

USER GUIDE

Essential Studio

for EJ2 TypeScript

Version - v24.1.41 | Release Date - December 18, 2023

Syncfusion JavaScript (ES5) UI Controls (Essential JS 2)	72
Components list	72
table	72
How to best read this user guide	74
Getting help	74
See also	74
Browser support	75
Required polyfills	75
Using CDN	75
Node.js	75
Getting started	76
Getting Started with Syncfusion JavaScript (ES5) UI control in a quickstart application	76
Prerequisites	76
Set up development environment	76
Add Syncfusion resources	76
Add Syncfusion control to the application.....	82
Run the application	83
See also	85
Compatibility with Syncfusion JavaScript (Essential JS 1)	85
Prerequisites	85
Creating JavaScript application with Syncfusion JavaScript (Essential JS 2) control.....	85
Adding Syncfusion JavaScript (Essential JS 1) control in the application.....	86
Installation and upgrade	88
Installation	89
Install by using npm CLI.....	89
Install by using package.json.....	89
Download JavaScript – EJ2 Installer	89
Download the Trial Version	89
Installation using Web Installer	92
Overview	92
Installation	93
Uninstallation.....	99
Installation using Offline Installer	104
Installing with UI	104
Installing in silent mode	112

Installing Syncfusion JavaScript – EJ2 Mac Installer.....	113
Steps to resolve the warning message in Catalina OS or later	113
Step-by-Step Installation.....	114
License key registration in samples	118
Linux Installer	118
Download Syncfusion JavaScript Linux Installer	118
Installing Syncfusion JavaScript Linux installer	122
Common Installation Errors	123
Unlocking the license installer using the trial key.....	123
License has expired	123
Unable to find a valid license or trial	124
Unable to install because of another installation.....	125
Unable to install due to controlled folder access	126
Upgrading Syncfusion JavaScript (Essential JS2).....	128
Upgrading to the latest version	128
Upgrade from trial version to license version.....	128
Licensing.....	128
Overview in EJ2 JavaScript Licensing control.....	128
Difference between unlock key and license key.....	129
Registering Syncfusion license keys in Build server	129
See Also	129
License key generation in EJ2 JavaScript Licensing control	129
Claim License key	130
See Also	131
License key registration in EJ2 JavaScript Licensing control	131
Javascript es5	131
See also	132
Licensing errors in EJ2 JavaScript Licensing control.....	132
Licensing errors.....	132
Licensing errors from version 16.2.0* to 20.3.0*	134
Licensing troubleshoot in EJ2 JavaScript Licensing control	138
Is an internet connection required for license validation.....	138
Upgrade from the trial version after purchasing a license	138
Where can I get a license key.....	138
Refer EJ2 scripts without registering the license key	138

Will the registered license key expire	140
When to generate new license key while upgrading.....	140
License registration for multiple developers on your project	140
Can I use the same key for all the web apps under the project	140
Does the license registration access any resources or data	140
License & Downloads shows the "Essential Studio Enterprise Edition Binary with Test Studio" and the "Project License". Which license to use.....	140
Appearance	141
Theme in EJ2 JavaScript controls	141
Reference themes in the application.....	142
NPM packages.....	142
CDN reference.....	143
Change theme dynamically	144
Common variables	146
Size modes Size Mode for Syncfusion EJ2 JavaScript Controls	162
Size mode for application	162
Size mode for a control	163
Change size mode for application at runtime.....	163
Change size mode for a control at runtime	165
See also	166
Icons Library	166
Referring icons in JavaScript application	166
Steps to use icons library	167
Available icons	170
Overview	171
Customizing theme color from theme studio.....	171
Import previously changed settings into the theme studio	180
Material 3 Theme.....	182
Syncfusion Material 3 Theme	182
What are CSS Variables?	183
Dark mode support	184
Common.....	187
Accessibility in Syncfusion EJ2 JavaScript controls	187
Accessibility overview	187
Accessibility standards	187

Accessibility compliance	188
Ensuring accessibility	189
Accessibility support for specific controls.....	189
table	189
Animation in EJ2 JavaScript	191
Animation effects.....	191
Animation duration.....	192
Animation delay	193
Enable or disable animation globally	194
Right-To-Left support in Syncfusion JavaScript Controls	194
Enable RTL for all controls.....	194
Enable RTL for an individual control	195
State Persistence in Syncfusion JavaScript controls	196
State Persistence supported controls and properties	198
Template Engine	200
Compiling	200
Available template syntax.....	201
Custom helper.....	201
Template in Syncfusion EJ2 JavaScript controls.....	202
Types of templates.....	202
String template	203
Script template.....	204
Function template.....	206
Getting started with Localization.....	210
Loading translations.....	210
Changing current locale	212
Internationalization.....	212
Loading culture data	212
Changing global culture and currency code.....	213
Manipulating numbers.....	213
Manipulating dateTime.....	218
Drag and drop in EJ2 JavaScript	224
Draggable	224
Droppable	227
See also	228

Troubleshoot.....	228
Content Security Policy	228
How To	229
Updating Syncfusion npm packages	229
How to load culture files in Essential JS 2 using Ajax.....	230
How to load the culture file in Essential JS 2	233
How to resolve Content Security Policy (CSP) errors.....	234
3D Chart	235
Working with data in EJ2 JavaScript 3D Chart control.....	235
Local data	235
Remote data.....	236
Binding data using ODataAdaptor	237
Empty points	238
Dimensions in EJ2 JavaScript 3D Chart control.....	241
Size for container	241
Size for chart	242
Category axis in EJ2 JavaScript 3D Chart control	245
Labels placement	246
Range	247
Indexed category axis.....	249
Numeric axis in EJ2 JavaScript 3D Chart control.....	250
Range	251
Range padding	252
Label format.....	259
Grouping separator	260
Custom label format	262
DateTime axis in EJ2 JavaScript 3D Chart control.....	263
DateTime axis.....	263
DateTime category axis.....	264
Label format.....	272
Custom label format	273
Logarithmic axis in EJ2 JavaScript 3D Chart control.....	275
Range	276
Logarithmic base	277
Logarithmic interval	279

Axis labels in EJ2 JavaScript 3D Chart control	280
Smart axis labels.....	280
Edge label placement.....	284
Maximum labels.....	285
Axis customization in EJ2 JavaScript 3D Chart control	287
Title	287
Title rotation	288
Tick lines customization	289
Grid lines customization	291
Multiple axis.....	292
Inversed axis.....	293
Opposed position	295
Multiple panes in EJ2 JavaScript 3D Chart control	296
Rows.....	296
Columns	300
Chart Types	303
Column Chart in EJ2 JavaScript 3D Chart control	303
Stacked column chart in EJ2 JavaScript 3D Chart control.....	309
100% Stacked column chart in EJ2 JavaScript 3D Chart control	315
Bar Chart in EJ2 JavaScript 3D Chart control.....	319
Stacked bar chart in EJ2 JavaScript 3D Chart control	326
100% Stacked bar chart in EJ2 JavaScript 3D Chart control.....	333
Data labels in EJ2 JavaScript 3D Chart control.....	337
Position	338
Template	340
Text mapping	341
Format.....	342
Margin.....	344
Customization	345
Customizing specific label	346
Legend in EJ2 JavaScript 3D Chart control.....	348
Position and alignment	348
Legend customization	354
Series selection through legend.....	362
Collapsing legend item.....	363

Legend title	365
Arrow page navigation	366
Legend item padding	368
Tooltip in EJ2 JavaScript 3D Chart control	369
Default tooltip	369
Fixed tooltip	371
Format the tooltip	372
Tooltip template	373
Customize the appearance of tooltip	375
Selection in EJ2 JavaScript 3D Chart control	376
Point	376
Series	378
Cluster	379
Selection type	380
Selection during initial loading	382
Selection through legend	383
Print and Export in EJ2 JavaScript 3D Chart control	385
Print	385
Export	386
Appearance in EJ2 JavaScript 3D Chart control	387
Custom color palette	387
Data point customization	389
Point level customization	390
Chart area customization	391
Animation	394
Chart rotation	395
Title	396
Accessibility in EJ2 JavaScript 3D Chart control	403
WAI-ARIA	403
Keyboard navigation	403
Accordion	403
Getting started in EJ2 JavaScript Accordion control	403
Component Initialization	403
Initialize the Accordion using JSON items collection	405
Initialize the Accordion using HTML elements	407

See Also	409
Expand mode in EJ2 JavaScript Accordion control	409
Single	409
Multiple	410
See Also	411
Accessibility in EJ2 JavaScript Accordion control	411
ARIA attributes	412
Keyboard interaction	413
Ensuring accessibility	413
See also	413
Style in EJ2 JavaScript Accordion control.....	414
Customizing Accordion	414
Customizing the list items	414
Customizing Accordion's header.....	414
Customizing Accordion's expand and collapse icons.....	414
Customizing the hover state of Accordion control	415
Customizing selected item of Accordion control	415
How To	415
Set the nested accordion in EJ2 JavaScript Accordion control	415
Load content through post in EJ2 JavaScript Accordion control	417
Set custom animation in EJ2 JavaScript Accordion control	419
To keep single pane open always in EJ2 JavaScript Accordion control.....	421
Create wizard using accordion in EJ2 JavaScript Accordion control	422
Load accordion with data source in EJ2 JavaScript Accordion control	428
Load accordion items dynamically in EJ2 JavaScript Accordion control	429
Add icon to accordion header in EJ2 JavaScript Accordion control	431
Add font awesome in EJ2 JavaScript Accordion control	437
Customize expand collapse actions in EJ2 JavaScript Accordion control	439
Integrate treeview inside the accordion in EJ2 JavaScript Accordion control	441
Ej1 api migration in EJ2 JavaScript Accordion control	443
Accessibility	443
AjaxSettings.....	443
Animation.....	444
Items	445
Common.....	447

AccumulationChart	448
Getting started in EJ2 JavaScript Accumulation chart control.....	448
Dependencies.....	448
Installation and Configuration	449
Add Accumulation Chart to the Project	450
Pie dough nut in EJ2 JavaScript Accumulation chart control.....	452
Pie Chart.....	452
Radius Customization.....	453
Pie Center.....	454
Various Radius Pie Chart	455
Doughnut Chart.....	456
Start and End angles	457
Color & Text Mapping	458
Customization	459
Hide pie or doughnut border	460
Multi-level pie chart.....	461
See Also	465
Pyramid in EJ2 JavaScript Accumulation chart control	465
Mode.....	466
Size	467
Gap Between the Segments.....	468
Explode.....	468
Customization	469
See Also	471
Funnel in EJ2 JavaScript Accumulation chart control	471
Size	472
Neck Size	472
Gap Between the Segments.....	473
Explode.....	474
Smart Data Label.....	475
Customization	477
See Also	478
Data label in EJ2 JavaScript Accumulation chart control	478
Positioning.....	479
Smart labels.....	480

Data Label Template	481
Connector Line	482
Text Mapping	484
Format.....	484
Customization	486
Text wrap	487
Show percentages in data labels of pie chart	488
Grouping in EJ2 JavaScript Accumulation chart control	490
Group Mode.....	491
Customization	493
Empty points in EJ2 JavaScript Accumulation chart control	494
Customization	495
Annotation in EJ2 JavaScript Accumulation chart control	496
Region	497
Co-ordinate Units.....	498
Alignment.....	499
Tooltip in EJ2 JavaScript Accumulation chart control	500
Header.....	501
Format.....	502
Tooltip format	503
Fixed tooltip	504
Customization	505
To customize individual tooltip.....	506
Legend in EJ2 JavaScript Accumulation chart control.....	507
Position and Alignment.....	508
Legend Reverse	509
Legend Shape	510
Legend Size.....	511
Legend Item Size	512
Paging for Legend.....	513
Legend Text Wrap	514
Legend Title.....	515
Arrow Page Navigation	516
Legend Item Padding	517
Center label in EJ2 JavaScript Accumulation chart control.....	518

Hover text	519
Customization	520
Title and sub title in EJ2 JavaScript Accumulation chart control	522
Title Customization	523
SubTitle	524
SubTitle Customization	525
Chart print in EJ2 JavaScript Accumulation chart control.....	527
Print.....	527
Export.....	528

Avatar	627
Types in EJ2 JavaScript Avatar control	627
Avatar size	627
Avatar types	628
How To	630
Avatar customization in EJ2 JavaScript Avatar control	630
Integrate avatar into listview in EJ2 JavaScript Avatar control.....	634
Integrate avatar into badge in EJ2 JavaScript Avatar control	635
Badge	639
Types in EJ2 JavaScript Badge control	639
Badge styles	639
Badge types.....	641
How To	650
Badge customization in EJ2 JavaScript Badge control	650
Integrate badge into listview in EJ2 JavaScript Badge control.....	653
Dynamic badge content in EJ2 JavaScript Badge control.....	655
Barcode	657
Getting started in EJ2 JavaScript Barcode control	657
Dependencies.....	657
Setup for local development.....	657
Configuring system JS	657
Adding CSS reference.....	658
Adding Barcode Generator control.....	659
Adding QR Generator control	660
Adding Datamatrix Generator control	661
BarcodeGenerator in EJ2 JavaScript Barcode control.....	662
Code39	662
Code39 Extended	663
Code 11	664

Codabar	665
Code 32	666
Code 93	668
Code 93 Extended	669
Code 128	669
Customizing the Barcode color	670
Customizing the Barcode dimension	671
Customizing the text	672
Qrcodegenerator in EJ2 JavaScript Barcode control.....	673
QR Code	673
Customizing the Barcode color	674
Customizing the Barcode dimension	675
Customizing the text	676
Datamatrixgenerator in EJ2 JavaScript Barcode control	677
Data Matrix	677
Customizing the Barcode color	678
Customizing the Barcode dimension	679
Customizing the text	680
Export in EJ2 JavaScript Barcode control	681
Export.....	681
Breadcrumb	682
Data binding in EJ2 JavaScript Breadcrumb control	682
Items based on current Url	683
Absolute Url	684
Customize text when generated items using Url.....	685
Icons in EJ2 JavaScript Breadcrumb control.....	686
Icon in Breadcrumb item	686
Icon Position.....	690
Icon Only	691
Show icon only for first item.....	693
Navigation in EJ2 JavaScript Breadcrumb control.....	694
URL	694
Enable navigation for last Breadcrumb item	697
Open URL in new page or tab	698
Templates in EJ2 JavaScript Breadcrumb control	700

Item Template.....	700
Separator Template	702
Customize Specific Item Template.....	703

Syncfusion JavaScript (ES5) UI Controls (Essential JS 2)

Syncfusion JavaScript (ES5) is a modern UI Controls library that has been built from the ground up to be lightweight, responsive, modular and touch friendly. It is written in TypeScript and has no external dependencies. It also includes complete support for Angular, React, Vue, ASP.NET MVC and ASP.NET Core frameworks.

The Syncfusion JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Components list

The Syncfusion JavaScript (ES5) UI controls are listed below.

<style>

table

```
{
border:0 !important;
line-height: 2!important;
}
tr
{
border:0 !important;
}
td
{
border:0 !important;
vertical-align: top;
}
.controlanchorlink
{
text-decoration: none!important;
font-size: 14px!important;
text-align: left!important;
padding: 5px 0px;
letter-spacing: 1px;
}
.controlcategory
{
```

```

font-size: 14px!important;
text-align: left!important;
font-weight: bold!important;
letter-spacing: 0.7px;
}
}
</style>

```

How to best read this user guide

- The best way to get started would be to read the "Getting Started" section of the documentation for the control that you would like to start using first. The "Getting Started" guide gives just enough information that you need to know before starting to write code. This is the only section that we recommend reading end-to-end before starting to write code, all other information can be referred as needed.

- Now that you are familiar with the basics of using the control, the next step would be to start integrating the control into your application. A good starting point would be to refer to the code snippets in the [online sample browser](#) which contains hundreds of code samples, it is very likely that you will find a code sample that resembles your intended usage scenario.

- Another valuable resource is the API reference which provides detailed information on the object hierarchy as well as the settings available on every object.

Getting help

- If you are still not able to find the information that you are looking for in the self-help resources mentioned above then please contact us by creating a support ticket in [our support site](#) or ask your query in Stack Overflow with tag `syncfusion-ej2`.

Syncfusion does not collect any kind of information when our components are used in customer applications.

See also

- [Product Development Life Cycle](#)
- [Getting Started with Syncfusion Javascript ES5 controls](#)

Browser support

The Syncfusion Essential JS 2 components are supported only in modern browsers. This includes the following versions.

| Chrome | Firefox | Opera | Edge | IE | Safari | iOS | Android | Windows Mobile |
|---|---------|-------|------|------|--------|-----|---------|----------------|
| ----- ----- ----- ----- ----- ----- ----- ----- ----- | | | | | | | | |
| 63+ | 58+ | 50+ | 13 + | 11 + | 9 + | 9 + | 4.4 + | IE 11 + |

Required polyfills

The following polyfills are required to run Essential JS 2 components in each browser.

| Browser | Polyfills |
|---|-------------|
| Chrome(latest), Firefox(latest), Opera(latest), Edge, Safari 9+ | NONE |
| IE 11 | ES6 Promise |

The Syncfusion Essential JS 2 components are supported in IE 11 browser with ES6 Promise polyfill.

Using CDN

To add ES6 Promise polyfill using CDN, include this in your HTML file.

```
`ts
<!-- Automatically provides/replaces Promise if missing or broken. -->
<script src="https://cdn.jsdelivr.net/npm/es6-promise@4/dist/es6-promise.js"></script>
<script src="https://cdn.jsdelivr.net/npm/es6-promise@4/dist/es6-promise.auto.js"></script>
<!-- Minified version of es6-promise-auto below. -->
<script src="https://cdn.jsdelivr.net/npm/es6-promise@4/dist/es6-promise.min.js"></script>
<script src="https://cdn.jsdelivr.net/npm/es6-promise@4/dist/es6-promise.auto.min.js"></script>
`
```

Node.js

ES6 Promise polyfill can also be installed in node.js.

To install:

```
`ts
yarn add es6-promise
(or)
npm install es6-promise
`
```

To Use:

```
`ts
```

```
var Promise = require('es6-promise').Promise;
```

,

For further details, refer to the link [here](#).

Getting started

Getting Started with Syncfusion JavaScript (ES5) UI control in a quickstart application

This section provides a step-by-step guide to configuring the Syncfusion JavaScript (ES5) UI control (Essential JS 2) and building a simple HTML web application.

Prerequisites

To get started, ensure the following software to be installed in the machine.

- [Essential Studio JavaScript \(Essential JS 2\)](#)
- [Visual Studio Code](#)

Check out the [download and installation](#) section of **Essential Studio JavaScript**. If you are using Syncfusion CDN resources to build your web application, you can skip the Essential Studio JavaScript prerequisite.

Set up development environment

- Create a folder named `~/quickstart` from the required directory and open it in Visual Studio Code.
- Create an HTML file `~/quickstart/index.html` to add the Syncfusion JavaScript (ES5) control's resources.

Add Syncfusion resources

You can access Syncfusion control resources using either of the following methods:

- [Using local scripts and styles](#)
- [Using CDN link for scripts and styles](#)

Syncfusion JavaScript controls have dependencies on other Syncfusion controls, so you must add these dependent control resources to use all their functionality. These dependencies are listed in the corresponding control's getting started documentation. For example, you can find the dependencies for the Grid control [here](#).

Using local scripts and styles

- After installing the [Essential Studio JavaScript \(Essential JS 2\)](#) build, it contains the scripts and styles reference for each individual package and all control resources in a single script and style file. In this getting started, simple Grid control is used as an example.
- Create a folder named `~/quickstart/resources`. Inside that folder, create the `base/styles/`, `popups/styles/`, `grids/styles/` and `scripts` folders. Then, copy/paste the individual scripts and styles from the below installed location to the corresponding `~/quickstart/resources/` location.

Individual control resources:

Dependency script:

(installed location) \Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web
(Essential JS
2)\JavaScript\{DEPENDENCYPACKAGE_NAME}\dist\global\{DEPENDENCYPACKAGE_NAME}.min.js

Control script:

(installed location) \Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web
(Essential JS 2)\JavaScript\{PACKAGE_NAME}\dist\global\{PACKAGE_NAME}.min.js

Example:

Grid's control script:

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS
2)\JavaScript\ej2-grids\dist\global\ej2-grids.min.js

Grid's dependency scripts:

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS
2)\JavaScript\ej2-base\dist\global\ej2-base.min.js

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS
2)\JavaScript\ej2-data\dist\global\ej2-data.min.js

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS
2)\JavaScript\ej2-popups\dist\global\ej2-popups.min.js

Dependency style:

(installed location) \Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web
(Essential JS 2)\JavaScript\{DEPENDENCYPACKAGE_NAME}\styles\material.css

Control style:

(installed location)\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASEVERSION}\Web (Essential JS 2)\JavaScript\{PACKAGENAME}\styles\material.css

Example:

Grid's control Style:

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS 2)\JavaScript\ej2-grids\styles\material.css

Grid's dependency styles:

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS 2)\JavaScript\ej2-base\styles\material.css

C:\Program Files (x86)\Syncfusion\Essential Studio\JavaScript - EJ2\20.4.0.38\Web (Essential JS 2)\JavaScript\ej2-popups\styles\material.css

You can also refer to a single script and style file that contains all Syncfusion JavaScript control resources from the following location.

Single script and style reference for all controls:

Script reference for all controls: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\dist\ej2.min.js

Style reference for all controls: **(installed location)**\Syncfusion\Essential Studio\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\material.css

Since this file includes all Syncfusion controls, it may impact the website's loading time. To reduce the size of the single file, you can generate custom scripts and styles for a set of specific Syncfusion JavaScript controls using the [Custom Resource Generator \(CRG\)](#) tool. This tool is useful for combining the required control scripts and styles into a single file. To know more about the CRG, refer to this [documentation](#).

- Once copy/paste the individual scripts and styles to the `~/quickstart/resources/` location. Add the required Grid control resources to the `~/quickstart/index.html` file in the following order.

`html

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Syncfusion JavaScript (ES5) UI Control</title>
<!-- Essential JS 2 Grid's dependent material themes -->
<link href="resources/base/styles/material.css" rel="stylesheet" type="text/css"/>
<link href="resources/popups/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Grid's material theme -->
<link href="resources/grids/styles/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Grid's dependent scripts -->
<script src="resources/scripts/ej2-base.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-data.min.js" type="text/javascript"></script>
<script src="resources/scripts/ej2-popups.min.js" type="text/javascript"></script>
<!-- Essential JS 2 Grid's global script -->
<script src="resources/scripts/ej2-grids.min.js" type="text/javascript"></script>
</head>
<body>
...
</body>
</html>
```

Using CDN link for scripts and styles

- Syncfusion hosts every Syncfusion JavaScript (ES5) control as a separate package on CDN. This allows you to load the scripts and styles for each individual package. Syncfusion also provides a single package that includes all Syncfusion JavaScript (ES5) controls, allowing you to load the scripts and styles for all controls as a single script and style file. In this getting started, simple Grid control is used as an example. Refer to the following CDN scripts and styles link.

Individual control CDN reference

Dependency script:

<https://cdn.syncfusion.com/ej2/22.1.34/{DEPENDENCYPACKAGENAME}/dist/global/{DEPENDENCYPACKAGENAME}.min.js>

Control script:

`https://cdn.syncfusion.com/ej2/22.1.34/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Example:

Grid's control script:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-grids/dist/global/ej2-grids.min.js>

Grid's dependency scripts:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-base/dist/global/ej2-base.min.js>

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-data/dist/global/ej2-data.min.js>

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-popups/dist/global/ej2-popups.min.js>

Dependency styles:

`https://cdn.syncfusion.com/ej2/22.1.34/{DEPENDENCYPACKAGENAME}/styles/material.css`

Control styles:

`https://cdn.syncfusion.com/ej2/22.1.34/{PACKAGE_NAME}/styles/material.css`

Example:

Grid's control style:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-grids/styles/material.css>

Grid's dependency styles:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-base/styles/material.css>

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-popups/styles/material.css>

You can also refer to a single script and style CDN link that contains all Syncfusion JavaScript control resources as follows:

Single script and style CDN reference for all controls:

Script reference for all controls: <https://cdn.syncfusion.com/ej2/22.1.34/dist/ej2.min.js>

Style reference for all controls: <https://cdn.syncfusion.com/ej2/22.1.34/material.css>

Warning: The un-versioned CDN links which always maintains latest version scripts are deprecated from 2022 Vol1 - 20.1 version. These links are available with 19.4 version scripts to avoid breaking in sites and apps that uses un-versioned links.

- Add the following Grid control CDN link references in the given order to the `~/quickstart/index.html` file.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>

```

```
<script src="https://cdn.syncfusion.com/ej2/22.1.34/ej2-grids/dist/global/ej2-grids.min.js"
type="text/javascript"></script>
</head>
<body>
...
</body>
</html>
`
```

Add Syncfusion control to the application

Now, add the Grid element and Syncfusion JavaScript (ES5) Grid control in the `~/quickstart/index.html` file as follows.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
...
</head>
<body>
<h2>Syncfusion JavaScript (ES5) Grid Control</h2>
<!-- Add the HTML <div> element for grid -->
<div id="Grid"></div>
<script>
//Grid data
var data = [
{
  OrderID: 10248, CustomerID: 'VINET', Role: 'Admin', EmployeeID: 5, OrderDate: new Date(8364186e5),
  ShipName: 'Vins et alcools Chevalier', ShipCity: 'Reims', ShipAddress: '59 rue de l Abbaye',
  ShipRegion: 'CJ', Mask: '1111', ShipPostalCode: '51100', ShipCountry: 'France', Freight: 32.38, Verified: !0
},
{
  OrderID: 10249, CustomerID: 'TOMSP', Role: 'Employee', EmployeeID: 6, OrderDate: new
  Date(836505e6),
  ShipName: 'Toms Spezialitäten', ShipCity: 'Münster', ShipAddress: 'Luisenstr. 48',
  ShipRegion: 'CJ', Mask: '2222', ShipPostalCode: '44087', ShipCountry: 'Germany', Freight: 11.61, Verified:
  !1
}
```

```
},
{
  OrderID: 10250, CustomerID: 'HANAR', Role: 'Admin', EmployeeID: 4, OrderDate: new Date(8367642e5),
  ShipName: 'Hanari Carnes', ShipCity: 'Rio de Janeiro', ShipAddress: 'Rua do Paço, 67',
  ShipRegion: 'RJ', Mask: '3333', ShipPostalCode: '05454-876', ShipCountry: 'Brazil', Freight: 65.83,
  Verified: !0
},
{
  OrderID: 10251, CustomerID: 'VICTE', Role: 'Manager', EmployeeID: 3, OrderDate: new
  Date(8367642e5),
  ShipName: 'Victuailles en stock', ShipCity: 'Lyon', ShipAddress: '2, rue du Commerce',
  ShipRegion: 'CJ', Mask: '4444', ShipPostalCode: '69004', ShipCountry: 'France', Freight: 41.34, Verified: !0
}
];

// Initialize Essential JS 2 JavaScript Grid control
var grid = new ej.grids.Grid({
  dataSource: data,
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 120, type: 'number' },
    { field: 'CustomerID', width: 140, headerText: 'Customer ID', type: 'string' },
    { field: 'Freight', headerText: 'Freight', textAlign: 'Right', width: 120, format: 'C' },
    { field: 'OrderDate', headerText: 'Order Date', width: 140, format: 'yMd' }
  ]
});

// Render initialized Grid control
grid.appendTo('#Grid');
</script>
</body>
</html>
`
```

Run the application

Open the `~/quickstart/index.html` file in the web browser and it will render the Syncfusion JavaScript (ES5) Grid control.

INDEX.HTML

```

Compatibility with Syncfusion JavaScript (Essential JS 1)

This article provides a step-by-step introduction to configure the Essential JS 1 and Essential JS 2 JavaScript controls in a same web page.

Prerequisites

To work with the Essential JS 1 and the Essential JS 2 controls compatibility in JavaScript (ES5), the below mentioned System requirements are necessary,

- [Essential JS 1 Dependencies](#)
- [Visual Studio Code](#)

Creating JavaScript application with Syncfusion JavaScript (Essential JS 2) control

1. Create a JavaScript (ES5) application with the help of the given Essential JS 2 [Getting Started Documentation](#).

2. Now, the Syncfusion (Essential JS 2) JavaScript Button control rendered successfully in the web page.

Adding Syncfusion JavaScript (Essential JS 1) control in the application

1. Before adding the Essential JS 1 control in the application, you should change the Essential JS 2 compatibility styles in the application.

The compatibility styles of Essential JS 1 and Essential JS 2 must be added in the application to prevent the UI conflicts between the Essential JS 1 and Essential JS 2 controls.

Replace the style file in the **resources** folder from the below location.

Syntax:

Styles: **(installed location)**\Syncfusion\JavaScript - EJ2\{RELEASE_VERSION}\Web (Essential JS 2)\JavaScript\ej2\styles\compatibility\material.css

Example:

Styles: C:\Program Files (x86)\Syncfusion\JavaScript - EJ2\16.3.0.17\Web (Essential JS 2)\JavaScript\ej2\styles\compatibility\material.css

If the CDN link is used in the application, then replace it with below link.

Styles: <https://cdn.syncfusion.com/ej2/styles/compatibility/material.css>

2. Now, add the Essential JS 1 script and compatibility styles with its dependencies in the **resources/ej1** location. You can get the Essential JS 1 scripts and styles from the below installed location.

Syntax:

Script:

(installed location)\Syncfusion\{RELEASE_VERSION}\Web (Essential JS 1)\JavaScript\assets\scripts\web\ej.web.all.min.js

Styles:

(installed location)\Syncfusion\{RELEASE_VERSION}\Web (Essential JS 1)\JavaScript\assets\css\web\default-theme\ej.web.all.compatibility.min

Example:

Script:

C:\Program Files (x86)\Syncfusion\16.3.0.17\Web (Essential JS 1)\JavaScript\assets\scripts\web\ej.web.all.min.js

Styles:

C:\Program Files (x86)\Syncfusion\16.3.0.17\Web (Essential JS 1)\JavaScript\assets\css\web\default-theme\ej.web.all.compatibility.min

3. Add the Essential JS 1 file references in the `index.html` with the HTML Button element for rendering Essential JS 1 Button control.

The Essential JS 1 scripts must be added before the Essential JS 2 script reference.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2 - Essential JS 1</title>
<!-- Essential JS 1 default theme -->
<link href="resources/ej1/default-theme/ej.web.all.compatibility.min.css" rel="stylesheet"
type="text/css" />
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css" />
<!-- Essential JS 1 scripts -->
<script src="https://cdn.syncfusion.com/js/assets/external/jquery-1.10.2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/js/assets/external/jquery.easing.1.3.min.js"
type="text/javascript"></script>
<script src="resources/ej1/ej.web.all.min.js" type="text/javascript"></script>
<!-- Essential JS 2 script -->
<script src="resources/ej2.min.js" type="text/javascript"></script>
</head>
<body>
<div style="margin: 50px;">
<!-- Add HTML Button element for Essential JS 2 -->
<button id="btn2">Essential JS 2</button>
</div>
<div style="margin: 50px;">
<!-- Add HTML Button element for Essential JS 1 -->
<button id="btn1">Essential JS 1</button>
</div>
</body>
```

</html>

,

4. Initialize the Essential JS 1 and Essential JS 2 Button control inside the `

`html

<script>

// Extend ej namespace with Syncfusion

\$.extend(ej, Syncfusion);

// Initialize Essential JS 2 JavaScript Button control

var button = new ej.buttons.Button({

isPrimary: true

});

button.appendTo('#btn2');

// Initialize Essential JS 1 JavaScript Button control

\$("#btn1").ejButton();

</script>

,

The `ej` namespace should be extended with `Syncfusion` before initializing the Essential JS 1 and Essential JS 2 controls.

5. Run `~/quickstart/index.html` in the web browser and the Essential JS 1 and Essential JS 2 Button controls will be rendered in the same web page.

Installation and upgrade

<!-- markdownlint-disable MD024 -->

Installation

Install by using npm CLI

Syncfusion JavaScript (Essential JS 2) packages are published in [npm](#). You can install the necessary packages from npm's install command. For example, grid package can be installed using following command.

`

```
npm install @syncfusion/ej2-grids --save
```

`

Install by using package.json

1. Add the Syncfusion JavaScript (Essential JS 2) package references in the `dependencies` of `~/package.json` file.

`

```
{  
  "dependencies": {  
    "@syncfusion/ej2-grids": "*",  
    "@syncfusion/ej2-charts": "*"  
  }  
}
```

`

`

The `*` indicates the latest version of npm package. Refer the [documentation](#) for more details about npm versioning.

2. Now, open the command prompt and run the `npm install` command line. This will install all npm dependencies in a single command line.

Refer the [documentation](#) for more details about npm package.json

Download JavaScript – EJ2 Installer

The Syncfusion JavaScript - EJ2 installer can be downloaded from the Syncfusion website. You can either download the licensed installer or try our trial installer depending on your license.

- Trial Installer
- Licensed Installer

Download the Trial Version

Our 30-day trial can be downloaded in two ways.

- Download Free Trial Setup
- Start Trials if using components through [npm](#)

Download Free Trial Setup

1. You can evaluate our 30-day free trial by visiting the [Download Free Trial](#) page and select the JavaScript platform.
2. After completing the required form or logging in with your registered Syncfusion account, you can download the JavaScript - EJ2 trial installer from the confirmation page. (See the screenshot below.)

Thank you for choosing to evaluate Essential Studio for JavaScript!

Please choose your preferred evaluation option to proceed.

Starting with v20.1.0.47 (2022 Vol. 1), we're providing licensing support for Essential Studio for JavaScript. Please refer to this [help topic](#) for more information.

Installation using Web Installer

You can refer to the [Download](#) section to learn how to get the JavaScript – EJ2 trial or licensed installer.

Overview

For the Essential Studio JavaScript – EJ2 product, Syncfusion offers a Web Installer. This installer alleviates the burden of downloading a larger installer. You can simply download and run the online installer, which will be smaller in size and will download and install the Essential Studio products you have chosen. You can get the most recent version of Essential Studio Web Installer [here](#).

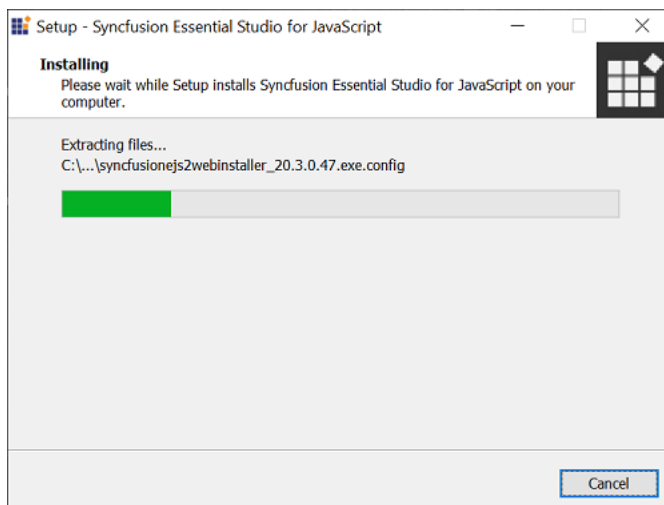

The frameworks listed below are supported in this installer.

- JavaScript
- Angular
- React
- Vue
- JavaScript (ES5)

Installation

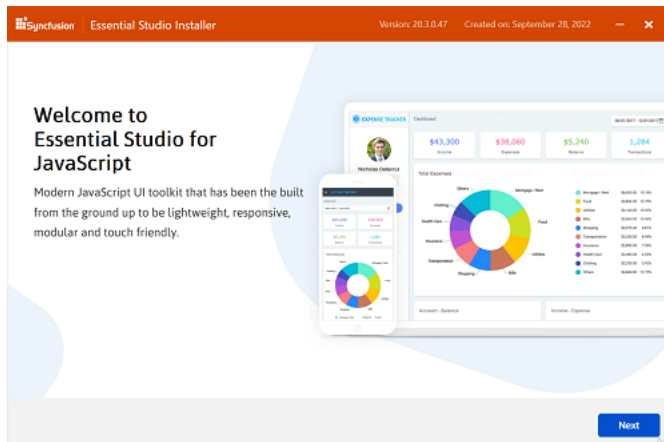

The steps below show how to install Essential Studio JavaScript – EJ2 Web Installer.

1. Open the Syncfusion Essential Studio JavaScript – EJ2 Web Installer file from downloaded location by double-clicking it. The Installer Wizard automatically opens and extracts the package.

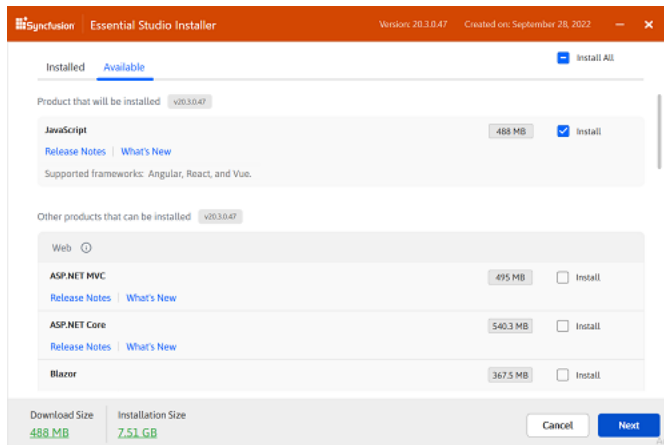

Note: The installer wizard extracts the syncfusionejs2webinstaller_{version}.exe dialog, which displays the package's unzip operation.

2. The Syncfusion JavaScript - EJ2 Web Installer's welcome wizard will be displayed. Click the Next button.

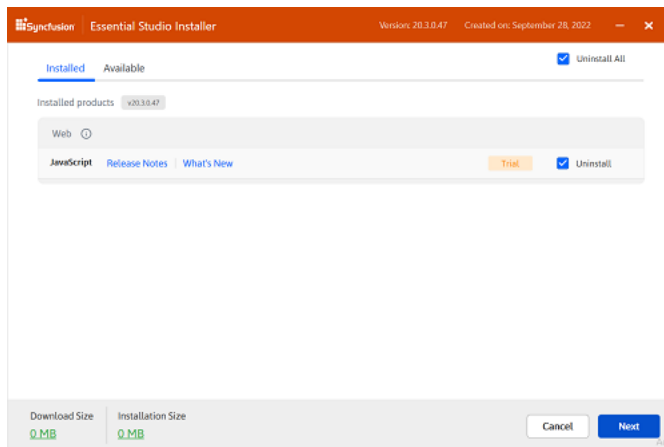

3. The Platform Selection Wizard will appear. From the **Available** tab, select the products to be installed. Select the Install All checkbox to **install all** products.

Available

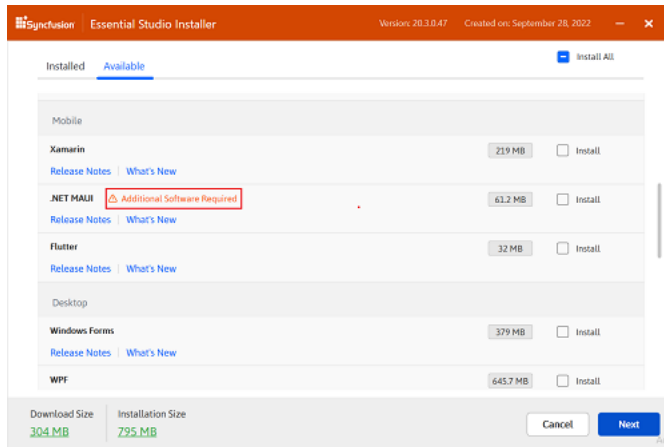

If you have multiple products installed in the same version, they will be listed under the **Installed** tab. You can also select which products to uninstall from the same version. Click the Next button.

Installed

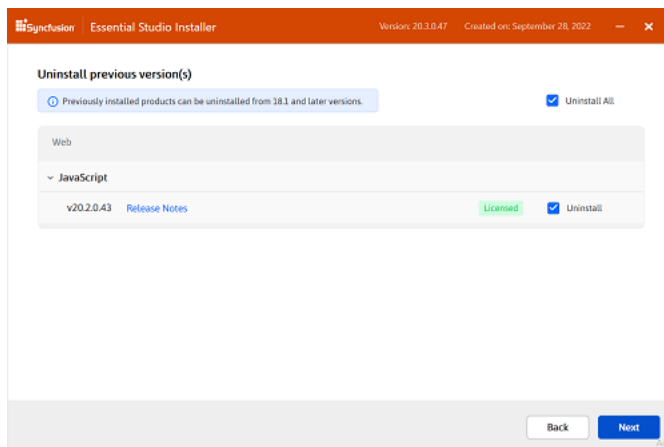

Important: If the required software for the selected product isn't already installed, the **Additional Software Required** alert will appear. You can, however, continue the installation and install the necessary software later.

Required Software

4. If previous version(s) for the selected products are installed, the Uninstall previous version wizard will be displayed. You can see the list of previously installed versions for the products you've chosen here. To remove all versions, check the **Uninstall All** checkbox. Click the Next button.

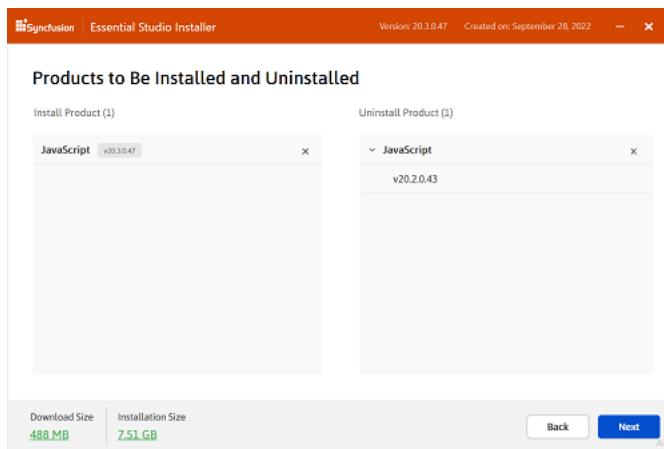

Note: From the 2021 Volume 1 release, Syncfusion has provided option to uninstall the previous versions from 18.1 while installing the new version.

5. Pop up screen will be displayed to get the confirmation to uninstall selected previous versions.

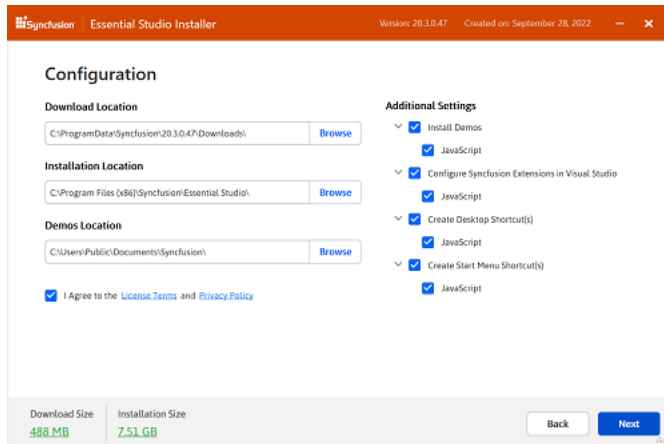

6. The Confirmation Wizard will appear with the list of products to be installed/uninstalled. You can view and modify the list of products that will be installed and uninstalled from this page.

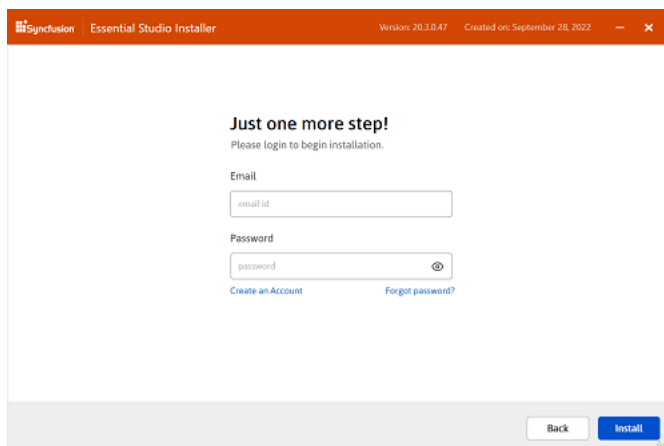

Note: By clicking the **Download Size** and **Installation Size** links, you can determine the approximate size of the download and installation

7. The Configuration Wizard will appear. You can change the Download, Install, and Demos locations from here. You can also change the Additional settings on a product-by-product basis. Click Next to install with the default settings.

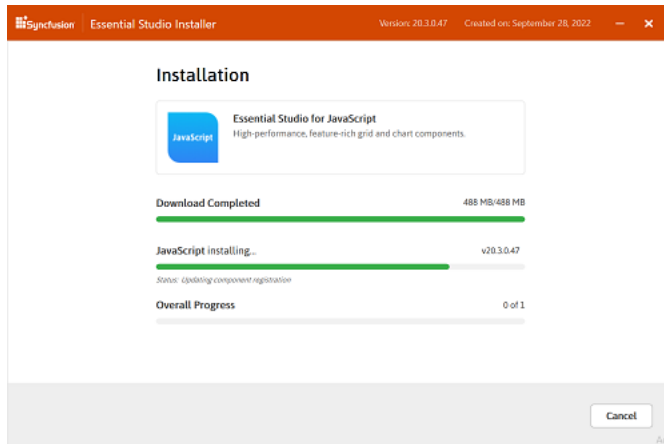

Additional settings

- Select the **Install Demos** check box to install Syncfusion samples, or leave the check box unchecked, if you do not want to install Syncfusion samples
 - Select the **Configure Syncfusion Extensions controls in Visual Studio** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.
 - Check the **Create Desktop Shortcut** checkbox to add a desktop shortcut for Syncfusion Control Panel
 - Check the **Create Start Menu Shortcut** checkbox to add a shortcut to the start menu for Syncfusion Control Panel
8. After reading the License Terms and Conditions, check the **I agree to the License Terms and Privacy Policy** check box. Click the Next button.
 9. The login wizard will appear. You must enter your Syncfusion email address and password. If you do not already have a Syncfusion account, you can create one by clicking on **Create an Account**. If you have forgotten your password, click **Forgot Password** to create a new one. Click the Install button.

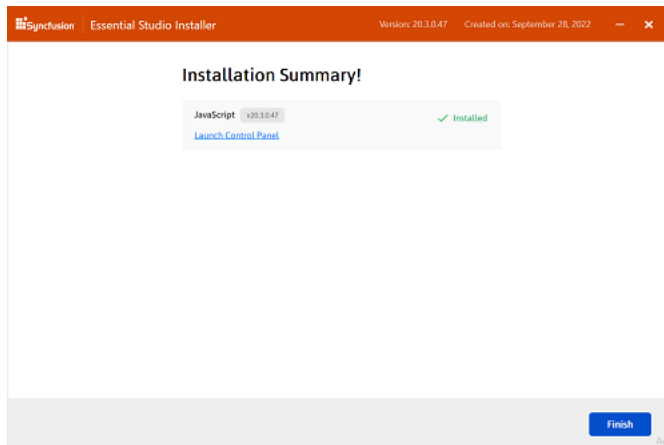

Important: The products you have chosen will be installed based on your Syncfusion License (Trial or Licensed).

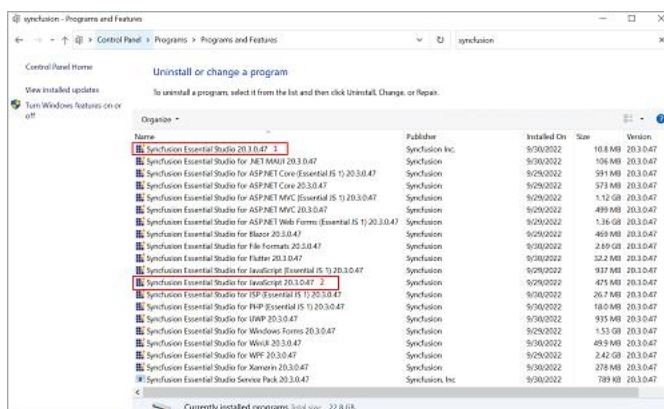

10. The download and installation\uninstallation progress will be displayed as shown below.

11. When the installation is finished, the **Summary** wizard will appear. Here you can see the list of products that have been installed successfully and those that have failed. To close the Summary wizard, click Finish.

- To open the Syncfusion Control Panel, click **Launch Control Panel**.
12. After installation, there will be two Syncfusion control panel entries, as shown below. The Essential Studio entry will manage all Syncfusion products installed in the same version, while the Product entry will only uninstall the specific product setup.

Uninstallation

Syncfusion JavaScript – EJ2 installer can be uninstalled in two ways.

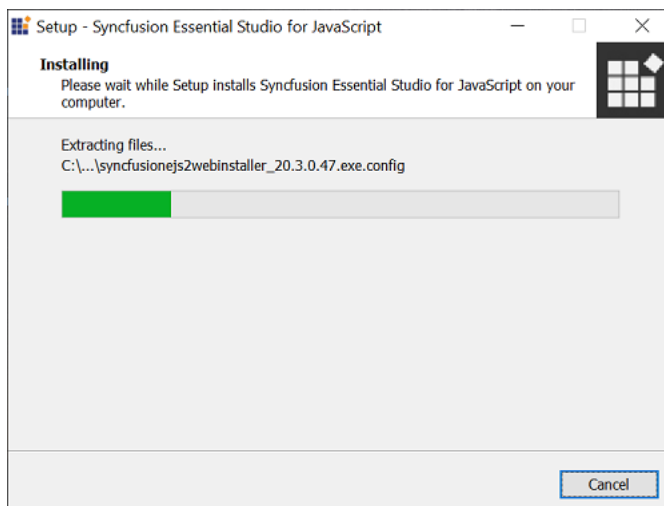

- Uninstall the JavaScript – EJ2 using the Syncfusion JavaScript – EJ2 web installer
- Uninstall the JavaScript – EJ2 from Windows Control Panel

Follow either one of the option below to uninstall Syncfusion Essential Studio JavaScript – EJ2 installer

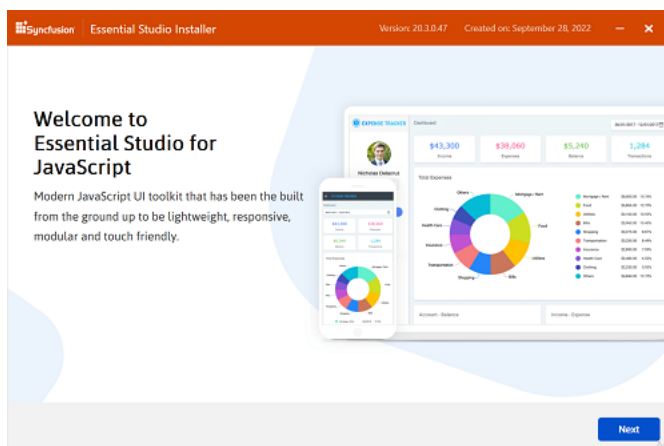

Option 1: Uninstall the JavaScript–EJ2 using the Syncfusion JavaScript–EJ2 web installer

Syncfusion provides the option to uninstall products of the same version directly from the Web Installer application. Select the products to be uninstalled from the list, and Web Installer will uninstall them one by one.

Open the Syncfusion Essential Studio JavaScript – EJ2 Online Installer file from downloaded location by double-clicking it. The Installer Wizard automatically opens and extracts the package

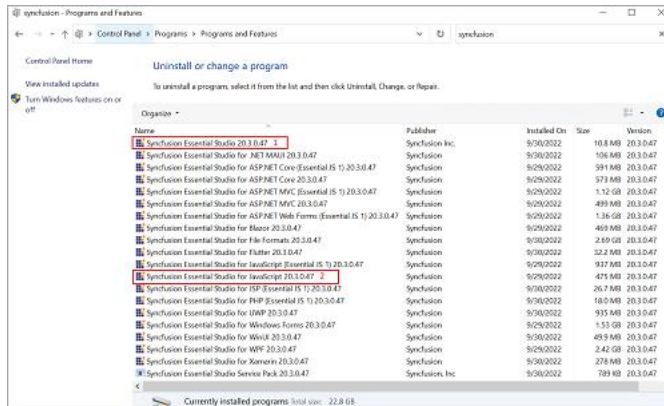

The Syncfusion JavaScript – EJ2 Web Installer’s welcome wizard will be displayed. Click the Next button

Option 2: Uninstall the JavaScript–EJ2 from Windows Control Panel

You can uninstall all the installed products by selecting the **Syncfusion Essential Studio {version}** entry (element 1 in the below screenshot) from the Windows control panel, or you can uninstall JavaScript –

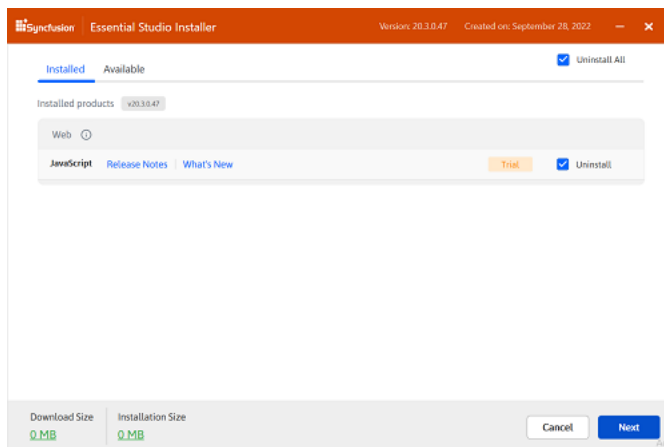

EJ2 alone by selecting the **Syncfusion Essential Studio for JavaScript – EJ2 {version}** entry (element 2 in the below screenshot) from the Windows control panel.

Note: If the **Syncfusion Essential Studio for JavaScript {version}** entry is selected from the Windows control panel, the Syncfusion Essential Studio JavaScript – EJ2 alone will be removed and the below default MSI uninstallation window will be displayed.

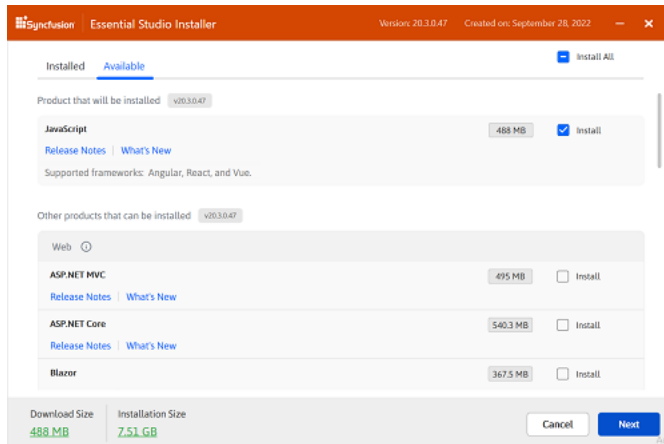

1. The Platform Selection Wizard will appear. From the **Installed** tab, select the products to be uninstalled. To select all products, check the **Uninstall All** checkbox. Click the Next button.

Installed

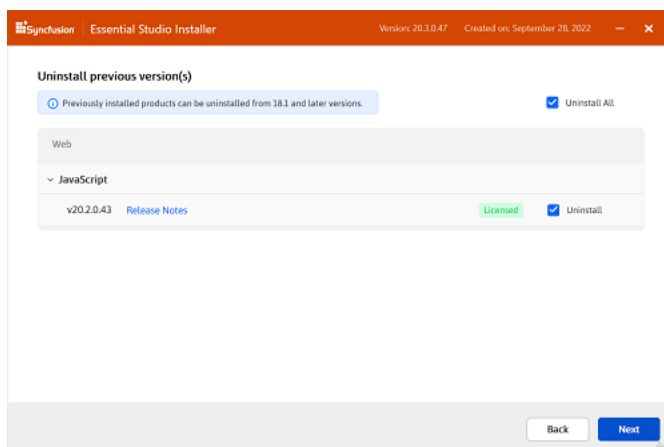

You can also select the products to be installed from the **Available** tab. Click the Next button.

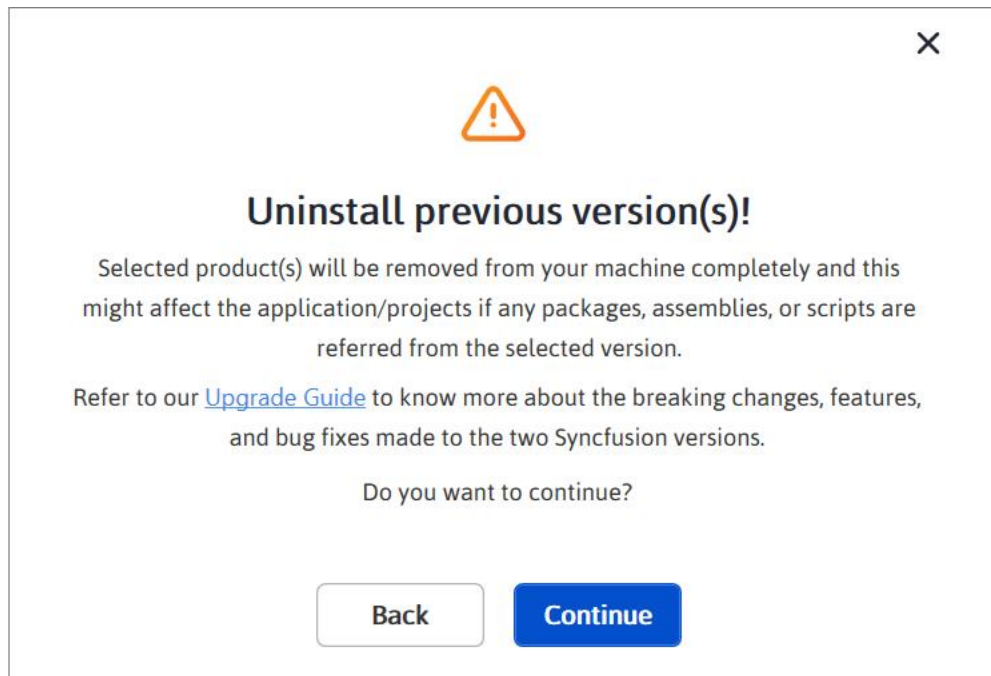

Available

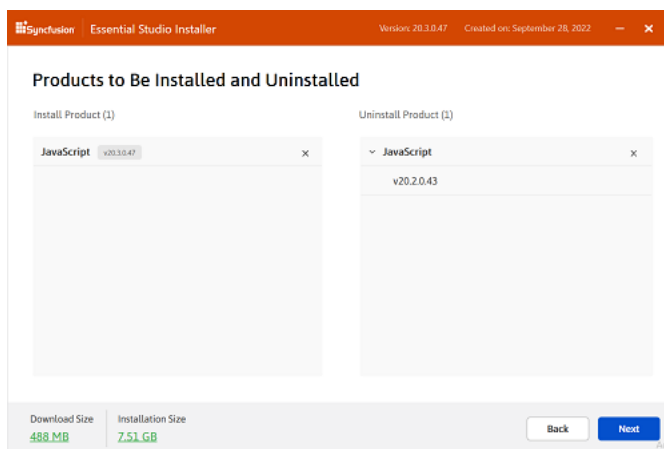

2. If any other products selected for installation, Uninstall previous version wizard will be displayed with previous version(s) installed for the selected products. Here you can view the list of installed previous versions for the selected products. Select **Uninstall All** checkbox to select all the versions. Click Next.

3. Pop up screen will be displayed to get the confirmation to uninstall selected previous versions.

4. The Confirmation Wizard will appear with the list of products to be installed/uninstalled. Here you can view and modify the list of products that will be installed/uninstalled.

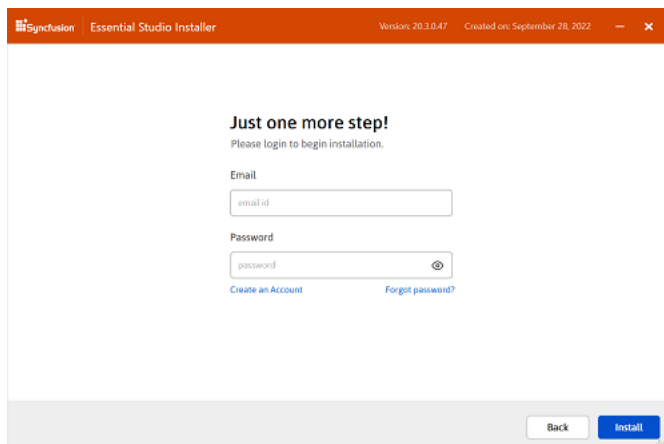

Note: By clicking the **Download Size** and **Installation Size** links, you can determine the approximate size of the download and installation

5. The Configuration Wizard will appear. You can change the Download, Install, and Demos locations from here. You can also change the Additional settings on a product-by-product basis. Click Next to install with the default settings.

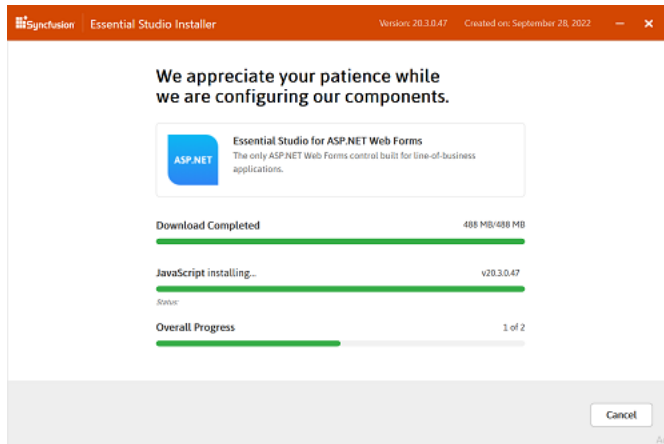

6. After reading the License Terms and Conditions, check the **I agree to the License Terms and Privacy Policy** check box. Click the Next button.
7. The login wizard will appear. You must enter your Syncfusion email address and password. If you do not already have a Syncfusion account, you can create one by clicking on **Create an Account**. If you have forgotten your password, click **Forgot Password** to create a new one. Click the Install button.

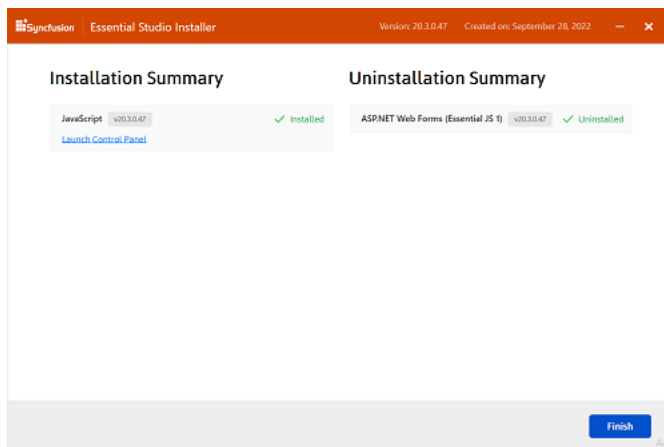

Important: The products you have chosen will be installed based on your Syncfusion License (Trial or Licensed).

8. The download, installation, and uninstallation progresses will be shown.

9. When the installation is finished, the **Summary** wizard will appear. Here you can see the list of products that have been successfully and unsuccessfully installed/uninstalled. To close the Summary wizard, click Finish.

- To open the Syncfusion Control Panel, click **Launch Control Panel**

Installation using Offline Installer

You can refer to the [Download](#) section to learn how to get the JavaScript – EJ2 trial or licensed installer.

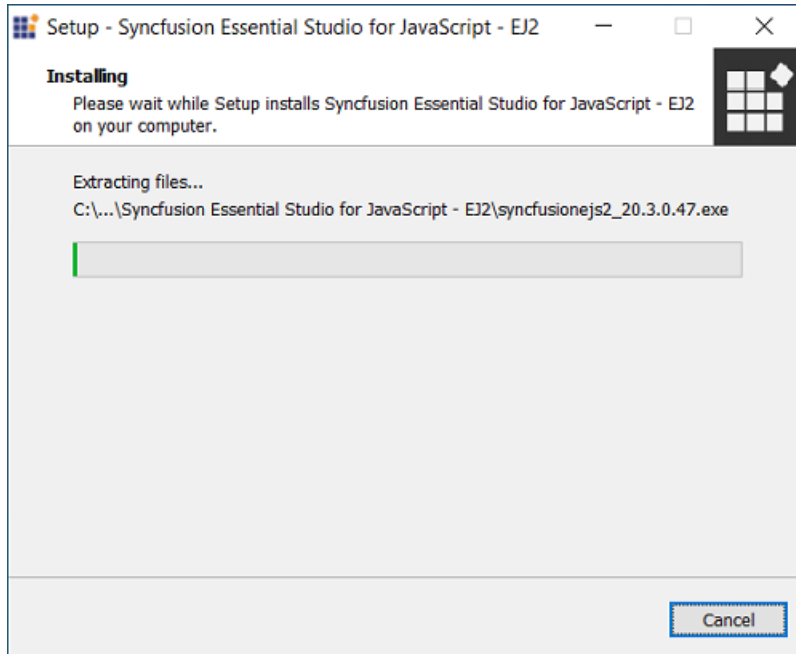

The frameworks listed below are supported in this installer.

- JavaScript
- Angular
- React
- Vue
- JavaScript (ES5)

Installing with UI

The steps below show how to install the Essential Studio JavaScript – EJ2 installer.

1. Open the Syncfusion JavaScript – EJ2 offline installer file from downloaded location by double-clicking it. The Installer Wizard automatically opens and extracts the package

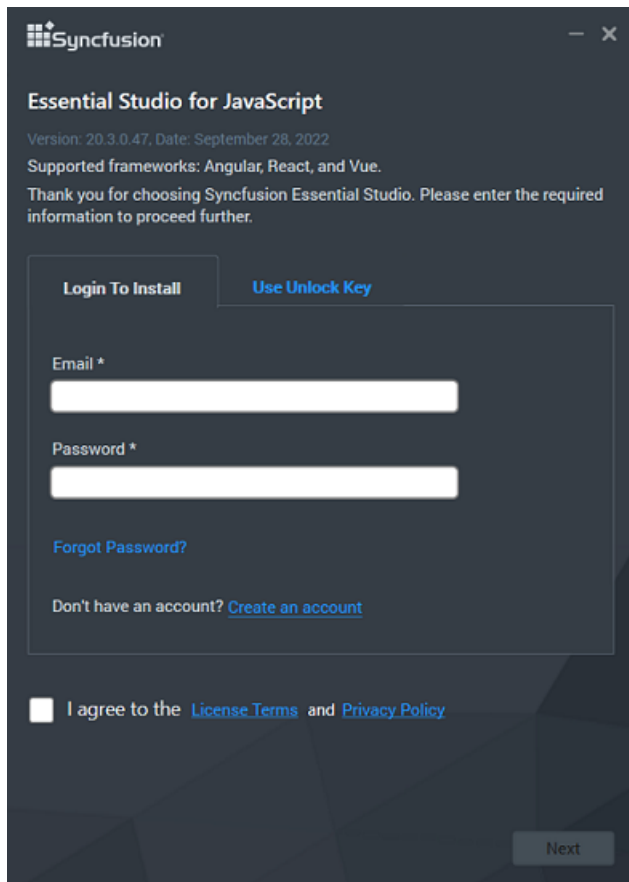

Note: The Installer wizard extracts the syncfusionejs2 (version).exe dialog, which displays the package's unzip operation.

2. To unlock the Syncfusion offline installer, you have two options:
 - Login To Install
 - Use Unlock Key

Login To Install

You must enter your Syncfusion email address and password. If you don't already have a Syncfusion account, you can sign up for one by clicking **"Create an account"**. If you have forgotten your password, click on **"Forgot Password"** to create a new one. Once you've entered your Syncfusion email and password, click Next.

Syncfusion

Essential Studio for JavaScript

Version: 20.3.0.47, Date: September 28, 2022

Supported frameworks: Angular, React, and Vue.

Thank you for choosing Syncfusion Essential Studio. Please enter the required information to proceed further.

Login To Install **Use Unlock Key**

Email *

Password *

[Forgot Password?](#)

Don't have an account? [Create an account](#)

☐ I agree to the [License Terms](#) and [Privacy Policy](#)

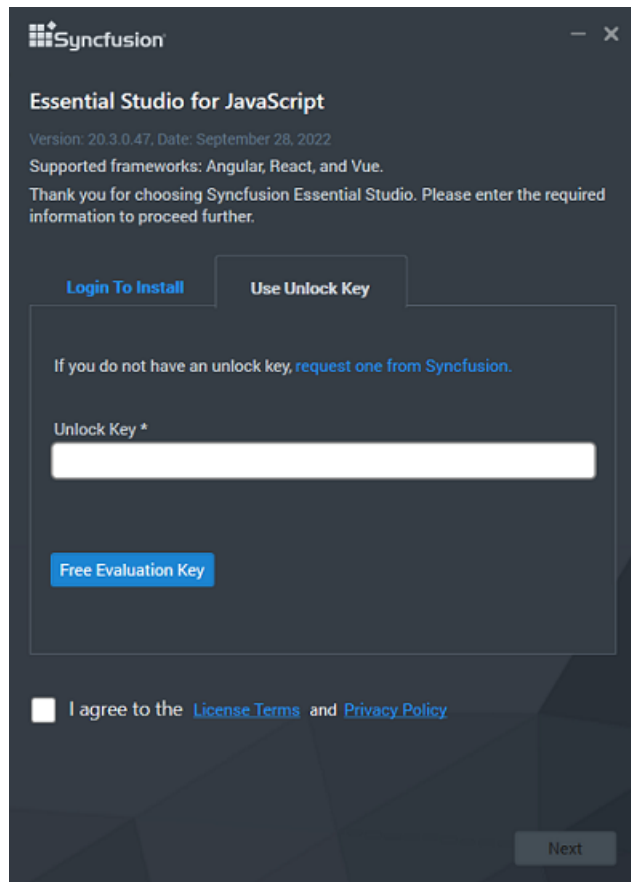

Next

Use Unlock Key

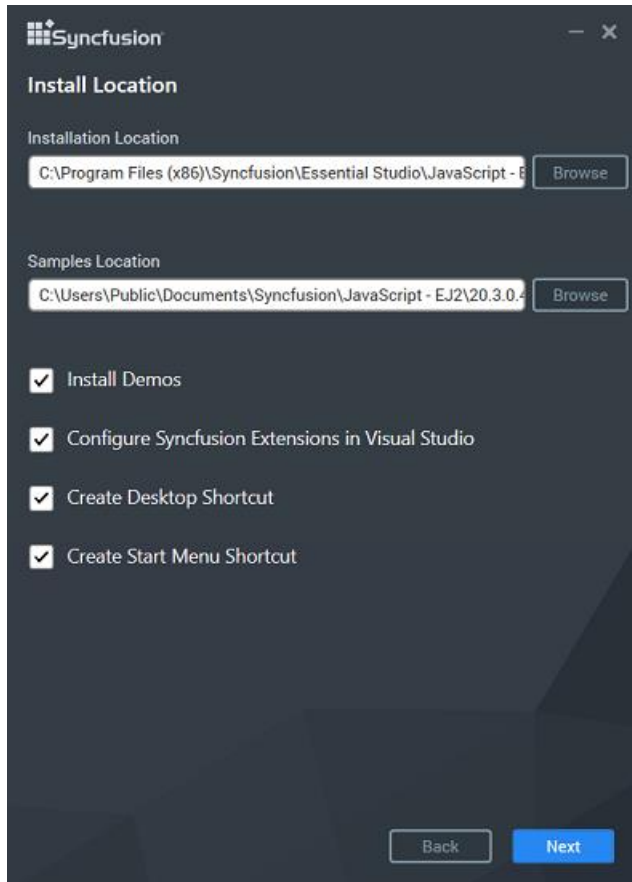

Unlock keys are used to unlock the Syncfusion offline installer, and they are platform and version specific. You should use either Syncfusion licensed or trial Unlock key to unlock Syncfusion JavaScript – EJ2 installer.

The trial unlock key is only valid for 30 days, and the installer will not accept an expired trial key.

To learn how to generate an unlock key for both trial and licensed products, see [this](#) Knowledge Base article.

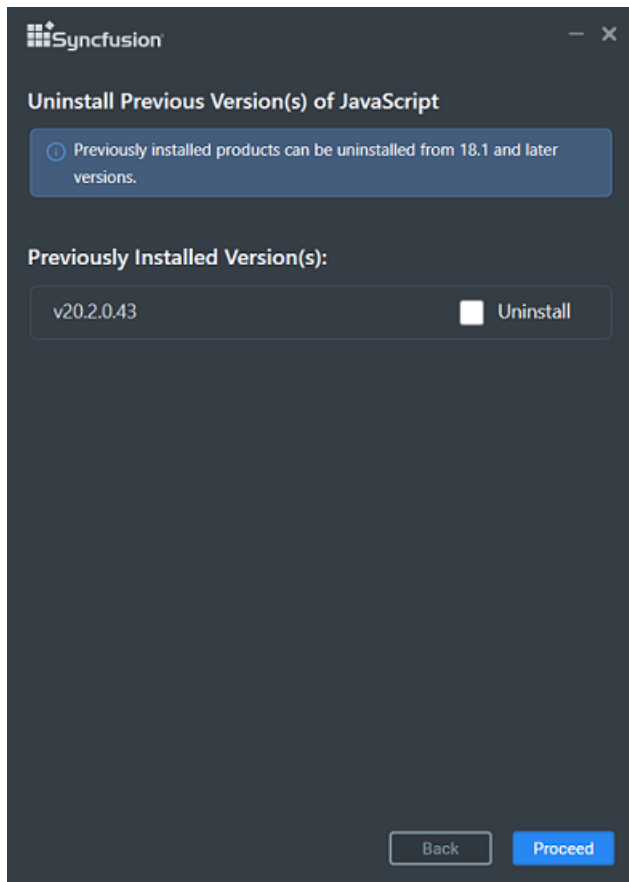

3. After reading the License Terms and Privacy Policy, check the **“I agree to the License Terms and Privacy Policy”** check box. Click the Next button.
4. Change the install and sample locations here. You can also change the Additional settings. Click Next\Install to install with the default settings.

Additional Settings

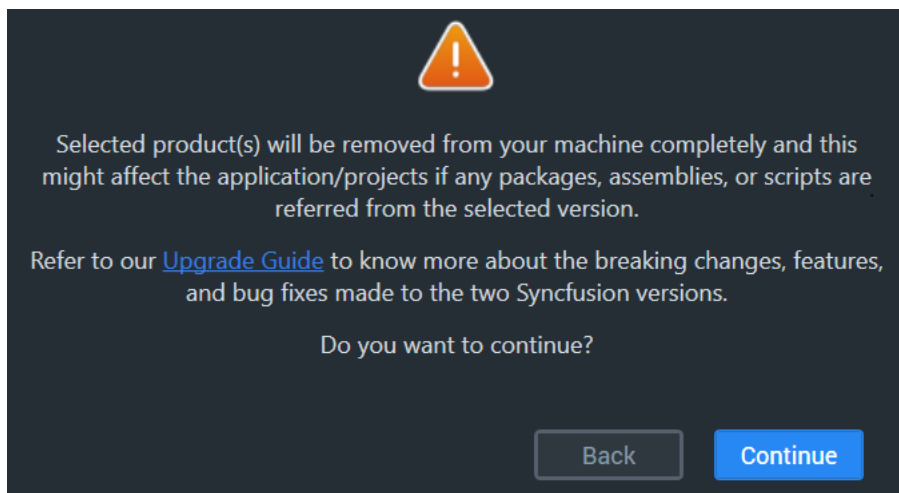

- Select the **Install Demos** check box to install Syncfusion samples, or leave the check box unchecked, if you do not want to install Syncfusion samples
- Select the **Configure Syncfusion Extensions controls in Visual Studio** checkbox to configure the Syncfusion Extensions in Visual Studio or clear this check box when you do not want to configure the Syncfusion Extensions in Visual Studio.
- Check the **Create Desktop Shortcut** checkbox to add a desktop shortcut for Syncfusion Control Panel
- Check the **Create Start Menu Shortcut** checkbox to add a shortcut to the start menu for Syncfusion Control Panel
- 5. If any previous versions of the current product is installed, the **Uninstall Previous Version(s)** wizard will be opened. Select Uninstall checkbox to uninstall the previous versions and then click the Proceed button.

Note: From the 2021 Volume 1 release, Syncfusion has added the option to uninstall previous versions from 18.1 while installing the new version.

Note: If any version is selected to uninstall, a confirmation screen will appear; if continue is selected, the Progress screen will display the uninstall and install progress, respectively. If none of the versions are chosen to be uninstalled, only the installation progress will be displayed.

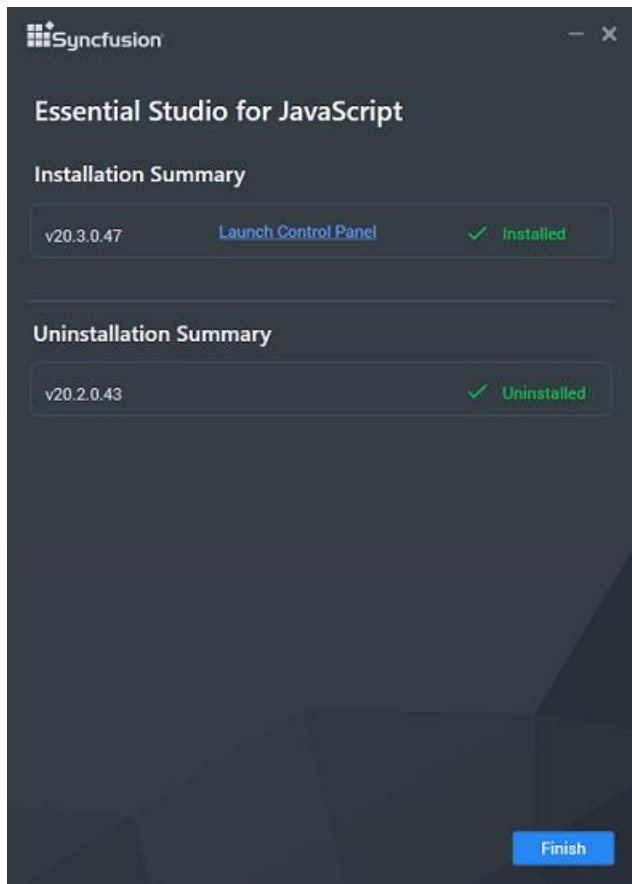

Confirmation Alert

Uninstall Progress:**Install Progress**

Note: The Completed screen is displayed once the JavaScript – EJ2 product is installed. If any version is selected to uninstall, The completed screen will display both install and uninstall status.

6. After installing, click the Launch Control Panel link to open the Syncfusion Control Panel.
7. Click the Finish button. Your system has been installed with the Syncfusion Essential Studio JavaScript – EJ2 product.

Installing in silent mode

The Syncfusion Essential Studio JavaScript – EJ2 Installer supports installation and uninstallation via the command line.

Command Line Installation

To install through the Command Line in Silent mode, follow the steps below.

1. Run the Syncfusion JavaScript – EJ2 installer by double-clicking it. The Installer Wizard automatically opens and extracts the package.
2. The file syncfusionejs2_(version).exe file will be extracted into the Temp directory.
3. Run %temp%. The Temp folder will be opened. The syncfusionejs2_(version).exe file will be located in one of the folders.
4. Copy the extracted syncfusionejs2_(version).exe file in local drive.
5. Exit the Wizard.
6. Run Command Prompt in administrator mode and enter the following arguments.

Arguments: "installer file path\SyncfusionEssentialStudio(product)_(version).exe" /Install silent /UNLOCKKEY:"(product unlock key)" [/log "{Log file path}"] [/InstallPath:{Location to install}]

