	ValidationOperator	Specifies Validation Operator.
value1	string	Specifies Validation Minimum Value.
value2	string	Specifies Validation Maximum Value.
ignoreBlank	boolean	Specifies IgnoreBlank option in Data Validation.
inCellDropDown	boolean	Specifies InCellDropDown option in Data Validation.
isHighlighted	boolean	Specifies to allow Highlight Invalid Data.

```
`js
type ValidationType = 'WholeNumber' | 'Decimal' | 'Date' | 'TextLength' | 'List' | 'Time';
type ValidationOperator = 'Between' | 'NotBetween' | 'EqualTo' | 'NotEqualTo' | 'LessThan' | 'GreaterThan' | 'GreaterThanOrEqualTo' | 'LessThanOrEqualTo';
`js
```

The following table defines each property of the Image.

Property	Type	Description
src	string	Specifies the image source.
id	string	Specifies image element id.
height	number	Specifies the height of the image.
width	number	Specifies the width of the image.
top	number	Specifies the top position of the image.
left	number	Specifies the left position of the image.

The following table defines each property of the ConditionalFormat.

Property	Type	Description
----------	------	-------------

```
|-----|-----|-----|
| type | HighlightCell or TopBottom or DataBar or ColorScale or IconSet | Specifies Conditional
formatting Type. |
| format | Format | Specifies format. |
| cFColor | CFColor | Specifies Conditional formatting Highlight Color. |
| value | string | Specifies Conditional formatting value. |
| range | string | Specifies Conditional formatting range. |
`js
type HighlightCell = 'GreaterThan' | 'LessThan' | 'Between' | 'EqualTo' | 'ContainsText' | 'DateOccur' |
'Duplicate' | 'Unique';
type TopBottom = 'Top10Items' | 'Bottom10Items' | 'Top10Percentage' | 'Bottom10Percentage' |
'BelowAverage' | 'AboveAverage';
type DataBar = 'BlueDataBar' | 'GreenDataBar' | 'RedDataBar' | 'OrangeDataBar' | 'LightBlueDataBar' |
'PurpleDataBar';
type ColorScale = 'GYRColorScale' | 'RYGColorScale' | 'GWRColorScale' | 'RWGColorScale' |
'BWRColorScale' | 'RWBColorScale' | 'WRCColorScale' | 'RWColorScale' | 'GWColorScale' |
'WGColorScale' | 'GYColorScale' | 'YGColorScale';
type IconSet = 'ThreeArrows' | 'ThreeArrowsGray' | 'FourArrowsGray' | 'FourArrows' | 'FiveArrowsGray'
| 'FiveArrows' | 'ThreeTrafficLights1' | 'ThreeTrafficLights2' | 'ThreeSigns' | 'FourTrafficLights' |
'FourRedToBlack' | 'ThreeSymbols' | 'ThreeSymbols2' | 'ThreeFlags' | 'FourRating' | 'FiveQuarters' |
'FiveRating' | 'ThreeTriangles' | 'ThreeStars' | 'FiveBoxes';
type CFColor = 'RedFT' | 'YellowFT' | 'GreenFT' | 'RedF' | 'RedT';
`
```

The following table defines each property of the **Format**.

Property	Type	Description
format	string	Specifies the number format code to display the value in specified number format.
style	CellStyle	Specifies the cell style options.

The following table defines each property of the **DefinedName**.

Property	Type	Description
name	string	Specifies a name for the defined name, which can be used in the formula.
scope	string	Specifies scope for the defined name.
comment	string	Specifies comment for the defined name.
refersTo	string	Specifies reference for the defined name.

In the following demo, the JSON structure is passed to the `openFromJson` method to render the spreadsheet in the `created` event.

### APP.JSX

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { jsonData } from '../datasource';
function App() {
    const spreadsheetRef = React.useRef(null);

```

### *Changing the active sheet while importing a file in React Spreadsheet component*

You can change the active sheet of imported file by updating [activeSheetIndex](#) property on the [openComplete](#) event.

The following code example shows how to set the active sheet when importing an Excel file.

### **APP.JSX**

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef(null);
  const openCompleteHandler = () => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.activeSheetIndex = 2;
    }
  };
}

```

```

    }
  }
  return (
    <SpreadsheetComponent
      openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/open'
      saveUrl='https://services.syncfusion.com/react/production/api/spreadsheet/save'
      ref={spreadsheetRef}
      openComplete={openCompleteHandler}
    >
    </SpreadsheetComponent>
  );
}
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  const openCompleteHandler = (): void => {
    let spreadsheet = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.activeSheetIndex = 2;
    }
  }
  return (
    <SpreadsheetComponent
      openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/open'
      saveUrl='https://services.syncfusion.com/react/production/api/spreadsheet/save'
      ref={spreadsheetRef}
      openComplete={openCompleteHandler}
    >
    </SpreadsheetComponent>
  );
}
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

*Identify the context menu opened in React Spreadsheet component*

The Spreadsheet includes several context menus that will open and display depending on the action. When you right-click on a cell, for example, a context menu with options related to the cell element appears.

The class name returned by the [contextMenuBeforeOpen](#) event can be used to identify the context menu that is opened. The context menus and their class names are tabulated below.

Class name	Context menu name
----- -----	
.e-sheet-content	Cell context menu
.e-toolbar-item	Footer context menu
.e-rowhdr-table	Row header context menu
.e-colhdr-table	Column header context menu

The following code example shows how to identify the context menu opened.

**APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { closest } from '@syncfusion/ej2-react-base';
function App() {
  const contextMenuBeforeOpen = (args) => {
    if (closest(args.event.target, '.e-sheet-content')) {
      console.log('Cell Context Menu');
    } else if (closest(args.event.target, '.e-colhdr-table')) {
      console.log('Column Header Context Menu');
    } else if (closest(args.event.target, '.e-rowhdr-table')) {
      console.log('Row Header Context Menu');
    } else if (closest(args.event.target, '.e-toolbar-item')) {
      console.log('Footer Context Menu');
    }
  }
  return (
    <SpreadsheetComponent
      contextMenuBeforeOpen={contextMenuBeforeOpen}
    > </SpreadsheetComponent>
  );
}
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}
```

**APP.TSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
```

```
import { closest } from '@syncfusion/ej2-react-base';
import { BeforeOpenCloseMenuEventArgs } from '@syncfusion/ej2-react-navigations';
function App() {
    const contextMenuBeforeOpen = (args: BeforeOpenCloseMenuEventArgs): void
=> {
        if (closest(args.event.target, '.e-sheet-content')) {
            console.log('Cell Context Menu');
        } else if (closest(args.event.target, '.e-colhdr-table')) {
            console.log('Column Header Context Menu');
        } else if (closest(args.event.target, '.e-rowhdr-table')) {
            console.log('Row Header Context Menu');
        } else if (closest(args.event.target, '.e-toolbar-item')) {
            console.log('Footer Context Menu');
        }
    }
    return (
        <SpreadsheetComponent
            contextMenuBeforeOpen={contextMenuBeforeOpen}
        > </SpreadsheetComponent>
    );
}
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}
```

#### *Import an excel document using file uploader in ##Platform\_Name## Spreadsheet component*

If you explore your machine to select and upload an excel document using the file uploader, you will receive the uploaded document as a raw file in the [success](#) event of the file uploader. In this [success](#) event, you should pass the received raw file as an argument to the Spreadsheet's [open](#) method to see the appropriate output.

The following code example shows how to import an excel document using file uploader in spreadsheet.

#### **APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    const spreadsheetRef = React.useRef(null);
    const uploaderRef = React.useRef(null);
    const asyncSettings = {
        saveUrl:
            'https://services.syncfusion.com/react/production/api/FileUploader/Save',
        removeUrl:
            'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    };
    const allowedExtensions = '.xlsx, .xls, .csv';
    const onSuccess = (args) => {
        if (args.operation == 'upload')
```

```

        spreadsheetRef.current.open({ file: args.file.rawFile });
    };
    return (
        <div>
            <SpreadsheetComponent
                ref={spreadsheetRef}
            />
        </div>
    );
}
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% enddraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { UploaderComponent } from '@syncfusion/ej2-react-inputs';
function App() {
    const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
    const uploaderRef = React.useRef<UploaderComponent>(null);
    const asyncSettings = {
        saveUrl:
            'https://services.syncfusion.com/react/production/api/FileUploader/Save',
        removeUrl:
            'https://services.syncfusion.com/react/production/api/FileUploader/Remove',
    };
    const allowedExtensions: string = '.xlsx, .xls, .csv';
    const onSuccess = (args) => {
        if (args.operation == 'upload')
            spreadsheetRef.current.open({ file: args.file.rawFile });
    };
    return (
        <div>
            <SpreadsheetComponent
                ref={spreadsheetRef}
            />
        </div>
    );
}
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

```

        ref={uploaderRef}
        asyncSettings={asyncSettings}
        success={onSuccess}
        allowedExtensions={allowedExtensions}
      ></UploaderComponent>
    </div>
  );
}
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

### Save and open Spreadsheet data as a Base64 string in React Spreadsheet component

In the Spreadsheet component, there is currently no direct option to save and open data as a **Base64** string. You can achieve this by saving the Spreadsheet data as blob data and then converting that saved blob data to a **Base64** string using **FileReader**.

You can get the Spreadsheet data as blob in the [saveComplete](#) event when you set the **needBlobData** as **true** and **isFullPost** as **false** in the [beforeSave](#) event.

The following code example shows how to save and open the spreadsheet data as base64 string.

#### APP.JSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective, RangeDirective, ColumnsDirective, ColumnDirective } from
'@syncfusion/ej2-react-spreadsheet';
import { data } from './datasource';
function App() {
  const spreadsheetRef = React.useRef(null);
  const [base64String, setBase64String] = React.useState('');
  const beforeSave = (args) => {
    args.needBlobData = true; // To trigger the saveComplete event.
    args.isFullPost = false; // Get the spreadsheet data as blob data in
the saveComplete event.
  }

  const saveComplete = (args) => {
    // Convert blob data to base64 string.
    let reader = new FileReader();
    reader.readAsDataURL(args.blobData);
    reader.onloadend = function () {
      setBase64String(reader.result);
    };
  }

  const importBtn = () => {
    let spreadsheet = spreadsheetRef.current;
    fetch(base64String)
      .then((response) => response.blob())
      .then((fileBlob) => {
        let file = new File([fileBlob], 'Sample.xlsx');
        spreadsheet.open({ file: file });
      });
  }
}

```

```

    });
  }
  const exportBtn = () => {
    let spreadsheet = spreadsheetRef.current;
    spreadsheet.save({
      url:
        'https://services.syncfusion.com/react/production/api/spreadsheet/save',
      fileName: 'Worksheet',
      saveType: 'Xlsx',
    }); // Specifies the save URL, file name, file type need to be
    saved.
    // Logs base64 string into the console.
    console.log('Base64 String - ', base64String);
  }
  return (
    <div className='control-section spreadsheet-control'>
      <button className="e-btn custom-btn" onClick={importBtn}>Import
      Base64</button>
      <button className="e-btn custom-btn" onClick={exportBtn}>Export
      as Base64</button>
      <SpreadsheetComponent
        openUrl='https://services.syncfusion.com/react/production/api/spreadsheet/op
        en' ref={spreadsheetRef} beforeSave={beforeSave}
        saveComplete={saveComplete} >
        <SheetsDirective>
          <SheetDirective name="Car Sales Report">

### *Insert a sheet programmatically and make it the active sheet in React Spreadsheet component*

A sheet is a collection of cells organized in the form of rows and columns that allows you to store, format, and manipulate the data. Using [insertSheet](#) method, you can insert one or more sheets at the desired index. Then, you can make the inserted sheet as active sheet by focusing the start cell of that sheet using the [goTo](#) method.

The following code example shows how to insert a sheet programmatically and make it the active sheet.

#### **APP.JSX**

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { SheetsDirective, SheetDirective, RangesDirective, RangeDirective,
ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-
spreadsheet';
import { data, employeeData } from './datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    const btnClick = () => {
        let spreadsheet = spreadsheetRef.current;
        if (spreadsheet) {
            spreadsheet.insertSheet(
                [
                    {

```

```

        index: 1,
        name: 'new_sheet',
        ranges: [
          {
            dataSource: employeeData,
            startCell: 'A1'
          },
        ]
      },
    ]
  );
  // Use the timeout function to wait until the sheet is inserted.
  setTimeout(() => {
    // Method for switching to a new sheet.
    spreadsheet.goTo('new_sheet!A1');
  })
}
};
return (
  <div>
    <button className='e-btn custom-btn' onClick={btnClick}>Insert
Sheet</button>
    <SpreadsheetComponent ref={spreadsheetRef}>
      <SheetsDirective>
        <SheetDirective name="Car Sales Report">
          <RangesDirective>
            <RangeDirective dataSource={data}></RangeDirective>
          </RangesDirective>
          <ColumnsDirective>
            <ColumnDirective width={180}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={180}></ColumnDirective>
            <ColumnDirective width={130}></ColumnDirective>
            <ColumnDirective width={120}></ColumnDirective>
          </ColumnsDirective>
        </SheetDirective>
      </SheetsDirective>
    </SpreadsheetComponent>
  </div>
);
}
export default App;
const root = createRoot(document.getElementById('root'));
root.render(<App />);
{% endraw %}

```

### APP.TSX

```

{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent } from '@syncfusion/ej2-react-spreadsheet';
import { SheetsDirective, SheetDirective, RangesDirective, RangeDirective,
ColumnsDirective, ColumnDirective } from '@syncfusion/ej2-react-
spreadsheet';

```

```

import { data, employeeData } from './datasource';
function App() {
  const spreadsheetRef = React.useRef<SpreadsheetComponent>(null);
  const btnClick = (): void => {
    let spreadsheet: SpreadsheetComponent = spreadsheetRef.current;
    if (spreadsheet) {
      spreadsheet.insertSheet(
        [
          {
            index: 1,
            name: 'new_sheet',
            ranges: [
              {
                dataSource: employeeData,
                startCell: 'A1'
              }
            ],
          }
        ],
      );
      // Use the timeout function to wait until the sheet is inserted.
      setTimeout(() => {
        // Method for switching to a new sheet.
        spreadsheet.goTo('new_sheet!A1');
      })
    }
  };
  return (
    <div>
      <button className='e-btn custom-btn' onClick={btnClick}>Insert
Sheet</button>
      <SpreadsheetComponent ref={spreadsheetRef}>
        <SheetsDirective>
          <SheetDirective name="Car Sales Report">
            <RangesDirective>
              <RangeDirective dataSource={data}></RangeDirective>
            </RangesDirective>
            <ColumnsDirective>
              <ColumnDirective width={180}></ColumnDirective>

              <ColumnDirective width={120}></ColumnDirective>
            </ColumnsDirective>
          </SheetDirective>
        </SheetsDirective>
      </SpreadsheetComponent>
    </div>
  );
}
export default App;
const root = createRoot(document.getElementById('root')!);
root.render(<App />);
{% endraw %}

```

*Get the filtered rows in React Spreadsheet component*

Filtering allows you to view specific rows in a spreadsheet while hiding the others. The [allowFiltering](#) property allows you to enable or disable filtering functionality through the UI. You can also use the [allowFiltering](#) property and [applyFilter](#) method combination to filter data via code behind. The filtered rows can be identified by iterating through the row collection on the sheet and using the `isFiltered` property available in each row object.

The following code example shows how to get the filtered rows.

**APP.JSX**

```
{% raw %}
import * as React from 'react';
import { createRoot } from 'react-dom/client';
import { SpreadsheetComponent, SheetsDirective, SheetDirective,
RangesDirective } from '@syncfusion/ej2-react-spreadsheet';
import { RangeDirective, ColumnsDirective, ColumnDirective } from
 '@syncfusion/ej2-react-spreadsheet';
import { defaultData } from './datasource';
function App() {
    const spreadsheetRef = React.useRef(null);
    const created = () => {
        spreadsheetRef.current.cellFormat({ fontWeight: 'bold', textAlign:
'center', verticalAlign: 'middle' }, 'A1:F1');
        // Construct the predicate model to be updated to the data.
        let predicates = [{
            field: 'C',
            operator: 'equal',
            value: 'Pink',
            matchCase: false
        }];
        // Apply filter to the specified range.
        spreadsheetRef.current.applyFilter(predicates, 'A1:C7');
    };
    const onClick = () => {
        let spreadsheet = spreadsheetRef.current;
        let activeSheet = spreadsheet.getActiveSheet();
        let usedRange = activeSheet.usedRange;
        for (let i = 0; i <= usedRange.rowIndex; i++) {
            // Get the filtered row using isFiltered property.
            let filteredRow = (activeSheet.rows[i]).isFiltered;
            if (!filteredRow) {
                let rowData = spreadsheet.getRowData(i);
                console.log("Row:", i + 1, "Cells", rowData);
            }
        }
    }
    return (
        <div className='control-section spreadsheet-control'>
            <button className="e-btn custom-btn" onClick={onClick}> Get
Filtered Data </button>
            <SpreadsheetComponent ref={spreadsheetRef} created={created}>
                <SheetsDirective>
                    <SheetDirective>
                        <RangesDirective>

### Mobile responsiveness in React Spreadsheet component

The Spreadsheet control rendered in desktop mode will be adaptive in all mobile devices where the layout gets adjusted based on their parent element's dimensions to accommodate any resolution.

You can see the overflowed items of ribbon header, ribbon content, and sheet tab using touch and swipe action. The right navigation arrow is added at the end of the ribbon content through which the user can navigate towards overflowed items. Once you reached the rightmost end of the ribbon content, the right navigation arrow will change to left navigation arrow through which you can navigate to the left of the ribbon content.

	A	B
1	Customer Name	Model
2	Romona Heaslip	Taurus
3	Clare Batterton	Sparrow
4	Eamon Traise	Grand Cherokee
5	Julius Gorner	GTO
6	Jenna Schoolfield	LX
7	Marylynne Harring	Catera
8	Vilhelmina Leipelt	7 Series
9	Barby Heisler	Corvette
10	Karyn Boik	Regal
11	Jeanette Pamplin	S4
12	Cristi Espinos	TL
13	Issy Humm	Club Wagon
14	Tuesday Fautly	V8 Vantage
15	Rosemaria Thomann	Caravan
16	Lyell Fuentez	Bravada
17	Raynell Layne	Colorado
18	Raye Whines	4Runner
19	Virgina Aharoni	TSX

### Feature list in React Spreadsheet component

The following table compares Excel functionality with the availability of EJ1 and EJ2 Spreadsheet features.

Features	Available in EJ1 Spreadsheet	Available in EJ2 Spreadsheet	Comments
---	---	---	---
Ribbon	Yes	Yes	-
Formula bar	Yes	Yes	-
Sheet tab	Yes	Yes	-
Show / Hide gridlines and header	Yes	Yes	-
Scrolling	Partially	Yes	-
Selection	Yes	Yes	-
Editing	Yes	Yes	-
Formulae	Yes	Partially	EJ2 supports limited number of <a href="#">most used formulas</a>
Named range	Yes	Partially	EJ2 Spreadsheet Named range supports only in workbook scope
Data Binding	Yes	Yes	-
Formatting	Yes	Yes	-
Context menu	Yes	Yes	-
Keyboard navigation	Yes	Yes	-
Keyboard shortcuts	Yes	Yes	-
Sorting	Yes	Yes	-
Filtering	Yes	Yes	-
Hyperlink	Yes	Yes	-
Undo & redo	Yes	Yes	-
Open and Save	Yes	Yes	-
Resize / Autofit	Yes	Yes	-
Clipboard	Yes	Yes	-
Collaborative editing	No	Yes	-
Wrap text	Yes	Yes	-
Template	No	Yes	-
Merge cells	Yes	Yes	-
Show / Hide rows and columns	Yes	Yes	-
Sheet customizations	Yes	Partially	Move or copy sheet is not supported in EJ2 spreadsheet.
Data Validation	Yes	Yes	-
Table	Yes	No	-

| Chart | Yes | Yes | - |

| Image | Yes | Yes | - |

| Conditional formatting | Yes | Yes | - |

| Freeze Pane | Yes | Yes | - |

| Scaling | No | No | - |

| Print | Yes | No | - |

| Grouping | No | No | - |

| Autofill | Yes | No | - |

| Auto Sum | Yes | Yes | - |

| Format painter | Yes | No | - |

| Cell Style | Yes | Partially | We can only customize the cell style in EJ2 Spreadsheet through API. |

| Protection | Yes | Partially | Custom encryption is not supported in EJ2 Spreadsheet's protect workbook. |

| Find and replace | Yes | Yes | - |

| Drag and Drop | Yes | No | - |

| Notes | Yes | No | - |

| Comments | No | No | - |

| Pivot table | Yes | No | - |

| Sparklines | Yes | No | - |

| Form controls | Yes | No | - |

| Shapes | No | No | - |

| Clear | Yes | Yes | - |

## Stepper

### Getting Started

This section explains how to create a simple Stepper and configure its available functionalities in the React environment.

### Dependencies

The following list of dependencies is required to use the Stepper component in your application.

```
`js
|-- @syncfusion/ej2-react-navigations
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-react-base
`,`
```

### Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

Start a new project using create-react-app command as follows

```
<div class='tsx'>
```

```
`bash
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
`,`
```

```
</div>
```

```
<div class='jsx'>
```

```
`bash
create-react-app quickstart
cd quickstart
`,`
```

```
</div>
```

'react-scripts-ts' is used for creating React app with typescript.

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install `Stepper` component, use the following command

```
`bash
npm install @syncfusion/ej2-react-navigations --save
`,`
```

### Adding CSS Reference

Import the Stepper component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
@import "../node_modules/@syncfusion/ej2-navigations/styles/material.css";
`
```

### Adding Stepper component to the application

To include the Stepper component in your application, import the `StepperComponent` from `ej2-react-navigations` package in the `App.tsx`.

To define each step, you can use the `StepDirective` tag inside the `StepsDirective` tag as shown in below code example.

```
{% raw %}
`ts
import { StepperComponent, StepsDirective, StepDirective } from '@syncfusion/ej2-react-navigations';
import * as React from "react";
import * as ReactDOM from "react-dom";
import "../App.css";
function App() {
  return (
    <StepperComponent>
    <StepsDirective>
    <StepDirective/>
    <StepDirective/>
    <StepDirective/>
    <StepDirective/>
    <StepDirective/>
    </StepsDirective>
    </StepperComponent>
  );
}
const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`
```

```
{% endraw %}
```

### Running the application

Run the application in the browser using the following command:

```
,
```

```
npm start
```

```
,
```

The following example shows a basic Stepper component.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="default-stepper">
            <StepperComponent>
                <StepsDirective>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="default-stepper">
            <StepperComponent>
                <StepsDirective>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

```

        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### Configure icon and label

You can define the step icon and label by setting the `iconCss` and `label` properties using the `StepDirective` tag.

#### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
    return (
        <div className="stepper-icon-label">
            <StepperComponent>
                <StepsDirective>
                    <StepDirective iconCss= {'sf-icon-cart'} label=
{'Cart'}/>
                    <StepDirective iconCss= {'sf-icon-user'} label=
{'Address'}/>
                    <StepDirective iconCss= {'sf-icon-transport'} label=
{'Delivery'}/>
                    <StepDirective iconCss= {'sf-icon-payment'} label=
{'Payment'}/>
                    <StepDirective iconCss= {'sf-icon-success'} label=
{'Ordered'}/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

#### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
    return (
        <div className="stepper-icon-label">
            <StepperComponent>
                <StepsDirective>

```

```

        <StepDirective iconCss= {'sf-icon-cart'} label=
{'Cart'}/>
        <StepDirective iconCss= {'sf-icon-user'} label=
{'Address'}/>
        <StepDirective iconCss= {'sf-icon-transport'} label=
{'Delivery'}/>
        <StepDirective iconCss= {'sf-icon-payment'} label=
{'Payment'}/>
        <StepDirective iconCss= {'sf-icon-success'} label=
{'Ordered'}/>
    </StepsDirective>
  </StepperComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;

## Steps in React Stepper component

The React Stepper component allows you to add steps using `StepDirective` tag. Each step can be configured with options such as `iconCss`, `text`, `label`, `cssClass` and more.

### Adding steps

You can define the icon and text content for each step using the `iconCss`, `text` and `label` properties.

### Defining icon CSS

You can define the CSS class to show the icon for each step using the `iconCss` property.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
  return (
    <div className="stepper-icon">
      <StepperComponent>
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'}/>
          <StepDirective iconCss= {'sf-icon-transport'} />
          <StepDirective iconCss= {'sf-icon-payment'} />
          <StepDirective iconCss= {'sf-icon-success'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
  return (
    <div className="stepper-icon">
      <StepperComponent>
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'}/>
          <StepDirective iconCss= {'sf-icon-transport'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

```

        <StepDirective iconCss= {'sf-icon-payment'} />
        <StepDirective iconCss= {'sf-icon-success'} />
      </StepsDirective>
    </StepperComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

.stepper-icon .sf-icon-payment:before { content: "\e706"; }
.stepper-icon .sf-icon-success:before { content: "\e715"; }

```

### Defining text content

You can define text instead of an icon by setting the `text` property and display label content for a step using the `label` property.

When both label and text are defined, the label takes priority for display based on the `stepType`.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-text">
      <StepperComponent>
        <StepsDirective>
          <StepDirective text= {'Cart'}/>
          <StepDirective text= {'Delivery Address'}/>
          <StepDirective text= {'Payment'}/>
          <StepDirective text= {'Confirmation'}/>
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```

## Optional steps

You can show whether the step is optional or not by using `optional` property. By default, the `optional` property is `false`.

## INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-optional-step">
```

```

        <StepperComponent>
          <StepsDirective>
            <StepDirective iconCss= {'sf-icon-cart'}/>
            <StepDirective iconCss= {'sf-icon-transport'} />
            <StepDirective iconCss= {'sf-icon-payment'}
optional={true}/>
            <StepDirective iconCss= {'sf-icon-success'} />
          </StepsDirective>
        </StepperComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById("element"));
  {% endraw %}

.stepper-disabled-step .sf-icon-payment:before { content: "\e706"; }
.stepper-disabled-step .sf-icon-success:before { content: "\e715"; }

```

### Setting active step

You can set the active step by specifying its index using the [activeStep](#) property. The default value is 0.

#### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-activestep">
      <StepperComponent activeStep={1}>
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'} />
          <StepDirective iconCss= {'sf-icon-transport'} />
          <StepDirective iconCss= {'sf-icon-payment'} />
          <StepDirective iconCss= {'sf-icon-success'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

#### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-activestep">
      <StepperComponent activeStep={1}>
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'} />

```

```

        <StepDirective iconCss= {'sf-icon-transport'} />
        <StepDirective iconCss= {'sf-icon-payment'} />
        <StepDirective iconCss= {'sf-icon-success'} />
      </StepsDirective>
    </StepperComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### Step status

Each step's progress state can be specified using the `status` property. The possible values are `NotStarted`, `InProgress` and `Completed`. By default, the value is `NotStarted`.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
    let stepperObj = React.useRef(null);
    const [color, setColor] = React.useState("#e74d4d");
    const [text, setText] = React.useState("Your payment has not started
yet");
    const statusMap = {
        'NotStarted': { text: 'Your payment has not started yet', color:
'#e74d4d' },
        'InProgress': { text: 'Processing your payment', color: 'orange' },
        'Completed': { text: 'Payment successful', color: '#4CAF50' }
    };
    const handleStepChange = () => {
        let status = stepperObj.current.steps[1].status;
        setColor(statusMap[status].color);
        setText(statusMap[status].text);
    }
    return (
        <div className="stepper-status">
            <StepperComponent ref={stepperObj}
stepChanged={handleStepChange}>
                <StepsDirective>
                    <StepDirective iconCss= {'sf-icon-cart'} label=
{'Cart'}/>
                    <StepDirective iconCss= {'sf-icon-payment'} label=

### Step styling

You can use the `cssClass` property to customize the appearance of each step.

#### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
  return (
    <div className="stepper-custom-style">
      <StepperComponent>
        <StepsDirective>
          <StepDirective label={"Cart"} iconCss= {'sf-icon-cart'}
        />
          <StepDirective label={"Delivery Address"} iconCss= {'sf-
icon-transport'} />

```

```

        <StepDirective label={"Payment"} iconCss= {'sf-icon-
payment'} cssClass="custom-step" optional={true}/>
        <StepDirective label={"Confirmation"} iconCss= {'sf-icon-
success'} />
      </StepsDirective>
    </StepperComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.TSX

## Step validation

You can set the validation state for each step to displaying a success or error icon by using `isValid` property.

To know more about Stepper validation, please refer to the [Validation](#) section.

## Step types in React Stepper component

The Stepper component provides support for displaying steps with the following step types.

### Default type

In default type, the Stepper displays steps with a combination of both indicators and labels by setting the `stepType` property as `Default`. By default, the Stepper displays steps in the `Default` type.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
  return (

```

```

        <div className="stepper-steptype-default">
            <StepperComponent stepType="Default">
                <StepsDirective>
                    <StepDirective iconCss={'sf-icon-cart'} label={'Cart'} />
                    <StepDirective iconCss={'sf-icon-transport'}
label={'Delivery Address'} />
                    <StepDirective iconCss={'sf-icon-payment'}
label={'Payment'} />
                    <StepDirective iconCss={'sf-icon-success'}
label={'Confirmation'} />
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

**INDEX.TSX**

.stepper-steptype-default .sf-icon-payment:before { content: "\e706"; }
.stepper-steptype-default .sf-icon-success:before { content: "\e715"; }
```

Label type

In label type, the Stepper displays the steps with only the step labels by setting the `stepType` property as `Label`.

When both label and text are defined, the label takes priority in displaying the steps.

### Label positions

You can display the label on the top, bottom, left, or right side of the steps using the [labelPosition](#) property.

The following label positions are supported in Stepper:

- | Value       | Description   |
|-------------|---|
| ----- ----- |   |
| Top         | Positions the label at the top of each step.        |
| Bottom      | Positions the label at the bottom of each step.     |
| Start       | Positions the label to the left side of each step.  |
| End         | Positions the label to the right side of each step. |

## Orientations in React Stepper component

The Stepper component supports the display of steps in both horizontal and vertical orientations by using the [orientation](#) property.

### Horizontal

In horizontal orientation, the steps are displayed in a side-by-side manner by setting the [orientation](#) property to **Horizontal**. By default, the steps are displayed in the horizontal orientation.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-horizontal">
      <StepperComponent orientation="horizontal">
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'} />
          <StepDirective iconCss= {'sf-icon-transport'} />
          <StepDirective iconCss= {'sf-icon-payment'} />
          <StepDirective iconCss= {'sf-icon-success'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
```

```
{% endraw %}
```

## INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
 '@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-horizontal">
      <StepperComponent orientation="horizontal">
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'} />
          <StepDirective iconCss= {'sf-icon-transport'} />
          <StepDirective iconCss= {'sf-icon-payment'} />
          <StepDirective iconCss= {'sf-icon-success'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## Vertical

You can display the steps one below the other vertically by setting the [orientation](#) property to **Vertical**.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-vertical">
      <StepperComponent orientation="vertical">
        <StepsDirective>
          <StepDirective iconCss= {'sf-icon-cart'} />
          <StepDirective iconCss= {'sf-icon-transport'} />
          <StepDirective iconCss= {'sf-icon-payment'} />
          <StepDirective iconCss= {'sf-icon-success'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## Linear flow in React Stepper component

The Stepper component enables users to progress sequentially through each step, ensuring navigation from one step to the next in a linear way by setting the [linear](#) property to `true`. The default value is `false` allowing navigation between any steps and vice versa.

The example demonstrates the functionality of both linear and non-linear flow in the Stepper.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
    const linearStepper = React.useRef(null);
    const updateLinear = (args) => {
        linearStepper.current.linear =
        (//true/).test(args.currentTarget.value) ? true : false;
        linearStepper.current.reset();
    };
    return (
        <div className="stepper-linear-position">
            <div className="e-btn-group">
                <input type="radio" id="linear" name="Linear" value="true"
onClick={updateLinear} defaultChecked />
                <label className="e-btn" htmlFor="linear">Linear</label>
                <input type="radio" id="nonLinear" name="Linear"
value="false" onClick={updateLinear} />
                <label className="e-btn" htmlFor="nonLinear">Non-
Linear</label>
            </div>
            <StepperComponent ref={linearStepper} id="stepper-linear-control"
linear={true}>

## Steps validation in React Stepper component

The Stepper component allows you to set the validation state for each step, displaying either a success or error icon. You can define the success state of a step by setting the `isValid` property to `true`. If set to `false`, the step will display an error state. By default, the `isValid` property is `null`.

Based on the `stepType`, the validation state icon will be displayed either as an indicator or as part of the step label/text.

### Template in React Stepper component

The Stepper component allows you to customize the default appearance and content of each step, creating a personalized experience for the user. You can use the [template](#) property to set the template content for the steps.

The step model and current step index are passed as `step` and `currentStep` properties in the template context for customization.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {

  const getTemplate = ({step}) => {
    return <div className="template-content"><span
className={step.iconCss}></span><br /><span className="e-
label">{step.label}</span></div>
  }

  return (
    <div className="stepper-template">
      <StepperComponent activeStep={1} template={getTemplate}>
        <StepsDirective>
          <StepDirective iconCss={'sf-icon-powerpoint'}
label={'Powerpoint'} />
          <StepDirective iconCss={'sf-icon-projector'}
label={'Presentation'} />
          <StepDirective iconCss={'sf-icon-onedrive'}
label={'Backup'} />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
```

```

        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## Tooltip in React Stepper component

The Stepper component supports tooltip to show additional information in the steps by setting the [showTooltip](#) property to `true`.

The tooltip appears when the user hovers over the step, providing the information such as the label or text. By default, the `showTooltip` property is `false`.

### INDEX.JSX

```

### Tooltip template

You can use the [tooltipTemplate](#) property to specify a custom template for the tooltips, providing detailed information about the steps.

When hovering over the step, the current step model is passed in the template context, allowing you to include dynamic information about the step.

### INDEX.JSX

```

{% raw %}
import * as React from "react";

### Animation in React Stepper component

The Stepper progress state can be animated, smoothly transitioning from one step to another. You can customize the animation's **duration** and **delay** by using the [animation](#) property.

You can disable the animation by setting the [enable](#) property to **false**. By default, the value is **true**.

| Fields | Type | Description |

|-----|-----|-----|

| [duration](#) | **number** | Specifies the duration of the animated transition for each step. The default value is **2000** milliseconds. |

| [delay](#) | **number** | Specifies the delay to initiate the animated transition for each step in milliseconds. The default value is **0**. |

The example demonstrates the animation **duration** and **delay** settings for the Stepper.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
function App() {
  return (
    <div className="stepper-animation">
      <StepperComponent animation={{ enable: true, duration: 2000,
delay: 500 }}>
        <StepsDirective>
          <StepDirective />
          <StepDirective />
          <StepDirective />
          <StepDirective />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
"@syncfusion/ej2-react-navigations";
```

```
function App() {
  return (
    <div className="stepper-animation">
      <StepperComponent animation={{ enable: true, duration: 2000,
delay: 500 }}>
        <StepsDirective>
          <StepDirective />
          <StepDirective />
          <StepDirective />
          <StepDirective />
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
```

## Globalization in React Stepper component

### Localization

The Localization library allows you to localize the default text content of the Stepper. You can change the static text content used for the **optional** property to other cultures (Arabic, Deutsch, French, etc.) by defining the **locale** value and its translation object.

| Locale key | en-US (default) |

|-----|-----|

| optional | Optional |

In this example, the **French** culture is set to Stepper and the default text is updated with the content defined by the locale key.

## Accessibility in React Stepper component

The Stepper component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Stepper component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support | `` |

| Right-To-Left Support | `` |

| Color Contrast | `` |

| Mobile Device Support | `` |

| Keyboard Navigation Support | `` |

| [Accessibility Checker](#) Validation | `` |

| [Axe-core](#) Accessibility Validation | `` |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The following ARIA attributes are used in the Stepper component:

- | Attributes    | Purpose   |
|---------------|---|
| aria-label    | Attribute provide a descriptive text that labels the interactive element for accessibility. |
| aria-current  | Attribute denotes the currently active step in the Stepper.                                 |
| aria-disabled | Indicates when the step is disabled and cannot be interacted.                               |

### Keyboard interaction

The following keyboard shortcuts are supported by the Stepper component.

- | Press     | To do this |
|-----------|------------|
| ---   --- |            |

- | Up Arrow | Focuses the previous step in a vertical Stepper. |
- | Down Arrow | Focuses the next step in a vertical Stepper. |
- | Left Arrow | Focuses the previous step in a horizontal Stepper. |
- | Right Arrow | Focuses the next step in a horizontal Stepper. |
- | Home | Focuses on the first step of the Stepper. |
- | End | Focuses on the last step of the Stepper. |
- | Enter / Space | Activates the currently focused step. |

### Ensuring accessibility

The Stepper component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Stepper component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Stepper component with accessibility tools.

### Events in React Stepper component

This section describes the Stepper events that will be triggered when an appropriate actions are performed. The following events are available in the Stepper component.

#### created

The Stepper component triggers the [created](#) event when the control rendering is completed.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-created">
      <StepperComponent created={() => { /* Your required action here
*/ } } >>
        <StepsDirective>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

  margin-top: 30px;
  padding: 30px;
}
```

**stepChanged**

The Stepper component triggers the [stepChanged](#) event after the active step is changed.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
 '@syncfusion/ej2-react-navigations';
function App() {
  return (
```

```

        <div className="stepper-step-changed">
            <StepperComponent stepChanged={ (args) => { alert("Step Changed
from "+args.previousStep + " to " + args.activeStep) } }>
                <StepsDirective>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective,
StepperChangedEventArgs } from '@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="stepper-step-changed">
            <StepperComponent stepChanged={ (args: StepperChangedEventArgs) =>
{ alert("Step Changed from " + args.previousStep + " to " + args.activeStep)
}}} >
                <StepsDirective>
                    <StepDirective />
                    <StepDirective />
                    <StepDirective />
                    <StepDirective />
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.CSS

```

/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.stepper-step-changed {

```

```
margin-top: 30px;
padding: 30px;
}
```

### stepChanging

The Stepper component triggers the [stepChanging](#) event before the active step change.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-step-changing">
      <StepperComponent stepChanging={ (args) => { alert("Step Changing
from "+args.previousStep + " to " + args.activeStep) } }>
        <StepsDirective>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective,
StepperChangingEventArgs } from '@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-step-changing">
      <StepperComponent stepChanging={ (args: StepperChangingEventArgs)
=> { alert("Step Changing from "+args.previousStep + " to " +
args.activeStep) } }>
        <StepsDirective>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.stepper-step-changing {
  margin-top: 30px;
  padding: 30px;
}
```

## stepClick

The Stepper component triggers the [stepClick](#) event when the step is clicked.

## INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
'@syncfusion/ej2-react-navigations';
function App() {
  return (
    <div className="stepper-step-click">
      <StepperComponent stepClick={(args) => { /* Your required action
here */ }}>
        <StepsDirective>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
          <StepDirective/>
        </StepsDirective>
      </StepperComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
```

```
import { StepperComponent, StepsDirective, StepDirective,
StepperClickEventArgs } from '@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="stepper-step-click">
            <StepperComponent stepClick={ (args: StepperClickEventArgs) => {
/* Your required action here */ } }>
                <StepsDirective>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.stepper-step-click {
    margin-top: 30px;
    padding: 30px;
}
```

## beforeStepRender

The Stepper component triggers the [beforeStepRenderLink to the Video](#) event before rendering each step.

## INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective } from
 '@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="stepper-before-render">
            <StepperComponent beforeStepRender={ (args) => { /* Your required
action here */ } }>
                <StepsDirective>
                    <StepDirective/>

```

```

                <StepDirective/>
                <StepDirective/>
                <StepDirective/>
            </StepsDirective>
        </StepperComponent>
    </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StepperComponent, StepsDirective, StepDirective,
StepperRenderingEventArgs } from '@syncfusion/ej2-react-navigations';
function App() {
    return (
        <div className="stepper-before-render">
            <StepperComponent beforeStepRender={ (args:
StepperRenderingEventArgs) => { /* Your required action here */ } }>
                <StepsDirective>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                    <StepDirective/>
                </StepsDirective>
            </StepperComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## INDEX.CSS

```

    margin-top: 30px;
    padding: 30px;
}

```

## Stock Chart

<!-- markdownlint-disable MD036 -->

### Getting Started

This section explains you the steps required to create a simple Stock Chart and demonstrate the basic usage of the Stock Chart control.

To get start quickly with React Stock Chart, you can check on this video:

### Dependencies

Below is the list of minimum dependencies required to use the chart component.

```
`javascript
|-- @syncfusion/ej2-react-charts
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-charts
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-svg-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-splitbuttons
`,`
```

### Installation and configuration

You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`
npm install -g create-react-app
`,`
```

- To set-up a React application in TypeScript environment, run the following command.

```
`  
create-react-app quickstart --template typescript  
cd quickstart  
npm start  
`
```

- To set-up a React application in JavaScript environment, run the following command.

```
`  
create-react-app quickstart  
cd quickstart  
npm start  
`
```

- Install Syncfusion packages using below command.

```
`  
npm install @syncfusion/ej2-react-charts --save  
`
```

### Add Stock Chart to the Project

Now, you can start adding Chart component in the application.

For getting started, add the Chart component in `src/App.tsx` file using following code.

#### INDEX.JSX

```
import { StockChartComponent } from '@syncfusion/ej2-react-charts';  
import * as React from 'react';  
function App() {  
  return (<StockChartComponent />);  
}  
export default App;
```

#### INDEX.TSX

```
import { StockChartComponent } from '@syncfusion/ej2-react-charts';  
import * as React from 'react';  
function App() {  
  return (<StockChartComponent />);  
}  
export default App;
```

Now run the `npm start` command in the console, it will run your application and open the browser window.

npm start

The below example shows a basic Chart.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, Inject, DateTime, Tooltip, RangeTooltip,
Crosshair, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines } from '@syncfusion/ej2-react-
charts';
import { EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
MomentumIndicator, SmaIndicator, AtrIndicator,
AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator, Export
} from '@syncfusion/ej2-react-charts';
import { chartData } from 'datasource.ts';
function App() {
    return (<StockChartComponent id='stockchart' primaryXAxis={{
        valueType: 'DateTime',
        majorGridLines: { width: 0 }, majorTickLines: { color:
'transparent' },
        crosshairTooltip: { enable: true }
    }} primaryYAxis={{
        labelFormat: 'n0',
        lineStyle: { width: 0 }, rangePadding: 'None',
        majorTickLines: { width: 0 }
    }} height='350'>
        <Inject services={[DateTime, Tooltip, RangeTooltip,
Crosshair, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines,
EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
MomentumIndicator, SmaIndicator, AtrIndicator, Export,
AccumulationDistributionIndicator, MacdIndicator,
StochasticIndicator]}/>
        <StockChartSeriesCollectionDirective>
            <StockChartSeriesDirective dataSource={chartData}
type='Candle'>
                </StockChartSeriesDirective>
            </StockChartSeriesCollectionDirective>
        </StockChartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import {
```

```

    StockChartComponent, StockChartSeriesCollectionDirective,
    StockChartSeriesDirective, Inject, ITooltipRenderEventArgs,
    IStockChartEventArgs, ChartTheme,
    DateTime, Tooltip, RangeTooltip, Crosshair, LineSeries, SplineSeries,
    CandleSeries, HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines
} from '@syncfusion/ej2-react-charts';
import {
    EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
    MomentumIndicator, SmaIndicator, AtrIndicator,
    AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator,
    Export
} from '@syncfusion/ej2-react-charts';
import { chartData } from 'datasource.ts';
function App() {
    return (
        <StockChartComponent id='stockchart'
            primaryXAxis={{
                valueType: 'DateTime',
                majorGridLines: { width: 0 }, majorTickLines: { color:
'transparent' },
                crosshairTooltip: { enable: true }
            }}
            primaryYAxis={{
                labelFormat: 'n0',
                lineStyle: { width: 0 }, rangePadding: 'None',
                majorTickLines: { width: 0 }
            }}
            height='350'
        >
            <Inject services={[DateTime, Tooltip, RangeTooltip,
Crosshair, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines,
                EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
                MomentumIndicator, SmaIndicator, AtrIndicator, Export,
                AccumulationDistributionIndicator, MacdIndicator,
                StochasticIndicator]} />
            <StockChartSeriesCollectionDirective>
                <StockChartSeriesDirective dataSource={chartData}
type='Candle'>
                    </StockChartSeriesDirective>
                </StockChartSeriesCollectionDirective>
            </StockChartComponent>
        )
    );
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% enddraw %}

```

### Module Injection

Stock Chart component are segregated into individual feature-wise modules. In order to use a particular feature, you need to inject its feature service in the AppModule. In the current application, we are going to modify the above basic chart to visualize stock value of a company.

For this application we are going to use candle series, tooltip, data label, DateTime axis

feature of the chart. Please find the relevant feature service name and description as follows.

- **CandleSeries** - Inject this module in to **services** to use candle series.
- **Tooltip** - Inject this module in to **services** to use tooltip feature.
- **DataLabel** - Inject this module in to **services** to use datalabel feature.
- **DateTime** - Inject this module in to **services** to use DateTime feature.

These modules should be injected to the **services** section as follows,

#### **INDEX.JSX**

```
import { DateTime, StockChartComponent, DataLabel, CandleSeries, Tooltip }
  from '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return <StockChartComponent id='stockcharts'>
    <Inject services={[CandleSeries, Tooltip, DataLabel, Category]} />
  </StockChartComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
```

#### **INDEX.TSX**

```
import { StockChartComponent, DataLabel, CandleSeries, Tooltip } from
  '@syncfusion/ej2-react-charts';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
  return <StockChartComponent id='stockcharts'>
    <Inject services={[CandleSeries, Tooltip, DataLabel, Category]} />
  </StockChartComponent>;
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
```

#### Populate Chart with Data

This section explains how to plot below JSON data to the Stock Chart. Please find the below imported datasource.

#### **INDEX.JSX**

```
export let data = [{
  "x": new Date('2012-04-02T00:00:00.000Z'),
  "open": 320.705719,
  "high": 324.074066,
  "low": 317.737732,
  "close": 323.783783,
  "volume": 45638000
}, {
  "x": new Date('2012-04-03T00:00:00.000Z'),
  "open": 323.028015,
  "high": 324.299286,
  "low": 319.639648,
  "close": 321.631622,
```

```

"volume": 40857000
}, {
"x": new Date('2012-04-04T00:00:00.000Z'),
"open": 319.544556,
"high": 319.819824,
"low": 315.865875,
"close": 317.892883,
"volume": 32519000
}, {
"x": new Date('2012-04-05T00:00:00.000Z'),
"open": 316.436432,
"high": 318.533539,
"low": 314.599609,
"close": 316.476471,
"volume": 46327000
}];

```

### INDEX.TSX

```

export let data: any[] = [{
"x": new Date('2012-04-02T00:00:00.000Z'),
"open": 320.705719,
"high": 324.074066,
"low": 317.737732,
"close": 323.783783,
"volume": 45638000
}, {
"x": new Date('2012-04-03T00:00:00.000Z'),
"open": 323.028015,
"high": 324.299286,
"low": 319.639648,
"close": 321.631622,
"volume": 40857000
}, {
"x": new Date('2012-04-04T00:00:00.000Z'),
"open": 319.544556,
"high": 319.819824,
"low": 315.865875,
"close": 317.892883,
"volume": 32519000
}, {
"x": new Date('2012-04-05T00:00:00.000Z'),
"open": 316.436432,
"high": 318.533539,
"low": 314.599609,
"close": 316.476471,
"volume": 46327000
}];

```

Add a series object to the chart by using [series](#) property and then set the JSON data to [dataSource](#) property.

Since the JSON contains DateTime data, set the [valueType](#) for horizontal axis to `DateTime`. By default, the axis valueType is `Numeric`.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";

MomentumIndicator, SmaIndicator, AtrIndicator, Export,
AccumulationDistributionIndicator, MacdIndicator,
StochasticIndicator]} />
      <StockChartSeriesCollectionDirective>
        <StockChartSeriesDirective dataSource={chartData}
type='Candle'>
          </StockChartSeriesDirective>
        </StockChartSeriesCollectionDirective>
      </StockChartComponent>
    )
  );
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}
```

### Add Crosshair

Crosshair has a vertical and horizontal line to view the value of the axis at mouse or touch position.

Crosshair lines can be enabled by using [enable](#) property in the `crosshair`. Likewise tooltip label for an axis can be enabled by using [enable](#) property of `crosshairTooltip` in the corresponding axis.

### INDEX.JSX

```
{% raw %}
import * as React from "react";

    </StockChartComponent>
)
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

### Add Trackball

Trackball is used to track a data point closest to the mouse or touch position. Trackball marker indicates the closest point and trackball tooltip displays the information about the point. To use trackball feature, we need to inject **Crosshair** and **Tooltip** module into the **services**.

Trackball can be enabled by setting the [enable](#) property of the crosshair to true and [shared](#) property in tooltip to true in chart.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";

```

You can refer to our [React Stock Chart](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Stock Chart example](#) that shows you how to present and manipulate data.

<!-- markdownlint-disable MD036 -->

## Working with data in React Stock chart component

Stock Chart can visualise data bound from local or remote data.

### Local Data

You can bind a simple JSON data to the chart using [dataSource](#) property in series.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, Inject, DateTime, Tooltip, RangeTooltip,

## Chart dimensions in React Stock chart component

### Size for Container

Stock Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

```
,  
  
<div id="stockcharts" style="width:650px; height:350px"></div>  
,  
  
`ts  
import * as React from "react";  
import * as ReactDOM from "react-dom";  
import { StockChartComponent }  
from '@syncfusion/ej2-react-charts';  
function App() {  
  return <StockChartComponent id='stockcharts'>  
    </StockChartComponent>  
  };  
  export default App;  
  ReactDOM.render(<App />, document.getElementById("stockcharts"));  
,  
  
`ts  
import * as React from "react";  
import * as ReactDOM from "react-dom";  
import { StockChartComponent } from '@syncfusion/ej2-react-charts';  
function App() {  
  return <StockChartComponent id='stockcharts'>  
    </StockChartComponent>;  
  }  
  ;  
  export default App;  
  ReactDOM.render(<App />, document.getElementById("stockcharts"));  
,
```

```

### In Percentage

By setting value in percentage, Stock Chart gets its dimension with respect to its container. For example, when the height is '50%', Stock Chart renders to half of the container height.

```

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

<!-- markdownlint-disable MD036 -->

## Axis types in React Stock chart component

### DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format. To use DateTime axis, set the [valueType](#) of axis to `DateTime`.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StockChartComponent, StockChartSeriesCollectionDirective,
StockChartSeriesDirective, Inject, DateTime, Tooltip, RangeTooltip,
Crosshair, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
HiloSeries, RangeAreaSeries, Trendlines } from '@syncfusion/ej2-react-
charts';
import { EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
MomentumIndicator, SmaIndicator, AtrIndicator,

```

```

AccumulationDistributionIndicator, MacdIndicator, StochasticIndicator, Export
} from '@syncfusion/ej2-react-charts';
import { chartData } from 'datasource.ts';
function App() {
    return (<StockChartComponent id='stockchart' primaryXAxis={{
        valueType: 'DateTime',
    }} height='350'>
        <Inject services={[DateTime, Tooltip, RangeTooltip,
        Crosshair, LineSeries, SplineSeries, CandleSeries, HiloOpenCloseSeries,
        HiloSeries, RangeAreaSeries, Trendlines,
        EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
        MomentumIndicator, SmaIndicator, AtrIndicator, Export,
        AccumulationDistributionIndicator, MacdIndicator,
        StochasticIndicator]}/>
        <StockChartSeriesCollectionDirective>
            <StockChartSeriesDirective dataSource={chartData}
type='Candle'>
                </StockChartSeriesDirective>
            </StockChartSeriesCollectionDirective>
        </StockChartComponent>);
}
;
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

## INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import {
    StockChartComponent, StockChartSeriesCollectionDirective,
    StockChartSeriesDirective, Inject, ITooltipRenderEventArgs,
    IStockChartEventArgs, ChartTheme,
    DateTime, Tooltip, RangeTooltip, Crosshair, LineSeries, SplineSeries,
    CandleSeries, HiloOpenCloseSeries, HiloSeries, RangeAreaSeries, Trendlines

HiloSeries, RangeAreaSeries, Trendlines,
      EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
MomentumIndicator, SmaIndicator, AtrIndicator, Export,
      AccumulationDistributionIndicator, MacdIndicator,
StochasticIndicator]} />
    <StockChartSeriesCollectionDirective>
      <StockChartSeriesDirective dataSource={series2} type='Line'
xName='x' yName='y'>
        </StockChartSeriesDirective>
      </StockChartSeriesCollectionDirective>
    </StockChartComponent>
  )
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
{% endraw %}

```

Note: To use this axis, we need to inject `DateTimeCategory` using `<Inject services={[DateTimeCategory]}>` method and set the `valueType` of axis to `DateTimeCategory`.

### Logarithmic axis

`<!-- markdownlint-disable MD033 -->`

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg:  $10^{-6}$ ) and higher order of magnitude (eg:  $10^6$ ). To use Logarithmic axis, set the `valueType` of axis to `Logarithmic`.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { StockChartComponent, StockChartSeriesCollectionDirective,

- [Axis Customization](#)

## Axis customization in React Stock chart component

### Axis Crossing

An axis can be positioned in the Stock Chart area using `crossesAt` and `[crossesInAxis]` (<https://ej2.syncfusion.com/react/documentation/api/stock-chart/stockChartAxisModel/#crossesinaxis>) properties. The `[crossesAt]` (<https://ej2.syncfusion.com/react/documentation/api/stock-chart/stockChartAxisModel/#crossesat>) property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to be intersected with the vertical axis or vice-versa, and the `[crossesInAxis]` (<https://ej2.syncfusion.com/react/documentation/api/stock-chart/stockChartAxisModel/#crossesinaxis>) property specifies the axis name with which the axis line has to be crossed.

```

## Title

You can add a title to the axis using [title](#) property to provide quick information to the user about the data plotted in the axis. Title style can be customized using [titleStyle](#) property of the axis.

### Series types in React Stock chart component

Essential JS 2 StockChart supports 6 major types of series namely **Line**, **Spline**, **Hilo**, **HiloOpenClose**, **Hollow Candle** and **Candle** . By using the series dropdown button you can navigate between the above listed series types.

<!-- markdownlint-disable MD036 -->

#### Line

To render a line series, use series **type** as **Line** and inject **LineSeries** module using **<Inject services={[LineSeries]}>** method.

#### Spline

To render a spline series, use series **type** as **Spline** and inject **SplineSeries** module using **<Inject services={[SplineSeries]}>** method.

#### Hilo

To render a hilo series, use series **type** as **Hilo** and inject **HiloSeries** module using **<Inject services={[HiloSeries]}>** method.

#### HiloOpenClose

To render a hiloOpenClose series, use series **type** as **HiloOpenClose** and inject **HiloOpenCloseSeries** module using **<Inject services={[HiloOpenCloseSeries]}>** method.

#### HollowCandle

To render a hollowcandle series, use series **type** as **Candle** and set **enableSolidCandle** as false. Now inject **CandleSeries** module using **<Inject services={[CandleSeries]}>** method.

## Candle

To render a candle series, use series [type](#) as `Candle` and inject `CandleSeries` module using `<Inject services=[[CandleSeries]]>` method.

## Trend lines in React Stock chart component

Trendlines are used to show the direction and speed of price.

StockChart supports 6 types of trendlines namely

Linear, Exponential, Logarithmic, Polynomial, Power, Moving Average. By using trendline dropdown button you can add or remove the required trendline type.

### Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline [type](#) as [Linear](#) and inject [Trendlines](#) module using `<Inject services=[[Trendlines]]>`.

### Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render an exponential trendline, use trendline [type](#) as **Exponential** and inject **Trendlines** module using `<Inject services={{Trendlines}}>`.

### Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline [type](#) as **Logarithmic** and inject **Trendlines** module using `<Inject services={{Trendlines}}>`.

### Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline [type](#) as **Polynomial** and inject **Trendlines** module using `<Inject services={{Trendlines}}>`.

**polynomialOrder** used to define the polynomial value.

### Power

A power trendline is a curved line that is best used with data sets that compare measurements that increase at a specific rate.

To render a power trendline, use trendline [type](#) as **Power** and inject **Trendlines** module using `<Inject services={{Trendlines}}>`.

### Moving Average

A moving average trendline smoothen out fluctuations in data to show a pattern or trend more clearly.

To render a moving average trendline, use trendline [type](#) as **MovingAverage** and inject **Trendlines** module using `<Inject services={{Trendlines}}>`.

**period** property defines the period to find the moving average.

<!-- markdownlint-disable MD036 -->

## Technical indicators in React Stock chart component

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

StockChart supports 10 types of technical indicators namely Accumulation Distribution, ATR, EMA, SMA, TMA, Momentum, MACD, RSI, Stochastic, Bollinger Band. By using indicator dropdown box you can add and remove the required indicators types.

### Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock. To render a Accumulation Distribution Indicator, use indicator [type](#) as AccumulationDistribution and inject AccumulationDistributionIndicator module using `<Inject services={[AccumulationDistributionIndicator]}>`. To calculate the signal line [volume](#) field is additionally added with dataSource.

### Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value. To render a Average True Range (ATR) Indicator, use indicator [type](#) as Atr and inject AtrIndicator module using `<Inject services={[AtrIndicator]}>`.

### Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator, use indicator [type](#) as Ema and inject EmaIndicator module using `<Inject services={[EmaIndicator]}>`.

### Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator [type](#) as Momentum and inject MomentumIndicator module using `<Inject services={[MomentumIndicator]}>` method. Momentum indicator will be represented by two lines (upperLine, signalLine). In momentum indicator the upperBand value is always renders at the value 100.

### Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator [type](#) as Macd and inject MacdIndicator module using `<Inject services={[MacdIndicator]}>`. MACD indicator will be represented by MACD line, signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

### Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator [type](#) as Rsi and inject RsiIndicator module using `<Inject services={[Rsindicator]}>`. RSI indicator will be represented by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by [overBought](#) and [overSold](#) properties of indicator and the signalLine is calculated by RSI formula.

### Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator [type](#) as Sma and inject SmaIndicator module using `<Inject services={[SmaIndicator]}>`.

### Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator [type](#) as `Stochastic` and inject `StochasticIndicator` module using `Chart.Inject(StochasticIndicator)` method. stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine).

In stochastic indicator the upperBand value and lowerBand value is customized by [overBought](#) and [overSold](#) properties of indicators and the periodLine and signalLine is render based on stochastic formula.

### Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator [type](#) as `Tma` and inject `TmaIndicator` module using `<Inject services=[[TmaIndicator]]>`.

### Bollinger Band

A StockChart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices. To render a Bollinger Band, use indicator [type](#) as `BollingerBand` and inject `BollingerBands` module using `<Inject services=[[BollingerBands]]>` method. Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine). The default values of the Bollinger Band [period](#) is 14 and [standardDeviations](#) is 2.

Note: To use crosshair feature, we need to inject **Crosshair** module `<Inject services={[Crosshair]}>` method.

### Legend in React Stock chart component

Legend provides information about the series rendered in the Stock Chart. Legend can be added to a Stock Chart by enabling the [visible](#) option in the [legendSettings](#).

#### Position and Alignment

By using the [position](#) property, legend can be placed at **Left**, **Right**, **Top**, **Bottom** or **Custom** of the Stock Chart. The legend is positioned at the bottom of the Stock Chart, by default.

#### INDEX.JSX

};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));
```

### Legend Size

By default, legend takes 20% - 25% of the Stock Chart's height horizontally, when it is placed on top or bottom position and 20% - 25% of the width vertically, while placing on left or right position of the Stock Chart. The default legend size can be changed by using the [width](#) and [height](#) property of the `legendSettings`.

export default App;
ReactDOM.render(<App />, document.getElementById("charts"));

```

Note: To use legend feature, we need to inject **StockLegend** module into the **services**.

### Period selector in React Stock chart component

The period selector allows to select a range with specified periods. By default the period selector is enabled in stock chart.

#### Periods

Periods is an array of objects that allows users to specify the range of **periods** (../api/stock-chart/stockChartModel/#periods). The **interval** property specifies the count value of the button, and the **text** property specifies the text to be displayed on button. The **intervalType** property allows users to customize the intervals of the buttons. The **intervalType** property supports the following interval types:

- Auto
- Years
- Quarter
- Months
- Weeks
- Days
- Hours
- Minutes
- Seconds

**INDEX.JSX**

### Range selector in React Stock chart component

The left and right thumb of RangeNavigator are used to indicate the selected range in the large collection of data. Following are the ways you can select a range.

- By dragging the thumbs.
- By tapping on the labels.

- By setting the start and end through Date Range button.

Following code example shows the [enableSelector](#) property allows users to toggle the visibility of range selector.

#### INDEX.JSX

```

### Export print in React Stock chart component

The rendered stock chart can be exported to JPEG, PNG, SVG, or PDF format using the export dropdown button in the period selector toolbar. You can choose the required format using the export dropdown button in stock-chart.

The rendered stock chart can be printed directly using print button in period selector toolbar.

border: { color: '#f48a21' }
    },
    {
      date: new Date(2015, 1, 2), text: 'Q1', description: 'Add
longer text',
      textStyle: { color: 'white' }, background: '#dd3c9f',
border: { color: '#dd3c9f' }, type: 'Text'
    },
    {
      date: new Date(2015, 2, 12), text: 'Close', description:
'Markets closed',
      textStyle: { color: 'white' }, background: '#f48a21',
border: { color: '#f48a21' }
    }
  ]}
>

```

```

    <Inject services={[DateTime, StripLine, LineSeries, Crosshair,
    SplineSeries, CandleSeries, HiloOpenCloseSeries, HiloSeries, RangeAreaSeries,
    Trendlines,
        EmaIndicator, RsiIndicator, BollingerBands, TmaIndicator,
    MomentumIndicator, SmaIndicator, AtrIndicator, Export,
        AccumulationDistributionIndicator, MacdIndicator,
    StochasticIndicator]} />
    <StockChartSeriesCollectionDirective>
        <StockChartSeriesDirective dataSource={aapl} type='Spline'
    xName='x' width={2} yName='high' name='google' close='high'>
        </StockChartSeriesDirective>
    </StockChartSeriesCollectionDirective>
</StockChartComponent>
};
export default App;
ReactDOM.render(<App />, document.getElementById("charts"));

```

### Stock Events for individual series

By default, stock events will be showed for all series. Now, you can set the stock events for particular series using `seriesIndexes` property.

#### INDEX.JSX

### Accessibility in React Stock chart component

The Stock chart component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Stock chart component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;
}
```

```
</style>
```

```
<div> - All
features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

### WAI-ARIA attributes

The Stock chart component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Stock chart component:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

### Keyboard interaction

The Stock chart component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Stock chart component.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the Stock chart element. |

| **Tab** | Moves the focus to the next element in the Stock chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Stock chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **ESC** | Cancel the tooltip for the data point. |

| **Ctrl + P** | Prints the Stock chart. |

### Ensuring accessibility

The Stock chart component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Stock chart component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Stock chart component with accessibility tools.

## Switch

### Getting Started

This section explains how to create a simple Switch, and configure its available functionalities in React, using React quickstart application.

### Dependencies

The following list of dependencies are required to use Switch component in your application.

```
`javascript
|-- @syncfusion/ej2-react-buttons
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-buttons
\`
```

### Installation and Configuration

You can use [create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
\`
```

To set-up a React application in TypeScript environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
\`
```

To set-up a React application in JavaScript environment, run the following command.

```
`bash
npx create-react-app my-app
cd my-app
npm start
\`
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](#) public registry.

To install Switch component, use the following command

```
`bash
npm install @syncfusion/ej2-react-buttons --save
`
```

### Adding CSS Reference

Import the Switch component's required CSS references as follows in `src/App.css`.

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-buttons/styles/material.css";
`
```

### Adding Switch component to the Application

To include Switch component in your application import the `SwitchComponent` from `ej2-react-buttons` package in `App.tsx`.

Add Switch component in application as shown in below code example.

```
`ts
// Import the Switch.
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import './App.css';
// To render Switch.
function App() {
  return ( <div style={{marginTop: '150px'}}><SwitchComponent /></div>);
}
export default App;
`
```

### Run the application

Run the application in the browser using the following command:

```
`npm start
`
```

The following example shows a basic Switch component.

### **APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
  return (<SwitchComponent checked={true}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

### APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
  return (
    <SwitchComponent checked={true} />
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

### Accessibility in React Switch component

The Switch component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Switch component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

```

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

| Accessibility Checker Validation |  |

| Axe-core Accessibility Validation |  |

<style>

.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}

</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

```

### WAI-ARIA attributes

The Switch component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Switch component:

| Attributes | Purpose |

| --- | --- |

| **role** | Indicates the switch component. |

| **aria-disabled** | Indicates that the element is perceivable but disabled, so it is not editable or otherwise operable. |

### Keyboard interaction

The Switch component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Switch component.

| **Press** | **To do this** |

| --- | --- |

| **Space** | When the switch has focus, pressing the Space key changes the state of the switch. |

### Ensuring accessibility

The Switch component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Switch component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Switch component with accessibility tools.

### Style and appearance in React Switch component

To modify the Switch appearance, you need to override the default CSS of Switch component. Please find the list of CSS classes and its corresponding section in Switch. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

#### CSS Class | Purpose of Class

`.e-switch-wrapper .e-switch-inner` | To customize the line of the switch in off mode

`.e-switch-wrapper .e-switch-handle` | To customize the handle of the switch in off mode

`.e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-handle:not(.e-switch-active)` | To customize the handle of the switch in off mode when hover

`.e-switch-wrapper:not(.e-switch-disabled):hover .e-switch-inner:not(.e-switch-active)` | To customize the line of the switch in off mode when hover

`.e-switch-wrapper .e-switch-handle.e-switch-active` | To customize the handle of the switch in on mode

`.e-switch-wrapper .e-switch-on` | To customize the line of the switch in on mode

`.e-switch-wrapper:hover .e-switch-handle.e-switch-active` | To customize the handle of the switch in on mode when hover

`.e-switch-wrapper:hover .e-switch-inner.e-switch-active .e-switch-on` | To customize the line of the switch in on mode when hover

### How To

#### Set text in React Switch component

This section explains how to set [onLabel](#) and [offLabel](#) texts on Switch. In the following example, `onLabel` is set as `ON` and `offLabel` is set as `OFF`.

#### APP.JSX

```
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Switch.
function App() {
    return (<SwitchComponent onLabel="ON" offLabel="OFF" checked={true}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

**APP.TSX**

```
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Switch.
function App() {
  return (
    <SwitchComponent onLabel="ON" offLabel="OFF" checked={true} />
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

Switch does not have text support for material themes, and does not support long custom text.

## Change size in React Switch component

The different Switch sizes available are default and small. To reduce the size of default Switch to small, set the [cssClass](#) property to `e-small`.

**APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch.
function App() {
  return (<table className='size'>
    <tr>
      <td className='lSize'>Small</td>
      <td>
        <SwitchComponent cssClass="e-small"/>
      </td>
    </tr>
    <tr>
      <td className='lSize'>Default</td>
      <td>
        <SwitchComponent />
      </td>
    </tr>
  </table>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

**APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch.
function App() {
```

```

return (
  <table className='size'>
    <tr>
      <td className='lSize'>Small</td>
      <td>
        <SwitchComponent cssClass="e-small" />
      </td>
    </tr>
    <tr>
      <td className='lSize'>Default</td>
      <td>
        <SwitchComponent />
      </td>
    </tr>
  </table>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));

```

### Customize the appearance of a switch in React Switch component

You can customize the appearance of the Switch component using the CSS rules. Define your own CSS rules according to your requirement and assign the class name to the [cssClass](#) property.

#### Customize Switch bar and handle

Switch bar and handle can be customized as per requirement using CSS rules. Switch bar and handle customized using `cssClass` property. In the following sample, the `border-radius` CSS property for the Switch bar (`e-switch-inner`) and handle (`e-switch-handle`) elements was changed border radius circle to square shape.

#### APP.JSX

```

{% raw %}
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Switch.
function App() {
  return (
    <div className="switch-control">
      <div>
        <h3>Customizing Shape</h3>
      </div>
      <div>
        <label htmlFor="switch1" style={{ padding: "10px 85px 10px 7px" }}> Square Switch </label>
        <SwitchComponent id="switch1" cssClass="square"/>
      </div>
      <div>
        <label htmlFor="switch2" style={{ padding: "10px 76px 10px 7px" }}> Bar and handle </label>
        <SwitchComponent id="switch2" cssClass="custom-switch" checked={true}/>
      </div>
    </div>
  );
}

```

```

        <label htmlFor='switch3' style={{ padding: "10px 96px
10px 7px" }}> Handle text </label>
        <SwitchComponent id="switch3" cssClass="handle-text"/>
      </div>
    </div>);
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('switch'));
  {% endraw %}

```

## APP.TSX

```

{% raw %}
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render Switch.
function App() {
  return (
    <div className="switch-control">
      <div>
        <h3>Customizing Shape</h3>
      </div>
      <div>
        <label htmlFor="switch1" style={{ padding: "10px 85px
10px 7px" }}> Square Switch </label>
        <SwitchComponent id="switch1" cssClass="square" />
      </div>
      <div>
        <label htmlFor='switch2' style= {{ padding: "10px 76px
10px 7px" }}> Bar and handle </label>
        <SwitchComponent id="switch2" cssClass="custom-switch"
checked={true} />
      </div>
      <div>
        <label htmlFor='switch3' style= {{ padding: "10px 96px
10px 7px" }}> Handle text </label>
        <SwitchComponent id="switch3" cssClass="handle-text" />
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}

```

### Color the Switch

Switch colors can be customized as per the requirement using CSS rules. Switch bar and handle colors customized using `cssClass` property. In the following sample, the Switch bar (`e-switch-inner`) element background and border colors were changed from default colors.

## APP.JSX

```

{% raw %}
import * as React from 'react';

```

```

import * as ReactDOM from 'react-dom';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
// To render Switch.
function App() {
    return (<div className="switch-control">
        <div>
            <h3>Customizing Color</h3>
        </div>
        <div>
            <label htmlFor="switch1" style={{ padding: "10px 85px 10px 0"
}}> Custom color </label>
            <SwitchComponent id="switch1" cssClass='bar-color' />
        </div>
        <div>
            <label htmlFor='switch2' style={{ padding: "10px 90px 10px 0"
}}> Handle color </label>
            <SwitchComponent id="switch2" cssClass='handle-color'
checked={true} />
        </div>
        <div>
            <label htmlFor='switch3' style={{ padding: "10px 103px 10px
0" }}> iOS Switch </label>
            <SwitchComponent id="switch3" cssClass='custom-iOS'
checked={true} />
        </div>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}

```

**APP.TSX**

```

{% raw %}
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
// To render Switch.
function App() {
    return (
        <div className="switch-control">
            <div>
                <h3>Customizing Color</h3>
            </div>
            <div>
                <label htmlFor="switch1" style={{ padding: "10px 85px 10px 0"
}}> Custom color </label>
                <SwitchComponent id="switch1" cssClass='bar-color' />
            </div>
            <div>
                <label htmlFor='switch2' style={{ padding: "10px 90px 10px 0"
}}> Handle color </label>
                <SwitchComponent id="switch2" cssClass='handle-color'
checked={true} />
            </div>
            <div>

```

```

        <label htmlFor='switch3' style={{ padding: "10px 103px 10px
0" }}> iOS Switch </label>
        <SwitchComponent id="switch3" cssClass='custom-iOS'
checked={true} />
    </div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}

```

### Enable ripple for switch label in React Switch component

By default, label with ripple effect is not available in Switch. You can achieve this by using `rippleMouseHandler` method.

The following example illustrates how to enable ripple effect for labels in Switch component.

#### APP.JSX

```

import { enableRipple } from '@syncfusion/ej2-base';
import { rippleMouseHandler } from '@syncfusion/ej2-buttons';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    function onCreated() {
        // Function to handle ripple effect for Switch with label.
        document.querySelector('.lSize label').addEventListener('mouseup',
rippleHandler);
        document.querySelector('.lSize label').addEventListener('mousedown',
rippleHandler);
        function rippleHandler(e) {
            const rippleSpan =
e.target.parentElement.nextElementSibling.querySelector('.e-ripple-
container');
            if (rippleSpan) {
                rippleMouseHandler(e, rippleSpan);
            }
        }
    }
    return (<table className='size'>
        <tr>
            <td className='lSize'>
                <label htmlFor='switch1'>USB Tethering</label>
            </td>
            <td>
                <SwitchComponent id="switch1" created={onCreated}
checked={true}/>
            </td>
        </tr>
    </table>);
}
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('switch'));
```

### APP.TSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { rippleMouseHandler } from '@syncfusion/ej2-buttons';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    function onCreated(): void {
        // Function to handle ripple effect for Switch with label.
        (document.querySelector('.lSize label') as
        HTMLElement).addEventListener('mouseup', rippleHandler);
        (document.querySelector('.lSize label') as
        HTMLElement).addEventListener('mousedown', rippleHandler);
        function rippleHandler(e: MouseEvent): void {
            const rippleSpan = (e.target as
            HTMLElement).parentElement.nextElementSibling.querySelector('.e-ripple-
            container');
            if (rippleSpan) {
                rippleMouseHandler(e, rippleSpan);
            }
        }
    }
    return (
        <table className='size'>
            <tr>
                <td className='lSize'>
                    <label htmlFor='switch1'>USB Tethering</label>
                </td>
                <td>
                    <SwitchComponent id="switch1" created={onCreated}
checked={true} />
                </td>
            </tr>
        </table>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

While accessing HTML Elements we got the exception 'object is possibly null' due to 'strictNullChecks' option. So you can disable it in 'tsconfig.json' file.

### Enable rtl in React Switch component

Switch component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Switch component.

### APP.JSX

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
```

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    return (<SwitchComponent enableRtl={true} checked={true}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

**APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    return (
        <SwitchComponent enableRtl={true} checked={true} />
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

## Set disabled state in React Switch component

Switch can be disabled by setting the [disabled](#) property to true.

The following example illustrates how to disable support in Switch component.