```
[/InstallSamples:{true/false}] [/InstallAssemblies:{true/false}] [/UninstallExistAssemblies:{true/false}]  
[/InstallToolbox:{true/false}]
```

Note: [...] – Arguments inside the square brackets are optional.

Example: “D:\Temp\syncfusionejs2x.x.x.x.exe” /Install silent /UNLOCKKEY:“product unlock key” /log
“C:\Temp\EssentialStudioPlatform.log” /InstallPath:C:\Syncfusion\x.x.x.x /InstallSamples:true
/InstallAssemblies:true /UninstallExistAssemblies:true /InstallToolbox:true

7. Essential Studio for JavaScript (Essential JS2) is installed.

Note: x.x.x.x should be replaced with the Essential Studio version and the Product Unlock Key needs to be replaced with the Unlock Key for that version.

Command Line Uninstallation

Syncfusion Essential JavaScript – EJ2 can be uninstalled silently using the Command Line.

1. Run the Syncfusion JavaScript – EJ2 installer by double-clicking it. The Installer Wizard automatically opens and extracts the package.
2. The syncfusionejs2_(version).exe file will be extracted into the Temp directory.
3. Run %temp%. The Temp folder will be opened. The syncfusionejs2_(version).exe file will be located in one of the folders.
4. Copy the extracted syncfusionejs2_(version).exe file in local drive.
5. Exit the Wizard.
6. Run Command Prompt in administrator mode and enter the following arguments.

Arguments: “Copied installer file path\ syncfusionejs2_(version).exe” /uninstall silent

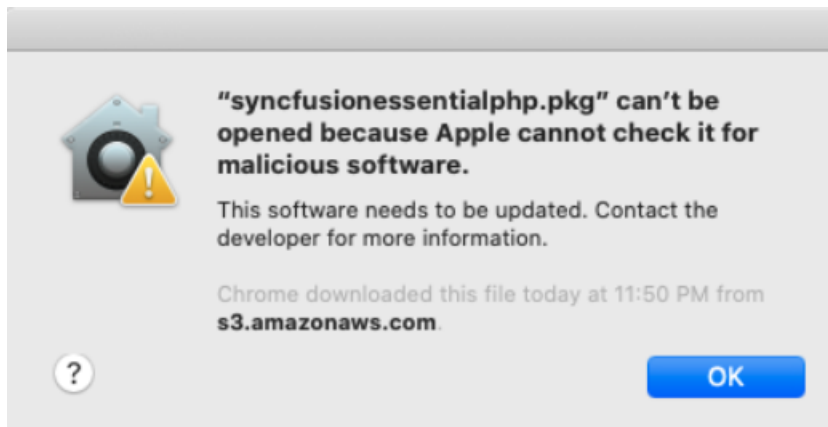

Example: “D:\Temp\syncfusionejs2_x.x.x.x.exe” /uninstall silent

7. Essential Studio for JavaScript (Essential JS2) is uninstalled.

Installing Syncfusion JavaScript – EJ2 Mac Installer

Steps to resolve the warning message in Catalina OS or later

While running Essential Studio JavaScript - EJ2 Mac Installer on Catalina MacOS or later, the below alert will be displayed.

If you receive this alert, follow the below steps for the easiest solution.

1. Right-click the downloaded pkg file.
2. Select the "Open With" option and choose "Installer (Default)". The following pop-up appears.

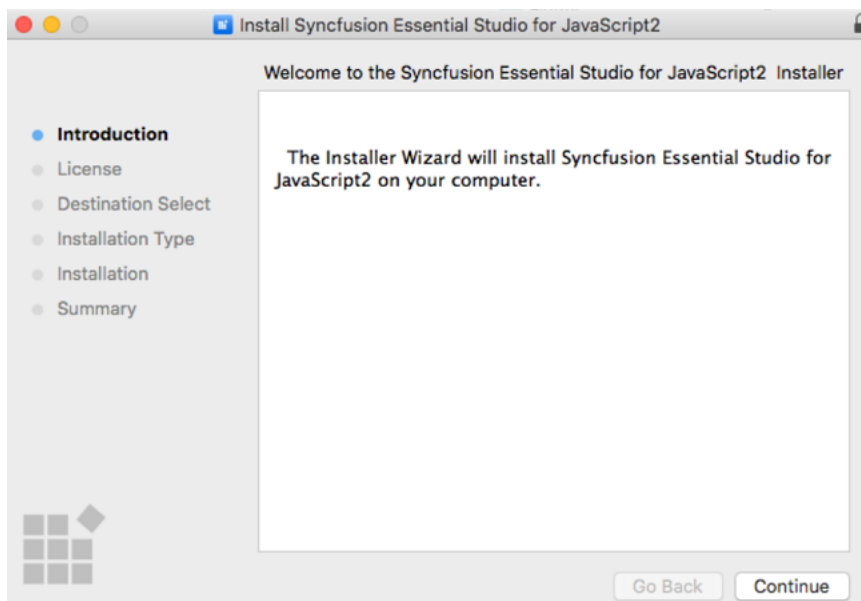

3. When you click "Open" the installer window will be opened.

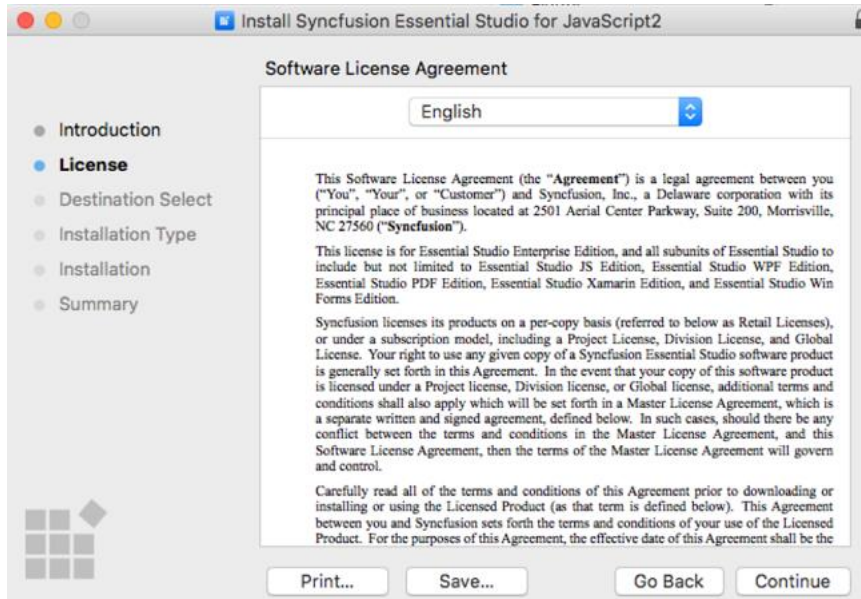

Step-by-Step Installation

The steps below show how to install the Essential Studio JavaScript - EJ2 Mac installer.

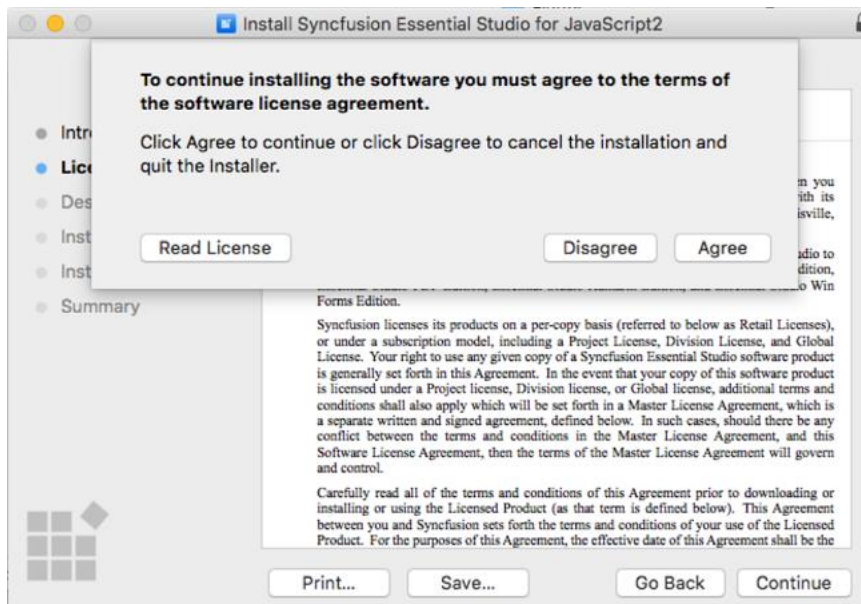

1. Double-click the Syncfusion Essential Studio JavaScript - EJ2 Mac installer(.pkg) file. The installer Wizard opens. Click Continue.

2. The Software License Agreement wizard will appear. Click the Continue button.

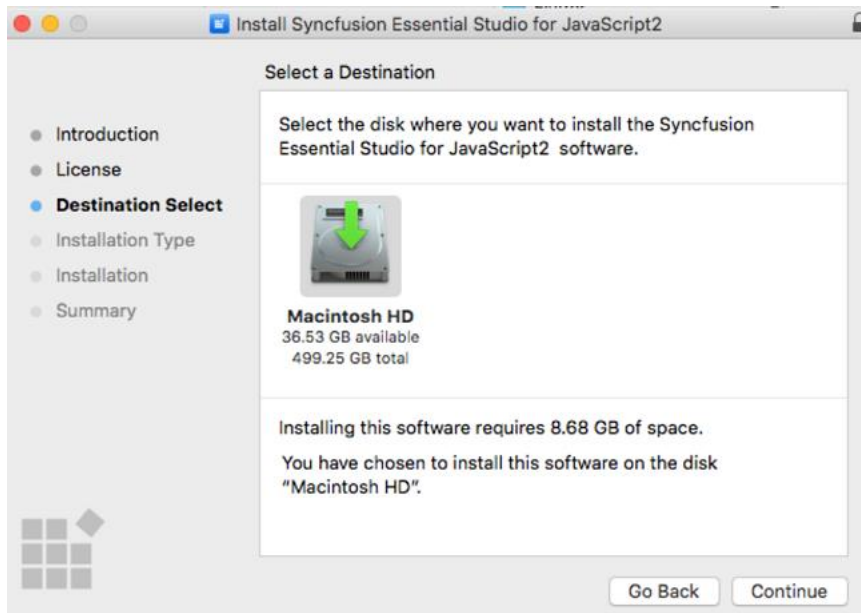

3. The License Agreement's Confirmation window will appear. If you have read the Software License Agreement, click **Agree**.

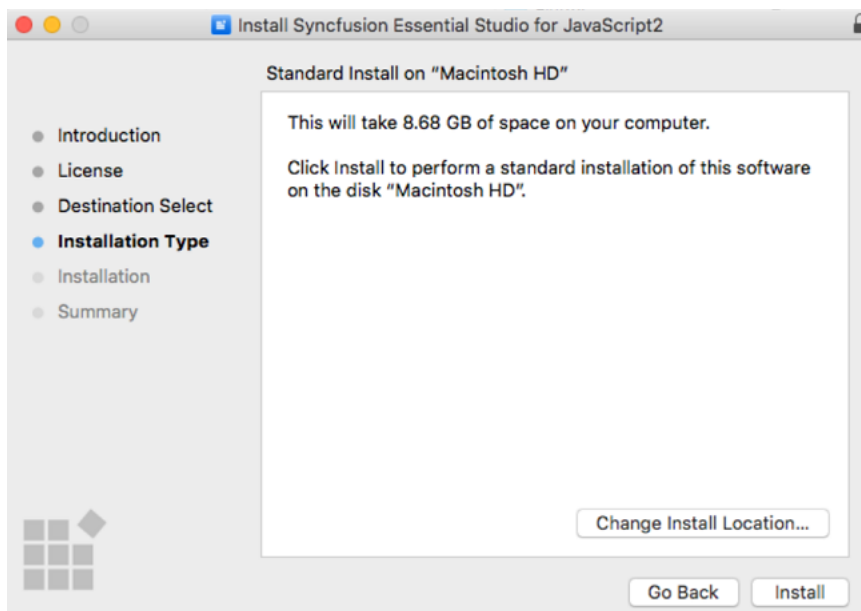

Note: The Unlock key is not required to install the Mac installer. The Syncfusion Essential Studio JavaScript - EJ2 Mac installer can be used for development purposes without registering the Unlock key.

4. The Destination select wizard will appear. You can choose which disc to install the Syncfusion Essential Studio for JavaScript - EJ2 Mac installer on here.

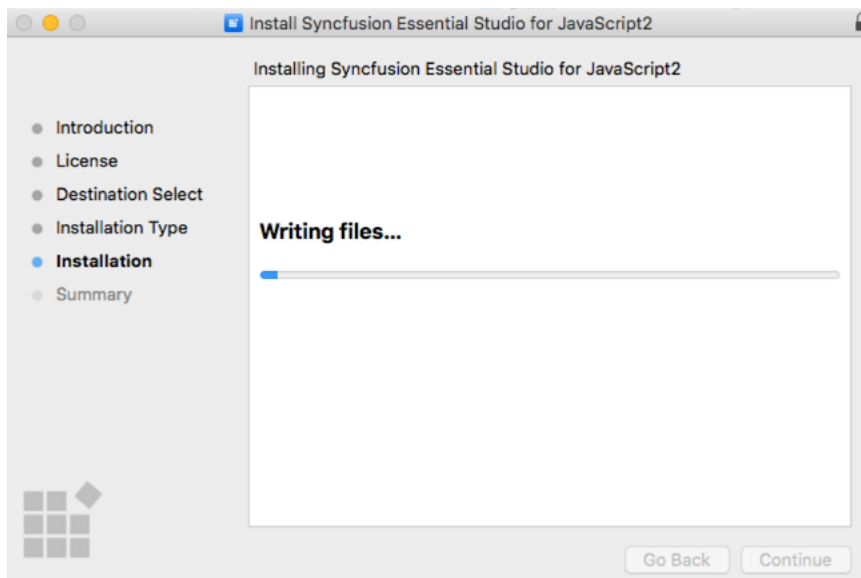

5. The Installation Type wizard will appear. Click Install to begin the standard installation of the Syncfusion Essential Studio JavaScript - EJ2 Mac installer.

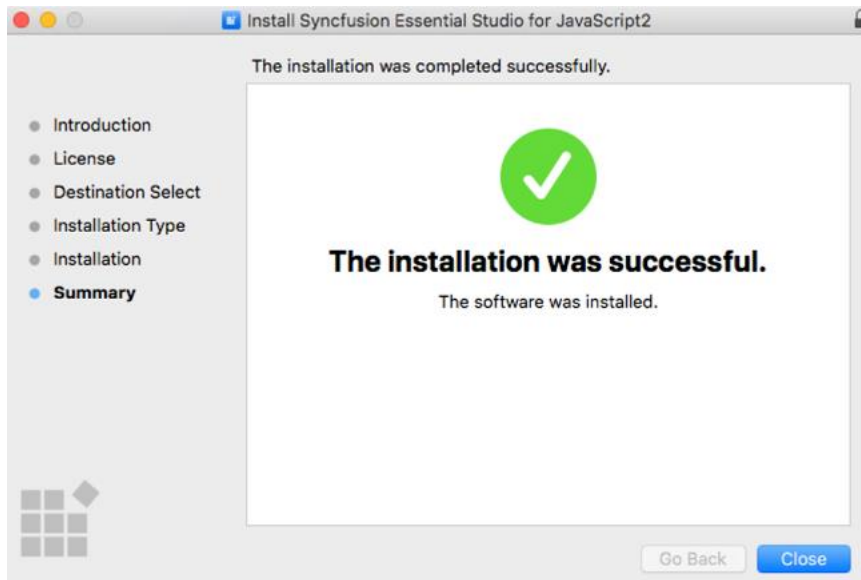

6. The Authentication window will appear. To begin the installation, enter the Mac machine's password and click **Install Software**.

7. The installation process will begin on your machine.

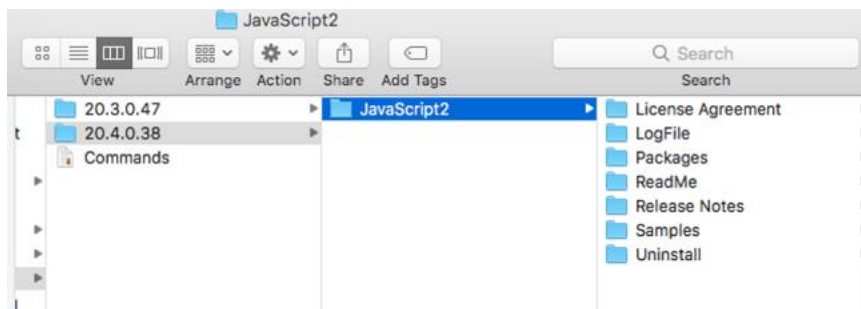

8. Once the installation is complete, the completed screen will be displayed. To exit the installation wizard, click Close.

By default, Mac installer will install the files in following location.

Location: {Documents}\Syncfusion\ {version}\ {platform}

License key registration in samples

After the installation, the license key is required to register the demo source that is included in the Mac installer. To learn about the steps for license registration for the JavaScript - EJ2 Mac installer, please refer to this.

Register the license key by using [registerLicense](#) method after the Syncfusion JavaScript script file reference.

Linux Installer

Download Syncfusion JavaScript Linux Installer

The Syncfusion installer can be downloaded from the [Syncfusion](#) website. You can either download the licensed installer or try our trial installer depending on your license.

- Trial Installer - Licensed Installer

You can download the Syncfusion installer from [Syncfusion.com](#) website

Download the Trial Version

Our 30-day trial can be downloaded in two ways.

- Download Free Trial Setup

- Start Trials if using components through [NuGet.org](https://www.nuget.org)

Download Free Trial Setup

1. You can evaluate our 30-day free trial by visiting the [Download Free Trial](#) page and select the product
2. After completing the required form or logging in with your registered Syncfusion account, you can download the trial installer from the confirmation page. (as shown in below screenshot.)

Thank you for choosing to evaluate Essential Studio for JavaScript!

Please choose your preferred evaluation experience to proceed.

Starting with v20.1.0.47 (2022 Vol. 1), we're providing licensing support for Essential Studio for JavaScript. Please refer to this [help topic](#) for more information.

Full installation evaluation

Download and install the evaluation version of the full product along with all the required assemblies and demo code.

Installing Syncfusion JavaScript Linux installer

Step-by-Step Installation

The steps below show how to install JavaScript Linux installer.

1. Extract the Syncfusion JavaScript Linux installer(.zip) file. The files are extracted in your machine.

2. The Linux zip file contains the following folders.

Note: The Unlock key is not required to install the Linux installer.

4. You can launch the demo source and use the NuGet packages included in the Linux installer.

[License key registration in samples](#)

After the installation, the license key is required to register the demo source that is included in the Linux installer. To learn about the steps for license registration for the JavaScript - EJ2 Linux installer, please refer to this.

Register the license key by using [registerLicense](#) method after the Syncfusion JavaScript script file reference.

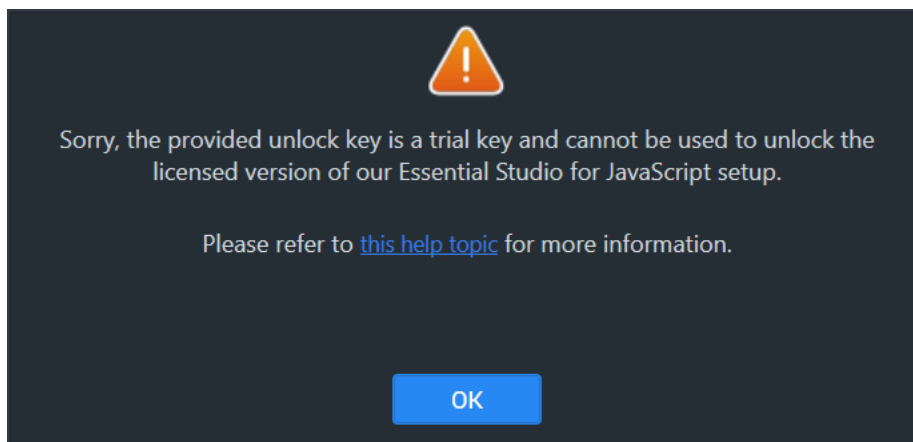

Common Installation Errors

This article describes the most common installation errors, as well as the causes and solutions to those errors.

- Unlocking the license installer using the trial key
- License has expired
- Unable to find a valid license or trial
- Unable to install because of another installation
- Unable to install due to controlled folder access

Unlocking the license installer using the trial key

Error Message: Sorry, the provided unlock key is a trial unlock key and cannot be used to unlock the licensed version of our Essential Studio for JavaScript installer.

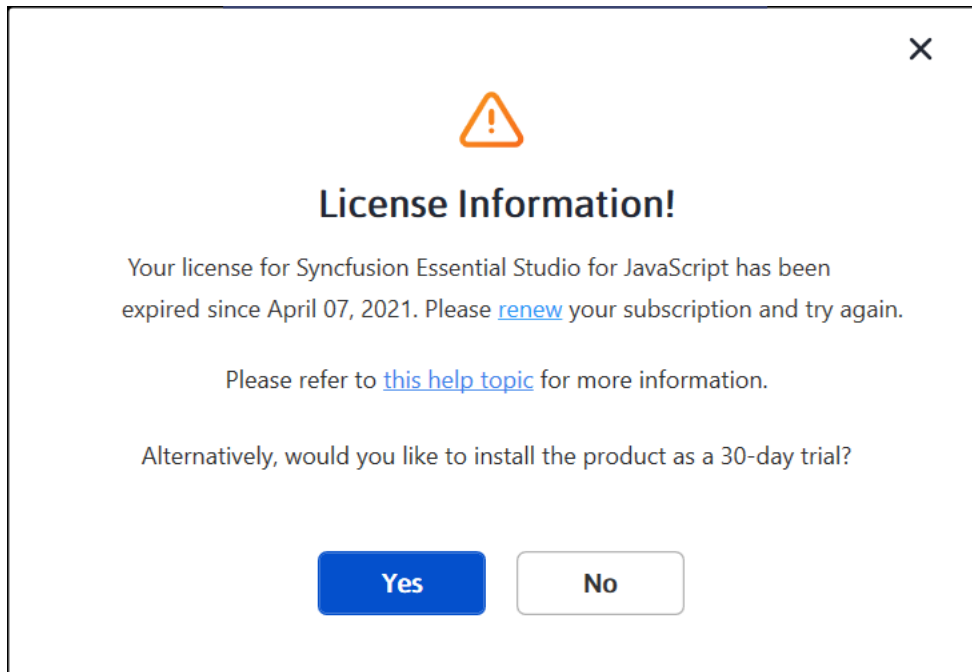

Reason
 You are attempting to use a Trial unlock key to unlock the licensed installer.

Suggested solution
 Only a licensed unlock key can unlock a licensed installer. So, to unlock the Licensed installer, use the Licensed unlock key. To generate the licensed unlock key, refer to [this](#) article.

License has expired

Error Message: Your license for Syncfusion Essential Studio for JavaScript – EJ2 has been expired since {date}. Please renew your subscription and try again.

Online Installer

Reason
 This error message will appear if your license has expired.

Suggested solution
 You can choose from the options below.

1. You can renew your subscription [here](#).
2. You can get a new license [here](#).
3. You can reach out to our sales team by emailing sales@syncfusion.com.
4. You can also extend the 30-day trial period after your trial license has expired.

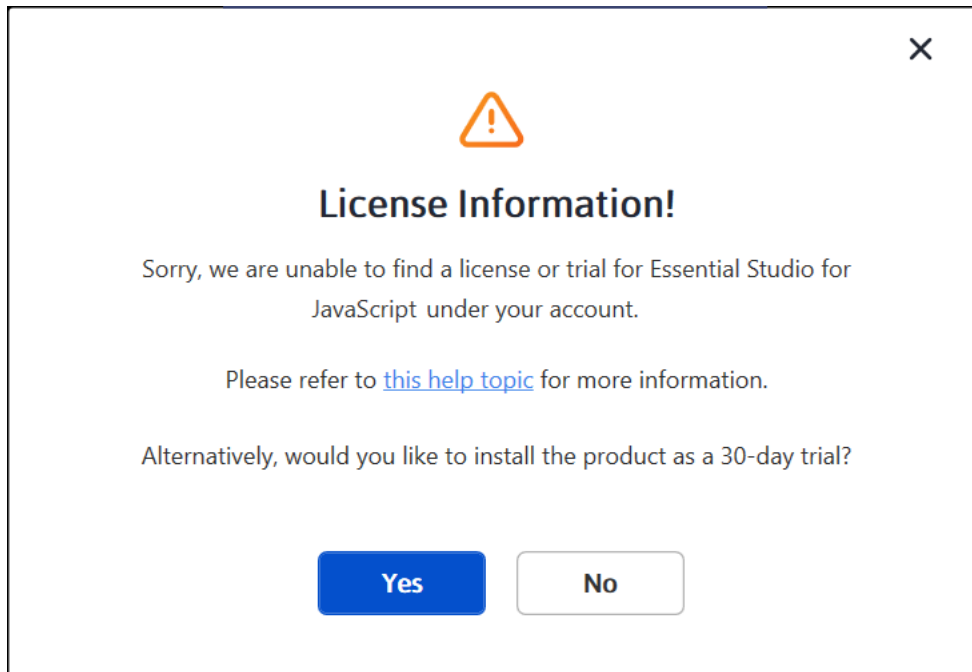

Unable to find a valid license or trial

Error Message: Sorry, we are unable to find a valid license or trial for Essential Studio for JavaScript – EJ2 under your account.

Offline installer

Online installer

Reason
 The following are possible causes of this error:

The following are possible causes of this error:

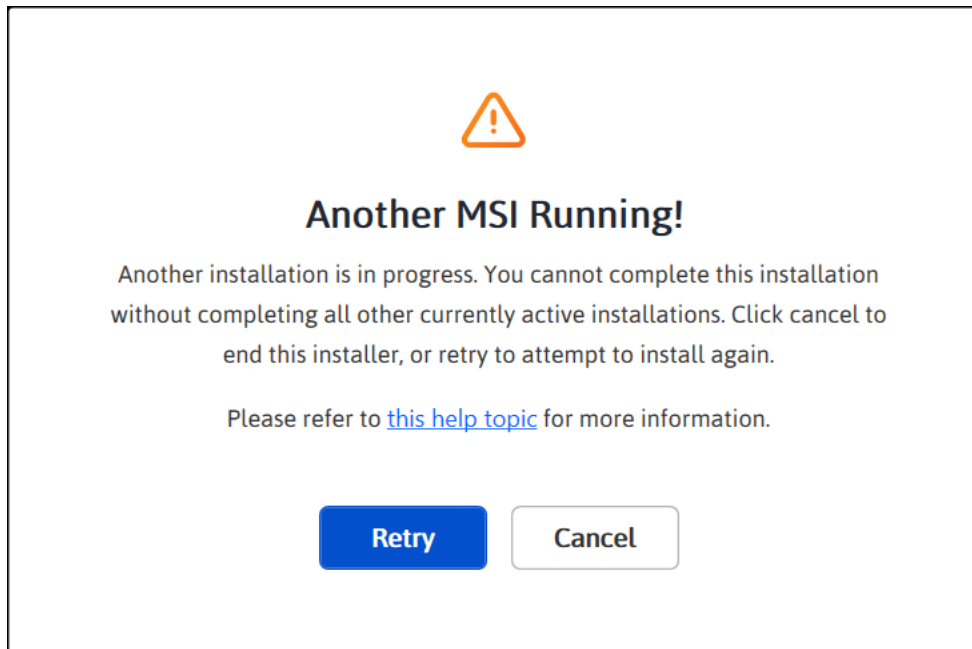

- When your trial period expired
- When you don't have a license or an active trial
- You are not the license holder of your license
- Your account administrator has not yet assigned you a license.

Suggested solution

1. You can get a new license [here](#).
2. Contact your account administrator.
3. Send an email to clientrelations@syncfusion.com to request a license.
4. You can reach out to our sales team by emailing sales@syncfusion.com.

Unable to install because of another installation

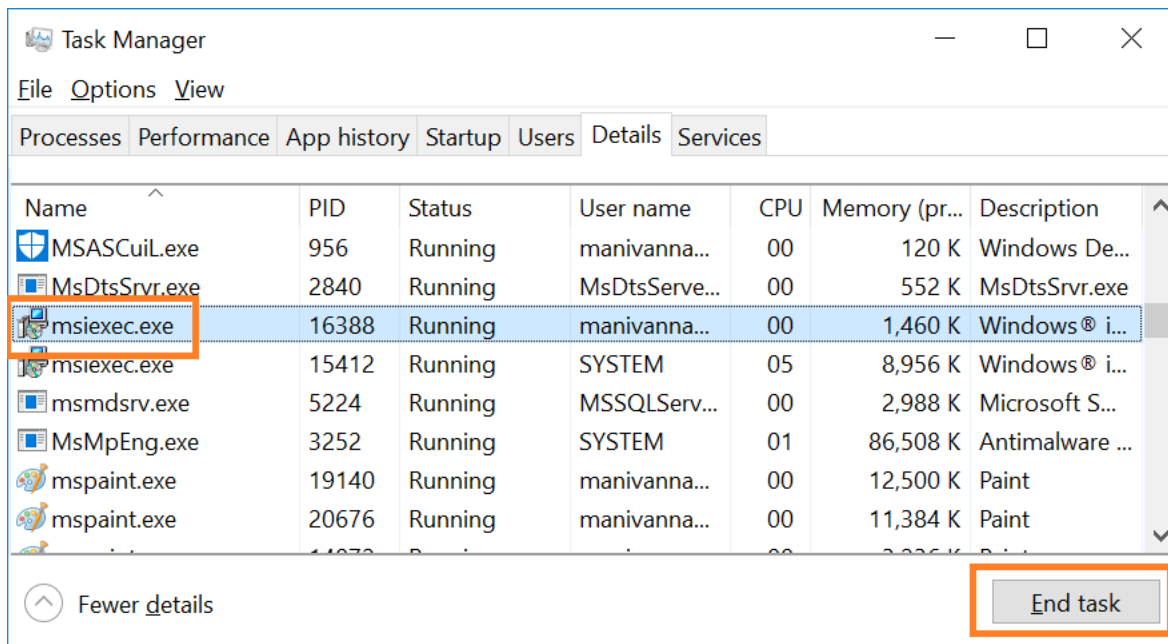

Error Message: Another installation is in progress. You cannot start this installation without completing all other currently active installations. Click cancel to end this installer or retry to attempt after currently active installation completed to install again.

Reason
 You are trying to install when another installation is already running in your machine.

Suggested solution
 Open and kill the msixec process in the task manager and then continue to install Syncfusion. If the problem is still present, restart the computer and try Syncfusion installer.

1. Open the Windows Task Manager.
2. Browse the Details tab.
3. Select the msixec.exe and click **End task**.

Unable to install due to controlled folder access

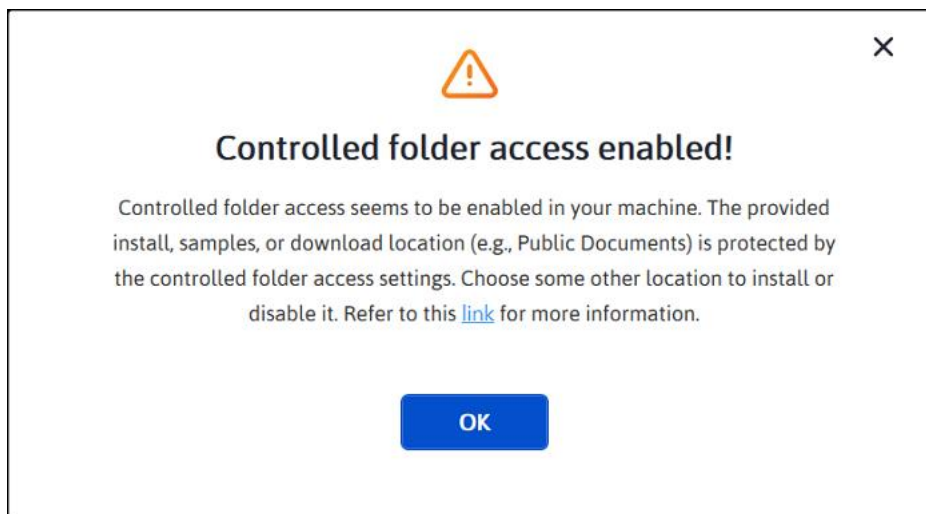

Offline

Error Message: Controlled folder access seems to be enabled in your machine. The provided install or samples location (e.g., Public Documents) is protected by the controlled folder access settings.

Online

Error Message: Controlled folder access seems to be enabled in your machine. The provided install, samples, or download location (e.g., Public Documents) is protected by the controlled folder access settings.

Reason
 You have enabled controlled folder access settings on your computer.

Suggested solution

Suggestion 1:

1. We will ship our demos in the public documents folder by default.
2. You have controlled folder access enabled on your machine, so our demos cannot be installed in the documents folder. If you need to install our demos in the Documents folder, follow the steps in this [link](#) and disable the controlled folder access.
3. You can enable this option after the installing our Syncfusion setup.

Suggestion 2:

1. If you do not want to disable controlled folder access, you can install our demos in another directory.

Upgrading Syncfusion JavaScript (Essential JS2)

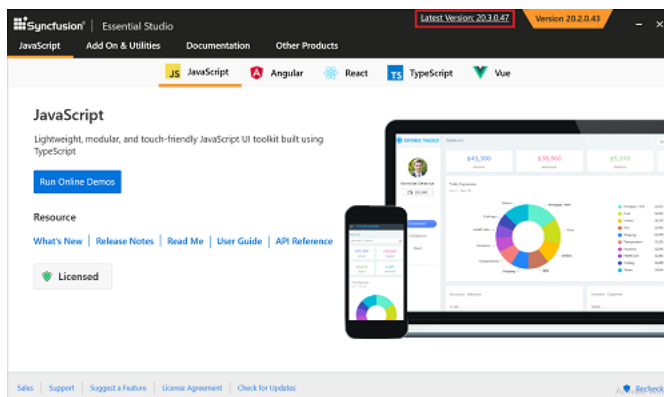

Syncfusion releases new volumes once every three months, with exciting new features. There will be one Service Pack release for these volume releases. Service Pack releases are provided to address major bug fixes in the volume releases.

You can upgrade to our latest version from any installed Syncfusion version.

See our "[Upgrade Guide](#)" for JavaScript – EJ2 to learn more about the “Breaking Changes, Bug Fixes, Features and Known Issues” between your current version and the latest version you are trying to upgrade.

Upgrading to the latest version

The most recent version of Syncfusion JavaScript – EJ2 can be downloaded and installed by clicking on the “Latest Version: {Version}” link at the top of the Syncfusion JavaScript – EJ2 Control Panel.

You can also upgrade to the latest version just by downloading and installing the products you require from [this](#) link. The existing installed versions are not required to be uninstalled.

It is not required to install the Volume release before installing the Service Pack release. As releases for Volume and Service Packs work independently, you can install the latest version with major bug fixes directly.

Upgrade from trial version to license version

Uninstall the trial version and install the fully licensed installer from the [License and Downloads](#) section of our website to upgrade from the trial version.

Note: License key registration is not required for JavaScript, if you are using scripts (.js) and css files.

Licensing

Overview in EJ2 JavaScript Licensing control

We have introduced license key validation for Essential JS2 platforms from the 2022 Volume 1 release. This licensing key validation will enforce the developer to register the valid licensing key in an application while referring to any of the latest JavaScript packages, either from npm or CDN or build.

License key can be obtained from the [My Account >> License and downloads](#) section of the Syncfusion website. To obtain a license key, you will need to have an active trial or license or community license.

Before using any JavaScript controls, you must register the obtained license key in the application code. Otherwise you will get license validation error message in application as shown in below

This application was built using a trial version of Syncfusion Essential Studio. Please include a valid license to permanently remove this license validation message. You can also obtain a free 30 day evaluation license to temporarily remove this message during the evaluation period. Please refer to this [help topic](#) for more information.

Difference between unlock key and license key

Please note that this license key is different from the installer unlock key that you might have used in the past and needs to be separately generated from Syncfusion website.

- **Unlock Key** - Syncfusion Unlock Key is used to unlock the Syncfusion installers alone.
- **License Key** - Syncfusion License Key is a string that needs to be registered in your script to avoid licensing warning.

Refer to [this](#) KB article to know more about difference between the Syncfusion Unlock Key and the Syncfusion License Key.

Registering Syncfusion license keys in Build server

| Source of Syncfusion assemblies | Details | License Key needs to be registered? | Where to get license key from |

| ----- | ----- | ----- | ----- |

| **NuGet package** | If the Syncfusion assemblies used in Build Server were from the Syncfusion NuGet packages, then no need to install any Syncfusion installer. We can directly use the required Syncfusion NuGet packages at [nuget.org](#).

But, if using NuGet packages from the [nuget.org](#), then we should register the Syncfusion license key in the application. | Yes | Use any developer license to [generate](#) keys for Build Environments as well. |

| **Trial installer** | If the Syncfusion assemblies used in Build Server were from Trial Installer, we should register the license key in the application for the corresponding version and platforms, to avoid trial license warning. | Yes | Use any developer trial license to [generate](#) keys for Build Environments as well. |

| **Licensed installer** | If the Syncfusion assemblies used in Build Server were from Licensed Installer, then there is no need to register the license keys.

You can [download](#) and [install](#) the licensed version of our installer. | No | Not applicable |

License key registration in EJ2 JavaScript Licensing control

Syncfusion license key should be registered, if your project using Syncfusion JavaScript (ES5) packages reference. The generated license key is a string that needs to be registered after any [Syncfusion JavaScript \(ES5\) reference](#).

Note: Syncfusion license validation is done offline during application execution and does not require internet access. Apps registered with a Syncfusion license key can be deployed on any system that does not have an internet connection.

The following code is used to register the license.

Javascript es5

Register the license key by using 'registerLicense' method after the [Syncfusion JavaScript script](#) file reference as below.

Note: As we have mandated License registration for the Syncfusion JavaScript components, we realize there is a possibility to view the registered Syncfusion License key from your application by others. We

acknowledge this is taking place in the JavaScript platform, as we have minimal scope for hiding the License key and we also recommend not to advertise it.

```
`ts
```

```
// Registering Syncfusion license key
```

```
ej.base.registerLicense('Replace your generated license key here');
```

```
,
```

Note: Only from 2022 Vol 1 v20.1.0.47, license key registration required for Essential JavaScript 2 products.

4. If you **do not already have a Syncfusion account**, you can create one here and [purchase a license](#) or [start your 30-day free trial](#). Then you can **generate the trial license key for a specific version and product** from [this page](#).
 - In your application, register the generated license key. Please refer to this [help topic](#) for information on registering the license key.

Trial expired

The following error message will be shown if the trial key has expired after 30 days.

Error message:
 Your Syncfusion trial license has expired. Please refer to this [help topic](#) for more information.

Your Syncfusion trial license has expired. Please refer to this help topic for more information.		
Order ID	Customer Name	Freight
10248	Buyer/ 10248	32.38
10249	Buyer/ 10249	11.61
10250	Buyer/ 10250	65.83
10251	Buyer/ 10251	41.34
10252	Buyer/ 10252	51.3
10253	Buyer/ 10253	58.17

Solution:
 Purchase from [here](#) to get a valid Syncfusion license.

Platform Mismatch

If the application is registered with another platform's license key, the following error message will pop up when launching the application.

Error message:
 The included Syncfusion license is invalid (Platform mismatch). Please refer to this [help topic](#) for more information.

The included Syncfusion license is invalid (Platform mismatch). Please refer to this help topic for more information.

Solution:

- License keys are version and product specific. So, if you use JavaScript (ES5) components through syncfusion installer, you can choose from the options listed below
 1. If you have a valid Syncfusion license, you can **generate a license key for a specific version and product** from [this page](#).

Essential Studio Enterprise Edition - Community license

Licensing troubleshoot in EJ2 JavaScript Licensing control

Is an internet connection required for license validation

No, Internet connection is not required for the Syncfusion Essential Studio license validation. The Syncfusion license validation is done offline during application execution. Apps registered with a Syncfusion license key can be deployed on any system that does not have an internet connection.

Upgrade from the trial version after purchasing a license

To upgrade from the trial version, there are two possible solutions:

- Uninstall the trial version and install the fully licensed build from the [License & Downloads](#) section of the Syncfusion website.
- If you are using Syncfusion controls from the [npm](#), replace the currently used trial license key with a paid license key that can be generated from the [License & Downloads](#) section of Syncfusion website. Refer to [this](#) topic for more information regarding registering the license in the application.

The license registration is not required if you reference Syncfusion scripts from the Licensed installer. These licensing changes apply to all evaluators who refer to the Syncfusion scripts from the evaluation installer and those who use the Syncfusion NuGet packages form [nuget.org](#).

Where can I get a license key

License keys can be generated from the [License & Downloads](#) or the [Trial & Downloads](#) section of the Syncfusion website.

The Syncfusion license keys are the **version and platform-specific**, refer to the [KB](#) to generate the license key for the required version and platform. Also, refer to this [KB](#) to know which version of the Syncfusion license key should be used in the application.

While using the ASP.NET Core controls with the Javascript(ES5) components, you need to register the license key in both the Javascript(ES5) and the [ASP.NET core](#). Since the license is validated at the client side for Javascript(ES5) components and server-side for the ASP.NET core components.

Refer EJ2 scripts without registering the license key

Registering the Syncfusion license key in the application is mandated from version 20.1 for all the Syncfusion EJ2 platforms to avoid licensing warnings. The end-users can easily inspect the License key registered in the script due to the nature of the JavaScript. If you are a licensed customer and don't want to expose your key due to security reasons or other reasons, follow the following steps to ej2 scripts without registering the license key in the application.

Using scripts from the licensed installer

License registration is not required for licensed users if referring to the script from a [licensed installer](#). The following steps will guide you to get the installed script from your machine.

- After installing the licensed build from a licensed installer, go to the installed location and navigate to the **EJ2/Installed Version/Web (Essential JS 2)/JavaScript/ej2-js-es5**.

Local Disk (C:) > Program Files (x86) > Syncfusion > Essential Studio > JavaScript - EJ2 > 20.1.0.55 > Web (Essential JS 2) > JavaScript

<input type="checkbox"/> Name	Date modified	Type	Size
ej2-heatmap	5/12/2022 4:30 PM	File folder	
ej2-inplace-editor	5/12/2022 4:30 PM	File folder	
ej2-inputs	5/12/2022 4:30 PM	File folder	
<input checked="" type="checkbox"/> ej2-js-es5	5/12/2022 4:30 PM	File folder	
ej2-kanban	5/12/2022 4:30 PM	File folder	
ej2-layouts	5/12/2022 4:30 PM	File folder	

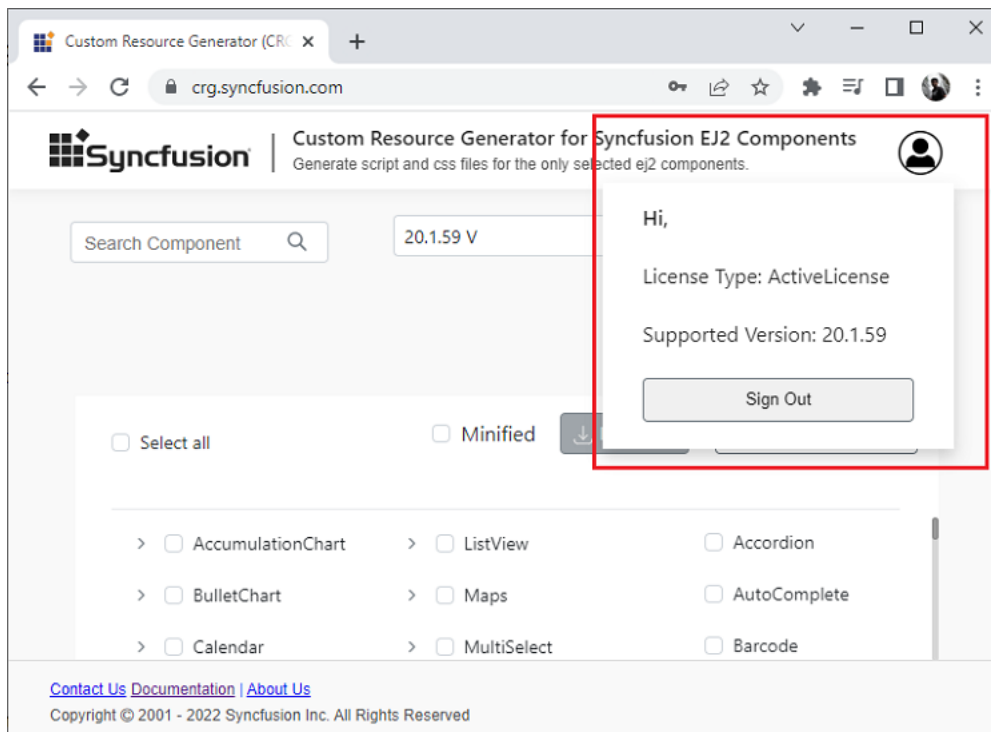

- Navigate to the ej2-js-es5 package folder and access the **ej2.min.js** from the **scripts** folder and utilize the minified ej2 script in the application.

Disk (C:) > Program Files (x86) > Syncfusion > Essential Studio > JavaScript - EJ2 > 20.1.0.55 > Web (Essential JS 2) > JavaScript > ej2-js-es5 > scripts

<input type="checkbox"/> Name	Date modified	Type	Size
ej2.d.ts	10/26/1985 1:45 PM	TS File	4 KB
ej2.min.js	10/26/1985 1:45 PM	JavaScript File	16,105 KB

Using scripts from the CRG

If you are a licensed customer, you can download scripts from the [CRG](#) which doesn't require the license registration by signing in with the Syncfusion account. You can check your license status by clicking my account icon as follows.

Refer to the [CRG documentation](#) to know more about how to refer to scripts.

Will the registered license key expire

No, the Syncfusion license keys won't expire for a particular version and you can continue to use it. So, you won't face any problems on the live site. If you have used the trial key, it will expire in 30 days and we don't recommend using it in production.

If you upgrade to newer versions of the Syncfusion packages, you have to generate new license keys and use them.

When to generate new license key while upgrading

You don't have to generate and change license keys for minor version upgrades. If you upgrade from one major version and another major version, you have to generate new license keys and register in the application.

For example,

- If you upgrade to weekly releases or the SP release in the same major version, you don't have to change license such as if you upgrade from the 20.1.47 version to 20.1.* you don't have to change the license keys.
- If you upgrade from one major version to another major version, you have to generate new license keys for the latest version and change in the application, such as if you upgrade from the 20.1. version to 20.2., you have to generate new license keys for the latest version and change in the application.

License registration for multiple developers on your project

Syncfusion license key is a version based and it's not based on the developer. You don't have to register different keys for each developer. Just register one valid license key when developing and publishing the software.

Can I use the same key for all the web apps under the project

Yes, you can use the same license key for all the web apps.

Does the license registration access any resources or data

No, the license registration doesn't access any data or resources.

License & Downloads shows the "Essential Studio Enterprise Edition Binary with Test Studio" and the "Project License". Which license to use

Use any licenses shown on the [accounts & downloads](#) page. It shows two licenses because if you are part of your company's enterprise portal Global license and an individual license is also assigned to your account, on your account & downloads page, the individual license and your enterprise portal Global license are shown.

Appearance

Theme in EJ2 JavaScript controls

The Syncfusion JavaScript library has provided the below list of in-built themes:

Theme	Style Sheet Name
-----	-----
Material 3	material3.css
Material 3 Dark	material3-dark.css
Fluent	fluent.css
Fluent Dark	fluent-dark.css
Bootstrap 5	bootstrap5.css
Bootstrap 5 Dark	bootstrap5-dark.css
Bootstrap 4	bootstrap4.css
Bootstrap 3	bootstrap.css
Bootstrap 3 Dark	bootstrap-dark.css
Google's Material	material.css
Google's Material-Dark	material-dark.css
Tailwind CSS	tailwind.css
Tailwind Dark CSS	tailwind-dark.css
Microsoft Office Fabric	fabric.css
Microsoft Office Fabric Dark	fabric-dark.css
High Contrast	highcontrast.css

The Syncfusion Bootstrap theme is designed based on **Bootstrap v3**, but it can be compatible with **Bootstrap v4** applications. In addition to these four built-in themes, [ThemeStudio](#) also provides support for the Fusion theme, which can only be downloaded from [ThemeStudio](#).

Reference themes in the application

Syncfusion JavaScript controls themes that can be used in the application by referencing the style sheet. Using the following approaches, themes can be referenced in the application.

- [NPM Packages](#) - Used to customize the existing themes and bundle stylesheet's in an application.
- [Content Delivery Network \(CDN\)](#) - Used to reference complete css via static web assets.
- [Theme Studio](#) - Used to customize and generate themes only for the selected (used) components.

NPM packages

All Syncfusion JavaScript (Essential JS 2) packages are available on the [npmjs.com](#) public registry. Themes are shipped as individual and combined CSS files. A combined CSS file can be referred to from the npm package [@syncfusion/ej2](#) and individual CSS files are available within the same control repository's **style** folder. In the **ej2** npm package, we have shipped both CSS and SCSS files for all controls.

Referring all controls theme

Referring all control CSS theme from ej2 package

```
@import "../nodemodules/@syncfusion/ej2/<themenam>.css";
```

Referring all control SCSS theme from ej2 package

```
`scss
@import "../nodemodules/@syncfusion/ej2/<themenam>.scss";
```

Referring individual control theme

The individual control theme can be referred from the [individual package](#) or from the **ej2** package.

Referring individual control SCSS theme from an individual package.

```
`scss
@import "<dependent-package>/<dependent-control>/<theme_name>.scss";
@import "ej2-buttons/styles/button/<theme_name>.scss";
```

Example:

```
`scss
@import "ej2-base/styles/material.scss";
@import "ej2-buttons/styles/button/material.scss";
```

`ej2-base` is common dependent package for all Syncfusion JavaScript control styles. so, it needs to be added first in the import statement.

Referring individual control SCSS theme from ej2 package

```
`scss
@import "ej2/<dependent-control>/<theme_name>.scss";
@import "ej2/button/<theme_name>.scss";
```

Example:

```
`scss
@import "ej2/base/material.scss";
@import "ej2/button/material.scss";
```

CDN reference

Syncfusion hosts every Syncfusion JavaScript control as a separate package on the CDN. This allows you to load the scripts and styles for each individual package. Syncfusion also provides a single package that includes all Syncfusion JavaScript controls, allowing you to load the scripts and styles for all controls as a single script and style file.

Single CDN theme reference for all controls

Refer to a single CDN link that contains all Syncfusion JavaScript control styles as follows:

```
https://cdn.syncfusion.com/ej2/<version>/<theme_name>.css
```

Theme Name	CDN Reference
Material 3	https://cdn.syncfusion.com/ej2/22.1.34/material3.css
Material 3 Dark	https://cdn.syncfusion.com/ej2/22.1.34/material3-dark.css
Fluent	https://cdn.syncfusion.com/ej2/22.1.34/fluent.css
Fluent Dark	https://cdn.syncfusion.com/ej2/22.1.34/fluent-dark.css
Bootstrap 5	https://cdn.syncfusion.com/ej2/22.1.34/bootstrap5.css
Bootstrap 5 Dark	https://cdn.syncfusion.com/ej2/22.1.34/bootstrap5-dark.css
Bootstrap 4	https://cdn.syncfusion.com/ej2/22.1.34/bootstrap4.css
Bootstrap 3	https://cdn.syncfusion.com/ej2/22.1.34/bootstrap.css
Bootstrap 3 Dark	https://cdn.syncfusion.com/ej2/22.1.34/bootstrap-dark.css
Google's Material	https://cdn.syncfusion.com/ej2/22.1.34/material.css

| Google's Material Dark | <https://cdn.syncfusion.com/ej2/22.1.34/material-dark.css> |

| Tailwind CSS | <https://cdn.syncfusion.com/ej2/22.1.34/tailwind.css> |

| Tailwind CSS Dark | <https://cdn.syncfusion.com/ej2/22.1.34/tailwind-dark.css> |

| Microsoft Office Fabric | <https://cdn.syncfusion.com/ej2/22.1.34/fabric.css> |

| Microsoft Office Fabric Dark | <https://cdn.syncfusion.com/ej2/22.1.34/fabric-dark.css> |

| High Contrast | <https://cdn.syncfusion.com/ej2/22.1.34/highcontrast.css> |

Individual control theme CDN reference

The primary goal of individual CDN control is to optimize the loading time and memory of the website or app in the production stage. Individual control package loading should be done in the order indicated by its dependency graph. The CDN of the dependency packages should be manually included before the intended individual control package CDN.

Dependency style:

<https://cdn.syncfusion.com/ej2/22.1.34/{DEPENDENCYPACKAGENAME}/styles/material.css>

Control style:

https://cdn.syncfusion.com/ej2/22.1.34/{PACKAGE_NAME}/styles/material.css

Example:

Button's control style:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-buttons/styles/material.css>

Button's dependency style:

<https://cdn.syncfusion.com/ej2/22.1.34/ej2-base/styles/material.css>

Change theme dynamically

In the application, Syncfusion themes can be changed dynamically by changing their style reference as follows.

- Add the theme CDN link and DropDownList element to the HTML file using the following code.

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
```

```

<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="author" content="Syncfusion JavaScript Grid control" />
<!-- Syncfusion JavaScript controls styles -->
<link id="css-link" href="https://cdn.syncfusion.com/ej2/22.1.34/bootstrap5.css" rel="stylesheet" />
</head>
<body>
<div id='container' style="margin: 50px;">
<div id='dropdown' style="margin:0 auto auto 0; width:300px; padding-bottom: 20px;">
<!--element which is going to render the DropDownList-->
<input type="text" tabindex="1" id='themes-dropdown' />
</div>
</div>
</body>
</html>
`

```

- The following code example demonstrates how to change the theme dynamically in the application using Syncfusion JavaScript DropDownList control.

```

`ts
import { DropDownList, ChangeEventArgs } from '@syncfusion/ej2-dropdowns';

// define the array of themes data
let themesData: string[] = ['material3', 'material3-dark', 'bootstrap5', 'bootstrap5-dark', 'fluent', 'fluent-dark', 'material', 'tailwind', 'tailwind-dark', 'fabric', 'fabric-dark'];

// initialize DropDownList component
let dropDownListObject: DropDownList = new DropDownList({
//set the data to dataSource property
dataSource: themesData,
placeholder: "Choose a theme",
change: (args: ChangeEventArgs) => {
let themeName = args.value as string;
document.getElementsByTagName('body')[0].style.display = 'none';
let styleLink: any = document.getElementById('css-link');
styleLink.href = 'https://cdn.syncfusion.com/ej2/22.1.34/' + themeName + '.css';
}
}

```

```

setTimeout(function () { document.getElementsByTagName('body')[0].style.display = 'block'; }, 250);
}
});
// render initialized DropDownList
dropDownListObject.appendTo('#themes-dropdown');
`

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Grid</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="author" content="Syncfusion JavaScript Grid control">
  <!-- Syncfusion JavaScript controls styles -->
  <link id="css-link"
href="https://cdn.syncfusion.com/ej2/24.1.41/bootstrap5.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin: 50px;">
    <div id="dropdown" style="margin:0 auto auto 0; width:300px;
padding-bottom: 20px;">
      <!--element which is going to render the DropDownList-->
      <input type="text" tabindex="1" id="themes-dropdown">
    </div>
    <!--element which is going to render-->
    <div id="Grid"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Common variables

The following list of common variables are used in the Syncfusion JavaScript library themes for all UI controls. You can change these variables to customize the corresponding theme.

```
<!-- markdownlint-disable MD033 -->
```

Syncfusion Material 3 theme

Name	Value (Default Theme)	Value (Dark Theme)
--color-sf-black	rgb(0,0,0)	rgb(0,0,0)
--color-sf-white	rgb(255,255,255)	rgb(255,255,255)

Size modes Size Mode for Syncfusion EJ2 JavaScript Controls

An application that is designed to be accessed through a web browser on various devices, including desktop computers and mobile devices, may have a distinct layout or user interface on a mobile device compared to a desktop computer to better suit the smaller screen size.

Syncfusion JavaScript controls support both touch (bigger) and normal size modes. Touch mode creates a responsive design for mobile devices by adding the `e-bigger` class, which enhances interactions, visibility, and the overall experience.

Size mode for application

The user can enable touch mode (bigger) for the entire application by adding the `e-bigger` class to the `body` element in the `index.html` file as follows:

,

```
<body className="e-bigger">
```

...

```
</body>
```

,

Size mode for a control

The user can enable touch mode (bigger) for a control by adding the `e-bigger` class to the `div` element that contains the control. Another way of enabling touch mode is by adding the `e-bigger` class using the available `cssClass` property of the control.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize the Button component.
let button: Button = new Button({ content: 'Button' });
// Render initialized button.
button.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container" class="e-bigger">

    <button id="element">Button</button>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Change size mode for application at runtime

The user can change the size mode of the application between touch and normal (mouse) mode at runtime by adding and removing the `e-bigger` class. The following steps explain how to change the size mode of an application at runtime:

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
import { Calendar } from '@syncfusion/ej2-calendars';
enableRipple(true);
// Initialize the touch button.
let touchButton: Button = new Button({ content: 'Touch Mode' });
touchButton.appendTo('#touch');
touchButton.element.onclick = (): void => {
    document.body.classList.add('e-bigger');
}
// Initialize the mouse button.
let mouseButton: Button = new Button({ content: 'Mouse Mode' });
mouseButton.appendTo('#mouse');
mouseButton.element.onclick = (): void => {
    document.body.classList.remove('e-bigger');
}
let calendarObject: Calendar = new Calendar();
//Render initialized calendar.
calendarObject.appendTo('#calendar');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Change size mode for a control at runtime

The user can change the size mode of a control between touch and normal (mouse) mode at runtime by setting the **e-bigger** CSS class.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
import { Calendar } from '@syncfusion/ej2-calendars';
enableRipple(true);
// Initialize the touch button.
let touchButton: Button = new Button({ content: 'Touch Mode' });
touchButton.appendTo('#touch');
touchButton.element.onclick = (): void => {
    let controls = document.querySelectorAll('.control');
    for (let index: number = 0; index < controls.length; index++) {
        controls[index].classList.add('e-bigger');
    }
}
// Initialize the mouse button.
let mouseButton: Button = new Button({ content: 'Mouse Mode' });
mouseButton.appendTo('#mouse');
mouseButton.element.onclick = (): void => {
    let controls = document.querySelectorAll('.control');
    for (let index: number = 0; index < controls.length; index++) {
        controls[index].classList.remove('e-bigger');
    }
}
let calendarObject: Calendar = new Calendar();
//Render initialized calendar.
calendarObject.appendTo('#calendar');

```

INDEX.HTML

```

Icons Library

Syncfusion's icon library is a collection of pre-designed icons that can be used to enhance the user interface of an application. This pre-designed icons are set of `base64` formatted font icons. Utilizing this icon library can make it simpler to create a cohesive, visually pleasing design for an application.

Referring icons in JavaScript application

Using the below approaches, the icons can be referenced in the JavaScript application.

- [npm package](#) - Use the npm package to access icons.
- [CDN reference](#) - Use the static web asset to access icons.

The npm package

All Syncfusion theme icons are shipped in the [ej2-icons](#) package, which is published on the [npmjs.com](#) public registry. This package contains both CSS and SCSS theme files for all themes.

Icons can be used from the npm package `ej2-icons`. To use the icons, install the npm package using the following command:

```
`bash
npm install @syncfusion/ej2-icons
`
```

Refer to the following syntax to use icons in a JavaScript application:

```
@import "../nodemodules/@syncfusion/ej2-icons/<themename>.css";
```

Example:

```
@import "../node_modules/@syncfusion/ej2-icons/material.css";
```

[CDN reference](#)

All Syncfusion theme icons are available on the CDN. Instead of using a local resource on the server, use a cloud CDN to refer to the icons.

Make sure that the version of the icons in the URL matches the version of the Syncfusion React package. This will prevent compatibility issues and ensure that the correct version of the icons is loaded.

To use the icons from the CDN, refer to the icons by URLs in the application. This can be done by linking the icons in the HTML file by adding a link tag to the head section.

```
// Bootstrap5
<head>
<link href="https://cdn.syncfusion.com/ej2/22.1.34/ej2-icons/styles/bootstrap5.css" rel="stylesheet"/>
</head>

//Material
<head>
<link href="https://cdn.syncfusion.com/ej2/22.1.34/ej2-icons/styles/material.css" rel="stylesheet"/>
</head>
```

[Steps to use icons library](#)

Let's create a JavaScript application using the following command:

For an introduction and configuration of the common specifications, see [getting started with the Syncfusion JavaScript application](#).

Using icons directly in HTML element

The built-in Syncfusion icons can be rendered directly in the HTML element by defining the `e-icons` class, which contains the font-family and common properties of font icons, and defining the available icon's class with the `e-` prefix.

The following steps explain the direct rendering of the Syncfusion icon in the HTML element.

1. Add the class name `e-icons` to the HTML element that needs to render the icon. 2. Add the icon class with corresponding icon content from the [available icons](#). For example, the below code snippet represents the paste icon class.

```
,
.e-paste:before {
content: '\e355';
}
```

3. Add `e-icons` and `e-paste` classes to the HTML element.

```
,
<span class="e-icons e-paste"></span>
```

4. Add the CDN link reference of icons library in the `~index.html` file.

```
,
<link href="https://cdn.syncfusion.com/ej2/22.1.34/ej2-icons/styles/bootstrap5.css" rel="stylesheet" />
```

Icon size

The `ej2-icons` package offers options to display icons in different size modes. A user can use different icon sizes in their application based on touch or mouse mode. If the user is using touch mode, add `e-large` class to the element to make the icon easily interactable, or add the `e-small` or `e-medium` class in mouse mode.

The pre-defined icon size is present in the available classes listed below.

- `e-small` - Sets the icon size as 8px.
- `e-medium` - Sets the icon size to 16px.
- `e-large` - Sets the icon size to 24px.

Example:

```
,
<span class="e-icons e-small e-search"></span>
<span class="e-icons e-medium e-search"></span>
<span class="e-icons e-large e-search"></span>
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container">

    <div>
      <p><b>Smaller Icons</b></p>
      <div class="small-icon-bar">
        <span class="e-icons e-small e-cut"></span>
        <span class="e-icons e-small e-copy"></span>
        <span class="e-icons e-small e-paste"></span>
      </div>
      <p><b>Medium Icons</b></p>
      <div class="medium-icon-bar">
        <span class="e-icons e-medium e-cut"></span>
        <span class="e-icons e-medium e-copy"></span>
        <span class="e-icons e-medium e-paste"></span>
      </div>
      <p><b>Larger Icons</b></p>
      <div class="large-icon-bar">
        <span class="e-icons e-large e-cut"></span>
        <span class="e-icons e-large e-copy"></span>
        <span class="e-icons e-large e-paste"></span>
      </div>
    </div>
  </div>
</body>
</html>

```