**APP.JSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    return (<SwitchComponent disabled={true}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
```

**APP.TSX**

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    return (
```

```

    <SwitchComponent disabled={true} />
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));

```

### Submit name and value in form in React Switch component

The name attribute of the Switch is used to group Switches. When the Switches are grouped in form, the checked items value attribute will post to the server on form submit. The disabled and unchecked Switch values will not be sent to the server on form submit.

In the following code snippet, USB and Wi-Fi in the checked state, and Bluetooth is in disabled state. Values that are in checked state only be sent on form submit.

### APP.JSX

```

{% raw %}
import { enableRipple } from '@syncfusion/ej2-base';
import { ButtonComponent, SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch.
function App() {
  return (
    <form>
      <div className="switch-control">
        <div>
          <h3>Form Submit</h3>
        </div>
        <div>
          <label htmlFor="switch1" style={{ padding: "10px 85px 10px 0" }}> USB </label>
          <SwitchComponent id="switch1" name='Tethering' value='USB' checked={true}/>
        </div>
        <div>
          <label htmlFor="switch2" style={{ padding: "10px 80px 10px 0" }}> Wi-Fi </label>
          <SwitchComponent id="switch2" name='Hotspot' value='Wi-Fi' checked={true}/>
        </div>
        <div>
          <label htmlFor="switch3" style={{ padding: "10px 53px 10px 0" }}> Bluetooth </label>
          <SwitchComponent id="switch3" name='Tethering' value='Bluetooth' disabled={true}/>
        </div>
        <div>
          <ButtonComponent isPrimary={true}>Submit</ButtonComponent>
        </div>
      </div>
    </form>
  );
}
export default App;

```

```
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
import { enableRipple } from '@syncfusion/ej2-base';
import { ButtonComponent, SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch.
function App() {
    return (
        <form>
            <div className="switch-control">
                <div>
                    <h3>Form Submit</h3>
                </div>
                <div>
                    <label htmlFor="switch1" style={{ padding: "10px 85px 10px 0" }}> USB </label>
                    <SwitchComponent id="switch1" name='Tethering' value='USB' checked={true} />
                </div>
                <div>
                    <label htmlFor="switch2" style={{ padding: "10px 80px 10px 0" }}> Wi-Fi </label>
                    <SwitchComponent id="switch2" name='Hotspot' value='Wi-Fi' checked={true} />
                </div>
                <div>
                    <label htmlFor="switch3" style={{ padding: "10px 53px 10px 0" }}> Bluetooth </label>
                    <SwitchComponent id="switch3" name='Tethering' value='Bluetooth' disabled={true} />
                </div>
                <div>
                    <ButtonComponent
                        isPrimary={true}>Submit</ButtonComponent>
                </div>
            </div>
        </form>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}
```

Change switch state using toggle method in React Switch component

This section explains about how to toggle between the switch states using [toggle](#) method.

### APP.JSX

```
{% raw %}
```

```
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    let switchRef;
    function created() {
        switchRef.toggle();
    }
    return (<SwitchComponent id="switch" ref={(scope) => { switchRef = scope;
}} enableRtl={true} checked={true} created={created}/>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}
```

### APP.TSX

```
{% raw %}
import { enableRipple } from '@syncfusion/ej2-base';
import { SwitchComponent } from '@syncfusion/ej2-react-buttons';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
enableRipple(true);
// To render Switch with checked state.
function App() {
    let switchRef: SwitchComponent;
    function created(): void {
        switchRef.toggle();
    }
    return (
        <SwitchComponent id="switch" ref={(scope) => { switchRef = scope as
SwitchComponent; }} enableRtl={true} checked={true} created={created}/>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('switch'));
{% endraw %}
```

Switch triggers [change](#) event on every state stage to perform custom operations.

## Tab

### Getting Started

This section briefly explains about how to create a simple [Link to the Video](#) component and configuring the Tab header content in React.

To get started quickly with React Tabs using Create React App, you can check out this video:

### Dependencies

The following is the list of dependencies required to use the Tab component in your application.

```
`javascript
```

```
|-- @syncfusion/ej2-react-navigations
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-navigations
|-- @syncfusion/ej2-buttons
|-- @syncfusion/ej2-popups
\
```

### Setup for Local Development

To set-up a React application, choose any of the following ways. The best and easiest way is to use the [create-react-app](#). It sets up your development environment in JavaScript and improvise your application for production. Refer to the [installation instructions](#) of `create-react-app`.

```
`bash
npx create-react-app my-app
cd my-app
npm start
\
```

or

```
`bash
yarn create react-app my-app
cd my-app
yarn start
\
```

To set-up a React application in `TypeScript` environment, run the following command.

```
`bash
npx create-react-app my-app --template typescript
cd my-app
npm start
\
```

Besides using the [npm](#) package runner tool, also create an application from the `npm init`. To begin with the `npm init`, upgrade the `npm` version to `npm 6+`.

```
`bash
npm init react-app my-app
cd my-app
npm start
```

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install Tab component, use the following command

```
npm install @syncfusion/ej2-react-navigations --save
```

### Adding CSS reference

Add components style as given below in `src/App.css`.

```
`css
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
@import '../node_modules/@syncfusion/ej2-buttons/styles/material.css';
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-navigations/styles/material.css';
```

To refer `App.css` in the application then import it in the `src/App.tsx` file

### Initialize the Tab using JSON items collection

The Tab can be rendered by defining a JSON array. The item is rendered with [header](#) text and [content](#) for each Tab.

- Import the Tab component to your `src/App.tsx` file using following code.

### INDEX.JSX

```
import { TabComponent, TabItemDirective, TabItemsDirective } from
 '@syncfusion/ej2-react-navigations';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
const ReactApp = () => {
  let headerText = [{ text: "Twitter" }, { text: "Facebook" }, { text:
    "WhatsApp" }];
  const content0 = () => {
    return <div>
      Twitter is an online social networking service that enables users to
      send and read short 140-character messages called "tweets". Registered users
      can read and post tweets, but those who are unregistered can only read them.
      Users access Twitter through the website interface, SMS or mobile device app
      Twitter Inc. is based in San Francisco and has more than 25 offices around
      the world. Twitter was created in March 2006 by Jack Dorsey, Evan Williams,
      Biz Stone, and Noah Glass and launched in July 2006. The service rapidly
      gained worldwide popularity, with more than 100 million users posting 340
      million tweets a day in 2012. The service also handled 1.6 billion search
      queries per day.
    </div>;
  }
}
```

```

    </TabComponent>
  );
}
const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<ReactApp />);

```

- Run the application in the browser using the following command.

```

,
npm start
,

```

In the above sample code, **element** is the **id** of the HTML element in a page to which the Tab is initialized.

### Initialize the Tab using HTML elements

The Tab component can be rendered based on the given HTML element using **<TabComponent>** tag. Header section must be enclosed with in a wrapper element using **e-tab-header** class and corresponding content must be mapped with **e-content** class.

You need to follow the below structure of HTML elements to render the Tab,

`<TabComponent id='defaultTab'>` --> Root Tab element

`<div class="e-tab-header">` --> Tab header

`<div>` --> Header Item

`</div>`

`</div>`

`<div class="e-content">` --> Tab content

`<div>` --> Content Item

`</div>`

`</div>`

`</TabComponent>`

## INDEX.JSX

## See Also

- [How to load tab with DataSource](#)

## Adaptive in React Tab component

The following section explains about rendering Tab when its width exceeds the viewable area or particularly in a given [width](#).

The available modes are as follows:

- Scrollable
- Popup

### Scrollable

The default overflow mode is Scrollable. Scrollable display mode supports displaying the Tab header items in a single line with horizontal scrolling enabled, when the item overflows to the available space.

- The right and left navigation arrow is added at the start and end of the Tab header through which user can navigate

towards overflowed items of the Tab header.

- You can also see the overflowed items using touch and swipe action on the header and content section.
- By default, navigation icon in the left direction is disabled, you can see the overflowed items by moving in the right direction.
- By clicking the arrow or by holding the arrow continuously, you can see the overflowed items.

- In devices the navigation icons are not available. You can touch and swipe to see the overflowed items of the Tab header.

## Popup

The Popup is the another type of [overflowMode](#) in which the Tab container holds the items that can be placed within the available space. The rest of the overflowing items for which there is no space to fit within the viewing area are moved to overflow popup container.

- The items placed in popup can be viewed by opening the popup with the help of drop-down icon given at the end of the Tab header.
- If the popup height exceeds the height of the visible area, you can scroll through the popup items and select one.

HTML

HyperText Markup Language, commonly referred to as HTML, is the standard markup language used to create web pages. Along with CSS, and JavaScript, HTML is a cornerstone technology, used by most websites to create visually engaging web pages, user interfaces for web applications, and user interfaces for many mobile applications.[1] Web browsers can read HTML files and render them into visible or audible web pages. HTML describes the structure of a website semantically along with cues for presentation, making it a markup language, rather than a programming language.

## Header in React Tab component

This section explains about modifying the style of Tab header, and configuring its icons and positions.

### Styles

You can customize header styles by adding predefined classes in the Tab root element. The pre-defined CSS class names are as follows:

- **e-fill:** The Selected Tab header background is set as solid fill.
- **e-background:** Tab header has a solid fill background, and the selected header has a highlighted border.

- **e-background e-accent:** Tab header has a solid fill background, and the selected header has a highlighted border with accent color.

If the above custom style classes are not included in the root element, the default style is applied to the Tab items.

#### INDEX.JSX

```
import { ChangeEventArgs, DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import { TabComponent, TabItemDirective, TabItemsDirective } from '@syncfusion/ej2-react-navigations';
import * as React from "react";
import { useRef } from 'react';
import * as ReactDOM from 'react-dom';

const ReactApp = () => {
  let tabObj = useRef(null);

### Icon positions

You can customize the position of the Tab header icons using the [iconPosition](#) property. This property depends on the header items [iconCss](#) property. By default, Tab header icon is placed on left position. The position values are as follows:

- **Left:** Icon is placed on the left of the Tab header item.
- **Right:** Icon is placed on the right of the Tab header item.
- **Top:** Icon is placed on the top of the Tab header item.
- **Bottom:** Icon is placed on the bottom of the Tab header item.

### See Also

- [How to customize selected tab styles](#)

### Localization in React Tab component

Localization library allows to localize the default text content of the Tab to different cultures using the [locale](#) property. In Tab, the close button's tooltip text alone will be localize based on culture. The close button is shown on tab header when enabled [showCloseButton](#) property.

| Locale key | en-US (default) |

|-----|-----|

| closeButtonTitle | Close |

### Loading translations

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `French` culture is set to Tab and change the close button's tooltip text.

### INDEX.JSX

```

## Orientation in React Tab component

This section explains about modifying the position and modes of Tab header.

It allows placing the header section inside the Tab component at different positions by using the [headerPlacement](#) property. The available positions are as follows:

- **Top:** Tab header items can be arranged horizontally, and their content can be placed after the header.
- **Bottom:** Tab header items can be arranged horizontally, and their content can be placed before the header.
- **Left:** Tab header items can be arranged vertically, and their content can be placed after the header.
- **Right:** Tab header items can be arranged vertically, and their content can be placed before the header.

It is also adaptable to the available space when the tab items exceed the view space. You can customize the modes by using [overflowMode](#) property. The available modes are as follows:

- Scrollable
- Popup

## Drag and drop in React Tab component

The Tab component allows you to drag and drop any item by setting `allowDragAndDrop` to `true`. Items can be reordered to any place by dragging and dropping them onto the desired location.

- If you need to prevent dragging action for a particular item, the `onDragStart` event can be used which will trigger when the item drag is started. If you need to prevent dropping action for a particular item, the `dragged` event can be used which will trigger when the drag action is stopped.
- The `dragArea` defines the area in which the draggable element movement will be occurring. Outside that area will be restricted for the draggable element movement.
- The `onDragStart` event will be triggered before dragging the item from Tab.
- The `dragging` event will be triggered when the Tab item is being dragged.
- The `dragged` event will be triggered when the Tab item is dropped on the target element successfully.

In the following sample, the [allowDragAndDrop](#) property is enabled.

### Drag and drop item between tabs

It is possible to drag and drop the tab items between two tabs, by manually saving those dropped items as new tab item data through the `addTab` method of Tab and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tab control as an external source, and the item from the tab component is dragged and dropped onto another Tab. Therefore, it is necessary to use the `onDragStart` and `dragged` event of the Tab component, where we can form an event object and save it using the `addTab` method of the Tab and remove the dragged item through `removeTab` method of Tab using the dragged item index.

### Drag and drop items to external source

It is possible to drag and drop the items to any of the external sources from the Tab, by manually saving those dropped items as new node data through the `addNodes` method of Treeview and removing the dragged item through the `removeTab` method of Tab.

In this example, we have used the tree view control as an external source, and the item from the tab component is dragged and dropped onto the child nodes of the tree view component. Therefore, it is necessary to use the `dragged` event of the Tab component, where we can form an event object and save it using the `addNodes` method of the Treeview and remove the dragged item through the `removeTab` method of Tab using the dragged item index.

## Accessibility in React Tab component

The Tab component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Tab component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support |  |

| [Section 508](#) Support |  |

| Screen Reader Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| Keyboard Navigation Support |  |

```
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |

<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>
```

### ARIA attributes

Tab component is designed by considering [WAI-ARIA](#) standard. Tab is supported with ARIA Accessibility which is accessible by on-screen readers, and other assistive technology devices. The following list of attributes are added in the Tab.

#### | Roles and Attributes | Functionalities |

| --- | --- |

| tablist | Attribute is set to the Tab header element that describes actual role of the element. |

| tab | Attribute is set to the Tab items element to indicates an interactive element inside a **tablist** that, when activated, displays its associated **tabpanel**. |

| tabpanel | Attribute is set to the Tab content that describes the role for viewing the active content. |

| aria-orientation | Attribute is set to the Tab header element indicates the Tab header orientation. Default value of this attribute is horizontal. |

| aria-selected | Attribute set to the Tab items to indicates the selection state for Tab items. Active Tab is set to true for this attribute. |

| aria-labelledby | Attribute is set to the Tab content element to indicates the associated Tab header for the content. |

| aria-controls | Attribute is set to the Tab items element to indicates the associated **tabpanel** for the header. |

| aria-haspopup | Attribute is set to the Popup element to indicates the popup mode in the Tab. The default value of this attribute is false. If popup mode is enabled, the attribute value is set to true. |

| aria-disabled | Attribute set to the Tab items to It indicates the disabled state of the Tab. |

### Keyboard interaction

By default, keyboard navigation is enabled. This component implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Tab element, you can use the following key combination for interacting with the Tab.

Key	Description
Left	Moves focus to the previous Tab. If focus is on the first Tab, the focus will not move to any Tab.
Right	Moves focus to the next Tab. If focus is on the last Tab element, the focus will not move to any Tab.
Enter or Space	Selects the Tab if it is not selected. Opens the popup dropdown icon if it is focussed. Select the Tab item as active when popup item is focussed.
Esc(Escape)	Closes the popup if popup is in opened state.
Down or Up	When the popup is open and focused, it will move to previous/next Tab items of the popup in the vertical direction.
Home	Moves focus to the first Tab.
End	Moves focus to the last Tab.
Shift + F10	If popup mode is enabled, it opens the popup when the Tab is focused.
Delete	Deletes the Tab, if close button is enabled in Tab header.
Tab	To Move focus through the interactive elements.
Shift + Tab	To Move focus through the interactive elements.

### Ensuring accessibility

The Tab component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Tab component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Tab component with accessibility tools.

- [Accessibility in Syncfusion React components](#)

### Style in React Tab component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

#### Customizing Tab

Use the following CSS to customize the Tab.

```
`css
.e-tab {
```

```
border: 5px solid rgb(173, 255, 47);  
}
```

,

### Customizing the Tab items

Use the following CSS to customize the header items of Tab.

```
`css  
.e-tab .e-tab-header .e-toolbar-items {  
background: #9faed8;  
border: 2px solid blue;  
}
```

,

Use the following CSS to customize the content items of Tab.

```
`css  
.e-tab .e-content .e-item {  
color: #a78515;  
font-size: 14px;  
}
```

,

### Customizing Tab's header

Use the following CSS to customize the header of Tab control.

```
`css  
.e-tab .e-tab-header {  
background: #badfba !important;  
}
```

,

### Customizing Tab's header icon

Use the following CSS to customize the header item icon of Tab control.

```
`css  
.e-tab .e-tab-header .e-toolbar-item .e-tab-icon {  
color: #badfba !important;  
}
```

,

### Customizing Tab's content

Use the following CSS to customize the content of Tab control.

```
`css
.e-tab .e-content {
background: #d1f6d1 !important;
}
`
```

#### Customizing the hover state of Tab control

Use the following CSS to customize the tab item when hovering.

```
`css
.e-tab .e-tab-header .e-toolbar-item .e-tab-wrap:hover {
background: #d1f6d1 !important;
}
`
```

Use the following CSS to customize the tab item popup icon when hovering.

```
`css
.e-tab .e-tab-header .e-hor-nav .e-popup-up-icon:hover,
.e-tab .e-tab-header .e-hor-nav .e-popup-down-icon:hover {
background: #d1f6d1 !important;
}
`
```

#### Customizing selected item of Tab control

Use the following CSS to customize the selected tab item.

```
`css
.e-tab .e-tab-header .e-toolbar-item.e-active {
background: #d1f4d1;
}
`
```

Use the following CSS to customize the selected tab item text and icon.

```
`css
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-text,
.e-tab .e-tab-header .e-toolbar-item.e-active .e-tab-icon {
color: green !important;
}
`
```

## How To

### Load content through post in React Tab component

The Tab supports to load external contents through **AJAX** library. Refer to the following steps.

- Import the **Ajax** module from **ej2-base** and initialize with URL path.
- Get the data from **Ajax Success** event, then initialize the Tab with retrieved external path data.

#### INDEX.JSX

```
import * as React from "react";
import { useState, useEffect } from 'react';
import * as ReactDOM from 'react-dom';
import { TabComponent, TabItemsDirective, TabItemDirective } from
 '@syncfusion/ej2-react-navigations';
function App() {
  const [headerText, setHeaderText] = useState([

### Customize selected tab styles in React Tab component

You can customize the Tab style by overriding its header and active tab CSS classes. Define HTML string for adding animation and customizing the Tab header and pass it to [text](#) property. Now you can override the style using custom CSS classes added to the Tab elements.

You can add the custom class into Tab component using [cssClass](#) property which is used to customize the Tab component.

### Customize tab scroll step in React Tab component

Tab supports to customize the scrolling distance when you click the left and right side navigation icons. we can customize **ScrollStep** property for scrolling distance. Refer to the following code example.

By using Tab scrollStep property, pass a required value to customize tab scrollStep.

#### INDEX.JSX

```

import { TabComponent, TabItemDirective, TabItemsDirective } from

**Create wizard using tab in React Tab component**

Tab items can be disabled dynamically by passing the index and boolean value with the [enableTab](#) method and also passing index or HTML element to select an item from the tab using [select](#) method.

Create the following contents for each tab in the wizard.

**1. Search tab:**

Created with [DropDownList](#) to select the source, destination and type of ticket. A [DatePicker](#) for choosing the date of journey.

**2. Train tab:**

Based on the selected start and end point, populated Grid with random list of available seats and train list. Initially define the columns and row selected event for validating, after the source and destination chosen update the [dataSource](#) for the Grid.

**3. Passenger tab:**

A table with Textbox, Numeric, DropDownList for adding passenger name, age, gender and preferred berth/seat. Add validation on entering passenger details to proceed.

**4. Payment tab:**

Calculate the ticket cost based on location, passenger count and ticket type. Generate data for Grid with passenger details, train number and ticket cost summary.

You can go back on each tab using buttons available in it and tabs are [disabled](#) to navigate through tab header click actions. Once you end the wizard all the data get cleared and wizard goes back to starting tab.

In the below demo, designed for simple train reservation module that enable/disable tab items based on sequential validation of each Tab content.

### Load tab with data source in React Tab component

You can bind any data object to Tab items, by mapping it to a [header](#) and [content](#) property.

In the below demo, Data is fetched from an OData service using `DataManager`. The result data is formatted as a JSON object with `header` and `content` fields, which is set to [items](#) property of Tab.

### INDEX.JSX

```

import * as React from "react";
import { useRef, useEffect } from 'react';
import * as ReactDOM from 'react-dom';
import { DataManager, Query, ODataV4Adaptor } from '@syncfusion/ej2-data';

```

```
import { TabComponent } from '@syncfusion/ej2-react-navigations';
const SERVICE_URI =
'https://services.odata.org/V4/Northwind/Northwind.svc/Employees';
const App = () => {
  const tabInstance = useRef(null);
  useEffect(() => {
    const fetchTabItems = async () => {
      const e = await new DataManager({ url: SERVICE_URI, adaptor: new
ODataV4Adaptor() }).executeQuery(new Query().range(1, 4));
      const result = e.result;
      const mapping = { header: 'FirstName', content: 'Notes' };
      const itemsData = result.map((item) => ({
        header: { text: item[mapping.header] },
        content: item[mapping.content],
      }));
      tabInstance.current.items = itemsData;
      tabInstance.current.refresh();
    };
    if (tabInstance.current) {
      fetchTabItems();
    }
  }, [tabInstance]);
  return (
    <TabComponent heightAdjustMode='Auto' ref={tabInstance}>
    </TabComponent>
  );
}
const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<App />);
```

## INDEX.TSX

```

### Set state persistence of the tab component in React Tab component

State persistence allows the Tab to retain the current modal value in the browser cookies for state maintenance. This action is handled through the [enablePersistence](#) property which is set to false by default. When it is set to true, some of the Tab component model values will be retained even after refreshing the page.

The following sample demonstrates how to set state persistence of the Tab component.

#### INDEX.JSX

### Set custom animation in React Tab component

Tab supports custom animations for both previous and next actions from the provided animation option of [Animation](#) library. The [animation](#) property also allows you to set [easing](#), [duration](#), and various other [effect](#).

Default animation is given as [SlideLeftIn](#) for [previous](#) tab animation and [SlideRightIn](#) for [next](#) tab animation. You can also disable the animation by setting the animation effect as [None](#). Also, please use the following CSS to disable indicator animation for animation effect as [None](#).

`css

```

.e-tab .e-tab-header:not(.e-vertical) .e-indicator, .e-tab .e-tab-header.e-vertical .e-indicator {
transition: none;
}
`

```

The sample demonstrates some types of animation that suits Tab. You can check all the animation effects [here](#).

### Load tab items dynamically in React Tab component

Tabs can be added dynamically by passing array of items and index value to the [addTab](#) method.

```
`ts
```

```
// New tab title and content inputs are fetched and stored in local variable
```

```
let title: string = document.getElementById('tab-title').value;
```

```
let content: string = document.getElementById('tab-content').value;
```

```
// Required tab item object formed by using textbox inputs
```

```
let item: Object = { header: { text: title }, content: createElement('pre', { innerHTML:
content.replace(/\n/g, '<br>\n') }).outerHTML };
```

// Item object and the index argument passed into the addTab method to add a new tab

```
this.addTab([item], this.totalItems-1);
```

,

In the following demo, you can add the tab content by clicking the +. This + icon is added on the tab header using [iconCss](#) property. Enter the new Tab heading and content details in the available text boxes, click 'Add Tab' button to pass the details as an array and here last index is calculated to append the new tab at the end.

### Create collapsible tabs in React Tab component

You can achieve collapse and expand functionality in Tab by adding/removing a custom CSS class in the click event handler for each tab.

- Define a CSS class to set the style property display as none. Here 'collapse' class is added to the content element for hiding it using [created](#) event.
- Bind the [selected](#) event for Tab to collapse the initially selected Tab item and bind custom click handler for the Tab headers.
- In the event handler, add and remove 'collapse' class to hide and show the corresponding Tab content.

```

```

        text-align: justify;
    }
    .container {
        margin: 0 10px;
        min-width: 350px;
    }
    .info {
        margin: 10px;
        font-weight: bold;
    }
    .e-tab .e-content > .e-item.e-active.collapse { /* csslint allow: adjoining-classes */
        display: none;
    }
    .e-tab .e-tab-header .e-indicator.collapse { /* csslint allow: adjoining-classes */
        display: none;
    }
}

```

### Customize tab content height in React Tab component

You can change the Tab content height by using the [heightAdjustMode](#) property. By default, the Tab content [heightAdjustMode](#) property is set to **Content** value.

- **None:** Each tab content height is set based on the Tab height. This value is used only the tab component having the [height](#) property.
- **Auto:** Each tab content height will take the maximum height of all other tabs content.
- **Content:** Each tab content height is set based on their own content.
- **Fill:** Each tab content height is set based on the full height of Tabs parent element.

### INDEX.JSX

```

import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import { TabComponent, TabItemDirective, TabItemsDirective } from
 '@syncfusion/ej2-react-navigations';
import { useRef } from 'react';

### Render other components in tab using template in React Tab component

You can render other components inside Tab using React [Link to the Video](#). Through this, we can add content as other components directly with all functionalities to our Tab. Follow the below guidelines for using the other components as template in tab.

- Declare a template within the function returns jsx element. If the template does not need arguments no need to pass the properties.
- Assign the function as value for the template property.

To quickly get started with integrating UI components inside the React Tabs component, you can check out this video:

#### INDEX.JSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
import { TabComponent, TabItemDirective, TabItemsDirective } from
 '@syncfusion/ej2-react-navigations';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DatePickerComponent, CalendarComponent } from '@syncfusion/ej2-
react-calendars';
const App = () => {
  let headertext;
  const buttonTemplate = () => {
    return (<ButtonComponent>Click me</ButtonComponent>);
  }
  const datePickerTemplate = () => {
    return (<DatePickerComponent></DatePickerComponent>);
  }
  const calendarTemplate = () => {
    return (<CalendarComponent></CalendarComponent>);
  }
  headertext = [{ text: "ButtonComponent" }, { text: "DatePickerComponent"
}, { text: "CalendarComponent" }];
  return (<div id='container'>
    <TabComponent heightAdjustMode='Auto' id='tabelement'>
      <TabItemsDirective>
        <TabItemDirective header={headertext[0]} content={buttonTemplate}/>
        <TabItemDirective header={headertext[1]}
content={datePickerTemplate}/>
        <TabItemDirective header={headertext[2]}
content={calendarTemplate}/>
      </TabItemsDirective>
    </TabComponent>
  </div>);
}
const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<App />);
```

#### INDEX.TSX

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
```

```
import { TabComponent, TabItemDirective, TabItemsDirective } from
 '@syncfusion/ej2-react-navigations';
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DatePickerComponent, CalendarComponent } from '@syncfusion/ej2-
react-calendars';
const App = () => {
  let headertext: any;
  const buttonTemplate = (): JSX.Element => {
    return (<ButtonComponent>Click me</ButtonComponent>);
  }
  const datePickerTemplate = (): JSX.Element => {
    return (<DatePickerComponent></DatePickerComponent>);
  }
  const calenderTemplate = (): JSX.Element => {
    return (<CalendarComponent ></CalendarComponent>);
  }
  headertext = [{ text: "ButtonComponent" }, { text: "DatePickerComponent" },
 { text: "CalendarComponent" }];
  return (
    <div id='container'>
      <TabComponent heightAdjustMode='Auto' id='tabelement'>
        <TabItemsDirective>
          <TabItemDirective header={headertext[0]}
            content={buttonTemplate} />
          <TabItemDirective header={headertext[1]}
            content={datePickerTemplate} />
          <TabItemDirective header={headertext[2]}
            content={calenderTemplate} />
        </TabItemsDirective>
      </TabComponent>
    </div>
  );
}
const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<App />);
```

</html>

```

### Passing props

The following code example demonstrates how to use `props` when rendering other components in tab component.

#### INDEX.JSX

```

import { useRef, useState } from "react";
import * as React from "react";
import * as ReactDOM from "react-dom";
import { enableRipple } from "@syncfusion/ej2-base";
import {
  TabComponent,
  TabItemDirective,
  TabItemsDirective,
  ContextMenuComponent
} from "@syncfusion/ej2-react-navigations";
import { ButtonComponent } from "@syncfusion/ej2-react-buttons";
import {
  DatePickerComponent,
  CalendarComponent
} from "@syncfusion/ej2-react-calendars";
enableRipple(true);
const App = () => {
  const contextMenuRef = useRef(null);
  const [menuItems] = useState([
    { text: "Cut" },
    { text: "Copy" },
    { text: "Paste" }
  ]);
  const btnClick = () => {
    contextMenuRef.current.open(80, 20);
  }
  let headertext;
  const contextMenuTemplate = () => {
    return (
      <div>
        <ContextMenuComponent
          id="contextmenu"
          ref={contextMenuRef}
          items={menuItems}
        />
        <ButtonComponent
          onClick={btnClick}
        >Click me</ButtonComponent>
      </div>
    );
  }
  const datePickerTemplate = () => {
    return <DatePickerComponent />;
  }
  const calendarTemplate = () => {

```

```

    return <CalendarComponent />;
  }
  headertext = [{ text: "ContextMenuComponent" }, { text:
  "DatePickerComponent" }, { text: "CalendarComponent" }];
  return (
    <div id="container">
      <TabComponent heightAdjustMode="Auto" id="tabelement">
        <TabItemsDirective>
          <TabItemDirective
            header={headertext[0]}
            content={conTextTemplate}
          />
          <TabItemDirective
            header={headertext[1]}
            content={datePickerTemplate}
          />
          <TabItemDirective
            header={headertext[2]}
            content={calenderTemplate}
          />
        </TabItemsDirective>
      </TabComponent>
    </div>
  );
}
const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<App />);

```

## INDEX.TSX

```

import { useRef, useState } from "react";

```

### Adding dynamic items with content reuse in React Tab component

You can add dynamic tabs by reusing the content using React **template**. Tabs can be added dynamically by passing array of items and index value to the [addTab](#) method.

Content reuse can be achieved by using the following steps:

1. Declare a template within the function returns jsx element. If the template does not need arguments no need to pass the properties.
2. Assign the function as value for the template property.
3. Provide separate template declaration for each react component and pass content by dynamically adding tab. It will reuse the content of react component.

Refer to the following sample.

#### INDEX.JSX

```

import { useRef } from 'react';
import * as React from "react";
import * as ReactDOM from 'react-dom/client';
import { TabComponent, TabItemDirective, TabItemsDirective } from
'@syncfusion/ej2-react-navigations';
import { DatePickerComponent } from '@syncfusion/ej2-react-calendars';
import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
const App = () => {
    const tabObj = useRef(null);
    const Dropdown = (props) => {
        return (
            <div>
                <DropDownListComponent
                    dataSource={props.data}
                    placeholder="Select a game"
                />
            </div>
        );
    };
    const addButtonClicked = (e) => {
        const newTabItem = [

```

```

        {
            header: { text: 'DynamicTabItem' },
            content: thirdDropdownTemplate
        }
    ];
    tabObj.current.addTab(newTabItem, 1);
}
const removeButtonClicked = (e) => {
    tabObj.current.removeTab(1);
}
const firstDropdownTemplate = () => {
    let sportsData = [
        'Badminton',
        'Basketball',
        'Cricket',
        'Golf',
        'Hockey',
        'Rugby'
    ];
    return <Dropdown data={sportsData} />;
}
const secondDropdownTemplate = () => {
    let sportsData = [
        'Cricket',
        'Golf',
        'Hockey',
        'Rugby',
        'Badminton',
        'Basketball'
    ];
    return <Dropdown data={sportsData} />;
}
const thirdDropdownTemplate = () => {
    let sportsData = [
        'Rugby',
        'Badminton',

### Reorder active tab in React Tab component

We can able to prevent the changing of the active tab item on resizing the browser when overflow mode is popup by using the [reorderActiveTab](#) property. By default, the active Tab should be reordered when we click the tab items from the popup. If we set `false` to [reorderActiveTab](#) property the active tab item from the popup will not be reordered and an active item is highlighted inside the popup. The following code example depicts to prevent the reorder active tab item inside the popup.

### Tab selection in React Tab component

We can able to find the tab selection whether it is selected by user interaction or programmatically way in the [selecting](#) and [selected](#) event argument with the field of `isInteracted`. When the user changes the tab through click actions it will return true otherwise, it will return false. The following code example depicts to find the tab selecting the state in selecting and selected events.

const root = ReactDOM.createRoot(document.getElementById('element'));
root.render(<App />);

```

## Tab key navigation in React Tab component

The [tabIndex](#) property of a Tab item is used to enable tab key navigation for that particular item. When a positive value is assigned to the [tabIndex](#) property, it allows the user to switch focus to the next or previous tab item using the Tab or Shift+Tab keys. By default, the user can only switch between tab items using the arrow keys.

If the [tabIndex](#) value is set to 0 for all tab items, the tab will switch based on the order of the elements on the page. This means that if the tab items are listed in a specific order on the page, the user will be able to navigate through them using the Tab key in that same order.

To use the [tabIndex](#) property, you can assign a positive value to the property of each tab item that you want to enable tab key navigation. For example:

### INDEX.JSX

```
import { TabComponent, TabItemDirective, TabItemsDirective } from
 '@syncfusion/ej2-react-navigations';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
const ReactApp = () => {

```

With this code, the user will be able to switch between the tab items using the Tab and Shift+Tab keys, in the order specified by the [tabIndex](#) values.

It's important to note that the [tabIndex](#) property only affects the ability to navigate between tab items using the Tab key. The user will still be able to use the arrow keys to switch between tab items, regardless of the value of the [tabIndex](#) property.

## Ej1 api migration in React Tab component

This article describes the API migration process of Tab component from Essential JS 1 to Essential JS 2.

### Accessibility and Localization

<!-- markdownlint-disable MD033 -->

Behavior	Property in Essential JS 1	Property in Essential JS 2

--	--	--

| Keyboard Navigation | **Property** : allowKeyboardNavigation<br/> <EJ.Tab id="Tab"  
allowKeyboardNavigation={false} ></EJ.Tab> | <b>Not Applicable</b> |

| Localization | <b>Not Applicable</b> | **Property** : locale<br/> <TabComponent id="Tab"  
locale="fr-BE"></TabComponent > |

| Right to left | **Property**: enableRTL<br/> <EJ.Tab id="tab" enableRTL={true}></EJ.Tab> | **Property**:  
enableRTL<br/> <TabComponent id='tab' enableRTL={true}> </TabComponent > |

### AjaxSettings

<!-- markdownlint-disable MD033 -->

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

|Show item | **Method** : showItem(index)<br/> <EJ.Tab id="Tab" ></EJ.Tab><br/> <br/>var  
 obj=\$('#Tab').ejTab('instance')<br/>obj.showItem(1); | **Method** : hideTab(index, false) <br/>  
 <TabComponent id="tab" ref = {(scope) => {this.TabObj = scope}}> </TabComponent ><br/>  
 <br/> constructor(props: {}) {<br/> this.TabObj.hideTab(1, false); }|

### Common

<!-- markdownlint-disable MD033 -->

| **Behavior** | **Property in Essential JS 1** | **Property in Essential JS 2** |

| ----- | ----- | ----- |

| Collapse active item | **Property** : collapsible <br/> <EJ.Tab id="tab" collapsible={true}> </EJ.Tab> |  
 <b>Not Applicable</b> |

| Custom class | **Property** : cssClass <br/> <EJ.Tab id="tab" cssClass="customClass" > </EJ.Tab> |  
**Property** : cssClass <br/> <TabComponent id="tab" cssClass="customClass" > </TabComponent >  
 |

| Enabled | **Property** : enabled <br/> <EJ.Tab id="tab" enabled={false}> </EJ.Tab> | **Method** :  
 disable(false)<br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/> constructor(props: {}) {<br/>  
 this.TabObj.disable(false); |

| Persistence | **Property** : enablePersistence <br/> <EJ.Tab id="tab" enablePersistence={false}> </EJ.Tab> | **Property** : enablePersistence <br/> <TabComponent id="tab"  
 enablePersistence={false}> </TabComponent > |

| Events | **Property** : events <br/> <EJ.Tab id="tab" events="click" > </EJ.Tab> | <b>Not  
 Applicable</b> |

| Height | **Property** : height <br/> <EJ.Tab id="Tab" height="100%" > </EJ.Tab> | **Property** : height  
 <br/> <TabComponent id="Tab" height="100%" > </TabComponent > |

| HeightAdjustMode | **Property** : heightAdjustMode <br/> <EJ.Tab id="Tab"  
 heightAdjustMode="Content" > </EJ.Tab> | **Property** : heightAdjustMode <br/> <TabComponent  
 id="Tab" heightAdjustMode="Content" > </TabComponent > |

| HtmlAttributes | **Property** : htmlAttributes <br/> <EJ.Tab id="Tab" [htmlAttributes]="attributes" >  
 </EJ.Tab><br/> <br/> this.attributes = {class: "my-class"}; | <b>Not Applicable</b> |

| ID prefix | **Property** : idPrefix <br/> <EJ.Tab id="Tab" [idPrefix]="EJ.Tab-" > </EJ.Tab> | <b>Not  
 Applicable</b> |

| ShowCloseButton | **Property** : showCloseButton <br/> <EJ.Tab id="Tab" showCloseButton={true}> </EJ.Tab> | **Property** : showCloseButton <br/> <TabComponent id="Tab"  
 {showCloseButton}="true" > </TabComponent > |

| showReloadIcon | **Property** : showReloadIcon <br/> <EJ.Tab id="Tab" showReloadIcon={true}> </EJ.Tab> | <b>Not Applicable</b> |

| ShowRoundedCorner | **Property** : showRoundedCorner <br/> <EJ.Tab id="Tab"  
 showRoundedCorner={true}> </EJ.Tab> | <b>Not Applicable</b> |

| Destroy | **Method** : destroy() <br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/> var  
 obj=\$('#Tab').ejTab('instance')<br/>obj.destroy(); | **Method** : destroy() <br/> <TabComponent  
 id="tab"></TabComponent ><br/> <br/> constructor(props: {}) {<br/> this.TabObj.destroy(); |

| Disable Tab | **Method** : disable() <br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/> var  
 obj=\$('#Tab').ejTab('instance')<br/>obj.disable(); | **Method** : disable(true) <br/> <TabComponent  
 id="Tab"></TabComponent ><br/> <br/> constructor(props: {}) {<br/> this.TabObj.disable(true); |

| Enable Tab | **Method** : enable() <br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/> var  
 obj=\$('#Tab').ejTab('instance')<br/>obj.enable(); | **Method** : disable(false) <br/> <TabComponent  
 id="Tab"></TabComponent ><br/> <br/> constructor(props: {}) {<br/> this.TabObj.disable(false); |

```
| Show Tab | Method : show() <br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/>var
obj=$('#Tab').ejTab('instance')<br/>obj.show(); | <b>Not Applicable</b> |

| Hide Tab | Method : hide() <br/> <EJ.Tab id="Tab"></EJ.Tab><br/> <br/>var
obj=$('#Tab').ejTab('instance')<br/>obj.hide(); | <b>Not Applicable</b> |

| Refresh | <b>Not Applicable</b> | Method : refresh() <br/> <TabComponent
id="tab"></TabComponent ><br/> <br/>constructor(props: {}) {<br/> this.TabObj.refresh(); }|

| Created | Event: create<br/> <EJ.Tab id="tab" create={this.onCreate}></EJ.Tab><br/> <br/>
oncreate(event) { } | Event: created<br/> <TabComponent id="tab"
created={oncreated.bind(this)}></TabComponent ><br/> <br/> oncreated(event) { } |

| Destroyed | Event: destroy<br/> <EJ.Tab id="tab" destroy={this.ondestroy}></EJ.Tab><br/> <br/>
ondestroy(event) { } | Event: destroyed<br/> <TabComponent id="tab"
destroyed={ondestroyed.bind(this)} ></TabComponent ><br/> <br/> ondestroyed(event) { } |
```

## TextArea

### Getting Started with React TextArea Component

This section briefly explains how to create a simple TextArea and demonstrate the basic functionalities of the TextArea component in an React environment.

#### Dependencies

The following list of dependencies are required to use the TextArea component in your application.

```
`javascript
|-- @syncfusion/ej2-react-inputs
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-base
`,`
```

#### Installation and configuration

- You can use [create-react-app](#) to setup the applications.

To install `create-react-app` run the following command.

```
`bash
npm install -g create-react-app
`,`
```

- Start a new project using create-react-app command as follows.

```
`bash
create-react-app quickstart --scripts-version=react-scripts-ts
```

cd quickstart

,

- To install TextArea component, use the following command.

```
`bash
```

```
npm install @syncfusion/ej2-react-inputs --save
```

,

- The above package installs [Input dependencies](#) which are required to render the TextArea component in React environment.
- The TextArea CSS files are available in the `ej2-react-inputs` package folder. This can be referenced in your application using the following code.

```
[src/App.css]
```

```
`css
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-react-inputs/styles/material.css";
```

,

The [Custom Resource Generator \(CRG\)](#) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

#### Adding TextArea to the application

To include the TextArea component in your application import the `TextAreaComponent` from `ej2-react-inputs` package in `App.tsx`.

Add the TextArea component in application as shown in below code example.

```
`ts
```

```
{ / Import the TextArea. / }
```

```
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
```

```
import './App.css';
```

```
{ / To render TextArea. / }
```

```
function App() {
```

```
  return (
```

```
    <TextAreaComponent id='default'></TextAreaComponent>
```

```
  );
```

```
}
```

```
export default App;
```

,

### Running the application

Run the application in the browser using the following command:

,

```
npm start
```

,

The following example shows a basic TextArea component.

#### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (<div className='wrap'>
        <TextAreaComponent id='default'></TextAreaComponent>
    </div>);
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

#### INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id='default'></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### Getting and setting values

To set the initial value of the TextArea component, you can utilize the [value](#) property. Here's how you can achieve it:

```
`ts
```

```
{/ Import the TextArea. /}
```

```
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' value='Comments'></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
`
```

- Alternatively, you can set the value of the TextArea using a state variable.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { useState } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  // Declare state variable textValue and a function setTextValue to update it.
  const [textValue, setTextValue] = useState("comments");
  return (
    <div className='wrap'>
      {/ Render TextArea with value property set to textValue state variable. /}
      <TextAreaComponent id='default' value={textValue}></TextAreaComponent>
    </div>
  );
}
export default App;
```

```
ReactDOM.render(<App />,document.getElementById('input-container'));
```

- You can dynamically retrieve the value of the TextArea component using the state variable assigned to the `value` property of the TextArea component.

`ts

```
{/ Import the TextArea. /}
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { useState } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  const [textValue, setTextValue] = useState("comments");
  function onButtonClick () {
    // Get the value of the TextArea using state variable.
    let value = textValue;
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='rating' value={textValue}></TextAreaComponent>
      <button id="valuebtn" onclick={onButtonClick.bind(this)}>Get Value</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
```

- You can retrieve the value of the TextArea by accessing it as an argument from the [change](#) event.

`ts

```
{/ Import the TextArea. /}
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
```

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  // triggers when the content of TextArea has changed and gets focus-out.
  function change(args) {
    // Get the value of the TextArea from event arguments.
    let value = args.value;
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' value='Comments' change={change}></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
```

## Floating Label in React TextArea Component

The floating label functionality in the TextArea component allows the placeholder text to float above the TextArea while the user interacts with it, providing a more intuitive user experience. This feature can be achieved using the [floatLabelType](#) API, which offers various options for defining the floating behavior:

Type	Description
--	--
Auto	The label floats above the TextArea when it receives focus or input, returning to its initial position when the TextArea loses focus and contains no value.
Always	The label always remains floating above the TextArea, regardless of user interaction.
Never	The label never floats; it remains in its default position within the TextArea.

## INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' placeholder='Enter your comments'
        floatLabelType='Auto'></TextAreaComponent>
    </div>
  );
}
```

```

        </div>);
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('input-container'));

```

### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id='default' placeholder='Enter your comments'
floatLabelType='Auto'></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

### Placeholder with localization

Localization library allows to localize the placeholder text of the TextArea to different cultures using the `locale` property.

### INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id="default" placeholder="veuillez inscrire
vos commentaires" locale="fr-BE" floatLabelType="Auto"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

```

```

    return (
      <div className='wrap'>
        <TextAreaComponent id="default" placeholder="veuillez inscrire vos commentaires" locale="fr-BE" floatLabelType="Auto"></TextAreaComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

To load translation object in an application use `load` function of `L10n` class.

In the below sample, `German` culture is loaded to the TextArea placeholder text.

#### INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { L10n } from '@syncfusion/ej2-base';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// Load culture for textarea
L10n.load({
  'de-DE': {
    'textarea': { 'placeholder': "Geben Sie Ihre Kommentare ein" }
  }
});
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id="default" locale="de-DE" floatLabelType="Auto"></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

#### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { L10n } from '@syncfusion/ej2-base';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// Load culture for textarea
L10n.load({
  'de-DE': {
    'textarea': { 'placeholder': "Geben Sie Ihre Kommentare ein" }
  }
});
// To render TextArea.
function App() {
  return (

```

```

        <div className='wrap'>
            <TextAreaComponent id="default" locale="de-DE"
floatLabelType="Auto"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## Rows and Columns in React TextArea Component

Two essential attributes, **rows** and **columns**, play a pivotal role in customizing the TextArea's appearance and layout.

The **rows** attribute determines the initial visible number of lines within the TextArea, controlling its vertical size. Conversely, the **columns** attribute specifies the visible width of the TextArea in characters per line, determining its initial width.

- You can customize the TextArea component by setting the number of rows using the [rowCount](#) property and the number of columns using the [columnsCount](#) property. These properties allow precise control over the dimensions of the TextArea, ensuring it fits seamlessly within the layout of the application.

### INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <div>
                <TextAreaComponent id="default1" placeholder="Enter your
comments" floatLabelType="Auto" rowCount="3"
columnsCount="35"></TextAreaComponent>
            </div>
            <div>
                <TextAreaComponent id="default2" placeholder="Enter your
comments" floatLabelType="Auto" rowCount="5"
columnsCount="40"></TextAreaComponent>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
```

```
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

    return (
        <div className='wrap'>
            <div>
                <TextAreaComponent id="default1" placeholder="Enter your
comments" floatLabelType="Auto" rowCount="3"
columnsCount="35"></TextAreaComponent>
            </div>
            <div>
                <TextAreaComponent id="default2" placeholder="Enter your
comments" floatLabelType="Auto" rowCount="5"
columnsCount="40"></TextAreaComponent>
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## Resize in React TextArea Component

The TextArea allows users to input and edit large amounts of text. Resizing this control effectively can enhance the user experience and accommodate varying content needs. This resizing behavior can be enabled and configured using the [resizeMode](#) API, which offers several options for resizing the TextArea:

Type	Description
Vertical	Allows users to adjust the height of the TextArea vertically. It is suitable when users want to resize the TextArea only along the vertical axis, accommodating varying amounts of text input.
Horizontal	Users can adjust the width of the TextArea horizontally. This option is helpful for accommodating longer lines of text without altering the height of the control.
Both	Allows users to adjust both the height and width of the TextArea, offering maximum flexibility in resizing. It is ideal for situations where users need precise control over the dimensions of the TextArea.
None	Disables the resizing in the TextArea. This option is ideal for situations where maintaining a consistent layout is critical, and resizing by users is unnecessary.

### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

    return (
        <div className='wrap'>
            <TextAreaComponent id="default" placeholder="Enter your comments"
resizeMode="Both"></TextAreaComponent>
        </div>
    );
}
```

```

        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## INDEX.TSX

```

{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
    public textareaObj: any;
    public render() {
        return (
            <div className="multiline">
                <TextBoxComponent multiline={true} value= 'Mr. Dodsworth Dodsworth,
System Analyst, Studio 103, The Business Center' input={this.onInput =
this.onInput.bind(this)} created={this.onCreate = this.onCreate.bind(this)}
placeholder='Enter your address' floatLabelType='Auto' ref = {scope =>
{this.textareaObj = scope }}/>
            </div>
        );
    }
    private onCreate(): void {
        this.textareaObj.addAttributes({rows: 1});
        this.textareaObj.respectiveElement.style.height = "auto";
        this.textareaObj.respectiveElement.style.height =
(this.textareaObj.respectiveElement.scrollHeight)+"px";
    }
    private onInput(): void {
        this.textareaObj.respectiveElement.style.height = "auto";
        this.textareaObj.respectiveElement.style.height =
(this.textareaObj.respectiveElement.scrollHeight)+"px";
    }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## Width of react TextArea component

You can easily customize the width of the TextArea using the [width](#) property. This property allows precise adjustment of the TextArea's width according to the specific layout requirements of the application.

## INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>

```

```

        <TextAreaComponent id="default" placeholder="Enter your comments"
        resizeMode="Both" width="500"></TextAreaComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

## INDEX.TSX

```

{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
  let textareaObj: any;
  return (
    <div className="multiline">
      <TextBoxComponent multiline={true} value= 'Mr. Dodsworth Dodsworth,
System Analyst, Studio 103, The Business Center' input={onInput =
onInput.bind(this)} created={onCreate = onCreate.bind(this)}
placeholder='Enter your address' floatLabelType='Auto' ref = {scope =>
{textareaObj = scope }}/>
    </div>
  );
  function onCreate(): void {
    textareaObj.addAttributes({rows: 1});
    textareaObj.respectiveElement.style.height = "auto";
    textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement.scrollHeight)+"px";
  }
  function onInput(): void {
    textareaObj.respectiveElement.style.height = "auto";
    textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement.scrollHeight)+"px";
  }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## Maximum Length in React TextArea Component

You can enforce a maximum length limit for the text input in the TextArea using the [maxLength](#) property. This property allows to define the maximum number of characters that users can input into the TextArea.

- By setting the **maxLength** property, you can control the length of text input, preventing users from exceeding a specified character limit.

## INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

```

```
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id="default" placeholder="Enter your comments"
        maxLength="20"></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

  return (
    <div className='wrap'>
      <TextAreaComponent id="default" placeholder="Enter your comments"
        maxLength="20"></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

When the user reaches the specified limit, the TextArea prevents further input, ensuring compliance with the defined character limit. This feature helps maintain data integrity and provides users with clear feedback on the allowed input length.

## Form Support in React TextArea Component

The TextArea component seamlessly integrates with HTML forms, enabling efficient submission of longer text data. By including TextArea inputs within HTML forms, users can conveniently input multiline text content and submit it as part of form submissions.

This integration enhances the usability of forms, allowing users to provide detailed feedback, enter lengthy descriptions, or input other multiline text data seamlessly.

## INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <br />
    </div>
  );
}
```

```

        <TextAreaComponent id='default' name="myTextarea"
placeholder='Enter your comments' floatLabelType='Auto' required =
{true}></TextAreaComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

## INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <br />
      <TextAreaComponent id='default' name="myTextarea"
placeholder='Enter your comments' floatLabelType='Auto' required =
{true}></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## Integration of react TextArea component with FormValidator component

TextArea component seamlessly integrates with the **FormValidator** component, allowing users to incorporate textarea inputs into form validation processes efficiently.

By integrating TextArea components with the **FormValidator** component, users can enforce validation rules specific to text inputs, such as required fields, minimum and maximum length constraints, pattern matching, and more. This ensures that user-submitted text data meets specified criteria and maintains data integrity.

## INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { useEffect } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
let formObject;
// To render TextArea.
function App() {
  useEffect(() => {
    const options = {
      // validation rules
      rules: {
        email: {

```

```

        required: [true, '* Please enter valid email'],
      },
      comments: {
        required: [true, '* Please enter your comments'],
      }
    },
  };
  // Initialize the form validator
  formObject = new FormValidator('#form1', options);
}, []);
return (
  <div>
    <div className="control_wrapper" id="control_wrapper">
      <h3 className="form-title">Feedback</h3>
      <div className="control_wrapper textarea-form">
        <form id="form1" method="post">
          <div className="form-group">
            <div className="e-float-input">
              <label>Email</label>
              <input type="email" id="email" name="Email"
data-email-message="Please enter valid email address."
data-required-message="Required field"
required data-msg-containerid="emailError"/>
              <span className="e-float-line"></span>
            </div>
            <div id="emailError"></div>
          </div>
          <div className="form-group">
            <div>
              <label>Comments</label>
              <TextAreaComponent id='default'
name="myTextArea" data-msg-containerid="commentError" placeholder='Enter your
comments' floatLabelType='Auto' required = {true}></TextAreaComponent>
            </div>
            <div id="commentError"></div>
          </div>
          <div className="row">
            <div style={{ float: 'left' }}>
              <button className="btn"
type="submit">Submit</button>
            </div>
            <div style={{ float: 'left' }}>
              <button className="btn"
type="reset">Reset</button>
            </div>
          </div>
        </form>
      </div>
    </div>
    <br />
    <br />
  </div>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

# INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { useEffect } from 'react';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
let formObject;
// To render TextArea.
function App() {
  useEffect(() => {
    const options = {
      // validation rules
      rules: {
        email: {
          required: [true, '* Please enter valid email'],
        },
        comments: {
          required: [true, '* Please enter your comments']
        }
      },
    };
    // Initialize the form validator
    formObject = new FormValidator('#form1', options);
  }, []);

  return (
    <div>
      <div className="control_wrapper" id="control_wrapper">
        <h3 className="form-title">Feedback</h3>
        <div className="control_wrapper textarea-form">
          <form id="form1" method="post">
            <div className="form-group">
              <div className="e-float-input">
                <label>Email</label>
                <input type="email" id="email" name="email"
data-email-message="Please enter valid email address."
data-required-message="Required field"
required data-msg-containerid="emailError"/>
                <span className="e-float-line"></span>
              </div>
              <div id="emailError"></div>
            </div>
            <div className="form-group">
              <div>
                <label>Comments</label>
                <TextAreaComponent id='default'
name="comments" data-msg-containerid="commentError" placeholder='Enter your
comments' floatLabelType='Auto' required = {true}></TextAreaComponent>
              </div>
              <div id="commentError"></div>
            </div>
            <div className="row">
              <div style={{ float: 'left' }}>

```

```

                                <button className="btn"
type="submit">Submit</button>
                                </div>
                                <div style={{ float: 'left' }}>
                                <button className="btn"
type="reset">Reset</button>
                                </div>
                            </div>
                        </form>
                    </div>
                <br />
                <br />
            </div>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## Sizing in React TextArea Component

you can adjust the size of the TextArea by applying specific classes:

| Property | Description |

| -- | -- |

| Small | Add the **e-small** class to the input element or its container to render a smaller-sized TextArea.

| Bigger | Add the **e-bigger** class to the input element or its container to render a larger-sized TextArea.

By applying these classes, users can easily customize the appearance of the TextArea to better fit their application's design requirements.

### INDEX.JSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <h4> Small Size </h4>
            <div className="e-input-group e-small">
                <textarea className="e-input" placeholder="Enter your
comments" onFocus={floatFocus} onBlur={floatBlur}></textarea>
            </div>
            <h4> Bigger Size </h4>
            <div className="e-input-group e-bigger">
                <textarea className="e-input" placeholder="Enter your
comments" onFocus={floatFocus} onBlur={floatBlur}></textarea>
            </div>
        </div>
    );
}
function floatFocus(args) {

```

```

    args.target.parentElement.classList.add("e-input-focus");
  }
  function floatBlur(args) {
    args.target.parentElement.classList.remove('e-input-focus');
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

## INDEX.TSX

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

  return (
    <div className='wrap'>
      <h4> Small Size </h4>
      <div className="e-input-group e-small">
        <textarea className="e-input" placeholder="Enter your
comments" onFocus={floatFocus} onBlur={floatBlur}></textarea>
      </div>
      <h4> Bigger Size </h4>
      <div className="e-input-group e-bigger">
        <textarea className="e-input" placeholder="Enter your
comments" onFocus={floatFocus} onBlur={floatBlur}></textarea>
      </div>
    </div>
  );
}
function floatFocus(args: React.FocusEvent) {
  args.target.parentElement.classList.add("e-input-focus");
}
function floatBlur(args: React.FocusEvent) {
  args.target.parentElement.classList.remove('e-input-focus');
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## Filled and outline mode

The Filled and Outline modes can be enabled in the TextArea component by adding the `e-outline` or `e-filled` class to the `cssClass` API.

By adding these classes, users can choose between a filled or outline appearance for the TextArea component, aligning with the design aesthetics of their application.

## INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (

```

```

        <div className='wrap'>
          <label className="custom-input-label"> Filled TextArea </label>
          <div id='container'>
            <TextAreaComponent id='filled' placeholder="Filled"
floatLabelType="Auto" cssClass="e-filled"></TextAreaComponent>
          </div>
          <label className="custom-input-label"> Outlined TextArea </label>
          <div id='container1'>
            <TextAreaComponent id='outlined' placeholder="Outlined"
floatLabelType="Auto" cssClass="e-outline"></TextAreaComponent>
          </div>
        </div>
      );
    }
    export default App;
    ReactDOM.render(<App />, document.getElementById('input-container'));
```

## INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

  return (
    <div className='wrap'>
      <label className="custom-input-label"> Filled TextArea </label>
      <div id='container'>
        <TextAreaComponent id='filled' placeholder="Filled"
floatLabelType="Auto" cssClass="e-filled"></TextAreaComponent>
      </div>
      <label className="custom-input-label"> Outlined TextArea </label>
      <div id='container1'>
        <TextAreaComponent id='outlined' placeholder="Outlined"
floatLabelType="Auto" cssClass="e-outline"></TextAreaComponent>
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

Note: Filled and Outline theme customization are available only with Material themes.

### Custom styling with cssClass API in TextArea

The `cssClass` API provides a powerful way to apply custom styling to the TextArea component, allowing users to customize its appearance and layout according to their design requirements.

By utilizing the `cssClass` API, users can apply custom CSS classes to the TextArea component's container, enabling control over its styling properties such as color, padding, margins, borders, and more.

## INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto" cssClass="custom-textarea"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {

    return (
        <div className='wrap'>
            <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto" cssClass="custom-textarea"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## Setting the disabled state in TextArea

To disable the TextArea, you can utilize the [enabled](#) property. When set to **false**, the TextArea becomes disabled, preventing user interaction.

`ts

*{/ Import the TextArea. /}*

import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';

import \* as React from 'react';

import \* as ReactDOM from 'react-dom';

*{/ To render TextArea./}*

function App() {

return (

<div className='wrap'>

```
<TextAreaComponent id="default" enabled={false}></TextAreaComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
`ts
```

### Set the readonly TextArea

To make the TextArea read-only , you can use the [readonly](#) property. When set to `true`, it prevents users from editing the content of the TextArea.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id="default" readonly={true}></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
`
```

### Set the rounded corner in TextArea

Render the TextArea with `rounded corner` by adding the `e-corner` class to the input parent element.

This rounded corner is visible only in box model input component

```
`ts
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
```

```
return (
  <div class="e-input-group e-corner">
    <textarea class="e-input" placeholder="Enter your comments"></textarea>
  </div>
);
}

export default App;

ReactDOM.render(<App />,document.getElementById('input-container'));
```

### Static clear button in TextArea

To display a static clear button in the TextArea component, you can add the `e-static-clear` class to the `cssClass` property. This class ensures that the clear button remains visible at all times, providing users with the ability to easily clear the TextArea content without needing to focus on the control.

#### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' placeholder="Enter your comments"
        cssClass="e-static-clear" showClearButton={true}></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

#### INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' placeholder="Enter your comments"
        cssClass="e-static-clear" showClearButton={true}></TextAreaComponent>
    </div>
  );
}
export default App;
```

```
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### Customize the TextArea background color and text color

You can customize the TextArea styles such as background-color, text-color and border-color by overriding its default styles to achieve the desired appearance for the TextArea.

#### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

#### INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    return (
        <div className='wrap'>
            <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto"></TextAreaComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### Change the floating label color of the TextArea

You can change the floating label color of the TextArea for both **success** and **warning** validation states by applying the following CSS styles.

```
`css
```

```
/ For Success state /
```

```
.e-float-input.e-success label.e-float-text,
```

```
.e-float-input.e-success input:focus ~ label.e-float-text,
```

```
.e-float-input.e-success input:valid ~ label.e-float-text {
color: #22b24b;
}
/ For Warning state /
.e-float-input.e-warning label.e-float-text,
.e-float-input.e-warning input:focus ~ label.e-float-text,
.e-float-input.e-warning input:valid ~ label.e-float-text {
color: #ffca1c;
}
`
```

### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <div>
        <TextAreaComponent id='default1' placeholder="Success"
floatLabelType="Auto" cssClass="e-success"></TextAreaComponent>
      </div>
      <div>
        <TextAreaComponent id='default2' placeholder="Warning"
floatLabelType="Auto" cssClass="e-warning"></TextAreaComponent>
      </div>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <div>
        <TextAreaComponent id='default1' placeholder="Success"
floatLabelType="Auto" cssClass="e-success"></TextAreaComponent>
      </div>
    </div>
  );
}
```

```

        <div>
          <TextAreaComponent id='default2' placeholder="Warning"
floatLabelType="Auto" cssClass="e-warning"></TextAreaComponent>
        </div>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

### Adding mandatory asterisk to placeholder

To add a mandatory asterisk (\*) to the placeholder in the TextArea component, you can utilize CSS to append the asterisk after the placeholder text.

`css

*/ To add asterick to float label in textarea /*

*.e-float-input.e-control-wrapper .e-float-text::after {*

*content: '\*/ Add asterisk after the placeholder \*/*

*color: red; / Customize asterisk color /*

*}*

*,*

### INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto"></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  return (
    <div className='wrap'>

```

```

        <TextAreaComponent id='default' placeholder="Enter your comments"
floatLabelType="Auto"></TextAreaComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById('input-container'));

```

## Events in React TextArea Component

This section describes the TextArea events that will be triggered when appropriate actions are performed. The following events are available in the TextArea component.

### Created event

The TextArea component triggers the [created](#) event when the TextArea component is created. This event provides users with an opportunity to perform actions immediately after the TextArea has been created and initialized.

```

`ts
{ / Import the TextArea. /}

import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';

{ / To render TextArea./}

function App() {
  function created(){
    //Your required action here
  }
  return (
    <div className='wrap'>
    <TextAreaComponent id="default" created={ created }></TextAreaComponent>
    </div>
  );
}

export default App;

ReactDOM.render(<App />,document.getElementById('input-container'));
`

```

### Input event

The TextArea component triggers the [input](#) each time when the value of TextArea has changed. This event provides users with an opportunity to perform actions in response to real-time changes in the TextArea's content.

The [InputEventArgs](#) passed as an event argument provides the details about the input event in the TextArea.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent, InputEventArgs } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
function inputHandler(args: InputEventArgs){
//Your required action here
}
return (
<div className='wrap'>
<TextAreaComponent id="default" input={ inputHandler }></TextAreaComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
```

### Change event

The TextArea component triggers the [change](#) event when the content of TextArea has changed and gets focus-out. This event provides users with an opportunity to execute specific actions in response to changes made by the user.

The [ChangedEventArgs](#) passed as an event argument provides the details about the changes in the TextArea's value.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent, ChangedEventArgs } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
function changeHandler(args: ChangedEventArgs){
```

```
//Your required action here
}
return (
<div className='wrap'>
<TextAreaComponent id="default" change={ changeHandler }></TextAreaComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
```

### Focus event

The TextArea component triggers the [focus](#) when the TextArea gains focus. This event allows developers to execute specific actions when the user interacts with the TextArea by focusing on it.

The [FocusInEventArgs](#) passed as an argument provides details about the focus event in the TextArea.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent, FocusInEventArgs } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
function focusHandler(args: FocusInEventArgs){
//Your required action here
}
return (
<div className='wrap'>
<TextAreaComponent id="default" focus={ focusHandler }></TextAreaComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
```

### Blur event

The TextArea component triggers the [blur](#) when the TextArea loses focus. This event allows users to execute specific actions when the user interacts with the TextArea by moving focus away from it.

The [FocusOutEventArgs](#) passed as an argument provides details about the blur event in the TextArea.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent, FocusOutEventArgs } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  function blurHandler(args: FocusOutEventArgs){
    //Your required action here
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id="default" blur={ blurHandler }></TextAreaComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
`
```

### Destroyed event

The TextArea component triggers the [destroyed](#) when the TextArea component is destroyed.

```
`ts
{/ Import the TextArea. /}
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
{/ To render TextArea./}
function App() {
  function destroyed(){
    //Your required action here
  }
}
```

```

}
return (
  <div className='wrap'>
    <TextAreaComponent id="default" destroyed={ destroyed }></TextAreaComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />,document.getElementById('input-container'));
`

```

## Methods in React TextArea Component

This section outlines the methods available for interacting with the TextArea component.

### FocusIn method

The [focusIn](#) method in the TextArea, is used to set focus to the textarea element, enabling user interaction.

By calling the `focusIn` method, you can programmatically set focus to the TextArea component, allowing users to interact with it via keyboard input or other means.

### INDEX.JSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  let textareaInstance;
  function onClick() {
    // use focusIn method to focus TextArea
    textareaInstance.focusIn();
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' ref={(scope) => {
        textareaInstance = scope }}></TextAreaComponent>
      <br/>
      <button id="button" onClick={onClick}>Focus-in</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

### INDEX.TSX

```

// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';

```

```
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  let textareaInstance;
  function onClick() {
    // use focusIn method to focus TextArea
    textareaInstance.focusIn();
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' ref={(scope) => {
        textareaInstance = scope }}></TextAreaComponent>
      <br/>
      <button id="button" onClick={onClick}>Focus-in</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### FocusOut method

The [focusOut](#) method in the TextArea component is used to remove focus from the textarea element, ending user interaction.

This method is beneficial for scenarios where user need to programmatically remove focus from the TextArea component, such as after completing a specific task or when navigating to another element in the application.

### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  let textareaInstance;
  function onClick() {
    // use focusOut method to remove focus from the TextArea
    textareaInstance.focusOut();
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' ref={(scope) => {
        textareaInstance = scope }}></TextAreaComponent>
      <br/>
      <button id="button" onClick={onClick}>Focus-Out</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### INDEX.TSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  let textareaInstance;
  function onClick() {
    // use focusOut method to remove focus from the TextArea
    textareaInstance.focusOut();
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' ref={ (scope) => {
        textareaInstance = scope } }></TextAreaComponent>
      <br/>
      <button id="button" onClick={onClick}>Focus-Out</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### GetPersistData method

The [getPersistData](#) method in the TextArea component retrieves the properties that need to be maintained in the persisted state.

This method returns an object containing the properties to be persisted, which can include various configuration options and state information of the TextArea component.

### INDEX.JSX

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
  let textareaInstance;
  function onClick() {
    // use getPersistData method in TextArea
    textareaInstance.getPersistData();
  }
  return (
    <div className='wrap'>
      <TextAreaComponent id='default' ref={ (scope) => {
        textareaInstance = scope } }></TextAreaComponent>
      <br/>
      <button id="button" onClick={onClick}>Get Persist-
        data</button>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

**INDEX.TSX**

```
// Import the TextArea.
import { TextAreaComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
// To render TextArea.
function App() {
    let textareaInstance;
    function onButtonClick() {
        // use getPersistData method in TextArea
        textareaInstance.getPersistData();
    }
    return (
        <div className='wrap'>
            <TextAreaComponent id='default' ref={(scope) => {
                textareaInstance = scope }}></TextAreaComponent>
            <br/>
            <button id="button" onClick={onButtonClick}>Get Persist-
            data</button>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## TextBox

### Getting Started

This section briefly explains about how to create a simple TextBox through CSS classes using **Create React App**.

#### Dependencies

The following list of dependencies are required to use the TextBox component in your application.

```
`javascript
|-- @syncfusion/ej2-react-inputs
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-base
\`
```

#### Installation and Configuration

- You can use [create-react-app](#) to setup the applications.

To install **create-react-app** run the following command.

```
`bash
npm install -g create-react-app
```

`

- Start a new project using create-react-app command as follows.

```
`bash
create-react-app quickstart --scripts-version=react-scripts-ts
cd quickstart
```

`

- To install TextBox component, use the following command.

```
`bash
npm install @syncfusion/ej2-react-inputs --save
```

`

- The above package installs [Input dependencies](#) which are required to render the TextBox component in React environment.
- The TextBox CSS files are available in the `ej2-react-inputs` package folder. This can be referenced in your application using the following code.

[src/App.css]

```
`css
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
@import "../node_modules/@syncfusion/ej2-react-inputs/styles/material.css";
```

`

The [Custom Resource Generator \(CRG\)](#) is an online web tool, which can be used to generate the custom script and styles for a set of specific components.

This web tool is useful to combine the required component scripts and styles in a single file.

#### [Adding TextBox to the application](#)

Return the `HTML input` element with `e-input` class within `render` method in `src/App.tsx` file to render the TextBox component as like below code.

[Class-component]

```
`ts
import * as React from "react";
import './App.css';
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
```

```
// element which is going to render the TextBox
<input className="e-input" type="text" placeholder="Enter Name" />
);
}
};
`
```

#### [Functional-component]

```
`ts
import * as React from "react";
import './App.css';
function App() {
  return (
    // element which is going to render the TextBox
    <input className="e-input" type="text" placeholder="Enter Name" />
  );
};
ReactDOM.render(<App />, document.getElementById('input-container'));
`
```

#### Adding icons to the TextBox

You can create a TextBox with icon as a group by creating the parent div element with the class `e-input-group` and

add the icon element as span with the class `e-input-group-icon`. For detailed information, refer to the [Groups](#) section.

#### [Class-component]

```
`ts
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  public render() {
    return (
      <div className="e-input-group">
        <input className="e-input" name="input" type="text" onFocus = {this.onInputFocus} onBlur =
        {this.onInputBlur} placeholder="Enter Date"/>
      </div>
    );
  }
}
```

```

<span className="e-input-group-icon e-input-popup-date" onMouseDown = {this.onIconMouseDown}
onMouseUp = {this.onIconMouseUp}/>
</div>
);
}
public onInputFocus(args: React.FocusEvent) {
((args.target as HTMLElement).parentElement as HTMLElement).classList.add('e-input-focus');
}
public onInputBlur(args: React.FocusEvent) {
((args.target as HTMLElement).parentElement as HTMLElement).classList.remove('e-input-focus');
}
public onIconMouseDown(args: React.MouseEvent) {
args.persist();
setTimeout(
() => {
(args.target as HTMLElement).classList.add('e-input-btn-ripple');
},
300);
}
public onIconMouseUp(args: React.MouseEvent) {
(args.target as HTMLElement).classList.remove('e-input-btn-ripple');
}
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
`

```

### [Functional-component]

```

`ts
import * as React from "react";
import * as ReactDOM from "react-dom";
function Default() {
return (
<div className="e-input-group">
<input className="e-input" name="input" type="text" onFocus = {onInputFocus} onBlur = {onInputBlur}
placeholder="Enter Date"/>

```

```

<span className="e-input-group-icon e-input-popup-date" onMouseDown = {onIconMouseDown}
onMouseUp = {onIconMouseUp}/>
</div>
);
};
function onInputFocus(args: React.FocusEvent) {
((args.target as HTMLElement).parentElement as HTMLElement).classList.add('e-input-focus');
}
function onInputBlur(args: React.FocusEvent) {
((args.target as HTMLElement).parentElement as HTMLElement).classList.remove('e-input-focus');
}
function onIconMouseDown(args: React.MouseEvent) {
args.persist();
setTimeout(
() => {
(args.target as HTMLElement).classList.add('e-input-btn-ripple');
},
300);
}
function onIconMouseUp(args: React.MouseEvent) {
(args.target as HTMLElement).classList.remove('e-input-btn-ripple');
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
、
、

.e-input-group .e-input-group-icon.e-input-popup-date {
font-size:16px;
}
.e-input-group-icon.e-input-popup-date:before {
content: "\e901";
}
、

```

- Run the application in the browser using the following command.

npm start

Output will be as follows:

[Class-component]

### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  render() {
    return (
      <div className="e-input-group">
        <input className="e-input" name="input" type="text"
onFocus={this.onInputFocus} onBlur={this.onInputBlur} placeholder="Enter
Date"/>
        <span className="e-icons e-input-group-icon e-input-popup-date"
onMouseDown={this.onIconMouseDown} onMouseUp={this.onIconMouseUp}/>
      </div>
    );
  }
  onInputFocus(args) {
    args.target.parentElement.classList.add('e-input-focus');
  }
  onInputBlur(args) {
    args.target.parentElement.classList.remove('e-input-focus');
  }
  onIconMouseDown(args) {
    args.persist();
    setTimeout(() => {
      args.target.classList.add('e-input-btn-ripple');
    }, 300);
  }
  onIconMouseUp(args) {
    args.target.classList.remove('e-input-btn-ripple');
  }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
```

### INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  public render() {
    return (
      <div className="e-input-group">
        <input className="e-input" name="input" type="text" onFocus =
{this.onInputFocus} onBlur = {this.onInputBlur} placeholder="Enter Date"/>
        <span className="e-icons e-input-group-icon e-input-popup-date"
onMouseDown = {this.onIconMouseDown} onMouseUp = {this.onIconMouseUp}/>
      </div>
    );
  }
  public onInputFocus(args: React.FocusEvent) {
```

```

        ((args.target as HTMLElement).parentElement as
HTMLElement).classList.add('e-input-focus');
    }
    public onInputBlur(args: React.FocusEvent) {
        ((args.target as HTMLElement).parentElement as
HTMLElement).classList.remove('e-input-focus');
    }
    public onIconMouseDown(args: React.MouseEvent) {
        args.persist();
        setTimeout(
            () => {
                (args.target as HTMLElement).classList.add('e-input-btn-ripple');
            },
            300);
    }
    public onIconMouseUp(args: React.MouseEvent) {
        (args.target as HTMLElement).classList.remove('e-input-btn-ripple');
    }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## [Functional-component]

### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
function Default() {
    return (<div className="e-input-group">
        <input className="e-input" name="input" type="text"
onFocus={onInputFocus} onBlur={onInputBlur} placeholder="Enter Date"/>
        <span className="e-icons e-input-group-icon e-input-popup-date"
onMouseDown={onIconMouseDown} onMouseUp={onIconMouseUp}/>
    </div>);
}
function onInputFocus(args) {
    args.target.parentElement.classList.add('e-input-focus');
}
function onInputBlur(args) {
    args.target.parentElement.classList.remove('e-input-focus');
}
function onIconMouseDown(args) {
    args.persist();
    setTimeout(() => {
        args.target.classList.add('e-input-btn-ripple');
    }, 300);
}
function onIconMouseUp(args) {
    args.target.classList.remove('e-input-btn-ripple');
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

### INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";

```

```
function Default() {
  return (
    <div className="e-input-group">
      <input className="e-input" name="input" type="text" onFocus =
{onInputFocus} onBlur = {onInputBlur} placeholder="Enter Date"/>
      <span className="e-icons e-input-group-icon e-input-popup-date"
onMouseDown = {onIconMouseDown} onMouseUp = {onIconMouseUp}/>
    </div>
  );
}
function onInputFocus(args: React.FocusEvent) {
  ((args.target as HTMLElement).parentElement as
HTMLElement).classList.add('e-input-focus');
}
function onInputBlur(args: React.FocusEvent) {
  ((args.target as HTMLElement).parentElement as
HTMLElement).classList.remove('e-input-focus');
}
function onIconMouseDown(args: React.MouseEvent) {
  args.persist();
  setTimeout(
    () => {
      (args.target as HTMLElement).classList.add('e-input-btn-ripple');
    },
    300);
}
function onIconMouseUp(args: React.MouseEvent) {
  (args.target as HTMLElement).classList.remove('e-input-btn-ripple');
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
```

## Floating Label

The floating label TextBox floats the label above the TextBox after focusing, or filled with value in the TextBox.