```

<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>

```

Icon appearance customization

The Syncfusion JavaScript icons can be customized with custom color and size by overriding the `e-icons` class. Customizing the icons in the library can be useful for making the icons more visually appealing and

fitting to the design of the application. For example, a user can change the color of an icon to match the color scheme of their application, or increase the size of an icon to make it more visible on smaller screens. It may also be useful for creating a consistent look and feel across different parts of the application. Overall, customizing the icons in the library can improve the overall user experience of the application.

In the example below, the icon colour is customized with custom color.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

Overview

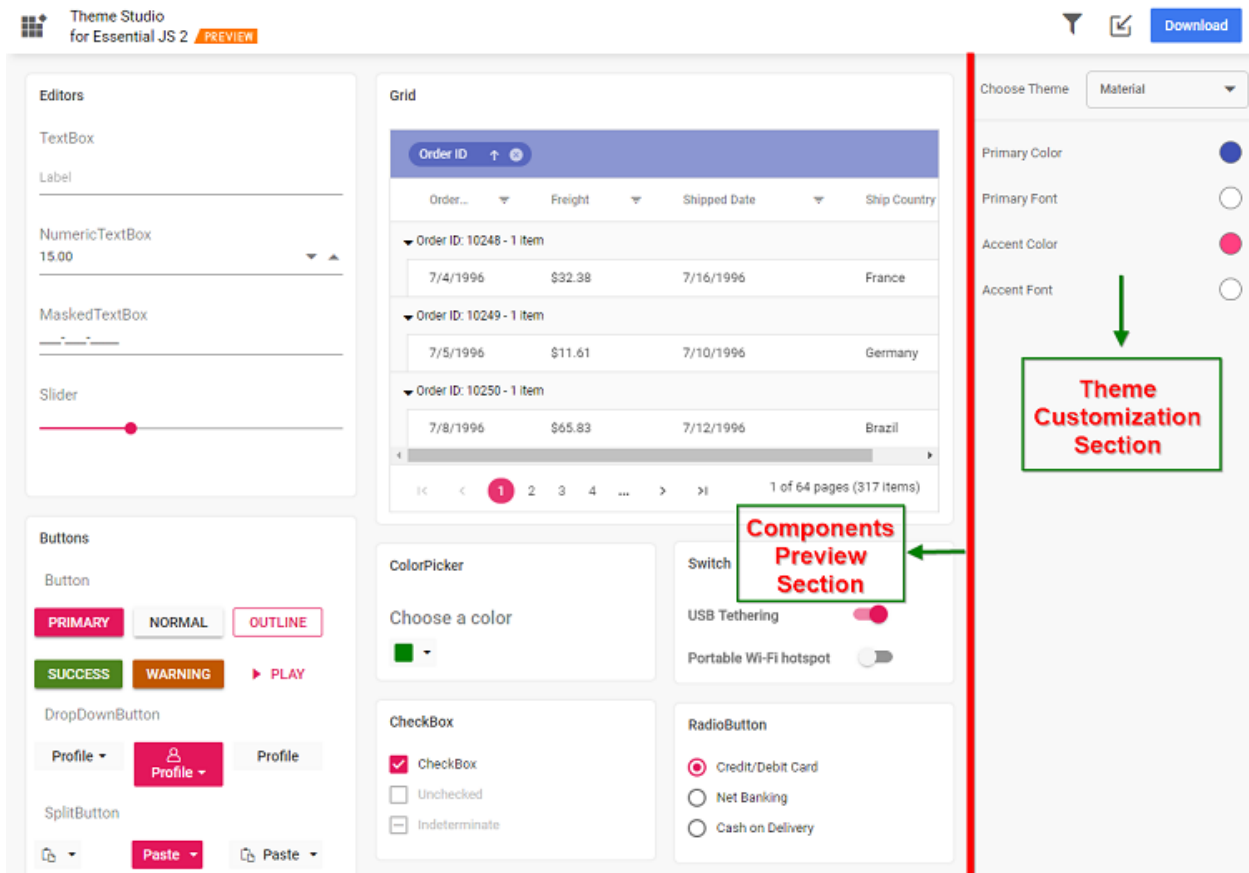

Theme Studio for Essential JS 2 can be used to customize a new theme from an existing theme. It doesn't support with Data visualization controls like Chart, Diagram, Gauge, Range Navigator, Maps.

Customizing theme color from theme studio

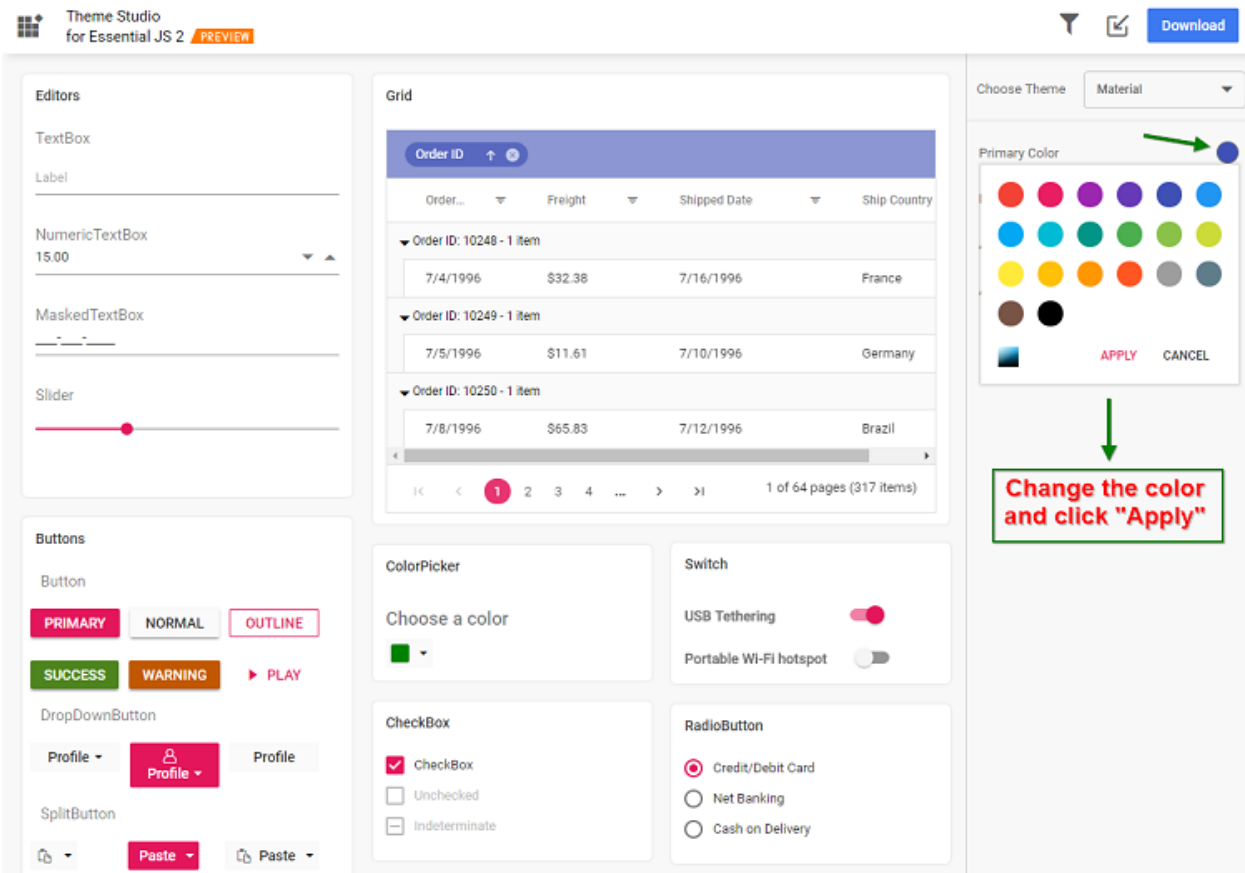

The Essential JS 2 themes are developed under the SCSS environment. Each theme has a unique common variable list. When you change the common variable color code value, it will reflect in all the Syncfusion JavaScript controls. All Syncfusion JavaScript control styles are derived from these [theme-based common variables](#). This common variable list is handled inside the theme studio application for customizing theme-based colors.

Step 1: Navigate to the theme studio application at <https://ej2.syncfusion.com/themestudio/>.

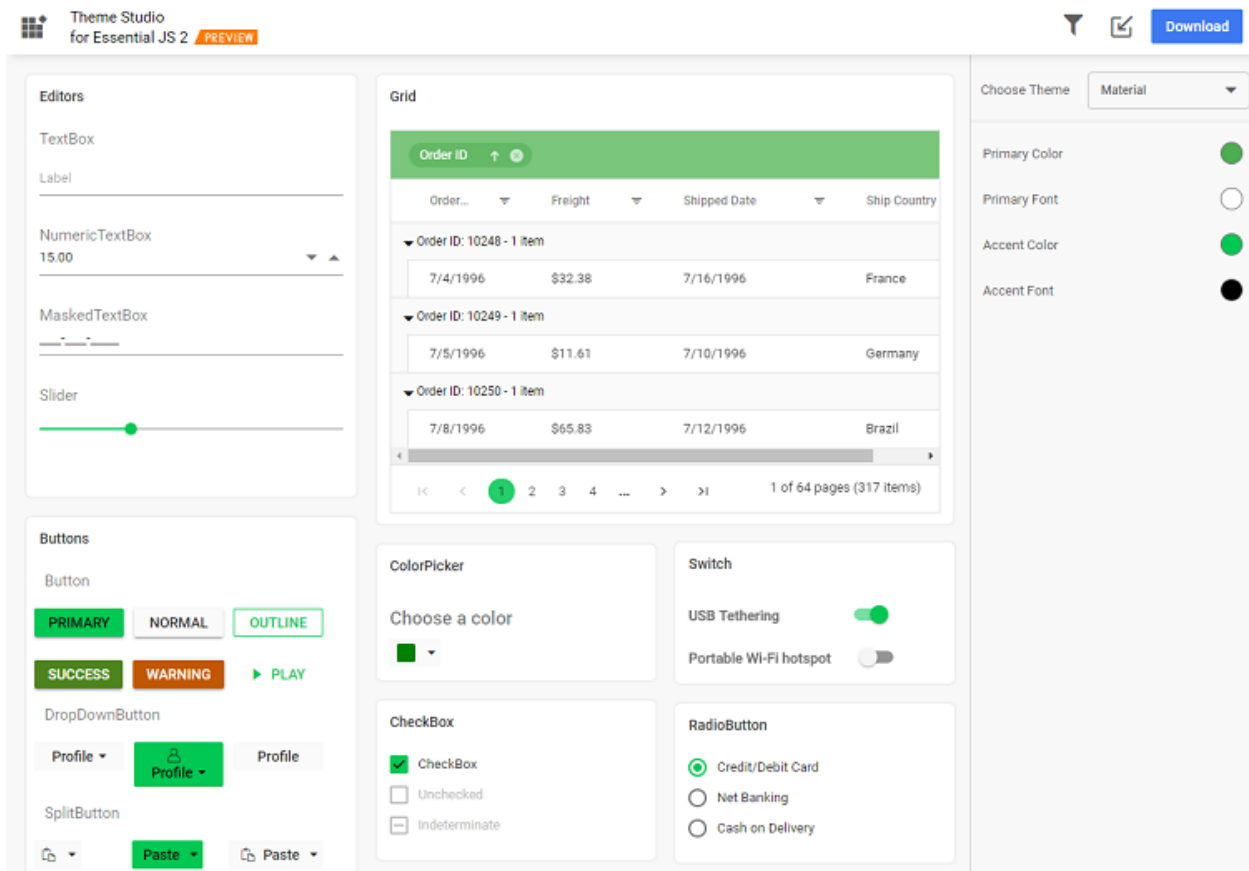

Step 2: The theme studio application page can be divided into two sections: the controls preview section on the left, and the theme customization section on the right.

Step 3: Click the color pickers in the theme customization section to select your desired colors.

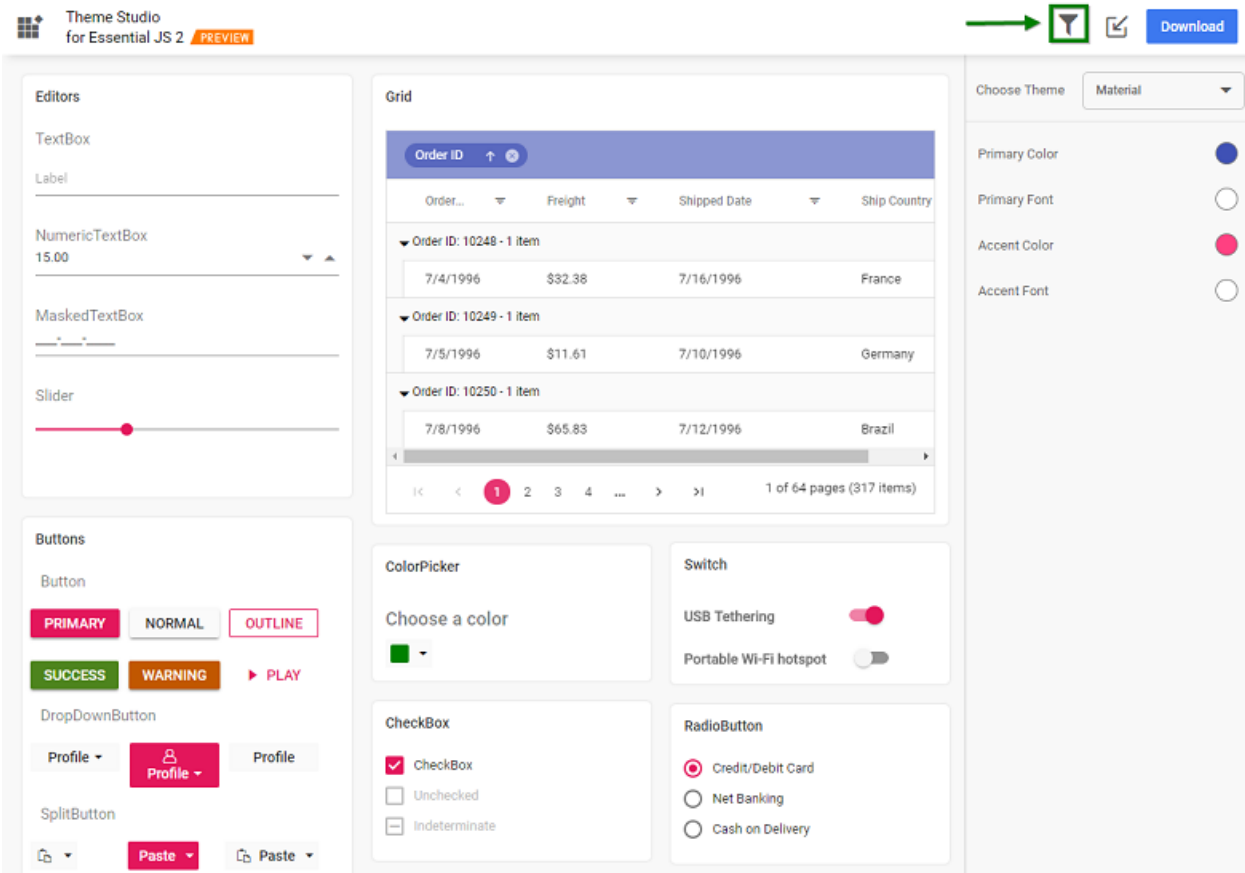

Step 4: The Syncfusion JavaScript UI controls will be rendered with the newly selected colors in the preview section, after selecting the custom color from pickers.

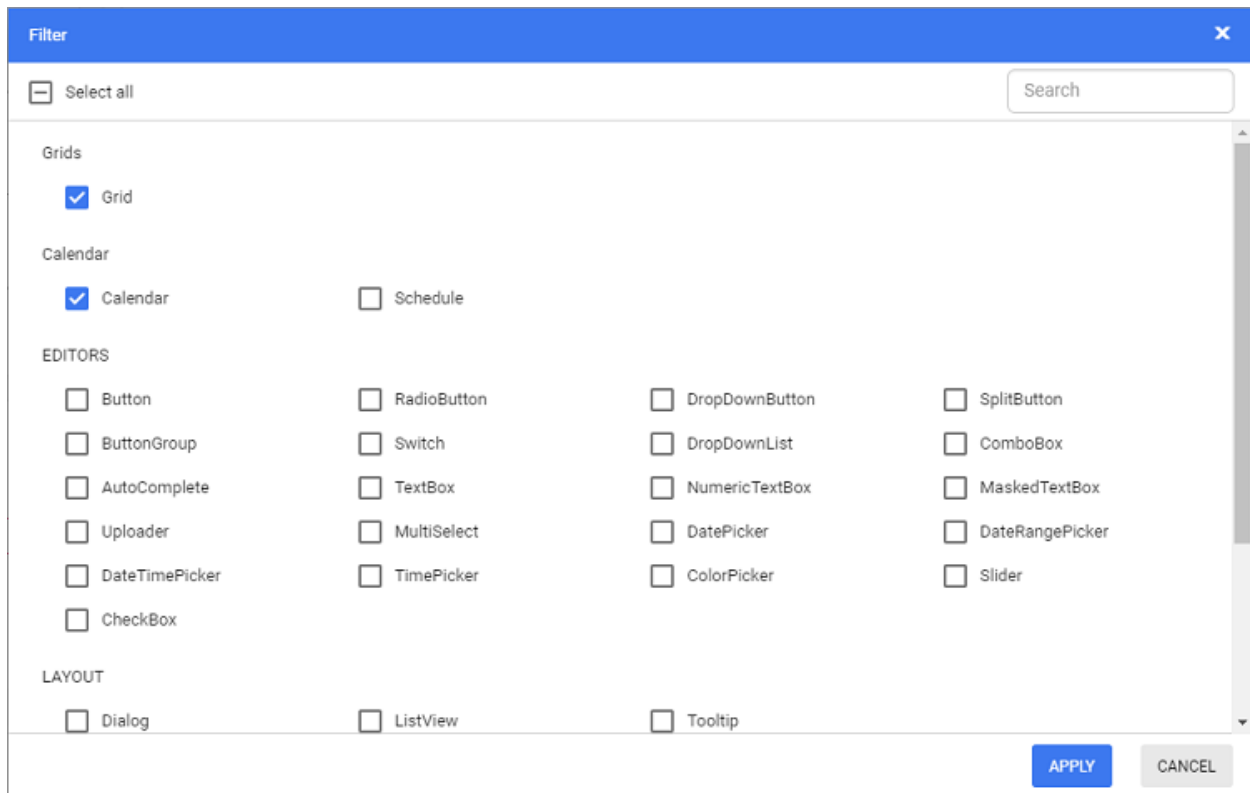

Filtering a specific list of controls

Using the theme studio, you can apply custom themes to a list of specific controls. This option is useful when you have integrated a selective list of Syncfusion JavaScript UI controls in your application. The theme studio will filter the selected controls and customize the final output for those controls' styles alone, reducing the final output file size.

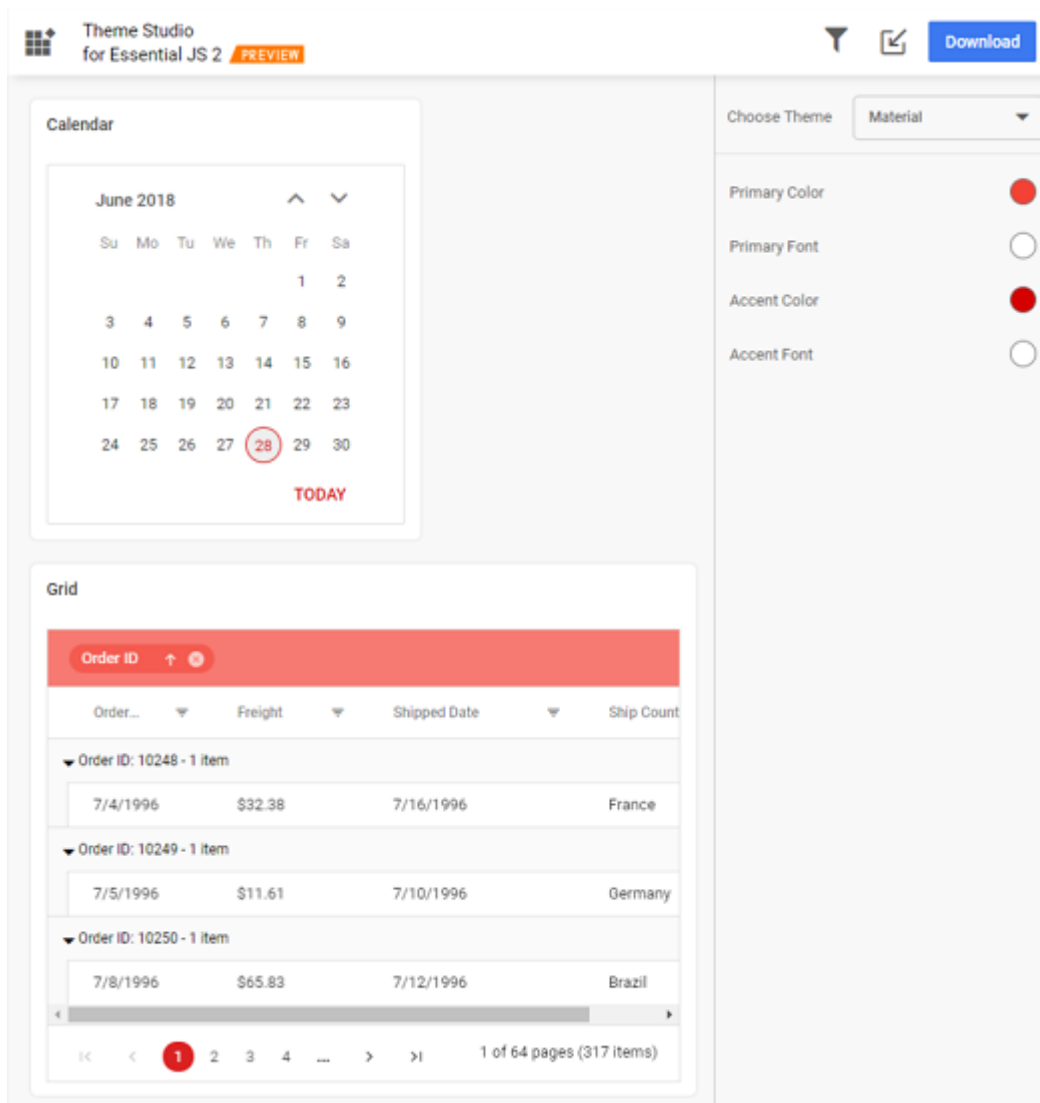

Step 1: Click the Filter icon in the top right corner and select the controls whose theme you want to customize.

Step 2: Click the Apply button in the Filter dialog. Now, only the selected controls will be rendered in the controls preview section.

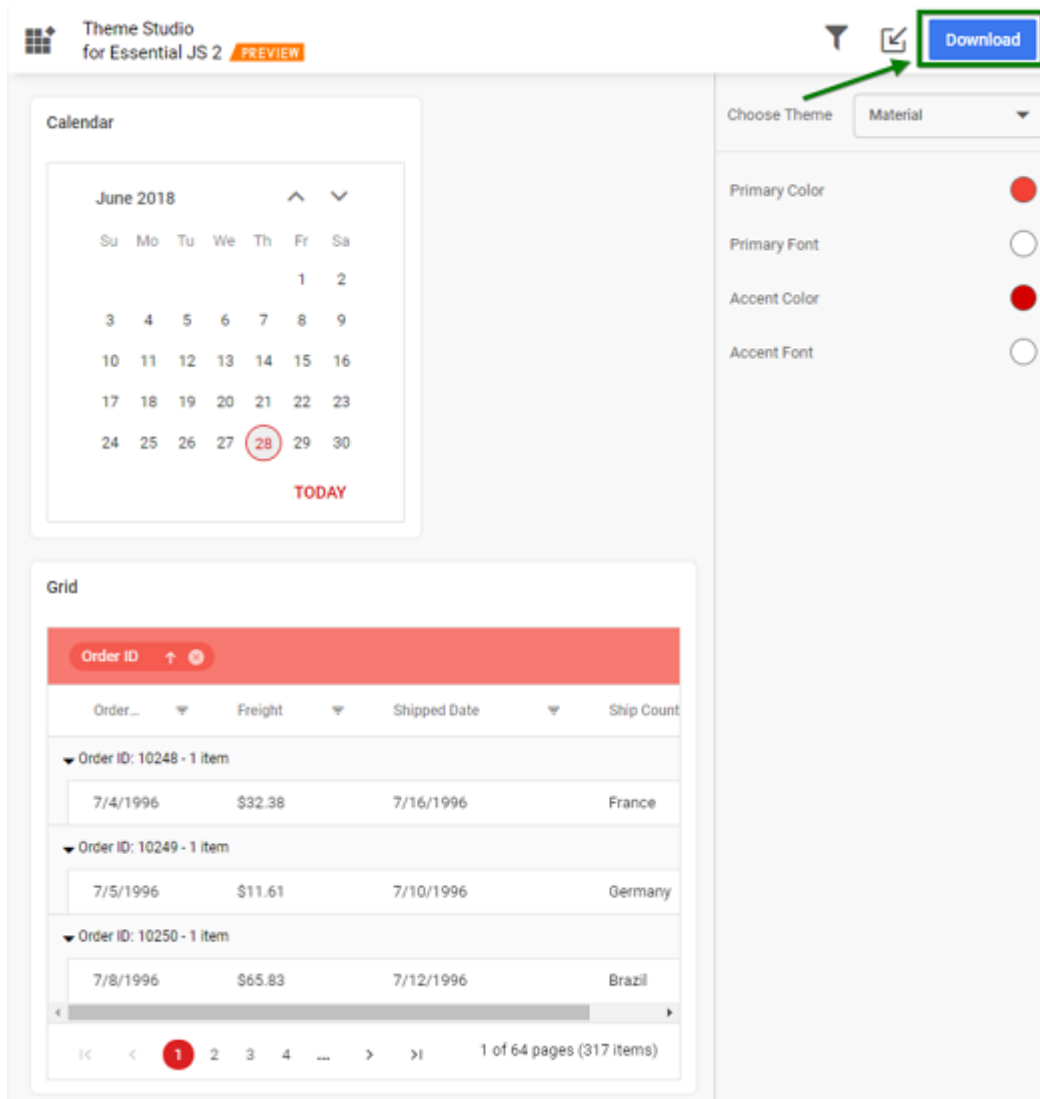

Step 3: Now you can customize the colors in the theme customization section for the controls you selected.

[Download the customized theme](#)

You can download the custom styles after customizing the theme colors.

Step 1: Click the Download button in the top right corner. The Download dialog will open.

Step 2: Assign a theme name in the File Name field and click the Download button. If your application uses both Essential JS 1 and Essential JS 2 controls, then select the Include compatibility css check box before downloading the theme. This option will generate the custom theme for Essential JS 2 compatibility styles, which are compatible as Essential JS 1 styles. Refer this [link](#) for more details about Essential JS 1 and Essential JS 2 compatibility.

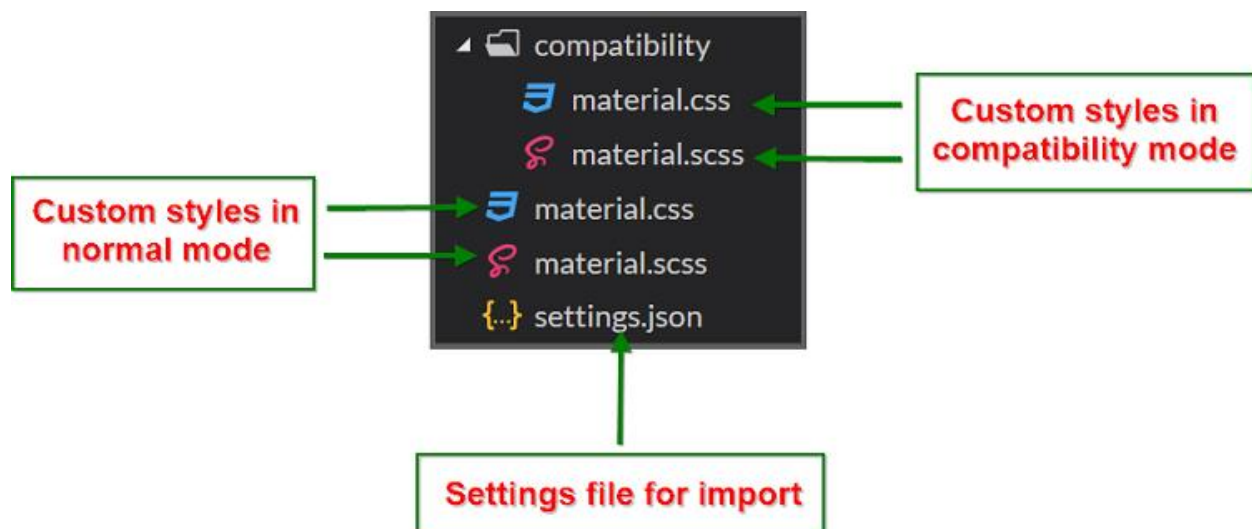

Download [X]

File Name
material

☐ Include compatibility css ⓘ

DOWNLOAD CANCEL

Step 3: The download styles will come as a zip file that contains SCSS and CSS files for the selected Syncfusion JavaScript UI controls. The current settings are stored in the `settings.json` file.

Using customized theme in a web application

You can directly use the customized CSS file in the web application.

Step 1: Copy/paste the customized CSS file from the download folder into your application at any folder.
Example: `styles\{file-name}.css`.

Step 2: Refer the customized CSS file reference in the `index.html` or `shared/_layout.cshtml` main page head section.

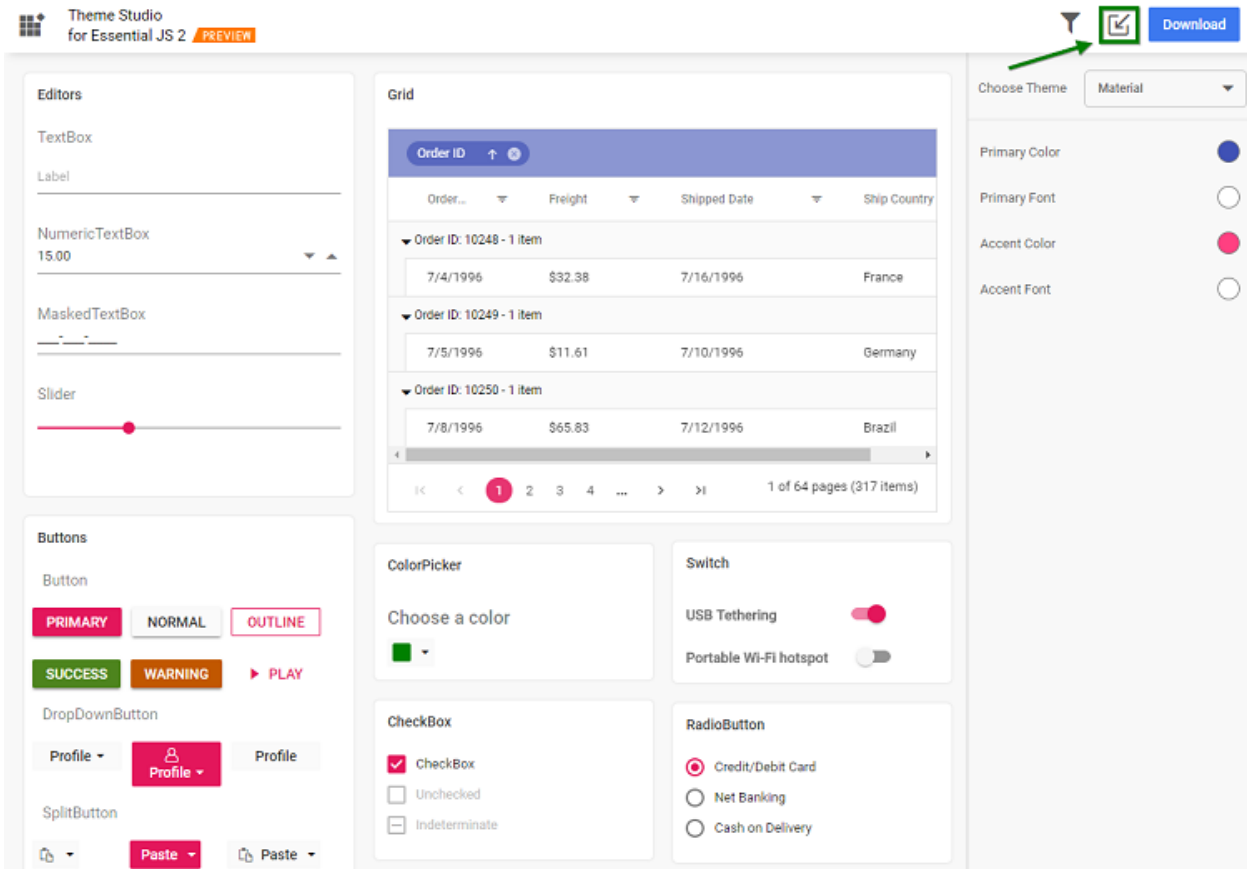

```
<head>
<link href="styles/{file-name}.css" rel="stylesheet"/>
</head>
```

If you are using Essential JS 1 and Essential JS 2 controls in a same web application, then you have to copy/paste the customized CSS file from the `compatibility` folder in the download location.

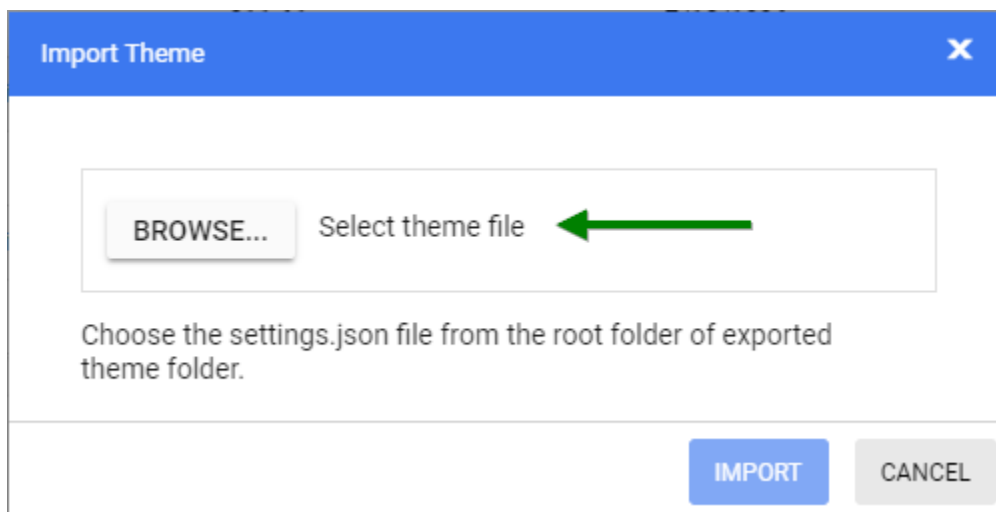

Import previously changed settings into the theme studio

When you want to change your application theme and UI design in the future, you won't need to customize the Syncfusion JavaScript UI controls from scratch in the theme studio. Just import the old `settings.json` file to review and update your stored settings in the theme studio application.

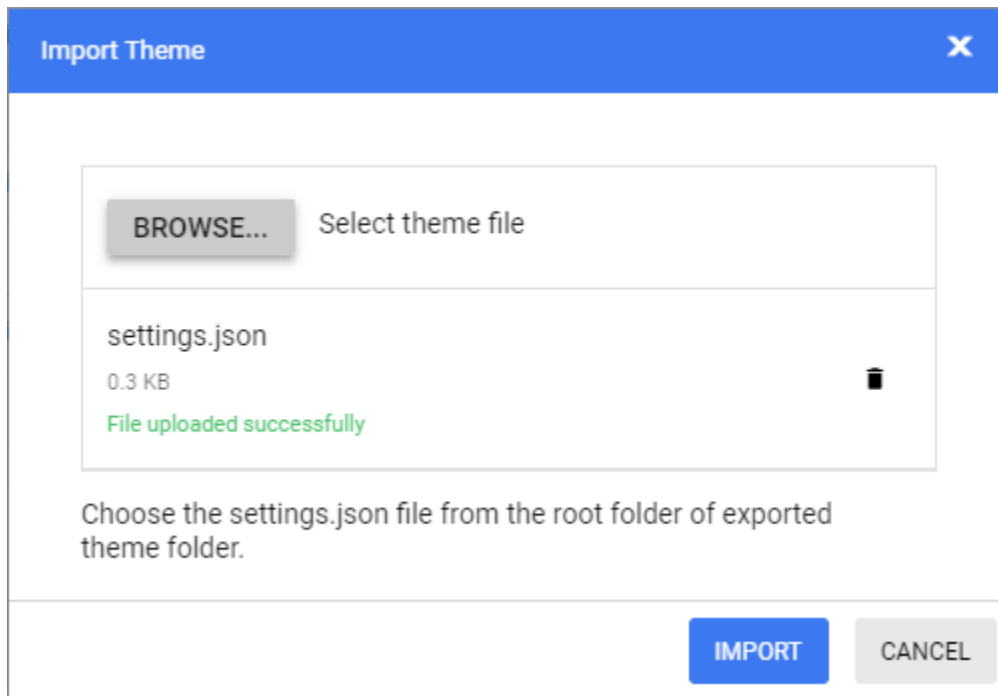

Step 1: Click the Import icon in the top right corner.

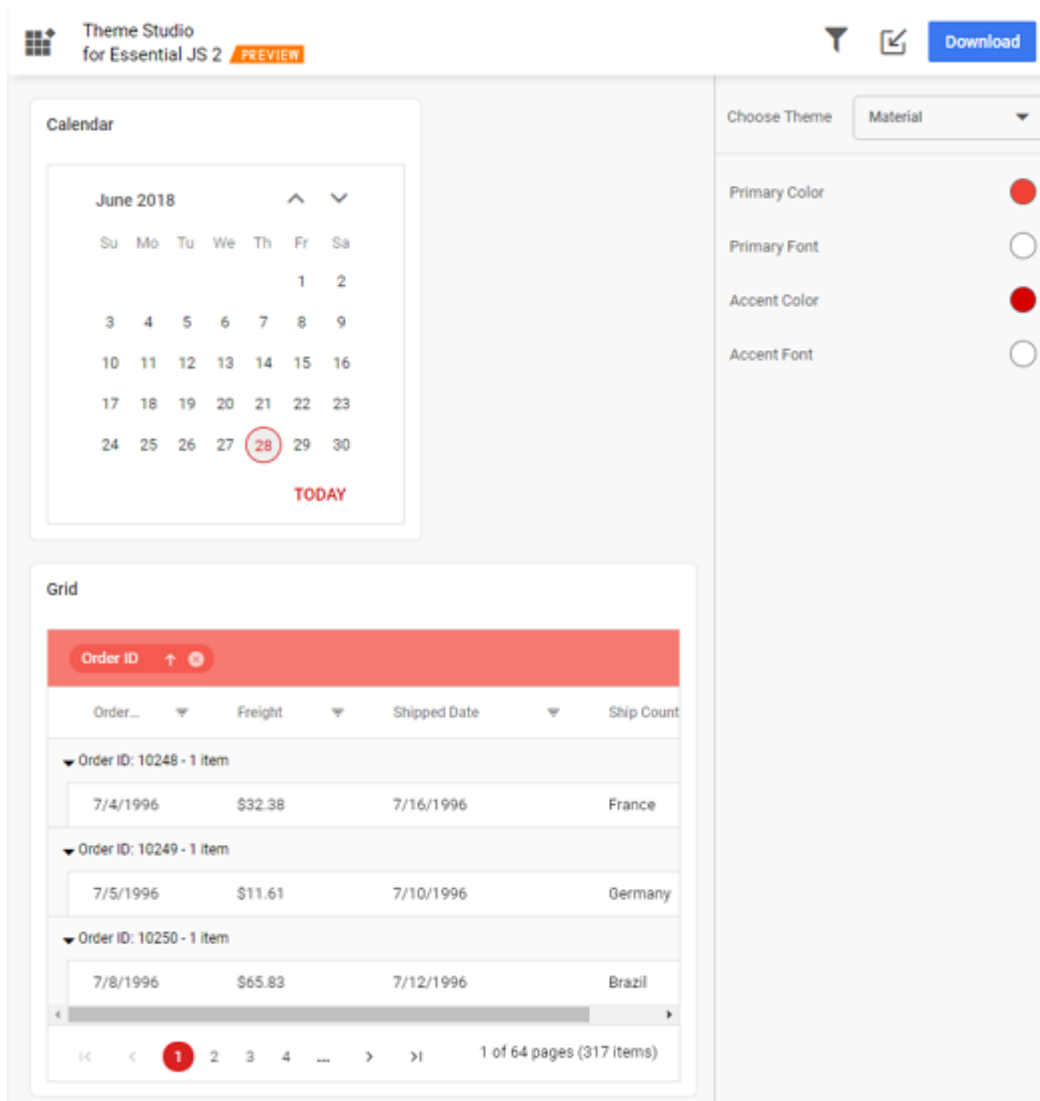

Step 2: The Import Theme dialog will open. Click the Browse button and select a `settings.json` file you exported previously.

Step 3: Click the Import button.

Step 4: The stored data will be reflected in the theme studio application. Now you can change the theme colors based on your latest design and export the theme again.

Step 5: The exported file will contain your latest changes. You can just replace the older custom style with the newer one to refresh your application.

Material 3 Theme

Material 3 is an updated theme that encompasses enhanced theming, components, and personalization features, including dynamic color capabilities. It has been specifically designed to align seamlessly with the new visual style and system UI introduced in Android 12 and above. For more detailed information, please refer to the following link: [Link to Material 3 Information](#).

Syncfusion Material 3 Theme

Syncfusion has introduced the Material theme across all EJ2 Controls. The theme includes light and dark variants and utilizes CSS variables for easy customization of control colors in CSS format. This implementation enables seamless switching between light and dark color schemes, offering users a flexible solution to suit their preferences and application needs.

Note: Please be aware that in the Material 3 theme, we utilize CSS variables with `rgb()` values for our color variables. Using hex values in this context may lead to improper functionality. For example, in previous versions of our Material theme or other themes, the primary color variable was defined as

follows: `$primary: #6200ee;`. In the Material 3 theme, the primary color variable is defined as follows: `--color-sf-primary: 98, 0, 238;`.

What are CSS Variables?

CSS variables, also known as custom properties, are a powerful feature in CSS that allows you to define reusable values and apply them throughout your stylesheets. Prefixed with "--", CSS variables can be utilized in any property value within a CSS rule. To retrieve the value of a CSS variable, the `var()` function is used. CSS variables can access the Document Object Model (DOM), enabling the creation of variables with either local or global scope. For further details, please consult the following link: [Link to CSS Variables Information](#).

How does Syncfusion Theming utilize CSS Variables?

The Material 3 theme in our system incorporates CSS variable support, utilizing CSS variables with `rgb()` values for color customization.

```
`CSS
:root {
--color-sf-black: 0, 0, 0;
--color-sf-white: 255, 255, 255;
--color-sf-primary: 103, 80, 164;
--color-sf-primary-container: 234, 221, 255;
--color-sf-secondary: 98, 91, 113;
--color-sf-secondary-container: 232, 222, 248;
--color-sf-tertiary: 125, 82, 96;
--color-sf-tertiary-container: 255, 216, 228;
--color-sf-surface: 255, 255, 255;
--color-sf-surface-variant: 231, 224, 236;
--color-sf-background: var(--color-sf-surface);
--color-sf-on-primary: 255, 255, 255;
--color-sf-on-primary-container: 33, 0, 94;
--color-sf-on-secondary: 255, 255, 255;
--color-sf-on-secondary-container: 30, 25, 43;
--color-sf-on-tertiary: 255, 255, 255;
}
```

Exploring Color Customization

Through the utilization of these CSS variables, customization of the color variables becomes remarkably straightforward. For example, to customize the primary color variable in this theme, simply modify its value in the root values.

Default primary value

```
--color-sf-black: 0, 0, 0;
--color-sf-white: 255, 255, 255;
--color-sf-primary: 103, 80, 164;
--color-sf-primary-container: 234, 221, 255;
--color-sf-secondary: 98, 91, 113;
--color-sf-secondary-container: 232, 222, 248;
--color-sf-tertiary: 125, 82, 96;
--color-sf-tertiary-container: 255, 216, 228;
--color-sf-surface: 255, 255, 255;
--color-sf-surface-variant: 231, 224, 236;
```

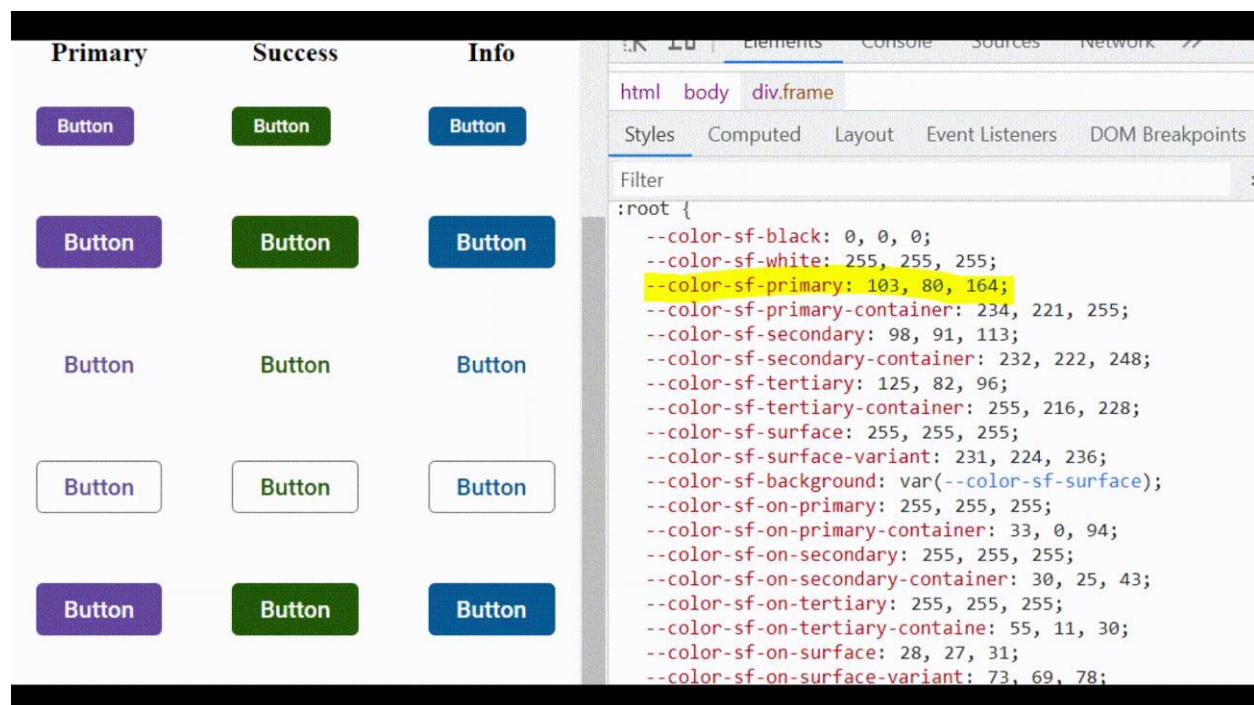

Customized primary value

```
--color-sf-black: 0, 0, 0;
--color-sf-white: 255, 255, 255;
--color-sf-primary: 236, 80, 164;
--color-sf-primary-container: 234, 221, 255;
--color-sf-secondary: 98, 91, 113;
--color-sf-secondary-container: 232, 222, 248;
--color-sf-tertiary: 125, 82, 96;
--color-sf-tertiary-container: 255, 216, 228;
--color-sf-surface: 255, 255, 255;
--color-sf-surface-variant: 231, 224, 236;
```

With this CSS variable support, you can effortlessly customize the color variable values for our EJ2 controls.

Dark mode support

The controls in our system now seamlessly transition between light and dark modes without any noticeable delay. This achievement was made by consolidating the configurations of the light theme and dark theme into [material 3 light theme](#) file.

INDEX.TS

```
import { Button, CheckBox } from '@syncfusion/ej2-buttons';
var checkBoxObj = new CheckBox({ label: 'Enable DarkMode', change:
onDarkMode });
checkBoxObj.appendTo('#darkmode');
function onDarkMode(e: any) {
    e.checked ? document.body.classList.add('e-dark-mode') :
document.body.classList.remove('e-dark-mode');
}
var btnObj = new Button({ isPrimary: true });
btnObj.appendTo('#normal4');
btnObj = new Button({ cssClass: 'e-success' });
btnObj.appendTo('#normal5');
btnObj = new Button({ cssClass: 'e-info' });
btnObj.appendTo('#normal6');
btnObj = new Button({ cssClass: 'e-warning' });
btnObj.appendTo('#normal7');
btnObj = new Button({ cssClass: 'e-danger' });
btnObj.appendTo('#normal8');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Material3</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Grid Control">
  <meta name="author" content="Syncfusion">
  <link href="./index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material3.css"
rel="stylesheet">
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div style="padding: 10px; display: inline-block;">
      <input id="darkmode" type="checkbox" />
    </div>
    <div class="frame">
      <table id="basic-button">
        <tbody>
          <tr>
            <td><button id="normal4">Button</button></td>
            <td><button id="normal5">Button</button></td>
            <td><button id="normal6">Button</button></td>
            <td><button id="normal7">Button</button></td>
            <td><button id="normal8">Button</button></td>
          </tr>
        </tbody>
      </table>
    </div>
  </div>
</script>
```

```
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="./index.js" type="text/javascript"></script>
</body></html>
```

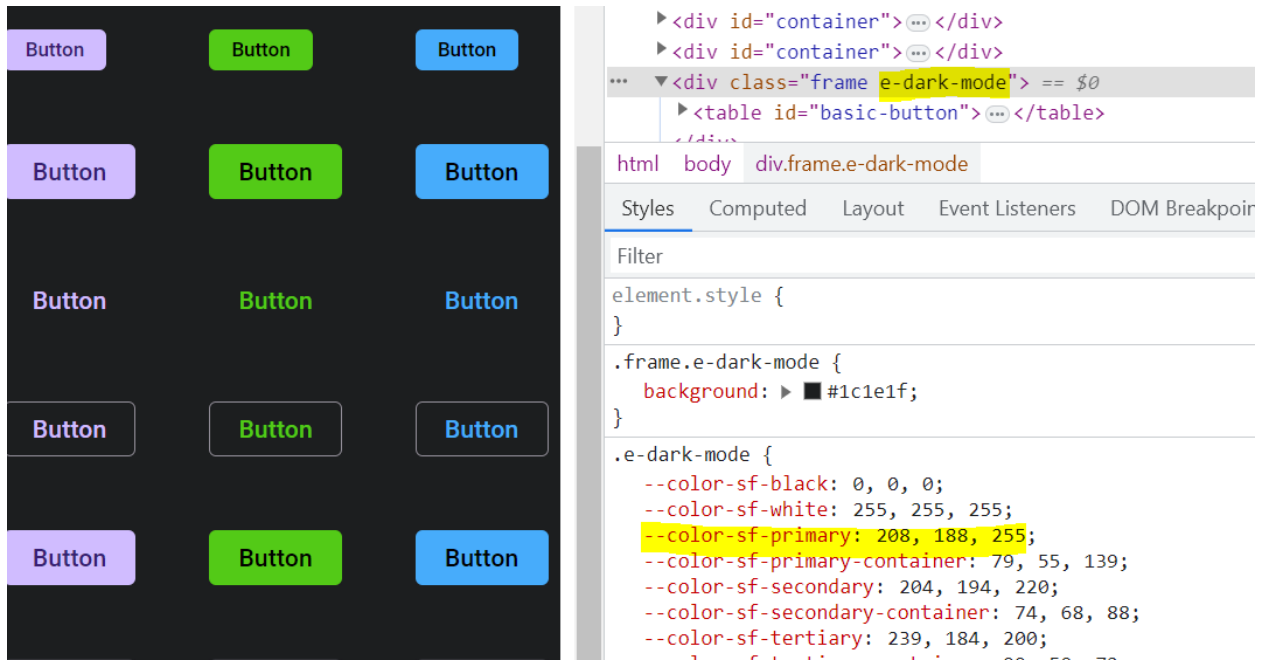

The above example demonstrates the appearance of an application in dark mode. By using CSS variable support, the transition between light and dark mode is smooth and visually pleasing.

`CSS

```
.e-dark-mode {
--color-sf-black: 0, 0, 0;
--color-sf-white: 255, 255, 255;
--color-sf-primary: 208, 188, 255;
--color-sf-primary-container: 79, 55, 139;
--color-sf-secondary: 204, 194, 220;
--color-sf-secondary-container: 74, 68, 88;
--color-sf-tertiary: 239, 184, 200;
--color-sf-tertiary-container: 99, 59, 72;
--color-sf-surface: 28, 27, 31;
--color-sf-surface-variant: 28, 27, 31;
--color-sf-background: var(--color-sf-surface);
--color-sf-on-primary: 55, 30, 115;
--color-sf-on-primary-container: 234, 221, 255;
--color-sf-on-secondary: 51, 45, 65;
--color-sf-on-secondary-container: 232, 222, 248;
--color-sf-on-tertiary: 73, 37, 50;
}
```

[How to switch to dark mode](#)

With this CSS variable support, transitioning between light and dark theme modes has become effortless. To switch to dark mode, simply add the `e-dark-mode` class to the body section of your application. Upon adding this class, the theme will seamlessly switch to dark mode. Please refer to the example image below for guidance.

ThemeStudio application

The ThemeStudio application now includes seamless integration with the Material 3 theme, offering a comprehensive solution for customization requirements. This enhancement enables users to effortlessly customize and personalize their themes.

Access the Syncfusion ThemeStudio application, featuring the Material 3 theme, via the following link:

Common

Accessibility in Syncfusion EJ2 JavaScript controls

Accessibility overview

Accessibility in controls refers to the practice of designing and building user interface elements in a way that makes them accessible to users with disabilities. This can include a variety of things, such as making sure that text is high-contrast and easy to read, providing alternative text for images, and designing controls and interactions that can be used with a keyboard or assistive technology.

Accessibility standards

The control is said to be accessible when it is constructed in accordance with certain standards that are required to make it accessible.

The accessibility of the controls consists of the following standards and aspects:

- [ADA](#) - A law to ensure that people with disabilities have the same opportunities and access as people without disabilities.
- [WCAG 2.2](#) - The Web Content Accessibility Guidelines (WCAG) provide guidelines developed by the World Wide Web Consortium (W3C) to ensure web content is accessible to people with disabilities. WCAG 2.2 establishes a framework of accessibility principles and their associated success criteria. The level of accessibility conformance achieved by a web application is

determined by the extent to which it meets these success criteria, categorized into three levels: A, AA, and AAA.

- [Section 508](#) - It is a set of guidelines for making electronic and information technology (EIT) accessible to people with disabilities. These standards apply to federal agencies in the United States, and they are based on the Web Content Accessibility Guidelines (WCAG).
- [WAI-ARIA](#) - WAI-ARIA stands for "Web Accessibility Initiative - Accessible Rich Internet Applications." It is a set of technical specifications and guidelines developed by the World Wide Web Consortium (W3C) as part of the Web Accessibility Initiative (WAI). WAI-ARIA is designed to enhance the accessibility of dynamic web content, particularly web applications and rich internet applications (RIAs), for people with disabilities. WAI-ARIA provides a set of roles, states, and properties that can be added to HTML elements to provide additional context and information about the purpose and behavior of those elements. This can help assistive technologies better understand and interpret web content and interact with web applications.
- [Keyboard navigation](#) - It refers to the ability to use a keyboard to interact with and navigate through a user interface. It is an important aspect of web accessibility, as it allows people who cannot use a mouse or other pointing device to access and use web content and applications.

Syncfusion EJ2 JavaScript controls adhere to these established standards.

Accessibility compliance

The accessibility support provided by Syncfusion EJ2 JavaScript controls is based on a collection of methodologies for adhering to and applying [recognized standards and technical specifications](#) to ensure an intuitive experience for people with disabilities.

There are several methodologies of accessibility validation that can be performed on the Syncfusion EJ2 JavaScript controls, such as:

- The [WAI-ARIA patterns](#) are followed by the Syncfusion EJ2 JavaScript controls to enable appreciable accessibility.
- Each EJ2 JavaScript control is subjected to manual testing with a screen reader and also automated test cases to ensure the control's required attributes.
- Attributes are allocated and updated correctly during interaction as well. Each control has been assigned a distinct **Role** attribute and its own set of ARIA attributes defined by the [WCAG 2.2](#) specification.

In addition to the methodologies mentioned above, Syncfusion EJ2 JavaScript controls are constructed to support the following accessibility aspects.

Screen reader support

A screen reader allows people who are blind or visually impaired to use a computer by reading aloud the text that is displayed on the screen. Syncfusion EJ2 JavaScript controls followed the [WAI-ARIA](#) standards to work properly in the screen readers such as [Narrator](#) for Windows and [Embedded VoiceOver](#) for MAC.

Right-To-Left support

Right-to-Left (RTL) support allows applications to effectively communicate with users who use languages that are written from right to left, such as Arabic, Hebrew, etc. Syncfusion EJ2 JavaScript controls support the Right-to-Left feature. Refer to the [Right-to-Left documentation](#) to learn more about this support.

Color contrast

Syncfusion EJ2 JavaScript controls come equipped with [predefined themes](#) that guarantee the presence of satisfactory color contrast, benefiting individuals with visual impairments.

Mobile device support

Syncfusion EJ2 JavaScript controls are more user-friendly and accessible to individuals using mobile devices, including those with disabilities. These are designed to be responsive, adaptable to various screen sizes and orientations, and touch-friendly.

Keyboard navigation support

Syncfusion EJ2 JavaScript controls support keyboard navigation, allowing users who rely on alternate methods to effortlessly navigate and interact with the control.

Ensuring accessibility

Ensuring the accessibility of Syncfusion EJ2 JavaScript controls is crucial for making the product inclusive and user-friendly for individuals with disabilities. This process involves various types of accessibility testing, including:

- **Automated testing:** The Syncfusion EJ2 JavaScript control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools.
- **Manual testing:** This type of testing involves manually evaluating the Syncfusion EJ2 JavaScript controls. During manual accessibility testing, testers will ensure accessibility using the screen readers such as [Narrator](#) for Windows and [Embedded VoiceOver](#) for MAC.

Syncfusion EJ2 JavaScript controls will keep improving when there is anything required. It also involves client feedback to make the control more accessible.

Accessibility support for specific controls

Consult the control-specific documents below for detailed information about how Syncfusion EJ2 JavaScript controls ensure compliance with accessibility standards, encompassing Section 508, WAI-ARIA, WCAG 2.2, keyboard navigation, and more.

Animation in EJ2 JavaScript

The **Animation** is used to perform animation effects on HTML elements by running a sequence of frames. It can be used to enhance the user experience.

Syncfusion [Animation](#) library supports animating the HTML elements using the [animate](#) method. This method adds the `e-animate`, `e-animation-id` attributes, and CSS style to the HTML element and removes them after the animation effect is completed.

Animation effects

An animation effect refers to the visual change that occurs over a period of time in HTML elements. The [Animation](#) library supports different types of animation [effects](#). The [name](#) property is used to specify the animation effect of an animation.

Here is an example code snippet using the `FadeOut` and `ZoomOut` animation effects:

INDEX.TS

```
import {Animation} from '@syncfusion/ej2-base';
let animation: Animation = new Animation();
animation.animate('#element1', { name: 'FadeOut' });
animation.animate('#element2', { name: 'ZoomOut' });
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
```

```
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element1"></div>
        <div id="element2"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Animation duration

Animation [duration](#) is the animation property that specifies the length of time that an animation should take to complete. The animation duration is specified in milliseconds (ms) and determines the total amount of time that an animation should run.

For example, if an animation has a duration of 2 seconds, it will take 2 seconds to complete from start to finish. The duration of an animation affects the overall pace of the animation and can be adjusted to match the desired speed and style of the animation.

The value of the animation duration can be adjusted to change the speed of the animation, with shorter durations resulting in faster animations and longer durations resulting in slower animations.

Here is an example code snippet using the animation effects with a duration of **5000** milliseconds:

INDEX.TS

```
import {Animation} from '@syncfusion/ej2-base';
let animation: Animation = new Animation({ duration: 5000 });
animation.animate('#element1', { name: 'FadeOut' });
animation.animate('#element2', { name: 'ZoomOut' });
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
```

```
<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element1"></div>
        <div id="element2"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Animation delay

The animation [delay](#) is the animation property that specifies the amount of time to wait before starting an animation. The animation delay is specified in milliseconds (ms) and determines the amount of time that should elapse before an animation begins.

For example, if an animation has a delay of 2 seconds, it will wait for 2 seconds before starting. This can be useful in creating more complex animations, where multiple elements are animated in sequence, or in creating animations that start only after a user interaction has taken place.

Here is an example code snippet using the animation effects with a delay of **2000** milliseconds:

INDEX.TS

```
import {Animation} from '@syncfusion/ej2-base';
let animation: Animation = new Animation({ delay: 2000, duration: 5000 });
animation.animate('#element1', { name: 'FadeOut' });
animation.animate('#element2', { name: 'ZoomOut' });
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element1"></div>
        <div id="element2"></div>
    </div>
</script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable or disable animation globally

Enable or disable animation for all EJ2 JavaScript controls globally by using the `setGlobalAnimation` method with one of the below options:

- `GlobalAnimationMode.Enable` - Enables the animation for all components, regardless of the individual component's animation settings.
- `GlobalAnimationMode.Disable` - Disables the animation for all components, regardless of the individual component's animation settings.
- `GlobalAnimationMode.Default` - Animation is enabled or disabled based on the component's animation settings.

In the below code snippet, animation is disabled.

INDEX.TS

```
import { GlobalAnimationMode, setGlobalAnimation } from "@syncfusion/ej2-base";
setGlobalAnimation(GlobalAnimationMode.Disable);
```

`setGlobalAnimation` method controls script-level animations only, and it is not applicable for direct CSS-level animations (animations defined from CSS classes or properties).

Right-To-Left support in Syncfusion JavaScript Controls

Right-to-Left (RTL) support allows applications to effectively communicate with users who use languages that are written from right to left, such as Arabic, Hebrew, etc.

Syncfusion JavaScript (ES5) controls support for right-to-left (RTL) by setting the `enableRtl` property to `true`. This adds the class name `e-rtl` to the control element and renders all Syncfusion JavaScript controls in a right-to-left direction.

Enable RTL for all controls

To enable Right-To-Left (RTL) support for all controls, users can set the `enableRtl` property directly in their application. Here is an example code snippet using the `ListView` control:

INDEX.TS

```
import { enableRtl } from '@syncfusion/ej2-base';
import { ListView } from '@syncfusion/ej2-lists';
import { data } from './datasource.ts';
// Enables Right to left alignment for all controls
enableRtl(true);
let rtlListObj: ListView = new ListView({
  dataSource: data,
  headerTitle: 'کاری',
  showHeader: true,
  height: '350px'
});
rtlListObj.appendTo('#listview');
```

INDEX.HTML

```
<!DOCTYPE html><html><head>
  <meta charset="UTF-8">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
lists/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="listview"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable RTL for an individual control

To enable Right-To-Left (RTL) support for an individual control, users can set the [enableRtl](#) property in the control's options. Here is an example code snippet using the ListView control:

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
import { data } from './datasource.ts';
let rtlListObj: ListView = new ListView({
  dataSource: data,
  enableRtl: true,
  headerTitle: 'کاری',
  showHeader: true,
```

```

        height: '350px'
    });
    rtlListObj.appendTo('#listview');

```

INDEX.HTML

```

<!DOCTYPE html><html><head>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
    lists/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="es5-datasource.js" type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="listview"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

State Persistence in Syncfusion JavaScript controls

Syncfusion JavaScript controls support persisting their state across page refreshes or navigation. To enable this feature, set the [enablePersistence](#) property to `true` for the desired control. This stores the control's state in the browser's `localStorage` object on the `unload` event of the page. For example, the [enablePersistence](#) property can be set for the Grid control, as shown in the following code snippet.

INDEX.TS

```

import { Grid, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Page);
let grid: Grid = new Grid({
    dataSource: data,
    enablePersistence: true,
    columns: [
        { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120, type: 'number' },
        { field: 'CustomerID', width: 140, headerText: 'Customer ID', type:
'string' },
        { field: 'Freight', headerText: 'Freight', textAlign: 'Right',
width: 120, format: 'C' },
        { field: 'OrderDate', headerText: 'Order Date', width: 140, format:
'yMd' }
    ],

```

```
    allowPaging: true,  
    pageSettings: { pageSize: 7 }  
});  
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html><head>  
  
    <meta charset="utf-8">  
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

- [Tabs](#)

Template Engine

Syncfusion JavaScript (Essential JS 2) has built-in template engine which provides options to compile template string into a executable function. Then the generated executable function can be used for rendering DOM element using desired data.

Compiling

`compile` method from `ej2-base` can be used to convert our template strings into executable functions.

INDEX.TS

```
import { compile } from '@syncfusion/ej2-base';
// data
let data: object = { name: 'Aston Martin' };
// Compiling template string into executable function
let getDOMString: (data: object) => NodeList =
  compile('<div>${name}</div>');
// Using generated function to get output element collection
let output: NodeList = getDOMString(data);
// append html collection to element
document.getElementById('element').appendChild(output[0]);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

To enable strict Content Security Policy (CSP), it is recommended to utilize the [function template](#) approach instead of the string template.

Available template syntax

Name	Syntax	Description
---	---	---
Expression	<div>\${name}</div>	We have expression evolution as like ES6 expression string literals.
Dot Variable Access	<div>\${person.info.name}</div>	Access the json variable with dot notation.
Variable Function	<div>\${name.toUpperCase()}</div>	Utilize the variable function example, name.toUpperCase()
Window Function	<div>\${getCurrentTime()}</div>	Use window function inside template. Note: Here, getCurrentTime() is a function that defined in the window object.
Custom Helper Function	<div>\${covertToCurrency()}</div>	Use function that passed in helper function.
IF Else Statement	<div> \${if(gender==="male")} Male \${else} Female \${/if} </div>	Branching statement in Template.
For Statement	<div> \${for(mark of marks)} \${mark} \${/for} </div>	Use for looping inside template.
For Index value access	<div> \${for(mark of marks)} \${markIndex} \${/for} </div>	Get the index value of item while using for statement. Use the variable Index that suffixed with loop item name.

Custom helper

Custom helper function can be defined and passed to `compile` function. Refer to the following example.

INDEX.TS

```
import { compile } from '@syncfusion/ej2-base';
let customHelper: Object = {
  upperCase: (str: string) => {
    return str.toUpperCase();
  }
};
let data: object = { name: 'Aston Martin' };
let getDOMString: (data: object) => HTMLCollection =
compile('<div>${upperCase(name)}</div>', customHelper);
let opElem: HTMLCollection = getDOMString(data);
document.getElementById('element').appendChild(opElem[0]);
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Template in Syncfusion EJ2 JavaScript controls

Syncfusion JavaScript controls are rendered with a pre-defined layout or structure that is used to define how the control should be rendered on the user interface. The user wants to customise the appearance of the control and add functionality that is specific to the needs of the application. Syncfusion JavaScript controls have the option to achieve this using template support. A template can contain a variety of elements, depending on the context in which it is being used.

Types of templates

Syncfusion JavaScript controls have two types of templates, such as:

- [String template](#)

- [Script template](#)
- [Function template](#)

String template

Users can add templates to Syncfusion JavaScript controls by using **string literals** and JavaScript expressions. Using this approach, the template string is passed to the library's template engine, which parses the string and generates the corresponding HTML elements along with the data bindings.

The template string can be added directly to the **template** property of the control. Refer to the following code snippet.

INDEX.TS

```
import { Grid } from '@syncfusion/ej2-grids';
let grid: Grid = new Grid({
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width: 125 },
    { field: 'CustomerName', headerText: 'Customer Name', width: 125 },
    { headerText: 'ShipCountry', template: '<div>${ShipCountry}</div>', width: 125 },
  ],
  dataSource: [
    { OrderID: 10248, ShipCountry: "France", CustomerName: "Paul Henriot" },
    { OrderID: 10249, ShipCountry: "Germany", CustomerName: "Karin Josephs" },
    { OrderID: 10250, ShipCountry: "Brazil", CustomerName: "Mario Pontes" },
    { OrderID: 10251, ShipCountry: "France", CustomerName: "Mary Saveley" }
  ],
  width: 'auto',
  height: 359
});
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html>
<html lang="en">
<head>
  <title>EJ2 Grid</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Grid Control">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
  <div id="container">
    <div id="Grid"></div>
```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Script template

A script template is a type of template that uses a scripting language, such as JavaScript, to define the structure and layout of the content that is displayed in the control. These template elements can be defined in the `script` tag along with the unique identifier. The script template's identifier needs to be mapped to the corresponding control's template property along with the fragment identifier (#). Refer to the below code sample.

Add the below HTML template to the `index.html` file.

```

`html
<script id="customTemplate" type="text/x-template">
<tr>
<td class="photo">
    ${EmployeeID}
</td>
<td class="details">

|            |               |
|------------|---------------|
| First Name | \${FirstName} |
| Last Name  | \${LastName}  |
| Title      | \${Title}     |
| Country    | \${Country}   |

</td>
</tr>
</script>
`

```

Here, the script template identifier (customTemplate) is assigned to the `template` property of the Grid control. Refer to the following code snippet.

INDEX.TS

```

import { Grid } from '@syncfusion/ej2-grids';
import { employeeData } from '../datasource.ts';

```

```

let grid: Grid = new Grid({
    dataSource: employeeData,
    rowTemplate: '#customTemplate',
    columns: [
        { headerText: 'Employee ID', width: 150, textAlign: 'Center', field:
'OrderID' },
        { headerText: 'Employee Details', width: 300, field: 'EmployeeID' }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

```

Function template

The function template approach is compatible with the strict guidelines of [Content-Security-Policy \(CSP\)](#). In the application, JavaScript functions with [string literals](#) can be used to add templates in the Syncfusion JavaScript (ES5) controls. This approach eliminates the need for the `unsafe-eval` keyword in the meta tag of project pages. It is essential to convert all inline string and script templates into function templates that comply with the [Content-Security-Policy \(CSP\)](#) guidelines in order to avoid potential security risks and enhance the overall safety of the application.

Lets discuss about converting the existing [string template](#) and [script template](#) into a function template approach.

Convert the existing string template into function template

To convert the existing [string template](#) into function template, create a function template and define the template using [template literals](#) enclosed in backticks. Add the following function template to the `index.html` file.

```
`js
```

```
var customTemplate = (data) => <div class="template">${data.ShipCountry}</div>
```

```
,
```

Here, the function template identifier (customTemplate) is assigned to the `template` property of the Grid control. Refer to the following code snippet.

INDEX.TS

```
import { Grid } from '@syncfusion/ej2-grids';
//function template
```

```

var customTemplate = (data: any) => `<div
class="template">${data.ShipCountry}</div>`
let grid: Grid = new Grid({
columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right', width:
125 },
    { field: 'CustomerName', headerText: 'Customer Name', width: 125 },
    { headerText: 'ShipCountry', template: customTemplate, width: 125 },
],
dataSource: [
    { OrderID: 10248, ShipCountry: "France", CustomerName: "Paul Henriot" },
    { OrderID: 10249, ShipCountry: "Germany", CustomerName: "Karin Josephs"
},
    { OrderID: 10250, ShipCountry: "Brazil", CustomerName: "Mario Pontes" },
    { OrderID: 10251, ShipCountry: "France", CustomerName: "Mary Saveley" }
],
width: 'auto',
height: 359
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Grid</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript Grid Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>
    <div id="container">
        <div id="Grid"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Convert the existing script template into function template

To convert the existing [script template](#) into function template, create a function template and define the template using [template literals](#) enclosed in backticks. Add the following function template to the `index.js` file.

```
`js
var customTemplate = (data) => `<tr>
<td class="photo">
${data.EmployeeID}
</td>
<td class="details">
```

First Name	\${data.FirstName}
Last Name	\${data.LastName}
Title	\${data.Title}
Country	\${data.Country}

```
</td>
</tr>`
`
```

Here, the function template identifier (customTemplate) is assigned to the `template` property of the Grid control. Refer to the following code snippet.

INDEX.TS

```
import { Grid } from '@syncfusion/ej2-grids';
import { employeeData } from './datasource.ts';
//function template
let customTemplate = (data: any) => `<tr>
  <td class="photo">
    ${data.EmployeeID}
  </td>
  <td class="details">
    <table class="CardTable" cellpadding="3" cellspacing="2">
      <colgroup>
        <col width="50%">
        <col width="50%">
      </colgroup>
      <tbody>
        <tr>
          <td class="CardHeader">First Name </td>
          <td>${data.FirstName} </td>
        </tr>
        <tr>
          <td class="CardHeader">Last Name</td>
          <td>${data.LastName} </td>
```

```

        </tr>
        <tr>
            <td class="CardHeader">Title</td>
            <td>${data.Title}</td>
        </tr>
        <tr>
            <td class="CardHeader">Country</td>
            <td>${data.Country}</td>
        </tr>
    </tbody>
</table>
</td>
</tr>`;
let grid: Grid = new Grid({
    dataSource: employeeData,
    rowTemplate: customTemplate,
    columns: [
        { headerText: 'Employee ID', width: 150, textAlign: 'Center', field: 'OrderID' },
        { headerText: 'Employee Details', width: 300, field: 'EmployeeID' }
    ],
    height: 315
});
grid.appendTo('#Grid');

```

INDEX.HTML

```

<!DOCTYPE html>
<html lang="en">
<head>
    <title>EJ2 Grid</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>

```

Getting started with Localization

Localization library allows you to localize the text content of the Syncfusion React UI Components. This is useful if you want to display the UI in a language other than English.

Loading translations

To load a translation object in your application, you can use the load function from the @syncfusion/ej2-base module. This function takes an object that contains the translations for various languages, with the keys being the language codes and the values being the translation objects.

INDEX.TS

```
import { L10n } from '@syncfusion/ej2-base';
import { Grid, Group, Page } from '@syncfusion/ej2-grids';
import { data } from './datasource.ts';
Grid.Inject(Group, Page);
L10n.load({
  'de-DE': {
    'grid': {
      'EmptyRecord': 'Keine Aufzeichnungen angezeigt',
      'GroupDropArea': 'Ziehen Sie einen Spaltenkopf hier, um die
Gruppe ihre Spalte',
      'UnGroup': 'Klicken Sie hier, um die Gruppierung aufheben',
      'EmptyDataSourceError': 'DataSource darf bei der Erstaustauslastung
nicht leer sein, da Spalten aus der dataSource im AutoGenerate
Spaltenraster',
      'Item': 'Artikel',
      'Items': 'Artikel'
    },
    'pager': {
      'currentPageInfo': '{0} von {1} Seiten',
      'totalItemsInfo': '({0} Beiträge)',
      'firstPageTooltip': 'Zur ersten Seite',
      'lastPageTooltip': 'Zur letzten Seite',
      'nextPageTooltip': 'Zur nächsten Seite',
      'previousPageTooltip': 'Zurück zur letzten Seit',
      'nextPagerTooltip': 'Zum nächsten Pager',
      'previousPagerTooltip': 'Zum vorherigen Pager'
    }
  }
});
let grid: Grid = new Grid({
  dataSource: data,
  locale: 'de-DE',
  allowGrouping: true,
  allowPaging: true,
  pageSettings: { pageSize: 6 },
  columns: [
    { field: 'OrderID', headerText: 'Order ID', textAlign: 'Right',
width: 120 },
    { field: 'CustomerID', headerText: 'Customer ID', width: 150 },
    { field: 'ShipCity', headerText: 'Ship City', width: 150 },
    { field: 'ShipName', headerText: 'Ship Name', width: 150 }
  ],
  height: 210
});
```

```
grid.appendTo('#Grid');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Grid</title>

splitbuttons/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="es5-datasource.js" type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="Grid"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Changing current locale

The current locale can be changed for all the Syncfusion React UI Components in your application by invoking `setCulture` function with your desired culture name.

```
`ts
import {L10n, setCulture} from '@syncfusion/ej2-base';
L10n.load({
  'fr-BE': {
    'Button': {
      'id': 'Numéro de commande',
      'date': 'Date de commande'
    }
  }
});
setCulture('fr-BE');
```

Note: Before changing a culture globally, you need to ensure that locale text for the concerned culture is loaded through `L10n.load` function.

Internationalization

The `Internationalization` library provides support for formatting and parsing date and number objects using the official [Unicode CLDR](#) JSON data. The `en-US` locale is set as default *culture* and `USD` is set as default *currencyCode* for all Syncfusion JavaScript UI controls.

Loading culture data

It requires the following CLDR data to be load using `loadCldr` function for cultures other than `en-US`.

File Name	Path
ca-gregorian	cldr/main/en/ca-gregorian.json
timeZoneNames	cldr/main/en/timeZoneNames.json
numbers	cldr/main/en/numbers.json
numberingSystems	cldr/supplemental/numberingSystems.json
currencies	cldr/main/en/currencies.json

Note: For `en`, dependency files are already loaded in the library.

Installing CLDR data

CLDR data is available as npm package. So, we can install it through below command to our package.

```
`bash
npm install cldr-data
```

`

Binding to i18n library

`ts

```
import { loadCldr } from '@syncfusion/ej2-base';
```

```
loadCldr(enNumberData, entimeZoneData);
```

`

Changing global culture and currency code

To set the default culture and the currency code for all Syncfusion JavaScript UI controls, you can use the methods `setCulture` for setting the default locale and `setCurrencyCode` for setting the currency code.

`ts

```
import { setCulture, setCurrencyCode } from '@syncfusion/ej2-base';
```

```
setCulture('ar');
```

```
setCurrencyCode('QAR');
```

`

Note: If global culture is not set, then `en-US` is set as the default locale, and `USD` is set as the default currency code.

Manipulating numbers

`<!-- markdownlint-disable MD024 -->`

Supported format string

`<!-- markdownlint-disable MD024 -->`

Based on the [NumberFormatOptions](#) number formatting and parsing operations are processed. You need to specify some or all of the following properties mentioned below table.

No	Properties	Description
----	------------	-------------

1	<code>format</code>	Denotes the format to be set .Possible values are 1. N - denotes numeric type. 2. C - denotes currency type. 3. P - denotes percentage type. E.g: <code>formatNumber(1234344 ,{format:'N4'})</code> . Note: If no format is specified it takes numeric as default format type.
---	---------------------	--

2	<code>minimumFractionDigits</code>	Indicates the minimum number of fraction digits. Possible values are 0 to 20.
---	------------------------------------	---

3	<code>maximumFractionDigits</code>	Indicates the maximum number of fraction digits. Possible values are 0 to 20.
---	------------------------------------	---

4	<code>minimumSignificantDigits</code>	Indicates the minimum number of significant digits. Possible values are 1 to 21. Note: If <code>minimumSignificantDigits</code> is given it is mandatory to give <code>maximumSignificantDigits</code>
---	---------------------------------------	---

5	<code>maximumSignificantDigits</code>	Indicates the maximum number of significant digits. Possible values are 1 to 21.
---	---------------------------------------	--

6	<code>useGrouping</code>	Indicates whether to use grouping. Possible values are <code>true</code> or <code>false</code> . Default value is <code>true</code> .
---	--------------------------	---

| 5 | `maximumSignificantDigits` | Indicates the maximum number of significant digits. . Possible values are 1 to 21. **Note:** If `maximumSignificantDigits` is given it is mandatory to give `minimumSignificantDigits` |

| 6 | `useGrouping` | Indicates whether to enable the group separator or not . By default grouping value will be true. |

| 7 | `minimumIntegerDigits` | Indicates the minimum number of the integer digits to be placed in the value. Possible values are 1 to 21. |

| 8 | `currency` | Indicates the currency code which needs to be considered for the currency formatting. |

Note: The `minimumIntegerDigits`, `minimumFractionDigits` and `maximumFractionDigits` are categorized

as group one,

`minimumSignificantDigits` and `maximumSignificantDigits` are categorized as group two.

If group two properties are defined, then the group one properties will be ignored.

Custom number formatting and parsing

Custom number formatting and parsing can also be achieved by directly specifying the pattern in the **format** property of `NumberFormatOptions`. One or more of the custom format specifiers listed in the table below can be used to create custom number format.

Specifier	Description	Input	Format Output
-----------	-------------	-------	---------------

-----	-----	-----	-----
-------	-------	-------	-------

0	Replaces the zero with the corresponding digit if one is present. Otherwise, zero appears in the result string.	<code>instance.formatNumber(123,{format: '0000' })</code>	'0123'
---	---	---	--------

#	Replaces the "#" symbol with the corresponding digit if one is present; otherwise, no digit appears in the result string.	<code>instance.formatNumber(1234,{format: '####' })</code>	'1234'
---	---	--	--------

.	Denotes the number of digits allowed after the decimal points if it's not specified then no need to specify decimal point values.	<code>instance.formatNumber(546321,{format: '###0.##0#' })</code>	'546321.000'
---	---	---	--------------

%	Percent specifier denotes the percentage type format.	<code>instance.formatNumber(1,{format: '0000 %' })</code>	'0100 %'
---	---	---	----------

\$	Denotes the currency type format based on the global currency code specified.	<code>instance.formatNumber(13,{format: '\$ ###.00' })</code>	'\$ 13.00'
----	---	---	------------

;	Denotes separate formats for positive, negative and zero values.	<code>instance.formatNumber(-120,{format: '###.##;(###.00);-0'})</code>	'(120.00)'
---	--	---	------------

'String' (single Quotes)	Denotes the characters enclosed within single Quote(') to be replaced in the resultant string.	<code>instance.formatNumber(-123.44,{format: '####.## '@'})</code>	'123.44 @'
--------------------------	--	--	------------

Note: If a custom format pattern is specified, other [NumberFormatOptions](#) properties will not be considered.

Number Parsing

`getNumberParser`

The [getNumberParser](#) method, which will return a function that parses a given string based on the [NumberFormatOptions](#) specified.

INDEX.TS

```
import { Internationalization } from '@syncfusion/ej2-base';
let intl: Internationalization = new Internationalization();
let nParser: Function = intl.getNumberParser({ format: 'P2' , useGrouping:
false });
let val: number = nParser('123567.45%');
document.querySelector('.result').innerHTML = val + '');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Form Validator</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

`parseNumber`

The [parseNumber](#) method, which takes two arguments, the string value and [NumberFormatOptions](#) and returns the numeric value.

INDEX.TS

```
import { Internationalization } from '@syncfusion/ej2-base';
let intl: Internationalization = new Internationalization();
```

```
let val: number = intl.parseNumber('$01,234,545.650', { format: 'C3',
currency: 'USD', minimumIntegerDigits: 8 });
document.querySelector('.result').innerHTML = val + '');
```

INDEX.HTML

Manipulating dateTime

Supported format string

Date formatting and parsing operations are performed based on the [DateFormatOptions](#). You need to specify some or all of the following properties mentioned in the table below.

| Options | Descriptions |

| --- | --- | --- |

| Type | It specifies the type of format to be used supported types .
1. **date**
2. **dateTime**
3. **time**
Based on the type specified the supported skeletons are given below.
1. short
2. medium,
3. long
4. full
E.g: formatDate(new Date(), {type: 'date', skeleton:medium})
Note: If no type is specified then **date** type is set by default. |

| skeleton | Specifies the format in which the **dateTime** format will process |

<!-- markdownlint-disable MD036 -->

Date type skeletons

| skeleton | Option input | Format Output |

| --- | --- | --- |

| short | {type: 'date', skeleton:'short'}) | 11/4/16 |

| medium | {type: 'date', skeleton:'medium'}) | Nov 4, 2016 |

| long | {type: 'date', skeleton:'long'}) | November 4, 2016 |

| full | {type: 'date', skeleton:'full'}) | Friday, November 4, 2016 |

Time type skeletons

| skeleton | Option input | Format Output |

| --- | --- | --- |

| short | {type: 'time', skeleton:'short'}) | 1:03 PM |

medium	{type: 'time', skeleton:'medium'}	1:03:04 PM
Long	{type: 'time', skeleton:'long'})	1:03:04 PM GMT+5
full	{type: 'time', skeleton:'full'})	1:03:04 PM GMT+05:30

DateTime type skeletons

Skeleton	Option input	Format Output
short	{type: 'dateTime', skeleton:'short'}	11/4/16, 1:03 PM
medium	{type: 'dateTime', skeleton:'medium'}	Nov 4, 2016, 1:03:04 PM
Long	{type: 'dateTime', skeleton:'long'})	November 4, 2016 at 1:03:04 PM GMT+5
full	{type: 'dateTime', skeleton:'full'})	Friday, November 4, 2016 at 1:03:04 PM GMT+05:30

Additional skeletons

Apart from the standard date type formats additional format are supported by using the additional skeletons given in below table.

skeleton	Option input	Format Output
d	{skeleton:'d'}	7
E	{skeleton:'E'}	Mon
Ed	{skeleton:'Ed'}	7 Mon
Ehm	{skeleton:'Ehm'}	Mon 12:43 AM
EHm	{skeleton:'EHm'}}	Mon 12:43
Ehms	{skeleton:'Ehms' }	Mon 2:45:23 PM
EHms	{skeleton:'EHms'}}	Mon 12:45:45
Gy	{skeleton:'Gy' }	2016 AD
GyMMM	{skeleton:'GyMMM'}	: Nov 2016 AD
GyMMMd	{skeleton:'GyMMMd'}	Nov 7, 2016 AD
GyMMMEd	{skeleton:'GyMMMEd'}	Mon, Nov 7, 2016 AD
h	{skeleton:'h'}	12 PM
H	{skeleton:'H'}	12
hm	{skeleton:'hm'}	12:59 PM
Hm	{skeleton:'Hm'}	12:59
hms	{skeleton:'hms'}	12:59:13 PM
Hms	{skeleton:'Hms'}	12:59:13
M	{skeleton:'M'}	11

Md	{skeleton:'Md'}	11/7
MEd	{skeleton:'hms'}	Mon, 11/7
MMM	{skeleton:'MMM'}	Nov
MMMEd	{skeleton:'MMMEd'}	Mon, Nov 7
MMMd	{skeleton:'MMMEd'}	Nov 7
ms	{skeleton:'ms'}	59:13
y	{skeleton:'y'}	2016
yM	{skeleton:'yM'}	11/2016
yMd	{skeleton:'yMd'}	11/7/2016
yMEd	{skeleton:'yMEd'}	Mon, 11/7/2016
yMMM	{skeleton:'yMMM'}	Nov 2016
yMMMd	{skeleton:'yMMMd'}	Nov 7, 2016
yMMMEd	{skeleton:'yMMMEd'}	Mon, Nov 7, 2016
yMMM	{skeleton:'yMMM'}	Nov 2016

Note: Culture specific format skeletons are also supported.

Custom formats

To use the custom date and time formats we need to specify the date/time pattern directly in the *format* property.

Custom format string must contain one or more of the following standard date/time symbols

Symbols	Description
-----	-----
G	Denotes the era in the date
y	Denotes the year.
M / L	Denotes month.
E / c	Denotes the day of week.
d	Denotes the day of month.
h / H	Denotes the hour. <i>h</i> for 12 hour and <i>H</i> for 24 hours format.
m	Denotes minutes.
s	Denotes seconds.
a	Denotes the am/pm designator it will only be displayed if hour is specified in the <i>h</i> format.
z	Denotes the time zone.
' (single quotes)	To display words in the formatted date you can specify the words with in the single quotes

Custom format example

```
`ts
import { Internationalization } from '@syncfusion/ej2-base';
let intl: Internationalization = new Internationalization();
let formattedString: string = intl.formatDate(new Date('1/12/2014 10:20:33'), { format: '\year:\y'
\month:\ MM' });
//Output: "year:2014 month:01"
```

Note: If the format property is given as an option, other properties are not considered.

```
<!-- markdownlint-enable MD036 -->
```

Date Parsing

```
`getDateParser`
```

The [getDateParser](#) method will return a function that parses a given string based on the [DateFormatOptions](#) specified.

INDEX.TS

```
import { Internationalization } from '@syncfusion/ej2-base';
let intl: Internationalization = new Internationalization();
let dParser: Function = intl.getDateParser({skeleton: 'full', type:
'datetime'});
let val: Date = dParser('Friday, November 4, 2016 at 1:03:04 PM GMT+05:30');
document.querySelector('.result').innerHTML = val.toString();
```

INDEX.HTML

```

<!-- markdownlint-enable MD036 -->

Drag and drop in EJ2 JavaScript

Drag and drop is a feature of a user interface that allows users to select an item or items and then move them to a different location or onto another interface element by "dragging" the selected item(s) with a pointing device (such as a mouse) and then "dropping" them at the desired location.

Syncfusion JavaScript controls support drag and drop feature through two libraries. These are [Draggable](#) and [Droppable](#).

Draggable

The Syncfusion's [Draggable](#) library allows users to make any DOM element draggable by passing it as a parameter to the [Draggable](#) constructor. This can be useful for creating interactive and user-friendly

interfaces, such as allowing a user to reorder items in a list by dragging them. The below code snippet enables the draggable functionality for the specific DOM element passed to the `Draggable` constructor.

INDEX.TS

```
import {Draggable} from '@syncfusion/ej2-base';
let dragElement: HTMLElement = document.getElementById('element1');
let draggable: Draggable = new Draggable(dragElement, { clone: false });
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Draggable</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element1"><p>Draggable Element </p></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Clone draggable element

Syncfusion provides the option to create a clone of a draggable element while the user is dragging it. It can be achieved by setting the `clone` property to `true`. Here's an example of how to create a clone of a draggable element.

INDEX.TS

```
import {Draggable} from '@syncfusion/ej2-base';
let dragElement: HTMLElement = document.getElementById('element1');
let draggable: Draggable = new Draggable(dragElement, { clone: true });
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Draggable</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element1"><p>Draggable Element </p></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Drag area

A drag area is a specific area within a user interface that is designated for drag and drop operations. When an object or element is dragged within a drag area, certain actions or events may be triggered. The user can specify the drag area by using the [dragArea](#) property. Refer to the below sample.

INDEX.TS

```

import { Draggable, Droppable, DropEventArgs } from '@syncfusion/ej2-base';
let draggable: Draggable = new
Draggable(document.getElementById('element1'), {
  clone: false, dragArea: "#droppable"
});

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Draggable</title>
  <meta charset="utf-8">

```

```

<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">
<link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="droppable">
            <p class="drop"><span>Drop Target </span></p></div>
            <div id="element1"><p class="drag-text">Drag </p></div>
        </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Droppable

Droppable element refers to an area of a user interface that can receive a draggable element that is being moved by a user. Syncfusion's [Droppable](#) library converts any DOM element into a droppable zone, which accepts draggable elements.

When a draggable element is moved over a droppable element, the [drop](#) event can be triggered. The user can get details about the dropped element through the event argument. Based on the event argument, the user can append the dragged element to the target element.

Refer to the following code snippet to enable droppable zones.

INDEX.TS

```

import { Draggable, Droppable, DropEventArgs } from '@syncfusion/ej2-base';
let draggable: Draggable = new
Draggable(document.getElementById('element1'), {
    clone: false
});
let droppable: Droppable = new
Droppable(document.getElementById('droppable'), {
    drop: (e: DropEventArgs) => {
        e.droppedElement.querySelector('.drag-text').textContent =
'Dropped';
    }
});

```

INDEX.HTML

```

Troubleshoot

Content Security Policy

Content Security Policy (CSP) is a security feature implemented by web browsers that helps to protect against attacks such as cross-site scripting (XSS) and data injection. It limits the sources from which content can be loaded on a web page.

To enable strict [Content Security Policy \(CSP\)](#), certain browser features are disabled by default. In order to use Syncfusion controls with strict CSP mode, it is essential to include following directives in the CSP meta tag.

- Syncfusion controls are rendered with calculated **inline styles** and **base64** font icons, which are blocked on a strict CSP-enabled site. To allow them, add the [style-src 'self' 'unsafe-inline'](#); and [font-src 'self' data:](#) directives in the meta tag as follows.

HTML

```
<meta http-equiv="Content-Security-Policy" content="default-src 'self';
style-src 'self' 'unsafe-inline';
font-src 'self' data:;" />
```

- Syncfusion **material** and **tailwind** built-in themes contain a reference to the [Roboto's external font](#), which is also blocked. To allow them, add the [external font](#) reference to the [style-src](#) and [font-src](#) directives in the above meta tag.

The resultant meta tag is included within the `<head>` tag and resolves the CSP violation on the application's side when utilizing Syncfusion controls with material and tailwind themes.

HTML

```
<head>
...
<meta http-equiv="Content-Security-Policy" content="default-src 'self';
style-src 'self' https://fonts.googleapis.com/ 'unsafe-inline';
font-src 'self' https://fonts.googleapis.com/ https://fonts.gstatic.com/
data:;" />
</head>
```

Note: From the release 2023 Vol2 - 22.1 version, the Content Security Policy for Syncfusion controls has been enhanced by implementing a [function template](#) approach for template properties to eliminate the usage of the `unsafe-eval` directive in the CSP meta tag.

[View the JavaScript sample enabled with strict CSP in Github](#)

How To

Updating Syncfusion npm packages

Keeping Syncfusion npm packages up to date is important to ensure that you have access to the latest features and bug fixes. The [npm-check-updates](#) package is a helpful tool that can be used to update your Syncfusion packages to their latest versions.

Updating All Syncfusion Packages

To update all Syncfusion packages, you can install the `npm-check-updates` package globally by running the following command,

```
`bash
```

```
npm install -g npm-check-updates
```

`

Next, use the `ncu` command to update the `package.json` file to the latest version for all `@syncfusion` packages,

```
`bash
```

```
ncu -u -f /^@syncfusion/
```

`

Finally, run the following commands to update the packages in `node_modules` and remove any duplicate packages that have been installed,

```
`bash
```

```
npm update
```

```
npm dedupe
```

`

Updating a specific npm package

You can also update a specific npm package by running the following commands from the command prompt in the root of your application,

```
`bash
```

```
npm update @syncfusion/ej2-grids
```

```
npm dedupe
```

`

This will update the specific package you have provided and run `npm dedupe` command which will remove any duplicate package.

How to load culture files in Essential JS 2 using Ajax

Ajax post can be used to load the `cldr` JSON files. To get started, install the `cldr-data` package using the following command.

`

```
npm install cldr-data
```

`

Loading culture using Ajax

To load locale files based on the selected culture, you can use the Ajax post method as shown in the following code snippet. The `cldr` files will be loaded based on the selected culture using the following function.

`

```
//Function for loading locale files based on culture name
```

```
function loadCultureFiles(name:any) {
```

```
let files: string[] = ['ca-gregorian.json', 'numbers.json', 'timeZoneNames.json'];
```

```
let loadCulture = function (prop:any) {
```

```

let val:string, ajax: Ajax;
if (name === 'ar' && prop === files.length - 1) {
  ajax = new Ajax( './node_modules/cldr-data/supplemental/' + files[prop], 'GET', false);
} else {
  ajax = new Ajax( './node_modules/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
}
ajax.onSuccess = function (value:any) {
  val = value;
  loadCldr(JSON.parse(val));
};
ajax.send();
};
for (let prop = 0; prop < files.length; prop++) {
  loadCulture(prop);
}
}
loadCultureFiles('de');
`

```

Loading translations

To load the translation object in your application, use the `load` function of the `L10n` class.

```

//loading locale files
L10n.load({
  'de': {
    'calendar': { today: 'heute' },
  },
});
`

```

Loading CLDR files using loadCldr function

Pass the loaded locale files into the `loadCldr` function, as shown in the following example. The `setCulture` method allows you to set the required culture.

```

import { Calendar } from '@syncfusion/ej2-calendars';
//import the loadCldr from ej2-base

```

```
import { loadCldr, L10n, Ajax, setCulture } from '@syncfusion/ej2-base';
declare var require: any;
//loading locale files
L10n.load({
  'de': {
    'calendar': { today: 'heute' },
  },
});
//Function for loading locale files based on culture name
function loadCultureFiles(name:any) {
  let files: string[] = ['ca-gregorian.json', 'numbers.json', 'timeZoneNames.json'];
  let loadCulture = function (prop:any) {
    let val:string, ajax: Ajax;
    if (name === 'ar' && prop === files.length - 1) {
      ajax = new Ajax( './node_modules/cldr-data/supplemental/' + files[prop], 'GET', false);
    } else {
      ajax = new Ajax( './node_modules/cldr-data/main/' + name + '/' + files[prop], 'GET', false);
    }
    ajax.onSuccess = function (value:any) {
      val = value;
      loadCldr(JSON.parse(val));
    };
    ajax.send();
  };
  for (let prop = 0; prop < files.length; prop++) {
    loadCulture(prop);
  }
}
loadCultureFiles('de');
let calendarObject: Calendar = new Calendar({
  //sets the locale.
  locale: 'de'
});
```

```
calendarObject.appendTo('#element');
setCulture('de');calendarObject.appendTo('#element');
setCulture('de');
`
```

All components' localized texts are provided in the ej2-locale [GitHub](#) repository. You can also find examples in this [link](#).

How to load the culture file in Essential JS 2

In Essential JS 2, the culture file can be loaded by using the `loadCldr` function. The culture file contains information about the specific culture, such as date and time formats, currency symbols, and translations for UI elements.

Installing the CLDR JSON Files

To use the `loadCldr` function, you first need to install the CLDR JSON files from the npm package. You can do this by running the following command.

```
`
npm install cldr-data
`
```

Loading the culture

To load the culture file in your application, you need to import the required locale and supplemental files from the `cldr` package. For example, to load the German culture, you would import the following files.

```
`
import * as n1 from '../node_modules/cldr-data/main/de/currencies.json'
import * as n2 from '../node_modules/cldr-data/main/de/timeZoneNames.json';
import * as n3 from '../node_modules/cldr-data/main/de/numbers.json';
import * as n4 from '../node_modules/cldr-data/main/de/ca-gregorian.json';
import * as s from '../node_modules/cldr-data/supplemental/currencyData.json';
import * as s2 from '../node_modules/cldr-data/supplemental/numberingSystems.json';
`
```

Loading translations

To load the translation object in the application, use the `load` function of the `L10n` class. For example, the following code loads a German translation for the word "today" in the calendar component.

```
`
L10n.load({
  'de': {
    'calendar': { today: 'heute' }
  }
})
`
```

```
});  
、
```

Using the loadCldr function

Once you have imported the necessary culture files, you can use the loadCldr function to load them in your application. You also need to pass the culture code in the setCulture function.

```
import { Calendar } from '@syncfusion/ej2-calendars';  
import { Tab } from '@syncfusion/ej2-navigations';  
import { L10n, setCulture, loadCldr } from '@syncfusion/ej2-base';  
import * as n1 from '../node_modules/cldr-data/main/de/currencies.json'  
import * as n2 from '../node_modules/cldr-data/main/de/timeZoneNames.json';  
import * as n3 from '../node_modules/cldr-data/main/de/numbers.json';  
import * as n4 from '../node_modules/cldr-data/main/de/ca-gregorian.json';  
import * as s from '../node_modules/cldr-data/supplemental/currencyData.json';  
import * as s2 from '../node_modules/cldr-data/supplemental/numberingSystems.json';  
L10n.load({  
  'de': {  
    'calendar': { today: 'heute' }  
  }  
});  
  
//Initialize calendar component.  
let calendarObject: Calendar = new Calendar();  
  
//Render initialized calendar.  
calendarObject.appendTo('#element');  
  
loadCldr(n1, n2, n3, n4, s, s2);  
setCulture('de');  
、
```

All components' localized texts are provided in the ej2-locale [GitHub](#) repository. Also find the example sample from this [link](#).

How to resolve Content Security Policy (CSP) errors

Enabling the strict Content Security Policy (CSP) may cause the following issues with the Essential JS 2 controls in your application.

Template rendering

From the 2023 Vol2 - 22.1 release onwards, the Content Security Policy for Syncfusion controls has been enhanced. The usage of the `unsafe-eval` directive has been eliminated from the CSP meta tag.

In your application, utilizes string or external templates, it is advisable to rewrite them using the [function template](#) approach for template properties.

Note: If users prefer to continue using inline string and external templates, it is necessary to include the `unsafe-eval` directive in the CSP meta tag in order to bypass the CSP violation.

Image loading

Syncfusion license banner utilize the image from **base64**, which is not allowed on strict CSP-enabled sites. To overcome this restriction, it is necessary to add the [img-src data:](#) directive in the meta tag or consider [registering the license key](#).

3D Chart

<!-- markdownlint-disable MD036 -->

Working with data in EJ2 JavaScript 3D Chart control

Local data

A simple JSON data can be bound to the 3D chart using [dataSource](#) property in series. Now map the fields in JSON to [xName](#) and [yName](#) properties.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
        labelRotation: -45,
        labelPlacement: 'BetweenTicks'
    },
    series:[{
        dataSource: chartData,
        type: 'Column',
        xName: 'month',
        yName: 'sales'
    }],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100,
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Remote data

The remote data can be bound to the 3D chart using the [DataManager](#). The [DataManager](#) requires minimal information like web service URL, adaptor and cross domain to interact with service endpoint properly. Assign the instance of the [DataManager](#) to the [dataSource](#) property in series and map the fields of data to [xName](#) and [yName](#) properties. You can also use the [query](#) property of the series to filter the data.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
import { DataManager, Query } from '@syncfusion/ej2-data';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let dataManager: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/orders'
});
let query: Query = new Query().take(5).where('Estimate', 'lessThan', 3,
false);
let chart: Chart3D = new Chart3D({
  //Initializing Primary X and Y Axis
  primaryXAxis: {
    valueType: 'Category',
    labelRotation: -45,
    labelPlacement: 'BetweenTicks'
  },
  series:[{

```

```

        dataSource: dataManager,
        type: 'Column',
        xName: 'CustomerID', yName: 'Freight', query: query
    }],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100,
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Binding data using ODataAdaptor

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the **DataManager**. Refer to the following code example for remote data binding using OData service.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
import { DataManager, Query, ODataAdaptor } from '@syncfusion/ej2-data';
let dataManager: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/orders',

```

```

    adaptor: new ODataAdaptor()
  });
let query: Query = new Query();
let chart: Chart3D = new Chart3D({
  //Initializing Primary X and Y Axis
  primaryXAxis: {
    valueType: 'Category',
    labelRotation: -45,
    labelPlacement: 'BetweenTicks'
  },
  series:[{
    dataSource: dataManager,
    type: 'Column',
    xName: 'CustomerID', yName: 'Freight', query: query,
  }],
  wallColor: 'transparent',
  enableRotation: true,
  rotation: 7,
  tilt: 10,
  depth: 100,
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Empty points

The data points that uses the `null` or `undefined` as value are considered as empty points. The empty data points are ignored and is not plotted in the chart. When the data is provided by using the points

property, by using [emptyPointSettings](#) property in series, the empty can be customized. The default [mode](#) of the empty point is **Gap**.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: null }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: undefined },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }

<!-- markdownlint-disable MD036 -->

Size for chart

<!-- markdownlint-disable MD036 -->

The size of the 3D chart can be set directly through [width](#) and [height](#) properties.

In Pixel

The size of the 3D chart can be set in pixel as demonstrated below.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series: [
        {
            dataSource: chartData, xName: 'month', yName: 'sales',
            type: 'Column'
        }
    ],
    enableRotation: true,
    rotation: 22,
    depth: 100,
    width: '650', height: '350'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

In Percentage

By setting the value in percentage, 3D chart gets its dimension with respect to its container. For example, when the height is **50%**, chart renders to half of the container height.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series: [
        {
            dataSource: chartData, xName: 'month', yName: 'sales',
            type: 'Column'
        }
    ],
    enableRotation: true,
    rotation: 22,
    depth: 100,
    width: '80%', height: '90%'
}, '#element');

```

```

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

Category axis in EJ2 JavaScript 3D Chart control

The category axis is the horizontal axis of a 3D chart that shows text values rather than numerical values. Compared to the vertical axis, this axis has fewer labels. The following sample shows to render the 3D chart using category axis.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { country: "USA", gold: 50, silver: 70, bronze: 45 },
    { country: "China", gold: 40, silver: 60, bronze: 55 },
    { country: "Japan", gold: 70, silver: 60, bronze: 50 },
    { country: "Australia", gold: 60, silver: 56, bronze: 40 },
    { country: "France", gold: 50, silver: 45, bronze: 35 },
    { country: "Germany", gold: 40, silver: 30, bronze: 22 },
    { country: "Italy", gold: 40, silver: 35, bronze: 37 },
    { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series:[{
        dataSource: chartData,
        xName: 'country', yName: 'gold',
        // Series type as column series
        type: 'Column'
    }],
    title: 'Olympic Medals',
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100

```

```
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: To use category axis, we need to inject `Category3D` module using `Chart3D.Inject(Category3D)` method and set the `valueType` of axis to **Category**.

Labels placement

By default, category axis labels are placed between ticks in an axis. It can also be placed on ticks using the `labelPlacement` property.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
```

```
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'Category',
    labelPlacement: 'OnTicks',
  },
  series:[{
    dataSource: chartData,
    xName: 'country', yName: 'gold', type: 'Column'
  }],
  title: 'Olympic Medals',
  wallColor: 'transparent',
  enableRotation: true,
  rotation: 7,
  tilt: 10,
  depth: 100,
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

Numeric axis in EJ2 JavaScript 3D Chart control

The [numeric axis](#) can be used to represent the numeric values of data in 3D chart. By default, the `valueType` of an axis is **Double**.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [{ x: 1, y: 7 }, { x: 2, y: 1 }, { x: 3, y: 1 }, { x:
4, y: 14 }, { x: 5, y: 1 }, { x: 6, y: 10 },
    { x: 7, y: 8 }, { x: 8, y: 6 }, { x: 9, y: 10 }, { x: 10, y: 10 }, { x:
11, y: 16 }, { x: 12, y: 6 },
    { x: 13, y: 14 }, { x: 14, y: 7 }, { x: 15, y: 5 }, { x: 16, y: 2 }, {
x: 17, y: 14 }, { x: 18, y: 7 },
    { x: 19, y: 7 }, { x: 20, y: 10 }];

let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Double',
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y', columnSpacing: 0.1,
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```

```

Range

The range of an axis will be calculated automatically based on the provided data, and it can also be customized by using the [minimum](#), [maximum](#) and [interval](#) properties of the axis.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [{ x: 1, y: 7 }, { x: 2, y: 1 }, { x: 3, y: 1 }, { x:
4, y: 14 }, { x: 5, y: 1 }, { x: 6, y: 10 },
  { x: 7, y: 8 }, { x: 8, y: 6 }, { x: 9, y: 10 }, { x: 10, y: 10 }, { x:
11, y: 16 }, { x: 12, y: 6 },
  { x: 13, y: 14 }, { x: 14, y: 7 }, { x: 15, y: 5 }, { x: 16, y: 2 }, {
x: 17, y: 14 }, { x: 18, y: 7 },
  { x: 19, y: 7 }, { x: 20, y: 10 }];
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'Double',
    minimum: 1,
    maximum: 20,
    interval: 5
  },
  series: [
    {

```

```

        type: 'Column', xName: 'x', yName: 'y', columnSpacing: 0.1,
        dataSource: chartData
    },
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Range padding

Padding can be applied to the minimum and maximum extremes of an axis range by using the [rangePadding](#) property. Numeric axis supports the following types of padding.

- None
- Round
- Additional
- Normal
- Auto

Numeric - None

When the [rangePadding](#) is set to **None**, minimum and maximum of the axis is based on the data.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [{ x: 1, y: 7 }, { x: 2, y: 1 }, { x: 3, y: 1 }, { x:
4, y: 14 }, { x: 5, y: 1 }, { x: 6, y: 10 },
    { x: 7, y: 8 }, { x: 8, y: 6 }, { x: 9, y: 10 }, { x: 10, y: 10 }, { x:
11, y: 16 }, { x: 12, y: 6 },
    { x: 13, y: 14 }, { x: 14, y: 7 }, { x: 15, y: 5 }, { x: 16, y: 2 }, {
x: 17, y: 14 }, { x: 18, y: 7 },
    { x: 19, y: 7 }, { x: 20, y: 10 }];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Double'
    },
    primaryYAxis: {
        //RangePadding as none in Y Axis
        rangePadding: 'None'
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y', columnSpacing: 0.1,
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"

Label format

Numeric label format

Numeric labels can be formatted by using the [labelFormat](#) property. Also, it supports all globalize format.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [{ x: 1, y: 7 }, { x: 2, y: 1 }, { x: 3, y: 1 }, { x:
4, y: 14 }, { x: 5, y: 1 }, { x: 6, y: 10 },
    { x: 7, y: 8 }, { x: 8, y: 6 }, { x: 9, y: 10 }, { x: 10, y: 10 }, { x:
11, y: 16 }, { x: 12, y: 6 },
    { x: 13, y: 14 }, { x: 14, y: 7 }, { x: 15, y: 5 }, { x: 16, y: 2 }, {
x: 17, y: 14 }, { x: 18, y: 7 },
    { x: 19, y: 7 }, { x: 20, y: 10 }];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Double'
    },
    primaryYAxis: {
        labelFormat: 'c'
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y', columnSpacing: 0.1,
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format: Property Value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place.
1000	n2	1000.00	The Number is rounded to 2 decimal place.
1000	n3	1000.000	The Number is rounded to 3 decimal place.
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place.
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place.
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place.
1000	c1	\$1000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place.
1000	c2	\$1000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place.

Grouping separator

To separate the y-axis labels to groups of thousands, set the [useGroupingSeparator](#) property to **true** in the 3D chart.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { x: 10, y: 7000 }, { x: 20, y: 1000 }, { x: 30, y: 12000 }, { x: 40, y:
14000 }, { x: 50, y: 11000 }, { x: 60, y: 5000 },
    { x: 70, y: 7300 }, { x: 80, y: 9000 }, { x: 90, y: 12000 }, { x: 100,
y: 14000 }, { x: 110, y: 11000 }, { x: 120, y: 5000 }
];
let chart: Chart3D = new Chart3D({
    useGroupingSeparator: true,
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y',
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<!-- markdownlint-disable MD036 -->

DateTime axis in EJ2 JavaScript 3D Chart control

DateTime axis

DateTime axis uses date time scale and displays the date time values as axis labels in the specified format.

INDEX.TS

```

import {Chart3D, DateTime3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { x: new Date(2000, 6, 11), y: 10 },
    { x: new Date(2002, 3, 7), y: 30 },
    { x: new Date(2004, 3, 6), y: 15 },
    { x: new Date(2006, 3, 30), y: 65 },
    { x: new Date(2008, 3, 8), y: 90 },
    { x: new Date(2010, 3, 8), y: 85 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        // Date time scale in primary X Axis
        valueType: 'DateTime',
    },
    series:[{
        dataSource: chartData,
        xName: 'x', yName: 'y',
        type: 'Column'
    }],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use datetime axis, we need to inject `Date3D` module using `Chart3D.Inject(Date3D)` method and set the `valueType` of axis to **Date**.

Date category axis

Date category axis is used to display the date time values with non-linear intervals. For example, the business days alone have been depicted in a week here.

INDEX.TS

```

import {Chart3D, DateCategory3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateCategory3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { x: new Date(2017, 11, 20), y: 21 }, { x: new Date(2017, 11, 21), y: 24
},
    { x: new Date(2017, 11, 22), y: 24 }, { x: new Date(2017, 11, 26), y: 70
},
    { x: new Date(2017, 11, 27), y: 75 }, { x: new Date(2018, 0, 2), y: 82
},
    { x: new Date(2018, 0, 3), y: 53 }, { x: new Date(2018, 0, 4), y: 54 },
    { x: new Date(2018, 0, 5), y: 53 }, { x: new Date(2018, 0, 8), y: 45 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'DateCategory',
        skeleton: 'Ed',
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y',
            dataSource: chartData

```

```

    }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
  }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use datetime category axis, we need to inject **DateTimeCategory3D** module using the **Chart3D.Inject(DateTimeCategory3D)** method and set the [valueType](#) of axis to **DateTimeCategory**.

Range

Range of an axis will be calculated automatically based on the provided data. You can also customize the range of an axis using [minimum](#), [maximum](#) and [interval](#) properties.

INDEX.TS

```

import {Chart3D, DateTime3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { x: new Date(2000, 6, 11), y: 10 }, { x: new Date(2002, 3, 7), y: 30 },
  { x: new Date(2004, 3, 6), y: 15 }, { x: new Date(2006, 3, 30), y: 65 },

```

```

    { x: new Date(2008, 3, 8), y: 90 }, { x: new Date(2010, 3, 8), y: 85 }
  ];
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'DateTime',
    minimum: new Date(2000, 6, 1),
    maximum: new Date(2010, 6, 1), interval: 1
  },
  series: [
    {
      type: 'Column', xName: 'x', yName: 'y',
      dataSource: chartData
    }
  ],
  wallColor: 'transparent',
  enableRotation: true,
  rotation: 7,
  tilt: 10,
  depth: 100
}, '#element');

```

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Interval customization

Date time intervals can be customized by using the [interval](#) and [intervalType](#) properties of the axis. For example, when you set `interval` as 2 and `intervalType` as `Years`, it considers 2 years as interval.

DateTime axis supports following interval types,

- Auto
- Years
- Months
- Days
- Hours
- Minutes
- Seconds

INDEX.TS

```
import {Chart3D, DateTimeCategory3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTimeCategory3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { x: new Date(2000, 6, 11), y: 10 }, { x: new Date(2002, 3, 7), y: 30 },
    { x: new Date(2004, 3, 6), y: 15 }, { x: new Date(2006, 3, 30), y: 65 },
    { x: new Date(2008, 3, 8), y: 90 }, { x: new Date(2010, 3, 8), y: 85 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'DateTime',
        intervalType: 'Years'
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y',
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">

  ="text/javascript"></script>
</head>
<body>
```

```

<div id="container">
  <div id="element"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Applying padding to the range

Padding can be applied to the minimum and maximum extremes of the range by using the [rangePadding](#) property. DateTime axis supports the following types of padding,

- None
- Round
- Additional

DateTime - None

When the [rangePadding](#) is set to **None**, minimum and maximum of an axis is based on the data.

INDEX.TS

```

import {Chart3D, DateTime3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { x: new Date(2017, 11, 20), y: 21 }, { x: new Date(2017, 11, 21), y: 24 },
  { x: new Date(2017, 11, 22), y: 24 }, { x: new Date(2017, 11, 26), y: 70 },
  { x: new Date(2017, 11, 27), y: 75 }, { x: new Date(2018, 0, 2), y: 82 },
  { x: new Date(2018, 0, 3), y: 53 }, { x: new Date(2018, 0, 4), y: 54 },
  { x: new Date(2018, 0, 5), y: 53 }, { x: new Date(2018, 0, 8), y: 45 }
];
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'DateTime',
    rangePadding: 'None'
  },
  series: [
    {
      type: 'Column', xName: 'x', yName: 'y',
      dataSource: chartData
    }
  ],
  wallColor: 'transparent',
  enableRotation: true,
  rotation: 7,

```

```

    tilt: 10,
    depth: 100
  }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

DateTime - Round

When the [rangePadding](#) is set to **Round**, minimum and maximum will be rounded to the nearest possible value, which is divisible by interval. For example, when the minimum is **15th Jan**, interval is **1** and interval type is **Month**, then the axis minimum will be **Jan 1st**.

INDEX.TS

```

import {Chart3D, DateTime3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Legend3D, Tooltip3D,

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some common date time formats to the **labelFormat** property.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
new Date(2000, 03, 10)	EEEE	Monday	The Date is displayed in day format.
new Date(2000, 03, 10)	yMd	04/10/2000	The Date is displayed in month/date/year format.
new Date(2000, 03, 10)	MMM	Apr	The Shorthand month for the date is displayed.
new Date(2000, 03, 10)	hm	12:00 AM	Time of the date value is displayed as label.
new Date(2000, 03, 10)	hms	12:00:00 AM	The Label is displayed in hours:minutes:seconds format.

Custom label format

Axis also supports custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

INDEX.TS

```

import {Chart3D, DateTime3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [

Logarithmic axis in EJ2 JavaScript 3D Chart control

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg: 10^6) and higher order of magnitude (eg: 10^8).

INDEX.TS

```
import { Chart3D, DateTime3D, Legend3D, Logarithmic3D, ColumnSeries3D,
Tooltip3D, Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, DateTime3D, Logarithmic3D, Legend3D,
Tooltip3D, Highlight3D);
let chartData: any[] = [
    { x: new Date(1995, 0, 1), y: 80 }, { x: new Date(1996, 0, 1), y: 200 },
    { x: new Date(1997, 0, 1), y: 400 }, { x: new Date(1998, 0, 1), y: 600 },
    { x: new Date(1999, 0, 1), y: 700 }, { x: new Date(2000, 0, 1), y: 1400 },
    { x: new Date(2001, 0, 1), y: 2000 }, { x: new Date(2002, 0, 1), y: 4000 },
    { x: new Date(2003, 0, 1), y: 6000 }, { x: new Date(2004, 0, 1), y: 8000 },
    { x: new Date(2005, 0, 1), y: 11000 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'DateTime'
    },
    primaryYAxis: {
        valueType: 'Logarithmic'
    },
    series: [
        {
            type: 'Column', xName: 'x', yName: 'y',
            dataSource: chartData
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

Logarithmic interval

The interval of the logarithmic axis can be customized by using the [interval](#) property in the axis. When the logarithmic base is 10 and logarithmic **interval** is 2, then the axis labels are placed at an interval of 10^2 . The default value of the [interval](#) is 1.

Axis labels in EJ2 JavaScript 3D Chart control

Axis labels are the labels that are positioned adjacent to the y-axis and beneath the x-axis. It provides descriptive information about the axis.

Smart axis labels

When the axis labels overlap with each other, [labelIntersectAction](#) property in the axis can be used to place them smartly.

Case 1: When setting `labelIntersectAction` as `Hide`.

INDEX.TS

```

Multiple panes in EJ2 JavaScript 3D Chart control

The chart area can be divided into multiple panes using [rows](#) and [columns](#).

Rows

To split the chart area vertically into number of rows, use [rows](#) property of the 3D chart.

- The space for each row can be allocated by using the [height](#) property. The value can be either in percentage or in pixel.
- To associate a vertical axis to a particular row, specify its index to [rowIndex](#) property of the axis.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { x: 'Jan', y: 15, y1: 33 }, { x: 'Feb', y: 20, y1: 31 }, { x: 'Mar', y:
35, y1: 30 },
  { x: 'Apr', y: 40, y1: 28 }, { x: 'May', y: 80, y1: 29 }, { x: 'Jun', y:
70, y1: 30 },
  { x: 'Jul', y: 65, y1: 33 }, { x: 'Aug', y: 55, y1: 32 }, { x: 'Sep', y:
50, y1: 34 },
  { x: 'Oct', y: 30, y1: 32 }, { x: 'Nov', y: 35, y1: 32 }, { x: 'Dec', y:
35, y1: 31 }

```

```

];
let chart: Chart3D = new Chart3D({

Chart Types

Column Chart in EJ2 JavaScript 3D Chart control

Column chart

To render a [column series](#), use series [type](#) as `Column` and inject `ColumnSeries3D` module using `Chart3D.Inject(ColumnSeries3D)` method.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'Category',
  },
  series:[{

```

```

        dataSource: chartData,
        xName: 'country', yName: 'gold',
        // Series type as column series
        type: 'Column'
    }],
    title: 'Olympic Medals',
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');

Stacked column chart in EJ2 JavaScript 3D Chart control

Stacked column chart

To render a stacked column series, use series [type](#) as `StackingColumn` and inject `StackingColumnSeries3D` module using `Chart3D.Inject(StackingColumnSeries3D)` method.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, StackingColumnSeries3D, Tooltip3D,
Highlight3D, Chart3DLoadedEventArgs } from '@syncfusion/ej2-charts';
Chart3D.Inject(StackingColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let stackedData: object[] = [
    { x: 2000, y: 0.61, y1: 0.03, y2: 0.48},{ x: 2001, y: 0.81, y1: 0.05,
y2: 0.53 },
    { x: 2002, y: 0.91, y1: 0.06, y2: 0.57 },{ x: 2003, y: 1, y1: 0.09, y2:
0.61 }, { x: 2004, y: 1.19, y1: 0.14, y2: 0.63 },
    { x: 2005, y: 1.47, y1: 0.20, y2: 0.64 },{ x: 2006, y: 1.74, y1: 0.29,
y2: 0.66 }, { x: 2007, y: 1.98, y1: 0.46, y2: 0.76 },
    { x: 2008, y: 1.99, y1: 0.64, y2: 0.77 },{ x: 2009, y: 1.70, y1: 0.75,
y2: 0.55 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series: [
        {
            dataSource: stackedData, xName: 'x', yName: 'y',
            //Series type as stacked column
            type: 'StackingColumn'
        }, {
            dataSource: stackedData, xName: 'x', yName: 'y1',
            type: 'StackingColumn'
        }, {
            dataSource: stackedData, xName: 'x', yName: 'y2',
            type: 'StackingColumn'
        }
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

Bar Chart in EJ2 JavaScript 3D Chart control

Bar chart

To render a [bar series](#), use series [type](#) as `Bar` and inject `BarSeries3D` module using `Chart3D.Inject(BarSeries3D)` method.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, BarSeries3D, Tooltip3D, Highlight3D,
Chart3DLoadedEventArgs } from '@syncfusion/ej2-charts';
Chart3D.Inject(BarSeries3D, Category3D, Legend3D, Tooltip3D, Highlight3D);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'Category',
```

```

    },
    series: [
        {
            dataSource: chartData,
            xName: 'country', yName: 'gold',
            type: 'Bar'
        },
    ],
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');

```

Stacked bar chart in EJ2 JavaScript 3D Chart control

Stacked bar chart

To render a stacked bar series, use series [type](#) as `StackingBar` and inject `StackingBarSeries3D` module using `Chart3D.Inject(StackingBarSeries3D)` method.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, StackingBarSeries3D, Tooltip3D,
Highlight3D, Chart3DLoadedEventArgs } from '@syncfusion/ej2-charts';
Chart3D.Inject(StackingBarSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chart: Chart3D = new Chart3D({
  primaryXAxis: {
    valueType: 'Category'
  },
  //Initializing Primary Y Axis
  primaryYAxis: {
    {
      interval: 20
    },
  },
  //Initializing Chart Series
  series: [
    {
      type: 'StackingBar',
      dataSource: [
        { x: 'Sochi', y: 9 },
        { x: 'Rio', y: 46 },
        { x: 'Pyeongchang', y: 9 },
        { x: 'Tokyo', y: 39 },
        { x: 'Beijing', y: 8 },
      ],
      name: 'America',
      xName: 'x',
      yName: 'y'
    },
    {
      type: 'StackingBar',
      dataSource: [
        { x: 'Sochi', y: 10 },
        { x: 'Rio', y: 4 },
        { x: 'Pyeongchang', y: 11 },
        { x: 'Tokyo', y: 7 },
        { x: 'Beijing', y: 4 },
      ],
      name: 'Canada',
      xName: 'x',
      yName: 'y'
    },
    {
      type: 'StackingBar',
      dataSource: [
        { x: 'Sochi', y: 4 },
        { x: 'Rio', y: 10 },
        { x: 'Pyeongchang', y: 5 },
        { x: 'Tokyo', y: 10 },
        { x: 'Beijing', y: 5 },
      ],
      name: 'France',
    }
  ]
});
```

```

        xName: 'x',
        yName: 'y'
    }
    ],
    enableRotation: true,
    rotation: 22,
    depth: 100,
    legendSettings: {
        enableHighlight: true
    },
}, '#element');

```

INDEX.HTML

```

Data labels in EJ2 JavaScript 3D Chart control

Data labels are fields that includes information about the sample point connected to an output. It can be added to a chart series by enabling the [visible](#) property in the [dataLabel](#). By default, the labels will arrange smartly without overlapping.

INDEX.TS

```

import { DataLabel3D, Chart3D, Category3D, Legend3D, ColumnSeries3D,
Tooltip3D, Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, DataLabel3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { country: "USA", gold: 50, silver: 70, bronze: 45 },
    { country: "China", gold: 40, silver: 60, bronze: 55 },
    { country: "Japan", gold: 70, silver: 60, bronze: 50 },
    { country: "Australia", gold: 60, silver: 56, bronze: 40 },
    { country: "France", gold: 50, silver: 45, bronze: 35 },
    { country: "Germany", gold: 40, silver: 30, bronze: 22 },
    { country: "Italy", gold: 40, silver: 35, bronze: 37 },
    { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series:[{
        dataSource: chartData,
        xName: 'country', yName: 'gold',
        // Series type as column series
        type: 'Column',
        dataLabel: {
            visible: true
        }
    }],
    title: 'Olympic Medals',
    wallColor: 'transparent',
    enableRotation: true,

```

```

rotation: 7,
tilt: 10,
depth: 100
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

<!-- markdownlint-disable MD036 -->

Legend in EJ2 JavaScript 3D Chart control

<!-- markdownlint-disable MD036 -->

Legend provides information about the series rendered in the 3D chart.

Position and alignment

By using the [position](#) property, the legend can be positioned at left, right, top or bottom of the 3D chart. The legend is positioned at the bottom of the 3D chart, by default.

INDEX.TS

```
import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },

Legend title

You can set title for legend using [title](#) property in [legendSettings](#). The [size](#), [color](#), [opacity](#), [fontStyle](#), [fontWeight](#), [fontFamily](#), [textAlignment](#), and [textOverflow](#) of legend title can be customized by using the [titleStyle](#) property in [legendSettings](#). The [titlePosition](#) is used to set the legend position in Top, Left and Right position. The [maximumTitleWidth](#) is used to set the width of the legend title. By default, it will be 100px.

INDEX.TS

```

```

Note: To use the legend feature, we need to inject the **Legend3D** module using **Chart3D.Inject(Legend3D)** method.

Tooltip in EJ2 JavaScript 3D Chart control

<!-- markdownlint-disable MD036 -->

The 3D Chart will display details about the points through tooltip, when the mouse is moved over the specific point.

Default tooltip

By default, tooltip is not visible. The tooltip can be enabled by setting the **enable** property in **tooltipSettings** to **true** and by injecting **Tooltip3D** module using **Chart3D.Inject(Tooltip3D)**.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';

```

```

Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [

Selection in EJ2 JavaScript 3D Chart control

The 3D chart provides selection support for the series and its data points on mouse click.

When mouse is clicked on the data points, the corresponding series legend will also be selected.

We have different types of selection mode for selecting a data.

- None
- Point
- Series
- Cluster

Point

To select a point, set the [selectionMode](#) property to **Point**.

INDEX.TS

```
import { DataLabel3D, Chart3D, Category3D, Legend3D, ColumnSeries3D,
Tooltip3D, Highlight3D, Selection3D} from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, DataLabel3D, Legend3D, Tooltip3D,
Highlight3D, Selection3D);
```

```

let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },

Print and Export in EJ2 JavaScript 3D Chart control

Print

The rendered 3D chart can be printed directly from the browser by calling the public method [print](#). The ID of the 3D chart's div element must be passed as the input parameter to that method.

INDEX.TS

```

import {Chart3D, Category3D, Legend3D, ColumnSeries3D, Tooltip3D,
Highlight3D } from '@syncfusion/ej2-charts';
Chart3D.Inject(ColumnSeries3D, Category3D, Legend3D, Tooltip3D,
Highlight3D);
let chartData: any[] = [
    { country: "USA", gold: 50, silver: 70, bronze: 45 },
    { country: "China", gold: 40, silver: 60, bronze: 55 },
    { country: "Japan", gold: 70, silver: 60, bronze: 50 },
    { country: "Australia", gold: 60, silver: 56, bronze: 40 },
    { country: "France", gold: 50, silver: 45, bronze: 35 },
    { country: "Germany", gold: 40, silver: 30, bronze: 22 },
    { country: "Italy", gold: 40, silver: 35, bronze: 37 },
    { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart3D = new Chart3D({
    primaryXAxis: {
        valueType: 'Category',
    },
    series:[{
        dataSource: chartData,
        xName: 'country', yName: 'gold',
        name: 'Gold', type: 'Column'
    }],
    title: 'Olympic Medals',
    wallColor: 'transparent',
    enableRotation: true,
    rotation: 7,
    tilt: 10,
    depth: 100
}, '#element');
document.getElementById('print').onclick = () => {
    chart.print();
};

```

```

Title customization

The [titleStyle](#) property of the 3D chart provides options to customize the title by using the following properties.

- [size](#) - Specifies the size of the title.
- [color](#) - Specifies the color for the title.
- [fontFamily](#) - Specifies the font family for the title.
- [fontWeight](#) - Specifies the font weight of the title.
- [fontStyle](#) - Specifies the font style for the title.
- [opacity](#) - Specifies the opacity for the color of the title.
- [textAlignment](#) - Specifies the alignment of the title.
- [textOverflow](#) - Specifies the overflow of the title.

Accessibility in EJ2 JavaScript 3D Chart control

Accessibility is achieved in the 3D chart control through WAI-ARIA standard and keyboard navigation. The 3D chart features can be effectively accessed through assistive technologies such as screen readers.

WAI-ARIA

WAI-ARIA (Accessibility Initiative – Accessible Rich Internet Applications) defines a way to increase the accessibility of web pages, dynamic content, and user interface components developed with AJAX, HTML, JavaScript, and related technologies. ARIA provides additional semantics to describe the role, state, and functionality of web components.

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

Keyboard navigation

All the 3D chart actions can be controlled via keyboard keys. The applicable key combinations and their relative functionalities are listed below.

Interaction Keys | Description

Tab | Moves the focus to the next element in the chart.

Shift + Tab | Moves the focus to the previous element in the chart.

DownArrow | Moves the focus to the data point left side from the selected point.

UpArrow | Moves the focus to the data point right side from the selected point.

Left Arrow | Moves the focus to the next series in the chart.

Right Arrow | Moves the focus to the previous series in the chart.

ESC | Cancel the tooltip for the data point.

Enter/Space | Selects the data point in the series.

Down/Left Arrow | Moves the focus to the legend left side from the selected legend.

Up/Right Arrow | Moves the focus to the legend right side from the selected legend.

Enter/Space | Toggles the visibility of the corresponding series.

Ctrl + P | Print the chart.

Accordion

Getting started in EJ2 JavaScript Accordion control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework which can be directly used in latest web browsers.

Component Initialization

The Essential JS 2 JavaScript components can be initialized by using either of the following ways.

- Using local script and style references in a HTML page.
- Using CDN link for script and style reference.

Using local script and style references in a HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)**/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js

Styles: **(installed location)**/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css

Example:

Script: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/dist/global/ej2-navigations.min.js

Styles: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.30/Essential JS 2/ej2-navigations/styles/material.css

Step 3: Create a folder `myapp/resources` and copy/paste the global scripts and styles from the above installed location to `myapp/resources` location.

Step 4: Create a HTML page (index.html) in `myapp` location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Accordion's global script -->
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
</body>
</html>
```

Step 5: Now, add the **Accordion** element and initiate the **Essential JS 2 Accordion** component in the **index.html** by using following code

Initialize the Accordion using JSON items collection

The Accordion can be rendered by defining an array of [items](#).

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
<!-- Essential JS 2 Accordion's global script -->
<script src="resources/ej2-navigations.min.js" type="text/javascript"></script>
</head>
<body>
<!-- Add the HTML <div> element -->
<div id="element"></div>
<script>
//Initialize Accordion component
var accordion = new ej.navigations.Accordion({
items: [
{ header: 'ASP.NET', expanded: 'true', content: 'Microsoft ASP.NET is a set of technologies in the
Microsoft .NET Framework for building Web applications and XML Web services.' },
{ header: 'ASP.NET MVC', content: 'The Model-View-Controller (MVC) architectural pattern separates an
application into three main components: the model, the view, and the controller.' },
{ header: 'JavaScript', content: 'JavaScript (JS) is an interpreted computer programming language. It was
originally implemented as part of web browsers so that client-side scripts could interact with the user,
control the browser, communicate asynchronously, and alter the document content that was displayed.'
},
]
});
//Render initialized Accordion component
accordion.appendTo('#element');
</script>
```

```
</body>
```

```
</html>
```

```
,
```

Step 6: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Accordion** component.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the below CDN link formats.

Syntax:

Script: `http://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `http://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Script: <http://cdn.syncfusion.com/ej2/ej2-navigations/dist/global/ej2-navigations.min.js>

Styles: <http://cdn.syncfusion.com/ej2/ej2-navigations/styles/material.css>

Step 3: Create a HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `Accordion` element and initiate the `Essential JS 2 Accordion` component in the `index.html` by using following code.

INDEX.HTML

```
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
  <head>

    <title>Essential JS 2</title>
    <!-- Essential JS 2 material theme -->
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet" type="text/css"/>
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet" type="text/css"/>
    <!-- Essential JS 2 all script -->
    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
  </head>
  <body>
    <!-- Add the HTML <div> element -->
    <div id="element"></div>
    <script>
var accordion = new ej.navigations.Accordion({
items: [
```

```

    { header: 'ASP.NET', expanded: 'true', content: 'Microsoft ASP.NET is a
set of technologies in the Microsoft .NET Framework for building Web
applications and XML Web services.' },
    { header: 'ASP.NET MVC', content: 'The Model-View-Controller (MVC)
architectural pattern separates an application into three main components:
the model, the view, and the controller.' },
    { header: 'JavaScript', content: 'JavaScript (JS) is an interpreted
computer programming language. It was originally implemented as part of web
browsers so that client-side scripts could interact with the user, control
the browser, communicate asynchronously, and alter the document content that
was displayed.' },
  ]
});
//Render initialized Accordion component
accordion.appendTo('#element');
</script>
</body>
</html>

```

Step 4: Now, run the `index.html` in web browser, it will render the **Essential JS 2 Accordion** component.

Initialize the Accordion using HTML elements

The Accordion component can be rendered based on the given HTML element using `id` as `target` property.

You need to follow the below structure of HTML elements to render the Accordion.

```

,
<div id='accordion/html/markup'> --> Root Accordion Element
<div> --> Accordion Item Container
<div> --> Accordion Header Container
<div> </div> --> Accordion Header
</div>
<div> --> Accordion Panel Container
<div> </div> --> Accordion Content
</div>
</div>
</div>
,

```

INDEX.JS

```

ej.base.enableRipple(true);
//Initialize Accordion component
var accordion = new ej.navigations.Accordion({});
//Render initialized Accordion component
accordion.appendTo('#accordion_html_markup');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Accordion</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="accordion_html_markup">
      <div>
        <div>
          <div> ASP.NET </div>
        </div>
        <div>
          <div> Microsoft ASP.NET is a set of technologies in the
Microsoft .NET Framework for building Web applications
and XML Web services </div>
        </div>
      </div>
      <div>
        <div>
          <div> ASP.NET MVC </div>
        </div>
        <div>
          <div> The Model-View-Controller (MVC) architectural
pattern separates an application into three main components:
the model, the view, and the controller </div>
        </div>
      </div>
      <div>
        <div>
          <div> JavaScript </div>
        </div>
        <div>
          <div> JavaScript (JS) is an interpreted computer
programming language.It was originally implemented as part
of web browsers so that client-side scripts could
interact with the user, control the browser </div>
        </div>
      </div>
    </div>
  </div>
  <br><br>
```

```
<div id="result"></div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

You can add the custom class into Accordion component using [cssClass](#) property which is used to customize the Accordion component.

- [How to load accordion items dynamically](#)

Expand mode in EJ2 JavaScript Accordion control

The [JavaScript Accordion](#) supports the two listed types of expand modes while expanding or collapsing the item.

- Single
- Multiple

Single

The property enables to expand only one Accordion item at a time. If you expand any new item, the previously expanded one is collapsed and new item changed to expanded state.

You can also choose which accordion pane is expanded state at initial rendering by enabling the [expanded](#) property on accordion items.

INDEX.TS

```
import {Accordion} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let accordion: Accordion = new Accordion({
    expandMode: 'Single',
    items: [
        { header: 'ASP.NET', expanded: true, content: 'Microsoft ASP.NET is a set of technologies in the Microsoft .NET Framework for building Web applications and XML Web services.' },
        { header: 'ASP.NET MVC', content: 'The Model-View-Controller (MVC) architectural pattern separates an application into three main components: the model, the view, and the controller.' },
        { header: 'JavaScript', content: 'JavaScript (JS) is an interpreted computer programming language. It was originally implemented as part of web browsers so that client-side scripts could interact with the user, control the browser, communicate asynchronously, and alter the document content that was displayed.' },
    ]
});
```

```
accordion.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Accordion</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
    <br><br>
    <div id="result"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Multiple

Default [expandMode](#) of the Accordion is **Multiple**. It enables you to expand more than one Accordion item at a time. Expand/collapse action can also be toggled by clicking on it again. For example, expanded item is collapsed when you click on it again.

INDEX.TS

```
import {Accordion} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let accordion: Accordion = new Accordion({
  expandMode: 'Multiple',
  items: [
    { header: 'ASP.NET', content: 'Microsoft ASP.NET is a set of
technologies in the Microsoft .NET Framework for building Web applications
and XML Web services.' },
    { header: 'ASP.NET MVC', content: 'The Model-View-Controller (MVC)
architectural pattern separates an application into three main components:
the model, the view, and the controller.' },
```

```

    { header: 'JavaScript', content: 'JavaScript (JS) is an interpreted
    computer programming language. It was originally implemented as part of web
    browsers so that client-side scripts could interact with the user, control
    the browser, communicate asynchronously, and alter the document content that
    was displayed.' },
  ]
});
accordion.appendTo('#element');

Accessibility in EJ2 JavaScript Accordion control

The Accordion control has been designed keeping in mind the [WAI-ARIA](#) specifications, by applying the prompt WAI-ARIA roles, states, and properties along with the keyboard support. Thus, making it usable for people who use assistive WAI-ARIA Accessibility supports that is achieved through the attributes like `aria-labelledby`. It helps to provides information about the elements in a document for assistive

technology. The control implements the keyboard navigation support by following the [WAI-ARIA practices](#) and tested in major screen readers.

The accessibility compliance for the Accordion control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

[ARIA attributes](#)

| **Roles and Attributes** | **Functionalities**

|

--	--

| role | **Button:** Attribute is set to the Accordion header elements to indicate that the element can be used to toggle the visibility of the associated content section, describing the actual role of the element.
 Region: Attribute is set to the Accordion panel elements to create a landmark region that contains the currently expanded accordion panel, describing the actual role of the element.
 |

| aria-labelledby | Attribute is set to content (panel) and it points to the corresponding Accordion header. |

| aria-controls | Attribute is set to the header and it points to the corresponding Accordion content. |

| aria-expanded | Attribute is set to the Accordion header elements to indicates the expand state of the Accordion Item. Default value of this attribute is **false**. If an item is expanded, the attribute value changes to 'true'. |

| aria-hidden | Attribute is set to the Accordion panel elements to indicates the content visible state of the Accordion Item. Default value of this attribute is **true**. If an item content is visible, the attribute value changes to **false**. |

| aria-disabled | It indicates the disabled state of the Accordion and its items. |

Keyboard interaction

Keyboard navigation is enabled by default. Possible keys are:

Key	Description

Space or Enter	When focus is on the Accordion header, click on the focused element makes the element to expand and collapse.
----------------	---

Down Arrow	Focus the next Accordion header.
------------	----------------------------------

Up Arrow	Focus the previous Accordion header.
----------	--------------------------------------

Home	Focus the first Accordion header.
------	-----------------------------------

End	Focus the last Accordion header.
-----	----------------------------------

Tab	To Move focus through the interactive elements.
-----	---

Shift + Tab	To Move focus through the interactive elements.
-------------	---

Ensuring accessibility

The Accordion control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Accordion control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Accordion control with accessibility tools.

Style in EJ2 JavaScript Accordion control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

Customizing Accordion

Use the following CSS to customize the Accordion.

```
`css
.e-accordion {
border: 5px solid rgb(173, 255, 47);
}
`
```

Customizing the list items

Use the following CSS to customize the items of Accordion.

```
`css
.e-accordion .e-acrdn-item {
text-align: center;
color: pink;
background-color: #2fa1ff;
}
`
```

Customizing Accordion's header

Use the following CSS to customize the header of Accordion control.

```
`css
.e-accordion .e-acrdn-item.e-select > .e-acrdn-header {
background: #2fa1ff !important;
justify-content: center;
}
`
```

Customizing Accordion's expand and collapse icons

Use the following CSS to customize the expand and collapse icons of Accordion control.

```
`css
.e-accordion .e-acrdn-item .e-acrdn-header .e-toggle-icon .e-icons {
color: pink;
}
`
```

Customizing the hover state of Accordion control

Use the following CSS to customize the accordion item when hovering.

```
`css
.e-accordion .e-acrdn-item .e-acrdn-header:hover {
border: 2px solid gray;
}
`
```

Customizing selected item of Accordion control

Use the following CSS to customize the selected accordion item.

```
`css
.e-accordion .e-acrdn-item.e-select.e-active>.e-acrdn-header,
.e-accordion .e-acrdn-item.e-select.e-item-focus>.e-acrdn-header {
background-color: rgb(0, 15, 100) !important;
}
`
```

Use the following CSS to customize the selected accordion item text.

```
`css
.e-accordion .e-acrdn-item.e-select.e-active>.e-acrdn-header .e-acrdn-header-content,
.e-accordion .e-acrdn-item.e-select.e-item-focus>.e-acrdn-header .e-acrdn-header-content {
color: #2fa1ff !important;
}
`
```

How To

Set the nested accordion in EJ2 JavaScript Accordion control

Accordion supports to render **nested** level of Accordion by using content property. You can give nested Accordion content inside the parent Accordion content property by using **id** of nested element. The nested Accordion can be rendered with the use of provided events, such as [clicked](#) and [expanding](#).

INDEX.TS

```
import { Accordion, AccordionClickArgs, ExpandEventArgs } from
 '@syncfusion/ej2-navigations';
let nestAcrdn_vid: Accordion;
let nestAcrdn_mus: Accordion;
let nestAcrdn_musNew: Accordion;
let nestAcrdn_img: Accordion;
let accordion: Accordion = new Accordion({
  expanding: expanding,
  items: [
    { header: 'Video', content: '<div id="nested_video"></div>' },
    { header: 'Music', content: '<div id="nested_music"></div>' },
```

```

    { header: 'Images', content: '<div id="nested_images"></div>' },
  ]
});
accordion.appendTo('#element');
function clicked(e: AccordionClickArgs): void {
  let ele: HTMLElement = e.originalEvent.target;
  if (ele.querySelectorAll('.e-accordion').length > 0) {
    return;
  }
  if (!document.getElementById("nested_musicNew").classList.contains("e-accordion")) {
    nestAcrdn_musNew = new Accordion({
      items: [
        { header: 'New Track1' },

Load content through post in EJ2 JavaScript Accordion control

Accordion supports to load external contents through **AJAX** library. Refer the below steps.

- Import the **Ajax** module from **ej2-base** and initialize with URL path.
- Get data from the Ajax Success event to initialize Accordion with retrieved external path data.

INDEX.TS

```

import {Accordion} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
import { Ajax } from '@syncfusion/ej2-base';
enableRipple(true);
let ajax: Ajax = new Ajax('./ajax.html', 'GET', true);
ajax.send().then();
ajax.onSuccess = (data: string): void => {
  let ctn2: string = data;
  let accordion: Accordion = new Accordion({
    items: [
      { header: 'Department', content: '#acrdnContent1' },

```

```

        { header: 'Platform', content: '#acrdnContent2' },
        { header: 'Employee Details', content: ctn2 }
    ]
});
accordion.appendTo('#element');
}

Set custom animation in EJ2 JavaScript Accordion control

Accordion supports custom animations for both expand and collapse actions from the provided animation option of **Animation** library. The [animation](#) property also allows you to set [easing](#), [duration](#), and various other effects of your choice.

Default animation is given as **SlideDown** for expanding the panel using [expand](#) animation property and **SlideUp** for collapsing the panel using [collapse](#) animation property. You can also disable the animation by setting animation [effect](#) as **none**.

The sample demonstrates some types of animation that suits for Accordion. You can check all the animation effects [here](#).

INDEX.TS

```
import {Accordion, AccordionEffect} from '@syncfusion/ej2-navigations';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let accordion: Accordion = new Accordion({
    items: [
        { header: 'ASP.NET', content: 'Microsoft ASP.NET is a set of
        technologies in the Microsoft .NET Framework for building Web applications
        and XML Web services.' },

Create wizard using accordion in EJ2 JavaScript Accordion control

Accordion items can be disabled dynamically by passing the index and boolean value with the [enableItem](#) method and also dynamically expand the item using [expandItem](#) method.

The below Wizard sample is designed for Online Shopping model. In this, each Accordion item is integrated with required components to fill

the details and designed for getting user details and making payment at the end. Each field is provided with validation for all mandatory

option to enable/disable to next Accordion. In below sample, accordion items can be disabled dynamically with [enableItem](#) method using [created](#) event.

Load accordion with data source in EJ2 JavaScript Accordion control

You can bind any data object to Accordion items, by mapping it to [header](#) and [content](#) property.

In the below demo, Data is fetched from an OData service using **DataManager**. The result data is formatted as a JSON object with **header** and **content** fields, which is set to items property of Accordion.

INDEX.TS

```

import { Accordion } from '@syncfusion/ej2-navigations';
import { DataManager, Query, ODataV4Adaptor, ReturnOption } from '@syncfusion/ej2-data';
let itemsData: any = [];
let mapping = { header: 'FirstName', content: 'Notes' };
const SERVICE_URI: string =
'https://services.odata.org/V4/Northwind/Northwind.svc/Employees';
new DataManager({ url: SERVICE_URI, adaptor: new ODataV4Adaptor,
crossDomain: true })
    .executeQuery(new Query().range(1, 4)).then((e: ReturnOption) => {
        let result: any = e.result;
        for(let i: number = 0; i < result.length; i++) {
            itemsData.push({ header: result[i][mapping.header], content:
result[i][mapping.content] });
        }
        let accordion: Accordion = new Accordion({
            items: itemsData
        });
        accordion.appendTo('#element');
    });

```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>

```

Load accordion items dynamically in EJ2 JavaScript Accordion control

Accordion items can be added dynamically by passing the item and index value with the [addItem](#) method.

In the following demo, new items are added dynamically when you expand an Accordion header using [expanded](#) event.

- Data is fetched from the data source and it is formatted as a JSON object with **header** and **content** fields.
- Here last index is calculated to append the new Accordion item at the end and the number of items are limited to 10, since the data bound have only 10 items.

INDEX.TS

```

import { Accordion, ExpandEventArgs, AccordionClickArgs, AccordionItemModel
} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
import { accordion } from './datasource.ts';
enableRipple(true);
let dbFlag: number = 0;
let dynamciAcrdnCount: number = 2;
let acrdnObj: Accordion = new Accordion({
    expanded: expanded,
    items : [
        { header: 'ASP.NET', content: 'Microsoft ASP.NET is a set of
technologies in the Microsoft .NET Framework for building Web applications
and XML Web services.' },
        { header: ' ASP.NET Core ', content: ' ASP.NET Core is a free
and open-source web framework, and the next generation of ASP.NET, developed
by Microsoft and the community. It is a modular framework that runs on both
the full .NET Framework, on Windows, and the cross-platform .NET Core.' },

```

```

        { header: 'ASP.NET MVC', content : 'The Model-View-Controller
(MVC) architectural pattern separates an application into three main
components: the model, the view, and the controller.' },
    ]
});
acrdnObj.appendTo('#Accordion_default');
function expanded( e: ExpandEventArgs) {
    //Find the expanded state item in accordion
    let Elementindex = document.getElementsByClassName("e-expand-state
e-selected e-active")[0];
    //Check the expand state item and currently selected item index. If
it is expanded state add dyanmic items or else does nothing

    if([].slice.call(e.element.parentElement.children).indexOf(e.element) ==
[.slice.call(e.element.parentElement.children).indexOf(Elementindex)) {
        let array: AccordionItemModel[] = accordion as
AccordionItemModel[];
        for(let i: number = 0 ; i < dynamciAcrdnCount; i++)
        {
            if (dbFlag === array.length) { //checking whether all the items
in data source added
                return; }
            // Item object and the index argument passed into the additem
method to add a new accordion
            acrdnObj.addItem( array[dbFlag] , acrdnObj.items.length );
            ++dbFlag;
        }
    }
}

```

Add font awesome in EJ2 JavaScript Accordion control

We can customize the Accordion component items by using font awesome icons.

- Need to add font awesome CDN reference link in your sample to use font awesome icons.

```
<link rel="stylesheet" href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-awesome.min.css" />
```

You can add the font awesome icons to the Accordion header using `'iconCss'` property. The following sample illustrates how to use font awesome in Accordion component.

INDEX.TS

```
import {Accordion} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let accordion: Accordion = new Accordion({
    items: [
        { header: 'Twitter', expanded: true, iconCss: 'fa fa-twitter',
          content: 'Twitter is an online social networking service that enables users
          to send and read short 140-character messages called "tweets".' },
        { header: 'Facebook', iconCss: 'fa fa-facebook', content: 'Facebook
          is an online social networking service headquartered in Menlo Park,
          California. Its website was launched on February 4, 2004, by Mark Zuckerberg
          with his Harvard College roommates.' },
        { header: 'WhatsApp', iconCss: 'fa fa-whatsapp', content: 'WhatsApp
          is an American freeware, cross-platform messaging and Voice over IP (VoIP)
          service owned by Facebook, Inc.' }
    ]
});
accordion.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Accordion</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript Toolbar Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/material.css"
rel="stylesheet">
  <link rel="stylesheet"
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"
>
  <link rel="stylesheet"
href="https://cdnjs.cloudflare.com/ajax/libs/font-awesome/4.7.0/css/font-
awesome.min.css">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
```

```
<body>

  <div id="container">
    <div id="element"></div>
    <br><br>
    <div id="result"></div>
  </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

Use following CSS to customize the accordion items header icons.

```
`css
.e-accordion .e-acrdn-item .e-acrdn-header .e-acrdn-header-icon {
display: inline-block;
padding: 0 10px 0 0 !important;
}
`
```

Use following CSS to customize the selected accordion item content icons.

```
`css
.e-accordion .e-acrdn-item.e-select .e-acrdn-panel .e-acrdn-content .e-content-icon {
color: rgba(0, 0, 0, 0.54) !important;
}
`
```

Customize expand collapse actions in EJ2 JavaScript Accordion control

Accordion component supports customizing the expand or collapse animation action behavior. You can manually change the expand animation action performed after the collapse animation operation performed on already expand pane when the expand icons are clicked.

By default, the Accordion component pane is expanded or collapsed, when click the expand or collapse icon. It is not affected on already expand pane.

The following sample demonstrates, how to expand the collapsed Accordion item after collapse animation performed on the expanded Accordion item using [created](#), [expanding](#), and [expanded](#) event. In the Expanding event, get the previously expanded item index and prevent the expanding behavior using `args.cancel` option. Expand the Accordion item dynamically based on specifying the `index` value using the [expandItem](#) public method and [expanded](#) event.

INDEX.TS

```
import {Accordion} from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let expandIndex;
let isCollapsed = false;
let initialLoad = true;
let accordion: Accordion = new Accordion({
    expandMode: 'Single',
    expanding: onExpanding,
    expanded: onExpanded,
    created: onCreate,
    items: [
        { header: 'ASP.NET', content: 'Microsoft ASP.NET is a set of
technologies in the Microsoft .NET Framework for building Web applications
and XML Web services. ASP.NET pages execute on the server and generate
markup such as HTML, WML, or XML that is sent to a desktop or mobile
browser. ASP.NET pages use a compiled, event-driven programming model that
improves performance and enables the separation of application logic and
user interface.' },
        { header: 'ASP.NET MVC', content: 'The Model-View-Controller (MVC)
architectural pattern separates an application into three main components:
the model, the view, and the controller. The ASP.NET MVC framework provides
an alternative to the ASP.NET Web Forms pattern for creating Web
applications. The ASP.NET MVC framework is a lightweight, highly testable
presentation framework that (as with Web Forms-based applications) is
integrated with existing ASP.NET features, such as master pages and
membership-based authentication.' },
        { header: 'JavaScript', content: 'JavaScript (JS) is an interpreted
computer programming language. It was originally implemented as part of web
browsers so that client-side scripts could interact with the user, control
the browser, communicate asynchronously, and alter the document content that
was displayed. More recently, however, it has become common in both game
development and the creation of desktop applications.' }
    ]
});
accordion.appendTo('#element');
function onCreate() {
    initialLoad = false;
}
function onExpanding(e) {
    if (e.isExpanded && !initialLoad && !isCollapsed) {
        e.cancel = true;
        expandIndex = accordion.items.indexOf (e.item);
        isCollapsed = true;
    }
}
function onExpanded(e) {
    if (!e.isExpanded && !initialLoad && isCollapsed) {
        accordion.expandItem(true, expandIndex);
        isCollapsed = false;
    }
}
}
```

```

Integrate treeview inside the accordion in EJ2 JavaScript Accordion control

Accordion supports to render other Essential JS 2 Components by using content property. You can give content as an element string like below, for initializing the component.

```
`js
```

```
content: '<div id="element"> </div>'
```

```
,
```

The other component can be rendered with the use of provided events, such as [clicked](#) and [expanding](#).

The following procedure is to render a TreeView within the Accordion,

- Import the **TreeView** module from **ej2-navigations**, for adding TreeView. Please refer the [TreeView initialization steps](#)
- You can initialize the TreeView component in [expanding](#) event, by getting the element and defining the required TreeView properties.

INDEX.TS

```
import { Accordion, TreeView } from '@syncfusion/ej2-navigations';
```

```
import { DocDB, DownloadDB, PicDB } from 'datasource.ts'
//Initialize Accordion component
let acrdnObj: Accordion = new Accordion({
    expanding: expand,
    width: 400,
    items : [
        { header: 'Documents', expanded: true, content: '<div
id="treeDoc"></div>' },
        { header: 'Downloads', content : '<div id="treeDownload"></div>' },
        { header: 'Pictures', content: '<div id="treePic"></div>' },
    ]
});
//Render initialized Accordion component
acrdnObj.appendTo('#element');
//Expanding Event function for Accordion component.
function expand(e: ExpandEventArgs): void {
    if (e.name === 'expanding' && [].indexOf.call(this.items, e.item) === 0 &&
e.element.querySelector('#treeDoc').childElementCount === 0) {
        //Initialize TreeView component
        let treeObj: TreeView = new TreeView({
            fields: { dataSource: DocDB, id: 'nodeId', text: 'nodeText', child:
'nodeChild', iconCss: 'icon', imageUrl: 'image' },
            sortOrder: 'Ascending'
        });
        //Render initialized TreeView component
        treeObj.appendTo('#treeDoc');
    }
    if (e.name === 'expanding' && [].indexOf.call(this.items, e.item) === 1
&& e.element.querySelector('#treeDownload').childElementCount === 0) {
        let treeObj: TreeView = new TreeView({
            fields: { dataSource: DownloadDB, id: 'nodeId', text: 'nodeText',
child: 'nodeChild', iconCss: 'icon', imageUrl: 'image' },
            sortOrder: 'Ascending'
        });
        treeObj.appendTo('#treeDownload');
    }
    if (e.name === 'expanding' && [].indexOf.call(this.items, e.item) ===
2 && e.element.querySelector('#treePic').childElementCount === 0) {
        let treeObj: TreeView = new TreeView({
            fields: { dataSource: PicDB, id: 'nodeId', text: 'nodeText', child:
'nodeChild', iconCss: 'icon', imageUrl: 'image' },
            sortOrder: 'Ascending'
        });
        treeObj.appendTo('#treePic');
    }
}
```

Ej1 api migration in EJ2 JavaScript Accordion control

This article describes the API migration process of Accordion component from Essential JS 1 to Essential JS 2.

Accessibility

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Keyboard Navigation | **Property:** *allowKeyboardNavigation*

 \$("#accordion").ejAccordion({
 allowKeyboardNavigation: false
 });
 | **Not Applicable** |

| Localization | **Not Applicable** | **Property:** *locale*

 var accordion = new ej.navigations.Accordion({
 locale: 'en-US'
 });
 accordion.appendTo('#ej2Accordion');
 |

| RTL | **Property:** *enableRTL*

 \$("#accordion").ejAccordion({
 enableRTL: false
 });
 | **Property:** *enableRtl*

 var accordion = new ej.navigations.Accordion({
 enableRtl: false
 });
 accordion.appendTo('#ej2Accordion');
 |

AjaxSettings

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Property:** *ajaxSettings*

 \$("#accordion").ejAccordion({
 ajaxSettings: { type: 'GET' }
 });
 | **Not Applicable** |

| Asynchronous | **Property:** *ajaxSettings.async*

 \$("#accordion").ejAccordion({
 ajaxSettings: { async: true }
 });
 | **Not Applicable** |

| Browser Cache | **Property:** *ajaxSettings.cache*

 \$(" #accordion").ejAccordion({
 ajaxSettings: { cache: false }
 });
 | **Not Applicable** |

| Request type | **Property:** *ajaxSettings.contentType*

 \$(" #accordion").ejAccordion({
 ajaxSettings: { contentType: "html" }
 });
 | **Not Applicable** |

| Data | **Property:** *ajaxSettings.data*

 \$(" #accordion").ejAccordion({
 ajaxSettings: { data: {} }
 });
 | **Not Applicable** |

| Response type | **Property:** *ajaxSettings.dataType*

 \$(" #accordion").ejAccordion({
 ajaxSettings: { dataType: "html" }
 });
 | **Not Applicable** |

| HTTP request type | **Property:** *ajaxSettings.type*

 \$(" #accordion").ejAccordion({
 ajaxSettings: { type: 'GET' }
 });
 | **Not Applicable** |

| AjaxBeforeLoad | **Event:** *ajaxBeforeLoad*

 \$(" #accordion").ejAccordion({
 ajaxBeforeLoad: function(args) {}
 });
 | **Not Applicable** |

| AjaxError | **Event:** *ajaxError*

 \$(" #accordion").ejAccordion({
 ajaxError: function(args) {}
 });
 | **Not Applicable** |

| AjaxLoad | **Event:** *ajaxLoad*

 \$(" #accordion").ejAccordion({
 ajaxLoad: function(args) {}
 });
 | **Not Applicable** |

| AjaxSuccess | **Event:** *ajaxSuccess*

 \$(" #accordion").ejAccordion({
 ajaxSuccess: function(args) {}
 });
 | **Not Applicable** |

Animation

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Not Applicable** | **Property:** *animation*

 var accordion = new ej.navigations.Accordion({
 animation: { expand: {} , collapse: {} }
 });
 accordion.appendTo('#ej2Accordion');
 |

| EnableAnimation | **Property:** *enableAnimation*

 \$(" #accordion").ejAccordion({
 enableAnimation: false
 });
 | **Not Applicable** |

| Expand animation | **Not Applicable** | **Property:** *animation.expand*

 var accordion = new ej.navigations.Accordion({
 animation: {
 expand: {
 duration: 400,
 easing: 'ease-in',
 effect: 'SlideLeft'
 }
 }
 });
 accordion.appendTo('#ej2Accordion');
 |

| Collapse animation | **Not Applicable** | **Property:** *animation.collapse*

 var accordion = new ej.navigations.Accordion({
 animation: {
 collapse: {
 duration: 400,
 easing: 'ease-in',
 effect: 'SlideLeft'
 }
 }
 });
 accordion.appendTo('#ej2Accordion');
 |

| Duration
 [expand / collapse] | **Not Applicable** | **Property:** *animation.collapse.duration*

 var accordion = new ej.navigations.Accordion({
 animation: {
 expand: { duration: 400 }
 }
 });
 accordion.appendTo('#ej2Accordion');
 |

| Easing
 [expand / collapse] | **Not Applicable** | **Property:** *animation.collapse.easing*

var accordion = new ej.navigations.Accordion({
 animation: {

expand: { easing: 'ease-in' }
 }
 });
 accordion.appendTo('#ej2Accordion');

|

| Effect
 [expand / collapse] | **Not Applicable** | **Property:** *animation.collapse.effect*

var accordion = new ej.navigations.Accordion({
 animation: {

expand: { effect: 'SlideLeft' }
 }
 });
 accordion.appendTo('#ej2Accordion');

</> |

Items

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | **Not Applicable** | **Property:** *items*

 var accordion = new ej.navigations.Accordion({

 items: []
 });
 accordion.appendTo('#ej2Accordion');
 |

| Content | **Not Applicable** | **Property:** *items[0].content*

 var accordion = new
ej.navigations.Accordion({
 items: [{ content: 'Contents' }]
 });

accordion.appendTo('#ej2Accordion');
 |

| Custom class | **Not Applicable** | **Property:** *items[0].cssClass*

 var accordion = new
ej.navigations.Accordion({
 items: [{ cssClass: 'customClass' }]
 });

accordion.appendTo('#ej2Accordion');
 |

| Header | **Not Applicable** | **Property:** *items[0].header*

 var accordion = new
ej.navigations.Accordion({
 items: [{ header: 'Header1' }]
 });

accordion.appendTo('#ej2Accordion');
 |

| HeaderSize | **Property:** *headerSize*

 \$("#accordion").ejAccordion({

headerSize: '50px'
 });
 | **Not Applicable** |

| Icon class | **Not Applicable** | **Property:** *items[0].iconCss*

 var accordion = new
ej.navigations.Accordion({
 items: [{ iconCss: 'e-icons' }]
 });

accordion.appendTo('#ej2Accordion');
 |

| IsExpand | **Not Applicable** | **Property:** *items[0].expanded*

 var accordion = new
ej.navigations.Accordion({
 items: [{ expanded: true }]
 });

accordion.appendTo('#ej2Accordion');
 |

| Collapse Item | **Method:** *collapsePanel(index)*

 \$("#accordion").ejTab();
 var
accordion = \$("#accordion").data("ejAccordion");
 accordion.collapsePanel(0);
 | **Method:**
expandItem(index, false)

 var accordion = new ej.navigations.Accordion();

accordion.appendTo('#ej2Accordion');
 accordion.expandItem(0, false);
 |

| Expand Item | **Method:** *expandPanel(index)*

 \$("#accordion").ejTab();
 var accordion
= \$("#accordion").data("ejAccordion");
 accordion.expandPanel(0);
 | **Method:**
expandItem(index, true)

 var accordion = new ej.navigations.Accordion();

accordion.appendTo('#ej2Accordion');
 accordion.expandItem(0, true);
 |

| CollapseAll | **Method:** *collapseAll()*

 \$("#accordion").ejTab();
 var accordion =
\$("#accordion").data("ejAccordion");
 accordion.collapseAll();
 | **Not Applicable** |

| ExpandAll | **Method:** *expandAll()* `

 $("#accordion").ejTab();
 var accordion = $("#accordion").data("ejAccordion");
 accordion.expandAll();
 | Not Applicable |`

| Get ItemsCount | **Method:** *getItemsCount()* `

 $("#accordion").ejTab();
 var accordion = $("#accordion").data("ejAccordion");
 accordion.getItemsCount();
 | Not Applicable |`

| AddItem | **Method:** *addItem(text, content, index)* `

 $("#accordion").ejTab();
 var accordion = $("#accordion").data("ejAccordion");
 accordion.addItem("New item", "The accordion content", 2);
 | Method: addItem(items, index)

 var accordion = new ej.navigations.Accordion();
 accordion.appendTo('#ej2Accordion');
 accordion.addItem({ header: 'App', content: 'text' }, 0)
 |`

| Remove Item | **Method:** *removeItem(index)* `

 $("#accordion").ejTab();
 var accordion = $("#accordion").data("ejAccordion");
 accordion.removeItem(0);
 | Method: removeItem(index)

 var accordion = new ej.navigations.Accordion();
 accordion.appendTo('#ej2Accordion');
 accordion.removeItem(0)
 |`

| Disable Items | **Property:** *disableItems* `

 $("#accordion").ejTab({
 disabledItems: [0, 1]
 });
 | Not Applicable |`

| Enable Items | **Property:** *enableItems* `

 $("#accordion").ejTab({
 enableItems: [0, 1]
 });
 | Not Applicable |`

| Disable Item | **Method:** *disableItems([index])* `

 $("#accordion").ejTab();
 var accordion = $("#accordion").data("ejAccordion");
 accordion.disableItems([1]);
 | Method: enableItem(index, false)

 var accordion = new ej.navigations.Accordion();
 accordion.appendTo('#ej2Accordion');
 accordion.enableItem(0, false)
 |`

| Enable Item | **Method:** *enableItems([index])* `

 $("#accordion").ejTab();

 var accordion = new ej.navigations.Accordion({
 destroyed: function(e: Event): void { }
 });
 accordion.appendTo('#ej2Accordion');
 |

AccumulationChart

<!-- markdownlint-disable MD036 -->

Getting started in EJ2 JavaScript Accumulation chart control

In EJ2, accumulation chart is implemented as a separate control to avoid the axis related logics. The dependencies for accumulation chart is same as chart control.

Dependencies

The list of minimum dependencies required to use an accumulation chart are follows:

```
`javascript
```

```
|-- @syncfusion/ej2-charts
```

```
|-- @syncfusion/ej2-base
```

```
|-- @syncfusion/ej2-data
|-- @syncfusion/ej2-pdf-export
|-- @syncfusion/ej2-file-utils
|-- @syncfusion/ej2-compression
|-- @syncfusion/ej2-svg-base
\
```

Installation and Configuration

- To get started with accumulation chart component, clone the [Essential JS 2 quickstart](#) project, and install necessary packages by using the following commands:

```
\
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart
cd quickstart
npm install
\
```

- Map the Accumulation chart packages in system.config.js configuration file.

```
`javascript
System.config({
  paths: {
    'syncfusion:': './node_modules/@syncfusion/',
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-charts": "syncfusion:ej2-charts/dist/ej2-charts.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",
    "@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
    "@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js",
    "@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
```

```

"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-svg-base": "syncfusion:ej2-svg-base/dist/ej2-svg-base.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js"
},
packages: {
  'app': { main: 'app', defaultExtension: 'js' }
}
});
`

```

The [project](#) is preconfigured with common settings

(src/styles/styles.css, system.config.js) to start with all Essential JS 2 components.

[Add Accumulation Chart to the Project](#)

Add HTML div elements in your `index.html`. [src/index.html] for accumulation chart.

```

`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>EJ2 Animation</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0" />
<meta name="description" content="Typescript UI Controls" />
<meta name="author" content="Syncfusion" />
<link href="index.css" rel="stylesheet" />
<script src="https://cdnjs.cloudflare.com/ajax/libs/systemjs/0.19.38/system.js"></script>
<script src="systemjs.config.js"></script>
</head>
<body>
<!--container which is going to render the Accumulation chart-->
<div id='element'>
</div>
</body>

```

```
</html>
```

Now, import an accumulation chart component in your `app.ts` to instantiate the accumulation chart, and append the accumulation chart instance to the `#element` [src/app/app.ts]

```
`javascript
import { AccumulationChart } from '@syncfusion/ej2-charts';
// initialize Accumulation Chart component
let chart: AccumulationChart = new AccumulationChart();
// render initialized Accumulation Chart
chart.appendTo('#element');
```

Pie Series

By default, the pie series will be rendered when assigning the JSON data to the series using the [dataSource](#) property. Map the field names in the JSON data to the [xName](#) and [yName](#) properties of the series.

INDEX.TS

```
import { AccumulationChart } from '@syncfusion/ej2-charts';
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [{ x: 'Jan', y: 3 }, { x: 'Feb', y: 3.5 }, { x:
'Mar', y: 7 }, { x: 'Apr', y: 13.5 },
      { x: 'May', y: 19 }, { x: 'Jun', y: 23.5 }, { x: 'Jul', y: 26 },
{ x: 'Aug', y: 25 },
      { x: 'Sep', y: 21 }, { x: 'Oct', y: 15 }],
      xName: 'x',
      yName: 'y'
    }
  ]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
```

```

</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Now, use the `npm run start` command to run the application in the browser.

`npm run start`

Pie dough nut in EJ2 JavaScript Accumulation chart control

Pie Chart

To render a pie series, use the series `type` as `Pie` and inject the `PieSeries` module using `AccumulationChart.Inject(PieSeries)` method. If the `PieSeries` module is not injected, this module will be loaded by default.

INDEX.TS

```

import { AccumulationChart, PieSeries } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(PieSeries);
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: [{ x: 'Jan', y: 3 }, { x: 'Feb', y: 3.5 }, { x:

```

Radius Customization

By default, radius of the pie series will be 80% of the size (minimum of chart width and height). You can customize this using [radius](#) property of the series.

INDEX.TS

```

import { AccumulationChart } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: data,
            radius: '100%',
            xName: 'x',
            yName: 'y'
        }
    ]
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Pie Center

The center position of the pie can be changed by Center X and Center Y. By default, center value of the pie series x and y is 50%. You can customize this using [center](#) property of the series.

INDEX.TS

```

import { AccumulationChart, PieSeries } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(PieSeries);
let piechart: AccumulationChart = new AccumulationChart({
    // Initialize the chart series
    series: [
        {
            dataSource: [
                { 'x': 'Chrome', y: 37, text: '37%' }, { 'x': 'UC
Browser', y: 17, text: '17%' },
                { 'x': 'iPhone', y: 19, text: '19%' },
                { 'x': 'Others', y: 4, text: '4%' }, { 'x': 'Opera', y:
11, text: '11%' },
                { 'x': 'Android', y: 12, text: '12%' }
            ],
            dataLabel: {
                visible: true, position: 'Inside', name: 'text', font: {
fontWeight: '600' }
            },
            radius: '70%', xName: 'x', yName: 'y', name: 'Browser'
        }
    ],
    center: { x: '60%', y: '60%' },
    enableSmartLabels: true,
    enableAnimation: false,
    legendSettings: { visible: false },

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Various Radius Pie Chart

You can use radius mapping to render the slice with different [radius](#) pie and also use [border](#), fill properties to customize the point. dataLabel is used to represent individual data and its value.

INDEX.TS

```

import { AccumulationChart, AccumulationLegend, PieSeries,
AccumulationDataLabel } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationChart, AccumulationLegend, PieSeries,
AccumulationDataLabel );
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [
        { x: 'Argentina', y: 505370, r: '100' },
        { x: 'Belgium', y: 551500, r: '118.7' },
        { x: 'Cuba', y: 312685, r: '124.6' },
        { x: 'Dominican Republic', y: 350000, r: '137.5' },
        { x: 'Egypt', y: 301000, r: '150.8' },
        { x: 'Kazakhstan', y: 300000, r: '155.5' },
        { x: 'Somalia', y: 357022, r: '160.6' }
      ],
      dataLabel: {
        visible: true, position: 'Outside',
        name: 'x'
      },
      radius: 'r', xName: 'x',
      yName: 'y', innerRadius: '20%'
    }
  ]
});

```

```

    },
    ],
    enableSmartLabels: true,
    legendSettings: {
        visible: true,
    },
    enableAnimation: true,
    title: 'Countries compared by population density and total area'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Doughnut Chart

To achieve a doughnut in pie series, customize the [innerRadius](#) property of the series. By setting value greater than 0%, a doughnut will appear. The [innerRadius](#) property takes value from 0% to 100% of the pie radius.

INDEX.TS

```

import { AccumulationChart } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: data,
      innerRadius: '40%',
      xName: 'x',

```

```

        yName: 'y'
    }
  ]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Start and End angles

You can customize the start and end angle of the pie series using the [startAngle](#) and [endAngle](#) properties. The default value of `startAngle` is 0 degree, and `endAngle` is 360 degrees. By customizing this, you can achieve a semi pie series.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
import { dataMapping } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: dataMapping,
      startAngle: 270,
      endAngle: 90,
      xName: 'x',
      yName: 'y'
    }
  ]
});

```

```
    ]
  }, '#element');
```

INDEX.HTML

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Color & Text Mapping

The fill color and the text in the data source can be mapped to the chart using `pointColorMapping` in series and `name` in datalabel respectively.

INDEX.TS

```
import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
import { dataMapping } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: dataMapping,
      //Map the fill color from data source
      pointColorMapping: 'fill',
      //Map the fill color from data source
      name: '',
      xName: 'x',
      yName: 'y',
      dataLabel: { visible: true, name: 'text' }
    }
  ]
});
```

```

    ]
  }, '#element');

```

INDEX.HTML

```

```

Customization

Individual points can be customized using the `pointRender` event.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel, IAccPointRenderEventArgs
} from '@syncfusion/ej2-charts';
import { dataMapping } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: dataMapping,
      xName: 'x',
      yName: 'y',
      border: { color: 'white', width: 1 },
    }
  ],
  pointRender: (args: IAccPointRenderEventArgs) => {
    if ((args.point.x as string).indexOf('Apr') > -1) {
      args.fill = '#f4bc42';
    }
  }
}

```

```

        else {
            args.fill = '#597cf9';
        }
    },
    '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Hide pie or doughnut border

By default, the border will appear in the pie/doughnut chart while mouse hover on the chart. You can disable the the border by setting `enableBorderOnMouseMove` property is `false`.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel, IAccPointRenderEventArgs
} from '@syncfusion/ej2-charts';
import { dataMapping } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  enableBorderOnMouseMove: false,
  series: [
    {
      dataSource: dataMapping,
      xName: 'x',
      yName: 'y',
    }
  ]
}

```

```
}, '#element');
```

```

Multi-level pie chart

You can achieve a multi-level drill down in pie and doughnut charts using [pointClick](#) event. If user clicks any point in the chart, that corresponding data will be shown in the next level and so on based on point clicked.

You can also achieve drill-up (back to the initial state) by using [chartMouseClicked](#) event. In below sample, you can drill-up by clicking back button in the center of the chart.

INDEX.TS

```
import {
  AccumulationTheme, getElement, AccumulationChart, AccumulationLegend,
  PieSeries,
  AccumulationTooltip, IAccLoadedEventArgs, IAccTextRenderEventArgs,
  chartMouseClicked, IMouseEventArgs, Index, indexFinder,
  AccumulationDataLabel,

Pyramid in EJ2 JavaScript Accumulation chart control

To render a pyramid series, use the series [type](#) as `Pyramid` and inject `PyramidSeries` module using the `AccumulationChart.Inject(PyramidSeries)` method.