You can create the floating label TextBox by using the `floatLabelType` API.

[Class-component]

## INDEX.JSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
  render() {
    return (
      <div className="App">
        <div className="textboxes">
          <h4>FloatLabelType as Auto</h4>
          <TextBoxComponent placeholder="First Name"
floatLabelType="Auto"/>
        </div>
        <div className="textboxes">
          <h4>FloatLabelType as Always</h4>
          <TextBoxComponent placeholder="Last Name"
floatLabelType="Always"/>
        </div>
      </div>
    );
  }
}
```

```

        </div>
    </div>);
}
;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

**INDEX.TSX**

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
    public render() {
        return (
            <div className="App">
                <div className="textboxes">
                    <h4>FloatLabelType as Auto</h4>
                    <TextBoxComponent placeholder="First Name"
floatLabelType="Auto"/>
                </div>
                <div className="textboxes">
                    <h4>FloatLabelType as Always</h4>
                    <TextBoxComponent placeholder="Last Name"
floatLabelType="Always"/>
                </div>
            </div>
        )
    }
};
ReactDOM.render(<App />, document.getElementById('input-container'));

```

**[Functional-component]****INDEX.JSX**

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
function App() {
    return (<div className="App">
        <div className="textboxes">
            <h4>FloatLabelType as Auto</h4>
            <TextBoxComponent placeholder="First Name"
floatLabelType="Auto"/>
        </div>
        <div className="textboxes">
            <h4>FloatLabelType as Always</h4>
            <TextBoxComponent placeholder="Last Name"
floatLabelType="Always"/>
        </div>
    </div>);
}
;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## INDEX.TSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";

function App() {
  return (
    <div className="App">
      <div className="textboxes">
        <h4>FloatLabelType as Auto</h4>
        <TextBoxComponent placeholder="First Name"
floatLabelType="Auto"/>
      </div>
      <div className="textboxes">
        <h4>FloatLabelType as Always</h4>
        <TextBoxComponent placeholder="Last Name"
floatLabelType="Always"/>
      </div>
    </div>
  );
};

ReactDOM.render(<App />, document.getElementById('input-container'));
```

You can refer to our [React TextBox](#) feature tour page for its groundbreaking feature representations. You can also explore our [React TextBox example](#) to know how to render and configure the textbox.

- [How to add floating label to TextBox programmatically](#)

## Groups in React Textbox component

The following section explains you the steps required to create TextBox with **icon** and **floating label**.

TextBox:

- Create a parent div element with the class **e-input-group**
- Place input element with the class **e-input** inside the parent div element.

[Class-component]

`ts

```
import * as React from "react";
import './App.css';
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
      // element which is going to render the TextBox
      <input className="e-input" type="text" placeholder="Enter Name" />
    );
  }
};
```

```
);
}
};
`
```

#### [Functional-component]

```
`ts
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  return (
    // element which is going to render the TextBox
    <input className="e-input" type="text" placeholder="Enter Name" />
  );
}
ReactDOM.render(<App />, document.getElementById('input-container'));
```

Floating label:

- Add the `e-float-input` class to the parent div element.
- Remove the `e-input` class and add `required` attribute to the input element.
- Place the span element with class `e-float-line` after the input element.
- Place the label element with class `e-float-text` after the above created span element.

When you focus or filled with value in the TextBox, the label floats above the TextBox.

Creating the Floating label TextBox, you have to set the `required` attribute to the Input element to achieve the floating label functionality which is used for validating the value existence in TextBox.

If you want to render the Floating label TextBox without `required` attribute then refer to the [Floating Label without required attribute](#) section.

#### [Class-component]

```
`ts
import * as React from "react";
import './App.css';
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
```

```
// element which is going to render the Floating TextBox
<div className="e-float-input e-input-group">
  <input type="text" required={true}/>
  <span className="e-float-line"/>
  <label className="e-float-text">Enter Name </label>
</div>
);
}
};
`
```

### [Functional-component]

```
`ts
import * as React from "react";
import * as ReactDOM from 'react-dom';
import './App.css';
function App() {
  return (
    // element which is going to render the Floating TextBox
    <div className="e-float-input e-input-group">
      <input type="text" required={true}/>
      <span className="e-float-line"/>
      <label className="e-float-text">Enter Name </label>
    </div>
  );
}

ReactDOM.render(<App />, document.getElementById('input-container'));
```

And refer to the following sections to add the icons to the TextBox.

### With icon and floating label

Create an icon element as a span with the class `e-input-group-icon`, and the user can place the icon in either side of TextBox by adding the created icon element before/after the input.

For the floating label enabled TextBox add the icon element as first or last element inside the TextBox wrapper, and based on the element position it will act as prefix or suffix icon.

### [Class-component]

}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

To place the icon on left side of the TextBox, create a div element with the class `e-input-in-wrap` as wrapper to the input element and place the floating line, floating text, and right side icon element within it. Add the `e-float-icon-left` class to the TextBox container element.

#### With clear button and floating label

The clear button is added to the input for clearing the value given in the TextBox. It is shown only when the input field has a value, otherwise not shown.

You can add the clear button to the TextBox by using `showClearButton` API in textbox.

#### [Class-component]

{true} floatLabelType="Auto"/>
      </div>
    </div>
  )
}
ReactDOM.render(<App />, document.getElementById('input-container'));

```

## Floating Label without required attribute

You can render the Floating label TextBox without required attribute by manually float the label above of the TextBox using input events.

You can manually float the label above of the TextBox by adding the below list of classes to the floating label element. The classes are:

Class Name | Description

e-label-top | Floats the label above of the TextBox.

e-label-bottom | Label to be placed as placeholder for the TextBox.

[Class-component]

### Multi-line input with floating label

Add the HTML textarea element with the `e-input` class to create default multi-line input.

Add the floating label support to the `multi-line input` by creating the floating label structure as defined in the initial section.

### [Class-component]

#### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";

## Sizing in React Textbox component

You can render the TextBox in two different sizes.

Property | Description

Normal | By default, the TextBox is rendered with normal size.

Small | You need to add `e-small` class to the input element, or else add to the input container.

[Class-component]

### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {

## Validation in React Textbox component

The TextBox supports three types of validation styles namely `error`, `warning`, and `success`. These states are enabled by adding corresponding classes `.e-error`, `.e-warning`, or `.e-success` to the input parent element.

### [Class-component]

#### INDEX.JSX

```

```

## Multiline in React Textbox component

This feature allows the textbox to accept one or more lines of text like address, description, comments, and more.

### Create multiline textbox

You can convert the default textbox into the multiline textbox by setting the [multiline](#) API value as true or pass HTML5 textarea as element to the textbox.

The multiline textbox allows you to resize it in vertical direction alone.

### [Class-component]

#### INDEX.JSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    render() {
        return (<div className="multiline">
            <TextBoxComponent multiline={true} placeholder='Enter your
address' value='Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
Business Center' />
        </div>);
    }
}
ReactDOM.render(<App />, document.getElementById('default'));

```

#### INDEX.TSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
    public render() {
        return (
            <div className="multiline">

```

```

        <TextBoxComponent multiline={true} placeholder='Enter your
address' value= 'Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
Business Center' />
    </div>
    );
}
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## [Functional-component]

### INDEX.JSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
    return (<div className="multiline">
        <TextBoxComponent multiline={true} placeholder='Enter your
address' value='Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
Business Center' />
    </div>);
}
ReactDOM.render(<App />, document.getElementById('default'));

```

### INDEX.TSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
    return (
        <div className="multiline">
            <TextBoxComponent multiline={true} placeholder='Enter your
address' value= 'Mr. Dodsworth Dodsworth, System Analyst, Studio 103, The
Business Center' />
        </div>
    );
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## Implementing floating label

You can achieve the floating label behavior in the multiline textbox by setting `floatLabelType` as 'Auto'. The placeholder text act as floating label to the multiline textbox. You can provide the placeholder text to the multiline textbox either by using the `placeholder` property or placeholder attribute.

## [Class-component]

### INDEX.JSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    render() {

```

```

        return (<div className="multiline">
            <label className='label'>Float label type Auto</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Auto' />
            <label className='label'>Float label type Always</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Always' />
            <label className='label'>Float label type Never</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Never' />
        </div>);
    }
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## INDEX.TSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
export default class App extends React.Component<{}, {}> {
    public render() {
        return (
            <div className="multiline">
                <label className='label'>Float label type Auto</label>
                <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Auto' />
                <label className='label'>Float label type Always</label>
                <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Always' />
                <label className='label'>Float label type Never</label>
                <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Never' />
            </div>
        );
    }
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## [Functional-component]

## INDEX.JSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
    return (<div className="multiline">
        <label className='label'>Float label type Auto</label>
        <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Auto' />
        <label className='label'>Float label type Always</label>
        <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Always' />
        <label className='label'>Float label type Never</label>
    </div>);
}

```

```

        <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Never' />
    </div>);
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## INDEX.TSX

```

import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
    return (
        <div className="multiline">
            <label className='label'>Float label type Auto</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Auto' />
            <label className='label'>Float label type Always</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Always' />
            <label className='label'>Float label type Never</label>
            <TextBoxComponent multiline={true} placeholder='Enter your
address' floatLabelType='Never' />
        </div>
    );
}
ReactDOM.render(<App />, document.getElementById('default'));

```

## Auto resizing

By default, you can manually resize the multiline textbox. But you can also create an **auto resizing** multiline textbox with both the initial and dynamic value change. It can be done by calculating the height of the textarea in the created event for initial value update and in the input event for dynamic value update of the auto resize multiline textbox, as explained in the following code sample.

## [Class-component]

## INDEX.JSX

```

{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    textareaObj;
    render() {
        return (<div className="multiline">
            <TextBoxComponent multiline={true} value='Mr. Dodsworth Dodsworth,
System Analyst, Studio 103, The Business Center' input={this.onInput =
this.onInput.bind(this)} created={this.onCreate = this.onCreate.bind(this)}
placeholder='Enter your address' floatLabelType='Auto' ref={scope => {
this.textareaObj = scope; }} />
        </div>);
    }
    onCreate() {
        this.textareaObj.addAttributes({ rows: 1 });
    }
}

```

```

        this.textareaObj.respectiveElement.style.height = "auto";
        this.textareaObj.respectiveElement.style.height =
        (this.textareaObj.respectiveElement.scrollHeight) + "px";
    }
    onInput() {
        this.textareaObj.respectiveElement.style.height = "auto";
        this.textareaObj.respectiveElement.style.height =
        (this.textareaObj.respectiveElement.scrollHeight) + "px";
    }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## INDEX.TSX

```

{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';

textareaObj = scope; }}/>
</div>);
function onCreate() {
  textareaObj.addAttributes({ rows: 1 });
  textareaObj.respectiveElement.style.height = "auto";
  textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement.scrollHeight) + "px";
}
function onInput() {
  textareaObj.respectiveElement.style.height = "auto";
  textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement.scrollHeight) + "px";
}
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## INDEX.TSX

```

{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
  let textareaObj: any;
  return (
    <div className="multiline">
      <TextBoxComponent multiline={true} value= 'Mr. Dodsworth Dodsworth,
System Analyst, Studio 103, The Business Center' input={onInput =
onInput.bind(this)} created={onCreate = onCreate.bind(this)}
placeholder='Enter your address' floatLabelType='Auto' ref = {scope =>
{textareaObj = scope } }/>
    </div>
  );
  function onCreate(): void {
    textareaObj.addAttributes({rows: 1});
    textareaObj.respectiveElement.style.height = "auto";
    textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement .scrollHeight)+"px";
  }
  function onInput(): void {
    textareaObj.respectiveElement.style.height = "auto";
    textareaObj.respectiveElement.style.height =
(textareaObj.respectiveElement .scrollHeight)+"px";
  }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

### Disable resizing

By default, the multiline textbox is rendered with resizable. You can disable the resize of the multiline textbox by applying the following CSS styles.

```
`css
textarea.e-input,
.e-float-input textarea,
.e-float-input.e-control-wrapper textarea,
.e-input-group textarea,
.e-input-group.e-control-wrapper textarea {
resize: none;
}
```

### [Class-component]

#### INDEX.JSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
  render() {
    return (<div className="multiline">
      <TextBoxComponent name="disable" multiline={true}
placeholder='Enter your address' floatLabelType='Auto' cssClass="sample"/>
    </div>);
  }
}
ReactDOM.render(<App />, document.getElementById('default'));
```

#### INDEX.TSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
      <div className="multiline">
        <TextBoxComponent name="disable" multiline={true}
placeholder='Enter your address' floatLabelType='Auto' cssClass="sample"/>
      </div>
    );
  }
}
ReactDOM.render(<App />, document.getElementById('default'));
```

### [Functional-component]

## INDEX.JSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
    return (<div className="multiline">
        <TextBoxComponent name="disable" multiline={true}
placeholder='Enter your address' floatLabelType='Auto' cssClass="sample"/>
        </div>);
}
ReactDOM.render(<App />, document.getElementById('default'));
```

## INDEX.TSX

```
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
function App() {
    return (
        <div className="multiline">
            <TextBoxComponent name="disable" multiline={true}
placeholder='Enter your address' floatLabelType='Auto' cssClass="sample"/>
            </div>
    );
}
ReactDOM.render(<App />, document.getElementById('default'));
```

## Limit the text length

By default, the text length of the multiline textbox is unlimited. You can limit the text length by setting the `maxLength` attribute using the `addAttribute` method.

## [Class-component]

## INDEX.JSX

```
{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    textareaObj;
    render() {
        return (<div className="multiline">
            <label className="label">Add maxlength attribute through
inline</label>
            <TextBoxComponent multiline={true} maxLength={15}
placeholder='Enter your address' floatLabelType='Auto' />
            <label className="label">Add maxlength attribute through
addAttributes method</label>
            <TextBoxComponent multiline={true} ref={scope => {
this.textareaObj = scope; }} placeholder='Enter your address'
floatLabelType='Auto' />
            <button className='e-control e-btn' id='targetButton1'
role='button' onClick={this.handleClick = this.handleClick.bind(this)}>Add
max length</button>
        </div>);
    }
}
```

```

        </div>);
    }
    handleClick() {
        this.textareaObj.addAttributes({ maxLength: 15 });
    }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## INDEX.TSX

    function handleClick(): void {
        textareaObj.addAttributes({maxLength: 15});
    }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}

```

## Count characters

You can show the number of characters entered inside the textarea by calculating the character count in the input event of multiline textbox. The character count is updated while entering or deleting any character inside the textarea. The character count shows how many characters can be entered or left to be entered.

[Class-component]

## INDEX.JSX

```
{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
import * as React from 'react';
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
  textareaObj;
  render() {
    return (<div className="multiline">
      <TextBoxComponent multiline={true} input={this.onInput =
this.onInput.bind(this)} placeholder='Enter your address'
floatLabelType='Auto' maxLength='25' ref={scope => { this.textareaObj =
scope; }}/>
      <span id='numbercount' />
    </div>);
  }
  onInput() {
    let word;
    let addressCount;
    word = this.textareaObj.respectiveElement.value;
    addressCount = word.length;
    document.getElementById('numbercount').textContent = addressCount +
"/25";
  }
}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}
```

## INDEX.TSX

```
{% raw %}
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';

}
ReactDOM.render(<App />, document.getElementById('default'));
{% endraw %}
```

## Accessibility in React Textbox component

The Textbox component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Textbox component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

#### WAI-ARIA attributes

The Textbox is characterized with complete ARIA Accessibility support that helps to access through the on-screen readers and other assistive technology devices. This component is designed with the reference of the guidelines document given in [WAI ARAI Accessibility practices](#).

The Textbox uses the `textbox` role and following ARIA properties for its element based on its state.

Property	Functionality
aria-placeholder	The <code>aria-placeholder</code> is a short hint to help the users with data entry when the Textbox has no value.
aria-labelledby	The <code>aria-labelledby</code> property indicates the floating label element of the Textbox.

#### Ensuring accessibility

The Textbox component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Textbox component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Textbox component with accessibility tools.

#### React functional component in React Textbox component

This section explains how to render the textbox component in the functional component with react hooks methods. Please find the list of basic hook methods in the following table.

Hooks	Description
useState	useState is a Hook that allows you to define the state in the functional components. If you pass the initial state to this function, then it will return a state variable with value and function to update this state value. Here, useState is used to store the value of description field.
useEffect	useEffect is a Hook that allows you to execute code after rendering and re-rendering the component. Here, defined the set of rules for the name and email fields and initiated the form validation to those fields.
useRef	useRef is a Hook function that allows to directly create a reference to the DOM element in the functional component. Here, assigned the name field reference for focusing the field on initial loading.
useReducer	useReducer is a Hook function that accepts a reducer function and an initial state as argument. It returns a state value and another function to dispatch an action. Here, dispatched the update action to update the name and email state values.

The following example shows how to render a simple textbox component with react hooks.

**APP.JSX**

```

import { useState, useEffect, useRef, useReducer } from 'react';
import * as React from 'react';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
let formObject;
function App() {
    const [description, setDescription] = useState('');
    const initialState = { name: '', email: '' };
    const userNameRef = useRef(null);
    const reducer = (state, action) => {
        switch (action.type) {
            case 'update':
                return { ...state, [action.field]: action.value };
            default:
                return initialState;
        }
    };
    const [state, dispatch] = useReducer(reducer, initialState);
    const changeHandler = (event) => {
        setDescription(event.value);
    };
    const update = (field) => (event) => {
        //update action is dispatched and triggered state changes
        dispatch({ type: 'update', field, value: event.value });
    };
    useEffect(() => {
        userNameRef.current.focusIn();
        const options = {
            // validation rules
            rules: {
                name: {
                    required: [true, '* Please enter your name'],
                },
                email: {
                    required: [true, '* Please enter your email'],
                },
                message: {
                    required: [true, '* Please enter your message'],
                },
            },
        };
        // Initialize the form validator
        formObject = new FormValidator('#form1', options);
    }, []);
    return (<div>
        <div className="control_wrapper" id="control_wrapper">
            <h3 className="form-title">User Detail</h3>
            <div className="control_wrapper textbox-form">
                <form id="form1" method="post">
                    <div className="form-group">
                        <TextBoxComponent ref={userNameRef} name="name"
value={state.name} change={update('name')} placeholder="Name"
floatLabelType="Auto" data-msg-containerid="errroForName"/>
                        <div id="errroForName"/>
                    </div>
                </form>
            </div>
        </div>
    </div>

```

```

        <div className="form-group">
            <TextBoxComponent type="email" name="email" value={state.email}
change={update('email')} placeholder="Email" floatLabelType="Auto" data-msg-
containerid="errroForEmail"/>
            <div id="errroForEmail"/>
        </div>
        <div className="form-group">
            <TextBoxComponent name="message" value={description}
change={changeHandler} multiline="true" placeholder="Description"
floatLabelType="Auto" data-msg-containerid="errroForMessage"/>
            <div id="errroForMessage"/>
        </div>
    </form>
</div>
<br />
<br />
</div>
</div>);
}
export default App;

```

## APP.TSX

```

import { useState, useEffect, useRef, useReducer } from 'react';
import * as React from 'react';
import { FormValidator } from '@syncfusion/ej2-inputs';
import { TextBoxComponent } from '@syncfusion/ej2-react-inputs';
let formObject;
function App() {
    const [description, setDescription] = useState('');
    const initialState = { name: '', email: '' };
    const userNameRef = useRef(null);
    const reducer = (state, action) => {
        switch (action.type) {
            case 'update':
                return { ...state, [action.field]: action.value };
            default:
                return initialState;
        }
    };
    const [state, dispatch] = useReducer(reducer, initialState);
    const changeHandler = (event) => {
        setDescription(event.value);
    };
    const update = (field) => (event) => {
        //update action is dispatched and triggered state changes
        dispatch({ type: 'update', field, value: event.value });
    };
    useEffect(() => {
        userNameRef.current.focusIn();
        const options = {
            // validation rules
            rules: {
                name: {
                    required: [true, '* Please enter your name'],
                },
            },
        };
    });
}

```

```

    email: {
      required: [true, '* Please enter your email'],
    },
    message: {
      required: [true, '* Please enter your message'],
    },
  },
};
// Initialize the form validator
formObject = new FormValidator('#form1', options);
}, []);
return (
  <div>
    <div className="control_wrapper" id="control_wrapper">
      <h3 className="form-title">User Detail</h3>
      <div className="control_wrapper textbox-form">
        <form id="form1" method="post">
          <div className="form-group">
            <TextBoxComponent
              ref={userNameRef}
              name="name"
              value={state.name}
              change={update('name')}
              placeholder="Name"
              floatLabelType="Auto"
              data-msg-containerid="erroForName"
            />
            <div id="erroForName" />
          </div>
          <div className="form-group">
            <TextBoxComponent
              type="email"
              name="email"
              value={state.email}
              change={update('email')}
              placeholder="Email"
              floatLabelType="Auto"
              data-msg-containerid="erroForEmail"
            />
            <div id="erroForEmail" />
          </div>
          <div className="form-group">
            <TextBoxComponent
              name="message"
              value={description}
              change={changeHandler}
              multiline="true"
              placeholder="Description"
              floatLabelType="Auto"
              data-msg-containerid="erroForMessage"
            />
            <div id="erroForMessage" />
          </div>
        </form>
      </div>
    </div>
    <br />
    <br />
  </div>
);

```

```

    </div>
  </div>
);
}
export default App;

```

## Style appearance in React Textbox component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

### Customizing the appearance of TextBox wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
```

*/ To specify height and font size /*

```
.e-input:not(:valid), .e-input:valid, .e-float-input.e-control-wrapper input:not(:valid), .e-float-input.e-control-wrapper input:valid, .e-float-input input:not(:valid), .e-float-input input:valid, .e-input-group input:not(:valid), .e-input-group input:valid, .e-input-group.e-control-wrapper input:not(:valid), .e-input-group.e-control-wrapper input:valid, .e-float-input.e-control-wrapper textarea:not(:valid), .e-float-input.e-control-wrapper textarea:valid, .e-float-input textarea:not(:valid), .e-float-input textarea:valid, .e-input-group.e-control-wrapper textarea:not(:valid), .e-input-group.e-control-wrapper textarea:valid, .e-input-group textarea:not(:valid), .e-input-group textarea:valid {
```

```
font-size: 30px;
```

```
height: 40px;
```

```
}
```

```
,
```

### Customizing the TextBox placeholder

Use the following CSS to customize the TextBox placeholder

```
`css
```

*/ To specify font size and color /*

```
.e-float-input.e-control-wrapper:not(.e-error) input:valid ~ label.e-float-text, .e-float-input.e-control-wrapper:not(.e-error) input ~ label.e-label-top.e-float-text {
```

```
color: pink;
```

```
font-size: 15px;
```

```
}
```

```
,
```

## How To

### Set the rounded corner in React Textbox component

Render the TextBox with **rounded corner** by adding the **e-corner** class to the input parent element.

### INDEX.JSX

```
import * as React from "react";
```

```
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  render() {
    return (<div>
      <div className="e-input-group e-corner">
        <input className="e-input" type="text" placeholder="Enter Date"
onFocus={this.onInputFocus} onBlur={this.onInputBlur}/>
        <span className="e-input-group-icon e-input-popup-date"
onMouseDown={this.onIconMouseDown} onMouseUp={this.onIconMouseUp}/>
      </div>
      <div className="e-float-input e-input-group e-corner">
        <input type='text' required={true} onFocus={this.onInputFocus}
onBlur={this.onInputBlur}/>
        <span className="e-float-line"/>
        <label className="e-float-text">Enter Date </label>
        <span className="e-input-group-icon e-input-popup-date"
onMouseDown={this.onIconMouseDown} onMouseUp={this.onIconMouseUp}/>
      </div>
    </div>);
  }
  onInputFocus(args) {
    if (!args.target.parentElement.classList.contains('e-input-in-wrap'))
    {
      args.target.parentElement.classList.add('e-input-focus');
    }
    else {

### Set the disabled state in React Textbox component

Disable the TextBox by adding the `e-disabled` to the input parent element and set `disabled` attribute to the input element.

#### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
  render() {
    return (
      <div>
        <input className="e-input" type="text" placeholder="Enter Name" disabled={true}/>
        <div className="e-float-input e-disabled">
          <input type='text' required={true} disabled={true}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Enter Name</label>
        </div>
      </div>);
  }
};
ReactDOM.render(<App />, document.getElementById('input-container'));
```

#### INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
      <div>
        <input className="e-input" type="text" placeholder="Enter Name" disabled={true}/>
        <div className="e-float-input e-disabled">
          <input type='text' required = {true} disabled = {true}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Enter Name</label>
        </div>
      </div>
    );
  }
};
ReactDOM.render(<App />, document.getElementById('input-container'));
```

### Set the read only textbox in React Textbox component

You can make the TextBox as `read-only` by setting the `readonly` attribute to the input element.

#### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  render() {
    return (
      <div>
```

```

        <input className="e-input" type="text" placeholder="Enter Name"
value="John" readOnly={true}/>
        <div className="e-float-input">
            <input type='text' required={true} readOnly={true} value="John"
onFocus={this.onInputFocus} onBlur={this.onInputBlur}/>
            <span className="e-float-line"/>
            <label className="e-float-text e-label-top">Enter Name</label>
        </div>
    </div>;
    }
    onInputFocus(args) {
        if (!args.target.parentElement.classList.contains('e-input-in-wrap'))
        {
            args.target.parentElement.classList.add('e-input-focus');
        }
        else {
            args.target.parentElement.parentElement.classList.add('e-input-
focus');
        }
    }
    onInputBlur(args) {
        if (!args.target.parentElement.classList.contains('e-input-in-wrap'))
        {
            args.target.parentElement.classList.remove('e-input-focus');
        }
        else {
            args.target.parentElement.parentElement.classList.remove('e-
input-focus');
        }
    }
    }
    ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
    public render() {
        return (
            <div>
                <input className="e-input" type="text" placeholder="Enter Name" value="John"
readOnly= {true}/>
                <div className="e-float-input">

HTMLElement).classList.contains('e-input-in-wrap')) {
        ((args.target as HTMLElement).parentElement as
HTMLElement).classList.remove('e-input-focus');
    } else {
        ((args.target as HTMLElement).parentElement as
HTMLElement).parentElement as HTMLElement).classList.remove('e-input-focus');
    }
}
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

### Add textbox programmatically in React Textbox component

- Create a TypeScript file and import the `Input` modules from `ej2-inputs` library as shown below.

`.ts`

```
import {Input} from '@syncfusion/ej2-inputs';
```

,

- Pass the `HTML Input` element as parameter to the `createInput` method.
- You can also add the `icons` on the input by passing `buttons` property value with the class name `e-input-group-icon` as parameter to the `createInput` method.

### INDEX.JSX

```

import { Input } from '@syncfusion/ej2-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
    input1;
    input2;
    render() {
        return (<div className="inner-container">
            <input id="input-01" type="text" ref={e1 => this.input1 =
e1}/>
            <input id="input-02" type="text" ref={e2 => this.input2 =
e2}/>
        </div>);
    }
    componentDidMount() {
        Input.createInput({
            element: this.input1,
            properties: {

```

```

        placeholder: 'Enter Name'
    }
    });
    Input.createInput({
        buttons: ['e-input-group-icon e-input-down'],
        element: this.input2,
        properties: {
            placeholder: 'Enter Value'
        }
    });
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## INDEX.TSX

```

import { Input } from '@syncfusion/ej2-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
    public input1: any;
    public input2: any;
    public render() {
        return (
            <div className="inner-container">
                <input id="input-01" type="text" ref = { e1 => this.input1 =
e1!} />
                <input id="input-02" type="text" ref = { e2 => this.input2 =
e2!} />
            </div>
        )
    }
    public componentDidMount() {
        Input.createInput({
            element: this.input1,
            properties:{
                placeholder:'Enter Name'
            }
        });
        Input.createInput({
            buttons: ['e-input-group-icon e-input-down'],
            element: this.input2,
            properties:{
                placeholder:'Enter Value'
            }
        });
    }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

Add floating label to textbox programmatically in React Textbox component

The **Floating Label TextBox** floats label above the TextBox after focusing, or entering a value in the TextBox.

Floating label supports the types of actions as given below.

Type | Description

Auto | The floating label will float above the input after focusing, or entering a value in the input.

Always | The floating label will always float above the input.

Never | By default, never float the label in the input when the placeholder is available.

- Create a TypeScript file and import the `Input` modules from `ej2-inputs` library as shown below.

`.ts`

```
import {Input} from '@syncfusion/ej2-inputs';
```

,

- Pass the `HTML Input` element and `floatLabelType` property as `Auto` to the `createInput` method.
- Set the `placeholder` value to the input element via `element attribute` or pass the parameter to the `createInput` method.

The watermark label will be updated based on the specified `placeholder` value of the `Floating Label TextBox`.

- You can add the `icons` on the input by passing `buttons` property value with the class name `e-input-group-icon` as parameter to the `createInput` method.

### INDEX.JSX

```
import { Input } from '@syncfusion/ej2-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  input1;
  input2;
  input3;
  input4;
  render() {
    return (
      <div className="inner-container">
        <h4> FloatLabelType as Auto </h4>
        <input id="input-01" type="text" ref={ele1 => this.input1 =
ele1}/>
        <h4> FloatLabelType as Always </h4>
        <input id="input-02" type="text" ref={ele2 => this.input2 =
ele2}/>
        <h4> FloatLabelType as Never </h4>
        <input id="input-03" type="text" ref={ele3 => this.input3 =
ele3}/>
        <h4> Float label input with icons </h4>
        <input id="input-04" type="text" ref={ele4 => this.input4 =
ele4}/>
      </div>
    );
  }
  componentDidMount() {
```

```

        Input.createInput({
            element: this.input1,
            floatLabelType: "Auto",
            properties: {
                placeholder: 'Enter Name'
            }
        });
        Input.createInput({
            element: this.input2,
            floatLabelType: "Always",
            properties: {
                placeholder: 'Enter Name'
            }
        });
        Input.createInput({
            element: this.input3,
            floatLabelType: "Never",
            properties: {
                placeholder: 'Enter Name'
            }
        });
        // Render Float Label TextBox with Icon
        Input.createInput({
            buttons: ['e-input-group-icon e-input-down'],
            element: this.input4,
            floatLabelType: "Auto",
            properties: {
                placeholder: 'Enter Value'
            }
        });
    }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## INDEX.TSX

```

import { Input } from '@syncfusion/ej2-inputs';
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
    public input1: any;
    public input2: any;
    public input3: any;
    public input4: any;
    public render() {
        return (
            <div className="inner-container">
                <h4> FloatLabelType as Auto </h4>
                <input id="input-01" type="text" ref = {ele1 => this.input1 =
ele1!} />
                <h4> FloatLabelType as Always </h4>
                <input id="input-02" type="text" ref = {ele2 => this.input2 =
ele2!} />
                <h4> FloatLabelType as Never </h4>
                <input id="input-03" type="text" ref = {ele3 => this.input3 =
ele3!} />
            </div>
        );
    }
}

```

```

        <h4> Float label input with icons </h4>
        <input id="input-04" type="text" ref = {ele4 => this.input4 =
ele4!} />
    </div>
    )
  }
  public componentDidMount() {
    Input.createInput({
      element: this.input1,
      floatLabelType: "Auto",
      properties:{
        placeholder:'Enter Name'
      }
    });
    Input.createInput({
      element: this.input2,
      floatLabelType: "Always",
      properties:{
        placeholder:'Enter Name'
      }
    });
    Input.createInput({
      element: this.input3,
      floatLabelType: "Never",
      properties:{
        placeholder:'Enter Name'
      }
    });
    // Render Float Label TextBox with Icon
    Input.createInput({
      buttons: ['e-input-group-icon e-input-down'],
      element: this.input4,
      floatLabelType: "Auto",
      properties:{
        placeholder:'Enter Value'
      }
    });
  }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

### Change the floating label color of the textbox in React Textbox component

You can change the floating label color of the TextBox for both **success** and **warning** validation states by applying the following CSS styles.

```

`css
/ For Success state /
.e-float-input.e-success label.e-float-text,
.e-float-input.e-success input:focus ~ label.e-float-text,
.e-float-input.e-success input:valid ~ label.e-float-text {
color: #22b24b;

```

```

}
/ For Warning state /
.e-float-input.e-warning label.e-float-text,
.e-float-input.e-warning input:focus ~ label.e-float-text,
.e-float-input.e-warning input:valid ~ label.e-float-text {
color: #ffca1c;
}
,

```

## INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  render() {
    return (
      <div>
        <div className="e-float-input e-input-group e-success">
          <input type='text' required={true} onFocus={this.onInputFocus}
onBlur={this.onInputBlur}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Success</label>
        </div>
        <div className="e-float-input e-input-group e-warning">
          <input type='text' required={true} onFocus={this.onInputFocus}
onBlur={this.onInputBlur}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Warning</label>
        </div>
      </div>);
  }
  onInputFocus(args) {
    if (!args.target.parentElement.classList.contains('e-input-in-wrap'))
    {
      args.target.parentElement.classList.add('e-input-focus');
    }
    else {
      args.target.parentElement.parentElement.classList.add('e-input-
focus');
    }
  }
  onInputBlur(args) {
    if (!args.target.parentElement.classList.contains('e-input-in-wrap'))
    {
      args.target.parentElement.classList.remove('e-input-focus');
    }
    else {
      args.target.parentElement.parentElement.classList.remove('e-
input-focus');
    }
  }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  public render() {
    return (
      <div>
        <div className="e-float-input e-input-group e-success">
          <input type='text' required = {true} onFocus =
{this.onInputFocus} onBlur = {this.onInputBlur}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Success</label>
        </div>
        <div className="e-float-input e-input-group e-warning">
          <input type='text' required = {true} onFocus =
{this.onInputFocus} onBlur = {this.onInputBlur}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Warning</label>
        </div>
      </div>
    );
  }
  public onInputFocus(args: React.FocusEvent) {
    if (!((args.target as HTMLElement).parentElement as
HTMLElement).classList.contains('e-input-in-wrap')) {
      ((args.target as HTMLElement).parentElement as
HTMLElement).classList.add('e-input-focus');
    } else {
      ((args.target as HTMLElement).parentElement as
HTMLElement).parentElement as HTMLElement).classList.add('e-input-focus')
    }
  }
  public onInputBlur(args: React.FocusEvent) {
    if (!((args.target as HTMLElement).parentElement as
HTMLElement).classList.contains('e-input-in-wrap')) {
      ((args.target as HTMLElement).parentElement as
HTMLElement).classList.remove('e-input-focus');
    } else {
      ((args.target as HTMLElement).parentElement as
HTMLElement).parentElement as HTMLElement).classList.remove('e-input-focus');
    }
  }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
```

Change the color of the textbox based on its value in React Textbox component

You can change the color of the TextBox by validating its value using regular expression in the **keyup** event for predicting the numeric values as demonstrated in the following code sample.

## INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
```

```

export default class App extends React.Component {
  constructor(props) {
    super(props);
    this.onKeyUp = this.onKeyUp.bind(this);
  }
  onKeyUp(e) {
    const str = e.target.value.match(/^[\d-]+$/);
    if (!((str && str.length > 0)) && e.target.value.length) {
      e.target.parentNode.classList.add('e-error');
    }
    else {
      e.target.parentNode.classList.remove('e-error');
    }
  }
  onInputFocus(args) {
    if (!args.target.parentNode.classList.contains('e-input-in-wrap'))
    {
      args.target.parentNode.classList.add('e-input-focus');
    }
    else {
      args.target.parentNode.parentNode.classList.add('e-input-
focus');
    }
  }
  onInputBlur(args) {
    if (!args.target.parentNode.classList.contains('e-input-in-wrap'))
    {
      args.target.parentNode.classList.remove('e-input-focus');
    }
    else {
      args.target.parentNode.parentNode.classList.remove('e-
input-focus');
    }
  }
  render() {
    return (<div className="wrap">
      <label> Normal Input </label>
      <div className="e-input-group">
        <input className="e-input" id="numericOnly" type="text"
placeholder="Enter numeric values" onKeyUp={this.onKeyUp}
onFocus={this.onInputFocus} onBlur={this.onInputBlur}/>
      </div>
      <label> Floating Input </label>
      <div className="e-float-input e-input-group">
        <input type="text" onKeyUp={this.onKeyUp} required={true}
onFocus={this.onInputFocus} onBlur={this.onInputBlur}/>
        <span className="e-float-line"/>
        <label className="e-float-text">Enter numeric
values</label>
      </div>
    </div>);
  }
}
;
ReactDOM.render(<App />, document.getElementById('input-container'));

```

# INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
  constructor(props: any) {
    super(props);
    this.onKeyUp = this.onKeyUp.bind(this);
  }
  public onKeyUp(e: React.KeyboardEvent) {
    const str = (e.target as HTMLInputElement).value.match(/^[0-9]+$/);
    if (!((str && str.length > 0)) && (e.target as
HTMLInputElement).value.length) {
      ((e.target as HTMLInputElement).parentNode as
HTMLInputElement).classList.add('e-error');
    } else {
      ((e.target as HTMLInputElement).parentNode as
HTMLInputElement).classList.remove('e-error');
    }
  }
  public onInputFocus(args: React.FocusEvent) {
    if (!((args.target as HTMLInputElement).parentElement as
HTMLInputElement).classList.contains('e-input-in-wrap')) {
      ((args.target as HTMLInputElement).parentElement as
HTMLInputElement).classList.add('e-input-focus');
    } else {
      ((args.target as HTMLInputElement).parentElement as
HTMLInputElement).parentElement as HTMLInputElement).classList.add('e-input-focus')
    }
  }
  public onInputBlur(args: React.FocusEvent) {
    if (!((args.target as HTMLInputElement).parentElement as
HTMLInputElement).classList.contains('e-input-in-wrap')) {
      ((args.target as HTMLInputElement).parentElement as
HTMLInputElement).classList.remove('e-input-focus');
    } else {
      ((args.target as HTMLInputElement).parentElement as
HTMLInputElement).parentElement as HTMLInputElement).classList.remove('e-input-focus');
    }
  }
  public render() {
    return (
      <div className="wrap">
        <label> Normal Input </label>
        <div className="e-input-group">
          <input className="e-input" id="numericOnly" type="text"
placeholder="Enter numeric values" onKeyUp={this.onKeyUp} onFocus =
{this.onInputFocus} onBlur = {this.onInputBlur}/>
        </div>
        <label> Floating Input </label>
        <div className="e-float-input e-input-group">
          <input type="text" onKeyUp={this.onKeyUp} required =
{true} onFocus = {this.onInputFocus} onBlur = {this.onInputBlur}/>
          <span className="e-float-line"/>
          <label className="e-float-text">Enter numeric
values</label>
        </div>
      </div>
    );
  }
}
```

```

        </div>
    )
  }
};
ReactDOM.render(<App />, document.getElementById('input-container'));

```

### Add floating label to read only textbox in React Textbox component

You can achieve floating label for read-only textboxes by adding/removing `e-label-top` and `e-label-bottom` classes to the label element

In this sample, click the update value button to fill the read-only textbox with value and float a label.

#### INDEX.JSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  valueBtn;
  removeBtn;
  inputElement;
  render() {
    return (
      <div className="wrap">
        <div className="row">
          <div className="e-float-input">
            <input
              className="e-input myField"
              onFocus={this.floatFocus}
              onBlur={this.floatBlur}
              ref={v => this.inputElement = v}
              type="text"
              id="myText"
              readOnly={true}
            />
            <span className="e-float-line" />
            <label
              className="e-float-text"
              >Enter value</label>
          </div>
        </div>
        <div className="row">
          <button
            className="e-btn update_value"
            id="valuebtn"
            onClick={this.updateBtnClick}
            ref={btn => this.valueBtn = btn}
            >Set value</button>
          <button
            className="e-btn remove_value"
            id="removebtn"
            onClick={this.removeBtnClick}
            ref={removeBtn => this.removeBtn = removeBtn}
            >Remove value</button>
        </div>
      </div>
    );
  }
  updateBtnClick = () => {
    this.inputElement.value = '10';
    this.checkFloatingLabel('myText');
  };
  removeBtnClick = () => {
    this.inputElement.value = '';
    this.checkFloatingLabel('myText');
  };
  checkFloatingLabel(id) {
    const inputElement = document.getElementById(id);
    const labelElement = inputElement.parentElement.querySelector('.e-float-text');
    if (inputElement.value !== '') {
      labelElement.classList.remove('e-label-bottom');
      labelElement.classList.add('e-label-top');
    }
  }
}

```

```

    }
    else {
      labelElement.classList.remove('e-label-top');
      labelElement.classList.add('e-label-bottom');
    }
  }
  floatFocus(args) {
    args.target.parentElement.classList.add('e-input-focus');
  }
  floatBlur(args) {
    args.target.parentElement.classList.remove('e-input-focus');
  }
}
ReactDOM.render(<Default />, document.getElementById('input-container'));

```

## INDEX.TSX

```

import * as React from "react";
import * as ReactDOM from "react-dom";
export default class Default extends React.Component {
  public valueBtn: HTMLButtonElement;
  public removeBtn: HTMLButtonElement;
  public inputElement: HTMLInputElement;
  public render() {
    return (
      <div className="wrap">
        <div className="row">
          <div className="e-float-input">
            <input className="e-input myField" onFocus= {this.floatFocus}
onBlur= {this.floatBlur} ref = { v => this.inputElement = v!} type="text"
id="myText" readOnly={true} />
            <span className="e-float-line" />
            <label className="e-float-text">Enter value</label>
          </div>
        </div>
        <div className="row">
          <button className="e-btn update_value" id="valuebtn" onClick = {
this.updateBtnClick} ref = { btn => this.valueBtn = btn! }>Set value</button>
          <button className="e-btn remove_value" id="removebtn" onClick = {
this.removeBtnClick} ref = { removeBtn => this.removeBtn = removeBtn!}>Remove
value</button>
        </div>
      </div>
    );
  }
  public updateBtnClick = (): void => {
    this.inputElement.value = '10';
    this.checkFloatingLabel('myText')
  }
  public removeBtnClick = (): void => {
    this.inputElement.value = '';
    this.checkFloatingLabel('myText')
  }
  public checkFloatingLabel(id: any): void {
    const inputElement: HTMLInputElement = document.getElementById(id) as
HTMLInputElement;

```

```
const labelElement: HTMLInputElement = (inputElement as
any).parentElement.querySelector('.e-float-text') as HTMLInputElement;
if (inputElement.value !== '') {
    labelElement.classList.remove('e-label-bottom');
    labelElement.classList.add('e-label-top');
} else {
    labelElement.classList.remove('e-label-top');
    labelElement.classList.add('e-label-bottom');
}
}
public floatFocus(args: any): void {
    args.target.parentElement.classList.add('e-input-focus');
}
public floatBlur(args: any): void {
    args.target.parentElement.classList.remove('e-input-focus');
}
}
ReactDOM.render(<Default />, document.getElementById('input-container'));
```

### Customize the textbox background color and text color in React Textbox component

You can customize the React textbox styles such as background-color, text-color and border-color by overriding its default styles.

To change the styles of the **floating label**, you must override the style to the input element.

#### INDEX.JSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component {
    constructor(props) {
        super(props);
    }
    render() {
        return (<div className="wrap">
            <label> Normal Input </label>
            <div className="e-input-group">
                <input className="e-input" onFocus={this.floatFocus}
onBlur={this.floatBlur} type="text" placeholder="First Name"/>
            </div>
            <label> Floating Input </label>
            <div className="e-float-input">
                <input type="text" required={true}/>
                <span className="e-float-line"/>
                <label className="e-float-text">Last Name</label>
            </div>
        </div>);
    }
    floatFocus(args) {
        args.target.parentElement.classList.add('e-input-focus');
    }
    floatBlur(args) {
        args.target.parentElement.classList.remove('e-input-focus');
    }
}
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## INDEX.TSX

```
import * as React from "react";
import * as ReactDOM from "react-dom";
export default class App extends React.Component<{}, {}> {
  constructor(props: any) {
    super(props);
  }
  public render() {
    return (
      <div className="wrap">
        <label> Normal Input </label>
        <div className="e-input-group">
          <input className="e-input" onFocus= {this.floatFocus} onBlur=
{this.floatBlur} type="text" placeholder="First Name"/>
        </div>
        <label> Floating Input </label>
        <div className="e-float-input">
          <input type="text" required={true} />
          <span className="e-float-line"/>
          <label className="e-float-text">Last Name</label>
        </div>
      </div>
    );
  }
  private floatFocus(args: React.FocusEvent): void {
    ((args.target as HTMLElement).parentElement as
HTMLElement).classList.add('e-input-focus');
  }
  private floatBlur(args: React.FocusEvent): void {
    ((args.target as HTMLElement).parentElement as
HTMLElement).classList.remove('e-input-focus');
  }
}
ReactDOM.render(<App />, document.getElementById('input-container'));
```

## Migration from css textbox to react textbox in React Textbox component

From v16.3.21 version, the textbox is provided as React component to achieve the floating label textbox with minimal code. You can find the available textbox properties, methods, and events in the [API reference](#).

The following table describes the migration from CSS textbox to React textbox component.

### Normal textbox

<!-- markdownlint-disable MD038 -->

Rendering mode	CSS textbox	React textbox component
Default rendering	<div class='e-input-group'> <input class='e-input' type='text' placeholder='Enter Value'/> </div>	<TextBoxComponent id="default" placeholder="Enter Value" floatLabelType="Never" />

| Textbox with clear button | `<div class='e-input-group'><br/><input class='e-input' placeholder='Enter Value' required='true'><br/><span class='e-clear-icon'></span><br/></div><br/><br/>`Note: You have to write action for clear button. | `<TextBoxComponent id="clear-input" placeholder="Enter Value" showClearButton={true} floatLabelType="Never" /> |`

| Validation states | `<div class='e-input-group e-error'><br/><input class='e-input' type='text' placeholder='Enter Value' /><br/></div><br/><br/>`Note: Textbox component consists of three types of validation rules such as success, warning, and error. | `<TextBoxComponent id="validation" placeholder="Enter Value" cssClass="e-error" floatLabelType="Never" /> |`

### Floating label textbox

`<!-- markdownlint-disable MD038 -->`

#### | Rendering mode | CSS textbox | React textbox component |

| ----- | ----- | ----- |

| Default rendering | `<div class='e-float-input'><br/><input type='text' required /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/></div> | <TextBoxComponent id="default" placeholder="Enter Value" floatLabelType="Auto" /> |`

| Textbox with clear button | `<div class='e-float-input e-input-group'><br/><input type='text' required value='Clear Input' /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/><span class='e-clear-icon'></span><br/></div><br/><br/>`Note: You have to write action for clear button. | `<TextBoxComponent id="clear-input" placeholder="Enter Value" showClearButton={true} floatLabelType="Auto" /> |`

| Validation states | `<div class='e-float-input e-error'><br/><input type='text' required /><br/><span class='e-float-line'></span><br/><label class='e-float-text'>Enter Value</label><br/></div><br/><br/>`Note: Textbox component consists of three types of validation rules such as success, warning, and error. | `<TextBoxComponent id="validation" placeholder="Enter Value" cssClass="e-error" floatLabelType="Auto" /> |`

## Timeline

### Getting Started

This section explains how to create a simple Timeline and configure its available functionalities in the React environment.

### Dependencies

The following list of dependencies is required to use the Timeline component in your application.

``js`

|-- @syncfusion/ej2-react-layouts

|-- @syncfusion/ej2-base

|-- @syncfusion/ej2-layouts

|-- @syncfusion/ej2-react-base

,

### Installation and Configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
```

```
npm install -g create-react-app
```

,

Start a new project using create-react-app command as follows

```
<div class='tsx'>
```

```
`bash
```

```
create-react-app quickstart --scripts-version=react-scripts-ts
```

```
cd quickstart
```

,

```
</div>
```

```
<div class='jsx'>
```

```
`bash
```

```
create-react-app quickstart
```

```
cd quickstart
```

,

```
</div>
```

'react-scripts-ts' is used for creating React app with typescript.

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](https://www.npmjs.com) public registry.

To install `Timeline` component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-layouts --save
```

,

### Adding CSS Reference

Import the Timeline component's required CSS references as follows in `src/App.css`.

```
`css
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-layouts/styles/material.css";
```

,

### Adding Timeline component to the application

To include the Timeline component in your application, import the `TimelineComponent` from `ej2-react-layouts` package in the `App.tsx`.

To define each item, you can use the `ItemDirective` tag inside the `ItemsDirective` tag as shown in below code example.

```
{% raw %}
`ts
import { TimelineComponent, ItemsDirective, ItemDirective } from '@syncfusion/ej2-react-layouts';
import * as React from "react";
import * as ReactDOM from "react-dom";
import "./App.css";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective />
          <ItemDirective />
          <ItemDirective />
          <ItemDirective />
          <ItemDirective />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
const root = ReactDOM.createRoot(document.getElementById("element"));
root.render(<App />);
`
{% endraw %}
```

### Running the application

Run the application in the browser using the following command:

```
`
npm start
`
```

The following example shows a basic Timeline component.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "350px" }}>
            <TimelineComponent>
                <ItemsDirective>
                    <ItemDirective />
                    <ItemDirective />
                    <ItemDirective />
                    <ItemDirective />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "320px" }}>
            <TimelineComponent>
                <ItemsDirective>
                    <ItemDirective />
                    <ItemDirective />
                    <ItemDirective />
                    <ItemDirective />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### Items in React Timeline component

The Timeline items can be added by using the `ItemDirective` tag. Each item can be configured with options such as `content`, `oppositeContent`, `dotCss`, `disabled` and `cssClass`.

### Adding content

You can define the item content using the [content](#) property.

#### String content

You can define string content for the Timeline items.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective content='Shipped' />
          <ItemDirective content='Departed' />
          <ItemDirective content='Arrived' />
          <ItemDirective content='Out for Delivery' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective content='Shipped' />
          <ItemDirective content='Departed' />
          <ItemDirective content='Arrived' />
          <ItemDirective content='Out for Delivery' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.CSS**

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
```

## Adding opposite content

You can add additional information to each Timeline item, by using the [oppositeContent](#) property which is positioned opposite to the item content.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective content='Breakfast' oppositeContent='8:00
AM' />
          <ItemDirective content='Lunch' oppositeContent='1:00 PM'
/>
          <ItemDirective content='Dinner' oppositeContent='8:00 PM'
/>
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.TSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent>
        <ItemsDirective>
```

```

        <ItemDirective content='Breakfast' oppositeContent='8:00
AM' />
        <ItemDirective content='Lunch' oppositeContent='1:00 PM'
/>
        <ItemDirective content='Dinner' oppositeContent='8:00 PM'
/>
    </ItemsDirective>
  </TimelineComponent>
</div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### Dot item

You can define CSS class to set icons, background colors, or images to personalize the appearance of dots associated with each Timeline item by using the [dotCss](#) property.

#### Adding icons

You can define the CSS class to show the icon for each item using the `dotCss` property.

#### Adding images

You can include images for the Timeline items using the `dotCss` property, by setting the CSS `background-image` property.

#### Adding text

You can display text for the Timeline items using the `dotCss` property, by adding text to the CSS `content` property.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective content='Default' />
          <ItemDirective content='Icon' dotCss='e-icons e-check' />
          <ItemDirective content='Image' dotCss='custom-image' />
          <ItemDirective content='Text' dotCss='custom-text' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

**INDEX.TSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "330px" }}>
            <TimelineComponent>
                <ItemsDirective>
                    <ItemDirective content='Default' />
                    <ItemDirective content='Icon' dotCss='e-icons e-check' />
                    <ItemDirective content='Image' dotCss='custom-image' />
                    <ItemDirective content='Text' dotCss='custom-text' />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.CSS**

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-dot.custom-image {
    background-image: url('./dot-image.png');
}
.e-dot.custom-text::before {
    content: 'A';
}
```

## Disabling items

You can use the [disabled](#) property to disable an item when set to `true`. By default, the value is `false`.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "350px" }}>
```

```

        <TimelineComponent>
          <ItemsDirective>
            <ItemDirective content='Eat' />
            <ItemDirective content='Code' />
            <ItemDirective content='Repeat' disabled={true} />
          </ItemsDirective>
        </TimelineComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById("element"));
  {% endraw %}

```

### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent>
        <ItemsDirective>
          <ItemDirective content='Eat' />
          <ItemDirective content='Code' />
          <ItemDirective content='Repeat' disabled={true} />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### Css class

You can customize the appearance of the Timeline item by specifying a custom CSS class using the [cssClass](#) property.

### Orientations in React Timeline component

The Timeline component supports the display of items in both horizontal and vertical direction by using the [orientation](#) property.

#### Vertical

You can display the items one below the other vertically by setting the [orientation](#) property to **Vertical**. By default, the items are displayed in vertical orientation.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";

```

```
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent orientation='Vertical'>
        <ItemsDirective>
          <ItemDirective content='Day 1, 4:00 PM'
oppositeContent='Check-in and campsite visit' />
          <ItemDirective content='Day 1, 7:00 PM'
oppositeContent='Dinner with music' />
          <ItemDirective content='Day 2, 5:30 AM'
oppositeContent='Sunrise between mountains' />
          <ItemDirective content='Day 2, 8:00 AM'
oppositeContent='Breakfast and check-out' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.TSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent orientation='Vertical'>
        <ItemsDirective>
          <ItemDirective content='Day 1, 4:00 PM'
oppositeContent='Check-in and campsite visit' />
          <ItemDirective content='Day 1, 7:00 PM'
oppositeContent='Dinner with music' />
          <ItemDirective content='Day 2, 5:30 AM'
oppositeContent='Sunrise between mountains' />
          <ItemDirective content='Day 2, 8:00 AM'
oppositeContent='Breakfast and check-out' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## Horizontal

In horizontal orientation, the items are displayed in a side-by-side manner by setting the [orientation](#) property to `Horizontal`.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline'>
      <TimelineComponent orientation='Horizontal'>
        <ItemsDirective>
          <ItemDirective content='Day 1, 4:00 PM'
oppositeContent='Check-in and campsite visit' />
          <ItemDirective content='Day 1, 7:00 PM'
oppositeContent='Dinner with music' />
          <ItemDirective content='Day 2, 5:30 AM'
oppositeContent='Sunrise between mountains' />
          <ItemDirective content='Day 2, 8:00 AM'
oppositeContent='Breakfast and check-out' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline'>
      <TimelineComponent orientation='Horizontal'>
        <ItemsDirective>
          <ItemDirective content='Day 1, 4:00 PM'
oppositeContent='Check-in and campsite visit' />
          <ItemDirective content='Day 1, 7:00 PM'
oppositeContent='Dinner with music' />
          <ItemDirective content='Day 2, 5:30 AM'
oppositeContent='Sunrise between mountains' />
          <ItemDirective content='Day 2, 8:00 AM'
oppositeContent='Breakfast and check-out' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
```

```

    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById("element"));
  {% endraw %}

```

## Alignment in React Timeline component

You can display the Timeline content **Before**, **After**, **Alternate** and **AlternateReverse** by using the [align](#) property. The oppositeContent will be displayed parallel to the content when configured in the **ItemDirective**.

### Before

In **Before** alignment, for **horizontal** orientation the item content is placed at the top and oppositeContent at the bottom whereas in **vertical**, the content to the left and oppositeContent to the right.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent align='Before'>
        <ItemsDirective>
          <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
          <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
          <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
          <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (

```

```

        <div id='timeline' style={{ height: "330px" }}>
            <TimelineComponent align='Before'>
                <ItemsDirective>
                    <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
                    <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
                    <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
                    <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### After

In [After](#) alignment, for **horizontal** orientation the item content is placed at the bottom and oppositeContent at the top whereas in **vertical**, the content to the right and oppositeContent to the left.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "350px" }}>
            <TimelineComponent align='After'>
                <ItemsDirective>
                    <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
                    <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
                    <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
                    <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent align='After'>
        <ItemsDirective>
          <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
          <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
          <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
          <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### Alternate

In [Alternate](#) alignment, the item content are arranged alternatively regardless of the Timeline orientation.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent align='Alternate'>
        <ItemsDirective>
          <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
          <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
          <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
          <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
{% endraw %}
```

```
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.TSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent align='Alternate'>
        <ItemsDirective>
          <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
          <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
          <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
          <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**Alternate reverse**

In [AlternateReverse](#) alignment, the item content are arranged in reverse alternate regardless of the Timeline orientation.

**INDEX.JSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent align='Alternatereverse'>
        <ItemsDirective>
          <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
          <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
          <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

```

                                <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />
                                </ItemsDirective>
                            </TimelineComponent>
                        </div>
                    );
                }
    export default App;
    ReactDOM.render(<App />, document.getElementById("element"));
    {% endraw %}

```

## INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "330px" }}>
            <TimelineComponent align='Alternatereverse'>
                <ItemsDirective>
                    <ItemDirective content='ReactJs' oppositeContent='Owned
by Facebook' />
                    <ItemDirective content='Angular' oppositeContent='Owned
by Google' />
                    <ItemDirective content='VueJs' oppositeContent='Owned by
Evan you' />
                    <ItemDirective content='Svelte' oppositeContent='Owned by
Rich Harris' />

            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## Reverse in React Timeline component

You can display the Timeline items in reverse order, for different alignments by using the [reverse](#) property which provides adaptability and improves user interaction.

## INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
    const careerProgress = [
        "Graduated \n Bachelors in Computer Engineering",
        "Software Engineering Internship \n ABC Software and Technology",
    ];
}

```

```

        "Associate Software Engineer \n ABC Software and Technology",
        "Software Level 1 Engineer \n XYZ Solutions"
    ];
    return (
        <div id='timeline' style={{ height: "350px" }}>
            <TimelineComponent align='before' reverse={true}>
                <ItemsDirective>
                    <ItemDirective content='June 2022' oppositeContent =
{careerProgress[0]} />
                    <ItemDirective content='Aug 2022' oppositeContent =
{careerProgress[1]} />
                    <ItemDirective content='Feb 2023' oppositeContent =
{careerProgress[2]} />
                    <ItemDirective content='Mar 2024' oppositeContent =
{careerProgress[3]} />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {

    const careerProgress = [
        "Graduated \n Bachelors in Computer Engineering",
        "Software Engineering Internship \n ABC Software and Technology",

                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
}

```

```
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## Template in React Timeline component

The Timeline component allows you to customize the appearance for each item by using the [template](#) to modify the dot items, templated contents, progress bar styling and more.

The `template` context receives the following information:

| Type | Purpose |

| --- | --- |

| `item` | Indicates the current data of the Timeline item. |

| `itemIndex` | Indicates the current index of the Timeline item. |

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  const projectMilestones = [
    { content: 'Kickoff meeting' },
    { content: 'Content approved' },
    { content: 'Design approved' },
    { content: 'Product delivered' }
  ];
  const getTemplate = (props) => {
    return (
      <div className={`template-container item-${props.itemIndex}`>
        <div className="content-container">
          <div className="timeline-content"> {props.item.content}
        </div>
        <div className="content-connector"></div>
        <div className="progress-line">
          <span className="indicator"></span>
        </div>
      </div>
    );
  }
  return (
    <div id='timeline' style={{ height: "150px", width: "600px", margin:
'50px auto' }}>
      <TimelineComponent cssClass='custom-timeline'
        template={getTemplate} orientation='Horizontal' >
        <ItemsDirective>
          {projectMilestones.map((item, index) => {
            return <ItemDirective key={index}
              content={item.content} />
          })}
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
```

```

        </TimelineComponent>
      </div>
    );
  }
  export default App;
  ReactDOM.render(<App />, document.getElementById("element"));
  {% endraw %}

```

## INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective, TimelineItemModel } from '@syncfusion/ej2-react-layouts';

/* END --- Customizing Icon and progress line */

```

## Customization in React Timeline component

You can customize the Timeline items dot size, connectors, dot borders, dot outer space and more to personalize its appearance. This section explains the different ways for styling the items.

### Connector styling

#### Common styling

You can define the styles applicable to the all the Timeline item connectors.

#### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='custom-connector'>
        <ItemsDirective>
          <ItemDirective content='Eat' />
          <ItemDirective content='Code' />
          <ItemDirective content='Repeat' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

#### INDEX.TSX

```

{% raw %}

```

```
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
 '@syncfusion/ej2-react-layouts';
function App() {
    return (
        <div id='timeline' style={{ height: "330px" }}>
            <TimelineComponent cssClass='custom-connector'>
                <ItemsDirective>
                    <ItemDirective content='Eat' />
                    <ItemDirective content='Code' />
                    <ItemDirective content='Repeat' />
                </ItemsDirective>
            </TimelineComponent>
        </div>
    );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.custom-connector .e-timeline-item.e-connector::after {
    border-color: #f7c867;
    border-width: 1.4px;
    animation: progress 2s;
}
@keyframes progress {
    from { height: 0%; }
    to { height: 100%; }
}
```

## Individual styling

You can also apply unique styles to individual connectors, to differentiate specific items within the timeline.

## INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
 '@syncfusion/ej2-react-layouts';
function App() {
    return (
```

```

    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='custom-connector'>
        <ItemsDirective>
          <ItemDirective content='Eat' cssClass='state-initial' />
          <ItemDirective content='Code' cssClass='state-
intermediate' />
          <ItemDirective content='Repeat' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

**INDEX.TSX**

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='custom-connector'>
        <ItemsDirective>
          <ItemDirective content='Eat' cssClass='state-initial' />
          <ItemDirective content='Code' cssClass='state-
intermediate' />
          <ItemDirective content='Repeat' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

**INDEX.CSS**

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.custom-connector .state-initial.e-connector::after {
  border: 1.5px #f8c050 dashed;
  animation: progress 1.5s ease-in-out;
}

```

```
.custom-connector .state-intermediate.e-connector::after {
  border: 1.5px #4d85f5 dashed;
  animation: progress 1.5s ease-in-out;
}
@keyframes progress {
  from { height: 0%; }
  to { height: 100%; }
}
```

## Dot styling

### Dot color

You can modify the color of the dots to highlight the specific Timeline items.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='dot-color'>
        <ItemsDirective>
          <ItemDirective content='Ordered' cssClass='state-
completed' />
          <ItemDirective content='Shipped' cssClass='state-
progress' />
          <ItemDirective content='Delivered' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='dot-color'>
        <ItemsDirective>
          <ItemDirective content='Ordered' cssClass='state-
completed' />
          <ItemDirective content='Shipped' cssClass='state-
progress' />

```

```

        <ItemDirective content='Delivered' />
      </ItemsDirective>
    </TimelineComponent>
  </div>
);
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

## INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.dot-color .state-completed .e-dot {
  background: #ff9900;
  outline: 1px dashed #ff9900;
  border-color: #ff9900;
}
.dot-color .state-progress .e-dot {
  background: #33cc33;
  outline: 1px dashed #33cc33;
  border-color: #33cc33;
}

```

## Dot size

You can adjust the size of the dot to make it larger or smaller by using the `--dot-size` variable.

## INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='dot-size'>
        <ItemsDirective>
          <ItemDirective content='Ordered' cssClass='x-small' />
          <ItemDirective content='Shipped' cssClass='small' />
          <ItemDirective content='Delivered' cssClass='medium' />
          <ItemDirective content='Delivered' cssClass='large' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}

```

```
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='dot-size'>
        <ItemsDirective>
          <ItemDirective content='Ordered' cssClass='x-small' />
          <ItemDirective content='Shipped' cssClass='small' />
          <ItemDirective content='Delivered' cssClass='medium' />
          <ItemDirective content='Delivered' cssClass='large' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.dot-size .e-dot {
  background: #33cc33;
}
.dot-size .x-small .e-dot {
  --dot-size: 12px;
}
.dot-size .small .e-dot {
  --dot-size: 18px;
}
.dot-size .medium .e-dot {
  --dot-size: 24px;
}
.dot-size .large .e-dot {
  --dot-size: 30px;
}
```

### Dot shadow

You can add shadow effects to the Timeline dots to make it feel visually engaging by using the `--dot-outer-space` & `--dot-border` variables.

#### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='dot-shadow'>
        <ItemsDirective>
          <ItemDirective content='Ordered' />
          <ItemDirective content='Shipped' />
          <ItemDirective content='Delivered' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='dot-shadow'>
        <ItemsDirective>
          <ItemDirective content='Ordered' />
          <ItemDirective content='Shipped' />
          <ItemDirective content='Delivered' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

#### INDEX.CSS

```

/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.dot-shadow .e-dot {
  --dot-outer-space: 3px;
  --dot-border: 3px;
  --dot-size: 20px;
  outline-color: #dee2e6;
  border-color: #fff;
  box-shadow: 3px 3px 10px rgba(0, 0, 0, 0.5) ,
    2px -2px 4px rgba(255, 255, 255, 0.5) inset;
}

```

### Dot variant

You can achieve the desired dot variant by customizing the border, outline and background colors of the Timeline dots.

### INDEX.JSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='dot-variant'>
        <ItemsDirective>
          <ItemDirective content='Filled' cssClass='dot-filled' />
          <ItemDirective content='Flat' cssClass='dot-flat' />
          <ItemDirective content='Outlined' cssClass='dot-outlined' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}

```

### INDEX.TSX

```

{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";

```

```
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='dot-variant'>
        <ItemsDirective>
          <ItemDirective content='Filled' cssClass='dot-filled' />
          <ItemDirective content='Flat' cssClass='dot-flat' />
          <ItemDirective content='Outlined' cssClass='dot-outlined' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## INDEX.CSS

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.dot-variant .dot-filled .e-dot::before { content: 'A'; color: #fff;}
.dot-variant .dot-flat .e-dot::before { content: 'B'; color: #fff;}
.dot-variant .dot-outlined .e-dot::before { content: 'C';}
.dot-variant .dot-filled .e-dot {
  background: #33cc33;
  --dot-outer-space: 3px;
  outline-color: #81ff05;
  --dot-size: 25px;
}
.dot-variant .dot-flat .e-dot {
  background: #33cc33;
  --dot-size: 25px;
  --dot-radius: 10%;
}
.dot-variant .dot-outlined .e-dot {
  outline-color: #33cc33;
  --dot-outer-space: 3px;
  background-color: unset;
  --dot-size: 25px;
}
```

### Dot outline

By adding the `e-outline` class to the Timeline `cssClass` property, it enables the dots to have an outline state.

## INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent cssClass='e-outline'>
        <ItemsDirective>
          <ItemDirective content='Shipped' />
          <ItemDirective content='Departed' />
          <ItemDirective content='Arrived' />
          <ItemDirective content='Out for Delivery' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.TSX**

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent cssClass='e-outline'>
        <ItemsDirective>
          <ItemDirective content='Shipped' />
          <ItemDirective content='Departed' />
          <ItemDirective content='Arrived' />
          <ItemDirective content='Out for Delivery' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

**INDEX.CSS**

```
/* Represents the styles for loader */
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
```

```
top: 45%;
width: 30%;
}
```

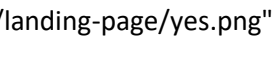

### Accessibility in React Timeline component

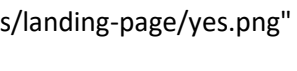

The Timeline component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

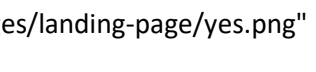

The accessibility compliance for the Timeline component is outlined below.

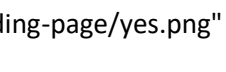

| Accessibility Criteria | Compatibility |

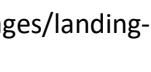

| -- | -- |

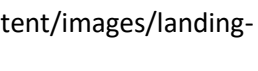

| [WCAG 2.2](#) Support |  |

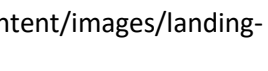

| [Section 508](#) Support |  |

| Right-To-Left Support |  |

| Color Contrast |  |

| Mobile Device Support |  |

| [Accessibility Checker](#) Validation |  |

| [Axe-core](#) Accessibility Validation |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The following ARIA attributes are used in the Timeline component:

| Attributes | Purpose |

| --- | --- |

| **role=navigation** | Specified its purpose as a navigational element. |

| **aria-label** | Provides an accessible name for an element when a visible label is not present |

### Ensuring accessibility

The Timeline component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

- [Accessibility in Syncfusion React components](#)

## Events in React Timeline component

This section describes the Timeline events that will be triggered when an appropriate actions are performed. The following events are available in the Timeline component.

### created

The Timeline component triggers the [created](#) event when the component rendering is completed.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent created={() => { /* Your required action here
*/ }}>
        <ItemsDirective>
          <ItemDirective content='Planning' />
          <ItemDirective content='Developing' />
          <ItemDirective content='Testing' />
          <ItemDirective content='Launch' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
"@syncfusion/ej2-react-layouts";
```

```
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent created={() => { /* Your required action here
*/ }}>
        <ItemsDirective>
          <ItemDirective content='Planning' />
          <ItemDirective content='Developing' />
          <ItemDirective content='Testing' />
          <ItemDirective content='Launch' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### beforeItemRender

The Timeline component triggers the [beforeItemRenderLink to the Video](#) event before rendering each item.

### INDEX.JSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
import { TimelineComponent, ItemsDirective, ItemDirective } from
'@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "350px" }}>
      <TimelineComponent beforeItemRender={(args) => { /* Your required
action here */ }}>
        <ItemsDirective>
          <ItemDirective content='Planning' />
          <ItemDirective content='Developing' />
          <ItemDirective content='Testing' />
          <ItemDirective content='Launch' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

### INDEX.TSX

```
{% raw %}
import * as React from "react";
import * as ReactDOM from "react-dom";
```

```
import { TimelineComponent, ItemsDirective, ItemDirective,
TimelineRenderingEventArgs } from '@syncfusion/ej2-react-layouts';
function App() {
  return (
    <div id='timeline' style={{ height: "330px" }}>
      <TimelineComponent beforeItemRender={ (args:
TimelineRenderingEventArgs) => { /* Your required action here */ }}>
        <ItemsDirective>
          <ItemDirective content='Planning' />
          <ItemDirective content='Developing' />
          <ItemDirective content='Testing' />
          <ItemDirective content='Launch' />
        </ItemsDirective>
      </TimelineComponent>
    </div>
  );
}
export default App;
ReactDOM.render(<App />, document.getElementById("element"));
{% endraw %}
```

## TimePicker

### Getting started

This section explains you the steps required to create a simple TimePicker and demonstrate the basic usage of the TimePicker component.

To get start quickly with React TimePicker, you can check on this video:

### Dependencies

The below list of dependencies are required to use the TimePicker component in your application.

```
`javascript
|-- @syncfusion/ej2-react-calendars
|-- @syncfusion/ej2-react-base
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-calendars
|-- @syncfusion/ej2-inputs
|-- @syncfusion/ej2-splitbuttons
|-- @syncfusion/ej2-lists
|-- @syncfusion/ej2-popups
|-- @syncfusion/ej2-buttons
`
```

### Installation and configuration

You can use [create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

`

```
npm install -g create-react-app
```

`

- To setup basic `React` sample use following commands.

`

```
create-react-app quickstart --scripts-version=react-scripts-ts
```

```
cd quickstart
```

`

### Adding Syncfusion packages

All the available Essential JS 2 packages are published in [npmjs.com](#) public registry. You can choose the component that you want to install. For this application, we are going to use `TimePicker` component.

To install `TimePicker` component, use the following command

```
`bash
```

```
npm install @syncfusion/ej2-react-calendars --save
```

`

### Adding Style sheet to the Application

To render the `TimePicker` component, need to import `TimePicker` and its dependent component's styles as given below in `App.css`.

```
`css
```

```
@import "../node_modules/@syncfusion/ej2-base/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-inputs/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-popups/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-lists/styles/material.css";
```

```
@import "../node_modules/@syncfusion/ej2-react-calendars/styles/material.css";
```

`

Note: If you want to refer the combined component styles, please make use of our [CRG](#) (Custom Resource Generator) in your application.

### Adding TimePicker component to the Application

- To include the `TimePicker` component in application import the `TimePickerComponent` from `ej2-react-calendars` package in `App.tsx`.
- Then add the `TimePicker` component as shown in below code example.

[src/App.tsx]

[Class-component]

```
`ts
import { enableRipple } from '@syncfusion/ej2-base';
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import './App.css';
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
  public render() {
    return <TimePickerComponent id="time" />
  }
};
`
```

[Functional-component]

```
`ts
import { enableRipple } from '@syncfusion/ej2-base';
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import './App.css';
// enable ripple effect
enableRipple(true);
function App() {
  return <TimePickerComponent id="time" />
};
`
```

### Run the application

Now run the `npm start` command in the console, it will run your application and open the browser window.