INDEX.TS

```

import { AccumulationChart, PyramidSeries } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(PyramidSeries);
let chart: AccumulationChart = new AccumulationChart({
    series: [{
        type: 'Pyramid',
        dataSource: [{ x: 'Australia', y: 20, text: 'Australia 20%' },
            { x: 'France', y: 22, text: 'France 22%' },
            { x: 'China', y: 23, text: 'China 23%' },
            { x: 'India', y: 24, text: 'India 24%' },
            { x: 'Japan', y: 25, text: 'Japan 25%' },
            { x: 'Germany', y: 27, text: 'Germany 27%' } ],
        xName: 'x', yName: 'y',
    }],
}, '#element');

Customization

Individual points can be customized using the `pointRender` event.

INDEX.TS

```
import { AccumulationChart, FunnelSeries, IAccPointRenderEventArgs } from
'@syncfusion/ej2-charts';
import { funnelData } from './datasource.ts';
AccumulationChart.Inject(FunnelSeries);
let funnelChart: AccumulationChart = new AccumulationChart({
  series: [{
    type: 'Funnel',
    dataSource: funnelData,
    xName: 'x', yName: 'y', gapRatio: 0.08
  }],
  pointRender: (args: IAccPointRenderEventArgs) => {
    if ((args.point.x as string).indexOf('Downloaded') > -1) {
      args.fill = '#f4bc42';
    }
    else {
      args.fill = '#597cf9';
    }
  }
});
```

```
    },
  }, '#element');
```

Data label in EJ2 JavaScript Accumulation chart control

Data label can be added to a chart series by enabling the [visible](#)

option in the dataLabel property.

INDEX.TS

```
import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  enableSmartLabels: true,
  series: [
    {
      dataSource: [{ x: 'Jan', y: 13, text: 'Jan: 3' }, { x: 'Feb', y:
13.5, text: 'Feb: 3.5' },
```

```

        { x: 'Mar', y: 7, text: 'Mar: 7' }, { x: 'Apr', y: 13.5,
text: 'Apr: 13.5' }]],
        xName: 'x',
        yName: 'y',
        dataLabel: { visible: true }
    }
]
}, '#element');

```

INDEX.HTML

```

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use the data label feature, inject the `DataLabel` using the `Chart.Inject(DataLabel)` method.

Positioning

Accumulation chart provides support for placing the data label either `inside` or `outside` the chart.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
import { labelData } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: labelData,
      xName: 'x',
      yName: 'y',

```

```

        dataLabel: { visible: true, position: 'Outside' }
    }
  ], '#element');

```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Smart labels

Data labels will be arranged smartly without overlapping with each other. You can enable or disable this feature using the [enableSmartLabels](#) property.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  enableSmartLabels: true,
  series: [
    {
      dataSource: [
        { x: 'Jan', y: 3, text: 'Jan: 3' }, { x: 'Feb', y: 3.5,
text: 'Feb: 3.5' },
        { x: 'Mar', y: 7, text: 'Mar: 7' }, { x: 'Apr', y: 13.5,
text: 'Apr: 13.5' },
        { x: 'May', y: 19, text: 'May: 19' }, { x: 'Jun', y: 23.5,
text: 'Jun: 23.5' },

```

```

        { x: 'Jul', y: 26, text: 'Jul: 26' }, { x: 'Aug', y: 25,
text: 'Aug: 25' },
        { x: 'Sep', y: 21, text: 'Sep: 21' }, { x: 'Oct', y: 15,
text: 'Oct: 15' } ]],
        dataLabel: { visible: true, name: 'text', position: 'Outside' },
        xName: 'x',
        yName: 'y'
    }
}
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Data Label Template

Label content can be formatted by using the template option. Inside the template, you can add the placeholder text `${point.x}` and `${point.y}` to display corresponding data points x & y value. Using [template](#) property, you can set data label template in chart.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
import { labelData } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  enableSmartLabels: true,
  series: [

```

```

    {
        dataSource: labelData,
        dataLabel: { visible: true, name: 'text', position: 'Inside',
            template: "<div id='templateWrap' style='background-color:#bd18f9;border-radius: 3px; float: right;padding: 2px;line-height: 20px;text-align: center;'>" + "<img src='https://ej2.syncfusion.com/demos/src/chart/images/sunny.png' />" +
            "<div style='color:white; font-family:Roboto; font-style: medium; font-size:14px;float: right;padding: 2px;line-height: 20px;text-align: center;padding-right:6px'><span>${point.y}</span></div></div>"
            }, xName: 'x', yName: 'y'
        }
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Connector Line

Connector line will be visible when the data label is placed outside the chart. The connector line can be customized using the type, color, width, length and dashArray properties

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-
charts';
import { labelData } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({

```

```

enableSmartLabels: true,
series: [
  {
    dataSource: labelData,
    dataLabel: {
      visible: true, name: 'text', position: 'Outside',
      connectorStyle: {
        //Length of the connector line in pixels
        length: '50px',
        //Width of the connector line in pixels
        width: 2,
        //dashArray of the connector line
        dashArray: '5,3',
        //Color of the connector line
        color: '#f4429e',
        //Specifies the type of the connector line either Line
or Curve
        type: 'Curve'
      }
    }, xName: 'x', yName: 'y'
  }
]
}, '#element');

```

INDEX.HTML

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Text Mapping

Text from the data source can be mapped to data label using `name` property.

INDEX.TS

```
import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-charts';
import { dataMapping } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: dataMapping,
            xName: 'x',
            yName: 'y',
            dataLabel: { visible: true, name: 'text' }
        }
    ]
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Format

Data label for the accumulation chart can be formatted using `format` property. You can use the global formatting options, such as 'n', 'p', and 'c'.

INDEX.TS

```
import { AccumulationChart, AccumulationDataLabel, IAccTextRenderEventArgs }
from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: [{ x: 'Jan', y: 13, text: 'Jan: 3' },
                { x: 'Feb', y: 13, text: 'Feb: 3.5' },
                { x: 'Mar', y: 7, text: 'Mar: 7' },
                { x: 'Apr', y: 13, text: 'Apr: 13.5' } ],
            xName: 'x',
            yName: 'y',
            dataLabel: { visible: true, format: 'n2' }
        }
    ],
}, '#element');
```

INDEX.HTML

    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Value	Format	Resultant Value	Description
1000	n1	1000.0	The number is rounded to 1 decimal place.
1000	n2	1000.00	The number is rounded to 2 decimal places.
1000	n3	1000.000	The number is rounded to 3 decimal place.

0.01	p1	1.0%	The number is converted to percentage with 1 decimal place.
0.01	p2	1.00%	The number is converted to percentage with 2 decimal place.
0.01	p3	1.000%	The number is converted to percentage with 3 decimal place.
1000	c1	\$1000.0	The currency symbol is appended to number and number is rounded to 1 decimal place.
1000	c2	\$1000.00	The currency symbol is appended to number and number is rounded to 2 decimal place.

Customization

Individual text can be customized using the `textRender` event.

INDEX.TS

```
import { AccumulationChart, FunnelSeries, IAccTextRenderEventArgs,
AccumulationDataLabel } from '@syncfusion/ej2-charts';
import { labelData } from './datasource.ts';
AccumulationChart.Inject(FunnelSeries, AccumulationDataLabel);
let accChart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: labelData,
            dataLabel: { visible: true, name: 'text', position: 'Outside' },
            xName: 'x',
            yName: 'y'
        }
    ],
    textRender: (args: IAccTextRenderEventArgs) => {
        if (args.text.indexOf('Mar') > -1) {
            args.color = 'red';
            args.border.width = 1;
        }
    },
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

Show percentages in data labels of pie chart

You can show the percentages in data labels of pie chart using `textRender` event and `template` option.

Using textRender event

You can customize the data label of pie chart using [textRender](#) event as follows to show percentage..

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel, IAccTextRenderEventArgs }
from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationDataLabel);

```

Grouping in EJ2 JavaScript Accumulation chart control

You can club/group few points of the series based on

[groupTo](#) property. For example, if the club

value is 11, then the points with value less than 11 is grouped together and will be showed as a single point with label **others**. The property also takes value in percentage (percentage of total data points value).

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel, IAccTextRenderEventArgs,
IAccPointRenderEventArgs } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [
        { x: 'Jan', y: 3, text: 'Jan: 3' }, { x: 'Feb', y: 3.5,
text: 'Feb: 3.5' },
        { x: 'Mar', y: 7, text: 'Mar: 7' }, { x: 'Apr', y: 13.5,
text: 'Apr: 13.5' },
        { x: 'May', y: 19, text: 'May: 19' }, { x: 'Jun', y: 23.5,
text: 'Jun: 23.5' },

```

```

        { x: 'Jul', y: 26, text: 'Jul: 26' }, { x: 'Aug', y: 25,
text: 'Aug: 25' },
        { x: 'Sep', y: 21, text: 'Sep: 21' }, { x: 'Oct', y: 15,
text: 'Oct: 15' },
        { x: 'Nov', y: 9, text: 'Nov: 9' }, { x: 'Dec', y: 3.5,
text: 'Dec: 3.5' }],
        dataLabel: { visible: true, name: 'text', position: 'Outside' },
        groupTo: '11',
        xName: 'x',
        yName: 'y'
    }
],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Group Mode

Slice can also be grouped based on number of points by specifying the `groupMode` to Point. For example, if the group to value is 11, accumulation chart will show 1st 11 points and will group remaining entries in the collection as a single point.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel, IAccTextRenderEventArgs,
IAccPointRenderEventArgs } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);

```

```

let accChart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: data,
      dataLabel: { visible: true, position: 'Outside' },
      groupTo: '4',
      groupMode: 'Point',
      xName: 'x',
      yName: 'y'
    }
  ],
  textRender: (args: IAccTextRenderEventArgs) => {
    if (args.text.indexOf('Others') > -1) {
      args.text = 'Grouped Slices';
      args.color = 'red';
      args.border.width = 1;
    }
  },
  pointRender: (args: IAccPointRenderEventArgs) => {
    if ((args.point.x as string).indexOf('Others') > -1) {
      args.fill = '#D3D3D3';
    }
  },
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Customization

You can customize the grouped point and its data label using `pointRender` and `textRender` event.

INDEX.TS

```
import { AccumulationChart, AccumulationDataLabel, IAccTextRenderEventArgs,
IAccPointRenderEventArgs } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
AccumulationChart.Inject(AccumulationDataLabel);
let accChart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: data,
      dataLabel: { visible: true, position: 'Outside' },
      groupTo: '11',
      xName: 'x',
      yName: 'y'
    }
  ],
  textRender: (args: IAccTextRenderEventArgs) => {
    if (args.text.indexOf('Others') > -1) {
      args.text = 'Grouped Slices';
      args.color = 'red';
      args.border.width = 1;
    }
  },
  pointRender: (args: IAccPointRenderEventArgs) => {
    if ((args.point.x as string).indexOf('Others') > -1) {
      args.fill = '#D3D3D3';
    }
  },
}, '#element');
```

```

Empty points in EJ2 JavaScript Accumulation chart control

The data points those uses the **null** or **undefined** as value are considered as empty points. The empty data points are ignored and not plotted in the chart. You can customize those points, using the **emptyPointSettings** property in series. The default mode of the empty point is **Gap**. Other supported modes are **Average** and **Zero**.

INDEX.TS

```

import { AccumulationChart, AccumulationDataLabel } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationDataLabel);
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: [{ x: 'Jan', y: 3 }, { x: 'Feb', y: 3.5 }, { x:
'Mar', y: undefined }, { x: 'Apr', y: 13.5 },
            { x: 'May', y: 19 }, { x: 'Jun', y: 23.5 }, { x: 'Jul', y: null
}, { x: 'Aug', y: 25 },
            { x: 'Sep', y: 21 }, { x: 'Oct', y: 15 }],
            xName: 'x',
            yName: 'y',
            emptyPointSettings: { mode: 'Zero', fill: 'pink' },
            dataLabel: { visible: true, position: 'Outside' }
        }
    ]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Annotation in EJ2 JavaScript Accumulation chart control

The annotations are used to mark the specific area of interest in the chart area with texts, shapes or images.

<!-- markdownlint-disable MD033 -->

By using the `<code>content</code>`

 option of annotation property, you can specify the Id of the element that needs to be displayed in the chart area

INDEX.TS

```

import { AccumulationChart, AccumulationAnnotation } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(AccumulationAnnotation);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [{ x: 'Jan', y: 13, text: 'Jan: 13' }, { x: 'Feb', y: 13, text: 'Feb: 13' },
        { x: 'Mar', y: 17, text: 'Mar: 17' }, { x: 'Apr', y: 13.5, text: 'Apr: 13.5' }],
      xName: 'x',
      yName: 'y'
    }
  ],
  annotations:[{
    content:'<div style="border: 1px solid black;background-color:#f5f5f5; padding: 5px 5px 5px 5px">13.5</div>',
    region: 'Series',
    coordinateUnits: 'Point',
    x: 'Jan',
    y: 13
  }],
}, '#element');

```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use tooltip feature, inject the `AccumulationTooltip` using the `Chart.Inject(AccumulationTooltip)` method.

Header

We can specify header for the tooltip using [header](#) property.

INDEX.TS

```

import { AccumulationChart, AccumulationTooltip } from '@syncfusion/ej2-
charts';
import { labelData } from './datasource.ts';
AccumulationChart.Inject(AccumulationTooltip);
let accChart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: labelData,
            xName: 'x',
            yName: 'y'
        }
    ],
    tooltip: { enable: true, header: "Pie Chart" }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

Legend in EJ2 JavaScript Accumulation chart control

As like a chart, the legend is also available for accumulation charts, which gives information about the points. By default, the legend will be placed on the right, if the width of the chart is high or will be placed on the bottom, if the height of the chart is high. Other customization features regarding the legend element are same as the [chart legend](#). Here, the legend for a point can be collapsed by giving the empty string to the x value of the point.

INDEX.TS

```

import { AccumulationChart, AccumulationLegend } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationLegend);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [{ x: 'Jan', y: 13, text: 'Jan: 13' }, { x: 'Feb',
y: 13, text: 'Feb: 13' },
{ x: 'Mar', y: 17, text: 'Mar: 17' }, { x: 'Apr', y: 13.5, text: 'Apr: 13.5'
}],
      xName: 'x',
      yName: 'y'
    }
  ],
  legendSettings: {
    visible: true,
  }
}, '#element');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: To use the legends feature, inject the `AccumulationLegend` using the `Chart.Inject(AccumulationLegend)` method.

Position and Alignment

By using the position property, you can position the legend at the `left`, `right`, `top` or `bottom` of the chart. You can also align the legend to `center`, `far` or `near` of the chart using the alignment property.

INDEX.TS

```
import { AccumulationChart, AccumulationLegend } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationLegend);
import { labelData } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: labelData,
      xName: 'x',
      yName: 'y'
    }
  ],
  legendSettings:{ position:'Top' ,alignment:'Near'}
}, '#element');
```

INDEX.HTML

</body></html>

```

Legend Title

You can set title for legend using `title` property in `legendSettings`. You can also customize the `fontStyle`, `size`, `fontWeight`,

`color`, `textAlignment`, `fontFamily`, `opacity` and `textOverflow` of legend title. `titlePosition` is used to set the legend position in `Top`, `Left` and `Right` position. `maximumTitleWidth` is used to set the width of the legend title. By default, it will be `100px`.

INDEX.TS

```

import { AccumulationChart, AccumulationLegend } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationLegend);
import { labelData } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: labelData,
            xName: 'x',
            yName: 'y',
            type: 'Pie'
        }
    ],
    legendSettings: { visible: true, title: 'Months', position: 'Bottom' }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Arrow Page Navigation

By default, the page number will be enabled while legend paging. Now, you can disable that page number and also you can get left and right arrows for page navigation. You have to set `false` value to `enablePages` to get this support.

INDEX.TS

```
import { AccumulationChart, AccumulationLegend } from '@syncfusion/ej2-
charts';
AccumulationChart.Inject(AccumulationLegend);
import { data } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
    series: [
        {
            dataSource: data,
            xName: 'x',
            yName: 'y',
        }
    ],
    legendSettings: { width: '260px', height: '50px', enablePages: false,
position: 'Bottom' }
}, '#element');
```

INDEX.HTML

Center label in EJ2 JavaScript Accumulation chart control

Using [centerLabel](#) it is now possible to place a label at the center of a pie or doughnut chart. To configure the default text rendered on the center label for the pie and doughnut charts, use the [text](#) property in the [centerLabel](#).

INDEX.TS

```

import { AccumulationChart } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [
        { x: 'Chrome', y: 61.3, text: 'Chrome: 61.3%' },
        { x: 'Safari', y: 24.6, text: 'Safari: 24.6%' },
        { x: 'Edge', y: 5.0, text: 'Edge: 5.0%' },
        { x: 'Samsung Internet', y: 2.7, text: 'Samsung Internet: 2.7%' },
        { x: 'Firefox', y: 2.6, text: 'Firefox: 2.6%' },
        { x: 'Others', y: 3.6, text: 'Others: 3.6%' }],
      innerRadius: '65%',
      xName: 'x',
      yName: 'y'
    }
  ],
  centerLabel: {
    text: 'Mobile<br>Browsers<br>Statistics'
  }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

Chart print in EJ2 JavaScript Accumulation chart control

Print

The rendered chart can be printed directly from the browser by calling the public method print.

INDEX.TS

```
import { AccumulationChart } from '@syncfusion/ej2-charts';
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [{ x: 'Jan', y: 3 }, { x: 'Feb', y: 3.5 }, { x:
'Mar', y: 7 }, { x: 'Apr', y: 13.5 },
      { x: 'May', y: 19 }, { x: 'Jun', y: 23.5 }, { x: 'Jul', y: 26 },
{ x: 'Aug', y: 25 },
      { x: 'Sep', y: 21 }, { x: 'Oct', y: 15 }],
      radius: '100%',
      xName: 'x',
      yName: 'y'
    }
  ]
}, '#element');
document.getElementById('print').onclick = () => {
  piechart.print();
};
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element" style="float: left "></div>
    <button id="print" type="button" width="15%" style="float:
right">Print</button>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Export

The rendered chart can be exported to **Image**(jpeg or png) or **SVG** or **PDF** format by using the export method.

Input parameters for this method are **Export** Type for **format** and **fileName** of result.

INDEX.TS

```
import { AccumulationChart, Export } from '@syncfusion/ej2-charts';
AccumulationChart.Inject(Export);
let piechart: AccumulationChart = new AccumulationChart({
  series: [
    {
      dataSource: [{ x: 'Jan', y: 3 }, { x: 'Feb', y: 3.5 }, { x:
'Mar', y: 7 }, { x: 'Apr', y: 13.5 },
      { x: 'May', y: 19 }, { x: 'Jun', y: 23.5 }, { x: 'Jul', y: 26 },
{ x: 'Aug', y: 25 },
      { x: 'Sep', y: 21 }, { x: 'Oct', y: 15 }],
      radius: '100%',
      xName: 'x',
      yName: 'y'
    }
  ]
}, '#element');
document.getElementById('print').onclick = () => {
  piechart.exportModule.export('PNG', 'result');
};
```

Accessibility in EJ2 JavaScript Accumulation chart control

The Accumulation chart control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Accumulation chart control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Accumulation chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Accumulation chart control:

- `img` (role)
- `button` (role)
- `region` (role)
- `aria-label` (attribute)
- `aria-hidden` (attribute)
- `aria-pressed` (attribute)

Keyboard interaction

The Accumulation chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Accumulation chart control.

| **Press** | **To do this** |

| --- | --- |

| **Alt + J** | Moves the focus to the Accumulation chart element. |

| **Tab** | Moves the focus to the next element in the Accumulation chart. |

| **Shift + Tab** | Moves the focus to the previous element in the Accumulation chart. |

| **Down Arrow** | Moves the focus to the data point left side from the selected point. |

| **Up Arrow** | Moves the focus to the data point right side from the selected point. |

| **Down/Left Arrow** | Moves the focus to the legend left side from the selected legend. |

| **Up/Right Arrow** | Moves the focus to the legend right side from the selected legend. |

| **Enter/Space** | Toggles the visibility of the corresponding series. |

| **Ctrl + P** | Prints the Accumulation chart. |

Ensuring accessibility

The Accumulation chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Accumulation chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Accumulation chart control with accessibility tools.

Fires before rendering the data labels.	Property:displayTextRendering\$("#chart").ejChart({ displayTextRendering: () { } });	Property:textRenderlet chart: AccumulationChart = new AccumulationChart({ textRender: () => { } });chart.appendTo('#chart');
Fires on clicking the legend item.	Property:legendItemClick\$("#chart").ejChart({ legendItemClick: () { } });	Not applicable
Fires when moving mouse over legend item	Property:legendItemMouseMove\$("#chart").ejChart({ legendItemMouseMove: () { } });	Not applicable
Fires before rendering the	Property:legendItemRendering\$("#chart").ejChart({ legendItemRendering: () { } });	Property:legendRenderlet chart: AccumulationChart = new AccumulationChart({ legendRender: () => { } });chart.appendTo('#chart');

legend item.		
Fires before loading the chart.	Property:load \$("#chart").ejChart({ load: () { } });	Property:load let chart: AccumulationChart = new AccumulationChart({ load: () => { } });chart.appendTo('#chart');
Fires on clicking a point in chart.	Property:pointRegionClick \$("#chart").ejChart({ pointRegionClick: () { } });	Property:pointClick let chart: AccumulationChart = new AccumulationChart({ pointClick : () => { } });chart.appendTo('#chart');
Fires when mouse is moved over a point.	Property:pointRegionMouseMove \$("#chart").ejChart({ pointRegionMouseMove: () { } });	Property:pointMove let chart: AccumulationChart = new AccumulationChart({ pointMove : () => { } });chart.appendTo('#chart');
Fires before rendering chart.	Property:preRender \$("#chart").ejChart({ preRender: () { } });	Not applicable
Fires when point render.	Not Applicable	Property:pointRender let chart: AccumulationChart = new AccumulationChart({ pointRender : () => { } });chart.appendTo('#chart');
Fires before rendering a series.	Property:seriesRendering \$("#chart").ejChart({ seriesRendering: () { } });	Property:seriesRender let chart: AccumulationChart = new AccumulationChart({ seriesRender : () => { } });chart.appendTo('#chart');
Fires before rendering the Chart title.	Property:titleRendering \$("#chart").ejChart({ titleRendering: () { } });	Not applicable
Fires before rendering	Property:subTitleRendering \$("#chart").ejChart({ subTitleRendering: () { } });	Not applicable

the Chart sub title.		
Fires before rendering the tooltip.	Property:tooltipInitialize\$("#chart").ejChart({ tooltipInitialize: () { }});	Property:tooltipRender let chart: AccumulationChart = new AccumulationChart({ tooltipRender : () => { }});chart.appendTo('#chart');

AppBar

Size and color in EJ2 JavaScript AppBar control

Size

The size of the AppBar can be set using the [mode](#) property. The available types of the AppBar are as follows:

- Regular AppBar
- Prominent AppBar
- Dense AppBar

Regular AppBar

This mode is the default one in which the AppBar is displayed with the default height.

INDEX.TS

```
import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
const defaultButtonLoginObj: Button = new Button({ cssClass: 'e-inherit',
content: 'FREE TRIAL' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');
```

INDEX.HTML

```

    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Prominent AppBar

This height mode can be set to the AppBar by setting **Prominent** to the property [mode](#). The prominent AppBar is displayed with a longer height and can be used for larger titles, images, or texts. It is also longer than the regular AppBar. In the following example, we have customized the prominent text using align-self and white-space CSS properties. You can change the prominent AppBar height if larger titles, images, or texts are used.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
    colorMode: 'Primary',
    mode: 'Prominent',
    cssClass: 'prominent-appbar'
});
defaultAppBarObj.appendTo("#defaultAppBar");

```

```

const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
const defaultButtonLoginObj: Button = new Button({ cssClass: 'e-inherit',
content: 'FREE TRIAL' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

<script src="index.js" type="text/javascript"></script>

```

```
</body></html>
```

Dense AppBar

This height mode can be set to the AppBar by setting **Dense** to the property **mode**. Dense AppBar is displayed with shorter height which is denser to accommodate all the AppBar content.

INDEX.TS

```
import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary',
  mode: 'Dense'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo("#defaultButtonMenu");
const defaultButtonLoginObj: Button = new Button({ cssClass: 'e-inherit',
content: 'FREE TRIAL' });
defaultButtonLoginObj.appendTo("#defaultButtonLogin");

```

Color

The background and font colors can be set using the [colorMode](#) property. The available types of background color for the AppBar are as follows:

- Light AppBar
- Dark AppBar
- Primary AppBar
- Inherit AppBar

Light AppBar

This color mode is the default one in which the AppBar can be displayed with a light background and its corresponding font color.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonLoginObj: Button = new Button({ isPrimary: true, content:
'FREE TRIAL' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');

```

```

Inherit AppBar

This color mode can be set to the AppBar by setting `Inherit` to the property `colorMode`. The AppBar inherits the background and font color from its parent element.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
    colorMode: 'Inherit'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonLoginObj: Button = new Button({ isPrimary: true, content:
'FREE TRIAL' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');

```

Accessibility in EJ2 JavaScript AppBar control

The AppBar control followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the AppBar control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

```
.post .post-content img {
```

```
display: inline-block;
```

```
margin: 0.5em 0;
```

```
}
```

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

Keyboard interaction

The AppBar control provides the focus element navigation based on its's tab key order.

Ensuring accessibility

The AppBar control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the AppBar control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the AppBar control with accessibility tools.

Position in EJ2 JavaScript AppBar control

The position of the AppBar can be set using the [position](#) and [isSticky](#) property. The AppBar provides the following options for setting its position:

- Top AppBar
- Bottom AppBar
- Sticky AppBar

Top AppBar

The top AppBar is the default one in which it positions the AppBar at the top of the content.

INDEX.TS

```
import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary'
});
```

```
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
const defaultButtonLoginObj: Button = new Button({ cssClass: 'e-inherit',
content: 'FREE TRIAL' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');
```

Design in EJ2 JavaScript AppBar control

Spacer

Spacer is used to provide spacing between the AppBar contents which gives additional space to the content layout.

The following example depicts the code to provide spacing between the home and pan buttons in the AppBar:

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";

```

```

const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonHomeObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-home' });
defaultButtonHomeObj.appendTo('#defaultButtonHome');
const defaultButtonCutObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-cut' });
defaultButtonCutObj.appendTo('#defaultButtonCut');
const defaultButtonPanObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-pan' });
defaultButtonPanObj.appendTo('#defaultButtonPan');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 - AppBar</title>
  <meta charset="utf-8">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="control-section default-appbar-section">
      <div class="control-container">
        <header id="defaultAppBar">
          <button id="defaultButtonHome"></button>
          <div class="e-appbar-spacer"></div>
          <button id="defaultButtonCut"></button>
          <div class="e-appbar-spacer"></div>
          <button id="defaultButtonPan"></button>
        </header>
      </div>
    </div>
  </div>
</script>

```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Separator

Separator shows a vertical line to visually group or separate the AppBar contents.

The following example depicts the code to provide a vertical line between a group of buttons in the AppBar.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
    colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonCutObj: Button = new Button({ cssClass: 'e-inherit',

Designing AppBar with Menu

AppBar is rendered with a Menu component in its AppBar header area. Menu component's styles are inherited from the AppBar component using the `e-inherit` CSS class.

INDEX.TS

```

import { AppBar, Menu, MenuItemModel } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const companyMenuItems: MenuItemModel[] = [
    {
        text : 'Company',
        items: [
            { text: 'About Us' },
            { text: 'Customers' },
            { text: 'Blog' },
            { text: 'Careers' }
        ]
    }
];
const productMenuItems: MenuItemModel[] = [
    {
        text : 'Products',
        items: [
            { text: 'Developer' },
            { text: 'Analytics' },
            { text: 'Reporting' },

```

```

        { text: 'Help Desk' }
    ]
}
];
const aboutMenuItems: MenuItemModel[] = [
    {
        text : 'About Us'
    }
];
const carrerMenuItems: MenuItemModel[] = [
    {
        text : 'Carrers'
    }
];
const defaultAppBarObj: AppBar = new AppBar({
    colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
const defaultMenuCompanyObj: Menu = new Menu({ cssClass: 'e-inherit', items:
companyMenuItems });
defaultMenuCompanyObj.appendTo('#defaultMenuCompany');
const defaultMenuProductsObj: Menu = new Menu({ cssClass: 'e-inherit',
items: productMenuItems });
defaultMenuProductsObj.appendTo('#defaultMenuProducts');
const defaultMenuAboutObj: Menu = new Menu({ cssClass: 'e-inherit', items:
aboutMenuItems });
defaultMenuAboutObj.appendTo('#defaultMenuAbout');

Designing AppBar with Buttons

The AppBar is rendered with a Button and DropDownButton component in its AppBar header area. Button and DropDownButton components' styles are inherited from the AppBar component using the `e-inherit` CSS class.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
import { DropDownButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
const productDropDownButtonItem: ItemModel[] = [
    { text: 'Developer' },
    { text: 'Analytics' },
    { text: 'Reporting' },
    { text: 'E-Signature' },
    { text: 'Help Desk' }
];
const defaultAppBarObj: AppBar = new AppBar({
    colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");

```

```

const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
const defaultDropDownButtonProductObj: DropDownButton = new DropDownButton({
cssClass: 'e-inherit', items: productDropDownButtonItem });
defaultDropDownButtonProductObj.appendTo('#defaultDropDownButtonProduct');
const defaultButtonLoginObj: Button = new Button({ cssClass: 'e-inherit',
content: 'Login' });
defaultButtonLoginObj.appendTo('#defaultButtonLogin');

```

INDEX.HTML

```

Designing AppBar with SideBar

The AppBar is rendered with the SideBar component below the AppBar. Click on the menu icon to expand/collapse the Sidebar. In the following sample, the `toggle` method has been used to show or hide the Sidebar on the AppBar button click.

INDEX.TS

```

import { AppBar, Sidebar, TreeView } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
import { TextBox } from "@syncfusion/ej2-inputs";
let data: { [key: string]: Object }[] = [
    {
        nodeId: '01', nodeText: 'Installation',
    },
    {
        nodeId: '02', nodeText: 'Deployment',
    },
    {
        nodeId: '03', nodeText: 'Quick Start',
    },
    {
        nodeId: '04', nodeText: 'Components',
        nodeChild: [
            { nodeId: '04-01', nodeText: 'Calendar' },
            { nodeId: '04-02', nodeText: 'DatePicker' },
            { nodeId: '04-03', nodeText: 'DateTimePicker' },
            { nodeId: '04-04', nodeText: 'DateRangePicker' },
            { nodeId: '04-05', nodeText: 'TimePicker' },
            { nodeId: '04-06', nodeText: 'SideBar' }
        ]
    }
];
const defaultAppBarObj: AppBar = new AppBar({});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-menu' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
defaultButtonMenuObj.element.addEventListener("click", toggle);
let sidebarMenu: Sidebar = new Sidebar({
    width: '220px',
    target: '.main-content',
    mediaQuery: '(min-width: 600px)',
    isOpen: true
});
sidebarMenu.appendTo('#sideTree');
let inputObj: TextBox = new TextBox({
    placeholder: "Search..."
});
inputObj.appendTo("#resSearch");

```

```

let mainTreeView: TreeView = new TreeView({
    cssClass: "main-treeview",
    fields: { dataSource: data, id: 'nodeId', text: 'nodeText', child:
'nodeChild' },
    expandOn: 'Click'
});
mainTreeView.appendTo('#mainTree');
function toggle() {
    sidebarMenu.toggle();
}

```

            This is a graphical aid for visualising and
categorising the site, in the style of an expandable and
collapsable treeview component.
            It auto-expands to display the node(s), if any,
corresponding to the currently viewed title,
            highlighting that node(s)
            and its ancestors. Load-on-demand when expanding
nodes is available where supported (most graphical
browsers),
            falling back to a full-page reload. MediaWiki-
supported caching, aside from squid, has been considered
so that
            unnecessary re-downloads of content are avoided
where possible. The complete expanded/collapsed state of
            the treeview persists across page views in most
situations.
        </p>
    </div>
</div>
</div>
</div>
</div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Style and appearance in EJ2 JavaScript AppBar control

To modify the AppBar appearance, you need to override the default CSS of the AppBar component. Please find the list of CSS classes and their corresponding sections in the AppBar component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

|CSS Class | Purpose of Class |

|-----|-----|

|.e-appbar|To customize the appbar.|

|.e-appbar.e-prominent|To customize the prominent appbar.|

|.e-appbar.e-dense|To customize the dense appbar.|

|.e-appbar.e-light|To customize the light appbar.|

|.e-appbar.e-dark|To customize the dark appbar.|

|.e-appbar.e-primary|To customize the dark appbar.|

|.e-appbar.e-inherit|To customize the inherit appbar.|

Note: You can change the prominent AppBar height if larger titles, images, or texts are used.

CssClass

CssClass is used for AppBar customization based on the custom class. In the example below, the AppBar background and color are customized using the [cssClass](#) property.

INDEX.TS

```
import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary',
  cssClass: 'custom-appbar'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
  iconCss: 'e-icons e-home' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 - AppBar</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
  user-scalable=no">
  <meta name="description" content="Essential JS 2">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
```

```

<body>

  <div id="container">
    <div class="control-section default-appbar-section">
      <div class="control-container">
        <header id="defaultAppBar">
          <button id="defaultButtonMenu"></button>
        </header>
      </div>
    </div>
  </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

HtmlAttributes

It can be used for additional inline attributes by specifying as inline attributes or by specifying htmlAttributes directive. In the code example below, the aria-label of the AppBar is customized by specifying as attributes.

INDEX.TS

```

import { AppBar } from "@syncfusion/ej2-navigations";
import { Button } from "@syncfusion/ej2-buttons";
const defaultAppBarObj: AppBar = new AppBar({
  colorMode: 'Primary'
});
defaultAppBarObj.appendTo("#defaultAppBar");
const defaultButtonMenuObj: Button = new Button({ cssClass: 'e-inherit',
iconCss: 'e-icons e-home' });
defaultButtonMenuObj.appendTo('#defaultButtonMenu');

```

AutoComplete

Data binding in EJ2 JavaScript Auto complete control

The AutoComplete loads the data either from local data sources or remote data services using the [dataSource](#) property. It supports the data type of array or [DataManager](#).

The AutoComplete also supports different kind of data services such as OData, OData V4, Web API and data formats such as XML, JSON, JSONP with the help of DataManager Adaptors.

Fields	Type	Description
value	number or string	Specifies the hidden data value mapped to each list item that should contain a unique value.
groupBy	string	Specifies the category under which the list item has to be grouped.
iconCss	string	Specifies the icon class of each list item.

While binding complex data to AutoComplete, fields should be mapped correctly. Otherwise, the selected

item remains undefined.

Bind to local data

Local data can be represented in two ways as described below.

Array of string

The AutoComplete has support to load array of primitive data such as strings and numbers.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let sportsData: string[] = ['Badminton', 'Basketball', 'Cricket',
'Football', 'Golf', 'Gymnastics', 'Hockey', 'Tennis'];
// initialize AutoComplete component
let atcObject: AutoComplete = new AutoComplete({
    //set the data to dataSource property
    dataSource: sportsData,
    // set placeholder to AutoComplete input element
    placeholder: "Find a game"
});
// render initialized AutoComplete
atcObject.appendTo('#atcelement');
```

INDEX.HTML

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Array of object

The AutoComplete can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Game** column from complex data have been mapped to the **value** field.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let sportsData: { [key: string]: Object }[] = [
  { Id: 'Game1', Game: 'Badminton' },
  { Id: 'Game2', Game: 'Basketball' },
  { Id: 'Game3', Game: 'Cricket' },
  { Id: 'Game4', Game: 'Football' },
  { Id: 'Game5', Game: 'Golf' },
  { Id: 'Game6', Game: 'Hockey' },
  { Id: 'Game7', Game: 'Rugby' },
  { Id: 'Game8', Game: 'Snooker' }
];
//initiate the AutoComplete
let atcObject: AutoComplete = new AutoComplete({
  // bind the sports Data to datasource property
  dataSource: sportsData,
  // maps the appropriate column to fields property
  fields: { value: 'Game' },
  //set the placeholder to AutoComplete input
  placeholder: "Find a game"
});
//render the component
atcObject.appendTo('#atcelement');
```

INDEX.HTML

```

Array of complex object

The AutoComplete can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property.

In the following example, **Country.Name** column from complex data have been mapped to the **value** field.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let countriesData: { [key: string]: Object }[] = [
  { Country: { Name: 'Australia' }, Code: { Id: 'AU' } },
  { Country: { Name: 'Bermuda' }, Code: { Id: 'BM' } },
  { Country: { Name: 'Canada' }, Code: { Id: 'CA' } },
  { Country: { Name: 'Cameroon' }, Code: { Id: 'CM' } },
  { Country: { Name: 'Denmark' }, Code: { Id: 'DK' } },
  { Country: { Name: 'France' }, Code: { Id: 'FR' } },
  { Country: { Name: 'Finland' }, Code: { Id: 'FI' } },
  { Country: { Name: 'Germany' }, Code: { Id: 'DE' } },
  { Country: { Name: 'Greenland' }, Code: { Id: 'GL' } },
  { Country: { Name: 'Hong Kong' }, Code: { Id: 'HK' } },
  { Country: { Name: 'India' }, Code: { Id: 'IN' } },
  { Country: { Name: 'Italy' }, Code: { Id: 'IT' } },
  { Country: { Name: 'Japan' }, Code: { Id: 'JP' } },
  { Country: { Name: 'Mexico' }, Code: { Id: 'MX' } },
  { Country: { Name: 'Norway' }, Code: { Id: 'NO' } },
  { Country: { Name: 'Poland' }, Code: { Id: 'PL' } },
  { Country: { Name: 'Switzerland' }, Code: { Id: 'CH' } },
  { Country: { Name: 'United Kingdom' }, Code: { Id: 'GB' } },
  { Country: { Name: 'United States' }, Code: { Id: 'US' } }
];
//initiate the AutoComplete
let atcObject: AutoComplete = new AutoComplete({
  // bind the sports Data to datasource property
  dataSource: countriesData,
  // maps the appropriate column to fields property
  fields: { value: 'Country.Name' },
  //set the placeholder to AutoComplete input
  placeholder: "Find a country"
});
//render the component
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

Bind to remote data

The AutoComplete supports retrieval of data from remote data services with the help of **DataManager** component. The [Query](#) property is used to fetch data from the database and bind it to the AutoComplete.

The following sample displays the first 6 contacts from the **Customers** table of the **Northwind** data service.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let customers: AutoComplete = new AutoComplete({
  //bind the DataManager instance to dataSource property
  dataSource: new DataManager({

```

```

        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    )),
    //bind the Query instance to query property
    query: new Query().from('Customers').select(['ContactName',
'CustomerID']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find a customer",
    //sort the resulted items
    sortOrder: 'Ascending'
});
//render the component
customers.appendTo('#atcelement');

```

Templates in EJ2 JavaScript Auto complete control

The AutoComplete has been provided with several options to customize each list items, group title, header and footer elements. It uses the Essential JS 2 [Template engine](#) to compile and render the elements properly.

Item template

The content of each list item within the AutoComplete can be customized with the help of [itemTemplate](#) property.

In the following sample, each list item is split into two columns to display relevant data's.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName', 'City', 'EmployeeID']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find an employee",
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the value to itemTemplate property
    itemTemplate: "<span><span class='name'>${FirstName}</span><span class='city'>${City}</span></span>",
});
//render the component
atcObject.appendTo('#atcelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Group template

The group header title under which appropriate sub-items are categorized can also be customize with the help of [groupTemplate](#) property. This template is common for both inline and floating group header template.

In the following sample, employees are grouped according to their city.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, Predicate, DataManager, ODataV4Adaptor } from
 '@syncfusion/ej2-data';
// form predicate to fetch the grouped data
let groupPredicate = new Predicate('City', 'equal', 'london').or('City',
 'equal', 'seattle');
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName', 'City',
 'EmployeeID']).take(6)
    .where(groupPredicate),
    //map the appropriate columns to fields property

```

```

    fields: { value: 'FirstName', groupBy: 'City' },
    //set the placeholder to AutoComplete input
    placeholder: "Find an employee",
    //sort the resulted items
    sortOrder: 'Ascending',
    //set the value to groupTemplate
    groupTemplate: "<strong>${City}</strong>"
  });
  //render the component
  atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Header template

The header element is shown statically at the top of the suggestion list items within the AutoComplete, and any custom element can be placed as a header element using [headerTemplate](#) property.

In the following sample, the list items and its headers are designed and displayed as two columns similar to multiple columns of the grid.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        url: 'https://services.odata.org/V4/Northwind/Northwind.svc/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Footer template

The AutoComplete has options to show a footer element at the bottom of the list items in the suggestion list. Here, you can place any custom element as a footer element using [footerTemplate](#) property.

In the following sample, footer element displays the total number of list items present in the AutoComplete.

INDEX.TS

```

import { AutoComplete, OpenEventArgs } from '@syncfusion/ej2-dropdowns';
let sportsData = ['Badminton', 'Basketball', 'Cricket', 'Football', 'Golf', 'Gymnastics', 'Hockey'];
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: sportsData,
    //set the placeholder to AutoComplete input
    placeholder: "Find a game",
    open: (e: OpenEventArgs) => {
        let count = atcObject.getItems().length;
        //set the value to footerTemplate property
        let ele = document.getElementsByClassName('foot')[0];
        ele.innerHTML = "Total list item: " + count;
    }
    //set the footer template
    footerTemplate: "<span class='foot'></span>"
});
//render the component
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 AutoComplete</title>
    <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

No records template

The AutoComplete is provided with support to custom design the suggestion list content when no data is found and no matches found on search with the help of [noRecordsTemplate](#) property.

In the following sample, suggestion list content displays the notification of no data available.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: [],
    //set the placeholder to AutoComplete input
    placeholder: "Find an item",
    //set the value to noRecords template
    noRecordsTemplate: "<span class='norecord'> NO DATA AVAILABLE</span>"
});
//render the component
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 AutoComplete</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Action failure template

There is also an option to custom design the suggestion list content when the data fetch request fails at the remote server. This can be achieved using the [actionFailureTemplate](#) property.

In the following sample, when the data fetch request fails, the AutoComplete displays the notification.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import data manager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data manager instance to dataSource property
    dataSource: new DataManager({
        // use the wrong url to display the action failure template
        url: 'https://services.odata.org/V4/Northwind/Northwind.svcs/',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Employees').select(['FirstName']).take(6),
    //map the appropriate columns to fields property
    fields: { value: 'FirstName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find an employee ",
    //set the value to action failure template
    actionFailureTemplate: "<span class='action-failure'> Data fetch get
fails</span>"
});
//render the component

```

```
atcObject.appendTo('#atcelement');
```

INDEX.HTML

```

Grouping in EJ2 JavaScript Auto complete control

The AutoComplete supports wrapping nested elements into a group based on different categories. The category of each list item can be mapped through the `groupBy` field in the data table. The group header is displayed as both inline and fixed headers. The fixed group header content is updated dynamically on scrolling the suggestion list with its category value.

In the following sample, vegetables are grouped according on its category using `groupBy` field.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//define the data with category
let vegetableData: { [key: string]: Object }[] = [
  { Vegetable: 'Cabbage', Category: 'Leafy and Salad', Id: 'item1' },
  { Vegetable: 'Spinach', Category: 'Leafy and Salad', Id: 'item2' },
  { Vegetable: 'Wheat grass', Category: 'Leafy and Salad', Id: 'item3' },
  { Vegetable: 'Yarrow', Category: 'Leafy and Salad', Id: 'item4' },
  { Vegetable: 'Pumpkins', Category: 'Leafy and Salad', Id: 'item5' },
  { Vegetable: 'Chickpea', Category: 'Beans', Id: 'item6' },
  { Vegetable: 'Green bean', Category: 'Beans', Id: 'item7' },
  { Vegetable: 'Horse gram', Category: 'Beans', Id: 'item8' },
  { Vegetable: 'Garlic', Category: 'Bulb and Stem', Id: 'item9' },
  { Vegetable: 'Nopal', Category: 'Bulb and Stem', Id: 'item10' },
  { Vegetable: 'Onion', Category: 'Bulb and Stem', Id: 'item11' }
];
//initiate the AutoComplete
let vegetables: AutoComplete = new AutoComplete({
  //set the grouped data to dataSource property
  dataSource: vegetableData,
  // map the groupBy field with Category column
  fields: { groupBy: 'Category', value: 'Vegetable' },
  // set the placeholder to the AutoComplete input
  placeholder: "Find a vegetable"
});
//render the AutoComplete component
vegetables.appendTo('#atcelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customization

The grouping header is also provided with customization option. This allows custom designing using the [groupTemplate](#) property for both inline and fixed headers as referred here:

Filtering in EJ2 JavaScript Auto complete control

The AutoComplete has built-in support to filter data items. The filter operation starts as soon as you start typing characters in the component.

Change the filter type

Determines on which filter type, the component needs to be considered on search action. The available [filterType](#) and its supported data types are

Filter Type	Description	Supported Types
---	---	---
StartsWith	Checks whether a value begins with the specified value.	String
EndsWith	Checks whether a value ends with specified value.	String
Contains	Checks whether a value contains with specified value.	String

The following examples shows the data filtering is done with **StartsWith** type.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let filter: AutoComplete = new AutoComplete({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().select(['ContactName']),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find a customer",

```

```
//set the filterType to searching operation
filterType: 'StartsWith',
//sort the resulted items
sortOrder: 'Ascending'
});
filter.appendTo('#atcelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <br>
    <input type="text" id="atcelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Filter item count

You can specify the filter suggestion item count through [suggestionCount](#) property of AutoComplete.

The following example, to restrict the suggestion list item counts as 5.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let filter: AutoComplete = new AutoComplete({
```

```

//bind the DataManager instance to dataSource property
dataSource: new DataManager({
    url:
'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
    adaptor: new ODataV4Adaptor,
    crossDomain: true
}),
//bind the Query instance to query property
query: new Query().select(['ContactName', 'CustomerID']),
//set the suggestionCount to show the maximum suggestion list item
suggestionCount: 5,
//map the appropriate columns to fields property
fields: { value: 'ContactName' },
//set the placeholder to AutoComplete input
placeholder: "Find a customer",
//sort the resulted items
sortOrder: 'Ascending'
});
filter.appendTo('#atcelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="styles.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
inputs/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
dropdowns/styles/material.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" style="margin:0 auto; width:250px;">
    <br>
    <input type="text" id="atcelement">
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Limit the minimum filter character

You can set the limit for the character count to filter the data on the AutoComplete. This can be done by set the [minLength](#) property to AutoComplete.

In the following example, the remote request doesn't fetch the search data, until the search key contains three characters.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, ODataV4Adaptor } from '@syncfusion/ej2-data';
//initiates the component
let filter: AutoComplete = new AutoComplete({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url:
        'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().select(['ContactName', 'CustomerID']),
    //set the minLength to restrict the remote request until search key
    //contains 3 characters.
    minLength: 3,
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find a customer",
    //set the filterType to searching operation
    filterType: 'StartsWith',
    //sort the resulted items
    sortOrder: 'Ascending'
});
filter.appendTo('#atcelement');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container" style="margin:0 auto; width:250px;">
        <br>
        <input type="text" id="atcelement">
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Case sensitive filtering

Data items can be filtered either with or without case sensitivity using the DataManager. This can be done by setting the [ignoreCase](#) property of AutoComplete.

The following sample depicts how to filter the data with case-sensitive.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//import DataManager related classes
import { Query, DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
//initiates the component
let filter: AutoComplete = new AutoComplete({
    //bind the DataManager instance to dataSource property
    dataSource: new DataManager({
        url:
        'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().from('Customers').select('ContactName').take(7),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    //set the placeholder to AutoComplete input
    placeholder: "Find a customer",
    //set the ignoreCase as false to enable the case sensitive filtering
    ignoreCase: false,
    //set the filterType to searching operation
    filterType: 'StartsWith',
    //sort the resulted items
    sortOrder: 'Ascending'
});
filter.appendTo('#atcelement');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Diacritics Filtering

An AutoComplete supports diacritics filtering which will ignore the [diacritics](#) and makes it easier to filter the results in international characters lists when the [ignoreAccent](#) is enabled.

In the following sample,data with diacritics are bound as dataSource for AutoComplete.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
// create local data
let data: string[] = [
  'Aeróbics',
  'Aeróbics en Agua',
  'Aerografía',
  'Aeromodelaje',
  'Águilas',
  'Ajedrez',
  'Ala Delta',
  'Álbumes de Música',
  'Alusivos',
  'Análisis de Escritura a Mano'];

```

```
// initialize AutoComplete component
let atcObj: AutoComplete = new AutoComplete({
    //set the local data to dataSource property
    dataSource: data,
    // set the placeholder to AutoComplete input element
    placeholder: 'e.g: aero',
    // enabled the ignoreAccent property for ignore the diacritics
    ignoreAccent: true
});
atcObj.appendTo('#atcelement');
```

INDEX.HTML

```

Virtualization in AutoComplete Component

AutoComplete virtualization is a technique used to efficiently render extensive lists of items while minimizing the impact on performance. This method is particularly advantageous when dealing with large datasets because it ensures that only a fixed number of DOM (Document Object Model) elements are created. When scrolling through the list, existing DOM elements are reused to display relevant data instead of generating new elements for each item. This recycling process is managed internally.

During virtual scrolling, the data retrieved from the data source depends on the popup height and the calculation of the list item height. Enabling the [enableVirtualization](#) option in a AutoComplete activates this virtualization technique.

When fetching data from the data source, the [actionBegin](#) event is triggered before data retrieval begins. Then, the [actionComplete](#) event is triggered once the data is successfully fetched.

When the enableVirtualization property is enabled, the skip and take properties provided by the user within the Query class at the initial state or during the actionBegin or actionComplete events will not be considered, since it is internally managed and calculated based on certain dimensions with respect to the popup height.

Binding local data

The AutoComplete can generate its list items through an array of complex data. For this, the appropriate columns should be mapped to the [fields](#) property. When using virtual scrolling, the list updates based on the scroll offset value, triggering a request to fetch more data from the server. As the data is being fetched, the actionBegin event occurs before the data retrieval starts. Once the data retrieval is successful, the actionComplete event is triggered, indicating that the data fetch process is complete.

In the following example, text column from complex data have been mapped to the value field.

INDEX.TS

```
import { AutoComplete, VirtualScroll } from '@syncfusion/ej2-dropdowns';
AutoComplete.Inject(VirtualScroll);
let records: { [key: string]: Object }[] = [];
for (let i: number = 1; i <= 150; i++) {
    let item = {
        id: 'id' + i,
        text: "Item " + i,
    };
    records.push(item);
}
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the dataSource property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { value: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
atcObject.appendTo('#atcelement');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 AutoComplete</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding Remote data

The AutoComplete supports retrieval of data from remote data services with the help of **DataManager** component. When using remote data, it initially fetches all the data from the server, triggering the **actionBegin** and **actionComplete** events, and then stores the data locally. During virtual scrolling, additional data is retrieved from the locally stored data, triggering the **actionBegin** and **actionComplete** events at that time as well.

The following sample displays the OrderId from the **Orders** Data Service.

INDEX.TS

```

import { AutoComplete, VirtualScroll } from '@syncfusion/ej2-dropdowns';
import { DataManager, WebApiAdaptor } from '@syncfusion/ej2-data';
AutoComplete.Inject(VirtualScroll);
//initiates the component
let atcObject: AutoComplete = new AutoComplete({

```

```

//bind the dataSorce property
dataSource: new DataManager({
    url: 'https://ej2services.syncfusion.com/js/development/api/orders',
    adaptor: new WebApiAdaptor ,
    crossDomain: true
}),
//map the appropriate columns to fields property
fields: { value: 'OrderID' },
//set the placeholder to DropDownList input
placeholder:"Select an ID ",
//set enableVirtualization property to true
enableVirtualization: true,
//set the height of the popup element
popupHeight: '200px'
});
//render the component
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Grouping with Virtualization

The AutoComplete component supports grouping with Virtualization. It allows you to organize elements into groups based on different categories. Each item in the list can be classified using the [groupBy](#) field in the data table. After grouping, virtualization works similarly to local data binding, providing a seamless user experience. When the data source is bound to remote data, an initial request is made to retrieve all data for the purpose of grouping. Subsequently, the grouped data works in the same way as local data binding virtualization, enhancing performance and responsiveness.

The following sample shows the example for Grouping with Virtualization.

INDEX.TS

```
import { AutoComplete, VirtualScroll } from '@syncfusion/ej2-dropdowns';
AutoComplete.Inject(VirtualScroll);
let records: { [key: string]: Object }[] = [];
for (let i = 1; i <= 150; i++) {
    let item: { [key: string]: Object } = {};
    item.id = 'id' + i;
    item.text = `Item ${i}`;
    // Generate a random number between 1 and 4 to determine the group
    const randomGroup = Math.floor(Math.random() * 4) + 1;
    switch (randomGroup) {
        case 1:
            item.group = 'Group A';
            break;
        case 2:
            item.group = 'Group B';
            break;
        case 3:
            item.group = 'Group C';
            break;
        case 4:
            item.group = 'Group D';
            break;
        default:
            break;
    }
    records.push(item);
}
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
    //bind the data source property
    dataSource: records,
    //map the appropriate columns to fields property
    fields: { groupBy: 'group', value: 'text' },
    //set the placeholder to DropDownList input
    placeholder: "Select an Item ",
    //set enableVirtualization property to true
    enableVirtualization: true,
    //set the height of the popup element
    popupHeight: '200px'
});
//render the component
atcObject.appendTo('#atcelement');
```

Localization in EJ2 JavaScript Auto complete control

The Localization library allows you to localize static text content of the [noRecordsTemplate](#) and [actionFailureTemplate](#) properties according to the culture currently assigned to the AutoComplete.

| Locale key | en-US (default) |

|-----|-----|

| noRecordsTemplate | No Records Found |

| actionFailureTemplate | The Request Failed |

Loading translations

To load translation object to your application, use load function of the **L10n** class.

In the following sample, French culture is set to the AutoComplete and no data is loaded. Hence, the `noRecordsTemplate` property displays its text in French culture initially and if the sample is run offline, the `actionFailureTemplate` property displays its text appropriately.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
// import L10n class for load function
import { L10n, setCulture } from '@syncfusion/ej2-base';
import { DataManager, ODataV4Adaptor, Query } from '@syncfusion/ej2-data';
let atcObj: AutoComplete = new AutoComplete({
    // bind remote data to showcase actionFailureTemplate in offline.
    dataSource: new DataManager({
        url:
            'https://services.odata.org/V4/Northwind/Northwind.svc/Customers',
        adaptor: new ODataV4Adaptor,
        crossDomain: true
    }),
    //bind the Query instance to query property
    query: new Query().select(['ContactName', 'CustomerID']).take(0),
    //map the appropriate columns to fields property
    fields: { value: 'ContactName' },
    // set locale culture to AutoComplete
    locale: 'fr-BE',
    // set placeholder to AutoComplete input element
    placeholder: 'Trouver un client'
});
atcObj.appendTo('#atcelement');
L10n.load({
    'fr-BE': {
        'dropdowns': {
            'noRecordsTemplate': "Aucun enregistrement trouvé",
            'actionFailureTemplate': "Modèle d'échec d'action"
        }
    }
});
```

Style in EJ2 JavaScript Auto complete control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the appearance of wrapper element

Use the following CSS to customize the appearance of wrapper element.

```

,
.e-ddl.e-input-group.e-control-wrapper .e-input {
font-size: 20px;
font-family: emoji;
color: #ab3243;
background: #32a5ab;
}
,

```

Customizing the dropdown icon's color

Use the following CSS to customize the dropdown icon's color.

```

,
.e-ddl.e-input-group .e-input-group-icon,.e-ddl.e-input-group.e-control-wrapper .e-input-group-
icon:hover {
color: #bb233d;
font-size: 13px;

```

```
}
,
```

Customizing the focus color

Use the following CSS to customize the focusing color of input element.

```
,
```

```
.e-ddl.e-input-group.e-control-wrapper.e-input-focus::before, .e-ddl.e-input-group.e-control-wrapper.e-input-focus::after {
```

```
background: #c000ff;
```

```
}
```

```
,
```

Customizing the outline theme's focus color

Use the following CSS to customize the focusing color of outline theme.

```
,
```

```
.e-outline.e-input-group.e-input-focus:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus.e-control-wrapper:hover:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled):not(.e-float-icon-left),.e-outline.e-input-group.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled),.e-outline.e-input-group.e-control-wrapper.e-input-focus:not(.e-success):not(.e-warning):not(.e-error):not(.e-disabled) {
```

```
border-color: #b1bd15;
```

```
box-shadow: inset 1px 1px #b1bd15, inset -1px 0 #b1bd15, inset 0 -1px #b1bd15;
```

```
}
```

```
,
```

Customizing the disabled component's text color

Use the following CSS to customize the text color when the component is disabled.

```
,
```

```
.e-input-group.e-control-wrapper .e-input[disabled] {
```

```
-webkit-text-fill-color: #0d9133;
```

```
}
```

```
,
```

Customizing the float label element's focusing color

Use the following CSS to customize the focusing color of float label element.

```
,
```

```
.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::before,.e-float-input.e-input-group:not(.e-float-icon-left) .e-float-line::after,.e-float-input.e-control-wrapper.e-input-group:not(.e-float-icon-left) .e-float-line::after {
```

```
background-color: #2319b8;
```

```
}  
.e-ddl.e-input-group.e-control-wrapper.e-float-input.e-input-focus .e-float-text.e-label-top, .e-float-  
input.e-control-wrapper:not(.e-error).e-input-focus input ~ label.e-float-text {  
color: #2319b8;  
}
```

Customizing the color of the placeholder text

Use the following CSS to customize the text color of placeholder.

```
.e-ddl.e-input-group input.e-input::placeholder {  
color: red;  
}
```

Customizing the text selection color

Use the following CSS to customize the selection color of text and background.

```
.e-ddl.e-input-group input.e-input::selection {  
color: red;  
background: yellow;  
}
```

Customizing the background color of focus, hover, and active item's

Use the following CSS to customize the background color of focus, hover and active item's.

```
.e-dropdownbase .e-list-item.e-item-focus, .e-dropdownbase .e-list-item.e-active, .e-dropdownbase .e-  
list-item.e-active.e-hover, .e-dropdownbase .e-list-item.e-hover {  
background-color: #1f9c99;  
color: #2319b8;  
}
```

Customizing the appearance of pop-up element

Use the following CSS to customize the appearance of popup element.

```
.e-dropdownbase .e-list-item, .e-dropdownbase .e-list-item.e-item-focus {  
background-color: #29c2b8;
```

```
color: #207cd9;
font-family: emoji;
min-height: 29px;
}
`
```

Adding mandatory asterisk to placeholder and float label

You can add a mandatory asterisk(*) to placeholder and float label using `.e-input-group.e-control-wrapper.e-float-input .e-float-text::after` class.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let sportsData: string[] = ['Badminton', 'Basketball', 'Cricket',
'Football', 'Golf', 'Gymnastics', 'Hockey', 'Tennis'];
// initialize AutoComplete component
let atcObject: AutoComplete = new AutoComplete({
    //set the data to dataSource property
    dataSource: sportsData,
    // set placeholder to AutoComplete input element
    placeholder: "Find a game"
    floatLabelType: "auto"
});
// render initialized AutoComplete
atcObject.appendTo('#atcelement');
```

Accessibility in EJ2 JavaScript Auto complete control

The AutoComplete component has been designed, keeping in mind the WAI-ARIA specifications, and applies the WAI-ARIA roles, states, and properties along with keyboard support. This component is characterized by complete keyboard interaction support and ARIA accessibility support that makes it easy for people who use assistive technologies (AT) or those who completely rely on keyboard navigation.

The AutoComplete component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the AutoComplete component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2 Support](#) | |

| [Section 508 Support](#) | |

| [Screen Reader Support](#) | |

| [Right-To-Left Support](#) | |

| [Color Contrast](#) | |

| [Mobile Device Support](#) | |

| [Keyboard Navigation Support](#) | |

| [Accessibility Checker Validation](#) | |

| [Axe-core Accessibility Validation](#) | |

<style>

.post .post-content img {

display: inline-block;

```
margin: 0.5em 0;
```

```
}
```

```
</style>
```

```
<div> - All features of the component meet the requirement.</div>
```

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The AutoComplete component uses the **combobox** role and each list item has an **option** role. The following **ARIA Attributes** denote the AutoComplete state.

| Property | Functionalities |

| --- | --- |

| aria-haspopup | Indicates whether the AutoComplete input element has a suggestion list or not. |

| aria-expanded | Indicates whether the suggestion list has expanded or not. |

| aria-selected | Indicates the selected option from the list. |

| aria-readonly | Indicates the readonly state of the AutoComplete element. |

| aria-disabled | Indicates whether the AutoComplete component is in a disabled state or not. |

| aria-activedescendent | This attribute holds the ID of the active list item to focus its descendant child element. |

| aria-owns | This attribute contains the ID of the suggestion list to indicate popup as a child element. |

| aria-autocomplete | This attribute contains the 'both' to a list of options shows and the currently selected suggestion also shows inline. |

Keyboard interaction

You can use the following key shortcuts to access the AutoComplete without interruptions.

| Keyboard shortcuts | Actions |

| --- | --- |

| Arrow Down | In popup hidden state, opens the suggestion list. In popup open state, selects the first item when no item selected else selects the item next to the currently selected item. |

| Arrow Up | In popup hidden state, opens the suggestion list. In popup open state, selects the last item when no item selected else selects the item previous to the currently selected one. |

| Page Down | Scrolls down to the next page and selects the first item when popup list opens. |

| Page Up | Scrolls up to previous page and select the first item when popup list open. |

| Enter | Selects the focused item and set to AutoComplete component. |

| Tab | Focuses on the next tab indexed element when the popup is closed. Otherwise, closes the popup list and remains the focus in component suppose if it is in an open state. |

| Shift + tab | Focuses the previous tab indexed element when the popup is closed. Otherwise, closes the popup list and remains the focus in component suppose if it is in an open state. |

| Alt + Down | Opens the popup list. |

| Alt + Up | In popup hidden state, opens the popup list. In popup open state, closes the popup list. |

| Esc(Escape) | Closes the popup list when it is in an open state then remove the selection. |

| Home | Cursor moves to before of first character in input. |

| End | Cursor moves to next of last character in input. |

In the below sample, focus the AutoComplete component using alt+t keys.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
// defined the array of data
let gameList: { [key: string]: Object }[] = [
  { Id: 'Game1', Game: 'Badminton' },
  { Id: 'Game2', Game: 'Basketball' },
  { Id: 'Game3', Game: 'Cricket' },
  { Id: 'Game4', Game: 'Football' },
  { Id: 'Game5', Game: 'Golf' },
  { Id: 'Game6', Game: 'Gymnastics' },
  { Id: 'Game7', Game: 'Hockey' },
  { Id: 'Game8', Game: 'Rugby' },
  { Id: 'Game9', Game: 'Snooker' },
  { Id: 'Game10', Game: 'Tennis' },
];
// initialize AutoComplete component
let atcObject: AutoComplete = new AutoComplete({
  //set the data to dataSource property
  dataSource: gameList,
  //map to column to fields
  fields: { value: 'Game' },
  // set placeholder to AutoComplete input element
  placeholder: "Find a game"
});
// render initialized AutoComplete
atcObject.appendTo('#atcelement');
document.onkeyup = function (e) {
  if (e.altKey && e.keyCode === 84 /* t */) {
    // press alt+t to focus the control.
    atcObject.focusIn();
  }
};
```

```

Ensuring accessibility

The AutoComplete component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the AutoComplete component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the AutoComplete component with accessibility tools.

How To

Autofill in EJ2 JavaScript Auto complete control

The AutoComplete supports the autofill behavior with the help of [autofill](#) property. Whenever you change the input value, the AutoComplete will autocomplete your data by matching the typed character. Suppose, if no matches found then, AutoComplete doesn't suggest any item.

In the below sample, showcase that how to work [autofill](#) with AutoComplete.

INDEX.TS

```
import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let searchData: { [key: string]: Object; }[] = [
  { Name: 'Australia', Code: 'AU' },
  { Name: 'Bermuda', Code: 'BM' },
  { Name: 'Canada', Code: 'CA' },
  { Name: 'Cameroon', Code: 'CM' },
  { Name: 'Denmark', Code: 'DK' },
  { Name: 'France', Code: 'FR' },
  { Name: 'Finland', Code: 'FI' },
  { Name: 'Germany', Code: 'DE' },
  { Name: 'Greenland', Code: 'GL' },
  { Name: 'Hong Kong', Code: 'HK' },
  { Name: 'India', Code: 'IN' },
  { Name: 'Italy', Code: 'IT' },
  { Name: 'Japan', Code: 'JP' },
  { Name: 'Mexico', Code: 'MX' },
  { Name: 'Norway', Code: 'NO' },
  { Name: 'Poland', Code: 'PL' },
  { Name: 'Switzerland', Code: 'CH' },
  { Name: 'United Kingdom', Code: 'GB' },
  { Name: 'United States', Code: 'US' }];
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
  // bind the country data to dataSource property
  dataSource: searchData,
  // maps the appropriate column to fields property
  fields: { value: "Name" },
  //set the placeholder to AutoComplete input
  placeholder: "Find a country",
  //enable the autofill property to fill a first matched value in input
  //when press a down key
  autofill: true
});
atcObject.appendTo("#atcelement");
```

INDEX.HTML

```

Icon support in EJ2 JavaScript Auto complete control

You can render **icons** to the list items by mapping the `iconCss` field. This `iconCss` field create a span in the list item with mapped class name to allow styling as per your need.

In the following sample, the icon classes are mapped with `iconCss` field.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
let sortFormatData: { [key: string]: Object }[] = [
    { Class: 'asc-sort', Type: 'Sort A to Z', Id: '1' },
    { Class: 'dsc-sort', Type: 'Sort Z to A ', Id: '2' },
    { Class: 'filter', Type: 'Filter', Id: '3' },
    { Class: 'clear', Type: 'Clear', Id: '4' }
];
let sortFormat: AutoComplete = new AutoComplete({
    //set the data to dataSource property
    dataSource: sortFormatData,
    // map the icon column to iconCSS field.
    fields: { value: 'Type', iconCss: 'Class' },
    // set placeholder to AutoComplete input element
    placeholder: 'Find a format'
});
sortFormat.appendTo('#atcelement');

```

```

Custom search in EJ2 JavaScript Auto complete control

The AutoComplete has built-in support to highlight the searched characters on suggested list items when enabled the [highlight](#) property.

In the below sample, to customize the matched character in suggestion list by `e-highlight` class.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
//define the array of complex data
let searchData: { [key: string]: Object; }[] = [
    { Name: 'Australia', Code: 'AU' },
    { Name: 'Bermuda', Code: 'BM' },
    { Name: 'Canada', Code: 'CA' },
    { Name: 'Cameroon', Code: 'CM' },
    { Name: 'Denmark', Code: 'DK' },
    { Name: 'France', Code: 'FR' },
    { Name: 'Finland', Code: 'FI' },
    { Name: 'Germany', Code: 'DE' },
    { Name: 'Greenland', Code: 'GL' },
    { Name: 'Hong Kong', Code: 'HK' },
    { Name: 'India', Code: 'IN' },
    { Name: 'Italy', Code: 'IT' },
    { Name: 'Japan', Code: 'JP' },
    { Name: 'Mexico', Code: 'MX' },
    { Name: 'Norway', Code: 'NO' },
    { Name: 'Poland', Code: 'PL' },
    { Name: 'Switzerland', Code: 'CH' },
    { Name: 'United Kingdom', Code: 'GB' },
    { Name: 'United States', Code: 'US' }];
//initiates the component
let atcObject: AutoComplete = new AutoComplete({

```

```

// bind the country data to dataSource property
dataSource: searchData,
// maps the appropriate column to fields property
fields: { value: "Name" },
//set the placeholder to AutoComplete input
placeholder: "Find a country",
//enable the highlight property to highlight the matched character in
suggestion list
highlight: true
});
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

Filter in EJ2 JavaScript Auto complete control

The AutoComplete data can be filtered based on both text and value fields using predicate of DataManager through filtering event. The filtered data can be again updated through updateData method.

In the following example, filtering is done based on text and value fields.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
import { Query, Predicate } from '@syncfusion/ej2-data';
//define the array of complex data
let searchData: { [key: string]: Object; }[] = [
  { Name: 'Australia', Code: 'AU' },
  { Name: 'Bermuda', Code: 'BM' },
  { Name: 'Canada', Code: 'CA' },
  { Name: 'Cameroon', Code: 'CM' },
  { Name: 'Denmark', Code: 'DK' },
  { Name: 'France', Code: 'FR' },
  { Name: 'Finland', Code: 'FI' },
  { Name: 'Germany', Code: 'DE' },
  { Name: 'Greenland', Code: 'GL' },
  { Name: 'Hong Kong', Code: 'HK' },
  { Name: 'India', Code: 'IN' },
  { Name: 'Italy', Code: 'IT' },
  { Name: 'Japan', Code: 'JP' },
  { Name: 'Mexico', Code: 'MX' },
  { Name: 'Norway', Code: 'NO' },
  { Name: 'Poland', Code: 'PL' },
  { Name: 'Switzerland', Code: 'CH' },
  { Name: 'United Kingdom', Code: 'GB' },
  { Name: 'United States', Code: 'US' }];
//initiates the component
let atcObject: AutoComplete = new AutoComplete({
  // bind the country data to dataSource property
  dataSource: searchData,
  // maps the appropriate column to fields property
  fields: { value: "Code", text: "Name" },
  //set the placeholder to AutoComplete input
  placeholder: "Find a country",
  //set item template
  itemTemplate: "<span><span class='name'>${Name}</span>-<span class='code'>${Code}</span></span></span>",
  filtering: function(e)
  {
    e.preventDefaultAction=true;
    let predicate = new Predicate('Name', 'contains', e.text);
    predicate = predicate.or('Code', 'contains', e.text);
    let query = new Query();
    //frame the query based on search string with filter type.
    query = (e.text !== "") ? query.where(predicate) : query;
    //pass the filter data source, filter query to updateData method.
    e.updateData(this.dataSource, query);
  }
});
atcObject.appendTo('#atcelement');

```

INDEX.HTML

```

```

Achieve virtual scrolling in EJ2 JavaScript Auto complete control

The Virtual Scrolling is used to display a large amount of data without buffering the entire load of a huge database record in the AutoComplete, that is, when scrolling, the request is sent and fetch some amount of data from the server dynamically. Using the `scroll` event, get the data and generate the list add to popup using the `addItem` method.

Refer to the following code sample for virtual scrolling.

INDEX.TS

```

import { AutoComplete } from '@syncfusion/ej2-dropdowns';
import { Query, DataManager, ODataAdaptor } from '@syncfusion/ej2-data';
let data: DataManager = new DataManager({
    url: 'https://js.syncfusion.com/demos/ejServices/Wcf/Northwind.svc/',
    crossDomain: true
});

// initialize AutoComplete component
let autoObj: AutoComplete = new AutoComplete({
    // bind the DataManager instance to dataSource property
    dataSource: data,
    // bind the Query instance to query property
    query: new Query().from('Customers').select('ContactName').take(7),
    // map the appropriate columns to fields property
    fields: { text: 'ContactName', value: 'ContactName' },
    // set the placeholder to AutoComplete input element
    placeholder: 'Select a customer',

```

```

        // sort the resulted items
        sortOrder: 'Ascending',
        // set the height of the popup element
        popupHeight: '200px',
        actionComplete: function (e: any) {
            let operator: Query = new
Query().from('Customers').select('ContactName');
            let start: number = 7;
            let end: number = 12;
            let listElement: HTMLElement = this.list;
            listElement.addEventListener('scroll', () => {
                if ((listElement.scrollTop + listElement.offsetHeight >=
listElement.scrollHeight)) {
                    let filterQuery = operator.clone();
                    data.executeQuery(filterQuery.range(start,
end)).then((event: any) => {
                        start = end;
                        end += 5;
                        autoObj.addItem(event.result as { [key: string]: Object
}[]);
                    }).catch((e: Object) => {
                    });
                }
            });
        });
        autoObj.appendTo('#atcelement');

```

Ej1 api migration in EJ2 JavaScript Auto complete control

This article describes the API migration process of AutoComplete component from Essential JS 1 to Essential JS 2.

MultiSelect concept is not present in EJ2-AutoComplete. If you want to use multiselection support in autocomplete, we suggest you to use MultiSelect component.