```
npm start
```

The following examples shows the basic TimePicker component.

### [Class-component]

#### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
  render() {
    return <TimePickerComponent id="timepicker" placeholder="Select a
Time"/>;
  }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

#### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
  public render() {
    return <TimePickerComponent id="timepicker" placeholder="Select a
Time" />
  }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

### [Functional-component]

#### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
  return <TimePickerComponent id="timepicker" placeholder="Select a
Time"/>;
}
```

```
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    return <TimePickerComponent id="timepicker" placeholder="Select a Time" />
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

Now, the TimePicker renders with default culture as **American English**('en-US'). For a different culture, refer to the

[Globalization](#) section.

### Setting the value, min, and max time

The following example demonstrates how to set the value, min and max time on initializing the TimePicker. Here the TimePicker allows you to select the time value within a range from **7:00 AM** to **4:00 PM**.

[Class-component]

### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
    // initialize the value, min and max time
    time = (new Date('8/3/2017 10:00 AM'));
    minTime = (new Date('8/3/2017 7:00 AM'));
    maxTime = (new Date('8/3/2017 4:00 PM'));
    render() {
        return <TimePickerComponent id="timepicker" value={this.time}
min={this.minTime} max={this.maxTime}/>;
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    // initialize the value, min and max time
    private time: Date = (new Date('8/3/2017 10:00 AM'));
    private minTime: Date = (new Date('8/3/2017 7:00 AM'));
    private maxTime: Date = (new Date('8/3/2017 4:00 PM'));
    public render() {
        return <TimePickerComponent id="timepicker" value={this.time}
min={this.minTime} max={this.maxTime} />
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

## [Functional-component]

### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the value, min and max time
    const time = (new Date('8/3/2017 10:00 AM'));
    const minTime = (new Date('8/3/2017 7:00 AM'));
    const maxTime = (new Date('8/3/2017 4:00 PM'));
    return <TimePickerComponent id="timepicker" value={time} min={minTime}
max={maxTime}/>;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the value, min and max time
    const time: Date = (new Date('8/3/2017 10:00 AM'));

```

```

const minTime: Date = (new Date('8/3/2017 7:00 AM'));
const maxTime: Date = (new Date('8/3/2017 4:00 PM'));
return <TimePickerComponent id="timepicker" value={time} min={minTime}
max={maxTime} />
};
ReactDOM.render(<App />, document.getElementById('timer'));

```

### Setting the time format

Time formats is a way of representing the time value in different string format in textbox and popup list. By default, the TimePicker's format is based on the culture. You can also customize the format by using the [format](#) property. To know more about the time format standards, refer to the [Date and Time Format](#) section.

The following example demonstrates the TimePicker component in 24 hours format with 60 minutes interval. The time interval is set to 60 minutes by using the [step](#) property.

#### [Class-component]

##### INDEX.JSX

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
  time = (new Date('8/3/2017 10:00'));
  render() {
    return <TimePickerComponent id="timepicker" value={this.time}
step={60} format={'HH:mm'} />;
  }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));

```

##### INDEX.TSX

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
  private time: Date = (new Date('8/3/2017 10:00'));
  public render() {
    return <TimePickerComponent id="timepicker" value={this.time}
step={60} format={'HH:mm'} />
  }
};

```

```
ReactDOM.render(<App />, document.getElementById('timer'));
```

### [Functional-component]

#### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    const time = (new Date('8/3/2017 10:00'));
    return <TimePickerComponent id="timepicker" value={time} step={60}
format={'HH:mm'} />;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

#### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    const time: Date = (new Date('8/3/2017 10:00'));
    return <TimePickerComponent id="timepicker" value={time} step={60}
format={'HH:mm'} />
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

Once the time format property is defined, it will be applicable to all the cultures.

### Time range in React Timepicker component

TimePicker provides an option to select a time value within a specified range by using the [min](#) and [max](#) properties. The min value should always be lesser than the max value.

When the min and max properties are configured and the selected time value is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The value property depends on the min/max with respect to [strictMode](#) property. The following example allows you to select a time value within a range of **9:00 AM** to **11:30 AM**.

#### [Class-component]

##### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
    // initialize the min and max time value
    minTime = (new Date('8/3/2017 9:00 AM'));
    maxTime = (new Date('8/3/2017 11:30 AM'));
    render() {
        return <TimePickerComponent id="timepicker" placeholder="Select a
Time" min={this.minTime} max={this.maxTime}/>;
    }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

##### INDEX.TSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    // initialize the min and max time value
    private minTime: Date = (new Date('8/3/2017 9:00 AM'));
    private maxTime: Date = (new Date('8/3/2017 11:30 AM'));
    public render() {
        return <TimePickerComponent id="timepicker" placeholder="Select a
Time" min={this.minTime} max={this.maxTime} />
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

#### [Functional-component]

##### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the min and max time value
    const minTime = (new Date('8/3/2017 9:00 AM'));
    const maxTime = (new Date('8/3/2017 11:30 AM'));
    return <TimePickerComponent id="timepicker" placeholder="Select a Time"
min={minTime} max={maxTime}/>;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

**INDEX.TSX**

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the min and max time value
    const minTime: Date = (new Date('8/3/2017 9:00 AM'));
    const maxTime: Date = (new Date('8/3/2017 11:30 AM'));
    return <TimePickerComponent id="timepicker" placeholder="Select a Time"
min={minTime} max={maxTime} />
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

If the value of `min` or `max` property is changed through code behind you have to update the `value` property to set within the range.

**Time masking in React Timepicker component**

TimePicker has `enableMask` property that provides the option to enable the built-in date masking support. Also, you must inject the `MaskedDateTime` module to enable the masking support.

**[Class-component]****INDEX.JSX**

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
export default class App extends React.Component {
    render() {
```

```

        return <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>;
    }
}
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
export default class App extends React.Component<{}, {}> {
    public render() {
        return <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] } /></TimePickerComponent>
    }
}
ReactDOM.render(<App />, document.getElementById('element'));

```

### [Functional-component]

### INDEX.JSX

```

import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
    return <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>;
}
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
    return <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] } /></TimePickerComponent>
}
ReactDOM.render(<App />, document.getElementById('element'));

```

The mask pattern is defined based on the provided time format to the component. If the format is not specified, the mask pattern is formed based on the default format of the current culture.

| Keys | Actions |

| --- | --- |

| Up / Down arrows | To increment and decrement the selected portion of the time. |

| Left / Right arrows and Tab | To navigate the selection from one portion to next portion |

The following example demonstrates default and custom format of TimePicker component with mask.

[Class-component]

#### INDEX.JSX

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
export default class App extends React.Component {
  render() {
    return (<div>
      /* specifies the masked TimePicker component without format */
      <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>
      <br />
      <br />
      /* specifies the masked TimePicker component with format */
      <TimePickerComponent format='h:mm a'
enableMask={true}><Inject services={ [MaskedDateTime] }/></TimePickerComponent>
    </div>);
  }
}
ReactDOM.render(<App />, document.getElementById('element'));
```

#### INDEX.TSX

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
export default class App extends React.Component<{}, {}> {
  public render() {
    return (
      <div>
        /* specifies the masked TimePicker component without format */
        <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] } /></TimePickerComponent>
        <br />
        <br />
        /* specifies the masked TimePicker component with format */
        <TimePickerComponent format='h:mm a'
enableMask={true}><Inject services={ [MaskedDateTime] }
/></TimePickerComponent>
      </div>
    );
  }
}
ReactDOM.render(<App />, document.getElementById('element'));
```

**[Functional-component]****INDEX.JSX**

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
    return (<div>
        /* specifies the masked TimePicker component without format */
        <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>
        <br />
        <br />
        /* specifies the masked TimePicker component with format */
        <TimePickerComponent format='h:mm a'
enableMask={true}><Inject services={ [MaskedDateTime] }/></TimePickerComponent>
    </div>);
}
ReactDOM.render(<App />, document.getElementById('element'));
```

**INDEX.TSX**

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
    return (
        <div>
            /* specifies the masked TimePicker component without format */
            <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] } /></TimePickerComponent>
            <br />
            <br />
            /* specifies the masked TimePicker component with format */
            <TimePickerComponent format='h:mm a'
enableMask={true}><Inject services={ [MaskedDateTime] }
/></TimePickerComponent>
        </div>
    );
}
ReactDOM.render(<App />, document.getElementById('element'));
```

**Configure Mask Placeholder**

You can change mask placeholder value through property **maskPlaceholder**. By default , it takes the full name of time co-ordinates such as **hour**, **minute** and **second**.

While changing to a culture other than **English**, ensure that locale text for the concerned culture is loaded through load method of L10n class for mask placeholder values like below.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized mask placeholder value
L10n.load({
  'de': {
    timepicker: { hour: 'Stunde', minute: 'Minute', second: 'Sekunde' }
  }
});
`
```

The following example demonstrates default and customized mask placeholder value.

#### [Class-component]

##### INDEX.JSX

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
export default class App extends React.Component {
  maskPlaceholderValue;
  constructor(props) {
    super(props);
    this.maskPlaceholderValue = { hour: 'h', minute: 'm', second: 's' };
  }
  render() {
    return (
      <div>
        /* specifies the masked TimePicker component without mask placeholder */
        <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>
        <br />
        <br />
        /* specifies the masked TimePicker component with mask placeholder */
        <TimePickerComponent enableMask={true}
maskPlaceholder={this.maskPlaceholderValue}><Inject
services={ [MaskedDateTime] }/></TimePickerComponent>
        </div>
      );
  }
}
ReactDOM.render(<App />, document.getElementById('element'));
```

##### INDEX.TSX

```
import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
```

```

export default class App extends React.Component<{}, {}> {
  private maskPlaceholderValue: object;
  constructor(props: {}) {
    super(props);
    this.maskPlaceholderValue = { hour: 'h', minute: 'm', second: 's' };
  }
  public render() {
    return (
      <div>
        /* specifies the masked TimePicker component without mask placeholder */
        <TimePickerComponent enableMask={true}><Inject
services=[MaskedDateTime] /></TimePickerComponent>
        <br />
        <br />
        /* specifies the masked TimePicker component with mask placeholder */
        <TimePickerComponent enableMask={true}
maskPlaceholder={this.maskPlaceholderValue}><Inject
services=[MaskedDateTime] /></TimePickerComponent>
      </div>
    );
  }
}
ReactDOM.render(<App />, document.getElementById('element'));

```

## [Functional-component]

### INDEX.JSX

```

import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
  let maskPlaceholderValue;
  maskPlaceholderValue = { hour: 'h', minute: 'm', second: 's' };
  return (<div>
    /* specifies the masked TimePicker component without mask placeholder */
    <TimePickerComponent enableMask={true}><Inject
services=[MaskedDateTime] /></TimePickerComponent>
    <br />
    <br />
    /* specifies the masked TimePicker component with mask placeholder */
    <TimePickerComponent enableMask={true}
maskPlaceholder={maskPlaceholderValue}><Inject
services=[MaskedDateTime] /></TimePickerComponent>
  </div>);
}
ReactDOM.render(<App />, document.getElementById('element'));

```

### INDEX.TSX

```

import { TimePickerComponent, Inject, MaskedDateTime } from '@syncfusion/ej2-react-calendars';
import * as ReactDOM from 'react-dom';
import * as React from 'react';
function App() {
    let maskPlaceholderValue: object;
    maskPlaceholderValue = { hour: 'h', minute: 'm', second: 's' };
    return (
        <div>
            /* specifies the masked TimePicker component without mask placeholder */
            <TimePickerComponent enableMask={true}><Inject
services={ [MaskedDateTime] } /></TimePickerComponent>
            <br />
            <br />
            /* specifies the masked TimePicker component with mask placeholder */
            <TimePickerComponent enableMask={true}
maskPlaceholder={maskPlaceholderValue}><Inject services={ [MaskedDateTime] }
/></TimePickerComponent>
        </div>
    );
}
ReactDOM.render(<App />, document.getElementById('element'));

```

### Strict mode in React Timepicker component

The [strictMode](#) is an act that allows you to enter only valid time value within the specified min/max range in the textbox. If the time value is invalid, the component value sets to the previous value.

If the time value is out of range, the component sets the time value to min/max value.

The following example demonstrates the TimePicker in `strictMode` with min/max range of 10:00 AM to 4:00 PM . It allows you to enter only valid time within the specified range. If you enter the out-of-range value like 8:00 PM, the value sets to the max time 4:00 PM as the value 8:00 PM is greater than max value of 4:00 PM. If you enter invalid time value like 9:00 tt, the value sets to the previous value.

#### INDEX.JSX

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
    // initialize the min and max time value
    minTime = new Date('8/3/2017 10:00 AM');
    maxTime = new Date('8/3/2017 4:00 PM');
    time = new Date('8/3/2017 8:00 PM');
    render() {

```

```

        return <TimePickerComponent id="timepicker" value={this.time}
placeholder="Select a Time" min={this.minTime} max={this.maxTime}
strictMode={true}/>;
    }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));

```

**INDEX.TSX**

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    // initialize the min and max time value
    private minTime: Date = new Date('8/3/2017 10:00 AM');
    private maxTime: Date = new Date('8/3/2017 4:00 PM');
    private time: Date = new Date('8/3/2017 8:00 PM');
    public render() {
        return <TimePickerComponent id="timepicker" value={this.time}
placeholder="Select a Time" min={this.minTime} max={this.maxTime}
strictMode={true} />
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));

```

**[Functional-component]****INDEX.JSX**

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the min and max time value
    const minTime = new Date('8/3/2017 10:00 AM');
    const maxTime = new Date('8/3/2017 4:00 PM');
    const time = new Date('8/3/2017 8:00 PM');
    return <TimePickerComponent id="timepicker" value={time}
placeholder="Select a Time" min={minTime} max={maxTime} strictMode={true}/>;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));

```

**INDEX.TSX**

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the min and max time value
    const minTime: Date = new Date('8/3/2017 10:00 AM');
    const maxTime: Date = new Date('8/3/2017 4:00 PM');
    const time: Date = new Date('8/3/2017 8:00 PM');
    return <TimePickerComponent id="timepicker" value={time}
placeholder="Select a Time" min={minTime} max={maxTime} strictMode={true} />
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

By default, the TimePicker act in strictMode **false** state, that allows to enter the invalid or out-of-range time in textbox.

If the time is out-of-range or invalid, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

The following example demonstrates the **strictMode** as **false**. Here, it allows to enter the valid or invalid value in textbox. If you are entering the out-of-range or invalid time value, then the model value will be set to **out of range** time value or **null** respectively with highlighted **error** class to indicates the time is out of range or invalid.

import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
    // initialize the min and max time value
    minTime = new Date('8/3/2017 10:00 AM');
    maxTime = new Date('8/3/2017 4:00 PM');
    time = new Date('8/3/2017 8:00 PM');
    render() {
        return <TimePickerComponent id="timepicker" value={this.time}
placeholder="Select a Time" min={this.minTime} max={this.maxTime}
strictMode={false}/>;
    }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

**INDEX.TSX**

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    // initialize the min and max time value
    private minTime: Date = new Date('8/3/2017 10:00 AM');
    private maxTime: Date = new Date('8/3/2017 4:00 PM');
    private time: Date = new Date('8/3/2017 8:00 PM');
    public render() {
        return <TimePickerComponent id="timepicker" value={this.time}
placeholder="Select a Time" min={this.minTime} max={this.maxTime}
strictMode={false} />
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

**[Functional-component]****INDEX.JSX**

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
function App() {
    // initialize the min and max time value
    const minTime = new Date('8/3/2017 10:00 AM');
    const maxTime = new Date('8/3/2017 4:00 PM');
    const time = new Date('8/3/2017 8:00 PM');
    return <TimePickerComponent id="timepicker" value={time}
placeholder="Select a Time" min={minTime} max={maxTime} strictMode={false}/>;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

**INDEX.TSX**

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
```

```
function App() {
  // initialize the min and max time value
  const minTime: Date = new Date('8/3/2017 10:00 AM');
  const maxTime: Date = new Date('8/3/2017 4:00 PM');
  const time: Date = new Date('8/3/2017 8:00 PM');
  return <TimePickerComponent id="timepicker" value={time}
    placeholder="Select a Time" min={minTime} max={maxTime} strictMode={false} />
  };
ReactDOM.render(<App />, document.getElementById('timer'));
```

If the value of `min` or `max` property is changed through code behind, update the `value` property to set within the range.

### Globalization in React Timepicker component

Globalization is the combination of internationalization and localization. You can adapt the component to various languages by means of parsing and formatting the date or number [internationalization](#), and also add culture specific customization and translation to the text [localization](#).

By default, TimePicker time format and meridian names are specific to the **American English** culture. It utilizes the

[Essential JavaScript 2 Internationalization](#) package to parse and format the date object based on the culture by using the official [UNICODE CLDR](#) JSON data. It provides the `loadCldr` method to load culture specific CLDR JSON data. To go with the different culture other than **English**, follow the steps below.

- Install the **CLDR-Data** package by using the following command (it installs all the CLDR JSON data). To know more about CLDR-Data refer the [CLDR-Data](#) link.

```
npm install cldr-data --save
```

Once the package is installed, you can find the culture specific JSON data under the location `\node_modules\cldr-data`.

- Import the installed CLDR JSON data into the `app.ts` file.
- Use the [loadCldr](#) method to load the culture specific CLDR JSON data from the installed location to `app.ts` file.
- TimePicker displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the TimePicker with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```
`ts
```

```
import { loadCldr } from '@syncfusion/ej2-base';
import { loadCldr } from "@syncfusion/ej2-base";
import * as gregorian from 'cldr-data/main/de/ca-gregorian.json';
import * as numbers from 'cldr-data/main/de/numbers.json';
```

```
import * as numberingSystems from 'cldr-data/supplemental/numberingSystems.json';
loadCldr(numberingSystems, gregorian, numbers);
`ts
```

if you are facing the error `/node_modules/cldr-data/main/de/*.json (1,1): unused expression, expected an assignment or function call` when you are adding the json files to render the culture sample, then add the below configuration in your `tslint.json` file

```
`ts
"linterOptions": {
"exclude": [
"*.json",
"/*.json"
]
}
`ts
```

- Before changing to a culture other than `English`, ensure that locale text for the concerned culture is loaded through `load` method of `L10n` class.

```
`ts
//Load the L10n, loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
'de': {
'timepicker': { placeholder: 'Wählen Sie Zeit' }
}
});
`ts
```

- Set the culture by using the `locale` property. In the following code example, the `DateTimePicker` is initialized in `German` culture with corresponding localized text.

The following example demonstrates the TimePicker in `German` culture.

## Right-To-Left

The TimePicker supports RTL (right-to-left) functionality for languages like Arabic and Hebrew to displays the text in the right-to-left direction. Use [enableRtl](#) property to set the RTL direction.

The code example demonstrates the TimePicker component in Arabic culture, also explains how to set the localized text to the placeholder using [L10n.load](#) method.

[Class-component]

## Accessibility in React Timepicker component

The TimePicker component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the TimePicker component is outlined below.

| Accessibility Criteria | Compatibility |

| - - | - - |

| [WCAG 2.2 Support](#) |  alt="Yes" |

| [Section 508 Support](#) | 

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

### WAI-ARIA attributes

The web accessibility makes web applications and its content more accessible to people with disabled without any barriers. Especially it tracks the dynamic value changes and DOM changes.

TimePicker component has covered the [WAI-ARIA](#) specifications with the following list of WAI-ARIA attributes `aria-haspopup`, `aria-selected`, `aria-disabled`, `aria-activedescendant`,

`aria-expanded`, `aria-owns`, and `aria-autocomplete`.

Here, the `combobox` as a role for input element and `listbox` as a role for popup element in the TimePicker.

- **Aria-haspopup** : Provides the information about whether this element display a pop-up window or not.
- **Aria-selected** : Indicates the current selected value of the TimePicker component.
- **Aria-disabled** : Indicates disabled state of the TimePicker component.
- **Aria-expanded** : Indicates expanded state of the popup.
- **Aria-autocomplete** : Indicates whether user input completion suggestions are provided or not.
- **Aria-owns** : Attribute that creates a parent/child relationship between the two DOM element in accessibility layer

- **Aria-activedescendent** : Attribute that helps in managing the current active child of the TimePicker component.
- **Role** : Attributes that gives assistive technologies information for handling each element in a widget.

### Keyboard Interaction

Keyboard accessibility is one of the most important aspects of web accessibility. It will be more useful to all the computer users, as they often allow to interact keyboard more than a mouse.

Among people with disabilities like blind or who have motor disabilities are also can make frequent use of keyboard shortcuts.

The TimePicker component has built-in keyboard accessibility support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys to interact with the TimePicker component.

| Press | To do this |

| --- | --- |

| Upper Arrow | Navigate and select the previous item. |

| Down Arrow | Navigate and select the next item. |

| Left Arrow | Move the cursor towards arrow key pressed direction. |

| Right Arrow | Move the cursor towards arrow key pressed direction. |

| Home | Navigate and select the first item. |

| End | Navigate and select the last item. |

| Enter | Select the currently focused item and close the popup. |

| Alt + Upper Arrow | Close the popup. |

| Alt + Down Arrow | Open the popup. |

| Esc | Close the popup. |

The following sample use the `alt+t` keys to focus the TimePicker component.

### INDEX.JSX

```
{% raw %}
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
  timepickerInstance;
  componentDidMount() {
    const proxy = this;
    document.onkeyup = (e) => {
```

```

        if (e.altKey && e.keyCode === 84 /* t */) {
            // press alt+t to focus the control.
            proxy.timepickerInstance.focus();
        }
    };
}
render() {
    return <TimePickerComponent id="timepicker" placeholder="Select a
Time" ref={ (scope) => { this.timepickerInstance = scope; } } />;
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
{% endraw %}

```

### INDEX.TSX

```

{% raw %}
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';

        proxy.timepickerInstance.focus();
      }
    };
  }, []);
  return <TimePickerComponent id="timepicker" placeholder="Select a Time"
  ref={(scope) => { (timepickerInstance as TimePicker | null) = scope; }}/>;
};
ReactDOM.render(<App />, document.getElementById('timer'));
{% endraw %}
```

## Ensuring accessibility

The TimePicker component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the TimePicker component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the TimePicker component with accessibility tools.

- [Accessibility in Syncfusion React components](#)

### Style appearance in React Timepicker component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the appearance of TimePicker wrapper element

Use the following CSS to customize the appearance of wrapper element.

```
`css
/ To specify height and font size /
.e-input-group input.e-input, .e-input-group.e-control-wrapper input.e-input, .e-input-group textarea.e-input, .e-input-group.e-control-wrapper textarea.e-input {
font-size: 20px;
height: 40px;
}
```

#### Customizing the TimePicker icon element

Use the following CSS to customize the TimePicker icon element

```
`css
/ To specify background color and font size /
.e-time-wrapper .e-time-icon.e-icons, *.e-control-wrapper.e-time-wrapper .e-time-icon.e-icons {
font-size: 20px;
background-color: beige;
}
```

#### Customizing the TimePicker popup

Use the following CSS to customize the TimePicker popup

```
`css
/ To specify height /
.e-timepicker.e-popup {
height: 100px;
}
```

`

### Customizing the TimePicker popup content

Use the following CSS to customize the TimePicker popup content

```
`css
/ To specify height /
.e-timepicker.e-popup .e-list-parent.e-ul li.e-list-item {
background-color: beige;
font-size: 20px;
}
```

`

### Full screen mode support in mobiles and tablets

The TimePicker component's full-screen mode feature enables users to view the component popup element in full-screen mode on mobile devices with improved visibility and a better user experience. It is important to mention that this feature is exclusively available for mobile and tablet devices in both landscape and portrait orientations. To activate the full screen mode within the TimePicker component, simply set the [fullScreenMode](#) API value to `true`. This action will extend the popup element to occupy the entire screen on mobile devices.

```
`typescript
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';

// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";

// enable ripple effect
enableRipple(true);

function App(){
const mobileMode:boolean = true;
return <TimePickerComponent id="timepicker" fullScreenMode={this.mobileMode} />
};

ReactDOM.render(<App />, document.getElementById('timer'));
```

`

## How To

### Css customization in React Timepicker component

TimePicker allows you to customize the textbox and popup list appearance to suit for your application by using [cssClass](#) property.

The below sample demonstrates customization of the text appearance in a textbox, popup button, and popup list along with hover and active state by using `e-custom-style` class. Following is the list of available classes used to customize the entire TimePicker component.

Class Name	Description
---	---
e-time-wrapper	Applied to TimePicker wrapper element.
e-timepicker	Applied to input element and TimePicker popup element.
e-time-wrapper.e-timepicker	Applied to input element only.
e-input-group-icon.e-time-icon	Applied to popup button.
e-float-text	Applied to floating label text element.
e-popup	Applied to popup element.
e-timepicker.e-popup	Applied to TimePicker popup element only.
e-list-parent	Applied to popup UL element.
e-timepicker.e-list-parent	Applied to TimePicker popup UL element only.
e-list-item	Applied to LI elements.
e-hover	Applied to LI element hovering time.
e-active	Applied to active LI element.

### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
  render() {
    return <TimePickerComponent id="timepicker" cssClass="e-custom-style"
placeholder="Select a Time"/>;
  }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));
```

### INDEX.TSX

```
// import the ripple effect
```

```
import { enableRipple } from '@syncfusion/ej2-base';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    public render() {
        return <TimePickerComponent id="timepicker" cssClass="e-custom-style"
placeholder="Select a Time" />
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));
```

### Client side validation using form validator in React Timepicker component

To achieve the client side validation in a TimePicker component by using [Essential JavaScript 2 FormValidator](#). It provides an option to customize the feedback error messages to the corresponding fields to take action to resolve the issue.

In the following example, the required field validation is implemented by mapping the name attribute value to the rules property. It validates the TimePicker component and displays the validation message when the textbox value is empty, during form post back or focus out.

### INDEX.JSX

```
// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the form validator related functions
import { FormValidator } from '@syncfusion/ej2-inputs';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component {
    componentDidMount() {
        const options = {
            customPlacement: (inputElement, errorElement) => {
                const parentElement = inputElement.parentElement;
                parentElement.parentElement.appendChild(errorElement);
            },
            rules: {
                // must specify the name attribute value in rules section
                // with required validation
                'timepicker': { required: true }
            }
        };
        const formObject = new FormValidator('#form-element', options);
        formObject.addRules('timepicker', { required: true });
    }
    render() {
        return (<form id='form-element'>
            <TimePickerComponent id="timepicker" placeholder="Select a
Time"/>
        </form>);
    }
}
```

```

        </form>;
    }
}
;
ReactDOM.render(<App />, document.getElementById('timer'));

```

## INDEX.TSX

```

// import the ripple effect
import { enableRipple } from '@syncfusion/ej2-base';
// import the form validator related functions
import { FormValidator, FormValidatorModel } from '@syncfusion/ej2-inputs';
// import the timepicker
import { TimePickerComponent } from '@syncfusion/ej2-react-calendars';
import * as React from "react";
import * as ReactDOM from "react-dom";
// enable ripple effect
enableRipple(true);
export default class App extends React.Component<{}, {}> {
    public componentDidMount(): void {
        const options: FormValidatorModel = {
            customPlacement: (inputElement: HTMLElement, errorElement:
HTMLElement) => {
                const parentElement: HTMLElement = inputElement.parentElement
as HTMLElement;
                (parentElement.parentElement as
HTMLElement).appendChild(errorElement);
            },
            rules: {
                // must specify the name attribute value in rules section
                // with required validation
                'timepicker': { required: true }
            }
        };
        const formObject: FormValidator = new FormValidator('#form-element',
options);
        formObject.addRules('timepicker', {required: true});
    }
    public render() {
        return (
            <form id='form-element'>
                <TimePickerComponent id="timepicker" placeholder="Select a
Time" />
            </form>)
        );
    }
};
ReactDOM.render(<App />, document.getElementById('timer'));

```

## Ej1 api migration in React Timepicker component

This article describes the API migration process of TimePicker component from Essential JS 1 to Essential JS 2.

### Time Selection

{% raw %}

&lt;!-- markdownlint-disable MD033 --&gt;

Behavior	API in Essential JS 1	API in Essential JS 2
Setting the value	Property: value	Property: Value

### Time Format

&lt;!-- markdownlint-disable MD033 --&gt;

Behavior	API in Essential JS 1	API in Essential JS 2
Display time format	Property: timeFormat	Property: format

### Time Range

&lt;!-- markdownlint-disable MD033 --&gt;

Behavior	API in Essential JS 1	API in Essential JS 2
Minimum time	Property: minTime	Property: min
Maximum time	Property: maxTime	Property: Max
Set current time	Method: setCurrentTime() function onCreate() { var timeObj = \$("#timepicker").data("ejTimePicker"); timeObj.setCurrentTime();}	Can be achieved by private timeValue: Date = new Date();

### Disabled Time Ranges

&lt;!-- markdownlint-disable MD033 --&gt;

Behavior	API in Essential JS 1	API in Essential JS 2
Disable time ranges	Property: disableTimeRanges var disableTime = [{ startTime: '3:00 AM', endTime: '6:00 AM' }, { startTime: '1:00 PM', endTime: '3:00 PM' }, { startTime: '8:00 PM', endTime: '10:00 PM' }];	Can be achieved by itemRenderHandler(args) { if (args.value.getHours() === 4) { args.isDisabled = true; }}

### Customization

&lt;!-- markdownlint-disable MD033 --&gt;

Behavior	API in Essential JS 1	API in Essential JS 2
CSS Class	Property: cssClass	Property: cssClass
Popup list customization	Not Applicable	Event: itemRenderitemRanderHandler() {/ code block */ }
Show/Hide the popup button	Property: showPopupButton	Can be achieved byonFocus(args) { this.show();}.e-control- wrapper .e-input-group-icon.e- time-icon { display: none;}
Enable/Disable the rounded corner	Property: showRoundedCorner	Can be achieved by.e-control- wrapper.e-custom-style.e-time- wrapper.e-input-group { border-radius: 4px;}
Enable/Disable the animation	Property: enableAnimation	Not Applicable
Interval	Property: interval	Property: step
FocusIn event	Event: focusInfunction onFocus() { / code block */ }	Event: focusonFocus() {/ code block */ }
FocusOut event	Event: focusOutfunction onFocusout() { }	Event: bluronBlur(args) { / code block */ }
FocusIn method	Not Applicable	Method: focusIn()create(args) { this.focusIn();}
FocusOut method	Not Applicable	Method: focusOutcreate(args) { this.focusOut();}
Prevent popup close	Not Applicable	Event: closeonClose(args) { args.cancel = true;}
Prevent popup open	Not Applicable	Event: openonOpen(args) { args.cancel = true;}

### Accessibility

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable/Disable the RTL	Property: enableRTL	Property: enableRtl

### Persistence

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Enable/Disable the persistence	Property: enablePersistence	Property: enablePersistence

### Validation

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Validation rules	Property: validationRules var validationRules = {required: {true}};\$\$.validator.setDefault({ errorClass: 'e-validation-error', errorPlacement: function (error, element) { \$(error).insertAfter(element.closest(".e-widget")); } });	Can be achieved by var options = { rules: { 'timepicker': { required: true } } };var formObject = new ej.inputs.FormValidator('#form-element', options);
Validation message	Property: validationMessages var validationRules = {required: {true}};var validationMessage = {required: "Required value"};\$\$.validator.setDefault({ errorClass: 'e-validation-error', errorPlacement: function (error, element) { \$(error).insertAfter(element.closest(".e-widget")); } });	A Can be achieved by var options = { rules: { 'timepicker': { required: true } }, customPlacement: (inputElement, errorElement) => { inputElement.parentElement.parentElement.appendChild(errorElement); } };var formObject = new ej.inputs.FormValidator('#form-element', options);

### Common

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Width	Property: width	Property: width
Readonly	Property: readOnly	Property: Readonly
Show/Hide the clear button	Not Applicable	Property: showClearButton
Height	Property: Height	Can be achieved by.e-control-wrapper.e-custom-style.e-time-wrapper.e-input-group { height: 35px;}
Html Attributes	Property: HtmlAttributes var htmlAttributes = {required:"required"}	Not Applicable
Watermark text	Property: watermarkText	Property: placeholder
Disable/Enable	Property: enabled	Property: enabled
Disable the TimePicker	Method: disable() function onCreate(args) { var timeObject = \$("#time").data("ejTimePicker"); timeObject.disable();}	Property: enabled
Enable the TimePicker	Method: enable() function onCreate(args) { var timeObject = \$("#time").data("ejTimePicker"); timeObject.enable();}	Not Applicable
Enable/Disable the textBox editing	Not Applicable	Property: allowEdit
zIndex	Not Applicable	Property: zIndex
Specify the placeholder text behavior	Not Applicable	Property: floatLabelType

### Globalization

<!-- markdownlint-disable MD033 -->

Behavior	API in Essential JS 1	API in Essential JS 2
Locale	Property: locale	Property: locale

### Strict Mode

Close	Event: closefunction onClose() {/ code block */ }	Event: closeonClose() {/ code block */ }
Open	Event: openfunction onOpen(args) {/ code block */ }	Event: openonOpen(args) {/ code block */ }
Hide	Method: hide()function onCreate(args) { var timeObject = \$("#time").data("ejTimePicker"); timeObject.show(); timeObject.hide();}	Method: hide()create() { this.show(); this.hide();}
Show	Method: show()function onCreate(args) { var timeObject = \$("#time").data("ejTimePicker"); timeObject.show();}	Method: show()onCreate() { this.show();}

{% endraw %}

## Toast

### Getting Started

This section briefly explains you the steps required to create a simple Toast and demonstrate the basic usage of the Toast component.

### Dependencies

The following list of dependencies are required to use the Toast component in your application.

```
`javascript
```

```
|-- @syncfusion/ej2-react-notifications
```

```
|-- @syncfusion/ej2-react-base
```

```
|-- @syncfusion/ej2-notifications
```

```
|-- @syncfusion/ej2-base
```

```
|-- @syncfusion/ej2-buttons
```

```
|-- @syncfusion/ej2-react-buttons
```

```
|-- @syncfusion/ej2-popups  
,
```

### Installation and configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash  
npm install -g create-react-app  
,
```

Start a new project using create-react-app command as follows

```
<div class='tsx'>  
,
```

```
create-react-app quickstart --scripts-version=react-scripts-ts  
cd quickstart  
,
```

```
</div>  
<div class='jsx'>  
,
```

```
create-react-app quickstart  
cd quickstart  
,
```

```
</div>
```

Install the below required dependency package in order to use the `Toast` component in your application.

```
`bash  
npm install @syncfusion/ej2-react-notifications --save  
,
```

The above package installs [Toast dependencies](#) which are required to render the Toast component in React environment.

- Toast CSS files are available in the `ej2-react-notifications` package folder.

Import the Toast component's required CSS references as follows in `src/App.css`.

```
`css  
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../node_modules/@syncfusion/ej2-react-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-popups/styles/material.css';
@import '../node_modules/@syncfusion/ej2-react-notifications/styles/material.css';
`
```

### Initialize the Toast with message

The Toast message can be rendered by defining an `title` or `content`.

- Import the Toast component to your `src/App.tsx` file using following code.

#### [Class-component]

```
`ts
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
class App extends React.Component<{}, {}> {
  public toastInstance:ToastComponent;
  public toastCreated(): void {
    this.toastInstance.show();
  }
  public render() {
    return (
      <ToastComponent ref={toast => this.toastInstance = toast!} title="Sample Toast Title" content="Sample
      Toast Content" created={this.toastCreated = this.toastCreated.bind(this)} />
    );
  }
};
ReactDOM.render(<App />, document.getElementById('element'));
```

#### [Functional-component]

```
`ts
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
  let toastInstance:ToastComponent;
  function toastCreated(): void {
    toastInstance.show();
  }
}
```

```

return (
  <ToastComponent ref={toast => toastInstance = toast!} title="Sample Toast Title" content="Sample
  Toast Content" created={toastCreated.bind(this)} />
);
};

ReactDOM.render(<App />, document.getElementById('element'));
`

```

- Run the application in the browser using the following command.

```

npm start
`

```

Output will be as follows:

[Class-component]

#### APP.JSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
class App extends React.Component {
  toastInstance;
  toastCreated() {
    this.toastInstance.show();
  }
  render() {
    return (<ToastComponent ref={toast => this.toastInstance = toast}
    title="Matt sent you a friend request" content="Hey, wanna dress up as
    wizards and ride our hoverboards?" created={this.toastCreated =
    this.toastCreated.bind(this)} />);
  }
}
;
export default App;

```

#### APP.TSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
class App extends React.Component<{}, {}> {
  public toastInstance: ToastComponent;
  public toastCreated(): void {
    this.toastInstance.show();
  }
  public render() {
    return (
      <ToastComponent ref={toast => this.toastInstance = toast!} title="Matt
      sent you a friend request" content="Hey, wanna dress up as wizards and ride

```

```

    our hoverboards?" created={this.toastCreated = this.toastCreated.bind(this)}
  />
    );
  }
};
export default App;

```

## [Functional-component]

### APP.JSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
  let toastInstance;
  function toastCreated() {
    toastInstance.show();
  }
  return (<ToastComponent ref={toast => toastInstance = toast} title="Matt
sent you a friend request" content="Hey, wanna dress up as wizards and ride
our hoverboards?" created={toastCreated.bind(this)} />);
}
;
export default App;

```

### APP.TSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
function App() {
  let toastInstance:ToastComponent;
  function toastCreated(): void {
    toastInstance.show();
  }
  return (
    <ToastComponent ref={toast => toastInstance = toast!} title="Matt sent
you a friend request" content="Hey, wanna dress up as wizards and ride our
hoverboards?" created={toastCreated.bind(this)} />
  );
};
export default App;

```

## Initialize the Toast with target

By default toast can be rendered in document body, we can change the target position for toast rendering using `target` property.

In the above sample code, `#element` is the `id` of the HTML element in a page to which the Toast is initialized.