DataBinding

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Default** | **Property:** *datasource*
 `$('#autocomplete').ejAutocomplete({ dataSource: countriesField,});` | **Property:** *dataSource*
 `var groupObj = new ej.dropdowns.AutoComplete({dataSource: vegetableData,});groupObj.appendTo('#vegetables');` |

| **Fields for mapping** | **Property:** *fields*
 `$('#autocomplete').ejAutocomplete({fields: { key: "index", text: "name" },});` | **Property:** *fields*
 `var groupObj = new ej.dropdowns.AutoComplete({fields: { groupBy: 'Category', value: 'Vegetable' },});groupObj.appendTo('#vegetables');` |

| **Query** | **Property:** *query*
 `$('#autocomplete').ejAutocomplete({query: query,});` | **Property:** *query*
 `var groupObj = new ej.dropdowns.AutoComplete({query: ej.Query().requiresCount(),});groupObj.appendTo('#vegetables');` |

| **Begin event** | **Event:** *actionBegin*
 `$('#autocomplete').ejAutocomplete({actionBegin: "actionBegin",});` | **Event:** *actionBegin*
 `var groupObj = new ej.dropdowns.AutoComplete({actionBegin: "actionBegin",});groupObj.appendTo('#vegetables');` |

| **Complete event** | **Event:** *actionComplete*
 `$('#autocomplete').ejAutocomplete({actionComplete: "actionComplete",});` | **Event:** *actionComplete*
 `var groupObj = new ej.dropdowns.AutoComplete({actionComplete: "actionComplete",});groupObj.appendTo('#vegetables');` |

| **Failure event** | **Event:** *actionFailure*
 `$('#autocomplete').ejAutocomplete({actionFailure: "actionFailure",});` | **Event:** *actionFailure*
 `var groupObj = new ej.dropdowns.AutoComplete({actionFailure: "actionFailure",});groupObj.appendTo('#vegetables');` |

| **Success event** | **Event:** *actionSuccess*
\$('#autocomplete').ejAutocomplete({actionSuccess: "actionSuccess",}); | **Not Applicable** |

Filtering

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Case sensitivity** | **Property:** *caseSensitiveSearch*
\$('#autocomplete').ejAutocomplete({ caseSensitiveSearch: true,}); | **Property:** *ignoreCase*
var groupObj = new ej.dropdowns.AutoComplete({ignoreCase: true,});groupObj.appendTo('#vegetables'); |

| **Accent effective search** | **Not applicable** | **Property :** *ignoreAccent*
var groupObj = new ej.dropdowns.AutoComplete({ignoreAccent: true,});groupObj.appendTo('#vegetables'); |

| **Filtering Type** | **Property:** *filterType*
\$('#autocomplete').ejAutocomplete({ filterType: "Contains",}); | **Property:** *filterType*
var groupObj = new ej.dropdowns.AutoComplete({filterType: filtertype,});groupObj.appendTo('#vegetables'); |

| **Autofill** | **Property:** *enableAutoFill*
\$('#autocomplete').ejAutocomplete({ enableAutoFill: true,}); | **Property::** *autoFill*
var groupObj = new ej.dropdowns.AutoComplete({autoFill: true,});groupObj.appendTo('#vegetables'); |

| **Highlight the search word** | **Property:** *highlightSearch* \$('#autocomplete').ejAutocomplete({ highlightSearch: true,}); | **Property:** *highlight*
var groupObj = new ej.dropdowns.AutoComplete({highlight: true,});groupObj.appendTo('#vegetables'); |

| **No of items to be shown** | **Property:** *itemsCount*
\$('#autocomplete').ejAutocomplete({ itemsCount: 3,}); | **Property:** *suggestionCount*
var groupObj = new ej.dropdowns.AutoComplete({suggestionCount: 5,});groupObj.appendTo('#vegetables'); |

| **Minimum characters to enter** | **Property:** *minCharacter*
\$('#autocomplete').ejAutocomplete({ minCharacter: 3,}); | **Property:** *minLength*
var groupObj = new ej.dropdowns.AutoComplete({minLength: 4,});groupObj.appendTo('#vegetables'); |

| **Search** | **Method:** *search*
\$("#autocomplete").ejAutocomplete("search"); | **Not applicable** |

Placeholder

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Watermark text** | **Property:** *watermarkText*
\$('#autocomplete').ejAutocomplete({watermarkText:"select" }); | **Property:** *placeholder*
var groupObj = new ej.dropdowns.AutoComplete({placeholder: "Select",});groupObj.appendTo('#vegetables'); |

| **Floating of watermark text** | **Not applicable** | **Property:** *floatLabelType*
var groupObj = new ej.dropdowns.AutoComplete({floatLabelType: floatLabelType,});groupObj.appendTo('#vegetables'); |

Popup

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **No records text** | **Property:** *emptyResultText*

```
$('#autocomplete').ejAutocomplete({emptyResultText:"no records" });| Property:  
noRecordsTemplate<br/> var groupObj = new ej.dropdowns.AutoComplete({noRecordsTemplate:  
noRecordsTemplate,});groupObj.appendTo('#vegetables');
```

| **No records showing** | **Property:** *showEmptyResultText*

```
$('#autocomplete').ejAutocomplete({showEmptyResultText:true }) | Not applicable |
```

| **Popupbutton** | **Property:** *showPopupButton*

```
$('#autocomplete').ejAutocomplete({ShowPopupButton:true }) | Property:  
showPopupButton<br/> var groupObj = new ej.dropdowns.AutoComplete({showPopupButton:  
true,});groupObj.appendTo('#vegetables');
```

| **Clear button** | **Property:** *showResetIcon*

```
$('#autocomplete').ejAutocomplete({showResetIcon:true }) | Property: showClearButton <br/>var  
groupObj = new ej.dropdowns.AutoComplete({showClearButton:  
true,});groupObj.appendTo('#vegetables');
```

| **Animation** | **Property:** *animateType*

```
$('#autocomplete').ejAutocomplete({animateType:animateType }) | Not Applicable |
```

| **Focusing the list item** | **Property:** *AutoFocus*

```
@Html.EJ().Autocomplete("selectCar").AutoFocus("true") | Not applicable |
```

| **Delaying the popup open time** | **Property:** *delaySuggestionTimeout*

```
$('#autocomplete').ejAutocomplete({delaySuggestionTimeout:300 }) | Not applicable |
```

| **Popup text when there is no popup items** | **Property:** *emptyResultText*

```
$('#autocomplete').ejAutocomplete({emptyResultText:"no Records" })  
| https://ej2.syncfusion.com/javascript/demos/#/material/auto-complete/template.html |
```

| **Enable/disable the duplicate option** | **Property:** *enableDistinct*

```
$('#autocomplete').ejAutocomplete({enableDistinct:true })| Not applicable |
```

| **Popup height** | **Property:** *popupHeight*

```
$('#autocomplete').ejAutocomplete({popupHeight:300px }) | Property: popupHeight <br/> var  
groupObj = new ej.dropdowns.AutoComplete({popupHeight:  
300px,});groupObj.appendTo('#vegetables');
```

| **Popup Width** | **Property:** *popupWidth*

```
$('#autocomplete').ejAutocomplete({popupWidth:300px }) | Property: popupWidth <br/> var  
groupObj = new ej.dropdowns.AutoComplete({popupWidth:  
300px,});groupObj.appendTo('#vegetables');
```

| **Open popup** | **Method:** *open*
 \$('#autocomplete').ejAutocomplete("open"); | **Method:**

```
showPopup<br/>var groupObj = new  
ej.dropdowns.AutoComplete({});groupObj.appendTo('#vegetables');<br/><br/>groupObj.showP  
opup(); |
```

| **Close event** | **Event:** *close*
`$('#autocomplete').ejAutocomplete({close:"onClose" })` | **Event:** *close*
`var groupObj = new ej.dropdowns.AutoComplete({close:"close",});groupObj.appendTo('#vegetables');`|

| **Open event** | **Event:** *open*
`$('#autocomplete').ejAutocomplete({open:"onopen" })` | **Event:** *open*
`var groupObj = new ej.dropdowns.AutoComplete({open:"open",});groupObj.appendTo('#vegetables');`|

CSS

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Default** | **Property:** *cssClass*
`$('#autocomplete').ejAutocomplete({cssClass:"cssClass" })` | **Property:** *cssClass*
`var groupObj = new ej.dropdowns.AutoComplete({cssClass:"cssClass",});groupObj.appendTo('#vegetables');`|

| **Height** | **Property:** *height*
`$('#autocomplete').ejAutocomplete({height:"300px" })` | **Acheivable through the [cssClass](#) property** |

| **showRoundedCorner** | **Property:** *showRoundedCorner*
`$('#autocomplete').ejAutocomplete({showRoundedCorner:true })` | **Acheivable through the [cssClass](#) property.** |

| **Width** | **Property:** *width*
`$('#autocomplete').ejAutocomplete({width:300px })` | **Property:** *width*
`var groupObj = new ej.dropdowns.AutoComplete({width:"300px",});groupObj.appendTo('#vegetables');`|

| **Visibility** | **Property:** *visible*
`$('#autocomplete').ejAutocomplete({visible:true })` | **Acheivable through the [cssClass](#) property.** |

Grouping

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Default** | **Property:** *fields*
`$('#autocomplete').ejAutocomplete({fields: { key: "index", groupBy: "name" },});`| **Property:** *fields*
`var groupObj = new ej.dropdowns.AutoComplete({fields: { groupBy: 'Category', value: 'Vegetable' },});groupObj.appendTo('#vegetables');`|

Localization

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| **Default** | **Property:** *Locale*
`$('#autocomplete').ejAutocomplete({lcoale: "fr-FE",});`| **Property:** *Locale*
`var groupObj = new ej.dropdowns.AutoComplete({locale: "fr-FE"});groupObj.appendTo('#vegetables');`|

Template

| **Behavior** | **API in Essential JS 1** | **API in Essential JS 2** |

| --- | --- | --- |

| Default | Property: *template* `$('#autocomplete').ejAutocomplete({template: "${FirstName}${City}"})` **| Property:** *itemTemplate* `
 var groupObj = new ej.dropdowns.AutoComplete({itemTemplate: "${FirstName}${City}");groupObj.appendTo('#vegetables');` |

| Group Template | Not Applicable | Property: *groupTemplate* `
var groupObj = new ej.dropdowns.AutoComplete({groupTemplate: "${City}");groupObj.appendTo('#vegetables');` |

| ValueTemplate | Not applicable | Property: *valueTemplate* `
var groupObj = new ej.dropdowns.AutoComplete({valueTemplate: "${FirstName} - ${City}");groupObj.appendTo('#vegetables');` |

| Header Template | Not applicable | Property: *headerTemplate* `
 var groupObj = new ej.dropdowns.AutoComplete({headerTemplate: "NameCity");groupObj.appendTo('#vegetables');` |

| FooterTemplate | Not applicable | Property: *footerTemplate* `
var groupObj = new ej.dropdowns.AutoComplete({footerTemplate: " Total list items: "+ sportsData.length + "");groupObj.appendTo('#vegetables');` |

| No records Template | Not applicable | Property: *noRecordsTemplate* `
var groupObj = new ej.dropdowns.AutoComplete({noRecordsTemplate: " NO DATA AVAILABLE");groupObj.appendTo('#vegetables');` |

| Action failure Template | Not applicable | Property: *actionFailureTemplate* `
var groupObj = new ej.dropdowns.AutoComplete({actionFailureTemplate: " Data fetch get fails");groupObj.appendTo('#vegetables');` |

Sorting

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Default | Property: *allowSorting* `
 $('#autocomplete').ejAutocomplete({allowSorting: true});` **| Achievable through** [sortOrder](#) **property |**

| Order of sorting | Property: *sortOrder* `
$('#autocomplete').ejAutocomplete({sortOrder: "Ascending"});` **| Property:** *sortOrder* `
 var groupObj = new ej.dropdowns.AutoComplete({sortOrder: "sortOrder"});groupObj.appendTo('#vegetables');` |

Accessibility

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| RTL support | Property: *enableRtl* `
$('#autocomplete').ejAutocomplete({enableRtl: true});` **| Property:** *enableRtl* `
var groupObj = new ej.dropdowns.AutoComplete({enableRtl: true});groupObj.appendTo('#vegetables');` |

Selection

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| ----- | ----- | ----- |

| Selecting particular value | Property: *selectValueByKey*

`
$('#autocomplete').ejAutocomplete({selectValueByKey: 1,});` | Achievable through [value](#) property |

| Selecting particular value | Property: *value*`
$('#autocomplete').ejAutocomplete({value: data,});` | Property: *value*`
var groupObj = new ej.dropdowns.AutoComplete({value: "data"});groupObj.appendTo('#vegetables');`

| Selecting particular text | Property: *text*`
 $('#autocomplete').ejAutocomplete({text: "data",});` | Not Applicable |

| Selecting particular value | Method: *selectValueByKey*`
`

`$('#autocomplete').selectValueByKey("key")` | Achievable through [value](#) property |

| Selecting particular text | Method: *selectValueByText* `
`

`$('#autocomplete').selectValueByText("key")` | Not Applicable |

| Select event | Event: *select*`
$('#autocomplete').ejAutocomplete({select: "onSelect",});` | Event: *select* `
var groupObj = new ej.dropdowns.AutoComplete({select: "onSelect"});groupObj.appendTo('#vegetables');`

Miscellaneous

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Enable/disable | Property: *enabled*`
$('#autocomplete').ejAutocomplete({enabled: true,});` | Property: *enabled* `
var groupObj = new ej.dropdowns.AutoComplete({enabled: true});groupObj.appendTo('#vegetables');`

| Enable persistence | Property: *enablePersistence*`
`

`$('#autocomplete').ejAutocomplete({enablePersistence: true,});` | Property: *enablePersistence* `
var groupObj = new ej.dropdowns.AutoComplete({enablePersistence: true});groupObj.appendTo('#vegetables');`

| Loading icon | Property: *showLoadingIcon*

`
$('#autocomplete').ejAutocomplete({showLoadingIcon: true,});` | By default, it is showing |

| Read only | Property: *readOnly* `
 $('#autocomplete').ejAutocomplete({readOnly: true,});` |

Property: *readOnly* `
var groupObj = new ej.dropdowns.AutoComplete({readOnly: true});groupObj.appendTo('#vegetables');` |

| Disable | Method: *disable*`
 $('#autocomplete').ejAutoComplete("disable");` | Achievable through [enabled](#) property |

Common

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| **Addition of new option watermark text** | **Property:** *addNewText*

\$('#autocomplete').ejAutocomplete({addNewText:"text"}); | **Not applicable** |

| **Addition of new item** | **Property:** *allowAddNew*

\$('#autocomplete').ejAutocomplete({allowAddNew: true}); | **Property:** *allowCustom*
 var groupObj = new ej.dropdowns.AutoComplete({allowCustom: true});groupObj.appendTo('#vegetables'); |

| **Reset the autocomplete** | **Property:** *showResetIcon*

\$('#autocomplete').ejAutocomplete({showResetIcon: true}); | **Property:** *showClearIcon*
 var groupObj = new ej.dropdowns.AutoComplete({allowCustom: true});groupObj.appendTo('#vegetables'); |

| **Destroy** | **Method:** *destroy*
 \$('#autocomplete').ejAutoComplete("destroy"); | **Method:**

destroy
var groupObj = new ej.dropdowns.AutoComplete({allowCustom: true});groupObj.appendTo('#vegetables');

groupObj.destroy(); |

| **Reset the autocomplete** | **Method:**

clearText
\$('#autocomplete').ejAutoComplete("clearText"); | **Property:** *value*
 var groupObj = new ej.dropdowns.AutoComplete({value: ""});groupObj.appendTo('#vegetables'); |

| **Multicolumn** | **Property:** *multiColumnSettings*
 var autocompleteInstance = new

Avatar

Types in EJ2 JavaScript Avatar control

This section explains different types of avatar.

Avatar size

The Essential JS 2 Avatar has the following predefined sizes that can be used with the `.e-avatar` class to change the appearance of the avatar.

Class Name	Description
:-----	:-----
e-avatar-xlarge	Displays xlarge size avatar.
e-avatar-large	Displays apply large size avatar.
e-avatar	Displays apply default size avatar.
e-avatar-small	Displays apply small size avatar.
e-avatar-xsmall	Displays apply xsmall size avatar.

</body></html>
```

Avatar types

The types of Essential JS 2 avatar are:

- Default
- Circle

Default

The default style of the avatar is rectangular shape with rounded corners, which can be applied from adding the modifier class `.e-avatar` to the target element.

How To

Avatar customization in EJ2 JavaScript Avatar control

Color customization

The avatar comes with default background color (grey). This can be easily customized to desired color by adding custom class or directly selecting the avatar class from the CSS.

INDEX.TS

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 for Avatar </title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Essential JS 2 for Avatar UI Control">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
    <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
layouts/styles/material.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element">
            <span class="e-avatar e-avatar-xlarge e-avatar-circle
green">AJ</span>
            <span class="e-avatar e-avatar-xlarge e-avatar-circle
violet">JK</span>
            <span class="e-avatar e-avatar-xlarge e-avatar-circle
rose">EL</span>
            <span class="e-avatar e-avatar-xlarge e-avatar-circle
blue">SR</span>

```

```

        <span class="e-avatar e-avatar-xlarge e-avatar-circle
red">PD</span>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize avatar sizes

Even though the avatar comes with five predefined sizes, sometimes it's not enough. So, the avatar is designed in such a way that the width and height will be relative to font-size. By changing the font-size of the avatar element, you can change the width and height automatically.

Integrate avatar into listview in EJ2 JavaScript Avatar control

Avatar can be integrated into various components to make a wide variety of applications. Some of the integrations are shown in the following section.

Avatar is integrated into the listview to create contacts applications. The `xsmall` size avatar is used to match the size of the list item. Letters and images are also used as avatar content.

INDEX.TS

```
import { ListView } from '@syncfusion/ej2-lists';
// Listview datasource with avatar and image source fields
let dataSource: { [key: string]: Object; }[] = [
    { id: 's_01', text: 'Robert', avatar: '', pic: 'pic04' },
    { id: 's_02', text: 'Nancy', avatar: 'N', pic: '' },
    { id: 's_05', text: 'John', pic: 'pic01', avatar: '' },
    { id: 's_03', text: 'Andrew', avatar: 'A', pic: '' },
    { id: 's_06', text: 'Michael', pic: 'pic02', avatar: '' },
    { id: 's_07', text: 'Steven', pic: 'pic03', avatar: '' },
    { id: 's_08', text: 'Margaret', avatar: 'M', pic: '' }
];
let letterAvatarList: ListView = new ListView({
    // Bind listview datasource
    dataSource: dataSource,
    // Assign header title
    headerTitle: 'Contacts',
    // Enable header title
    showHeader: true,
    // Assign list-item template
    template: '<div class="listWrapper">' +
        '${'if(avatar!=="")}' +
```

```

        '<span class="e-avatar e-avatar-small e-avatar-
circle">${avatar}</span>' +
        '${else}' +
        '<span class="${pic} e-avatar e-avatar-small e-avatar-circle">
</span>' +
        '${/if}' +
        '<span class="text">' +
        '${text} </span> </div> ',
        // Assign sorting order
        sortOrder: 'Ascending'
    });
    letterAvatarList.appendTo('#letterAvatarList');

```

INDEX.HTML

Integrate avatar into badge in EJ2 JavaScript Avatar control

The badge is dependent and supportive component, and it can be used with avatar to create a notification avatar.

The default avatar (`.e-avatar`) and circle avatar (`.e-avatar-circle`) have been used with notification badges (`.e-badge-notification`) in the following sample.

Badge

Types in EJ2 JavaScript Badge control

This section explains different styles and types of the badges.

Badge styles

The Essential JS 2 Badge has the following predefined styles that can be used with `.e-badge` class to change the appearance of a badge.

Class Name	Description
:-----	:-----
e-badge-primary	Represents a primary notification.
e-badge-secondary	Represents a secondary notification.
e-badge-success	Represents a positive notification.
e-badge-danger	Represents a negative notification.
e-badge-warning	Represents notification with caution.
e-badge-info	Represents an informative notification.
e-badge-light	Represents notification in light variant.
e-badge-dark	Represents notification in dark variant.

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Badge types

The types of Essential JS 2 badges are as follows:

- Circle
- Pill
- Link
- Notification
- Overlap
- Dot

- Position

Circle

The circle badge style can be applied by adding the modifier class `.e-badge-circle` to the target element.

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Link

When badge modifier classes are applied to the anchor tag, the badge's appearance will change from normal state to hover state on mouseover.

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Notification

The notification badge style can be applied by adding the modifier class `.e-badge-notification` to the target element. Notification badges are used when a content or a context needs special attention. While using the notification badge, set the parent element to `position: relative`.

if(ele) {

```

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Dot

Dot can be applied by adding the modifier class `.e-badge-dot` to the target element. Dot badges are similar to notification badges, but in a minimalistic way. While using the dot badge, set the parent element to `position: relative`.

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Overlap

The overlap badge can be used with notification or dot badge, which overlaps with the target element by adding the modifier class `e-badge-overlap`. While using the overlap badge, set the parent element to `position: relative`.

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Position

The default position of the notification or dot badge is top. But, the position can be changed to bottom using the modifier class `.e-badge-bottom`. For example, the bottom class modifier is used with dot badge to display the status in the avatar as shown in the following sample.

```

How To

Badge customization in EJ2 JavaScript Badge control

Colour customization

Even though badges come with **8 predefined colors**, you can also customize the colour of the badge as desired.

INDEX.TS

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

      <h1>Color Customization <span class="e-badge e-badge-primary e-
badge-pill green">New</span></h1>
      <h1>Color Customization <span class="e-badge e-badge-primary e-
badge-pill blue">New</span></h1>
      <h1>Color Customization <span class="e-badge e-badge-primary e-
badge-pill purple">New</span></h1>
      <h1>Color Customization <span class="e-badge e-badge-primary e-
badge-pill gradient">New</span></h1>
    </div>
  </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize badge size

Badges are designed to change its size based on the content. To change the size of a badge, adjust the font size of the badge.

INDEX.TS

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 for Badge </title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element">
      <h1>Badge Component <span class="e-badge e-badge-primary
size_1">New</span></h1>
      <h1>Badge Component <span class="e-badge e-badge-primary
size_2">New</span></h1>
      <h1>Badge Component <span class="e-badge e-badge-primary
size_3">New</span></h1>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Custom position

Even though the badges support the conventional **top** and **bottom** positions, the position of the badges can be changed as desired.

This can be done by adding a custom class to the badge element to override the default position applied from the source.

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Integrate badge into listview in EJ2 JavaScript Badge control

The badges can be integrated with the **listview** component to indicate new notification with colour based on priority.

In the following sample, **default** badges are used and there is no need to customize the badge size. The component will automatically adjust the size based on the container element.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
// Datasource for listview, badge field is the class data for Badges
let dataSource: { [key: string]: Object }[] = [
    { id: 'p_01', text: 'Primary', messages: '3 New', badge: 'e-badge e-
badge-primary', icons: 'primary', type: 'Primary' },
    { id: 'p_02', text: 'Social', messages: '27 New', badge: 'e-badge e-
badge-secondary', icons: 'social', type: 'Primary' },
    { id: 'p_03', text: 'Promotions', messages: '7 New', badge: 'e-badge e-
badge-success', icons: 'promotion', type: 'Primary' },
    { id: 'p_04', text: 'Updates', messages: '13 New', badge: 'e-badge e-
badge-info', icons: 'updates', type: 'Primary' },
    { id: 'p_05', text: 'Starred', messages: '', badge: '', icons:
'starred', type: 'All Labels' },
    { id: 'p_06', text: 'Important', messages: '2 New', badge: 'e-badge e-
badge-danger', icons: 'important', type: 'All Labels' },
    { id: 'p_07', text: 'Sent', messages: '', badge: '', icons: 'sent',
type: 'All Labels' },
    { id: 'p_08', text: 'Outbox', messages: '', badge: '', icons: 'outbox',
type: 'All Labels' },

```

```

    { id: 'p_09', text: 'Drafts', messages: '7 New', badge: 'e-badge e-
badge-warning', icons: 'draft', type: 'All Labels' },
  ];
let list: ListView = new ListView({
  // Bind listview datasource
  dataSource: dataSource,
  // Assign header title
  headerTitle: 'Inbox',
  // Enable header
  showHeader: true,
  // Assign template
  template: '<div class="listWrapper" style="width: inherit;height:
inherit;"><span class="{icons} list_svg">&#160;</span>' +
    '<span class="list_text">{text}</span>' +
    '<span class="{badge}" style="float: right;margin-top: 16px;font-
size: 12px;">{messages}</span></div>',
  // Map fields
  fields: { groupBy: 'type' },
  // Bind actioncomplete event
  actionComplete: () => {
    let list: HTMLElement =
<HTMLElement>document.getElementById('lists').getElementsByClassName('e-
list-group-item')[0];
    list.style.display = 'none';
  }
});
list.appendTo('#lists');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</body></html>

```

Dynamic badge content in EJ2 JavaScript Badge control

Badges in real-time needs to be updated dynamically based on the requirements. The following sample demonstrates how to update the badges content dynamically. Click the increment button to change the badge value.

INDEX.TS

```

import { ListView } from '@syncfusion/ej2-lists';
let badgeElements: HTMLElement[];
// Datasource for listview, badge field is the class data for Badges
let dataSource: { [key: string]: Object }[] = [
    { id: 'p_01', text: 'Primary', messages: '3 New', badge: 'e-badge e-badge-primary', icons: 'primary', type: 'Primary' },
    { id: 'p_02', text: 'Social', messages: '27 New', badge: 'e-badge e-badge-secondary', icons: 'social', type: 'Primary' },
    { id: 'p_03', text: 'Promotions', messages: '7 New', badge: 'e-badge e-badge-success', icons: 'promotion', type: 'Primary' },
    { id: 'p_04', text: 'Updates', messages: '13 New', badge: 'e-badge e-badge-info', icons: 'updates', type: 'Primary' },
    { id: 'p_05', text: 'Starred', messages: '', badge: '', icons: 'starred', type: 'All Labels' },
    { id: 'p_06', text: 'Important', messages: '2 New', badge: 'e-badge e-badge-danger', icons: 'important', type: 'All Labels' },
    { id: 'p_07', text: 'Sent', messages: '', badge: '', icons: 'sent', type: 'All Labels' },
    { id: 'p_08', text: 'Outbox', messages: '', badge: '', icons: 'outbox', type: 'All Labels' },
    { id: 'p_09', text: 'Drafts', messages: '7 New', badge: 'e-badge e-badge-warning', icons: 'draft', type: 'All Labels' },

Barcode

Getting started in EJ2 JavaScript Barcode control

This section explains the steps used to create a simple Barcode and demonstrates the basic usage of the barcode component using Essential JS 2

[quickstart](#) seed repository. This seed repository is pre-configured with the Essential JS 2 package.

Dependencies

Following is the list of minimum dependencies required to use the barcode.

```
`javascript
|-- @syncfusion/ej2-barcode-generator
|-- @syncfusion/ej2-base
|-- @syncfusion/ej2-data
\
```

Setup for local development

Clone the Essential JS 2 quickstart application project from [GitHub](#), and install the necessary npm packages using the following command line scripts.

```
`
git clone https://github.com/syncfusion/ej2-quickstart.git quickstart
cd quickstart
npm install
\
```

Configuring system JS

[Syncfusion BarcodeGenerator packages](#) have to be mapped in the `system.config.js` configuration file.

```
`javascript
System.config({
  paths: {
    'syncfusion:': './node_modules/@syncfusion/',
  },
  map: {
```

```

app: 'app',
//Syncfusion packages mapping
"@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
"@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
"@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
"@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
"@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
"@syncfusion/ej2-navigations": "syncfusion:ej2-navigations/dist/ej2-navigations.umd.min.js",
"@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
"@syncfusion/ej2-dropdowns": "syncfusion:ej2-dropdowns/dist/ej2-dropdowns.umd.min.js",
"@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
"@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
"@syncfusion/ej2-barcode-generator": "syncfusion:ej2-barcode-generator/dist/ej2-barcode-generator.umd.min.js",
"@syncfusion/ej2-excel-export": "syncfusion:ej2-excel-export/dist/ej2-excel-export.umd.min.js",
"@syncfusion/ej2-pdf-export": "syncfusion:ej2-pdf-export/dist/ej2-pdf-export.umd.min.js",
"@syncfusion/ej2-file-utils": "syncfusion:ej2-file-utils/dist/ej2-file-utils.umd.min.js",
"@syncfusion/ej2-compression": "syncfusion:ej2-compression/dist/ej2-compression.umd.min.js"
},
packages: {
'app': { main: 'app', defaultExtension: 'js' }
}
});
System.import('app');
`

```

Adding CSS reference

Combined CSS files are available in the Essential JS 2 package root folder. This can be referenced in your `[src/styles/styles.css]` using the following code.

```

@import '../node_modules/@syncfusion/ej2/material.css';
`

```

To know about individual component CSS, please refer to [Individual Component theme files](#) section.

Adding Barcode Generator control

You can start adding Essential JS 2 barcode-generator component to the application. To get started, add the barcode component in `app.ts` and `index.html` files using the following code.

Place the following barcode-generator code in the `app.ts`.

INDEX.TS

```
import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new BarcodeGenerator({
    width: '200px',
    height: '150px',
    mode: 'SVG',
    type: 'Codabar',
    value: '123456789',
});
barcode.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Barcode-Generator</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <style>
    .barcodeStyle{
      height: 150px;
      width: 200px;
      padding-left: 40%;
      padding-top: 9%;
    }
  </style><script
src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container" class="barcodeStyle">
    <div id="element"></div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Now, add an HTML div element to act as the barcode element in `index.html` using the following code.

```
`html
<!DOCTYPE html>
<html lang="en">
<head>
<title>Essential JS 2</title>
<meta charset="utf-8" />
<meta name="viewport" content="width=device-width, initial-scale=1.0, user-scalable=no" />
<meta name="description" content="Essential JS 2" />
<meta name="author" content="Syncfusion" />
<link rel="shortcut icon" href="resources/favicon.ico" />
<link href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css" rel="stylesheet"
/>
<!--style reference from app-->
<link href="/styles/styles.css" rel="stylesheet" />
<!--system js reference and configuration-->
<script src="node_modules/systemjs/dist/system.src.js" type="text/javascript"></script>
<script src="system.config.js" type="text/javascript"></script>
</head>
<body>
<!--Element which will render as Barcode-->
<div id="barcode"></div>
</body>
</html>
```

[Adding QR Generator control](#)

You can add the QR code in our barcode generator component.

INDEX.TS

```
import { QRCodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new QRCodeGenerator({
    width: '200px',
    height: '150px',
    displayText: { visibility: false },
    mode: 'SVG',
    value: 'Syncfusion',
```

```
});
barcode.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Barcode-Generator</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

<style>
  .barcodeStyle{
    height: 150px;
    width: 200px;
    padding-left: 40%;
    padding-top: 9%;
  }

```

Adding Datamatrix Generator control

You can add the datamatrix code in our barcode generator component.

INDEX.TS

```
import { DataMatrixGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new DataMatrixGenerator({
  width: '200px',
  height: '150px',
  displayText: { visibility: false },
  mode: 'SVG',
  value: 'Syncfusion',
});
barcode.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Barcode-Generator</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

[BarcodeGenerator in EJ2 JavaScript Barcode control](#)**Code39**

The Code 39 character set includes the digits 0-9, the letters A-Z (upper case only), and the symbols: space, minus (-), plus (+), period (.), dollar sign (\$), slash (/), and percent (%). A special start / stop character is placed at the beginning and ending of each barcode. The barcode can be of any length; even more than 25 characters begin to push the bounds. Code 39 is the only type of barcode that does not require a checksum for common use.

INDEX.TS

```
import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new BarcodeGenerator({
  width: '200px',
  height: '150px',
```

```

        mode: 'SVG',
        type: 'Code39',
        value: 'SYNCFUSION',
    });
    barcode.appendTo('#element');

```

INDEX.HTML

```

Codabar

Codabar is a variable length symbol that encodes the following 20 characters:

0123456789-\$:/.+ABCD

The characters, A, B, C and D are used as start and stop characters. Codabar is used in libraries, blood banks, the package delivery industry and a variety of other information processing applications.

INDEX.TS

```

import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';

```

```
let barcode = new BarcodeGenerator({
    width: '200px',
    height: '150px',
    mode: 'SVG',
    type: 'Codabar',
    value: '123456789',
});
barcode.appendTo('#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Code 32

Code 32 is mainly used for coding pharmaceuticals, cosmetics and dietetics. It is often used to encode Italian Pharmacode that has the following structure:

- 'A' character (ASCII 65), that is not really encoded.
- 8 digits for Pharmacode (It generally begins with / and prefixed with 0).
- 1 digit for checksum module 10, that is automatically calculated by barcode.

The value to be encoded must be 8 digits Pharmacode (prefix it with '0' if necessary) and the 9th digit (the checksum) is automatically calculated by barcode.

INDEX.TS

```
import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new BarcodeGenerator({
    type: 'Code32',
    value: '01234567',
    width: '200px', height: '150px',
    mode: 'SVG',
});
barcode.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Barcode</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Code 93

Code 93 is designed to complement and improve upon Code 39. It can represent the entire ASCII character set by using combinations of 2 characters. Code 93 is a continuous, variable-length symbology and produces denser code. The Standard Mode (default implementation) can encode uppercase letters (A-Z), digits (0-9), and special characters like *, -, \$, %, (Space), ., /, and +.

INDEX.TS

```
import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new BarcodeGenerator({
    type: 'Code93',
    value: '01234567',
    width: '200px', height: '150px',
    mode: 'SVG',
});
barcode.appendTo('#element');

</body></html>
```

Code 93 Extended

The Code 93 Extended Barcode symbology is continuous, variable length, and self-checking. It is based on Code 93 Barcode. The Extended Version can encode all 128 ASCII characters.

Code 128

Code 128 is a variable length, high density, alphanumeric, linear bar code symbology, capable of encoding the full 128-character ASCII character set and extended character sets. This symbology includes a checksum digit for verification and the barcode can also be verified character-by-character by verifying the parity of each data byte.

Code 128 Code Sets

- Code Set A (or Chars Set A) includes all of the standard upper case U.S. alphanumeric keyboard characters and punctuation characters along with the control characters, (namely, characters with ASCII values from 0 to 95 inclusive), and seven special characters.
- Code Set B (or Chars Set B) includes all of the standard upper case alphanumeric keyboard characters and punctuation characters along with the lower case alphabetic characters (namely, characters with ASCII values from 32 to 127 inclusive), and seven special characters.
- Code Set C (or Chars Set C) includes the set of 100 digit pairs from 00 to 99 inclusive along with three special characters. This allows numeric data to be encoded as two data digits per symbol character, at effectively twice the density of standard data.

Code 128 Special characters

The last seven characters of Code Sets A and B (character values 96 - 102) and the last three characters of Code Set C (character values 100 - 102) are special non-data characters with no ASCII character equivalents that have a particular significance to the Barcode reading device.

INDEX.TS

```
import { BarcodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new BarcodeGenerator({
    type: 'Code128',
    value: 'SYNCFUSION',
    width: '200px', height: '150px',
    mode: 'SVG',
});
barcode.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Barcode</title>
  <meta charset="utf-8">

Qrcodegenerator in EJ2 JavaScript Barcode control

QR Code

A QR Code is a two-dimensional barcode that consists of a grid of dark and light dots or blocks that form a square. The data encoded in the barcode can be numeric, alphanumeric, or Shift Japanese Industrial Standards (JIS8) characters. The QR Code uses version from 1 to 40. Version 1 measures 21 modules x 21 modules, Version 2 measures 25 modules x 25 modules, and so on. The number of modules increases in steps of 4 modules per side up to Version 40 that measures 177 modules x 177 modules. Each version has its own capacity. By default, the barcode control automatically set the version according to the length of the input text. The QR Barcodes are designed for industrial uses and also commonly used in consumer advertising.

INDEX.TS

```

import { QRCodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new QRCodeGenerator({
    width: '200px',
    height: '200px',
    displayText: { visibility: false },
    mode: 'SVG',
    value: 'Syncfusion',
});
barcode.appendTo('#element');

```

Customizing the Barcode dimension

The dimension of the barcode can be changed using the height and width properties of the barcodegenerator.

INDEX.TS

```

import { QRCodeGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new QRCodeGenerator({
    width: '100px',
    height: '100px',
    displayText: { visibility: false },
    mode: 'SVG',
    value: 'Syncfusion',
});
barcode.appendTo('#element');

```

Datamatrixgenerator in EJ2 JavaScript Barcode control

Data Matrix

DataMatrix Barcode is a two dimensional barcode that consists of a grid of dark and light dots or blocks forming square or rectangular symbol. The data encoded in the barcode can either be numbers or alphanumeric. They are widely used in printed media such as labels and letters. You can read it easily with the help of a barcode reader and mobile phones.

INDEX.TS

```

import { DataMatrixGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new DataMatrixGenerator({
  width: '200px',
  height: '150px',
  displayText: { visibility: false },
  mode: 'SVG',
  value: 'Syncfusion',
});
barcode.appendTo('#element');

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
```

```

<title>EJ2 Barcode</title>
<meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing the Barcode color

A page or printed media with barcode often appears colorful in the background and surrounding region with other contents. In such cases the barcode can also be customized to suit the needs. You can achieve this by using the forecolor property .

INDEX.TS

```

import { DataMatrixGenerator, ValidateEvent } from '@syncfusion/ej2-barcode-generator';
let barcode = new DataMatrixGenerator({
    width: '200px',
    height: '150px',
    displayText: { visibility: false },
    mode: 'SVG',
    value: 'Syncfusion',
    foreColor: 'red',
});
barcode.appendTo('#element');

```

INDEX.HTML

Export in EJ2 JavaScript Barcode control

Export barcode as an image and base64 string is common for barcode,QRcode and datamatrix. The following code samples explain how to export barcode as an image and base64 string.

Export

Barcode provides the support to export its content as an image in the specified image type and downloads it in the browser.

The following code example shows how to export the barcode as an image

```
`ts
```

```

import { BarcodeGenerator, BarcodeExportType } from '@syncfusion/ej2-barcode-generator';
let barcode: BarcodeGenerator = new BarcodeGenerator({
width: '200px', height: '150px',
type: 'Code39',
value: 'BARCODE',
displayText: { text: 'ABCD' },

```

```
});  
barcode.appendTo('#element');  
let filename: string = 'Export';  
barcode.exportImage(filename,'JPG');  
`
```

The filename specifies the name of the file to be downloaded.

[Export As Base64String](#)

Barcode provides the support to export its content as an image in the specified image type and returns it as base64 string.

The following code example shows how to export the barcode as a base64 string

```
`ts  
import { BarcodeGenerator, BarcodeExportType } from '@syncfusion/ej2-barcode-generator';  
let barcode: BarcodeGenerator = new BarcodeGenerator({  
width: '200px', height: '150px',  
type: 'Code39',  
value: 'BARCODE',  
displayText: { text: 'ABCD' },  
});  
barcode.appendTo('#element');  
async function () {  
// Can able to store the return base64 string in variable  
var data = await barcode.exportAsBase64Image('JPG');  
};  
`
```

Note:

Format is to specify the type or format of the exported file. You can export the barcode to the following formats:

- * JPG.

- * PNG.

Breadcrumb

[Data binding in EJ2 JavaScript Breadcrumb control](#)

The Breadcrumb supports to generate items based on the current URL by default. You can set the [items](#) property or [url](#) property to generate the items.

Items based on current Url

The breadcrumb items can be generated based on the current URL of the page when the user does not specify the breadcrumb items using [items](#) property. The following example shows the breadcrumb items generated from the provided URL in the component.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
new Breadcrumb({
    enableNavigation: false
}, '#breadcrumb');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
  <meta name="description" content="Essential JS 2">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <!--style reference from app-->
  <link href="styles.css" rel="stylesheet">
  <!--system js reference and configuration-->

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="control-section">
      <nav id="breadcrumb"></nav>
    </div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

This sample is hosted in different location, so the Breadcrumb component is rendered with different location instead of the actual location.

Absolute Url

The breadcrumb items can be generated based on the [url](#) property in the component when the user does not specify the breadcrumb items using [items](#) property. The following example shows the breadcrumb items generated from the provided url in the component.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
new Breadcrumb({
    enableNavigation: false,
    url: "https://ej2.syncfusion.com/demos/breadcrumb/bind-to-location"
}, '#breadcrumb');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
  <meta name="description" content="Essential JS 2">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <!--style reference from app-->
  <link href="styles.css" rel="stylesheet">
  <!--system js reference and configuration-->

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="control-section">
      <nav id="breadcrumb"></nav>
    </div>
  </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize text when generated items using Url

The breadcrumb items text can be customized by using the [beforeItemRender](#) event. In the following example, **bind-to-location** text was changed as **location**.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb,
BreadcrumbBeforeItemRenderEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
new Breadcrumb({
  enableNavigation: false,
  url: "https://ej2.syncfusion.com/demos/breadcrumb/bind-to-location",
  beforeItemRender: (args: BreadcrumbBeforeItemRenderEventArgs) => {
    if (args.item.text === 'bind-to-location') {
      args.item.text = 'location';
    }
  }
}, '#breadcrumb');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">

</head>
<body>

  <div id="container">
    <div class="control-section">
      <nav id="breadcrumb"></nav>
    </div>
  </div>
</script>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Icons in EJ2 JavaScript Breadcrumb control

The Breadcrumb component contains an icon/image to provide a visual representation of an item.

Icon in Breadcrumb item

To load the icon/image on the breadcrumb item, set the [iconCss](#) property.

Breadcrumb with Font Icon

To place the font icon on the breadcrumb item, set the [iconCss](#) property to **e-icons** with the required icon CSS. By default, the icon is positioned to the left side of the item.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {
        iconCss: 'e-icons e-home',
        url: "https://ej2.syncfusion.com/demos",
    },
    {
        text: "Components",
        url: "https://ej2.syncfusion.com/demos/#/material/grid/grid-
overview",
    },
    {
        text: "Navigations",
        url:
"https://ej2.syncfusion.com/demos/#/material/breadcrumb/default",
    },
    {
        text: "Breadcrumb",
        url: "./breadcrumb/default",
    }
];
new Breadcrumb({
    items: items,
    enableNavigation: false
}, '#breadcrumb');
```

INDEX.HTML

```

Breadcrumb with Image

In the Breadcrumb component, images can be added for the items using the [iconCss](#) property. In the following example, an image was added to the breadcrumb item by using the iconCss class `e-image-home` and specifying height and width for the css class.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {
        iconCss: 'e-image-home',
        url: "https://ej2.syncfusion.com/demos",
    },
    {
        text: "Components",
        url: "https://ej2.syncfusion.com/demos/#/material/grid/grid-
overview",
    },
];

```

```

    {
        text: "Navigations",
        url:
"https://ej2.syncfusion.com/demos/#/material/breadcrumb/default",
    },
    {
        text: "Breadcrumb",
        url: "../breadcrumb/default",
    }
];
new Breadcrumb({
    items: items,
    enableNavigation: false
}, '#breadcrumb');
```

INDEX.HTML

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Icon Position

By default, the icon is positioned to the left side of the item in the Breadcrumb component. If you need to add the icon to right of the breadcrumb item, add the `e-icon-right` class to the required item. In the following example, the `e-icon-right` class was added to the breadcrumb items using the [beforeItemRender](#) event. You can also add the `e-icon-right` class to the [cssClass](#) property of the breadcrumb component to position the icons to the right of all breadcrumb items.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb,
BreadcrumbBeforeItemRenderEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {

Navigation in EJ2 JavaScript Breadcrumb control

Breadcrumb navigations support you to provide relative or absolute URL for breadcrumb items, enable navigation for the last item of the Breadcrumb component, and open URL in a new tab or new page.

URL

In the Breadcrumb component, the item represents the URL. The breadcrumb items can be provided with either relative or absolute URL.

Relative URL

The [url](#) property of the items contains a portion of the full path which is based on its relation to the current path where it is linked. In the following example, the items represent only the relative URL path.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {
        text: "Home",
        url: "../"
    },
    {
        text: "Getting",
        url: "../breadcrumb/getting-started"
    },

```

```
{
    text: "Icons",
    url: "../breadcrumb/icons"
},
{
    text: "Navigation",
    url: "../breadcrumb/navigation"
},
{
    text: "Overflow",
    url: "../breadcrumb/overflow"
}
];
new Breadcrumb({
    items: items,
    enableNavigation: false
}, '#breadcrumb');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Enable navigation for last Breadcrumb item

Breadcrumb enables the navigation for the last item by setting the [enableActiveItemNavigation](#) property to true. In the following example, the last item of the **Breadcrumb** was enabled.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {
        text: "Home",
        url: "https://ej2.syncfusion.com/documentation/introduction/"
    },
    {
        text: "Getting",
        url:
"https://ej2.syncfusion.com/documentation/breadcrumb/getting-started"
    },
    {
        text: "Icons",
        url: "https://ej2.syncfusion.com/documentation/breadcrumb/icons"
    },
    {
        text: "Navigation",
        url:
"https://ej2.syncfusion.com/documentation/breadcrumb/navigation"
    },
    {
```

```

        text: "Overflow",
        url:
        "https://ej2.syncfusion.com/documentation/breadcrumb/overflow"
    }
];
new Breadcrumb({
    items: items,
    enableNavigation: false,
    enableActiveItemNavigation: true
}, '#breadcrumb');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>

    ele.style.visibility = "visible";
  }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Open URL in new page or tab

To open the url provided in the items in a new page or tab, set the target property of the anchor element for the required item to "_blank" in the [beforeItemRender](#) event of Breadcrumb component. In the

following example, the target property of anchor element for the item was set to "_blank" by using the [beforeItemRender](#) event which locates to the path in the new tab.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb,
BreadcrumbBeforeItemRenderEventArgs } from '@syncfusion/ej2-navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);

Templates in EJ2 JavaScript Breadcrumb control

The Breadcrumb component provides a way to customize the items using [itemTemplate](#) and the separators using [separatorTemplate](#) properties.

Item Template

In the following example, Shopping Cart details are used as breadcrumb Items and the each items is rendered as chips component using [itemTemplate](#).

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
const items: BreadcrumbItemModel[] = [
    {
        text: 'Cart'
    },
    {
        text: 'Billing'
    },
    {
        text: 'Shipping'
    },
    {
        text: 'Payment'
    }
]

```

```

];
new Breadcrumb({
  items: items,
  enableNavigation: false,
  itemTemplate: '<div id="chip-default" class="e-lib e-chip-list e-control e-chip-set" role="listbox" aria-multiselectable="false"><div class="e-chip e-primary" tabindex="0" role="option" aria-label="Apple" aria-selected="false"><span class="e-chip-text">${text}</span></div></div>'
}, '#breadcrumb');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0, user-scalable=no">

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize Specific Item Template

The specific breadcrumb item can be customizable using itemTemplate with conditional rendering. In the following example, added the span element only for the breadcrumb text in breadcrumb item.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
var specificTemplateItems = [
{
    text: "Home",
    url: "https://ej2.syncfusion.com/demos",
},
{
    text: "Components",
    url: "https://ej2.syncfusion.com/demos/#/material/grid/grid-overview",
},
{
    text: "Navigations",
    url: "https://ej2.syncfusion.com/demos/#/material/menu/default",
},
{
    text: "Breadcrumb",
    url: "./breadcrumb/default",
}
];
new Breadcrumb({
    items: specificTemplateItems,
    itemTemplate: '<div>${if(text=="Breadcrumb")}<span class="e-searchfor-
text"><span style="margin-right: 5px">Search for:</span><a class="e-
breadcrumb-text" href="${url}" onclick="return
false">${text}</a></span>${else}<a class="e-breadcrumb-text" href="${url}"
onclick="return false">${text}</a>${if}</div>',
    cssClass: 'e-specific-item-template'
}, '#breadcrumb');

```

```

Overflow in EJ2 JavaScript Breadcrumb control

In the Breadcrumb component, [maxItems](#) and [overflowMode](#) properties were used to limit the number of breadcrumb items to be displayed.

In the following example, the maxItems is set as 3 with overflowMode as Default. To prevent breadcrumb item navigation, the [enableNavigation](#) property has been set to false in the Breadcrumb component.

INDEX.TS

```

import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition

```

```
let items: BreadcrumbItemModel[] = [
    {
        text: "Home",
        url: "../"
    },
    {
        text: "Getting",
        url: "../breadcrumb/getting-started"
    },
    {
        text: "Data-Binding",
        url: "../breadcrumb/data-binding"
    },
    {
        text: "Icons",
        url: "../breadcrumb/icons"
    },
    {
        text: "Navigation",
        url: "../breadcrumb/navigation"
    },
    {
        text: "templates",
        url: "../breadcrumb/templates"
    },
    {
        text: "Overflow",
        url: "../breadcrumb/overflow"
    }
];
new Breadcrumb({
    items: items,
    enableNavigation: false,
    maxItems: 3,
    separatorTemplate: '<span class="e-icons e-arrow"></span>'
}, '#breadcrumb');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0,

<body>

    <div id="container">
        <div class="control-section">
            <nav id="breadcrumb"></nav>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

The following overflow modes are available in the Breadcrumb component.

- Collapsed
- Menu
- Wrap
- Scroll
- Hidden
- None

Collapsed

Collapsed mode shows the first and last Breadcrumb items and hides the remaining items with a collapsed icon. When the collapsed icon is clicked, all items become visible and navigable.

INDEX.TS

```
import { BreadcrumbItemModel, Breadcrumb } from '@syncfusion/ej2-
navigations';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Breadcrumb items definition
let items: BreadcrumbItemModel[] = [
    {
        text: "Home",
        url: "../"
    },
    {
        text: "Getting",
        url: "../breadcrumb/getting-started"
    },
    {
        text: "Data-Binding",
        url: "../breadcrumb/data-binding"
    },
]
```

```
{
    text: "Icons",
    url: "../breadcrumb/icons"
},
{
    text: "Navigation",
    url: "../breadcrumb/navigation"
},
{
    text: "templates",
    url: "../breadcrumb/templates"
},
{
    text: "Overflow",
    url: "../breadcrumb/overflow"
}
];
new Breadcrumb({
    items: items,
    enableNavigation: false,
    maxItems: 3,
    overflowMode: 'Collapsed'
}, '#breadcrumb');
```

INDEX.HTML

```

None

None mode shows all the items in a single line.

Accessibility in EJ2 JavaScript Breadcrumb control

The Breadcrumb component followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Breadcrumb component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The component does not meet the requirement.</div>

WAI-ARIA attributes

The Breadcrumb component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Breadcrumb component:

| Attributes | Purpose |

| --- | --- |

| **aria-label** | Indicates the breadcrumb item text. |

| **aria-disabled** | Indicates the state of breadcrumb item whether it is disabled. |

Keyboard interaction

The Breadcrumb component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Breadcrumb component.

| Press | To do this |

| --- | --- |

| **Tab** | Navigate to the next item and also next item in the popup of menu type overflow. |

| **Shift + Tab** | Navigate to the previous item also previous item in the popup of menu type overflow. |

| **Enter key in normal mode** | Select the breadcrumb item. |

| **Enter key in normal mode** | To open the popup of menu type overflow mode when you press enter on collapsed button and It will expand the items of collapsed type overflow mode when you press enter on collapsed button. |

Ensuring accessibility

The Breadcrumb component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Breadcrumb component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Breadcrumb component with accessibility tools.

Bullet Chart

Bullet chart dimensions in EJ2 JavaScript Bullet chart control

Size for Container

The size of the Bullet Chart is determined by the container size, and it can be changed inline or via CSS as following.

```
`javascript
<div id='container'>

<div id='element' style="width:650px; height:350px;"></div>

</div>
`
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Size for Bullet Chart

The **width** and **height** properties are used to adjust the size of the Bullet Chart.

Pixel

Can set the size of the Bullet Chart in pixels as shown below.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    //width and height for chart in pixel
    width: '650', height: '350',
    dataSource: [{ value: 23, target: 22 }],
    animation: { enable: false },
    valueField: 'value',
    targetField: 'target',
    ranges: [{ end: 20 },
        { end: 25 },
        { end: 30 }
    ],
    minimum: 0, maximum: 30, interval: 5,
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Percentage

By setting a value in percentage, the Bullet Chart gets its dimension with respect to its container. For example, when the height is **50%**, the Bullet Chart renders to half of the container's height.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    // Width and height for chart in percentage
    width: '80%', height: '90%',
    dataSource: [{ value: 23, target: 22 }],
    animation: { enable: false },
    valueField: 'value',
    targetField: 'target',
    ranges: [{ end: 20 },
        { end: 25 },
        { end: 30 }
    ],
    minimum: 0, maximum: 30, interval: 5,
}, '#element');
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

If the size is not specified, the Bullet Chart will be rendered with a height of **126px** and a width of the window.

Axis customization in EJ2 JavaScript Bullet chart control

MajorTickLines and MinorTickLines Customization

You can customize the **width**, **color**, and **size** of minor and major tick lines using the [majorTickLines](#) and [minorTickLines](#) properties of the bullet-chart.

The following properties can be used to customize **majorTicklines** and **minorTicklines**.

- **width** - Specifies the width of ticklines.
- **height** - Specifies the height of ticklines.
- **color** - Specifies the color of ticklines.
- **useRangeColor** - Specifies the color of ticklines and represents the color from corresponding range colors.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    //color and width customization of the major and minor ticks
    majorTickLines: { color: 'blue', width: 5 },
    minorTickLines: { width: 4, color: 'red' },
    dataSource: [{ value: 23, target: 22 }],
    animation: { enable: false },
    valueField: 'value',
    targetField: 'target',
    ranges: [{ end: 20 },
        { end: 25 },
        { end: 30 }
    ],
    minimum: 0, maximum: 30, interval: 5
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

</body></html>

```

Label Format

Axis Label Format

Axis numeric labels can be formatted by using the [labelFormat](#) property. Axis labels support all globalize formats. The following table describes the result of applying some commonly used label formats on numeric axis values.

Axis numeric labels can be formatted by using the `labelFormat` property. Axis labels support all globalize formats.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  //Label format as currency
  labelFormat: 'c',
  title: 'Sales Rate',
  dataSource: [{ value: 1500, target: 1300 }],
  animation: { enable: false },
  valueField: 'value',
  targetField: 'target',
  ranges: [{ end: 500 },
    { end: 1500 },
    { end: 2500 }
  ],
  minimum: 0, maximum: 2500, interval: 250
}, '#element');

```

INDEX.HTML

```

```

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some commonly used formats to numeric axis labels.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

GroupingSeparator

To separate groups of thousands, use the [enableGroupSeparator](#) property of bullet-chart.

To separate the groups of thousands, set the `enableGroupSeparator` property to **true**.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    enableGroupSeparator: true,
    title: 'Sales Rate',
    dataSource: [{ value: 1500, target: 1300 }],
    animation: { enable: false },
    valueField: 'value',
    targetField: 'target',
    ranges: [{ end: 500 },
        { end: 1500 },
    ],
});

```

```

        { end: 2500 }
    ],
    minimum: 0, maximum: 2500, interval: 250
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom Label Format

Using the `labelFormat` property, axis labels can be specified with a custom defined format in addition to the axis value. The label format uses a placeholder such as `${value}K`, which represents the axis label.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  labelFormat: '${value}K',
  title: 'Sales Rate',
  dataSource: [{ value: 1500, target: 1300, category: 'Product A' }],
  animation: { enable: false },
  valueField: 'value',
  targetField: 'target',
  ranges: [{ end: 500 },
    { end: 1500 },
    { end: 2500 }
  ],
  minimum: 0, maximum: 2500, interval: 250
});

```

```
}, '#element');
```

INDEX.HTML

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Category Label

The Bullet Chart supports X-axis label by specifying the property from the data source to the **categoryField**. It helps to understand the input data in a more efficient way.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    title: 'Sales Rate',
    dataSource: [{ value: 1500, target: 1300, category: 'Product A' }],
    animation: { enable: false },
    valueField: 'value',
    targetField: 'target',
    categoryField: 'category',
    ranges: [{ end: 500 },
        { end: 1500 },
        { end: 2500 }
    ],
    minimum: 0, maximum: 2500, interval: 250
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Animation</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">

</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Category Label Customization

The label color, opacity, font size, font family, font weight, and font style can be customized by using the `categoryLabelStyle` setting for category and the `labelStyle` setting for axis label. The `useRangeColor` property specifies the color of the axis label and represents the color from the corresponding range colors.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    title: 'Sales Rate',

Ranges in EJ2 JavaScript Bullet chart control

Ranges represent the quality of a specific range such as **Good**, **Bad** and **Satisfactory** in the Bullet Chart scale. The ending point of a qualitative range is specified in the **end** property in **ranges**. The **minimum** value of a quantitative scale is considered the starting point of the first range or the previous range end point.

Value bar in EJ2 JavaScript Bullet chart control

To display the primary data or the current value of the data being measured known as the **Feature Measure** that should be encoded as a bar. This is called as the **Actual Bar** or the **Feature Bar** in the Bullet Chart, and to display the actual bar the [valueField](#) should be mapped to the appropriate field from the data source.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate',
  dataSource: [
    { value: 55, target: 75, category: 'Year 1' },
  ],
  animation: { enable: false },
  valueField: 'value',
  ranges: [ { end: 35 },
    { end: 50 },
  ],
});

```

```

        { end: 100 }
      ],
      minimum: 0, maximum: 100, interval: 20
    }, '#element');

```

INDEX.HTML

```

Comparative bar in EJ2 JavaScript Bullet chart control

The line marker that runs perpendicular to the orientation of the graph is known as the **Comparative Measure** and it is used as a target marker to compare against the feature measure value. This is also called as the **Target Bar** in the Bullet Chart. To display the target bar, the [targetField](#) should be mapped to the appropriate field from the datasource.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate',
  dataSource: [
    { value: 55, target: 75, category: 'Year 1' },
  ],
  animation: { enable: false },
  targetField: 'target',
  ranges: [ { end: 35 },
    { end: 50 },

```

```

        { end: 100 }
      ],
      minimum: 0, maximum: 100, interval: 20
    }, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Title in EJ2 JavaScript Bullet chart control

Title

The title of the Bullet Chart displays the information about the data plotted by specifying it in the `title` property.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate',
  dataSource: [
    { value: 55, target: 75, category: 'Year 1' },
  ],
  animation: { enable: false },
  valueField: 'value',
```

```

        ranges: [ { end: 35 },
        { end: 50 },
        { end: 100 }
        ],
        minimum: 0, maximum: 100, interval: 20
    }, '#element');

```

INDEX.HTML

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Subtitle

To show additional information about the data plotted, the Bullet Chart can also be given a subtitle using the `subtitle` property.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate in dollars',
  subtitle: '(in dollars $)',
  dataSource: [
    { value: 55, target: 45, category: 'Year 1' },
  ],
  animation: { enable: false },
  targetField: 'target',
  valueField: 'value',
  labelFormat: '${value}',

```

```

        ranges: [ { end: 35 },
        { end: 50 },
        { end: 100 }
        ],
        minimum: 0, maximum: 100, interval: 20
    }, '#element');

```

INDEX.HTML

Customization in EJ2 JavaScript Bullet chart control

Orientation

The Bullet Chart can be rendered in different orientations such as **Horizontal** or **Vertical** via the **orientation** property. By default, the Bullet Chart is rendered in the **Horizontal** orientation.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate in dollars',
  subtitle: '(in dollars $)',
  dataSource: [
    { value: 55, target: 45, category: 'Year 1' },
  ],
  animation: { enable: false },
  targetField: 'target',
  valueField: 'value',
  labelFormat: '${value}',
  ranges: [ { end: 35 },
    { end: 50 },
    { end: 100 }
  ],
  width: '20%',
  orientation: 'Vertical',
  minimum: 0, maximum: 100, interval: 20
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Right-to-left (RTL)

The Bullet Chart supports the right-to-left rendering that can be enabled by setting the `enableRtl` property to **true**.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  dataSource: [
    { value: 1500, target: 1000, category: 'Year 1' },
  ],
  animation: { enable: false },
  targetField: 'target',
  valueField: 'value',
  ranges: [{ end: 500 },
    { end: 1500 },
    { end: 2000 }
  ],
  enableRtl: true,
  minimum: 0, maximum: 2000, interval: 200
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Animation

The actual and the target bar supports the linear animation via the **animation** setting. The speed and the delay are controlled using the **duration** and **delay** properties respectively.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  dataSource: [
    { value: 1500, target: 1000, category: 'Year 1' },
  ],
  animation: { enable: true },
  targetField: 'target',
  valueField: 'value',
  ranges: [ { end: 500 },
    { end: 1500 },
    { end: 2000 }
  ],
  minimum: 0, maximum: 2000, interval: 200
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Theme

The Bullet Chart supports different type of themes via the `theme` property.

INDEX.TS

```
import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  title: 'Profit in %',
```

```

    dataSource: [
      { value: 50, target: 45, category: 'Year 1' },
    ],
    animation: { enable: false },
    targetField: 'target',
    valueField: 'value',
    ranges: [ { end: 15 },
      { end: 50 },
      { end: 100 }
    ],
    theme: 'HighContrast',
    minimum: 0, maximum: 100, interval: 10
  }, '#element');

```

Data label in EJ2 JavaScript Bullet chart control

Data Labels are used to identify the value of actual bar in the Bullet Chart component. The Data Labels will be shown by specifying the `dataLabel` setting's `enable` property to **true**.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let localData: any[] = [

```

```

    {
        value: 5, comparativeMeasureValue: 7.5,
        category: '2001'
    },
    {
        value: 7, comparativeMeasureValue: 5,
        category: '2002'
    },
    {
        value: 10, comparativeMeasureValue: 6,
        category: '2003'
    },
    {
        value: 5, comparativeMeasureValue: 8,
        category: '2004'
    },
    {
        value: 12, comparativeMeasureValue: 5,
        category: '2005'
    },
    {
        value: 8, comparativeMeasureValue: 6,
        category: '2006'
    }
];
let chart: BulletChart = new BulletChart({
    dataSource: localData,
    animation: { enable: false },
    valueField: 'value',
    targetField: 'comparativeMeasureValue',
    title: 'Profit in percentage',
    height: '400',
    ranges: [{ end: 5 },
        { end: 15 },
        { end: 20 }
    ],
    labelFormat: '{value}%',
    dataLabel: { enable: true },
    minimum: 0, maximum: 20, interval: 5,
}, '#element');
```

Tool tip in EJ2 JavaScript Bullet chart control

When the mouse is hovered over a bar in the Bullet Chart, the tooltip displays important summary about the actual and the target bar values.

Default tooltip

By setting [enable](#) the property to 'True' and by injecting `BulletTooltip` module using `BulletChart.Inject(BulletTooltip)`. The 'Tooltip' is visible in the 'Bullet chart' by default.

The tooltip is not visible by default. To make it visible, set the `enable` property in the `tooltip` to `true` and injecting `BulletTooltip` module using `BulletChart.Inject(BulletTooltip)`.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);

```

```
let chart: BulletChart = new BulletChart({
  title: 'Sales Rate in dollars',
  subtitle: '(in dollars $)',
  dataSource: [
    { value: 55, target: 45, category: 'Year 1' },
  ],
  animation: { enable: false },
  targetField: 'target',
  valueField: 'value',
  labelFormat: '${value}',
  ranges: [ { end: 35 },
    { end: 50 },
    { end: 100 }
  ],
  minimum: 0, maximum: 100, interval: 20,
  tooltip: { enable: true }
}, '#element');
```

```

Tooltip template

Any HTML elements can be displayed in the tooltip by using the `template` property of the `tooltip`. You can use the `#{target}` and `#{value}` as place holders in the HTML element to display the value and target values from the data source of corresponding data point.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
    height: '110px',
    tooltip: { enable: true, template : '#Tooltip' },
    dataSource: [{ value: 70, target: 50 }],
    valueField: 'value',
    targetField: 'target',
    animation: { enable: false },
    ranges: [{ end: 30, color: '#599C20' },
    { end: 60, color: '#EFC820' },
    { end: 100, color: '#CA4218' }
    ],
    minimum: 0, maximum: 100, interval: 10,
    title: 'Revenue YTD',
    labelFormat: '#{value}K'
}, '#element');

```

INDEX.HTML

```

```

Customization of the appearance of tooltip

The [fill](#) and [border](#) properties are used to customize the background color and border of the tooltip respectively. The [textStyle](#) property in the tooltip is used to customize the font of the tooltip text.

The following properties can be used to customize the Bullet Chart tooltip.

- **fill** - Specifies the color of tooltip.
- **border** - Specifies the tooltip border color and width.
- **textStyle** - Specifies the tooltip font family, font style, font weight, color and size.

INDEX.TS

```

import { BulletChart, BulletTooltip } from '@syncfusion/ej2-charts';
BulletChart.Inject(BulletTooltip);
let chart: BulletChart = new BulletChart({
  height: '110px',
  tooltip: { enable: true, fill: 'red', border:{ color: 'green',
width: 10 } },
  dataSource: [{ value: 70, target: 50 }],
  valueField: 'value',

```

Accessibility in EJ2 JavaScript Bullet chart control

The Bullet chart control followed the accessibility guidelines and standards, including [ADA](#), [Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Bullet chart control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

WAI-ARIA attributes

The Bullet chart control followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Bullet chart control:

- img (role)
- button (role)
- aria-label (attribute)

- aria-pressed (attribute)

Keyboard interaction

The Bullet chart control followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Bullet chart control.

| Press | To do this |

| --- | --- |

| Tab | Moves the focus to the next element in the Bullet chart. |

| Shift + Tab | Moves the focus to the previous element in the Bullet chart. |

| Ctrl + P | Prints the Bullet chart. |

Ensuring accessibility

The Bullet chart control's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Bullet chart control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Bullet chart control with accessibility tools.

ButtonGroup

Getting started in EJ2 JavaScript Button group control

This section explains how to create a simple ButtonGroup, and configure its available functionalities by using the Essential JS 2 [quickstart](#) seed repository.

This application is integrated with the `webpack.config.js` configuration and uses the latest version of the [webpack-cli](#). It requires node v14.15.0 or higher. For more information about webpack and its features, refer to the [webpack documentation](#).

Dependencies

The following list of dependencies are required to use the ButtonGroup component in your application.

```
`js
```

```
|-- @syncfusion/ej2-splitbuttons
```

```
,
```

Set up development environment

Open the command prompt from the required directory, and run the following command to clone the Syncfusion JavaScript (Essential JS 2) quickstart project from [GitHub](#).

CMD

```
git clone https://github.com/SyncfusionExamples/ej2-quickstart-webpack- ej2-quickstart
```

After cloning the application in the `ej2-quickstart` folder, run the following command line to navigate to the `ej2-quickstart` folder.

CMD

```
cd ej2-quickstart
```

Add Syncfusion JavaScript packages

Syncfusion JavaScript (Essential JS 2) packages are available on the [npmjs.com](https://www.npmjs.com) public registry. You can install all Syncfusion JavaScript (Essential JS 2) controls in a single [@syncfusion/ej2](https://www.npmjs.com/package/@syncfusion/ej2) package or individual packages for each control.

The quickstart application is preconfigured with the dependent [@syncfusion/ej2](https://www.npmjs.com/package/@syncfusion/ej2) package in the `~/package.json` file. Use the following command to install the dependent npm packages from the command prompt.

NPM

```
npm install
```

Import the Syncfusion CSS styles

The ButtonGroup CSS files are available in the `ej2-splitbuttons` package folder. This can be referenced in the `~/src/styles/styles.css` file of your application by using the following code.

STYLE.CSS

```
@import '../..../node_modules/@syncfusion/ej2-base/styles/material.css';  
@import '../..../node_modules/@syncfusion/ej2-buttons/styles/material.css';  
@import '../..../node_modules/@syncfusion/ej2-splitbuttons/styles/material.css';
```

Add ButtonGroup to the project

Add the HTML div tag with class name as `e-btn-group` and the button elements that should group inside the div element with class name as

`e-btn` to your `index.html` file.

[src/index.html]

INDEX.HTML

```
<!DOCTYPE html>  
<html lang="en">  
<head>  
<title>Essential JS 2</title>  
<meta charset="utf-8" />

<meta name="description" content="Essential JS 2" />  
<meta name="author" content="Syncfusion" />  
<link rel="shortcut icon" href="resources/favicon.ico" />  
<link  
href="https://maxcdn.bootstrapcdn.com/bootstrap/3.3.7/css/bootstrap.min.css"  
rel="stylesheet" />
```

```
</head>
<body>
<div>
<!--element which is going to render-->
<div class='e-btn-group'>
<button class='e-btn'>HTML</button>
<button class='e-btn'>CSS</button>
<button class='e-btn'>Javascript</button>
</div>
</div>
</body>
</html>
```

Run the application

Run the application in the browser by using the following command.

NPM

```
npm start
```

The following example shows a basic ButtonGroup component.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="e-btn-group">
      <button class="e-btn">HTML</button>
      <button class="e-btn">CSS</button>
      <button class="e-btn">Javascript</button>
    </div>
  </div>
</body>
</html>
```

```
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.e-btn-group {
  margin: 25px 5px 20px 20px;
}
```

Orientation

ButtonGroup can be arranged in a vertical and horizontal orientation. By default, it is horizontally aligned.

Vertical Orientation

ButtonGroup can be aligned vertically by using the built-in CSS class `e-vertical` to the target element.

The following example illustrates how to achieve vertical orientation in ButtonGroup.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">

  type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="e-btn-group e-vertical">
            <button class="e-btn">HTML</button>
            <button class="e-btn">CSS</button>
            <button class="e-btn">Javascript</button>
        </div>
    </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}
```

ButtonGroup does not support SplitButton component nesting in a vertical orientation.

Types and styles in EJ2 JavaScript Button group control

This section explains about different types and styles of ButtonGroup.

ButtonGroup types

Outline ButtonGroup

An Outline ButtonGroup has a border with transparent background. To create an Outline ButtonGroup, **e-outline** class should be added to the target element and also add **e-outline** and **e-btn** class to each button elements.

The following sample illustrates how to achieve an Outline ButtonGroup.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
popups/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
splitbuttons/styles/material.css" rel="stylesheet">
  <link href="styles.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="e-btn-group e-outline">
      <button class="e-btn e-outline">HTML</button>
      <button class="e-btn e-outline">CSS</button>
      <button class="e-btn e-outline">Javascript</button>
    </div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
```

```
.e-btn-group {  
  margin: 25px 5px 20px 20px;  
}
```

ButtonGroup does not have support for flat and round types.

ButtonGroup styles

The Essential JS 2 ButtonGroup has the following predefined styles. This can be achieved by adding corresponding class name in each button elements.

Class	Description
-----	-----
e-primary	Used to represent a primary action.
e-success	Used to represent a positive action.
e-info	Used to represent an informative action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.

The following example illustrates how to achieve predefined styles in ButtonGroup.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
  <title>EJ2 Button-Group</title>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width, initial-scale=1.0">  
  <meta name="description" content="Typescript UI Controls">  
  <meta name="author" content="Syncfusion">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
base/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
buttons/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
splitbuttons/styles/material.css" rel="stylesheet">  
  <link href="styles.css" rel="stylesheet">  
  
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
type="text/javascript"></script>  
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
="text/javascript"></script>  
</head>  
<body>  
  
  <div id="container">  
    <div class="e-btn-group">  
      <button class="e-btn e-info">View</button>  
      <button class="e-btn">Edit</button>  
      <button class="e-btn e-danger">Delete</button>  
    </div>  
  </div>
```

```

    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}

```

Predefined ButtonGroup styles provide only the visual indication. So, ButtonGroup content should define the ButtonGroup style for the users of assistive technologies such as screen readers.

Selection in EJ2 JavaScript Button group control

Selection

Single selection

ButtonGroup supports radio type selection in which only one button can be selected. This can be achieved by adding input element along with **id** attribute with its corresponding label along with **for** attribute inside the target element. In this ButtonGroup, the type of the input element should be **radio** and **e-btn** is added to the **label** element.

The following example illustrates the single selection behavior in ButtonGroup.

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Button-Group</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

```

```

splitbuttons/styles/material.css" rel="stylesheet">
<link href="styles.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div class="e-btn-group">
            <input type="radio" id="radioleft" name="align" value="left">
            <label class="e-btn" for="radioleft">Left</label>
            <input type="radio" id="radiomiddle" name="align"
value="middle">
            <label class="e-btn" for="radiomiddle">Center</label>
            <input type="radio" id="radiatoright" name="align" value="right">
            <label class="e-btn" for="radiatoright">Right</label>
        </div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}

```

Multiple selection

ButtonGroup supports checkbox type selection in which multiple button can be selected. This can be achieved by adding input element along with `id` attribute with its corresponding label along with `for` attribute inside the target element. In this ButtonGroup, the type of the input element should be `checkbox` and `e-btn` is added to the `label` element.

The following example illustrates the multiple selection behavior in ButtonGroup.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="e-btn-group">
      <input type="checkbox" id="checkbold" name="font" value="bold">
      <label class="e-btn" for="checkbold">Bold</label>
      <input type="checkbox" id="checkitalic" name="font"
value="italic">
      <label class="e-btn" for="checkitalic">Italic</label>
      <input type="checkbox" id="checkline" name="font"
value="underline">
      <label class="e-btn" for="checkline">Underline</label>
    </div>
  </div>

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}
```

Nesting

Nesting with other components can be possible in ButtonGroup. The following components can be nested in ButtonGroup.

- DropDownButton
- SplitButton

For nesting support, [SplitButton dependencies](#) should be configured and added in `system.config.js`.

DropDownButton

To initialize DropDownButton component, refer [DropDownButton Getting Started documentation](#).

In the following example, the DropDownButton component can be added by creating button element with ID as `dropdownnelement` in `index.html` and

import the DropDownButton in `script` file, and initialize with the `dropdownnelement`.

INDEX.TS

```
import { DropDownButton, ItemModel, DropDownButtonModel } from
'@syncfusion/ej2-splitbuttons';
let items: ItemModel[] = [
{
    text: 'Learn SQL'
},
{
    text: 'Learn PHP'
},
{
    text: 'Learn Bootstrap'
}];
let menuOptions: DropDownButtonModel = {
    items: items
};
// To render DropDownButton.
let btnObj: DropDownButton = new DropDownButton(menuOptions);
btnObj.appendTo('#dropdownnelement');
```

INDEX.HTML

      <button class="e-btn">Javascript</button>
      <button class="e-btn" id="dropdownelement">More</button>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}

  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
.e-btn-group {
  margin: 25px 5px 20px 20px;
```

```
}
```

SplitButton

To initialize SplitButton component, refer [SplitButton Getting Started documentation](#).

In the following example, the SplitButton component can be added by creating button element with ID as `splitbuttonelement` in `index.html` and

import the SplitButton in `app.ts` file, and initialize with the `splitbuttonelement`.

INDEX.TS

```
import { SplitButton, ItemModel } from '@syncfusion/ej2-splitbuttons';
let items: ItemModel[] = [
  {
    text: 'Paste'
  },
  {
    text: 'Paste Text'
  },
  {
    text: 'Paste Special'
  }
];
// To render SplitButton.
let btnObj: SplitButton = new SplitButton({items: items});
btnObj.appendTo('#splitbuttonelement');
```

Accessibility in EJ2 JavaScript Button group control

The Button group component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Button group component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

```
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>

<div> - All
features of the component meet the requirement.</div>

<div> - Some features of the component do not meet the requirement.</div>

<div> - The
component does not meet the requirement.</div>
```

Keyboard interaction

The Button group component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Button group component.

Normal behavior

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Focuses the next button in the ButtonGroup.** |

| **Enter/Space** | **Activates the focussed button in the ButtonGroup.** |

Checkbox behavior

| **Press** | **To do this** |

| --- | --- |

| **Tab** | **Focuses the next button in the ButtonGroup.** |

| **Space** | **Activates the focussed button in the ButtonGroup.** |

Radiobutton behavior

| Press | To do this |

| --- | --- |

| Tab | Focuses the active button in the ButtonGroup. |

| Right | Activates next/previous button in the ButtonGroup. |

Ensuring accessibility

The Button group component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Button group component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Button group component with accessibility tools.

How To

Create buttongroup with icons in EJ2 JavaScript Button group control

To create ButtonGroup with icons, `span` element should be added inside each button element with `e-btn-icon` and `e-icon-left` along with icon classes.

The following example illustrates how to create ButtonGroup with icons.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}
.e-left-icon::before {
    content: '\e33a';
}
.e-right-icon::before {
    content: '\e34d';
}
.e-middle-icon::before {
    content: '\e35e';
}

```

Create buttongroup with rounded corner in EJ2 JavaScript Button group control

The ButtonGroup with rounded corner has round edges on both side. In the ButtonGroup with rounded corner, **e-round-corner** class is to be

added to the target element.

The following example illustrates how to create ButtonGroup with rounded corner.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button-Group</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="e-btn-group e-round-corner">
      <button class="e-btn">HTML</button>
      <button class="e-btn">CSS</button>
      <button class="e-btn">Javascript</button>
    </div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
  visibility: hidden;
}
#loader {
  color: #008cff;
  height: 40px;
  left: 45%;
  position: absolute;
  top: 45%;
  width: 30%;
}
```

```
.e-btn-group {  
  margin: 25px 5px 20px 20px;  
}
```

Disable in EJ2 JavaScript Button group control

Particular button

To disable a particular button in a ButtonGroup, [disabled](#) attribute should be added to the corresponding button element.

Whole ButtonGroup

To disable whole ButtonGroup, [disabled](#) attribute should be added to all the button elements.

The following example illustrates how to disable the particular and the whole ButtonGroup.

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>  
  <title>EJ2 Button-Group</title>  
  <meta charset="utf-8">  
  <meta name="viewport" content="width=device-width, initial-scale=1.0">  
  <meta name="description" content="Typescript UI Controls">  
  <meta name="author" content="Syncfusion">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-

  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
buttons/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
popups/styles/material.css" rel="stylesheet">  
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-  
splitbuttons/styles/material.css" rel="stylesheet">  
  <link href="styles.css" rel="stylesheet">  
  
  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"  
type="text/javascript"></script>  
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type  
="text/javascript"></script>  
</head>  
<body>  
  
  <div id="container">  
    <div class="e-btn-group">  
      <button class="e-btn">HTML</button>  
      <button class="e-btn" disabled="">CSS</button>  
      <button class="e-btn">Javascript</button>  
    </div>  
    <div class="e-btn-group">  
      <button class="e-btn" disabled="">HTML</button>  
      <button class="e-btn" disabled="">CSS</button>  
      <button class="e-btn" disabled="">Javascript</button>  
    </div>  
  </div>  
  
  <script>  
var ele = document.getElementById('container');  
if(ele) {  
  ele.style.visibility = "visible";  
}
```

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 25px 5px 20px 20px;
}

```

To disable radio/checkbox type ButtonGroup, the `disabled` attribute should be added to the particular input element.

Enable ripple in EJ2 JavaScript Button group control

Ripple can be enabled by importing `rippleEffect` method from `ej2-base` and initialize rippleEffect with `.e-btn-group` element, and selector as `e-btn`.

The following example illustrates how to enable ripple for ButtonGroup.

<!-- markdownlint-disable MD033 -->

INDEX.TS

```

import { rippleEffect, enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// To enable ripple in ButtonGroup.
let button: HTMLElement = document.querySelector('.e-btn-group');
rippleEffect(button, { selector: '.e-btn' });

```

INDEX.HTML

```

Form submit in EJ2 JavaScript Button group control

The name attribute of the input element is used to group the radio/checkbox type ButtonGroup. When the radio/checkbox type are grouped in the form, the checked items value attribute will be posted to the server on form submit that can be retrieved through the name. The disabled

radio/checkbox type value will not be sent to the server on form submit.

In the following code snippet, the radio type ButtonGroup is explained with male value as checked. Now, the value that is in checked state will be sent on form submit.

```

Initialize buttongroup using util function in EJ2 JavaScript Button group control

Though, it is a CSS component for easy initialization of ButtonGroup `createButtonGroup` util function can be used.

To use `createButtonGroup` util function, [SplitButton dependencies](#) should be configured and added in `system.config.js` and it should also be imported in `script` file.

Using `createButtonGroup` method, the button options, selector, and `cssClass` is passed and the corresponding classes is added to the elements.

Create basic ButtonGroup

To create a basic ButtonGroup, the target element along with the button elements should be created in `index.html` file.

Create radio type ButtonGroup

To create a radio type ButtonGroup, the target element along with the input elements should be created with type `radio` in `index.html`.

Create checkbox type ButtonGroup

Checkbox type ButtonGroup creation is similar to radio type ButtonGroup, instead the type of the input elements should be `checkbox`.

The following example illustrates how to create ButtonGroup using `createButtonGroup` function for basic, checkbox, and radio

type behaviors.

INDEX.TS

```
import { createButtonGroup } from '@syncfusion/ej2-splitbuttons';
// To create basic ButtonGroup.
createButtonGroup('#basic', {
    buttons: [
        { content: 'HTML' },
        { content: 'CSS' },
    ],
});
```

```

        { content: 'Javascript' }
    ]
});
// To create checkbox type ButtonGroup.
createButtonGroup('#checkbox', {
    buttons: [
        { content: 'Bold' },
        { content: 'Italic' },
        { content: 'Undeline' }
    ]
});
// To create radio type ButtonGroup.
createButtonGroup('#radio', {
    buttons: [
        { content: 'Left' },
        { content: 'Center' },
        { content: 'Right' }
    ]
});

```

<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLES.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
.e-btn-group {
    margin: 0 5px 5px 5px;
}

```

If null value is passed in button options, then that particular button will be skipped from processing in `createButtonGroup` util function.

Show `buttongroup` selected state on initial render in EJ2 JavaScript Button group control

To show selected state on initial render, `checked` property should be added to the corresponding input element.

The following example illustrates how to show selected state on initial render.

Button

Types and styles in EJ2 JavaScript Button control

This section explains the different styles and types of Buttons.

Button styles

The Essential JS 2 Button has the following predefined styles that can be defined using the [cssClass](#) property.

Class	Description
e-primary	Used to represent a primary action.
e-success	Used to represent a positive action.
e-info	Used to represent an informative action.
e-warning	Used to represent an action with caution.
e-danger	Used to represent a negative action.
e-link	Changes the appearance of the Button like a hyperlink.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Primary Button - Used to represent a primary action.
let button: Button = new Button({ cssClass: `e-primary`, '#primarybtn' });
//Success Button - Used to represent a positive action.
button = new Button({ cssClass: `e-success`, '#successbtn' });
//Info Button - Used to represent an informative action.
button = new Button({ cssClass: `e-info`, '#infobtn' });
//Warning Button - Used to represent an action with caution.
button = new Button({ cssClass: `e-warning`, '#warningbtn' });
//Danger Button - Used to represent a negative action.
button = new Button({ cssClass: `e-danger`, '#dangerbtn' });
//Link Button - Changes the appearance of the Button like a hyperlink.
button = new Button({ cssClass: `e-link`, '#linkbtn' });

```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-buttons/styles/material.css" rel="stylesheet">

```

```
<link href="styles.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <button id="primarybtn">Primary</button>
        <button id="successbtn">Success</button>
        <button id="infobtn">Info</button>
        <button id="warningbtn">Warning</button>
        <button id="dangerbtn">Danger</button>
        <button id="linkbtn">Link</button>
    </div>
    <script>
        let loader = document.getElementById('loader');
        let container = document.getElementById('container');
        if (loader) {
            loader.style.display = "none";
        }
        if (container) {
            container.style.visibility = "visible";
        }
    </script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
button {
    margin: 25px 5px 20px 20px;
}
```

Predefined Button styles provide only the visual indication. So, Button content should define the Button style for the users of assistive technologies such as screen readers.

Primary action button can also be achieved by setting `isPrimary` property as `true`.

Button types

The types of Essential JS 2 Button are as follows:

- Basic types
- Flat Button
- Outline Button
- Round Button
- Toggle Button

Basic types

The basic Button types are explained below.

Type	Description
Button	Defines a click Button.
Submit	This Button submits the form data to the server.
Reset	This Button resets all the controls in the form elements to their initial values.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Submit.
let button: Button = new Button();
button.appendTo('#submitbtn');
//Reset.
button = new Button();
button.appendTo('#resetbtn');
```

INDEX.HTML

```

type="text/javascript"></script>
```

```
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type="text/javascript"></script>
</head>
<body>

    <div id="container">
        <form>
            <button type="submit" id="submitbtn">Submit</button>
            <button type="reset" id="resetbtn">Reset</button>
        </form>
    </div>
    <script>
        let loader = document.getElementById('loader');
        let container = document.getElementById('container');
        if (loader) {
            loader.style.display = "none";
        }
        if (container) {
            container.style.visibility = "visible";
        }
    </script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
button {
    margin: 25px 5px 20px 20px;
}
```

Flat Button

The Flat Button is styled with no background color. To create a flat Button, set the [cssClass](#) property to `e-flat`.