## [Class-component]

### APP.JSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';

```

```
import * as React from "react";
class App extends React.Component {
  toastInstance;
  toastCreated() {
    this.toastInstance.show();
  }
  render() {
    return (
      <div>
        <div id='#toast_target' />
        <ToastComponent id='toast_target' ref={toast => this.toastInstance =
toast} title="Sample Toast Title" content="Sample Toast Content"
created={this.toastCreated = this.toastCreated.bind(this)} />
      </div>
    );
  }
}
;
export default App;
```

**APP.TSX**

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
class App extends React.Component<{}, {}> {
  public toastInstance: ToastComponent;
  public toastCreated(): void {
    this.toastInstance.show();
  }
  public render() {
    return (
      <div>
        <div id='#toast_target' />
        <ToastComponent id='toast_target' ref={toast => this.toastInstance =
toast!} title="Sample Toast Title" content="Sample Toast Content"
created={this.toastCreated = this.toastCreated.bind(this)} />
      </div>
    );
  }
};
export default App;
```

**[Functional-component]****APP.JSX**

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
  let toastInstance;
  function toastCreated() {
    toastInstance.show();
  }
  return (
    <div>
      <div id='#toast_target' />
      <ToastComponent id='toast_target' ref={toast => toastInstance = toast}
title="Sample Toast Title" content="Sample Toast Content"
created={toastCreated.bind(this)} />
    </div>
  );
}
```

```
    </div>);  
  }  
;  
export default App;
```

### APP.TSX

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';  
import * as React from "react";  
function App() {  
  let toastInstance: ToastComponent;  
  function toastCreated(): void {  
    toastInstance.show();  
  }  
  return (  
    <div>  
      <div id='#toast_target' />  
      <ToastComponent id='toast_target' ref={toast => toastInstance = toast!}  
title="Sample Toast Title" content="Sample Toast Content"  
created={toastCreated.bind(this)} />  
    </div>  
  );  
};  
export default App;
```

### See Also

- [Render different types of toast](#)

**Note:** You can refer to our [React Toast](#) feature tour page for its groundbreaking feature representations. You can also explore our [React Toast Example](#) that shows you how to render the Toast in React.

### Getting Started

This section briefly explains you the steps required to create a simple Toast and demonstrate the basic usage of the Toast component.

### Dependencies

The following list of dependencies are required to use the Toast component in your application.

```
`javascript  
|-- @syncfusion/ej2-react-notifications  
|-- @syncfusion/ej2-react-base  
|-- @syncfusion/ej2-notifications  
|-- @syncfusion/ej2-base  
|-- @syncfusion/ej2-buttons  
|-- @syncfusion/ej2-react-buttons  
|-- @syncfusion/ej2-popups
```

,

### Installation and configuration

You can use [Create-react-app](#) to setup the applications. To install `create-react-app` run the following command.

```
`bash
```

```
npm install -g create-react-app
```

,

Start a new project using create-react-app command as follows

```
<div class='tsx'>
```

,

```
create-react-app quickstart --scripts-version=react-scripts-ts
```

```
cd quickstart
```

,

```
</div>
```

```
<div class='jsx'>
```

,

```
create-react-app quickstart
```

```
cd quickstart
```

,

```
</div>
```

Install the below required dependency package in order to use the `Toast` component in your application.

```
`bash
```

```
npm install @syncfusion/ej2-react-notifications --save
```

,

The above package installs [Toast dependencies](#) which are required to render the Toast component in React environment.

- Toast CSS files are available in the `ej2-react-notifications` package folder.

Import the Toast component's required CSS references as follows in `src/App.css`.

```
`css
```

```
@import '../node_modules/@syncfusion/ej2-base/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-react-buttons/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-react-popups/styles/material.css';
```

```
@import '../node_modules/@syncfusion/ej2-react-notifications/styles/material.css';  
`
```

### Initialize the Toast with message

The Toast message can be rendered by defining an `title` or `content`.

- Import the Toast component to your `src/App.tsx` file using following code.

```
`ts  
import { ToastComponent } from '@syncfusion/ej2-react-notifications';  
import * as React from "react";  
import { useRef } from 'react';  
function App() {  
  const toastInstance = useRef<ToastComponent>(null);  
  function toastCreated() {  
    toastInstance.current.show();  
  }  
  return (  
    <ToastComponent  
      ref={toastInstance}  
      title="Sample Toast Title"  
      content="Sample Toast Content"  
      created={toastCreated}  
    />  
  );  
};  
export default App;  
ReactDOM.render(<App />, document.getElementById('element'));  
`
```

- Run the application in the browser using the following command.

```
`  
npm start  
`
```

Output will be as follows:

**APP.JSX**

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import { useRef } from 'react';
function App() {
    const toastInstance = useRef(null);
    function toastCreated() {
        toastInstance.current.show();
    }
    return (<div>
        <ToastComponent ref={toastInstance} title="Matt sent you a friend
request" content="Hey, wanna dress up as wizards and ride our hoverboards?"
created={toastCreated}/>
    </div>);
}
export default App;
```

### APP.TSX

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import * as ReactDOM from 'react-dom';
import { useRef } from 'react';
function App() {
    const toastInstance = useRef<ToastComponent>(null);
    function toastCreated() {
        toastInstance.current.show();
    }
    return (
        <div>
            <ToastComponent
                ref={toastInstance}
                title="Matt sent you a friend request"
                content="Hey, wanna dress up as wizards and ride our hoverboards?"
                created={toastCreated}
            />
        </div>
    );
}
export default App;
```

### Initialize the Toast with target

By default toast can be rendered in document body, we can change the target position for toast rendering using `target` property.

In the above sample code, `#element` is the `id` of the HTML element in a page to which the Toast is initialized.

### APP.JSX

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import { useRef } from 'react';
function App() {
    const toastInstance = useRef(null);
    function toastCreated() {
```

```

        toastInstance.current.show();
    }
    return (<div id='#toast_target' />
        ,
        <ToastComponent id="toast_target" ref={toastInstance}
        title="Sample Toast Title" content="Sample Toast Content"
        created={toastCreated} />);
    div >
    ;
    ;
}
export default App;

```

### APP.TSX

```

import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
function App() {
    let toastInstance;
    function toastCreated() {
        toastInstance.show();
    }
    return (<div>
        <div id='#toast_target' />
        <ToastComponent id='toast_target' ref={toast => toastInstance = toast}
        title="Sample Toast Title" content="Sample Toast Content"
        created={toastCreated.bind(this)} />
        </div>);
    }
    ;
export default App;

```

### Config in React Toast component

This section explains on customizing the Toast appearance using built-in APIs.

#### Title and content template

Toast can be created with the notification message. The message contains [title](#) and [content](#) of the Toasts. Title and contents are adaptable in any resolution.

Title or Content property can be given as HTML element/element ID as a string that can be displayed as a Toast.

[Class-component]

### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
class App extends React.Component {
    toastInstance;

```

```

position = { X: 'Center' };
toastCreated() {
    this.toastInstance.show();
}
toastShow() {
    this.toastInstance.show();
}
render() {
    return (<div>
        <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
        <ToastComponent ref={toast => this.toastInstance = toast} title="Matt
sent you a friend request" content="Hey, wanna dress up as wizards and ride
our hoverboards?" position={this.position} created={this.toastCreated =
this.toastCreated.bind(this)} />
    </div>);
}
}
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
class App extends React.Component<{}, {}> {
    public toastInstance: ToastComponent;
    public position = { X: 'Center' };
    public toastCreated(): void {
        this.toastInstance.show();
    }
    public toastShow() {
        this.toastInstance.show();
    }
    public render() {
        return (
            <div>
                <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
                <ToastComponent ref={toast => this.toastInstance = toast!}
title="Matt sent you a friend request" content="Hey, wanna dress up as
wizards and ride our hoverboards?" position={this.position}
created={this.toastCreated = this.toastCreated.bind(this)} />
            </div>
        );
    }
}
export default App;

```

### [Functional-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';

```

```
import * as React from 'react';
function App() {
  let toastInstance;
  let position = { X: 'Center' };
  function toastCreated() {
    toastInstance.show();
  }
  function toastShow() {
    toastInstance.show();
  }
  return (<div>
    <ButtonComponent cssClass="e-primary" onClick={toastShow.bind(this)}>
Show Toast </ButtonComponent>
    <ToastComponent ref={toast => toastInstance = toast} title="Matt sent
you a friend request" content="Hey, wanna dress up as wizards and ride our
hoverboards?" position={position} created={toastCreated.bind(this)} />
    </div>);
}
export default App;
```

### APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let toastInstance: ToastComponent;
  let position = { X: 'Center' };

  function toastCreated(): void {
    toastInstance.show();
  }

  function toastShow() {
    toastInstance.show();
  }

  return (
    <div>
      <ButtonComponent cssClass="e-primary" onClick={toastShow.bind(this)}>
Show Toast </ButtonComponent>
      <ToastComponent ref={toast => toastInstance = toast!} title="Matt
sent you a friend request" content="Hey, wanna dress up as wizards and ride
our hoverboards?" position={position} created={toastCreated.bind(this)} />
    </div>
  );
}
export default App;
```

### Specifying custom target

By default toast can be rendered in the document body, we can change the target position for toast rendering using [target](#) property. Based on the target [position](#) will update.

### Close Button

By default [showCloseButton](#) will not be enabled. We can enable it by setting true value. Before expiring toast we can use to close or destroy toasts manually.

### Progress bar

By default [showProgressBar](#) will not be enabled. If we enabled it can visually indicate how long time to get toast expires. Based on the `timeOut` property Progress bar will appear.

### Progress bar direction

By default, the [progressDirection](#) is set to "Rtl" and it will appear from right to left direction. You can change the progressDirection to "Ltr" to make it appear from left to right direction.

### Newest on top

In default, newly created toasts will append next with existing toast. We can change the Sequence like inserting before the toast, by enabling the [newestOnTop](#).

Here below sample demonstrates the combination of `target`, `showCloseButton`, `showProgressBar` and `newestOnTop` properties in toast.

[Class-component]

### APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
class App extends React.Component {
  toastInstance;
  position = { X: 'Center' };
  toastCreated() {
    this.toastShow();
  }
  toastShow() {
    setTimeout(() => {
      this.toastInstance.show();
    }, 600);
  }
  render() {
    return (
      <div>
        <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
        <ToastComponent ref={toast => this.toastInstance = toast} title="File
Downloading" content="<div class='progress'><span style='width:
80%'></span></div>" position={this.position} showCloseButton='true'
target="#toast_target" newestOnTop='true' showProgressBar='true'
progressDirection='Ltr' created={this.toastCreated =
this.toastCreated.bind(this)} />
      </div>
    );
  }
}
export default App;
```

### APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
```

```

import * as React from 'react';
import * as ReactDOM from 'react-dom';
class App extends React.Component<{}, {}> {
  public toastInstance: ToastComponent;
  public position = { X: 'Center' };
  public toastCreated(): void {
    this.toastShow();
  }
  public toastShow() {
    setTimeout(
      () => {
        this.toastInstance.show();
      }, 600);
  }
  public render() {
    return (
      <div>
        <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
        <ToastComponent ref={toast => this.toastInstance = toast!}
title="File Downloading" content="<div class='progress'><span style='width:
80%'></span></div>" position={this.position} showCloseButton='true'
target="#toast_target" newestOnTop='true' showProgressBar='true'
progressDirection='Ltr' created={this.toastCreated =
this.toastCreated.bind(this)} />
      </div>
    );
  }
}
export default App;

```

### [Functional-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
function App() {
  let toastInstance;
  let position = { X: 'Center' };
  function toastCreated() {
    toastShow();
  }
  function toastShow() {
    setTimeout(() => {
      toastInstance.show();
    }, 600);
  }
  return (
    <div>
      <ButtonComponent cssClass="e-primary"
onClick={toastShow.bind(this)}> Show Toast </ButtonComponent>
      <ToastComponent ref={toast => toastInstance = toast} title="File
Downloading" content="<div class='progress'><span style='width:
80%'></span></div>" position={position} showCloseButton={true}

```

```
target="#toast_target" newestOnTop={true} showProgressBar={true}
progressDirection='Ltr' created={toastCreated.bind(this)} />
</div>;
}
export default App;
```

### APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
import * as ReactDOM from 'react-dom';
function App() {
  let toastInstance: ToastComponent;
  let position = { X: 'Center' };

  function toastCreated(): void {
    toastShow();
  }

  function toastShow() {
    setTimeout(
      () => {
        toastInstance.show();
      }, 600);
  }

  return (
    <div>
      <ButtonComponent cssClass="e-primary"
onClick={toastShow.bind(this)}> Show Toast </ButtonComponent>
      <ToastComponent ref={toast => toastInstance = toast!} title="File
Downloading" content="<div class='progress'><span style='width:
80%'></span></div>" position={position} showCloseButton={true}
target="#toast_target" newestOnTop={true} showProgressBar={true}
progressDirection='Ltr' created={toastCreated.bind(this)} />
      </div>
    );
  }
}
export default App;
```

### Width and height

we can set toast dimensions through [width](#) and [height](#) property. The height and width can be applied for specific set of toasts. So you can create different toasts with custom dimension.

In default toast can be rendered with '300px' width with 'auto' height

In mobile device toast default width gets '100%' width of the page.

When we sets toast width as '100%' toast will occupies full width and displayed top or bottom based on position [Y](#) property.

Both width and height property allows setting pixels/numbers/percentage. The number value is considered as pixels.

**[Class-component]****APP.JSX**

```

import { ButtonComponent, CheckBoxComponent, RadioButtonComponent } from
 '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
class App extends React.Component {
  toastInstance;
  checkboxObj;
  constructor(props) {
    super(props);
    this.state = {
      content: 'Hey, wanna dress up as wizards and ride our
hoverboards?',
      position: { X: 'Center', Y: "Bottom" },
      title: 'Matt sent you a friend request',
      width: 300
    };
  }
  toastCreated() {
    this.toastShow(600);
  }
  toastShow(timeOutDelay) {
    setTimeout(() => {
      this.toastInstance.show();
    }, timeOutDelay);
  }
  checkboxChange(e) {
    if (e.event.target.checked) {
      this.setState({ position: { Y: "Top" } });
      this.toastInstance.hide('All');
      this.toastShow(700);
    }
  }
  checkboxChange1(e) {
    if (e.event.target.checked) {
      this.setState({ position: { Y: "Bottom" } });
      this.toastInstance.hide('All');
      this.toastShow(700);
    }
  }
  onChange(e) {
    if (e.checked) {
      this.toastInstance.hide('All');
      this.setState({
        content: "<div class='e-custom'>Take a look at our next
generation <b>Javascript</b> <a
href='https://ej2.syncfusion.com/home/index.html' target='_blank'>LEARN
MORE</a></div>",
        width: '100%',
        title: ''
      });
      this.toastShow(500);
    }
    else {

```

```

        this.toastInstance.hide('All');
        this.setState({
            content: 'Hey, wanna dress up as wizards and ride our
hoverboards?',
            width: 300,
            title: 'Matt sent you a friend request'
        });
        this.toastShow(500);
    }
}
render() {
    return (<div id="container">
        <div id="toast_full_width" className='row'>
            <table>
                <tbody>
                    <tr>
                        <td>
                            <div>
                                <RadioButtonComponent checked={true} label='Top'

## Position in React Toast component

Toast position can be updated based on predefined positions or user customizable positions. Predefined position combinations are updated in [X](#) and [Y](#) position properties.

### Predefined

#### X Positions

- Left
- Center
- Right

#### Y Positions

- Top

- Bottom

In the case of multiple Toast display, new Toast position will not update on dynamic change of property values, until the old Toast messages removed.

Toast occupies full width when we set width as '100%', so X positions won't affect changes when '100%' width.

#### Custom

Custom X and Y Position can be given as pixels/numbers/percentage. The number value is considered as pixels. based value top and left value updated in the toast.

## Action buttons in React Toast component

You can include action Buttons into toast by adding [buttons](#) property. You can bind collections of Essential JS 2 Button Model to `model` property inside buttons property, You can also include click event callback function, for each button.

[Class-component]

- [Configuring options](#)

### Timeout in React Toast component

The [timeOut](#) property helps to change the default value of toast expire time. By default, the set timeOut value will be 5000 milliseconds. React Toast will live till the timeOut reaches without user interaction, the timeOut value will be taken in milliseconds. Once the toast reached a given timeOut it will expire automatically.

### Visual representation of timeOut

The toast component's [expire time](#) can be visually shown using a [Progress Bar](#). To show progress bar you must set showProgressbar api as true.

### How long the toast displayed in page

The [extendedTimeOut](#) property is used to decide how long the toast to be displayed after the user hovers on it.

You can destroy toast at any time by clicking on the close button. The close button can be enabled by [showCloseButton](#) property as true.

## Template in React Toast component

Template property can be given as the HTML element that is either a string or a query selector.

The HTML element tag can be given as a string for the template property.

`ts

template: "<div>Toast Content</div>"

,

The template property also allows getting template content through query selector. Here, element 'ID' attribute is specified in the template.

,

template: "#Template"

### Style in React Toast component

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

#### Customizing the toast title

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```

`css
/ To change color, font family and font size /
.e-toast-container .e-toast .e-toast-message .e-toast-title {
color: red;
font-size: 18px;
font-weight: bold;
}
`

```

#### Customizing the toast content

Use the following CSS to customize the default toast's content properties like font-family, font-size and color.

```

`css
/ To change color, font family and font size /
.e-toast-container .e-toast .e-toast-message .e-toast-content {

```

```
color: aqua;
font-size: 13px;
font-weight: normal;
}
`
```

### Customizing the toast icon

Use the following CSS to customize the default toast icon color.

```
`css
/ To change icon color /
.e-toast-container .e-toast .e-toast-icon {
color: yellow;
}
`
```

### Customizing the toast background

Use the following CSS to customize the default toast's background color.

```
`css
/ To change background color /
.e-toast-container .e-toast {
background-color: navy;
}
`
```

### Animation in React Toast component

[React Toasts](#) support custom animations for both shows and hide actions from the provided animation option of [Animation](#) library.

Default animation is given as [FadeIn](#) for showing the toast and [FadeOut](#) for hiding the toast.

The sample demonstrates some types of animation that suits Toast. You can check all the animation effects [here](#).

[Class-component]

#### APP.JSX

```

### Toast services in React Toast component

The Toast component provides a built-in utility function to render the toast with minimal code. The utility function will render the toast without the need of rendering the container element in the DOM where the toast is appended. So that, the toast can now be rendered on the go. The following are the option to render the toast using the utility function.

#### Show Toast with predefined types

The Toast component support 4 types of predefined toast with essential colors for various situations which can be shown using the `ToastUtility.show` by just defining the type of the toast without defining any class names. The following options are used as an argument on calling the utility function for predefined types:

Options	Description
-----	-----
<a href="#">content</a>	Specifies the content that can be displayed on the Toast.
type	Specifies the type of the predefined Toasts. The 4 types of predefined toasts are <b>Information</b> , <b>Success</b> , <b>Error</b> , <b>Warning</b>
<a href="#">timeOut</a>	Specifies the Toast display time duration on the page in milliseconds. Once the time expires, Toast message will be removed. Setting 0 as a time out value displays the Toast on the page until the user closes it manually.

### Show Toast with ToastModel

The utility function can be called using the [ToastModel](#) as argument to show the toast where all the properties in the `ToastModel` like any events, position, close icon, action buttons, etc. can be used in the `ToastUtility.show`.

[Class-component]

### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastUtility } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
const toastObj;
class App extends React.Component {
    toastShow() {
        toastObj = ToastUtility.show({
            title: 'Toast Title',
            content: 'Toast shown using utility function with ToastModel',
            timeout: 20000,
            position: { X: 'Right', Y: 'Bottom' },

```

## Accessibility in React Toast component

The Toast component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Toast component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) |  |

| [Section 508 Support](#) |  |

| [Screen Reader Support](#) |  |

| [Right-To-Left Support](#) |  |

| [Color Contrast](#) |  |

| [Mobile Device Support](#) |  |

| [Keyboard Navigation Support](#) |  |

| [Accessibility Checker Validation](#) |  |

| [Axe-core Accessibility Validation](#) |  |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

```
    );  
  }  
};  
export default App;
```

### [Functional-component]

#### APP.JSX

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';  
import * as React from "react";  
function App() {  
  let toastInstance;  
  function toastCreated() {  
    toastInstance.show();  
  }  
  return (<ToastComponent ref={toast => toastInstance = toast}  
title="Sample Toast Title" content="Sample Toast Content"  
created={toastCreated.bind(this)} />);  
}  
;  
export default App;
```

#### APP.TSX

```
import { ToastComponent } from '@syncfusion/ej2-react-notifications';  
import * as React from "react";  
function App() {  
  let toastInstance:ToastComponent;  
  function toastCreated() {  
    toastInstance.show();  
  }  
  return (  
    <ToastComponent ref={ toast => toastInstance = toast!} title="Sample  
Toast Title" content="Sample Toast Content" created={toastCreated.bind(this)}  
/>  
  );  
};  
export default App;
```

### Ensuring accessibility

The Toast component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Toast component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Toast component with accessibility tools.

## How To

### Prevent duplicate toast display in React Toast component

You can prevent identical same Toast displaying in a screen by event function. You can terminate the Toast displaying process by setting cancel event property in [beforeOpen](#) Event.

Here below sample demonstrates preventing duplicate title Toast element displaying, with custom code blocks.

#### [Class-component]

#### APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
    toastInstance;
    toasts = [
        { title: 'Warning !', content: 'There was a problem with your network connection.', isOpen: false },
        { title: 'Success !', content: 'Your message has been sent successfully.', isOpen: false },
        { title: 'Error !', content: 'A problem has been occurred while submitting your data.', isOpen: false }
    ];
    toastFlag = 0;
    timeOutDelay = 600;
    position = { X: 'Center' };
    toastCreated() {
        this.toastInstance.show(this.toasts[this.toastFlag]);
        ++this.toastFlag;
    }
    onClose(e) {
        for (let i = 0; i < this.toasts.length; i++) {
            if (this.toasts[i].title === e.options.title) {
                this.toasts[i].isOpen = false;
            }
        }
    }
    toastShow() {
        setTimeout(() => {
            this.toastInstance.show(this.toasts[this.toastFlag]);
            ++this.toastFlag;
            if (this.toastFlag === (this.toasts.length)) {
                this.toastFlag = 0;
            }
        }, this.timeOutDelay);
    }
    btnClick() {
        this.toastShow();
    }
    onBeforeOpen(e) {
        if (this.preventDuplicate(e)) {
            e.cancel = true;
        }
    }
}
```

```

    }
    preventDuplicate(e) {
        for (let i = 0; i < this.toasts.length; i++) {
            if (this.toasts[i].title === e.options.title &&
!this.toasts[i].isOpen) {
                this.toasts[i].isOpen = true;
                return false;
            }
        }
        return true;
    }
    render() {
        return (<div>
            <ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Toast </ButtonComponent>
            <ToastComponent ref={toast => this.toastInstance = toast}
position={this.position} beforeOpen={this.onBeforeOpen =
this.onBeforeOpen.bind(this)} created={this.toastCreated =
this.toastCreated.bind(this)} close={this.onClose =
this.onClose.bind(this)}>/>
        </div>);
    }
}
;
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

    </div>
  );
};
export default App;

```

### Restrict the maximum toast to show in React Toast component

You can restrict the maximum toast count by event callback function. You can terminate the toast displaying process by setting boolean as true to cancel, the argument which is obtained from [beforeOpen](#) Event.

You can restrict by your own count with custom code blocks. The below sample demonstrates that, how to restrict toast displaying up to 3.

#### [Class-component]

##### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
  toastInstance;
  toasts = [
    { title: 'Warning !', content: 'There was a problem with your network connection.' },
    { title: 'Success !', content: 'Your message has been sent successfully.' },
    { title: 'Error !', content: 'A problem has been occurred while submitting your data.' },
  ];
  toastFlag = 0;
  maxCount = 3;
  timeoutDelay = 600;
  position = { X: 'Right', Y: 'Bottom' };
  toastCreated() {
    this.toastInstance.show(this.toasts[this.toastFlag]);
    ++this.toastFlag;
  }
  toastShow() {
    setTimeout(() => {
      this.toastInstance.show(this.toasts[this.toastFlag]);
      ++this.toastFlag;
      if (this.toastFlag === (this.toasts.length)) {
        this.toastFlag = 0;
      }
    });
  }
}

```

```

    }, this.timeOutDelay);
  }
  btnClick() {
    this.toastShow();
  }
  onBeforeOpen(e) {
    if (this.maxCount === this.toastInstance.element.childElementCount) {
      e.cancel = true;
    }
    else {
      e.cancel = false;
    }
  }
  render() {
    return (<div>
      <ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Toast </ButtonComponent>
      <ToastComponent ref={toast => this.toastInstance = toast}
position={this.position} beforeOpen={this.onBeforeOpen =
this.onBeforeOpen.bind(this)} created={this.toastCreated =
this.toastCreated.bind(this)}>/>
    </div>);
  }
}
;
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

### Customize progress bar theme and sizing in React Toast component

In default, the Progress bar will appear based on the theme stylings and dimensions. You can customize progress bar stylings through custom CSS or Event functions.

Here below sample demonstrates customize the progress bar Stylings using [beforeOpen](#) Event.

[Class-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { DropDownListComponent } from '@syncfusion/ej2-react-dropdowns';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
    toastInstance;
    timeOutDelay = 600;
    position = { X: 'Right', Y: 'Bottom' };
    style = { padding: '20px' };
    dropDownInstance;
    progressBarColor = ['Red', 'Cyan', 'Blue', 'Yellow', 'Pink'];
    toastCreated() {
        this.toastInstance.show();
    }
}

```

```

toastShow() {
  setTimeout(() => {
    this.toastInstance.show();
  }, this.timeOutDelay);
}
btnClick() {
  this.toastShow();
}
onBeforeOpen(e) {
  const progress = e.element.querySelector('.e-toast-progress');
  progress.style.height =
(document.getElementById('progressHeight').value + 'px').toString();
  progress.style.backgroundColor =
this.dropDownInstance.value.toString();
}
valueChange() {
  const progressElements =
this.toastInstance.element.querySelectorAll('.e-toast-progress');
  progressElements.forEach((ele) => {
    ele.style.backgroundColor =
this.dropDownInstance.value.toString();
  });
}
render() {
  return (<div>
    <ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Toast </ButtonComponent>
    <div className="e-row" style={this.style}>
      <div className="e-float-input">
        <input type="text" className="e-input" id="progressHeight"
defaultValue={'4'} required={true}/>
        <span className="e-float-line"/>
        <label className="e-float-text">ProgressBar Height</label>
      </div>
    </div>
    <div className="e-row" style={this.style}>
      <div className="col-xs-6 col-sm-6 col-lg-6 col-md-6">
        <label>Progress Bar</label>
      </div>

### Play an audio before open the toast in React Toast component

Here below sample demonstrates to playing audio background while opening Toast. Here we have included audio play codes into beforeOpen event Function.

If you want to stop the audio after displaying Toast use [open](#) event in Toast. please check the Toast Events [api's](#) for further customization.

[Class-component]

**APP.JSX**

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
    toastInstance;
    timeOutDelay = 600;
    position = { X: 'Right', Y: 'Bottom' };
    toastCreated() {
        this.toastInstance.show();
    }
    toastShow() {
        const audio = new
Audio('https://drive.google.com/uc?export=download&id=1M95VOptolcQ4FQHzNBaLf0
WFQglrtWi7');
        audio.play();
        setTimeout(() => {
            this.toastInstance.show();
        }, this.timeOutDelay);
    }
    btnClick() {
        this.toastShow();
    }

```

### Show different types of toast in React Toast component

The Essential JS 2 Toast has the following predefined styles that can be defined using the [cssClass](#) property for achieving different types of Toast.

Class	Description
e-toast-success	Used to represent a positive Toast.
e-toast-info	Used to represent an informative Toast.

| e-toast-warning | Used to represent a Toast with caution. |

| e-toast-danger | Used to represent a negative Toast. |

[Class-component]

### APP.JSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
  toastInstance;
  toasts = [
    { title: 'Warning !', content: 'There was a problem with your network connection.', cssClass: 'e-toast-warning' },
    { title: 'Success !', content: 'Your message has been sent successfully.', cssClass: 'e-toast-success' },
    { title: 'Error !', content: 'A problem has been occurred while submitting your data.', cssClass: 'e-toast-danger' },
    { title: 'Information !', content: 'Please read the comments carefully.', cssClass: 'e-toast-info' }
  ];
  timeoutDelay = 600;
  toastFlag = 0;
  position = { X: 'Right', Y: 'Bottom' };
  toastCreated() {
    this.toastInstance.show(this.toasts[this.toastFlag]);
    ++this.toastFlag;
  }
  toastShow() {
    setTimeout(() => {
      this.toastInstance.show(this.toasts[this.toastFlag]);
      ++this.toastFlag;
      if (this.toastFlag === (this.toasts.length)) {
        this.toastFlag = 0;
      }
    }, this.timeoutDelay);
  }
  btnClick() {
    this.toastShow();
  }
  render() {
    return (
      <div>
        <ButtonComponent cssClass="e-primary" onClick={this.btnClick = this.btnClick.bind(this)}> Show Toast </ButtonComponent>
        <ToastComponent ref={toast => this.toastInstance = toast} position={this.position} created={this.toastCreated = this.toastCreated.bind(this)} />
      </div>
    );
  }
}
;
export default App;
```

### APP.TSX

```

### Show multiple toasts in various positions in React Toast component

In default Toast position only updates once visible Toasts get destroyed. If You needs to display multiple Toasts with different position means needs to initiate another Toast for achieving this.

Here below sample demonstrates to add multiple Toasts adding in the different position.

#### [Class-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
  toastInstance;
  toastLeftInstance;
  timeOutDelay = 600;
  position = { X: 'Right', Y: 'Bottom' };
  leftPosition = { X: 'Right', };

```

```

toastCreated() {
    this.toastShow(this.toastInstance);
    this.toastShow(this.toastLeftInstance);
}
toastShow(toastObj) {
    setTimeout(() => {
        toastObj.show();
    }, this.timeOutDelay);
}
btnClick() {
    this.toastShow(this.toastInstance);
}
btnToastClick() {
    this.toastShow(this.toastLeftInstance);
}
onClick(e) {
    e.clickToClose = true;
}
render() {
    return (<div id='multiToast'>
        <div><ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Bottom Position Toast</ButtonComponent></div>
        <div><ButtonComponent cssClass="e-primary"
onClick={this.btnToastClick = this.btnToastClick.bind(this)}> Show Top
Position Toast</ButtonComponent></div>
        <ToastComponent click={this.onClick = this.onClick.bind(this)}
ref={toast => this.toastInstance = toast} title='Warning !' content='There
was a problem with your network connection.' position={this.position}
created={this.toastCreated = this.toastCreated.bind(this)}>/>
        <ToastComponent click={this.onClick = this.onClick.bind(this)}
ref={toast => this.toastLeftInstance = toast} title='Warning !'
content='There was a problem with your network connection.'
position={this.leftPosition} created={this.toastCreated =
this.toastCreated.bind(this)}>/>
    </div>);
}
}
;
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastClickEventArgs, ToastComponent } from '@syncfusion/ej2-react-
notifications';
import * as React from "react";
import './App.css';
class App extends React.Component<{}, {}> {
    public toastInstance: ToastComponent;
    public toastLeftInstance: ToastComponent;

```

### Close the toast with click tap in React Toast component

By default, Toast gets expired based on timeout value. You can customize Toast hide with click/tap action by setting boolean value to [clickToClose](#) in click callback function with [static Toast](#).

### [Class-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
    toastInstance;
    timeoutDelay = 600;
    position = { X: 'Right', Y: 'Bottom' };
    toastCreated() {
        this.toastShow(this.toastInstance);
    }
    toastShow(toastObj) {
        setTimeout(() => {
            toastObj.show();
        }, this.timeoutDelay);
    }
    btnClick() {
        this.toastShow(this.toastInstance);
    }
}

```

```

    }
    onClick(e) {
        e.clickToClose = true;
    }
    render() {
        return (<div>
            <div><ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Bottom Position Toast</ButtonComponent></div>
            <ToastComponent click={this.onClick = this.onClick.bind(this)}
ref={toast => this.toastInstance = toast} title='Warning !' content='There
was a problem with your network connection.' position={this.position}
created={this.toastCreated = this.toastCreated.bind(this)} />
            </div>);
    }
}
;
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastClickEventArgs, ToastComponent } from '@syncfusion/ej2-react-
notifications';
import * as React from "react";
import './App.css';

```

### Add dynamic template in React Toast component

Toast provides the support to change its templates dynamically, So that you can update templates to multiple Toasts. We can change Toast properties while calling [show](#) method.

#### [Class-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
class App extends React.Component {
    toastInstance;
    toasts = [
        { template: '2 Mail has received' },
        { template: 'User Guest Logged in' },
        { template: 'Logging in as Guest' },
        { template: 'Ticket has reserved' },
        { template: '#templateToast' }
    ];
    toastFlag = 0;
    maxCount = 3;
    timeOutDelay = 600;
    position = { X: 'Right', Y: 'Bottom' };
    toastCreated() {
        this.toastInstance.show(this.toasts[this.toastFlag]);
        ++this.toastFlag;
    }
    toastShow() {
        setTimeout(() => {

```

```

        this.toastInstance.show(this.toasts[this.toastFlag]);
        ++this.toastFlag;
        if (this.toastFlag === (this.toasts.length)) {
            this.toastFlag = 0;
        }
    }, this.timeOutDelay);
}
btnClick() {
    this.toastShow();
}
onClick(e) {
    e.clickToClose = true;
}
render() {
    return (<div>
        <div><ButtonComponent cssClass="e-primary" onClick={this.btnClick =
this.btnClick.bind(this)}> Show Bottom Position Toast</ButtonComponent></div>
        <ToastComponent click={this.onClick = this.onClick.bind(this)}
ref={toast => this.toastInstance = toast} position={this.position}
created={this.toastCreated = this.toastCreated.bind(this)} />
        </div>);
}
}
;
export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastClickEventArgs, ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';

        </div>
    );
}
};
export default App;

```

## [Functional-component]

### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from "react";
import './App.css';
function App() {
    let toastInstance;
    let toasts = [
        { template: '2 Mail has received' },
        { template: 'User Guest Logged in' },
        { template: 'Logging in as Guest' },
        { template: 'Ticket has reserved ' },
        { template: '#templateToast' }
    ];
    let toastFlag = 0;
    let maxCount = 3;
    let timeOutDelay = 600;
    let position = { X: 'Right', Y: 'Bottom' };
    function toastCreated() {
        toastInstance.show(toasts[toastFlag]);
        ++toastFlag;
    }
    function toastShow() {
        setTimeout(() => {
            toastInstance.show(toasts[toastFlag]);
            ++toastFlag;
            if (toastFlag === (toasts.length)) {
                toastFlag = 0;
            }
        });
    }
}

```

```

        }, timeOutDelay);
    }
    function btnClick() {
        toastShow();
    }
    function onClick(e) {
        e.clickToClose = true;
    }
    return (<div>
        <div><ButtonComponent cssClass="e-primary"
onClick={btnClick.bind(this)}> Show Bottom Position
Toast</ButtonComponent></div>
        <ToastComponent click={onClick.bind(this)} ref={toast => toastInstance
= toast} position={position} created={toastCreated.bind(this)}/>
        </div>);
    }
    export default App;

```

### APP.TSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';

```

    e.clickToClose = true;
  }
  return (
    <div>
      <div><ButtonComponent cssClass="e-primary"
onClick={btnClick.bind(this)}> Show Bottom Position
Toast</ButtonComponent></div>
      <ToastComponent click={onClick.bind(this)} ref={toast => toastInstance
= toast!} position={position} created={toastCreated.bind(this)} />
    </div>
  );
}
export default App;

```

### Prevent toast close with mobile swipe in React Toast component

You can prevent the toast close with mobile swipe action by setting [beforeClose](#) argument cancel value to true while argument type as a swipe. The following code shows how to prevent toast close with mobile swipe.

The following sample demonstrates preventing toast close with mobile swipe element displaying with custom code blocks.

#### [Class-component]

#### APP.JSX

```

import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
class App extends React.Component {
  constructor() {
    super(...arguments);
    this.position = { X: 'Center' };
  }
  onBeforeClose(e) {
    if (e.type === "swipe") {
      e.cancel = true;
    }
  }
  toastCreated() {
    this.toastInstance.show();
  }
  toastShow() {
    this.toastInstance.show();
  }
  render() {
    return (<div>
      <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
      <ToastComponent ref={toast => this.toastInstance = toast} title="Matt
sent you a friend request" content="Hey, wanna dress up as wizards and ride
our hoverboards?" position={this.position} beforeClose={this.onBeforeClose =
this.onBeforeClose.bind(this)} created={this.toastCreated =
this.toastCreated.bind(this)} />
    </div>);
  }
}

```

```
}
export default App;
```

### APP.TSX

```
import { ButtonComponent } from '@syncfusion/ej2-react-buttons';
import { ToastComponent } from '@syncfusion/ej2-react-notifications';
import * as React from 'react';
class App extends React.Component {
  constructor() {
    super(...arguments);
    this.position = { X: 'Center' };
  }
  onBeforeClose(e: any):void {
    if (e.type === "swipe") {
      e.cancel = true;
    }
  }
  toastCreated() {
    this.toastInstance.show();
  }
  toastShow() {
    this.toastInstance.show();
  }
  render() {
    return (<div>
      <ButtonComponent cssClass="e-primary" onClick={this.toastShow =
this.toastShow.bind(this)}> Show Toast </ButtonComponent>
      <ToastComponent ref={toast => this.toastInstance = toast} title="Matt
sent you a friend request" content="Hey, wanna dress up as wizards and ride
our hoverboards?" position={this.position}