Outline Button

An outline Button has a border with transparent background. To create an outline Button, set the [cssClass](#) property to `e-outline`.

Round Button

A round Button is shaped like a circle. Usually, it contains an icon representing its action. To create a round Button, set the [cssClass](#) property to `e-round`.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Flat Button.
let button: Button = new Button({ cssClass: `e-flat`, '#flatbtn' });
//Outline Button.
button = new Button({ cssClass: `e-outline`, '#outlinebtn' });
//Round Button - Icon can be loaded by setting "e-icons e-plus-icon" in
"iconCss" property.
//Use "e-icons" class name to load Essential JS 2 built-in icons.
//Use "e-plus-icon" class name to load plus icon that you can refer in
"styles.css".
button = new Button({ cssClass: `e-round`, iconCss: 'e-icons e-plus-icon',
isPrimary:true }, '#roundbtn');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Button</title>

  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <button id="flatbtn">Flat</button>
    <button id="outlinebtn">Outline</button>
    <button id="roundbtn"></button>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

STYLES.CSS

```
#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
/* For Round Button*/
.e-plus-icon::before {
    content: '\e823';
}
button {
    margin: 25px 5px 20px 20px;
}
```

Toggle Button

A toggle Button allows you to change between the two states. The Button is active in toggled state and can be recognized through the `e-active` class. The functionality of the toggle Button is handled by click event. To create a toggle Button, set the `isToggle` property to `true`. In the following code snippet, the toggle Button text changes to play/pause based on the state of the Button with the use of click event.

INDEX.TS

```
//Button is active in toggled state.
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let togglebtn: Button = new Button({cssClass: `e-flat`, iconCss: 'e-btn-sb-icon e-play-icon', isToggle: true, content: 'Play'}, '#togglebtn');
//Click Event.
document.getElementById('togglebtn').onclick = (): void => {
    if (document.getElementById('togglebtn').classList.contains('e-active')) {
        togglebtn.content = 'Pause';
        togglebtn.iconCss = 'e-btn-sb-icon e-pause-icon';
    } else {
        togglebtn.content = 'Play';
        togglebtn.iconCss = 'e-btn-sb-icon e-play-icon';
    }
};
```

INDEX.HTML

}

```

Icons

Button with font icons

The Button can have an icon to provide the visual representation of the action. To place the icon on a Button, set the [iconCss](#) property with the required icon CSS. By default, the icon is positioned to the left side of the Button. You can customize the icon's position by using the [iconPosition](#) property.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//To position the icon to the left of the text on a Button.
let button: Button = new Button({iconCss: 'e-btn-sb-icon e-prev-icon'},
'#iconbutton');
//To position the icon to the right of the text on a Button.
button = new Button({iconCss: 'e-btn-sb-icon e-stop-icon', iconPosition:
'Right'}, '#iconposbtn');
```

Button with SVG image

SVG image can be added to the Button using [iconCss](#) property.

In the following example, SVG image is added using the iconCss class `e-search-icon` by setting `height` and `width`.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let button: Button = new Button({ iconCss: 'e-search-icon' },
'#iconbutton');

```

    width: 30%;
}
.e-btn-icon.e-search-icon {
    background: url('search_icon.svg');
    height: 25px;
    width: 25px;
}
button {
    margin: 25px 5px 20px 20px;
}

```

The Essential JS 2 provides a set of icons that can be loaded by applying `e-icons` class name to the element. You can also use third party icons on the Button using the [iconCss](#) property.

Button size

The two types of Button sizes are default and small. To change the size of the default Button to small Button, set the [cssClass](#) property to `e-small`.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Small Button.
let button: Button = new Button({ cssClass: `e-small`, '#smallbtn' });
//Normal Button.
button = new Button();

```

```
button.appendTo('#normalbtn');
```

Accessibility in EJ2 JavaScript Button component

The Button component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Button component is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | `` |

| [Section 508](#) Support | `` |

| Screen Reader Support | `` |

| Right-To-Left Support | `` |

| Color Contrast | `` |

| Mobile Device Support | `` |

| Keyboard Navigation Support | `` |

| [Accessibility Checker](#) Validation | `` |

| [Axe-core](#) Accessibility Validation | `` |

`<style>`

`.post .post-content img {`

`display: inline-block;`

`margin: 0.5em 0;`

`}`

`</style>`

`<div> - All features of the component meet the requirement.</div>`

```
<div> - Some features of the component do not meet the requirement.</div>
```

```
<div> - The component does not meet the requirement.</div>
```

WAI-ARIA attributes

The Button component followed the [WAI-ARIA](#) patterns to meet the accessibility. The following ARIA attributes are used in the Button component:

| Attributes | Purpose |

| --- | --- |

| `aria-label` | Provides an accessible name for the icon only button. |

Keyboard interaction

The Button component followed the [keyboard interaction](#) guideline, making it easy for people who use assistive technologies (AT) and those who completely rely on keyboard navigation. The following keyboard shortcuts are supported by the Button component.

| Press | To do this |

| --- | --- |

| Space | When the button has focus, pressing the space key changes the state of the button. |

Ensuring accessibility

The Button component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Button component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Button component with accessibility tools.

How To

Add link to a button in EJ2 JavaScript Button control

The appearance of the Button can be changed like a link by `e-link` class using [cssClass](#) property and link navigation can be handled in Button click.

In the following example, link is added in Button click by using `window.open()` method.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize the Button component.
let button: Button = new Button({cssClass: 'e-link'});
// Render initialized button.
button.appendTo('#element');
button.element.onclick = (): void => {
    window.open("https://www.google.com");
};
```

```
}

```

INDEX.HTML

```

  position: absolute;
  top: 45%;
  width: 30%;
}
```

Create a block button in EJ2 JavaScript Button control

You can customize a Button into a Block Button that will span the entire width of its parent element. To create a Block Button, set the [cssClass](#) property to `e-block`.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//Block Button.
let button: Button = new Button({cssClass: `e-block`});
button.appendTo('#blockbtn');
//Primary Block Button.
button = new Button({ isPrimary: true, cssClass: `e-block` });
button.appendTo('#primarybtn');
//Success Block Button.
button = new Button({ cssClass: `e-block e-success` });
button.appendTo('#successbtn');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <button id="blockbtn">Block Button</button>
    <button id="primarybtn">Block Button</button>
    <button id="successbtn">Block Button</button>
  </div>
  <script>
    let loader = document.getElementById('loader');
    let container = document.getElementById('container');
    if (loader) {
      loader.style.display = "none";
    }
    if (container) {
      container.style.visibility = "visible";
    }
  </script>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
```

```

}
    </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

STYLE.CSS

```

#container {
    visibility: hidden;
}
#loader {
    color: #008cff;
    height: 40px;
    left: 45%;
    position: absolute;
    top: 45%;
    width: 30%;
}
button {
    margin: 25px 0;
}

```

Customize button appearance in EJ2 JavaScript Button control

You can customize the appearance of the Button by using the Cascading Style Sheets (CSS). Define the CSS according to your requirement, and assign the class name to the [cssClass](#) property. In the following code snippet the background color, text color, height, width, and sharp corner of the Button can be customized through the `e-custom` class for all states (hover, focus, and active).

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
//To customize Button appearance.
//Refer the "e-custom" class details in "styles.css".
let button: Button = new Button({cssClass: `e-custom`, content: 'Custom'},
'#custombtn');

```

INDEX.HTML

Customize input and anchor elements in EJ2 JavaScript Button control

You can customize the appearance of the input and anchor elements using predefined styles through the class property. In the following code

snippet, the input element is customized as a link Button by setting the `e-btn e-link` class, and the anchor element is customized as a

primary Button by setting the `e-btn e-primary` class.

Repeat button in EJ2 JavaScript Button control

The Repeat button is a type of Button in that the click event is triggered at regular time interval from the pressed state till the released state.

The following example explains about how to achieve Repeat Button in mouse and touch events.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { EventHandler, enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let timeout: any = null;
let button: Button = new Button({ cssClass: 'e-small' });
button.appendTo('#button');
let clear: Button = new Button({ cssClass: 'e-small' });
clear.appendTo('#clear');
clear.element.onclick = () => {
  document.getElementById('eventlog').innerHTML = '';
}

```

```

button.element.addEventListener("mousedown", mouseDownHandler);
button.element.addEventListener("touchstart", mouseDownHandler);
button.element.addEventListener("mouseup", mouseUpHandler);
button.element.addEventListener("touchend", mouseUpHandler);
button.element.addEventListener("click", clickEventHandler);
function mouseUpHandler(event: any): void {
    clearInterval(timeout);
}
function mouseDownHandler(event: any): void {
    event.preventDefault();
    timeout = setInterval(clickEventHandler, 200);
}
function clickEventHandler() {
    EventHandler.trigger(button.element, "click");
    appendSpanElement('Button click event triggered.<hr>');
}
function appendSpanElement(text: string): void {
    let span: HTMLElement = document.createElement('span');
    span.innerHTML = text;
    let log: HTMLElement = document.getElementById('eventlog');
    log.insertBefore(span, log.firstChild);
}

```

Right to left in EJ2 JavaScript Button control

Button component has RTL support. This can be achieved by setting [enableRtl](#) as `true`.

The following example illustrates how to enable right-to-left support in Button component.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let button: Button = new Button({iconCss: 'e-btn-icons e-setting-icon',
content: 'Settings', enableRtl: true}, '#custombtn');
```

INDEX.HTML

Set the disabled state in EJ2 JavaScript Button control

Button component can be enabled/disabled by giving [disabled](#) property. To disable Button component, the `disabled` property can be set as `true`.

The following example demonstrates Button in `disabled` state.

INDEX.TS

```
import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
let button: Button = new Button({content: 'Disabled', disabled: true},
'#custombtn');
```

Tooltip for button in EJ2 JavaScript Button control

Tooltip can be shown on Button hover and it can be achieved by setting `title` attribute.

The following snippets illustrates how to show tooltip on Button hover.

INDEX.TS

```

import { Button } from '@syncfusion/ej2-buttons';
import { enableRipple } from '@syncfusion/ej2-base';
enableRipple(true);
// Initialize the Button component.
let button: Button = new Button({isPrimary: true, content: 'Button'});
// Render initialized button.
button.appendTo('#element');
button.element.setAttribute("title", "Primary Button");

```

INDEX.HTML

```

Ej1 api migration in EJ2 JavaScript Button control

This article describes the API migration process of Button component from Essential JS 1 to Essential JS 2.

Properties

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Specifies the text of the button | **Property:** *text*

 \$("#button").ejButton({
 text: "Button"
}); | **Property:** *content*

 var button = new ej.buttons.Button({
content: "Button"
});
button.appendTo("#button"); |

| Specifies the content type of the button | **Property:** *ContentType*
`$("#button").ejButton({contentType: ej.ContentType.TextAndImage, prefixIcon: "e-icon e-save", text: "Save" });` | Not applicable |

| Specifies icon for the button | **Property:** *prefixIcon*
`$("#button").ejButton({contentType: ej.ContentType.ImageOnly, prefixIcon: "e-icon e-save" });` | **Property:** *iconCss*
`var button = new ej.buttons.Button({iconCss: "e-icons e-save" });`
`button.appendTo("#button");` |

| Positioning icon in the button | **Property:** *imagePosition*
`$("#button").ejButton({imagePosition: ej.ImagePosition.ImageRight, contentType: ej.ContentType.TextAndImage, prefixIcon: "e-icon e-save", text: "Save" });` | **Property:** *iconPosition*
`var button = new ej.buttons.Button({iconCss: "e-icons e-save", iconPosition: "Right", content: "Save" });`
`button.appendTo("#button");` |

| Specifies secondary icon for the button | **Property:** *suffixIcon*
`$("#button").ejButton({contentType: ej.ContentType.ImageTextImage, suffixIcon: "e-icon e-file-html", prefixIcon: "e-icon e-search", text: "FileSearch" });` | Not applicable |

| Specifies the size of the button | **Property:** *size*
`$("#button").ejButton({size: ej.ButtonSize.Small, text: "Button" });` | **Property:** *cssClass*
`var button = new ej.buttons.Button({cssClass: "e-small", content: "Button" });`
`button.appendTo("#button");` |

| Adding custom css class | **Property:** *cssClass*
`$("#button").ejButton({cssClass: "custom-class", text: "Button" });` | **Property:** *cssClass*
`var button = new ej.buttons.Button({cssClass: "custom-class", content: "Button" });`
`button.appendTo("#button");` |

| Triggers click event repeatedly while pressing the button | **Property:** *repeatButton*
`$("#button").ejButton({repeatButton: true, text: "Button" });` | Not applicable |

| Sets time interval between two consecutive click event on the repeat button | **Property:** *timeInterval*
`$("#button").ejButton({repeatButton: true, timeInterval: "100", text: "Button" });` | Not applicable |

| Specifies the type of the button | **Property:** *type*
`$("#button").ejButton({type: ej.ButtonType.Submit, text: "Submit" });` | Not applicable |

| Changes normal button into rounded corner | **Property:** *showRoundedCorner*
`$("#button").ejButton({showRoundedCorner: true, text: "Button" });` | Not applicable |

| Specifies the width of the button | **Property:** *width*
`$("#button").ejButton({width: "150px", text: "Button" });` | Not applicable |

| Specifies the height of the button | **Property:** *height*
`$("#button").ejButton({height: "30px", text: "Button" });` | Not applicable |

| Adds HTML attributes to the button | **Property:** *htmlAttributes*
`$("#button").ejButton({htmlAttributes: { disabled: "disabled" }, text: "Button" });` | Not applicable |

| Allows the appearance of the Button to be enhanced and visually appealing | Not applicable | **Property:** *isPrimary*
`var button = new ej.buttons.Button({isPrimary: true, content: "Button" });`
`button.appendTo("#button");` |

| Makes the button toggle from normal to active state | Not applicable | **Property:** *isToggle*

 var button = new ej.buttons.Button({
isToggle: true,
content: "Button"
});

button.appendTo("#button"); |

| Specifies the disabled state of the button | **Property:** *enabled*

 \$("#button").ejButton({

enabled: false,
text: "Button"
}); | **Property:** *disabled*

 var button = new
 ej.buttons.Button({
 disabled: true,
 content: "Button"
});

 button.appendTo("#button"); |

| Enable or disable rendering component in right to left direction | **Property:** *enableRTL*

 \$("#button").ejButton({
 enableRTL: true,
 text: "Button"
}); | **Property:** *enableRtl*

 var button = new ej.buttons.Button({
enableRtl: true,
content:
 "Button"
});
 button.appendTo("#button"); |

Methods

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Destroys the control | **Methods:** *destroy*

 \$("#button").ejButton({
text: "Button"

});
 var button = \$("#button").data("ejButton");
button.destroy(); | **Methods:** *destroy*

 var button = new ej.buttons.Button({
content: "Button"
});

 button.appendTo("#button");
button.destroy(); |

| Disables the button | **Methods:** *disable*

 \$("#button").ejButton({
 text: "Button"

 });
 var button = \$("#button").data("ejButton");
 button.disable(); | Not applicable |

| Enables the button | **Methods:** *enable*

 \$("#button").ejButton({
enabled: false,

text: "Button"
});
 var button = \$("#button").data("ejButton");
button.enable(); |
 Not applicable |

Events

| Behavior | API in Essential JS 1 | API in Essential JS 2 |

| --- | --- | --- |

| Triggers while clicking the button | **Events:** *click*

 \$("#button").ejButton({
text:
 "Button",
click: function(args) { / code block */ }
}); | Not applicable |

| Triggers once the component rendering is completed | **Events:** *create*

 \$("#button").ejButton({
text: "Button",
create: function(args) { / code block / }
}); |
Events: *created*

 var button = new ej.buttons.Button({
content:
 "Button",
created: function created() { / code block / }
});
 button.appendTo("#button");
 |

| Triggers once the component is destroyed | **Events:** *destroy*

 \$("#button").ejButton({

text: "Button",
destroy: function(args) { / code block */ }
}); | Not applicable |

Calendar

Date range in EJ2 JavaScript Calendar control

Calendar provides an option to select a date value within a specified range by defining the [min](#) and [max](#) properties. The min date should always be lesser than the max date. If the value of [min](#) or [max](#) properties are changed through code behind, then update the [value](#) property to be set

within the specified range, or else, if the value is out of specified date range and less than **min** date, value property will be updated with min date or the value is higher than max date, value property will be updated with **max** date.

The following example allows you to select a date within the range of 7th to 27th days in a month.

INDEX.TS

```
import { Calendar, ChangedEventArgs } from '@syncfusion/ej2-calendars';
//Creates a Calendar with min and max properties.
let today: Date = new Date();
let currentYear: number = today.getFullYear();
let currentMonth: number = today.getMonth();
let currentDay: number = today.getDate();
let calendarObject: Calendar = new Calendar({
    //sets the min date
    min: new Date(currentYear, currentMonth, 7),
    //sets the max date
    max: new Date(currentYear, currentMonth, 27),
    //sets the value
    value: new Date(new Date().setDate(14))
});
calendarObject.appendTo('#element');
```

INDEX.HTML

```

</body></html>

```

Multi select in EJ2 JavaScript Calendar control

Calendar provides an option to select **single** or **multiple dates** by using `isMultiSelection` and `values` properties. By default, `isMultiSelection` property will be in disabled state.

| API | Type | Description |

|-----|-----|-----|

| `isMultiSelection` | **Boolean** | Enables the multi-selection option in the Calendar control |

| `values` | **Date[]** | Gets or sets the date range values in multi-selection option |

The following example demonstrates the functionality of `isMultiSelection` property and `values` properties in the Calendar control.

INDEX.TS

```

import { Calendar } from '@syncfusion/ej2-calendars';
/*Initialize the calendar component*/
let calendar: Calendar = new Calendar({
    isMultiSelection: true,
    values: [new Date('1/1/2020'), new Date('1/15/2020'), new
Date('1/3/2020'), new Date('1/25/2020')]
});
calendar.appendTo('#element');

```

- [Select a sequence of dates in Calendar](#)

Globalization in EJ2 JavaScript Calendar control

Globalization is the combination of adapting the component to various languages by means of parsing and formatting the date or number [Internationalization](#) and also by adding cultural specific customizations and translating the text [localization](#)

By default, the Calendar date format, week, and month names are specific to American English culture. It uses the [Essential JavaScript 2 Internationalization](#) package to parse and format date object based on the culture using the official [UNICODE CLDR](#) JSON data. It provides the [loadCldr](#) method to load the culture-specific CLDR JSON data.

All the Essential JS 2 component are specific to English culture ('en-US'). If you want to go with the different culture other than [English](#), follow the below steps.

- Install the `CLDR-Data` package by using the below command (installs the CLDR JSON data). To know more about CLDR data, refer to the [CLDR-Data](#) link.

```
npm install cldr-data --save
```

Once the package is installed, the culture-specific JSON data will be available in `/node_modules/cldr-data`.

- Now, import the installed CLDR JSON data to the `app.ts` file. To import JSON data, install the JSON plugin loader. In the example, SystemJS JSON plugin loader is used.

```
npm install systemjs-plugin-json --save-dev
```

- After it is installed, configure the `system.config.js` settings as given below to map the `systemjs-plugin-json` loader.

```
`ts
System.config({
  paths: {
    'npm:': './node_modules/',
    'syncfusion:': 'npm:@syncfusion/'
  },
  map: {
    app: 'app',
    //Syncfusion packages mapping
    "@syncfusion/ej2-base": "syncfusion:ej2-base/dist/ej2-base.umd.min.js",
    "@syncfusion/ej2-data": "syncfusion:ej2-data/dist/ej2-data.umd.min.js",
    "@syncfusion/ej2-inputs": "syncfusion:ej2-inputs/dist/ej2-inputs.umd.min.js",
    "@syncfusion/ej2-buttons": "syncfusion:ej2-buttons/dist/ej2-buttons.umd.min.js",
    "@syncfusion/ej2-splitbuttons": "syncfusion:ej2-splitbuttons/dist/ej2-splitbuttons.umd.min.js",
    "@syncfusion/ej2-lists": "syncfusion:ej2-lists/dist/ej2-lists.umd.min.js",
    "@syncfusion/ej2-popups": "syncfusion:ej2-popups/dist/ej2-popups.umd.min.js",
    "@syncfusion/ej2-calendars": "syncfusion:ej2-calendars/dist/ej2-calendars.umd.min.js",
    "cldr-data": 'npm:cldr-data',
    //systemjs-plugin-json loader package mapping
    "plugin-json": "npm:systemjs-plugin-json/json.js"
  },
  meta: {
    '*.json': { loader: 'plugin-json' }
  },
  packages: {
    'app': { main: 'app', defaultExtension: 'js' },
    'cldr-data': { main: 'index.js', defaultExtension: 'js' }
  }
});
System.import('app');
```

- Now, use the [loadCldr](#) method to load the culture-specific CLDR JSON data from the installed location to `app.ts` file.
- Calendar displayed **Sunday** as the first day of week based on default culture ("en-US"). If you want to display the Calendar with loaded culture's first day of week, you need to import `weekdata.json` file from the `cldr-data/supplemental` as given in the code example.

```
`ts
//import the loadCldr from ej2-base
import { loadCldr } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/de/ca-gregorian.json'),
  require('cldr-data/main/de/numbers.json'),
  require('cldr-data/main/de/timeZoneNames.json'),
  require('cldr-data/supplemental/weekdata.json')); // To load the culture based first day of week
`
```

The [Localization](#) library allows you to localize default text content of the Calendar. The Calendar component has static text for **today** feature that can be changed to other cultures (Arabic, Deutsch, French, etc.) by defining the [locale](#) value and translation object.

Locale keywords | Text

today | Name of the button to choose Today date.

- Before changing the culture other than **English**, ensure that locale text for the concerned culture is loaded through `load` method of

[L10n](#) class.

```
`ts
//Load the L10n from ej2-base
import { L10n } from '@syncfusion/ej2-base';
//load the locale object to set the localized placeholder value
L10n.load({
  'de': {
    'calendar': { today: 'heute' }
  }
})
```

```
});  
`
```

- Set the culture by using the [locale](#) property. The code example initializes the Calendar component in the **German** culture.

```
`ts  
import { Calendar } from '@syncfusion/ej2-calendars';  
//import the loadCldr from ej2-base  
import { loadCldr, L10n } from '@syncfusion/ej2-base';  
declare var require: any;  
loadCldr(  
  require('cldr-data/supplemental/numberingSystems.json'),  
  require('cldr-data/main/de/ca-gregorian.json'),  
  require('cldr-data/main/de/numbers.json'));  
require('cldr-data/main/de/timeZoneNames.json');  
L10n.load({  
  'de': {  
    'calendar': { today: 'heute' }  
  }  
});  
let calendarObject: Calendar = new Calendar({  
  //sets the locale.  
  locale: 'de'  
});  
calendarObject.appendTo('#element');  
`
```

The following example displays the Calendar in **German** culture.

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';  
//import the loadCldr from ej2-base  
import { loadCldr, L10n } from '@syncfusion/ej2-base';  
//load the CLDR JSON data files.  
import * as numberingSystems from './numberingSystems.json';  
import * as gregorian from './ca-gregorian.json';  
import * as numbers from './numbers.json';  
import * as timeZoneNames from './timeZoneNames.json';  
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
```

```

L10n.load({
  'de': {
    'calendar': {
      today: 'heute'
    }
  }
});
//creates a calendar with German culture.
let calendarObject: Calendar = new Calendar({ locale: 'de' });
calendarObject.appendTo('#element');

```

  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Right-to-left

The Calendar supports right-to-left functionality for languages like Arabic, Hebrew, etc. to display text in the right-to-left direction. Use

[enableRtl](#) property to set the RTL direction.

The following code example initializes the Calendar component in Arabic culture.

```
`ts
import { Calendar } from '@syncfusion/ej2-calendars';
//import the loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
declare var require: any;
loadCldr(
  require('cldr-data/supplemental/numberingSystems.json'),
  require('cldr-data/main/ar/ca-gregorian.json'),
  require('cldr-data/main/ar/numbers.json'));
require('cldr-data/main/ar/timeZoneNames.json'));
L10n.load({
  'ar': {
    'calendar': {
      today: 'اليوم'
    }
  }
});
let calendarObject: Calendar = new Calendar({
  //sets the locale.
  locale: 'ar'
});
calendarObject.appendTo('#element');
```

The following example displays the Calendar in Arabic culture in the right-to-left direction.

INDEX.TS

```
//imports the loadCldr from ej2-base
import { loadCldr, L10n } from '@syncfusion/ej2-base';
import { Calendar } from '@syncfusion/ej2-calendars';
//loads the CLDR data files.
import * as numberingSystems from './numberingSystems.json';
import * as gregorian from './ca-gregorian.json';
import * as numbers from './numbers.json';
import * as timeZoneNames from './timeZoneNames.json';
loadCldr(numberingSystems, gregorian, numbers, timeZoneNames);
L10n.load({
```

```
'ar': {
    'calendar': { today: 'اليوم' }
};
});
//creates the calendar with Arabic culture.
let calendarObject: Calendar = new Calendar({
    //sets the locale
    locale: 'ar',
    //sets the enableRtl
    enableRtl: true
});
calendarObject.appendTo('#element');
```

Customization in EJ2 JavaScript Calendar control

Each day cell of the Calendar can be customized by using the [renderDayCell](#)

event.

The following section demonstrates how to disable or highlight specific dates in a Calendar.

Disable weekends

You can disable weekends of every month in a Calendar by using the [renderDayCell](#) event. The `renderDayCell` event offers the following arguments on each day cell creation to help you disable the dates.

View	Description
---	---
date	Defines the current date of the Calendar.
isDisabled	Specifies whether the current date is to be disabled or not.
isOutOfRange	Defines whether the current date is out of range or not.

The following example demonstrates how to disable weekends of every month.

INDEX.TS

```
import { Calendar, RenderDayCellEventArgs } from '@syncfusion/ej2-
calendars';
//Creates a calendar with weekends disabled.
let calendarObject: Calendar = new Calendar({
    renderDayCell: disabledDate,
    value: new Date()
});
calendarObject.appendTo('#element');
function disabledDate(args: RenderDayCellEventArgs): void {
    if (args.date.getDay() === 0 || args.date.getDay() === 6) {
        //Set 'true' to disable the weekends.
        args.isDisabled = true;
    }
}
```

INDEX.HTML

```

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <!--element which is going to render the Calendar-->
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Day cell format

You can also highlight specific dates by adding custom CSS or element to the day cell by using the [renderDayCell](#) event.

You can customize the appearance of the Calendar by overriding the existing styles. The following list of CSS class names are used to customize the Calendar component.

Class Name	Description
--- ---	
e-calendar	Applied to the Calendar.
e-header	Applied to the header.
e-title	Applied to the title.
e-icon-container	Applied to the previous and next icon container.
e-prev	Applied to the previous icon.
e-next	Applied to the next icon.
e-weekend	Applied to weekends.
e-other-month	Applied to days of other months.
e-day	Applied to each day cell.
e-selected	Applied to the selected dates.
e-disabled	Applied to the disabled dates.

The following example highlights the World Health Day (every 7th April) and World Forest Day (every 21st March) by using the custom icon and ToolTip.

INDEX.TS

```

import { Calendar, RenderDayCellEventArgs } from '@syncfusion/ej2-
calendars';

```

```
//Creates a Calendar with World Health Day and World Forest Day highlighted.
let calendarObject: Calendar = new Calendar({
    renderDayCell: customDates,
    value: new Date('03/10/2017')
});
calendarObject.appendTo('#element');
function customDates(args: RenderDayCellEventArgs): void {
    let span: HTMLElement;
    //Defines the custom HTML element to be added.
    span = document.createElement('span');
    //Uses "e-icons" class name to load Essential JS 2 built-in icons.
    span.setAttribute('class', 'e-icons highlight-day');
    if (+args.date.getDate() === 7 && +args.date.getMonth() == 3) {
        //Appends the span element to day cell.
        args.element.appendChild(span);
        //Sets the custom tooltip to the special dates.
        args.element.setAttribute('title', 'World health day!');
        //Uses "special" class name to highlight special dates that you can
        refer in "styles.css".
        args.element.className = 'special';
    }
    if (+args.date.getDate() === 21 && +args.date.getMonth() == 2) {
        args.element.appendChild(span);
        args.element.className = 'special';
        //Sets the custom tooltip to the special dates.
        args.element.setAttribute('title', 'World forest day!');
    }
}
}
```

```

Highlight weekends

You can highlight the weekends of every month in a Calendar by using the [renderDayCell](#) event. The following example demonstrates how to highlight the weekends of every month.

INDEX.TS

```

import { Calendar, RenderDayCellEventArgs } from '@syncfusion/ej2-
calendars';
//Creates a calendar with weekends highlighted.
let calendarObject: Calendar = new Calendar({
    renderDayCell: highlightDate,
    value: new Date()
});
calendarObject.appendTo('#element');
function highlightDate(args: RenderDayCellEventArgs): void {
    if (args.date.getDay() === 0 || args.date.getDay() === 6) {
        // To highlight the week end of every month
        args.element.classList.add('e-highlightweekend');
    }
}

```

INDEX.HTML

Calendar views in EJ2 JavaScript Calendar control

The Calendar has the following predefined views that provide a flexible way to navigate back and forth when selecting dates.

| View | Description |

| --- | --- |

| month (default) | Displays the days in a month. |

| year | Displays the months in a year. |

| decade | Displays the years in a decade. |

When view is defined to the [start](#) property of the Calendar, it allows you to set the initial view on rendering.

The following example demonstrates how to set the **year** as the start view of the Calendar.

INDEX.TS

```
import { Calendar, ChangedEventArgs } from '@syncfusion/ej2-calendars';
//creates a calendar with year view.
let calendarObject: Calendar = new Calendar({
    //sets the start view.
    start: "Year",
    //sets the value.
    value: new Date()
});
calendarObject.appendTo('#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2 Calendar control</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <!--element which is going to render the Calendar-->
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

View restriction

Calendar view navigation can be restricted by defining the [start](#) and [depth](#) property that allows you to select the date from that view.

By defining the start and depth property with the different view, drill-down and drill-up views navigation can be limited to the user. Calendar views will be drill-down up to the view which is set in **depth** property and drill-up up to the view which is set in **start** property.

The following example displays the Calendar in **decade** view, and allows you to select a date in **month** view.

Depth view should always be smaller than the start view. If the views are the same, then the Calendar view remains unchanged.

INDEX.TS

```
import { Calendar, ChangedEventArgs } from '@syncfusion/ej2-calendars';
```

```
//creates a calendar with decade view and navigates up to year view.
let calendarObject: Calendar = new Calendar({
    //sets the start view.
    start: "Decade",
    //sets the depth view.
    depth: "Year"
});
calendarObject.appendTo('#element');
```

Accessibility in EJ2 JavaScript Calendar control

The Calendar component followed the accessibility guidelines and standards, including [ADA, Section 508](#), [WCAG 2.2](#) standards, and [WCAG roles](#) that are commonly used to evaluate accessibility.

The accessibility compliance for the Calendar component is outlined below.

| Accessibility Criteria | Compatibility |

```

| -- | -- |
| WCAG 2.2 Support |  |
| Section 508 Support |  |
| Screen Reader Support |  |
| Right-To-Left Support |  |
| Color Contrast |  |
| Mobile Device Support |  |
| Keyboard Navigation Support |  |
| Accessibility Checker Validation |  |
| Axe-core Accessibility Validation |  |
<style>
.post .post-content img {
display: inline-block;
margin: 0.5em 0;
}
</style>
<div> - All
features of the component meet the requirement.</div>
<div> - Some features of the component do not meet the requirement.</div>
<div> - The
component does not meet the requirement.</div>

```

WAI-ARIA attributes

The web accessibility makes web content and web applications more accessible for disabled people. It especially helps in dynamic content change and development of advanced user interface controls with AJAX, HTML, JavaScript, and related technologies.

Calendar provides built-in compliance with [WAI-ARIA](#) specifications. WAI-ARIA support is achieved through attributes like `aria-label`, `aria-selected`, `aria-disabled`, and `aria-activedescendant` applied for navigation buttons, disable and active day cells.

It helps disabled persons by providing the information about the widget for assistive technology in the screen readers. Calendar component contains grid role and grid cell for each day cell.

- **Aria-label:** This attribute provides text labels for an object for the previous and next month's elements. It helps the screen reader object to read.
- **Aria-selected:** Indicates the currently selected date of the Calendar component.
- **Aria-disabled:** Indicates the disabled state of the Calendar component.
- **Aria-activedescendent:** Helps in managing the current active child of the Calendar component.
- **Role:** Gives information to assistive technologies about how to handle each element in a widget.
- **Grid-cell:** Defines the individual cell that can be focused and selected.

Keyboard interaction

You can use the following keys to interact with the Calendar. This component implements keyboard navigation support by following the [WAI-ARIA practices](#).

It supports the following list of shortcut keys:

| **Press** | **To do this** |

| --- | --- |

| **Upper Arrow** | **Focuses the same day of the previous week.** |

| **Down Arrow** | **Focuses the same day of the next week.** |

| **Left Arrow** | **Focuses the day before.** |

| **Right Arrow** | **Focuses the next day.** |

| **Home** | **Focuses the first day of the month.** |

| **End** | **Focuses the last day of the month.** |

| **Page Up** | **Focuses the same date of the previous month.** |

| **Page Down** | **Focuses the same date of the next month.** |

| **Enter** | **Selects the currently focused date.** |

| **Shift + Page Up** | **Focuses the same date for the previous year.** |

| **Shift + Page Down** | **Focuses the same date for the next year.** |

| **Control + Upper Arrow** | **Moves to the inner level of view like month to year and year to decade.** |

| **Control + Down Arrow** | **Moves out from the depth level view like decade to year and year to month.** |

| **Control + Home** | **Focuses the first date of the current year.** |

| **Control + End** | **Focuses the last date of the current year.** |

To focus the Calendar component, use **alt+t** keys.

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';
```

```
// creates a Calendar component.
let calendarObj: Calendar = new Calendar();
calendarObj.appendTo('#element');
document.onkeyup = function (e) {
    if (e.altKey && e.keyCode === 84) {
        // press alt+t to focus the control.
        (<HTMLElement>calendarObj.element.querySelectorAll('.e-content
table')[0]).focus();
    }
};
```

Ensuring accessibility

The Calendar component's accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Calendar component is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Calendar component with accessibility tools.

[Islamic calendar in EJ2 JavaScript Calendar control](#)

In addition to the Gregorian calendar, the calendar control supports displaying the Islamic calendar (Hijri calendar). **Islamic calendar** or **Hijri calendar** is a **lunar calendar** consisting of 12 months in a year of 354 or 355 days. To know more about Islamic calendar, please refer this [wikipedia](#).

Also, it consists of all Gregorian calendar functionalities as like min and max date, week number, start day of the week, multi selection, enable RTL, start and depth view, localization, highlight and customize the specific dates.

By default, calendar mode is in **Gregorian**. You can enable the Islamic mode by setting the **calendarMode** as **Islamic**. Also, need to import and injecting the **Islamic** module from **ej2-calendars** as shown below.

```
import { Islamic, Calendar } from '@syncfusion/ej2-calendars';\n\nCalendar.Inject(Islamic);
```

The following example demonstrates how to display the Islamic Calendar (Hijri Calendar).

INDEX.TS

```
import { Calendar, Islamic, RenderDayCellEventArgs } from '@syncfusion/ej2-calendars';
import { addClass } from '@syncfusion/ej2-base';
// 'Islamic' module injection
Calendar.Inject(Islamic);
//creates a calendar with islamic mode.
let calendarObject: Calendar = new Calendar({
    // To display the Islamic calendar
    calendarMode: 'Islamic',
    renderDayCell: customDates
});
calendarObject.appendTo('#element');
function customDates(args: RenderDayCellEventArgs): void {
    /*Date need to be disabled*/
    if ( args.date.getDate() === 12 || args.date.getDate() === 17 ||
args.date.getDate() === 28) {
        args.isDisabled = true;
    }
    /*Dates need to be customized*/
    if (args.date.getDate() === 13) {
        let span: HTMLElement;
        span = document.createElement('span');
        args.element.children[0].className += 'e-day sf-icon-cup highlight';
        addClass([args.element], ['special', 'e-day', 'dinner']);
        args.element.setAttribute('data-val', 'Dinner !');
        args.element.appendChild(span);
    }
    if (args.date.getDate() === 23) {
```

```

let span: HTMLElement;
span = document.createElement('span');
args.element.children[0].className += 'e-day sf-icon-start highlight';
span.setAttribute('class', 'sx !');
//use the imported method to add the multiple classes to the given
element
addClass([args.element], ['special', 'e-day', 'holiday']);
args.element.setAttribute('data-val', ' Holiday !');
args.element.appendChild(span);
}
}

```

Style appearance in EJ2 JavaScript Calendar control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on the user preference.

Customizing the background color for the Calendar

Use the following CSS to customize the background color and border for the Calendar.

,

/ To specify background color and border /

```
.e-calendar {  
background-color: peachpuff;  
border: 3px solid red;  
}
```

,

Customizing the Calendar date elements on hovering

Use the following CSS to customize the date elements on hovering in the Calendar.

,

/ To specify background color, color, and border /

```
.e-calendar .e-content td:hover span.e-day, .e-calendar .e-content td:focus span.e-day, .e-bigger.e-small  
.e-calendar .e-content td:hover span.e-day, .e-bigger.e-small .e-calendar .e-content td:focus span.e-day  
{  
background-color: red;  
border: 2px solid;  
color: #212529;  
}
```

,

Customizing the border of date cell grid

Use the following CSS to add the border to the date cell grid.

,

/ To specify border /

```
.e-calendar .e-content span.e-day, .e-bigger.e-small .e-calendar .e-content span.e-day {  
border: 1px solid;  
}
```

,

Customizing the Calendar title

Use the following CSS to customize the Calendar title.

,

/ To specify color and font size /

```
.e-calendar .e-header .e-title, .e-bigger.e-small .e-calendar .e-header .e-title {  
color: black;
```

```
font-size: 20px;
```

```
}
```

```
,
```

[Customizing the previous and next icon](#)

Use the following CSS to customize the previous and next icon.

```
,
```

/ To specify color and border /

```
.e-calendar .e-header span, .e-bigger.e-small .e-calendar .e-header span {
```

```
border: 1px solid;
```

```
color: chocolate;
```

```
}
```

```
,
```

[Customizing the footer button](#)

Use the following CSS to customize the footer button.

```
,
```

/ To specify background color, color, and border-color /

```
.e-calendar .e-btn.e-today.e-flat.e-primary, .e-calendar .e-css.e-btn.e-today.e-flat.e-primary {
```

```
background-color: red;
```

```
border-color: black;
```

```
color: black;
```

```
}
```

```
,
```

[Customizing the selected date cell grid](#)

Use the following CSS to customize the selected date cell grid in Calendar.

```
,
```

/ To specify background color and color /

```
.e-calendar .e-content td.e-focused-date.e-today span.e-day {
```

```
background-color: maroon;
```

```
color: #fff;
```

```
}
```

```
,
```

[Customizing the content header in Calendar](#)

Use the following CSS to customize the content header in Calendar.

```
,
```

/ To specify background /

```
.e-calendar .e-content thead, .e-bigger.e-small .e-calendar .e-content thead {
background: aquamarine;
}
`
```

How To

Set clear button in calendar in EJ2 JavaScript Calendar control

To configure **clear** button in Calendar UI, do the following:

1. To the [created](#) event of the Calendar, add the required elements to make clear button visible. In the following example, Essential JS 2 button component within **div** element is used.
2. When the **e-footer** class is used, the div tag acts as the footer.
3. Using these button, selected date can be cleared.
4. Bind the required event handler to the button tags to update the value.

Code example is as follows:

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';
// creates a Calendar with today and clear buttons.
let calendarObject: Calendar = new Calendar({
    created: onCreate
});
calendarObject.appendTo('#element');
function onCreate() {
    //creates the custom element for clear button.
    let clearBtn: HTMLElement = document.createElement('button');
    let footerElement: HTMLElement = document.getElementsByClassName('e-
footer-container')[0];
    clearBtn.className = 'e-btn e-clear e-flat';
    clearBtn.textContent = 'Clear';
    footerElement.prepend(clearBtn);
    this.element.appendChild(footerElement);
}
// custom click handler to update the value property with current date
object.
document.querySelector('.e-footer-container .e-
clear').addEventListener('click', function () {
    calendarObject.value = new Date();
    calendarObject.dataBind();
});
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>Essential JS 2 Calendar control</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Show dates of other months in EJ2 JavaScript Calendar control

The following example demonstrates how to show dates of other months.

Using the styles below, you can bring the dates of other months to visibility from its hidden state.

```

.
.e-calendar .e-content tr.e-month-hide,
.e-calendar .e-content td.e-other-month>span.e-day {
display: block;
}
.e-calendar .e-content td.e-month-hide,
.e-calendar .e-content td.e-other-month {
pointer-events: auto;
touch-action: auto;
}
.

```

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';  
//creates a calendar with dates of other months shown.  
let calendarObject: Calendar = new Calendar({  
});  
calendarObject.appendTo('#element');
```

```

```
</body></html>
```

Select a sequence of dates in calendar in EJ2 JavaScript Calendar control

The following example demonstrates how to select the week dates of chosen date in the Calendar using [values](#) property, when [multiSelection](#) property is enabled. Methods of Moment.js is used in this sample for calculating the start and end of week from the selected date.

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';
import moment from "moment";
/*Initialize the calendar component*/
let calendar: Calendar = new Calendar({
    isMultiSelection: true,
    change: onChange
});
calendar.appendTo('#calendar');
/*selected current week dates when click the button*/
document.getElementById('workweek').addEventListener('click', function () {
    if (calendar.element.classList.contains('week')) {
        calendar.element.classList.remove('week')
    }
    calendar.element.classList.add('workweek');
});
/*selected current week dates when click the button*/
document.getElementById('week').addEventListener('click', function () {
    if (calendar.element.classList.contains('workweek')) {
        calendar.element.classList.remove('workweek')
    }
    calendar.element.classList.add('week');
});
function onChange(args: ChangedEventArgs) {
    let startOfWeek: any = moment(calendar.value).startOf('week');
    let endOfWeek: any = moment(calendar.value).endOf('week');
    if (calendar.element.classList.contains('workweek')) {
        getWeekArray(startOfWeek.day(1), endOfWeek.day(5));
    } else if (calendar.element.classList.contains("week")) {
        getWeekArray(startOfWeek, endOfWeek);
    }
}
function getWeekArray(startOfWeek: any, endOfWeek: any): void {
    let days: Date[] = [];
    let day: any = startOfWeek;
    while (day <= endOfWeek) {
        days.push(day.toDate());
        day = day.clone().add(1, 'd');
    }
    calendar.values = days;
}

Skip a month in calendar in EJ2 JavaScript Calendar control

The following example demonstrates how to skip a month in the Calendar while clicking the previous and next icons. In the example below, the [navigated](#) event is used to skip a month with [navigateTo](#) method.

INDEX.TS

```

import { Calendar, NavigatedEventArgs } from '@syncfusion/ej2-calendars';
//Creates a calendar component.
let calendarObject: Calendar = new Calendar({ navigated: onNavigate });
calendarObject.appendTo('#element');
//Skips a month while clicking previous and next icons in month view.
function onNavigate(args: NavigatedEventArgs) {

```

```

    let date: Date;
    if ((<HTMLElement>args.event.currentTarget).classList.contains('e-
next')) {
        //Increments the month while clicking the next icon.
        date = new Date(args.date.setMonth(args.date.getMonth() + 1));
    }
    if ((<HTMLElement>args.event.currentTarget).classList.contains('e-
prev')) {
        //Decrements the month while clicking the previous icon.
        date = new Date(args.date.setMonth(args.date.getMonth() - 1));
    }
    if (args.view == 'month') {+
        calendarObject.navigateTo('month', date);
    }
}

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Change the first day of week in EJ2 JavaScript Calendar control

The Calendar provides an option to change the first day of the week by using the [firstDayOfWeek](#) property. Generally, the day of the week starts from 0 (Sunday) and ends with 6 (Saturday).

By default, the first day of the week is culture specific.

The following example shows the Calendar with **Tuesday** as the first day of the week.

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';
//creates a calendar with Tuesday as the first day of the week.
let calendarObject: Calendar = new Calendar({
    //sets the first day of the week.
    firstDayOfWeek: 2
});
calendarObject.appendTo('#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

<body>

  <div id="container">
    <!--element which is going to render the Calendar-->
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customize the calendar day header in EJ2 JavaScript Calendar control

You can change the format of the day that to be displayed in header using [dayHeaderFormat](#) property. By default, the format is **Short**.

You can find the possible formats on below.

Name	Description
Short	Sets the short format of day name (like Su) in day header.
Narrow	Sets the single character of day name (like S) in day header.
Abbreviated	Sets the min format of day name (like Sun) in day header.
Wide	Sets the long format of day name (like Sunday) in day header.

INDEX.TS

```
import { Calendar } from '@syncfusion/ej2-calendars';
import { DropDownList } from '@syncfusion/ej2-dropdowns';
let calendarObject: Calendar = new Calendar({
    dayHeaderFormat: "Short"
});
calendarObject.appendTo('#element');
let formatLabel: DropDownList = new DropDownList({
    // set the height of the popup element
    popupHeight: '200px',
    // bind the change event
    change: (args: any) => {
        calendarObject.dayHeaderFormat = args.value;
    }
});
formatLabel.appendTo('#select');
```

```

Card

Getting started in EJ2 JavaScript Card control

The Essential JS 2 for JavaScript (global script) is an ES5 formatted pure JavaScript framework that can be directly used in latest web browsers.

Component initialization

The Essential JS 2 JavaScript components can be initialized by using any of the following two ways:

- Using local script and style references in an HTML page.
- Using CDN link for script and style reference.

Using local script and style references in an HTML page

Step 1: Create an app folder `myapp` for Essential JS 2 JavaScript components.

Step 2: You can get the global scripts and styles from the [Essential Studio JavaScript \(Essential JS 2\)](#) build installed location.

Syntax:

Script: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/dist/global/{PACKAGE_NAME}.min.js**

Styles: **(installed location)/Syncfusion/Essential Studio/{RELEASEVERSION}/Essential JS 2/{PACKAGENAME}/styles/material.css**

Example:

Script: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.17/Essential JS 2/ej2-lists/dist/global/ej2-lists.min.js

Styles: C:/Program Files (x86)/Syncfusion/Essential Studio/15.4.17/Essential JS 2/ej2-layouts/styles/material.css

Step 3: Create a folder **myapp/resources**, and copy and paste the global scripts and styles from the above installed location to **myapp/resources** location.

Step 4: Create an HTML page (index.html) in **myapp** location and add the Essentials JS 2 script and style references.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
</head>
<body>
</body>
</html>
`
```

Step 5: Now, create a **span** element to apply the **Essential JS 2 Card** component in the **index.html** by using following code.

```
`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
```

```

<!-- Essential JS 2 material theme -->
<link href="resources/material.css" rel="stylesheet" type="text/css"/>
</head>
<body>
<!-- Add the HTML <span> element -->
<span class='e-card'></span>
</body>
</html>
`

```

Step 6: Now, open the `index.html` in web browser, it will render the **Essential JS 2 Card** component.

Using CDN link for script and style reference

Step 1: Create an app folder `myapp` for the Essential JS 2 JavaScript components.

Step 2: The Essential JS 2 component's global scripts and styles are already hosted in the following CDN link formats.

Syntax:

Script: `https://cdn.syncfusion.com/ej2/{PACKAGENAME}/dist/global/{PACKAGENAME}.min.js`

Styles: `https://cdn.syncfusion.com/ej2/{PACKAGE_NAME}/styles/material.css`

Example:

Styles: <https://cdn.syncfusion.com/ej2/ej2-layouts/styles/material.css>

Step 3: Create an HTML page (`index.html`) in `myapp` location and add the CDN link references. Now, add the `span` element and initiate the `Essential JS 2 Card` component in the `index.html` by using the following code.

```

`html
<!DOCTYPE html>
<html xmlns="http://www.w3.org/1999/xhtml">
<head>
<title>Essential JS 2</title>
<!-- Essential JS 2 material theme -->
<link href="https://cdn.syncfusion.com/ej2/ej2-base/styles/material.css" rel="stylesheet"
type="text/css"/>
<link href="https://cdn.syncfusion.com/ej2/ej2-layouts/styles/material.css" rel="stylesheet"
type="text/css"/>
</head>

```

```

<body>
<!-- Add the HTML <span> element -->
<span class='e-card'>This is simple Card</span>
</body>
</html>
`

```

Step 4: Now, open the `index.html` in the web browser, it will render the **Essential JS 2 Card** component.

Need to refer dependency component styles and scripts as like above example. We can also use [CRG](#) to generate combined component styles.

Adding a header and content

You can create Card with a header in a specific structure. For adding header you need to create a `div` element with `e-card-header` class added.

- You can include heading inside the Card header by adding a `div` element with `e-card-header-caption` class, and also content will be added by adding element with `e-card-content`. For detailed information, refer to the [Header and Content](#).

```

<div class = "e-card">           --> Root Element
<div class="e-card-header">      --> Root Header Element
<div class="e-card-header-caption"> --> Root Heading Element
<div class="e-card-header-title"></div> --> Heading Title Element
</div>
<div class="e-card-content"></div> --> Card content Element
</div>
</div>
`

```

- Now, open the html file in the web browser, it will render the **Card** component with header and content.

Output will be as follows:

INDEX.HTML

```

<html><head><script
src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>

```

```
</head><body><script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

- [How to add a header and content](#)

Header content in EJ2 JavaScript Card control

Header

The Card can be created with header title, sub title and images. For adding header you need to create `div` element with the class `e-card-header` added.

Card provides below elements and corresponding class definitions to include header.

Elements | Description

`e-card-header-caption` | To group the title and subtitle within the header which acts as wrapper.

`e-card-header-title` | Main title text with in the header.

`e-card-sub-title` | A sub-title within the header.

`e-card-header-image` | To include heading image within the header.

`e-card-corner` | To add rounded corner for the image.

Title and Subtitle

For adding header to the Card , you need to create wrapper `div` element with `e-card-header-caption` class.

- Place the `div` element with `e-card-header-title` class inside the header caption for adding main title.
- Place the `div` element with `e-card-sub-title` class inside the header caption element for adding sub-title.

Image

Card header has an option for adding images in the header. It is aligned with either before or after the header based on the HTML element positioned in the header structure.

- The header image can be added by creating a `div` element with `e-card-header-image` class which can be placed before or after the header caption wrapper element.

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Content

Content in Card holds texts, images, links and all possible HTML elements. Its adaptable within the Card root element.

- Create a `div` element with the class `e-card-content`.
- Place content `div` element in the Card root element or within any Card inner elements.

Card image in EJ2 JavaScript Card control

Images

The Card supports to include images within the elements, you can add image as direct element anywhere inside card root by adding the `e-card-image` class to `div` element. Using the class defined, you can write CSS styles to load images to that element.

By default, card images occupies full width of its parent element.

```
<div class = "e-card">
<div class="e-card-image">
</div>
</div>
```

Title

Card image is supported to include a title or caption for the image. By default, Title is placed over the image on left-bottom position with overlay.

```
<div class = "e-card">
<div class="e-card-image">
<div class="e-card-title"></div>
</div>
</div>
```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Divider

Divider used to separate the elements inside the card. You can add divider inside the card elements to separate it.

- Place the `div` element with `e-card-separator` class inside the card element for adding a divider.

Action buttons in EJ2 JavaScript Card control

You can include Action buttons within the Card and customize them. Action button is a `div` element with `e-card-actions` class followed by button tag or anchor tag within the card root element.

- For adding action buttons you can create button or anchor tag with `e-card-btn` class within the card action element.

```

,
<div class = "e-card">
<div class="e-card-actions">
<button class="e-card-btn"></button>
<a href="#"></a>
</div>
</div>
,

```

Vertical

By default, action buttons positioned in horizontal alignment , and also it can be aligned to show in vertical alignment by adding `e-card-vertical` class.

```

,
<div class = "e-card">
<div class="e-card-actions e-card-vertical">
<button class="e-card-btn">More</button>
<a href="#">Share</a>
</div>
</div>
,

```

Horizontal in EJ2 JavaScript Card control

By default, all the card elements are aligned vertically one after the other as in the DOM. You can achieve the element to align horizontally as well by adding the class `e-card-horizontal` in the root card element.

Stacked cards

- An horizontally aligned card can push a specific column to align vertical using `e-card-stacked` class. This will align the stacked section vertically aligned differentiating from horizontal layout.

Class | Description

`e-card-horizontal` | To align card elements horizontally.

`e-card-stacked` | To align elements vertically within the horizontal layout.

,

```
<div tabindex="0" class="e-card e-card-horizontal">
 --> Aligned in horizontal
<div class="e-card-stacked">    --> Aligned in horizontal
// Inside the element all are aligned vertical directions
</div>
</div>
,
```

Style in EJ2 JavaScript Card control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

Customizing the card

Use the following CSS to customize the card properties.

```

.e-card {
background-color: aqua;
padding-left: 20px;
margin-bottom: 20px;
}

```

`

Customizing the Header element

Use the following CSS to customize the Header element properties.

`

```
.e-card .e-card-header {  
font-family: cursive;  
font-style: italic;  
}
```

`

Customizing the card content

Use the following CSS to customize the card content properties.

`

```
.e-card .e-card-content {  
font-size: 20px;  
color: gray;  
line-height: initial;  
font-weight: normal;  
}
```

`

Divider used to separate the elements inside the card

Use the following CSS to customize the Divider used to separate the elements inside the card properties.

`

```
.e-card .e-card-separator {  
padding-bottom: 30px;  
}
```

`

Including image within card element

Use the following CSS to Include image within card element.

`

```
.e-card .e-card-image {  
background-image: url(images.png);  
background-color: yellow;  
height: 160px;  
}
```

`

Including a title or caption for the image

Use the following CSS to Include a title or caption for the image.

`

```
.e-card .e-card-image .e-card-title {  
font-family: cursive;  
font-style: italic;  
}
```

`

To include heading image within the header

Use the following CSS to Include heading image within the header.

`

```
.e-card .e-card-header .e-card-header-image {  
height: 48px;  
width: 48px;  
}
```

`

Customizing the Header main title

Use the following CSS to Customize the Header main title.

`

```
.e-card .e-card-header .e-card-header-caption .e-card-header-title {  
font-size: large;  
color: aquamarine;  
}
```

`

Customizing the Header subtitle

Use the following CSS to Customize the Header subtitle.

`

```
.e-card .e-card-header .e-card-header-caption .e-card-sub-title {  
font-size: 20px;  
font-variant: all-petite-caps;  
}
```

`

Including action buttons or anchor tags

Use the following CSS to Include action buttons or anchor tags.

```
,  
  
.e-card .e-card-actions .e-card-btn {  
padding-left: 20px;  
background-color: wheat;  
}  
,
```

To align card elements horizontally

Use the following CSS to align card elements horizontally.

```
,  
  
.e-card .e-card-horizontal {  
margin: auto;  
width: inherit;  
}  
,
```

To align elements vertically within the horizontal layout

Use the following CSS to align elements vertically within the horizontal layout.

```
,  
  
.e-card .e-card-horizontal .e-card-stacked {  
justify-content: flex-start;  
margin: initial;  
}  
,
```

How To

Customize the card image title position in EJ2 JavaScript Card control

Card Image titles are placed as always Bottom-Left Corner only, You can manually customize to placing titles anywhere over the image by adding styles.

    <script src="index.js" type="text/javascript"></script>
  </body></html>

```

INDEX.TS

```

import { DropDownList } from '@syncfusion/ej2-dropdowns';
// initialize DropDownList component
let dropDownListObject: DropDownList = new DropDownList({
  placeholder:"Select Position",
  change: changed,

});
// render initialized DropDownList
dropDownListObject.appendTo('#title_position');

```

```
function changed(e) {
    let cardEle = document.querySelector('.e-card');
    let titleEle = cardEle.querySelector('.e-card-image .e-card-title');
    titleEle.className = '';
    titleEle.classList.add('e-card-title');
    titleEle.classList.add('e-card-' + e.value);
}
```

Integrate other component inside the card in EJ2 JavaScript Card control

You can integrate any component inside the card element. Here ListView component is placed inside the card for showcasing the To-Do list.

```

Carousel

Populating items in EJ2 JavaScript Carousel control

In the Carousel, slides can be rendered in two ways as follows,

- Populating items using carousel item
- Populating items using data source

Populating items using carousel item

When rendering the Carousel component using items binding, you can assign templates for each item separately or assign a common template to each item. You can also customize the slide transition interval for each item separately. The following example code depicts the functionality as item property binding.

INDEX.TS

```
import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
  items: [
    { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
  ]
});
carouselObj.appendTo("#carousel");
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,
user-scalable=no">
  <meta name="description" content="Essential JS 2">
  <meta name="author" content="Syncfusion">
```

```

<link
href="https://cdn.jsdelivr.net/npm/bootstrap@5.1.3/dist/css/bootstrap.min.cs
s" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
base/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
buttons/styles/material.css" rel="stylesheet">
  <link href="https://cdn.syncfusion.com/ej2/24.1.41/ej2-
navigations/styles/material.css" rel="stylesheet">
  <!--style reference from app-->
  <link href="styles.css" rel="stylesheet">
  <!--system js reference and configuration-->

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div class="control-section">
      <div class="control-container">
        <div id="carousel"></div>
      </div>
    </div>
  </div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Populating items using data source

When rendering the Carousel component using data binding, you can assign a common template only for all items using the `itemTemplate` property. You cannot set the interval for each item. The following example code depicts the functionality as data binding.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
(window as TemplateFunction).getImage = (bird: string) => {
  return `https://ej2.syncfusion.com/products/images/carousel/${bird}.png`;
};
interface TemplateFunction extends Window {
  getImage?: Function;
}
const productItems: Record<string, string | number>[] = [
  { ID: 1, Name: "Cardinal", imageName: 'cardinal' },
  { ID: 2, Name: "Kingfisher", imageName: 'hunei' },
  { ID: 3, Name: "Keel-billed-toucan", imageName: 'costa-rica' },
  { ID: 4, Name: "Yellow-warbler", imageName: 'kaohsiung' },

```

```

    { ID: 5, Name: "Bee-eater", imageName: 'bee-eater' }
  ];
  const carouselObj: Carousel = new Carousel({
    dataSource: productItems,
    itemTemplate: '<figure class="img-container"><figcaption class="img-
caption">${Name}</figcaption></figure>'
  });
  carouselObj.appendTo("#carousel");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0,

  <div id="container">
    <div class="control-section">
      <div class="control-container">
        <div id="carousel"></div>
      </div>
    </div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Selection

The Carousel items will be populated from the first index of the Carousel items and can be customized using the following ways,

- Select an item using the property.
- Select an item using the method.

Select an item using the property

Using the [selectedIndex](#) property of the Carousel component, you can set the slide to be populated at the time of initial rendering else you can switch to the particular slide item.

INDEX.TS

```
import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
  items: [
    { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },

```

Partial visible slides

The Carousel component supports to show one complete slide and a partial view of adjacent (previous and next) slides at the same time. You can enable or disable the partial slides using the [partialVisible](#) property.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    partialVisible: true,
    items: [
        { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
    ]
});
carouselObj.appendTo("#carousel");

```

```

Slide animation only applicable if the **partialVisible** is enabled.

The last slide will be displayed as a partial slide at the initial rendering when the [loop](#) and [partialVisible](#) properties are enabled.

The previous slide is not displayed at the initial rendering when the **loop** is disabled.

The following example code depicts the functionality of **partialVisible** and without **loop** functionalities.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    partialVisible: true,
    loop: false,
    items: [

```

```

Navigators and indicators in EJ2 JavaScript Carousel control

The navigators and indicators are used to transition the slides manually.

Navigators

Show or hide previous and next button

In navigators, the previous and next slide transition buttons are used to perform slide transitions manually. You can show/hide the navigators using the [buttonsVisibility](#) property. The possible property values are as follows:

- **Hidden** – the navigator's buttons are not visible.
- **Visible** – the navigator's buttons are visible.
- **VisibleOnHover** – the navigator's buttons are visible only when hovering over the carousel.

The following example depicts the code to show/hide the navigators in the carousel.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    items: [
        { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
        { template: '<figure class="img-container"><img

            <div id="next"></div>
            <div class="control-container">
                <div id="carousel"></div>
            </div>
        </div>
    </div>

```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Showing preview of slide in indicator

You can customize the indicators by showing the preview image of each slide using the [indicatorTemplate](#) property. The following example depicts the code for showing the preview image using a template for indicators in the carousel.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
(window as TemplateFunction).getContent = (index: number) => {
    const slides: string[] = ["Slide 1", "Slide 2", "Slide 3", "Slide 4",
    "Slide 5"];
    return slides[index];
};
interface TemplateFunction extends Window {
    getContent?: Function;
}
const carouselObj: Carousel = new Carousel({
    items: [
        { template: '<div class="slide-content">Slide 1</div>' },
        { template: '<div class="slide-content">Slide 2</div>' },
        { template: '<div class="slide-content">Slide 3</div>' },
        { template: '<div class="slide-content">Slide 4</div>' },
        { template: '<div class="slide-content">Slide 5</div>' },
    ],
    indicatorsTemplate: "#indicatorTemplate",
});
carouselObj.appendTo("#carousel");

```

INDEX.HTML

```

```

Indicators Types

Choose different types of indicators available using the [indicatorsType](#) property. The indicator types are categorized as follows:

- [Default Indicator](#)
- [Dynamic Indicator](#)
- [Fraction Indicator](#)
- [Progress Indicator](#)

Default Indicator

A default indicator in a carousel is a set of dots that indicate the current position of the slide in the carousel. The Default indicator can be achieved by setting the [indicatorsType](#) to **Default**.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({

```

```

items: [
  { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
  { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
  { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
  { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
  { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
],
indicatorsType: "Default",
});
carouselObj.appendTo("#carousel");

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Play button

Show or hide the play button

In the carousel, [autoPlay](#) actions have been controlled by using the [showPlayButton](#) property in the user interface. When you enable this property, the slide transitions are controlled using this play and pause button. The following example depicts the code to show the play button in the carousel.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    items: [
        { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
        { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },

```

```

    { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
  ],
  showPlayButton: true,
});
carouselObj.appendTo("#carousel");

```

Animations and transitions in EJ2 JavaScript Carousel control

Animations

Fade animation

In Carousel, two built-in animations are provided for slide transitions. You can disable animation using the [animationEffect](#) property. By default, Slide animation is applied for the transition between slides.

The following demo depicts the example for fade animation,

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({

```

```

    items: [
      { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
      { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
      { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
      { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
      { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
    ],
    animationEffect: "Fade",
  },
});
carouselObj.appendTo("#carousel");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>Essential JS 2</title>
  <meta charset="utf-8">

</head>
<body>

```

```

    <div id="container">
      <div class="control-section">
        <div class="control-container">
          <div id="carousel"></div>
        </div>
      </div>
    </div>
</div>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Custom animation

In Carousel, you can use customized animation effects for slide transitions using the [Custom](#) option of the [animationEffect](#) property and apply custom animation css via [cssClass](#) property.

The following demo depicts the example for **parallax** custom animation,

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
  items: [
    { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
  ],
  cssClass: 'parallax',
  animationEffect: 'Custom'
});
carouselObj.appendTo("#carousel");

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Intervals between slides

Using the items property, you can set different intervals for each item to transition between slides. The default interval is 5000 ms (5 seconds). The following example depicts the code for setting the different intervals between each item.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
  items: [
    { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>', interval: 3000 },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>', interval: 1000 },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>', interval:
2000 },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>', interval: 5000 },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>', interval: 6000 }
  ]
});
carouselObj.appendTo("#carousel");

```

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: Interval property can accept value in terms of milliseconds.

Auto play slides

In the carousel, all slides transitions are performed continuously after the specified or default intervals. You can enable or disable the auto slide transition using the [autoPlay](#) property. The following example depicts the code to enable or disable the auto slide transitions.

INDEX.TS

```

import { Carousel } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    items: [
        { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },

```

Slide changing events

Using the [slideChanging](#) or [slideChanged](#) events of the Carousel component, you can perform sample end customization while the carousel items are switched.

The following demo depicts the example for carousel events,

INDEX.TS

```

import { Carousel, SlideChangedEventArgs, SlideChangingEventArgs } from
"@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
    items: [
        { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },

```

```

    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Keel-billed-toucan</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption
class="img-caption">Yellow-warbler</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Bee-eater</figcaption></figure>' }
  ],
  slideChanging: function (args: SlideChangingEventArgs) {
    console.log(args.currentSlide); // You can customize the slide before
changing.
  },
  slideChanged: function (args: SlideChangedEventArgs) {
    console.log(args.currentSlide); // You can customize the slide after
changed.
  },
});
carouselObj.appendTo("#carousel");

```

<script src="index.js" type="text/javascript"></script>
</body></html>
```

Swipe Modes

In the carousel, the [swipeMode](#) property allows specifying whether the slide transition should occur while performing swiping via touch or mouse. The slide swiping is enabled or disabled using the bitwise operator.

The following are the different swipe modes available in the carousel:

- CarouselSwipeMode.Touch - Allows the user to slide the slides using touch actions.
- CarouselSwipeMode.Mouse - Allows the user to slide the slides using mouse actions.

- CarouselSwipeMode.Touch & CarouselSwipeMode.Mouse - Allows the user to slide the slides using both touch and mouse actions.
- ~CarouselSwipeMode.Touch & ~CarouselSwipeMode.Mouse - Disables both touch and mouse actions.

INDEX.TS

```
import { Carousel, CarouselSwipeMode } from "@syncfusion/ej2-navigations";
const carouselObj: Carousel = new Carousel({
  items: [
    { template: '<figure class="img-container"><figcaption class="img-
caption">Cardinal</figcaption></figure>' },
    { template: '<figure class="img-container"><figcaption class="img-
caption">Kingfisher</figcaption></figure>' },

Accessibility in EJ2 JavaScript Carousel control

The [JavaScript Carousel](#) control has been designed, keeping in mind the [WAI-ARIA](#) specifications, and applying the WAI-ARIA roles, states and properties along with keyboard support for people who use assistive devices. WAI-ARIA accessibility support is achieved through attributes like `aria-roledescription`, `aria-label`, `aria-current`, `aria-live`, `aria-role` and `aria-hidden`. It provides information about elements in a document for assistive technology. The control implements keyboard navigation support by following the [WAI-ARIA practices](#) and has been tested in major screen readers.

The accessibility compliance for the Carousel control is outlined below.

| Accessibility Criteria | Compatibility |

| -- | -- |

| [WCAG 2.2](#) Support | |

| [Section 508](#) Support | |

| Screen Reader Support | |

| Right-To-Left Support | |

| Color Contrast | |

| Mobile Device Support | |

| Keyboard Navigation Support | |

| [Accessibility Checker](#) Validation | |

| [Axe-core](#) Accessibility Validation | |

<style>

.post .post-content img {

display: inline-block;

margin: 0.5em 0;

}

</style>

<div> - All features of the control meet the requirement.</div>

<div> - Some features of the control do not meet the requirement.</div>

<div> - The control does not meet the requirement.</div>

ARIA attributes

The Carousel control is designed by considering [WAI-ARIA](#) standard. Carousel is supported with ARIA Accessibility which is accessible by on-screen readers and other assistive technology devices. The following list of attributes is added to the Carousel.

| Roles and Attributes | Functionalities

|

| ----- | -----
----- |

| aria-roledescription | The role description attribute has been added for the root element (carousel) and each carousel slide item (slide). |

| aria-label | Previous, next and play/pause buttons and all indicator elements.

|

| aria-current | For the active item indicator element, **aria-current** is set to **true**.

|

| aria-hidden | For all carousel elements except the currently visible item, **aria-hidden** is set to **true**. |

| aria-live | For carousel items element, when **autoPlay** is **true**, **aria-live** is set to **off**; when **autoPlay** is **false**, **aria-live** is set to **polite**. |

| aria-role | For carousel slide item, **aria-role** has been grouped.

|

Keyboard interaction

By default, keyboard navigation is enabled. This control implements keyboard navigation support by following the WAI-ARIA practices. Once focused on the active Carousel element, you can use the following key combination for interacting with the Carousel.

Key	Description
Alt + J	Keys to focus the Carousel control (done at application end).
Arrows	Keys to navigate between slides.
Home	To navigate to the first slide.
End	To navigate to the last slide.
Space	To play/pause the slide transitions.
Enter	To perform the respective action on its focus.
Tab	To Move focus through the interactive elements.
Shift + Tab	To Move focus through the interactive elements.

Ensuring accessibility

The Carousel control accessibility levels are ensured through an [accessibility-checker](#) and [axe-core](#) software tools during automated testing.

The accessibility compliance of the Carousel control is shown in the following sample. Open the [sample](#) in a new window to evaluate the accessibility of the Carousel control with accessibility tools.

Styles and appearance in EJ2 JavaScript Carousel control

To modify the Carousel appearance, you need to override the default CSS of Carousel component. Please find the list of CSS classes and its corresponding section in Carousel component. Also, you have an option to create your own custom theme for the controls using our [Theme Studio](#).

CSS Structure in JavaScript Carousel Control

The following content provides the exact CSS structure that can be used to modify the control's appearance based on user preference.

CSS Class | Purpose of Class

.e-carousel .e-carousel-item	To customize the carousel item
.e-carousel-item.e-active	To customize the active carousel item
.e-carousel .e-carousel-indicators	To customize the indicators
.e-carousel .e-carousel-indicators .e-indicator-bars .e-indicator-bar	To customize the indicator bars
.e-carousel .e-carousel-indicators .e-indicator-bars .e-indicator-bar .e-indicator	To customize the individual indicator appearance

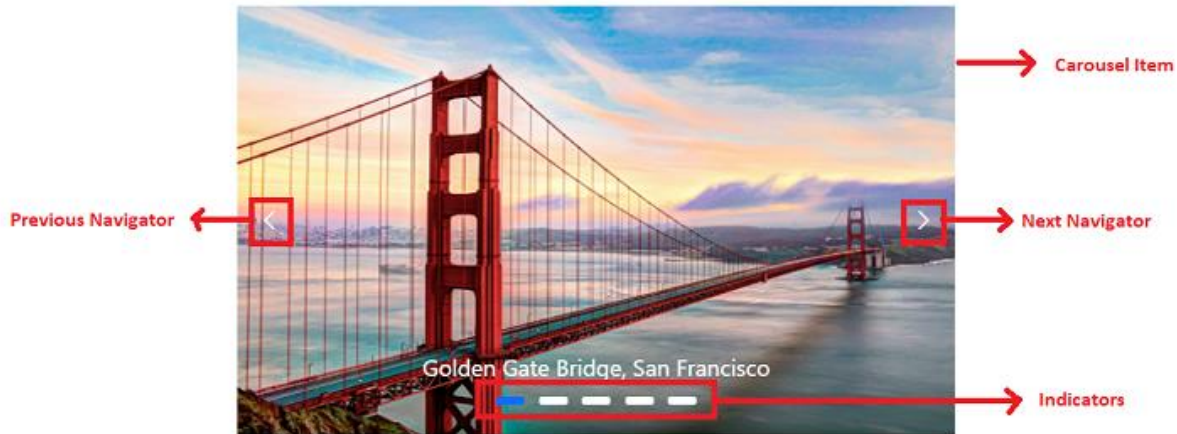

|.e-carousel .e-carousel-navigators|To customize the navigators

|.e-carousel .e-carousel-navigators .e-previous|To customize the previous button

|.e-carousel .e-carousel-navigators .e-next|To customize the next button

|.e-carousel .e-carousel-navigators .e-play-pause|To customize the play and pause button

|.e-carousel.e-partial .e-carousel-slide-container|To customize the partial visible slides

Customizing the indicators

Use the following CSS to customize the space between indicators by overriding the `.e-indicator-bar` CSS class.

```
`css
```

```
.e-carousel .e-carousel-indicators .e-indicator-bars .e-indicator-bar {
```

```
padding: 8px;
```

```
}
```

```
`
```

Use the following CSS to customize the indicators appearance by overriding the `.e-indicator` CSS class.

```
`css
```

```
.e-carousel .e-carousel-indicators .e-indicator-bars .e-indicator-bar .e-indicator {
```

```
width: 20px;
```

```
border-radius: 100%;
```

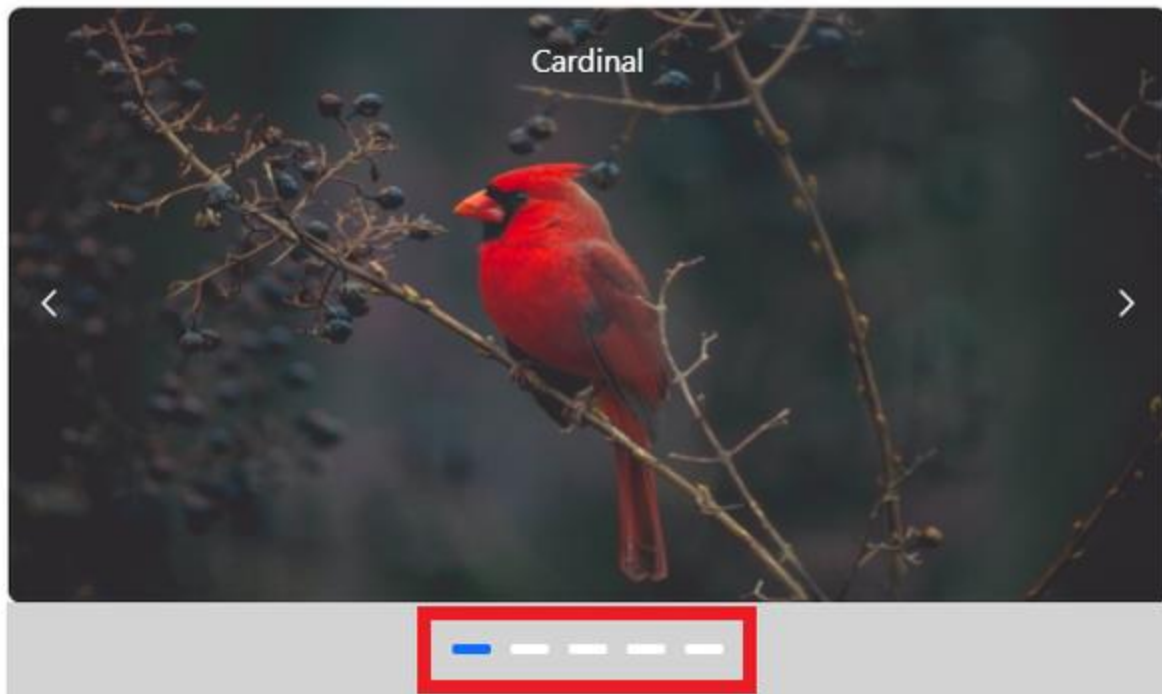

```
}
```

```
,
```

Use the following CSS to render the indicators outside the carousel items by overriding the `.e-carousel-indicators` CSS class.

```
`css
.e-carousel .e-carousel-indicators {
  bottom: auto;
}
```

Customizing the navigators

Use the following CSS to customize the previous and next icon size and colors.

```
`css
```

```
.e-carousel .e-carousel-navigators .e-next .e-btn:not(:disabled) .e-btn-icon,  
.e-carousel .e-carousel-navigators .e-previous .e-btn:not(:disabled) .e-btn-icon  
{  
  color: greenyellow;  
  font-size: 25px;  
}
```

```
,
```

Use the following CSS to customize the navigators position to bottom by overriding the `.e-carousel-navigators` CSS class.

```
`css
.e-carousel .e-carousel-navigators {
top: 120px;
}
```

Use the following CSS to render the previous and next icon to outside the carousel items by overriding the `.e-previous` and `.e-next` CSS class.

```
`css
.e-carousel .e-carousel-navigators .e-previous,
.e-carousel .e-carousel-navigators .e-next
{
margin: -60px;
background: black;
}
`
```

Customizing partial slides size

You can customize the partial slide size by overriding the `.e-carousel-slide-container` CSS class.

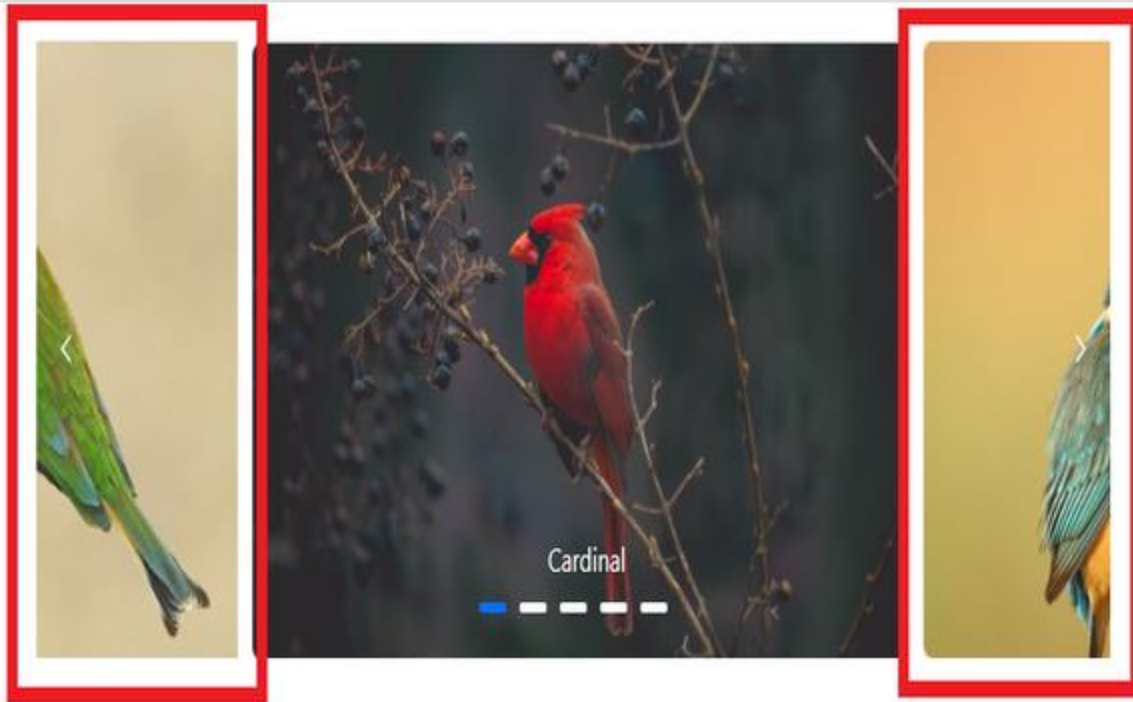

```
`css
```

```
.e-carousel.e-partial .e-carousel-slide-container{
```

```
padding: 0 150px;
```

```
}
```

```
`
```

Chart

<!-- markdownlint-disable MD036 -->

Working with data in EJ2 JavaScript Chart control

Chart can visualise data bound from local or remote data.

Local Data

You can bind a simple JSON data to the chart using [dataSource](#) property in series. Now map the fields in JSON to [xName](#) and [yName](#) properties.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category);
let chartData: any[] = [
  { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
  { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
  { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
  { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
  { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
  { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  series: [{
    dataSource: chartData,
    xName: 'month',
    yName: 'sales',
    type: 'Column'
  }]
});
```

```
    }}
  }, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Remote Data

You can also bind remote data to the chart using DataManager. The **DataManager** requires minimal information like webservice URL, adaptor and crossDomain to interact with service endpoint properly. Assign the instance of DataManager to the [dataSource](#) property in series and map the fields of data to [xName](#) and

[yName](#) properties. You can also use the [query](#) property of the series to filter the data.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { DataManager, Query } from '@syncfusion/ej2-data';
Chart.Inject(ColumnSeries, Category);
let dataManager: DataManager = new DataManager({
  url: 'https://services.syncfusion.com/js/production/api/orders'
});
let query: Query = new Query().take(5).where('Estimate', 'lessThan', 3,
false);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  },
```

```

primaryYAxis:
{
    title: 'Freight rate in U.S. dollars'
},
series: [
    {
        type: 'Column',
        dataSource: dataManager,
        xName: 'CustomerID', yName: 'Freight', query: query
    }
],
title: 'Container freight rate'
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
  }
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Binding Data Using ODataAdaptor

OData is a standardized protocol for creating and consuming data. You can retrieve data from OData service using the DataManager. Refer to the following code example for remote Data binding using OData service.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { DataManager, Query, ODataAdaptor } from '@syncfusion/ej2-data';
Chart.Inject(ColumnSeries, Category);
let dataManager: DataManager = new DataManager({

```

```
url: 'https://services.syncfusion.com/js/production/api/orders',
adaptor: new ODataAdaptor()
});
let query: Query = new Query();
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  //Initializing Chart Sample
  series: [
    {
      type: 'Column',
      dataSource: dataManager,
      xName: 'CustomerID', yName: 'Freight', query: query,
    }
  ],
  title: 'Sprint Task Analysis'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Lazy loading

Lazy loading allows you to load data for chart on demand. Chart will fire the scrollEnd event, in that we can get the minimum and maximum range of the axis, based on this, we can upload the data to chart.

INDEX.TS

```

import { Chart, ScrollBar, Zoom, IScrollEventArgs, LineSeries, Tooltip,
DateTime } from '@syncfusion/ej2-charts';
import { Internationalization, DateFormatOptions } from '@syncfusion/ej2-
base';
Chart.Inject(DateTime, ScrollBar, Zoom, LineSeries, Tooltip);
let intl: Internationalization = new Internationalization();
let chart: Chart = new Chart({
  primaryXAxis: {
    title: 'Day',
    valueType: 'DateTime',
    edgeLabelPlacement: 'Shift',
    skeleton: 'yMMM',
    skeletonType: 'Date',
    scrollbarSettings: {
      range: {
        minimum: new Date(2009, 0, 1),
        maximum: new Date(2014, 0, 1)
      },
      enable: true,
    }
  },
  primaryYAxis: {
    title: 'Server Load',
    labelFormat: '{value}MB'
  },
  series: [{
    dataSource: GetDateTimeData(new Date(2009, 0, 1), new Date(2009, 8,
1)),
    xName: 'x', yName: 'y',
    type: 'Line', animation: { enable: false },
  }],
  height: '450',
  title: 'Network Load',
  crosshair: { enable: true, lineType: 'Vertical' },
  tooltip: { enable: true, shared: true },
  legendSettings: { visible: true },
  scrollEnd: (args: IScrollEventArgs) => {
    if (lazymode.value === 'Range') {
      chart.series[0].dataSource =
GetDateTimeData(args.currentRange.minimum as Date, args.currentRange.maximum
as Date);
    }
    chart.dataBind();
  },
}, '#element');
function GetDateTimeData(start: Date, end: Date): { x: Date, y: number }[] {
  let series1: { x: Date, y: number }[] = [];
  let date: number;
  let value: number = 30;
  let option: DateFormatOptions = {
    skeleton: 'full',
    type: 'dateTime'
  };
  let dateParser: Function = intl.getDateParser(option);
  let dateFormatter: Function = intl.getDateFormat(option);
  for (let i: number = 0; start <= end; i++) {
    date = Date.parse(dateParser(dateFormatter(start)));
  }
}

```

```

    if (Math.random() > .5) {
        value += (Math.random() * 10 - 5);
    } else {
        value -= (Math.random() * 10 - 5);
    }
    if (value < 0) {
        value = getRandomInt(20, 40);
    }
    let point1: { x: Date, y: number } = { x: new Date(date), y:
Math.round(value) };
    new Date(start.setDate(start.getDate() + 1));
    series1.push(point1);
}
return series1;
} function getRandomInt(min: number, max: number): number {
    return Math.floor(Math.random() * (max - min + 1)) + min;
}

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Empty points

The Data points that uses the `null` or `undefined` as value are considered as empty points. Empty data points are ignored and not plotted in the Chart. When the data is provided by using the points property, By using `emptyPointSettings` property in series, you can customize the empty point. Default mode of the empty point is `Gap`.

INDEX.TS

```
import { Chart, ColumnSeries, LineSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, LineSeries, Category);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: null }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: undefined },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series:[{
        dataSource: chartData,
        xName: 'month',
        yName: 'sales',
        type: 'Column',
        emptyPointSettings: {
            mode: 'Gap'
        }
    },
    {
        dataSource: chartData,
        xName: 'month',
        yName: 'sales',
        type: 'Line',
        marker: { visible: true },
        emptyPointSettings: {
            mode: 'Average'
        }
    }
], '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

```

Chart dimensions in EJ2 JavaScript Chart control

Size for Container

Chart can render to its container size. You can set the size via inline or CSS as demonstrated below.

```
`javascript
<div id='container'>
  <div id='element' style="width:650px; height:350px;"></div>
</div>
`
```

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category);
let chartData: any[] = [
  { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
  { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
  { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
  { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
  { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
```

```

        { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
    ];
    let chart: Chart = new Chart({
        primaryXAxis: {
            valueType: 'Category'
        },
        series:[{
            dataSource: chartData,
            xName: 'month',
            yName: 'sales',
            type: 'Line'
        }],
        width: '650px',
        height: '350px'
    }, '#element');

```

```

<!-- markdownlint-disable MD036 -->

Size for Chart

<!-- markdownlint-disable MD036 -->

You can also set size for chart directly through [width](#) and [height](#) properties.

In Pixel

You can set the size of chart in pixel as demonstrated below.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series:[{
        dataSource: chartData,
        xName: 'month',
        yName: 'sales',
        type: 'Line'
    }],
    // Width and height for chart in pixel
    width: '650', height: '350'
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

In Percentage

By setting value in percentage, chart gets its dimension with respect to its container. For example, when the height is '50%', chart renders to half of the container height.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, Category);
let chartData: any[] = [
    { month: 'Jan', sales: 35 }, { month: 'Feb', sales: 28 },
    { month: 'Mar', sales: 34 }, { month: 'Apr', sales: 32 },
    { month: 'May', sales: 40 }, { month: 'Jun', sales: 32 },
    { month: 'Jul', sales: 35 }, { month: 'Aug', sales: 55 },
    { month: 'Sep', sales: 38 }, { month: 'Oct', sales: 30 },
    { month: 'Nov', sales: 25 }, { month: 'Dec', sales: 32 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series:[{
        dataSource: chartData,
        xName: 'month',
        yName: 'sales',
        type: 'Line'
    }],
    // Width and height for chart in percentage
    width: '80%', height: '90%'
}, '#element');
```

Note: When you do not specify the size, it takes 450px as the height and window size as its width.

Category axis in EJ2 JavaScript Chart control

<!-- markdownlint-disable MD036 -->

Category axis are used to represent, the string values instead of numbers.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category);
let chartData: any[] = [
    { country: "USA", gold: 50 },
    { country: "China", gold: 40 },
    { country: "Japan", gold: 70 },
    { country: "Australia", gold: 60 },
    { country: "France", gold: 50 },
    { country: "Germany", gold: 40 },
    { country: "Italy", gold: 40 },
    { country: "Sweden", gold: 30 }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        //Category in primary X Axis
        valueType: 'Category',
    },
    series:[{
        dataSource: chartData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use category axis, we need to inject **Category** module using **Chart.Inject(Category)** method and set the [valueType](#) of axis to Category.

Labels Placement

By default, category labels are placed between the ticks in an axis, this can also be placed on ticks using **[labelPlacement]**(../api/chart/axis/) property.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        // label placement as on ticks
        labelPlacement: 'OnTicks',
    },
    series: [{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    ="text/javascript"></script>
</head>
<body>

    <div id="container">

```

```

        <div id="element"></div>
    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Range

Range of the category axis can be customized using [minimum](#), [maximum](#) and [interval](#) property of the axis.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        interval: 2, minimum: 1, maximum: 5
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
</script>
var ele = document.getElementById('container');
```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Indexed category axis

Category axis also can be rendered based on the index values of data source. This can be achieved by defining the `isIndexed` property to `true` in the axis.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        isIndexed: true
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: [{ x: 'Myanmar', y: 7.3 }, { x: 'India', y: 7.9 }, { x: 'Bangladesh', y: 6.8 }, { x: 'Cambodia', y: 7.0 }, { x: 'China', y: 6.9 }],
            xName: 'x', yName: 'y',
        },
        {
            type: 'Column',
            dataSource: [{ x: 'Poland', y: 2.7 }, { x: 'Australia', y: 2.5 }, { x: 'Singapore', y: 2.0 }, { x: 'Canada', y: 1.4 }, { x: 'Germany', y: 1.8 }],
            xName: 'x', yName: 'y',
        }
    ],
    '#element');

```

<!-- markdownlint-disable MD036 -->

Numeric axis in EJ2 JavaScript Chart control

You can use [numeric axis](#) to represent numeric values of data in chart. By default, the `valueType` of an axis is `Double`.

INDEX.TS

```
import { Chart, LineSeries } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries);
let chartData: any[] = [{ x: 1, y: 7 }, { x: 2, y: 1 }, { x: 3, y: 1 }, { x: 4, y: 14 }, { x: 5, y: 1 }, { x: 6, y: 10 }, { x: 7, y: 8 }, { x: 8, y: 6 }, { x: 9, y: 10 }, { x: 10, y: 10 }, { x: 11, y: 16 }, { x: 12, y: 6 }, { x: 13, y: 14 }, { x: 14, y: 7 }, { x: 15, y: 5 }, { x: 16, y: 2 }, { x: 17, y: 14 }, { x: 18, y: 7 }, { x: 19, y: 7 }, { x: 20, y: 10 }];
let chart: Chart = new Chart({
  primaryXAxis: {
    // Numerical scale in primary X Axis
    valueType: 'Double',
  },
  series:[{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">
```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Range

Range of an axis, will be calculated automatically based on the provided data, you can also customize the range of the axis using [minimum](#), [maximum](#) and [interval](#) property of the axis.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Double',
        // Numeric axis range
        minimum: 1,
        maximum: 20,
        interval: 5
    },
    series: [{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Range Padding

Padding can be applied to the minimum and maximum extremes of an axis range by using the [rangePadding](#) property. Numeric axis supports the following types of padding.

- None
- Round
- Additional
- Normal
- Auto

Numeric - None

When the [rangePadding](#) is set to **None**, minimum and maximum of the axis is based on the data.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Double',
    },
    primaryYAxis: {
        //RangePadding as none in Y Axis
        rangePadding: 'None'
    },
    series:[{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Numeric - Round

When the [rangePadding](#) is set to **Round**, minimum and maximum will be rounded to the nearest possible value, which is divisible by interval. For example, when the minimum is 3.5 and the interval is 1, then the minimum will be rounded to 3.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Double',
  },
  primaryYAxis: {
    rangePadding: 'Round'
  },
  series:[{
    dataSource: numericData,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Numeric - Additional

When the [rangePadding](#) is set to **Additional**, interval of an axis will be added to the minimum and maximum of the axis.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Double',
    },
    primaryYAxis: {
        rangePadding: 'Additional'
    },
    series:[{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Numeric - Normal

When the [rangePadding](#) is set to **Normal**, padding is applied to the axis based on default range calculation.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Double',
    },
    primaryYAxis: {
        rangePadding: 'Normal'
    },
    series:[{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Numeric - Auto

When the [rangePadding](#) is set to **Auto**, horizontal numeric axis takes None as padding calculation, while the vertical numeric axis takes Normal as padding calculation.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Double',
        // Set the rangePadding as auto in X Axis
        rangePadding: 'Auto'
    },
    primaryYAxis: {
        valueType: 'Double',
        // Set the rangePadding as auto in Y Axis
        rangePadding: 'Auto'
    },
    series:[{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

```

Label Format

Numeric Label Format

Numeric labels can be formatted by using the [labelFormat](#) property. Numeric labels supports all globalize format.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
    primaryYAxis: {
        //Label format as currency
        labelFormat: 'c'
    },
    series:[{
        dataSource: numericData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">

```

```

<link href="index.css" rel="stylesheet">

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some commonly used label formats on numeric values.

<!-- markdownlint-disable MD033 -->

Label Value	Label Format property value	Result	Description
1000	n1	1000.0	The Number is rounded to 1 decimal place
1000	n2	1000.00	The Number is rounded to 2 decimal place
1000	n3	1000.000	The Number is rounded to 3 decimal place
0.01	p1	1.0%	The Number is converted to percentage with 1 decimal place
0.01	p2	1.00%	The Number is converted to percentage with 2 decimal place
0.01	p3	1.000%	The Number is converted to percentage with 3 decimal place
1000	c1	\$1000.0	The Currency symbol is appended to number and number is rounded to 1 decimal place
1000	c2	\$1000.00	The Currency symbol is appended to number and number is rounded to 2 decimal place

GroupingSeparator

To separate groups of thousands, use [useGroupingSeparator](#) property in chart.

INDEX.TS

```
import { Chart, ColumnSeries } from '@syncfusion/ej2-charts';
import { groupingData } from './datasource.ts';
Chart.Inject(ColumnSeries);
let chart: Chart = new Chart({
  series:[{
    dataSource: groupingData,
    xName: 'x', yName: 'y',
    type: 'Column'
  }],
  useGroupingSeparator: true
}, '#element');
```

INDEX.HTML

```

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Custom Label Format

Axis also supports custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

INDEX.TS

```
import { Chart, ColumnSeries } from '@syncfusion/ej2-charts';
import { numericData } from './datasource.ts';
Chart.Inject(ColumnSeries);
let chart: Chart = new Chart({
  primaryYAxis: {
    // Custom label format
    labelFormat: '${value}K'
  }
});
```

```

    },
    series:[{
      dataSource: numericData,
      xName: 'x', yName: 'y',
      type: 'Column'
    }],
  }, '#element');

```

INDEX.HTML

<!-- markdownlint-disable MD036 -->

Date time axis in EJ2 JavaScript Chart control

DateTime Axis

Date time axis uses date time scale and displays the date time values as axis labels in the specified format.

INDEX.TS

```

import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime);
let chartData: any[] = [{ x: new Date(2000, 6, 11), y: 10 }, { x: new
Date(2002, 3, 7), y: 30 },
  { x: new Date(2004, 3, 6), y: 15 }, { x: new Date(2006, 3, 30), y: 65 },
  { x: new Date(2008, 3, 8), y: 90 }, { x: new Date(2010, 3, 8), y: 85 }];
let chart: Chart = new Chart({
  primaryXAxis: {

```

```
// Date time scale in primary X Axis
valueType: 'DateTime',
},
series:[{
  dataSource: chartData,
  xName: 'x', yName: 'y',
  type: 'Line'
}],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: To use datetime axis, we need to inject DateTime using `Chart.Inject(DateTime)` method and set the [valueType](#) of axis to DateTime.

DateTimeCategory Axis

Date-time category axis is used to display the date-time values with non-linear intervals. For example, the business days alone have been depicted in a week here.

INDEX.TS

```
import { Chart, DateTimeCategory, ColumnSeries } from '@syncfusion/ej2-
charts';
Chart.Inject(ColumnSeries, DateTimeCategory);
let chartData: any[] = [{ x: new Date(2017, 11, 20), y: 21 }, { x: new
Date(2017, 11, 21), y: 24 },
```

```

        { x: new Date(2017, 11, 22), y: 24 }, { x: new
Date(2017, 11, 26), y: 70 },
        { x: new Date(2017, 11, 27), y: 75 }, { x: new
Date(2018, 0, 2), y: 82 },
        { x: new Date(2018, 0, 3), y: 53 }, { x: new Date(2018,
0, 4), y: 54 },
        { x: new Date(2018, 0, 5), y: 53 }, { x: new Date(2018,
0, 8), y: 45 }
    ];
    let chart: Chart = new Chart({
        //Initializing Primary X Axis
        primaryXAxis: {
            valueType: 'DateTimeCategory',
            skeleton: 'Ed',
        },
        series: [
            {
                type: 'Column',
                dataSource: chartData,
                xName: 'x', yName: 'y',
            },
        ],
    }, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>
    <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note: To use `dateTimeCategory` axis, we need to inject `DateTimeCategory` using `Chart.Inject(DateTimeCategory)` method and set the [valueType](#) of axis to `DateTimeCategory`.

Range

Range of an axis will be calculated automatically based on the provided data, you can also customize the range of the axis using [minimum](#), [maximum](#) and [interval](#) property of the axis.

INDEX.TS

```
import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
  primaryXAxis: {
    // Date time range in primary X Axis
    valueType: 'DateTime',
    minimum: new Date(2000, 6, 1),
    maximum: new Date(2010, 6, 1), interval: 1
  },
  series:[{
    dataSource: data,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
```

```
</body></html>
```

Interval Customization

Date time intervals can be customized by using the [interval](#) and [intervalType](#) properties of the axis. For example, when you set interval as 2 and intervalType as years, it considers 2 years as interval. Datetime axis supports following interval types,

- Auto
- Years
- Months
- Days
- Hours
- Minutes
- Seconds

INDEX.TS

```
import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',
    //interval type as years in primary x axis
    intervalType: 'Years'
  },
  series:[{
    dataSource: data,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
```

```

    </div>
</script>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Applying Padding to the Range

Padding can be applied to the minimum and maximum extremes of the range by using the [rangePadding](#) property. Date time axis supports the following types of padding,

- None
- Round
- Additional

Datetime - None

When the [rangePadding](#) is set to **None**, minimum and maximum of an axis is based on the data.

INDEX.TS

```

import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        //Range padding as none
        rangePadding: 'None'
    },
    series:[{
        dataSource: data,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>

```

```

<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Datetime - Round

When the [rangePadding](#) is set to **Round**, minimum and maximum will be rounded to the nearest possible value, which is divisible by interval. For example, when the minimum is 15th Jan, interval is 1 and the interval type is 'month', then the axis minimum will be Jan 1st.

INDEX.TS

```

import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        //Range padding as round
        rangePadding: 'Round'
    },
    series:[{
        dataSource: data,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Datetime - Additional

When the [rangePadding](#) is set to **Additional**, interval of an axis will be padded to the minimum and maximum of the axis.

INDEX.TS

```

import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
        //Range padding as additional
        rangePadding: 'Additional'
    },
    series:[{
        dataSource: data,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Label Format

You can format and parse the date to all globalize format using [labelFormat](#) property in an axis.

INDEX.TS

```
import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(LineSeries, DateTime);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',
    //Label format as yMd
    labelFormat: 'yMd'
  },
  series:[{
    dataSource: data,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

The following table describes the result of applying some common date time formats to the **labelFormat** property

<!-- markdownlint-disable MD033 -->

Label Value	Label Format Property Value	Result	Description
new Date(2000, 03, 10)	EEEE	Monday	The Date is displayed in day format
new Date(2000, 03, 10)	yMd	04/10/2000	The Date is displayed in month/date/year format
new Date(2000, 03, 10)	MMM	Apr	The Shorthand month for the date is displayed
new Date(2000, 03, 10)	hm	12:00 AM	Time of the date value is displayed as label
new Date(2000, 03, 10)	hms	12:00:00 AM	The Label is displayed in hours:minutes:seconds format

Custom Label Format

Axis also supports custom label format using placeholder like {value}°C, in which the value represent the axis label e.g 20°C.

INDEX.TS

```

import { Chart, DateTime, LineSeries } from '@syncfusion/ej2-charts';
import { data } from './datasource.ts';
Chart.Inject(DateTime, LineSeries);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
    },
    primaryYAxis: {
        // Custom label format
        labelFormat: '${value}K'
    },
    series: [{
        dataSource: data,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Logarithmic axis in EJ2 JavaScript Chart control

```
<!-- markdownlint-disable MD033 -->
```

Logarithmic axis uses logarithmic scale and it is very useful in visualizing data, when it has numerical values in both lower order of magnitude (eg: 10^{-6}) and higher order of magnitude (eg: 10^6).

INDEX.TS

```

import { Chart, DateTime, LineSeries, Logarithmic } from '@syncfusion/ej2-
charts';
Chart.Inject(LineSeries, DateTime, Logarithmic);
let chartData: any[] = [{ x: new Date(1995, 0, 1), y: 80 }, { x: new
Date(1996, 0, 1), y: 200 },
  { x: new Date(1997, 0, 1), y: 400 }, { x: new Date(1998, 0, 1), y: 600
},
  { x: new Date(1999, 0, 1), y: 700 }, { x: new Date(2000, 0, 1), y: 1400
},
  { x: new Date(2001, 0, 1), y: 2000 }, { x: new Date(2002, 0, 1), y: 4000
},
  { x: new Date(2003, 0, 1), y: 6000 }, { x: new Date(2004, 0, 1), y: 8000
},
  { x: new Date(2005, 0, 1), y: 11000 }];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',

```

```

    },
    primaryYAxis: {
        // Logarithmic scale in primary X Axis
        valueType: 'Logarithmic',
    },
    series:[{
        dataSource: chartData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Note: To use log axis, we need to inject **Logarithmic** using method **Chart.Inject(Logarithmic)** and set the **valueType** of axis to **Logarithmic**.

Range

Range of an axis, will be calculated automatically based on the provided data, you can also customize the range of an axis using [minimum](#), [maximum](#) and [interval](#) property of the axis.

INDEX.TS

```

import { Chart, DateTime, LineSeries, Logarithmic } from '@syncfusion/ej2-
charts';
import { logData } from './datasource.ts';
Chart.Inject(LineSeries, DateTime, Logarithmic);

    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Logarithmic Base

Logarithmic base can be customized by using the [logBase](#) property of the axis. For example when the logBase is 5, the axis values follows 5^{-2} , 5^{-1} , 5^0 , 5^1 , 5^2 etc.

INDEX.TS

```
import { Chart, DateTime, LineSeries, Logarithmic } from '@syncfusion/ej2-charts';
import { logData } from './datasource.ts';
Chart.Inject(LineSeries, DateTime, Logarithmic);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'DateTime',
  },
  primaryYAxis: {
    valueType: 'Logarithmic',
    // logBase for logarithmic scale
    logBase: 2
  },
  series:[{
    dataSource: logData,
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Logarithmic Interval

Logarithmic axis interval can be customized by using the [interval](#) property of the axis. When the logarithmic base is 10 and logarithmic interval is 2, then the axis labels are placed at an interval of 10^2 . The default value of the interval is 1.

INDEX.TS

```
import { Chart, DateTime, LineSeries, Logarithmic } from '@syncfusion/ej2-charts';
import { logData } from './datasource.ts';
Chart.Inject(LineSeries, DateTime, Logarithmic);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'DateTime',
    },
    primaryYAxis: {
        //Logarithmic interval in primary X Axis
        valueType: 'Logarithmic',
        interval: 2
    },
    series:[{
        dataSource: logData,
        xName: 'x', yName: 'y',
        type: 'Line'
    }],
}, '#element');
```

```

Axis labels in EJ2 JavaScript Chart control

Smart Axis Labels

When the axis labels overlap with each other, you can use [labelIntersectAction](#) property in the axis, to place them smartly.

When setting `labelIntersectAction` as `Hide`

INDEX.TS

```
import { Chart, Category, ColumnSeries, LineSeries } from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, LineSeries);
let chartData: any[] = [{ x: "South Korea", y: 39.4 }, { x: "India", y: 61.3 }, { x: "Pakistan", y: 20.4 }, { x: "Germany", y: 65.1 }, { x: "Australia", y: 15.8 }, { x: "Italy", y: 29.2 }, { x: "United Kingdom", y: 44.6 }, { x: "Saudi Arabia", y: 9.7 }, { x: "Russia", y: 40.8 }, { x: "Mexico", y: 31 }, { x: "Brazil", y: 75.9 }, { x: "China", y: 51.4 }];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    //label intersect as hide
    labelIntersectAction: 'Hide'
  },
  series:[{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    type: 'Column'
  }],
}, '#element');
```

```

Axis Labels Positioning

By default, the axis labels can be placed at **outside** the axis line and this also can be placed at **inside** the axis line using the **labelPosition** property.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    // label placement as on ticks
    labelPosition: 'Inside',
  },
  series:[{
    dataSource: categoryData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Multilevel Labels

Any number of levels of labels can be added to an axis using the `multiLevelLabels` property. This property can be configured using the following properties:

- Categories
- Overflow
- Alignment
- Text style
- Border

Note: To use multilevel label feature, we need to inject `MultiLevelLabel` using `Chart.Inject(MultiLevelLabel)` method.

Categories

Using the categories property, you can configure the `start`, `end`, `text`, and `maximumTextWidth` of multilevel labels.

INDEX.TS

```
import { Chart, ColumnSeries, Category, MultiLevelLabel } from
 '@syncfusion/ej2-charts';
import { categoryData, MultiLevelLabel } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, MultiLevelLabel);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    multiLevelLabels:[{ categories: [
      {
        //Start and end values of the multi-level labels
        //accepts number, date and string values
        start: -0.5,
        end: 3.5,
        //Multi-level label's text.
        text: 'Half Yearly 1',
        //Maximum width of the text for multi level
        //labels
        maximumTextWidth:50
      },
      { start: 3.5, end: 7.5, text: 'Half Yearly
2',maximumTextWidth:50 },
    ]}]
  },
  series:[{
    dataSource: categoryData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Overflow

Using the **overflow** property, you can **trim** or **wrap** the multilevel labels.

INDEX.TS

```

import { Chart, ColumnSeries, Category, MultiLevelLabel } from
'@syncfusion/ej2-charts';
import { categoryData, MultiLevelLabel } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, MultiLevelLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        multiLevelLabels:[{
            categories: [{start: -0.5, end: 3.5, text: 'Half Yearly 1',
maximumTextWidth:50 },
                { start: 3.5, end: 7.5, text: 'Half Yearly
2',maximumTextWidth:50 }},
            overflow:'Trim'
        ]
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Alignment

The **alignment** property provides option to position the multilevel labels at **far**, **center**, or **near**.

INDEX.TS

```

import { Chart, ColumnSeries, Category, MultiLevelLabel } from
'@syncfusion/ej2-charts';
import { categoryData, MultiLevelLabel } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, MultiLevelLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        multiLevelLabels:[{
            categories: [{start: -0.5, end: 3.5, text: 'Half Yearly 1' },
                { start: 3.5, end: 7.5, text: 'Half Yearly 2' }],
            alignment : 'Far'
        }]
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');

```

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Text customization

The `textStyle` property of multilevel labels provides options to customize the `size`, `color`, `fontFamily`, `fontWeight`, `fontStyle`, `opacity`, `textAlignment` and `textOverflow`.

INDEX.TS

```

import { Chart, ColumnSeries, Category, MultiLevelLabel } from
'@syncfusion/ej2-charts';
import { categoryData, MultiLevelLabel } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, MultiLevelLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        multiLevelLabels:[{
            categories: [{start: -0.5, end: 3.5, text: 'Half Yearly 1' },
                { start: 3.5, end: 7.5, text: 'Half Yearly 2' }]],
            textStyle:{size:'18px', color:'Red'}
        }
    ],
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```

Edge Label Placement

Labels with long text at the edges of an axis may appear partially in the chart. To avoid this, use [edgeLabelPlacement](#) property in axis, which moves the label inside the chart area for better appearance or hides it.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    //Edgelabelplacement for primary x axis
    edgeLabelPlacement: 'Shift',
  },
  series:[{
    dataSource: categoryData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Sorting

The chart's data source can be sorted using the `sort` method of chart. The arguments that are required to pass to sort method are data of chart. The fields depend on which sorting is performed either `x` or `y`, and the `isDescending` with which data source values are sorted in either `ascending` or `descending`.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        //EdgeLabelplacement for primary x axis
        edgeLabelPlacement: 'Shift',
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],

</body></html>

```

Labels Customization

Border of the axis labels can be customized using **width**, **color** and **typr** property of the axis.

INDEX.TS

```

import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        border: { width: 1, type: 'Rectangle', color: 'red' }
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
<title>EJ2 Animation</title>
<meta charset="utf-8">
<meta name="viewport" content="width=device-width, initial-scale=1.0">
<meta name="description" content="Typescript UI Controls">
<meta name="author" content="Syncfusion">
<link href="index.css" rel="stylesheet">

```

="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing Specific Point

You can customize the specific text in the axis labels using `axisLabelRender` event.

INDEX.TS

```

import { Chart, ColumnSeries, Category, IAxisLabelRenderEventArgs } from
'@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        border: { width: 1, type: 'Rectangle', color: 'red' }
    },
    series:[{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
    axisLabelRender : (args : IAxisLabelRenderEventArgs ) => {
        if(args.text === 'France') {
            args.labelStyle.color = 'Red';
        }
    }
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

```

```

<script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
type="text/javascript"></script>
<script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Line break support

Line break feature used to customize the long axis label text into multiple lines by using tag. Refer the below example in that dataSource x value contains long text, it breaks into two lines by using `
` tag.

INDEX.TS

```

import {
    Chart, BarSeries, DataLabel, Category,
    Tooltip
} from '@syncfusion/ej2-charts';
import { Browser } from '@syncfusion/ej2-base';
Chart.Inject(BarSeries, Category, Tooltip, DataLabel);
let chart: Chart = new Chart({
    //Initializing Primary X and YAxis
    primaryXAxis: {
        title: 'Country',
        valueType: 'Category',
        majorGridLines: { width: 0 },
        enableTrim: false,
    },
    //Initializing Primary Y Axis
    primaryYAxis: {
        {
            minimum: 0,
            maximum: 800,
            labelFormat: Browser.isDevice ? '{value}' : '{value}M',
            labelStyle: {
                color: 'transparent'
            }
        },

```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Maximum Labels

MaximumLabels property is set, then the labels will be rendered based on the count in the property per 100 pixel. If you have set range (minimum, maximum, interval) and maximumLabels, then the priority goes to range only. If you haven't set the range, then we have considered priority to maximumLabels property.

INDEX.TS

```

import { DateTime, ILoadedEventArgs, ChartTheme, ScrollBar } from

Axis customization in EJ2 JavaScript Chart control

Axis Crossing

An axis can be positioned in the chart area using `crossesAt` and `crossesInAxis` properties. The `crossesAt` property specifies the values (datetime, numeric, or logarithmic) at which the axis line has to

be intersected with the vertical axis or vice-versa, and the `crossesInAxis` property specifies the axis name with which the axis line has to be crossed.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { stripData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    crossesAt : 15
  },
  primaryYAxis: {
    crossesAt : 5
  },
  series:[{
    dataSource: stripData,
    xName: 'x', yName: 'y',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Title

You can add a title to the axis using `title` property to provide quick information to the user about the data plotted in the axis. Title style can be customized using `titleStyle` property of the axis.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    title: 'Countries',
    //Axis title text style
    titleStyle: {
      size: '16px', color: 'grey',
      fontFamily : 'Segoe UI', fontWeight : 'bold'
    }
  },
  series:[{
    dataSource: categoryData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Title Rotation

By using the [titleRotation](#) property, you can rotate the axis title from 0 to 360 degree.

INDEX.TS

```
import { Chart, ColumnSeries, Category } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    title: 'Countries', titleRotation: 90,
    //Axis title text style
    titleStyle: {
      size: '16px', color: 'grey',
      fontFamily : 'Segoe UI', fontWeight : 'bold'
    }
  },
  series:[{
    dataSource: categoryData,
    xName: 'country', yName: 'gold',
    type: 'Column'
  }],
}, '#element');
```

INDEX.HTML

```

```

Tick Lines Customization

You can customize the **width**, **color** and **size** of the minor and major tick lines, using [majorTickLines](#) and

[minorTickLines](#) properties in the axis.

INDEX.TS

```
import { Chart, Category, ColumnSeries } from '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        //Tick lines customization
        majorTickLines: {
            color: 'blue',
            width: 5
        },
        minorTickLines: {
            color: 'red',
            width: 0
        }
    },
    primaryYAxis: {
        //Grid lines customization
        majorTickLines: {
            color: 'blue',
            width: 5
        },
        minorTickLines: {
            color: 'red',
            width: 0
        }
    },
    series: [{
        dataSource: categoryData,
        xName: 'country', yName: 'gold',
        type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```

Inversed Axis

<!-- markdownlint-disable MD033 -->

When an axis is inversed, highest value of the axis comes closer to origin and vice versa. To place an axis in inversed manner set this property

[isInversed](#) to true.

INDEX.TS

```

import { Chart, LineSeries, Category, Legend, DataLabel } from
 '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(LineSeries, Category, Legend, DataLabel);
/**
 * inversed axis sample
 */
let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',
    isInversed: true

```

```

    },
    //Initializing Primary Y Axis
    primaryYAxis:
    {
        isInversed: true
    },
    series: [
        {
            type: 'Line',
            dataSource: categoryData,
            xName: 'country',
            yName: 'gold',
        },
    ],
    title: 'Exchange rate',
}, '#element');

```

```

Opposed Position

To place an axis opposite from its original position, set [opposedPosition](#) property of the axis to true.

INDEX.TS

```

import { Chart, LineSeries, Category, Legend, DataLabel } from
 '@syncfusion/ej2-charts';
import { categoryData } from './datasource.ts';
Chart.Inject(LineSeries, Category, Legend, DataLabel);

```

```
/**
 * inversed axis sample
 */
let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',
  },
  //Initializing Primary Y Axis
  primaryYAxis: {
    //Axis position as opposite
    opposedPosition: true
  },
  series: [
    {
      type: 'Line',
      dataSource: categoryData,
      xName: 'country',
      yName: 'gold',
    },
  ],
  title: 'Exchange rate',
}, '#element');

Strip line in EJ2 JavaScript Chart control

<!-- markdownlint-disable MD036 -->

EJ2 chart supports horizontal and vertical strip lines and customization of stripline in both orientation. To use strip line in axis, we need to inject `StripLine` module using `Chart.Inject(StripLine)` method

Horizontal Strip lines

You can create Horizontal stripline by adding the `stripline` in the vertical axis and set `visible` option to true. Striplines are rendered in the specified start to end range and you can add more than one stripline for an axis.

INDEX.TS

```
import { Chart, Category, ColumnSeries, LineSeries, DataLabel, StripLine }
from '@syncfusion/ej2-charts';
Chart.Inject(ColumnSeries, Category, LineSeries, DataLabel, StripLine);
let chartData: any[] = [{x: 1, y: 20},{x: 2, y: 22},{x: 3, y: 0},{x: 4, y:
12},{x: 5, y: 5},
    {x: 6, y: 15},{x: 7, y: 6},{x: 8, y: 12},{x: 9, y: 20},{x: 10, y: 7}];
let chart: Chart = new Chart({
    primaryYAxis: {
        stripLines:[
            { start: 15, end: 22 },
            { start: 8, end: 15 },
            { start: 0, end: 8 }
        ],
    },
    series:[{
        dataSource: chartData,
        xName: 'x', yName: 'y', type: 'Column'
    }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
</body>
```

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Vertical Striplines

You can create vertical stripline by adding the `stripline` in the horizontal axis and set `visible` option to true. Striplines are rendered in the specified start to end range and you can add more than one stripline for an axis.

INDEX.TS

```

import { Chart, Category, ColumnSeries, LineSeries, DataLabel, StripLine }
from '@syncfusion/ej2-charts';
import { stripData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, LineSeries, DataLabel, StripLine);
let chart: Chart = new Chart({
    primaryXAxis: {
        stripLines:[
            {start: 0, end: 5 },
            {start: 5, end: 10 },
        ]
    },
    series:[{
        dataSource: stripData,
        xName: 'x', yName: 'y',
        type: 'Column'}],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">
    <meta name="viewport" content="width=device-width, initial-scale=1.0">
    <meta name="description" content="Typescript UI Controls">
    <meta name="author" content="Syncfusion">
    <link href="index.css" rel="stylesheet">

    <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
    type="text/javascript"></script>
    <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
    ="text/javascript"></script>
</head>
<body>

    <div id="container">
        <div id="element"></div>
    </div>
<script>
var ele = document.getElementById('container');

```

```

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize the strip line

Starting value in specific strip line can be customized by **start** property in strip line. Similarly, ending value is customized by **end**. It can be also set for starting from the corresponding origin of the axis by **startFromOrigin**. Size of the strip line is customized by **size**. Border for the stripline is customized by **border**. Order of the strip line such that whether it should be rendered in behind or over the series elements is customized by **zIndex**.

INDEX.TS

```

import { Chart, ColumnSeries, LineSeries, DataLabel, StripLine } from
'@syncfusion/ej2-charts';
import { stripData } from './datasource.ts';
Chart.Inject(ColumnSeries, LineSeries, DataLabel, StripLine);
let chart: Chart = new Chart({
    primaryXAxis: {
        stripLines:[
            { startFromOrigin: true, size: 4, zIndex: 'Behind', opacity:
0.5}
        ]
    },
    series:[{
        dataSource: stripData,
        xName: 'x', yName: 'y',
        type: 'Column',
    }]
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customize the stripline text

You can customize the text rendered in stripline by `textStyle` property. Rotation of the strip line text can be changed by `rotation` property.

Horizontal and Vertical alignment of stripline text can be changed by `horizontalAlignment` and `verticalAlignment` property.

INDEX.TS

```

import { Chart, ColumnSeries, LineSeries, StripLine } from '@syncfusion/ej2-charts';
import { stripData } from './datasource.ts';
Chart.Inject(ColumnSeries, LineSeries, StripLine);
let chart: Chart = new Chart({
    primaryXAxis: {
        stripLines: [
            { startFromOrigin: true, size: 4, zIndex: 'Behind', opacity: 0.5, text: 'Good', verticalAlignment: 'Middle', horizontalAlignment: 'Middle', rotation: 90, textStyle: { size: 15 } },
            { start: 5, end: 8, verticalAlignment: 'Start', horizontalAlignment: 'End', rotation: 45, text: 'Poor' }
        ]
    },
    series: [{
        dataSource: stripData,
        xName: 'x', yName: 'y',
        type: 'Column',
    }],
}, '#element');

- [Mark the threshold in chart](#)

Multiple panes in EJ2 JavaScript Chart control

Chart area can be divided into multiple panes using [rows](#) and [columns](#).

Rows

To split the chart area vertically into number of rows, use [rows](#) property of the chart.

- You can allocate space for each row by using the [height](#) property. The value can be either percentage or in pixel.
- To associate a vertical axis to a particular row, specify its index to [rowIndex](#) property of the axis.
- To customize each row's bottom line, use [border](#) property.

Chart Types

Line Chart in EJ2 JavaScript control

Line

To render a line series, use series [type](#) as `Line` and inject `LineSeries` module using `Chart.Inject(LineSeries)` method.

INDEX.TS

```

import { Chart, LineSeries } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries);
let chartData: any[] = [
  { x: 2005, y: 28 }, { x: 2006, y: 25 }, { x: 2007, y: 26 }, { x: 2008, y: 27 },
  { x: 2009, y: 32 }, { x: 2010, y: 35 }, { x: 2011, y: 30 }
];
let chart: Chart = new Chart({
  series:[{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    //Series type as line
    type: 'Line'
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>

```

```
<body>

  <div id="container">
    <div id="element"></div>
  </div>
</body>
<script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Multicolored line

To render a multicolored line series, use the series type as `MultiColoredLine`, and inject the `MultiColoredLineSeries` module using `Chart.Inject(MultiColoredLineSeries)` method. Here, the individual colors to the data can be mapped by using `pointColorMapping`.

INDEX.TS

```
import { Chart, MultiColoredLineSeries } from '@syncfusion/ej2-charts';
Chart.Inject(MultiColoredLineSeries);
let chart: Chart = new Chart({
  series:[{
    dataSource: [{ x: 2005, y: 28, color: 'red'}, { x: 2006, y: 25,
color:'green'}, { x: 2007, y: 26, color: '#ff0097' }, { x: 2008, y: 27,
color: 'crimson' }, { x: 2009, y: 32, color: 'blue' }, { x: 2010, y: 35
,color: 'darkorange'}],
    xName: 'x', yName: 'y', pointColorMapping: 'color',
    type: 'MultiColoredLine'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Series customization

The following properties can be used to customize the **line** series.

- [fill](#) – Specifies the color of the series.
- [opacity](#) – Specifies the opacity of [fill](#).
- [dashArray](#) – Specifies the dashes for series.
- [width](#) – Specifies the width for series.

INDEX.TS

```
import { Chart, LineSeries } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries);
let chart: Chart = new Chart({
  series:[{
    dataSource: numData,
    //fill for chart series
    fill: 'red',
    //line width as 4 for chart series
    width:4,
    //dash array value as 5,5
    dashArray: '5,5',
    xName: 'x', yName: 'y',
    type: 'Line'
  }],
}, '#element');
```

Spline range area Chart in EJ2 JavaScript control

Spline Range Area

The Spline Range Area Chart is used to display continuous data points as a set of splines that vary between high and low values over intervals of time and across different categories.

To render a spline range area series, use series [type](#) as `SplineRangeArea` and inject `SplineRangeAreaSeries` module using `Chart.Inject(SplineRangeAreaSeries)` method.

INDEX.TS

```
import { Chart, SplineRangeAreaSeries, Category } from '@syncfusion/ej2-charts';
import { splinedata } from './datasource.ts';
Chart.Inject(SplineRangeAreaSeries, Category);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
        edgeLabelPlacement: 'Shift',
        majorGridLines: { width: 0 },
    },
    primaryYAxis: {
        labelFormat: '{value}°C',
        lineStyle: { width: 0 },
        minimum: 0,
        maximum: 40,
        majorTickLines: { width: 0 }
    },
    series: [
        {
            type: 'SplineRangeArea',
            name: 'England',
            dataSource: splinedata,
            xName: 'x', high: 'high', low: 'low',
            opacity: 0.4,
        },
        {
            type: 'SplineRangeArea',
            name: 'India',
            dataSource: splinedata,
            xName: 'x', high: 'high1', low: 'low1',

Cylindrical column chart

To render a cylindrical column chart, set the [columnFacet](#) property to **Cylinder** in the chart series.

INDEX.TS

```
import { Chart, ColumnSeries, Category, Tooltip } from '@syncfusion/ej2-
charts';
import { cylindricalData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, Tooltip);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    interval: 1
  },
  primaryYAxis: {
    minimum: 0, maximum: 80,
    interval: 10, title: 'Medal Count'
  },
  series: [{
    dataSource: cylindricalData,
    xName: 'country', yName: 'gold',
    tooltipMappingName: 'tooltipMappingName',
    // Series type as column series with cylinder shape
    type: 'Column', columnFacet: 'Cylinder'
  }],
  title: 'Olympic Gold Medal Counts - RIO',
  tooltip: { enable: true, header: "<b>${point.tooltip}</b>", format:
    "Gold Medal: <b>${point.y}</b>" }
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

Stack bar Chart in EJ2 JavaScript control

Stacked bar

To render a stacked bar series, use series [type](#) as `StackingBar` and inject `StackingBarSeries` module using `Chart.Inject(StackingBarSeries)` method.

INDEX.TS

```

import { Chart, StackingBarSeries, Category } from '@syncfusion/ej2-charts';
import { stackedData } from './datasource.ts';
Chart.Inject(StackingBarSeries, Category);
let chart: Chart = new Chart({
    series: [
        {
            //Series type as stacked bar
            type: 'StackingBar',
            dataSource: stackedData, xName: 'x', yName: 'y'
        }, {
            type: 'StackingBar',
            dataSource: stackedData, xName: 'x', yName: 'y1'
        }, {
            type: 'StackingBar',
            dataSource: stackedData, xName: 'x', yName: 'y2'
        }
    ],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

```

Stacking group

You can use the [stackingGroup](#) property to group the stacked bar and 100% stacked bar. Columns with same group name are stacked on top of each other.

INDEX.TS

```

import { Chart, StackingBarSeries } from '@syncfusion/ej2-charts';
import { stackedData } from './datasource.ts';
Chart.Inject(StackingBarSeries);
let chart: Chart = new Chart({
    series: [
        {
            type: 'StackingBar',
            //Stacking group for stacked bar
            stackingGroup: 'JohnAndAndrew',
            dataSource: stackedData, xName: 'x', yName: 'y'
        }, {
            type: 'StackingBar', name: 'Andrew', stackingGroup:
'JohnAndAndrew',
            dataSource: stackedData, xName: 'x', yName: 'y1'
        }, {
            type: 'StackingBar', name: 'Thomas', stackingGroup:
'ThomasAndMichael',
            dataSource: stackedData, xName: 'x', yName: 'y2'
        }
    ],
}, '#element');

```

Bubble Size Mapping

size property can be used to map the size value specified in data source.

INDEX.TS

```

import { Chart, BubbleSeries } from '@syncfusion/ej2-charts';
import { bubbleData } from './datasource.ts';
import { EmitType } from '@syncfusion/ej2-base';
Chart.Inject(BubbleSeries);
let chart: Chart = new Chart({
    series: [
        {
            type: 'Bubble',
            dataSource: bubbleData,
            xName: 'x', yName: 'y',
            //size property used to map size values from data source
            size: 'size',
        },
    ],
}, '#element');
```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

Polar Chart in EJ2 JavaScript control

Polar Chart

To render a polar series, use series [type](#) as **Polar** and inject **PolarSeries** module using **Chart.Inject(PolarSeries)** method.

Draw Types

Polar drawType property is used to change the series plotting type to line, column, area, range column, spline, scatter, stacking area and stacking column. The default value of drawType is **Line**.

Line

To render a line draw type, use series [drawType](#) as **Line** and inject **LineSeries** module using **Chart.Inject(LineSeries)** method.

[isClosed](#) property specifies whether to join start and end point of a line series used in polar chart to form a closed path. Default value of isClosed is true.

INDEX.TS

```
import { Chart, LineSeries, PolarSeries } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, PolarSeries);
let chartData: any[] = [
    { x: 2005, y: 28 }, { x: 2006, y: 25 }, { x: 2007, y: 26 }, { x: 2008, y:
27 },
    { x: 2009, y: 32 }, { x: 2010, y: 35 }, { x: 2011, y: 30 }
];
let chart: Chart = new Chart({
    series:[{
        dataSource: chartData,
        xName: 'x', yName: 'y',
        //Series type as polar
        type: 'Polar',
        // Series draw type as line
        drawType: 'Line'
    }],
}, '#element');
```

INDEX.HTML

```

```

Series customization

Start Angle

You can customize the start angle of the polar series using [startAngle](#) property. By default, `startAngle` is 0 degree.

INDEX.TS

```

import { Chart, Category, PolarSeries } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(Category, PolarSeries);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    startAngle: 90
  },
  series:[{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    // Series type as polar series
    type: 'Polar',
    // Series draw type as column series
    drawType: 'Column'
  }],
}, '#element');
```

INDEX.HTML

Radar Chart in EJ2 JavaScript control

Radar Chart

To render a radar series, use series [type](#) as **Radar** and inject **PolarSeries** module using **Chart.Inject(RadarSeries)** method.

Draw Type

similar to Polar drawType, Radar draw property is used to change the series plotting type to line, column, area, range column, spline, scatter, stacking area and stacking column. The default value of drawType is **Line**.

INDEX.TS

```

import { Chart, LineSeries, RadarSeries } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, RadarSeries);
let chart: Chart = new Chart({
    series:[{
        dataSource: numData, xName: 'x', yName: 'y',
        //Series type as polar
        type: 'Radar',
        // Series draw type as line
        drawType: 'Line'
    }
    ]
});

```

```
    }],
  }, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>

  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

Start Angle

You can customize the start angle of the polar series using [startAngle](#) property. By default, `startAngle` is 0 degree.

INDEX.TS

```
import { Chart, Category, RadarSeries, LineSeries } from '@syncfusion/ej2-
charts';
import { columnData } from './datasource.ts';
Chart.Inject(Category, RadarSeries, LineSeries);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    startAngle: 120
  },
  series: [{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    // Series type as polar series
    type: 'Radar',
    // Series draw type as column series
  }]
```

```

        drawType: 'Line'
    }],
}, '#element');

```

INDEX.HTML

  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Radius

You can customize the radius of the polar series using [coefficient](#) property. By default, `coefficient` is 100.

INDEX.TS

```

import { Chart, Category, RadarSeries } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(Category, RadarSeries);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
    coefficient: 50
  },
  series:[{
    dataSource: columnData,
    xName: 'country', yName: 'gold',

High low Chart in EJ2 JavaScript control

Hilo

Hilo Series illustrates the price movements in stock using the high and low values. To render a Hilo series, use series [type](#) as Hilo and inject HiloSeries module using Chart.Inject(HiloSeries) method.

Hilo series requires 3 fields (x, high and low) to show the high and low price in the stock.

INDEX.TS

```
import { Chart, HiloSeries, Category } from '@syncfusion/ej2-charts';
Chart.Inject(HiloSeries, Category);
let chartData: any[] = [
  { x: 'Jan', low: 87, high: 200 }, { x: 'Feb', low: 45, high: 135 },
  { x: 'Mar', low: 19, high: 85 }, { x: 'Apr', low: 31, high: 108 },
  { x: 'May', low: 27, high: 80 }, { x: 'June', low: 84, high: 130 },
  { x: 'July', low: 77, high: 150 }, { x: 'Aug', low: 54, high: 125 },
```

```

    { x: 'Sep', low: 60, high: 155 }, { x: 'Oct', low: 60, high: 180 },
    { x: 'Nov', low: 88, high: 180 }, { x: 'Dec', low: 84, high: 230 }
  ];
  let chart: Chart = new Chart({
    primaryXAxis: {
      valueType: 'Category',
    },
    series:[
      {
        dataSource: chartData,
        xName: 'x', high: 'high', low: 'low',
        //Series type as Hilo
        type: 'Hilo'
      }
    ],
  }, '#element');

```

INDEX.HTML

Hollow Candles

Candle charts allow to visually compare the current price with previous price by coloring them.

Candles are filled/left as hollow based on the following criteria.

<!-- markdownlint-disable MD033 -->

States	Description
Filled	candle sticks are filled when the close value is lesser than the open value
Unfilled	candle sticks are unfilled when the close value is greater than the open value

The color of the candle will be defined by comparing with previous values. Bear color will be applied when the current closing value is greater than the previous closing value. Bull color will be applied when the current closing value is less than the previous closing value.

By default, `bullFillColor` is set as red and `bearFillColor` is set as green.

Solid Candles

[enableSolidCandles](#) is used to enable/disable the solid candles. By default is set to be false. The fill color of the candle will be defined by its opening and closing values.

[bearFillColor](#) will be applied when the opening value is less than the closing value.

[bullFillColor](#) will be applied when the opening value is greater than closing value.

  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Box Plot

You can change the rendering mode of the Box and Whisker series using the `boxPlotMode` property. The default `boxPlotMode` is `exclusive`. The other `boxPlotMode` available are `inclusive` and `normal`.

INDEX.TS

```

import {
  Chart, Category, IPointRenderEventArgs, BoxAndWhiskerSeries, Tooltip,
  getElement, BoxPlotMode
} from '@syncfusion/ej2-charts';
import { boxPlot } from '../datasource.ts';

```

```

Chart.Inject(Category, BoxAndWhiskerSeries, Tooltip);
let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    valueType: 'Category',
  },
  //Initializing Chart Series
  series: [
    {
      type: 'BoxAndWhisker',
      boxPlotMode: 'Normal',
      dataSource: boxPlot,
      xName: 'x',
      yName: 'y',
      marker: {
        visible: true,
        width: 10,
        height: 10
      },
    },
  ],
}, '#element');

```

INDEX.HTML

```

Waterfall Chart in EJ2 JavaScript control

Waterfall Chart

Waterfall chart helps to understand the cumulative effect of the sequentially introduced positive and negative values. To render a Waterfall series, use series [type](#) as `Waterfall` and inject `WaterfallSeries` module using `Chart.Inject(WaterfallSeries)` method. [intermediateSumIndexes](#) property of waterfall is used to represent the in between sum values and [sumIndexes](#) is used to represent the cumulative sum values.

INDEX.TS

```
import { Chart, WaterfallSeries, Category, DataLabel } from
 '@syncfusion/ej2-charts';
Chart.Inject(WaterfallSeries, Category, DataLabel);
let chartData: any[] = [
  { x: 'Income', y: 4711 }, { x: 'Sales', y: -1015 },
  { x: 'Development', y: -688 },
  { x: 'Revenue', y: 1030 }, { x: 'Balance' },
  { x: 'Administrative', y: -780 },
  { x: 'Expense', y: -361 }, { x: 'Tax', y: -695 },
  { x: 'Net Profit' }
];
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category',
  },
  series: [
    {
      dataSource: chartData,
      xName: 'x', yName: 'y', intermediateSumIndexes: [4], sumIndexes:
[8],
      //Series type as Waterfall
      type: 'Waterfall',
    }
  ],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">

if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Series customization

The negative changes of waterfall charts are represented by using `negativeFillColor` and the summary changes are represented by using `summaryFillColor` properties respectively. By default, the `negativeFillColor` is **green** and the `summaryFillColor` is **black**.

INDEX.TS

```

import { Chart, WaterfallSeries, Category, DataLabel } from
'@syncfusion/ej2-charts';
Chart.Inject(WaterfallSeries, Category, DataLabel);
let chartData: any[] = [
    { x: 'Income', y: 4711 }, { x: 'Sales', y: -1015 },
    { x: 'Development', y: -688 },
    { x: 'Revenue', y: 1030 }, { x: 'Balance' },
    { x: 'Administrative', y: -780 },
    { x: 'Expense', y: -361 }, { x: 'Tax', y: -695 },
    { x: 'Net Profit' }
];
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category',
    },
    series: [
        {
            dataSource: chartData,
            xName: 'x', yName: 'y', intermediateSumIndexes: [4], sumIndexes:
[8],
            //Series type as Waterfall
            type: 'Waterfall', summaryFillColor: "black",
            negativeFillColor: 'green'
        }
    ],
}, '#element');

Error bar Chart in EJ2 JavaScript control

Error Bar

Error bars are graphical representations of the variability of data and used on graphs to indicate the error or uncertainty in a reported measurement. To render the error bar for the series, set [visible](#) as **true** and inject **ErrorBar** module using **Chart.Inject(ErrorBar)** method.

INDEX.TS

```

import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, ErrorBar);
let chartData: any[] = [{ x: 2005, y: 28 }, { x: 2006, y: 25 }, { x: 2007, y: 26 }, { x: 2008, y: 27 }, { x: 2009, y: 32 }, { x: 2010, y: 35 }, { x: 2011, y: 30 }];
let chart: Chart = new Chart({
  series: [{
    dataSource: chartData,
    xName: 'x', yName: 'y',
    errorBar: {
      visible: true,
    },
    type: 'Line'
  }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>

    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing Error Bar

To customize the error bar type, set error bar [type](#) as **Custom** and then change the horizontal/vertical positive and negative error of error bar.

INDEX.TS

```

import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, ErrorBar);
let chart: Chart = new Chart({
    series: [{
        dataSource: numData,
        xName: 'x', yName: 'y',
        errorBar: {
            visible: true,
            type: 'Custom',
            mode: 'Both'
            verticalPostiveError: 3,
            horizontalPositiveError: 2,
            verticalNegativeError: 3,
            horizontalNegativeError: 2
        },
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>
    <meta charset="utf-8">

var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Error Bar Mode

Error bar mode is used to define whether the error bar line has to be drawn horizontally, vertically or in both side. To change the error bar mode use [mode](#) option.

INDEX.TS

```

import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, ErrorBar);
let chart: Chart = new Chart({
  series: [{
    dataSource: numData,
    xName: 'x', yName: 'y',
    errorBar: {
      visible: true,
      mode: 'Horizontal'
    },
    type: 'Line'
  }],
}, '#element');

```

INDEX.HTML

```

var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
</script>
<script src="index.js" type="text/javascript"></script>
</body></html>

```

Error Bar Direction

To change the error bar direction to plus, minus or both side using [direction](#) option.

INDEX.TS

```

import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, ErrorBar);
let chart: Chart = new Chart({
    series: [{
        dataSource: numData,
        xName: 'x', yName: 'y',
        errorBar: {
            visible: true,
            mode: 'Vertical',
            direction: 'Minus'
        },
        type: 'Line'
    }],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

        <div id="element"></div>
    </div>
    <script>
var ele = document.getElementById('container');
if(ele) {
    ele.style.visibility = "visible";
}
    </script>

```

```
<script src="index.js" type="text/javascript"></script>
</body></html>
```

Customizing Error Bar Cap

To customize the error bar cap length, width and fill color, you can use [errorBarCap](#) option.

INDEX.TS

```
import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, ErrorBar);
let chart: Chart = new Chart({
  series: [{
    dataSource: numData,
    xName: 'x', yName: 'y',
    errorBar: {
      visible: true,
      errorBarCap: {
        length: 10,
        width: 10,
        color: '#0000ff'
      }
    },
    type: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customizing Error Bar Color

To customise the error bar color for individual errors, use the `[errorBarColorMapping]` property. You can also customize the vertical error, horizontal error, horizontal negative and positive error and vertical negative and positive error for an individual point using [verticalError](#), [horizontalError](#), [horizontalNegativeError](#), [horizontalPositiveError](#), [verticalNegativeError](#) and [verticalPositiveError](#) properties.

INDEX.TS

```
import { Chart, LineSeries, ErrorBar } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, ErrorBar);
let chart: Chart = new Chart({
    series: [{
        dataSource: numData,
        xName: 'x', yName: 'y',
        errorBar: {
            visible: true,
            errorBarColorMapping: 'color',
            verticalError: 'error'
        },
        type: 'Line'
    }],
}, '#element');
```

INDEX.HTML

```

Vertical Chart in EJ2 JavaScript control

Vertical chart

In EJ2 chart, you can draw a chart in vertical manner by changing orientation of the axis. All series types support this feature.

You can use `isTransposed` property in chart to render a chart in vertical manner.

INDEX.TS

```
import { Chart, SplineSeries, Category } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(SplineSeries, Category);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  series:[{
    dataSource: columnData,
    xName: 'country', yName: 'gold',
    type: 'Spline',
  }],
  isTransposed: true,
}, '#element');
```

INDEX.HTML

```

Pareto Chart in EJ2 JavaScript control

Pareto

Pareto charts are used to find the cumulative values of data in different categories. It is a combination of Column and Line series.

The initial values are represented by column chart and the cumulative values are represented by Line chart. To render a pareto chart, use series [type](#) as Pareto and inject ParetoSeries ColumnSeries and LineSeries module using Chart.Inject(ParetoSeries, LineSeries, ColumnSeries) method.

INDEX.TS

```

import { ChartTheme, Chart, ColumnSeries, Legend, Tooltip, ILoadedEventArgs } from '@syncfusion/ej2-charts';
import { ParetoSeries, Category, LineSeries } from '@syncfusion/ej2-charts';
import { Browser } from '@syncfusion/ej2-base';
Chart.Inject(ColumnSeries, Category, ParetoSeries, LineSeries, Legend, Tooltip);
/**
 * Sample for Pareto chart
 */
let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {
    interval: 1,
    valueType: 'Category',
    majorGridLines: { width: 0 }, minorGridLines: { width: 0 },
    majorTickLines: { width: 0 }, minorTickLines: { width: 0 },
    lineStyle: { width: 0 }, labelIntersectAction: 'Rotate45'
  },
  //Initializing Primary Y Axis
  primaryYAxis: {
    {
      title: 'Frequency of Occurrence',
      minimum: 0,
      maximum: 25,
      interval: 5,
      lineStyle: { width: 0 },
      majorTickLines: { width: 0 }, majorGridLines: { width: 1 },
      minorGridLines: { width: 1 }, minorTickLines: { width: 0 }
    },
    chartArea: {
      border: {

```

```

        width: 0
    },

Polar radar in EJ2 JavaScript Chart control

Polar Chart

To render a polar series, use series [type](#) as **Polar** and inject **PolarSeries** module using **Chart.Inject(PolarSeries)** method.

Draw Types

Polar drawType property is used to change the series plotting type to line, column, area, range column, spline, scatter, stacking area and stacking column. The default value of drawType is **Line**.

Line

To render a line draw type, use series [drawType](#) as **Line** and inject **LineSeries** module using **Chart.Inject(LineSeries)** method.

[isClosed](#) property specifies whether to join start and end point of a line series used in polar chart to form a closed path. Default value of isClosed is true.

INDEX.TS

```
import { Chart, LineSeries, PolarSeries } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, PolarSeries);
let chartData: any[] = [
    { x: 2005, y: 28 }, { x: 2006, y: 25 }, { x: 2007, y: 26 }, { x: 2008, y:
27 },
    { x: 2009, y: 32 }, { x: 2010, y: 35 }, { x: 2011, y: 30 }
];
let chart: Chart = new Chart({
    series:[{
        dataSource: chartData,
        xName: 'x', yName: 'y',
        //Series type as polar
        type: 'Polar',
        // Series draw type as line
        drawType: 'Line'
    }],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
    <title>EJ2 Animation</title>

```

Scatter

To render a scatter draw type, use series [DrawType](#) as `Scatter` and inject `ScatterSeries` module using `Chart.Inject(ScatterSeries)` method.

INDEX.TS

```

import { Chart, ScatterSeries, Legend, Category, PolarSeries } from
 '@syncfusion/ej2-charts';
import { polarCategory } from './datasource.ts';
Chart.Inject(ScatterSeries, Legend, Category, PolarSeries);
let chart: Chart = new Chart({
  primaryXAxis: {
    valueType: 'Category'
  },
  series:[{
    dataSource: polarCategory,
    xName: 'x', yName: 'y',
    // Series type as Polar series
    type: 'Polar'
    // Series draw type as scatter
    drawType: 'Scatter'
  }],

```

```
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">

</body></html>
```

Radar Chart

To render a radar series, use series [type](#) as **Radar** and inject **PolarSeries** module using **Chart.Inject(RadarSeries)** method.

Draw Type

similar to Polar drawType, Radar draw property is used to change the series plotting type to line, column, area, range column, spline, scatter, stacking area and stacking column. The default value of drawType is **Line**.

INDEX.TS

```
import { Chart, LineSeries, RadarSeries } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, RadarSeries);
let chart: Chart = new Chart({
  series:[{
    dataSource: numData, xName: 'x', yName: 'y',
    //Series type as polar
    type: 'Radar',
    // Series draw type as line
    drawType: 'Line'
  }],
}, '#element');
```

INDEX.HTML

```

Chart series in EJ2 JavaScript Chart control

Multiple Series

You can add multiple series to the chart by using [series](#) property. The series are rendered in the order as it is added to the series array.

INDEX.TS

```
import { Chart, ColumnSeries, Category, Legend } from '@syncfusion/ej2-
charts';
Chart.Inject(ColumnSeries, Category, Legend);
let chartData: any[] = [
  { country: "USA", gold: 50, silver: 70, bronze: 45 },
  { country: "China", gold: 40, silver: 60, bronze: 55 },
  { country: "Japan", gold: 70, silver: 60, bronze: 50 },
  { country: "Australia", gold: 60, silver: 56, bronze: 40 },
  { country: "France", gold: 50, silver: 45, bronze: 35 },
  { country: "Germany", gold: 40, silver: 30, bronze: 22 },
  { country: "Italy", gold: 40, silver: 35, bronze: 37 },
  { country: "Sweden", gold: 30, silver: 25, bronze: 27 }
];
let chart: Chart = new Chart({
```

```

primaryXAxis: {
    valueType: 'Category',
    title: 'Countries'
},
primaryYAxis: {
    minimum: 0, maximum: 80,
    interval: 20, title: 'Medals'
},
series:[{
    dataSource: chartData,
    xName: 'country', yName: 'gold',
    name: 'Gold', type: 'Column'
}, {
    dataSource: chartData,
    xName: 'country', yName: 'silver',
    name: 'Silver', type: 'Column'

Enable Complex Property in Series

By setting `enableComplexProperty` value as `true` in series you can bind complex data to the chart.

INDEX.TS

```

import { Chart, LineSeries, DateTime, Legend, Tooltip, ILoadedEventArgs,
ChartTheme, Category, ColumnSeries, } from '@syncfusion/ej2-charts';
import { Browser } from '@syncfusion/ej2-base';
Chart.Inject(LineSeries, DateTime, Category, ColumnSeries, Legend, Tooltip);
/**
 * Sample for Line series
 */
export let data: any[] = [
  {group: { x: 'Aaa', y: 10}, y: 20},
  {group: { x: 'Baa', y: 30}, y: 10}
];

let chart: Chart = new Chart({
  //Initializing Primary X Axis
  primaryXAxis: {

```

```

        valueType: 'Category'
    },
    //Initializing Chart Series
    series: [
        {
            type: 'Column',
            dataSource: data,
            enableComplexProperty: true,
            xName: 'group.x', yName: 'group.y',
        },
        {
            type: 'Column',
            dataSource: data,
            enableComplexProperty: true,
            xName: 'group.x', yName: 'y',
        },
    ],
    ],
    '#element');

```

Technical indicators in EJ2 JavaScript Chart control

A technical indicator is a mathematical calculation based on historic price, volume or open interest information that aims to forecast financial market direction.

Chart supports 10 types of technical indicators.

Accumulation Distribution

Accumulation Distribution combines price and volume to show how money may be flowing into or out of stock. To render a Accumulation Distribution Indicator, use indicator [type](#) as

`AccumulationDistribution` and inject

`AccumulationDistributionIndicator` module using

`Chart.Inject(AccumulationDistributionIndicator)`. To calculate the signal line [volume](#) field is additionally added with `dataSource`.

INDEX.TS

```
import { Chart, LineSeries, DateTime, CandleSeries,
  AccumulationDistributionIndicator, Tooltip, Crosshair,
  IAxisLabelRenderEventArgs } from '@syncfusion/ej2-charts';
Chart.Inject(LineSeries, DateTime, CandleSeries,
  AccumulationDistributionIndicator, Tooltip, Crosshair);

Average True Range (ATR)

ATR measures the stock volatility by comparing the current value with the previous value. To render a Average True Range (ATR) Indicator,

use indicator [type](#) as `Atr` and inject `AtrIndicator` module using `Chart.Inject(AtrIndicator)`.

Bollinger Band

A chart overlay that shows the upper and lower limits of normal price movements based on the standard deviation of prices. To render a Bollinger Band, use indicator [type](#) as `BollingerBand` and inject `BollingerBands` module using `Chart.Inject(BollingerBands)` method. Bollinger band will be represented by three lines (upperLine, lowerLine, signalLine). The default values of the Bollinger Band [period](#) is 14 and [standardDeviations](#) is 2.

Customization of BollingerBand

`stroke`, `stroke-width`, and `color` of `upperLine` can be customized by using [upperLine](#),

and the `lowerLine` can be customized by using [lowerLine](#) properties of indicator.

Exponential Moving Average (EMA)

Moving average Indicators are used to define the direction of the trend. To render a EMA Indicator, use indicator [type](#) as `Ema` and inject `EmaIndicator` module using `Chart.Inject(EmaIndicator)`.

Momentum

Momentum shows the speed at which the price of the stock is changing. To render a Momentum indicator, use indicator [type](#) as `Momentum` and inject `MomentumIndicator` module using `Chart.Inject(MomentumIndicator)` method. Momentum indicator will be represented by two lines (upperLine, signalLine). In momentum indicator the upperBand value is always renders at the value 100.

```

Moving Average Convergence Divergence (MACD)

MACD is based on the difference between two EMA's. To render a MACD Indicator, use indicator [type](#) as

Macd and inject **MacdIndicator** module using **Chart.Inject(MacdIndicator)**. MACD indicator will be represented by MACD line, signal line, MACD histogram. MACD histogram is used to differentiate MACD line and signal line.

INDEX.TS

```

Customization of MACD

stroke, stroke-width, and color of macdLine can be customized by using, [macdLine](#),

property of indicator. The positive and negative changes of histogram can be customized by [macdPositiveColor](#) and [macdNegativeColor](#) properties. The [macdType] is used to define the type of MACD indicator. To customize the MACD period using [slowPeriod](#) and [fastPeriod](#) properties.

By default macdType as 'Both'.

Relative Strength Index (RSI)

RSI shows how strongly a stock is moving in its current direction. To render a RSI Indicator, use indicator [type](#) as `Rsi` and inject `RsiIndicator` module using `Chart.Inject(Rsindicator)`. RSI indicator will be represented

by three lines (upperBand, lowerBand, signalLine). The upperBand and lowerBand values are customized by [overBought](#) and [overSold](#) properties of indicator and the signalLine is calculated by RSI formula.

Simple Moving Average (SMA)

Moving average Indicators are used to define the direction of the trend. To render a SMA Indicator, use indicator [type](#) as `Sma` and inject `SmaIndicator` module using `Chart.Inject(SmaIndicator)`.

INDEX.TS

```

Stochastic

It shows how a stock is, when compared to previous state. To render a Stochastic indicator, use indicator [type](#) as [Stochastic](#) and inject [StochasticIndicator](#) module using [Chart.Inject\(StochasticIndicator\)](#) method.

stochastic indicator will be represented by four lines (upperLine, lowerLine, periodLine, signalLine). In stochastic indicator the upperBand value and lowerBand value is customized by [overBought](#) and [overSold](#) properties of indicators and the periodLine and signalLine is render based on stochastic formula.

Customization of StochasticIndicator

stroke, stroke-width, and color of upperLine can be customized by using [upperLine](#),

the lowerLine can be customized by using [lowerLine](#) and the periodLine can be customized by using [periodLine](#) properties of indicator. To customize the period to find the average price using [kPeriod](#) and [dPeriod](#)

properties.

Triangular Moving Average (TMA)

Moving average Indicators are used to define the direction of the trend. To render a TMA Indicator, use indicator [type](#) as `Tma` and inject `TmaIndicator` module using `Chart.Inject(TmaIndicator)`.

INDEX.TS

Customization of Technical Indicators

stroke, stroke-width, and color of signalLine can be customized by using fill, width and dashArray properties. and the period property is used to predict the data forecast calculations. The field value is used to compare the current price with previous price. It is applicable to Bollinger bands and moving averages. The showZones property is used to show/hides the overBought and overSold regions. It is applicable for RSI and stochastic indicators.

Data Source

Usually technical indicators are added along with a financial series. The [seriesName](#) represents the series, the data of which has to be analysed through indicators.

Technical indicators can also be added without series using [dataSource](#) property of indicator.

Trend lines in EJ2 JavaScript Chart control

Trendlines are used to show the direction and speed of price.

Trendlines can be generated for Cartesian type series (Line, Column, Scatter, Area, Candle, Hilo etc.) except bar type series. You can add more than one trendline to a series.

Chart supports 6 types of trendlines.

Linear

A linear trendline is a best fit straight line that is used with simpler data sets. To render a linear trendline, use trendline [type](#) as `Linear` and inject `Trendlines` module using `Chart.Inject(Trendlines)`.

INDEX.TS

```

import { Chart, Category, Trendlines, ScatterSeries, SplineSeries, Tooltip,
LineSeries, TrendlineTypes} from '@syncfusion/ej2-charts';
Chart.Inject(Chart, ScatterSeries, SplineSeries, LineSeries, Tooltip,
Trendlines Category);
let data: Object[] = [];
let yValue: number[] = [7.66, 8.03, 8.41, 8.97, 8.77, 8.20, 8.16, 7.89,

Exponential

An exponential trendline is a curved line that is most useful when data values rise or fall at increasingly higher rates. You cannot create an exponential trendline, if your data contains zero or negative values.

To render a exponential trendline, use trendline [type](#) as **Exponential** and inject **Trendlines** module using **Chart.Inject(Trendlines)**.

INDEX.TS

```

import { Chart, ScatterSeries, Trendlines, SplineSeries, Category,
LineSeries, Tooltip, Crosshair, Legend, DateTime } from '@syncfusion/ej2-
charts';
Chart.Inject(ScatterSeries, LineSeries, SplineSeries, Category, Tooltip,
Crosshair, Trendlines, Legend, DateTime);

Logarithmic

A logarithmic trendline is a best-fit curved line that is most useful when the rate of change in the data increases or decreases quickly and then levels out. A logarithmic trendline can use negative and/or positive values.

To render a logarithmic trendline, use trendline [type](#) as **Logarithmic** and inject **Trendlines** module using **Chart.Inject(Trendlines)**.

INDEX.TS

Polynomial

A polynomial trendline is a curved line that is used when data fluctuates.

To render a polynomial trendline, use trendline [type](#) as **Polynomial** and inject **Trendlines** module using **Chart.Inject(Trendlines)**.

polynomialOrder used to define the polynomial value.

INDEX.TS

```

import { Chart, Category, Trendlines, ScatterSeries, SplineSeries,
LineSeries, Tooltip, TrendlineTypes} from '@syncfusion/ej2-charts';
Chart.Inject(Chart, ScatterSeries, SplineSeries, LineSeries, Trendlines,
Tooltip, Category);
let data: Object[] = [];
let yValue: number[] = [7.66, 8.03, 8.41, 8.97, 8.77, 8.20, 8.16, 7.89,

Forecasting

Trendline forecasting is the prediction of future/past situations.

Forward Forecasting and Backward Forecasting are the two types of forecasting.

Forward Forecasting

The value set for forwardForecast is used to determine the distance moving towards the future trend.

Data markers in EJ2 JavaScript Chart control

Data markers are used to provide information about the data points in the series. You can add a shape to adorn each data point.

<!-- markdownlint-disable MD036 -->

Marker

<!-- markdownlint-disable MD036 -->

Markers can be added to points by enabling the [visible](#) option of the marker property. By default, distinct markers will be enabled for each series in the chart.

INDEX.TS

```

import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';

```

```

Chart.Inject(LineSeries, Category);

</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Shape

Markers can be assigned with different shapes such as Rectangle, Circle, Diamond, etc. using the [shape](#) property.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, Category);
let chart: Chart = new Chart({
    series: [
        {
            type: 'Line',
            dataSource: numData, xName: 'x', yName: 'y',
            marker: {
                visible: true,
                shape: 'Diamond',
                height: 10, width: 10
            }
        }
    ],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Note : To know more about the marker shape type refer the [shape](#).

Images

Apart from the shapes, you can also add custom images to mark the data point using the [imageUrl](#) property.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
```

```
import { numData } from './datasource.ts';
Chart.Inject(LineSeries, Category);
let chart: Chart = new Chart({
  series: [
    {
      type: 'Line',
      dataSource: numData, xName: 'x', yName: 'y',
      //Marker shape as image
      marker: {
        visible: true,
        width: 10, height: 10,
        shape: 'Image',
        imageUrl: 'sun_annotation.png'
      }
    }
  ],
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Customization

Marker's color and border can be customized using **fill** and **border** properties.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
```

```

Chart.Inject(LineSeries, Category);
let chart: Chart = new Chart({
    series: [
        {
            type: 'Line',
            dataSource: numData, xName: 'x', yName: 'y',
            marker: {
                visible: true,
                fill: 'Red', height: 10, width: 10,
                border:{width: 2, color: 'blue'},
            }
        }
    ],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>

```

Customizing specific point

You can also customize the specific marker and label using [pointRender](#) event. The `pointRender` event allows you to change the shape, color and border for a point.

INDEX.TS

```

import { Chart, LineSeries, IPointRenderEventArgs } from '@syncfusion/ej2-
charts';
import { numData } from './datasource.ts';
Chart.Inject(LineSeries);

```

```
let chart: Chart = new Chart({
  series: [
    {
      type: 'Line',
      dataSource: numData, xName: 'x', yName: 'y',
      marker: {
        visible: true,
        height: 10, width: 10,
      }
    }
  ],
  // pointRender event for chart
  pointRender: (args: IPointRenderEventArgs) => {
    if (args.point.index === 3) {
      args.fill = 'red'
    }
  },
}, '#element');
```

INDEX.HTML

```
<!DOCTYPE html><html lang="en"><head>
  <title>EJ2 Animation</title>
  <meta charset="utf-8">
  <meta name="viewport" content="width=device-width, initial-scale=1.0">
  <meta name="description" content="Typescript UI Controls">
  <meta name="author" content="Syncfusion">
  <link href="index.css" rel="stylesheet">

  <script src="https://cdn.syncfusion.com/ej2/24.1.41/dist/ej2.min.js"
  type="text/javascript"></script>
  <script src="https://cdn.syncfusion.com/ej2/syncfusion-helper.js" type
  ="text/javascript"></script>
</head>
<body>

  <div id="container">
    <div id="element"></div>
  </div>
  <script>
var ele = document.getElementById('container');
if(ele) {
  ele.style.visibility = "visible";
}
  </script>
  <script src="index.js" type="text/javascript"></script>
</body></html>
```

Fill marker with series color

Marker can be filled with the series color by setting the [isFilled](#) property to **true**.

INDEX.TS

```
import { Chart, LineSeries, Category } from '@syncfusion/ej2-charts';
import { numData } from './datasource.ts';
```

```

Chart.Inject(LineSeries, Category);
let chart: Chart = new Chart({
    series: [
        {
            type: 'Line',
            dataSource: numData, xName: 'x', yName: 'y',
            marker: {
                visible: true, isFilled: true,
                height: 10, width: 10,
            }
        }
    ],
}, '#element');

```

INDEX.HTML

```

<!DOCTYPE html><html lang="en"><head>

Data labels in EJ2 JavaScript Chart control

Data label can be added to a chart series by enabling the [visible](#) option in the dataLabel. By default, the labels will arrange smartly without overlapping.

INDEX.TS

```
import { Chart, ColumnSeries, Category, DataLabel } from '@syncfusion/ej2-charts';
import { columnData } from './datasource.ts';
Chart.Inject(ColumnSeries, Category, DataLabel);
let chart: Chart = new Chart({
    primaryXAxis: {
        valueType: 'Category'
    },
    series: [
        {
            type: 'Column',
            dataSource: columnData, xName: 'country', yName: 'gold',
            marker: {
                //Data label for chart series
                dataLabel: { visible: true }
            }
        }
    ],
}, '#element');
```
